In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
 consul.dc:
 ^dev-.*$: dev-datacenter
 ^(?P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
 consul.dc:
 ^(?P<env>.*): '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
- consul: my_consul_config

ext_pillar:
- consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
- consul: my_consul_config
- consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
- consul: my_consul_config root=salt/%(minion_id)s
- consul: my_consul_config root=salt/%(role)s
- consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
- consul: my_consul_config root=salt-shared
- consul: my_other_consul_config root=salt-private/%(minion_id)s
```

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:

```
role: my-minion-role
environment: dev
```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes `"` are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```
ext_pillar:
- consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"
```

The data from Consul can be merged into a nested key in Pillar.

```
ext_pillar:
- consul: my_consul_config pillar_root=consul_data
```

By default, keys containing YAML data will be deserialized before being merged into Pillar. This behavior can be disabled by setting `expand_keys` to `false`.

```
ext_pillar:
- consul: my_consul_config expand_keys=false
```

`salt.pillar.consul_pillar.consul_fetch(client, path)`  
Query consul for all keys/values within base path

`salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)`  
Check consul for all data

`salt.pillar.consul_pillar.fetch_tree(client, path, expand_keys)`  
Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.get_conn(opts, profile)`

Return a client object for accessing consul

`salt.pillar.consul_pillar.pillar_format(ret, keys, value, expand_keys)`

Perform data formatting to be used as pillar data and merge it with the current pillar data

### 21.12.8 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```
ext_pillar:
 - csv: /path/to/file.csv

or

ext_pillar:
 - csv:
 path: /path/to/file.csv
 namespace: 'subkey'
 fieldnames:
 - col1
 - col2
 - col2
```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

id	role	env
jerry	web	prod
stuart	web	stage
dave	web	qa
phil	db	prod
kevin	db	stage
mike	db	qa

Will produce the following Pillar values for a minion named "jerry":

```
{
 'role': 'web',
 'env': 'prod',
}
```

`salt.pillar.csvpillar.ext_pillar(mid, pillar, path, idkey='id', namespace=None, fieldnames=None, restkey=None, restval=None, dialect='excel')`

Read a CSV into Pillar

Parameters

- **path** (*str*) -- Absolute path to a CSV file.
- **idkey** (*str*) -- (Optional) The column name of minion IDs.
- **namespace** (*str*) -- (Optional) A pillar key to namespace the values under.
- **fieldnames** (*list*) -- (Optional) if the first row of the CSV is not column names they may be specified here instead.

### 21.12.9 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```
ext_pillar:
- digicert: True
```

`salt.pillar.digicert.ext_pillar(minion_id, pillar, conf)`

Return an existing set of certificates

### 21.12.10 salt.pillar.django\_orm

Generate Pillar data from Django models through the Django ORM

**maintainer** Micah Hausler <micah.hausler@gmail.com>

**maturity** new

#### Configuring the django\_orm ext\_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.

```
ext_pillar:
- django_orm:
 pillar_name: my_application
 project_path: /path/to/project/
 settings_module: my_application.settings
 env_file: /path/to/env/file.sh
 # Optional: If your project is not using the system python,
 # add your virtualenv path below.
 env: /path/to/virtualenv/

 django_app:

 # Required: the app that is included in INSTALLED_APPS
 my_application.clients:

 # Required: the model name
 Client:

 # Required: model field to use as the key in the rendered
 # Pillar. Must be unique; must also be included in the
 # ``fields`` list below.
 name: shortname

 # Optional:
 # See Django's QuerySet documentation for how to use .filter()
 filter: {'kw': 'args'}

 # Required: a list of field names
 # List items will be used as arguments to the .values() method.
 # See Django's QuerySet documentation for how to use .values()
```

(continues on next page)

(continued from previous page)

```

fields:
 - field_1
 - field_2

```

This would return pillar data that would look like

```

my_application:
 my_application.clients:
 Client:
 client_1:
 field_1: data_from_field_1
 field_2: data_from_field_2
 client_2:
 field_1: data_from_field_1
 field_2: data_from_field_2

```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```

ext_pillar:
 - django_orm:
 pillar_name: djangotutorial
 project_path: /path/to/mysite
 settings_module: mysite.settings

 django_app:
 mysite.polls:
 Choices:
 name: poll__question
 fields:
 - poll__question
 - poll__id
 - choice_text
 - votes

```

## Module Documentation

`salt.pillar.django_orm.ext_pillar(minion_id, pillar, pillar_name, project_path, settings_module, django_app, env=None, env_file=None, *args, **kwargs)`

Connect to a Django database through the ORM and retrieve model fields

### Parameters

- **pillar\_name** (*str*) -- The name of the pillar to be returned
- **project\_path** (*str*) -- The full path to your Django project (the directory `manage.py` is in)
- **settings\_module** (*str*) -- The settings module for your project. This can be found in your `manage.py` file
- **django\_app** (*str*) -- A dictionary containing your apps, models, and fields
- **env** (*str*) -- The full path to the virtualenv for your Django project
- **env\_file** (*str*) -- An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

### 21.12.11 salt.pillar.ec2\_pillar

Retrieve EC2 instance data for minions for `ec2_tags` and `ec2_tags_list`

The minion id must be the AWS instance-id or value in `tag_match_key`. For example set `tag_match_key` to `Name` to have the minion-id matched against the tag 'Name'. The tag contents must be unique. The value of `tag_match_value` can be 'uqdn' or 'asis'. if 'uqdn', then the domain will be stripped before comparison.

Additionally, the `use_grain` option can be set to `True`. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

---

**Note:** If you are using `use_grain: True` in the configuration for this external pillar module, the minion must have `metadata_server_grains` enabled in the minion config file (see also [here](#)).

It is important to also note that enabling the `use_grain` option allows the minion to manipulate the pillar data returned, as described above.

---

The optional `tag_list_key` indicates which keys should be added to `ec2_tags_list` and be split by `tag_list_sep` (by default `;`). If a tag key is included in `tag_list_key` it is removed from `ec2_tags`. If a tag does not exist it is still included as an empty list.

**..note::** As with any master configuration change, restart the salt-master daemon for changes to take effect.

```
ext_pillar:
- ec2_pillar:
 tag_match_key: 'Name'
 tag_match_value: 'asis'
 tag_list_key:
 - Role
 tag_list_sep: ';'
 use_grain: True
 minion_ids:
 - trusted-minion-1
 - trusted-minion-2
 - trusted-minion-3
```

This is a very simple pillar configuration that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

```
salt.pillar.ec2_pillar.ext_pillar(minion_id, pillar, use_grain=False, minion_ids=None,
 tag_match_key=None, tag_match_value='asis',
 tag_list_key=None, tag_list_sep=';')
```

Execute a command and read the output as YAML

### 21.12.12 salt.pillar.etcd\_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

**depends**

- python-etcd

In order to use an etcd server, a profile must be created in the master configuration file:

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
 - etcd: my_etcd_config

ext_pillar:
 - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```
ext_pillar:
 - etcd: my_etcd_config
 - etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```
ext_pillar:
 - etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
 - etcd: my_etcd_config root=/salt-shared
 - etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

```
salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)
 Check etcd for all data
```

### 21.12.13 salt.pillar.extra\_minion\_data\_in\_pillar

Add all extra minion data to the pillar.

**codeauthor** [Alexandru.Bleotu@morganstanley.ms.com](mailto:Alexandru.Bleotu@morganstanley.ms.com)

One can filter on the keys to include in the pillar by using the `include` parameter. For subkeys the `'.'` notation is supported (i.e. `'key:subkey'`) The keyword `<all>` includes all keys.

### Complete example in etc/salt/master

```
ext_pillar:
 - extra_minion_data_in_pillar:
 include: *
```

```
ext_pillar:
 - extra_minion_data_in_pillar:
 include:
 - key1
 - key2:subkey2
```

```
ext_pillar:
 - extra_minion_data_in_pillar:
 include: <all>
```

```
salt.pillar.extra_minion_data_in_pillar.ext_pillar(minion_id, pillar, include, extra_minion_data=None)
```

### 21.12.14 salt.pillar.file\_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

---

**Note:** This is an external pillar and is subject to the [rules and constraints](#) governing external pillars.

---

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

#### Example `file_tree` Pillar

#### Master Configuration

```
ext_pillar:
 - file_tree:
 root_dir: /srv/ext_pillar
 follow_dir_links: False
 keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to False. If `follow_dir_links` is set to True, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the [pillar\\_roots](#) of the environment specified by [pillarenv](#). If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *file.managed* state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```
ext_pillar:
- file_tree:
 root_dir: /path/to/root/directory
 keep_newline:
 - files/testdir/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
- file_tree:
 root_dir: /path/to/root/directory
 render_default: jinja|yaml
 renderer_blacklist:
 - gpg
 renderer_whitelist:
 - jinja
 - yaml
 template: True
```

## Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:

 apache:
```

(continues on next page)

(continued from previous page)

```

config.d:

 00_important.conf:
 <important_config important_setting="yes" />
 20_bob_extra.conf:
 <bob_specific_cfg has_freeze_ray="yes" />
corporate_app:

settings:

 common_settings:
 // This is the main settings file for the corporate
 // internal web app
 main_setting: probably
 bob_settings:
 role: bob

```

**Note:** The leaf data in the example shown is the contents of the pillar files.

`salt.pillar.file_tree.ext_pillar`(*minion\_id*, *pillar*, *root\_dir*=None, *follow\_dir\_links*=False, *debug*=False, *keep\_newline*=False, *render\_default*=None, *renderer\_blacklist*=None, *renderer\_whitelist*=None, *template*=False)

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion's ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```

ext_pillar:
- file_tree:
 root_dir: /path/to/root/directory
 render_default: jinja|yaml
 renderer_blacklist:
 - gpg
 renderer_whitelist:
 - jinja
 - yaml
 template: True

```

#### Parameters

- **minion\_id** -- The ID of the Minion whose pillar data is to be collected
- **pillar** -- Unused by the `file_tree` pillar module
- **root\_dir** -- Filesystem directory used as the root for pillar data (e.g. `/srv/ext_pillar`)

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

- **follow\_dir\_links** -- Follow symbolic links to directories while collecting pillar files. Defaults to `False`.

**Warning:** Care should be exercised when enabling this option as it will follow links that point outside of `root_dir`.

**Warning:** Symbolic links that lead to infinite recursion are not filtered.

- **debug** -- Enable debug information at log level `debug`. Defaults to `False`. This option may be useful to help debug errors when setting up the `file_tree` pillar module.
- **keep\_newline** -- Preserve the end-of-file newline in files. Defaults to `False`. This option may either be a boolean or a list of file globs (as defined by the [Python fnmatch package](#)) for which end-of-file newlines are to be kept.

`keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the `root_dir`.

```
ext_pillar:
- file_tree:
 root_dir: /srv/ext_pillar
 keep_newline:
 - apache/config.d/*
 - corporate_app/settings/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline`. However, this module does not actually distinguish between binary and text files.

- **render\_default** -- Override Salt's `default global renderer` for the `file_tree` pillar.

```
render_default: jinja
```

- **renderer\_blacklist** -- Disallow renderers for pillar files.

```
renderer_blacklist:
- json
```

- **renderer\_whitelist** -- Allow renderers for pillar files.

```
renderer_whitelist:
- yaml
- jinja
```

- **template** -- Enable templating of pillar files. Defaults to `False`.

### 21.12.15 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

#### Configuring the Foreman ext\_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
- foreman:
 key: foreman # Nest results within this key
 only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme
```

The following options are optional:

```
foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](#).

#### Module Documentation

`salt.pillar.foreman.ext_pillar(minion_id, pillar, key=None, only=())`  
Read pillar data from Foreman via its API.

### 21.12.16 salt.pillar.git\_pillar

#### Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
 '*':
 - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

**Important:** Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for `git_pillar`, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
 'dev-*':
 - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see [here](#)), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

## Configuring `git_pillar` for Salt

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described [here](#).

**Important:** `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See [here](#) for documentation on the `git_pillar` configuration options and their usage.

Here is an example `git_pillar` configuration:

```
ext_pillar:
 - git:
 # Use 'prod' instead of the branch name 'production' as the environment
 - production https://gitserver/git-pillar.git:
 - env: prod
 # Use 'dev' instead of the branch name 'develop' as the environment
 - develop https://gitserver/git-pillar.git:
 - env: dev
 # No per-remote config parameters (and no trailing colon), 'qa' will
 # be used as the environment
 - qa https://gitserver/git-pillar.git
 # SSH key authentication
 - master git@other-git-server:pillardata-ssh.git:
 # Pillar SLS files will be read from the 'pillar' subdirectory in
 # this repository
 - root: pillar
 - privkey: /path/to/key
 - pubkey: /path/to/key.pub
 - passphrase: CorrectHorseBatteryStaple
 # HTTPS authentication
 - master https://other-git-server/pillardata-https.git:
 - user: git
 - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to `gitfs`), and global versions of the `git_pillar` configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
- git:
 - production https://gitserver/git-pillar.git:
 - env: prod
```

If `__env__` is specified as the branch name, then `git_pillar` will decide which branch to use based on the following criteria:

- If the minion has a `pillarenv` configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's `git_pillar_base` will be used.

---

**Note:** The use of `environment` to choose the pillar environment dates from a time before the `pillarenv` parameter was added. In a future release, it will be ignored and either the minion's `pillarenv` or the master's `git_pillar_base` will be used.

---

Here's an example of using `__env__` as the `git_pillar` environment:

```
ext_pillar:
- git:
 - __env__ https://gitserver/git-pillar.git:
 - root: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
 '*':
 - bar
```

With the addition of `pygit2` support, `git_pillar` can now interact with authenticated remotes. Authentication works just like in `gitfs` (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

---

**Note:** The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

---

## How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git` `ext_pillar` configuration. Consider the following:

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001

ext_pillar:
 - etcd: my_etcd_config
 - git:
 - master https://mydomain.tld/foo.git:
 - root: pillar
 - master https://mydomain.tld/bar.git
 - master https://mydomain.tld/baz.git
 - dev https://mydomain.tld/qux.git
 - git:
 - master https://mydomain.tld/abc.git
 - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each `ext_pillar` is called separately from the others. So, in the above example, the `etcd` `ext_pillar` will be evaluated first, with the first group of `git_pillar` remotes evaluated next (and merged into the `etcd` pillar data). Lastly, the second group of `git_pillar` remotes will be evaluated, and then merged into the `ext_pillar` data evaluated before it.
2. Within a single group of `git_pillar` remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

---

**Note:** Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

---

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of `git_pillar` remotes, the top file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a `pillarenv` in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that `pillarenv`. A `pillarenv` can also be specified for a given minion or set of minions when *running states*, by using the `pillarenv` argument. The CLI `pillarenv` will override one set in the minion config file. So, assuming that a `pillarenv` of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a `pillarenv` of `dev`, which would mean that it would then ignore any items from the `base` `pillarenv`. A more detailed explanation of pillar environments can be found [here](#).

Moving on to point #3, and looking at the example `ext_pillar` configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced

by the `bar` remote's top file will first be looked for in the `bar` remote, followed by `foo`, and `baz`, and when the `baz` remote is processed, SLS files will be looked for in `baz`, followed by `foo` and `bar`. This "failover" logic is called a *directory overlay*, and it is also used by *file\_roots* and `:conf_minion`pillar_roots``. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of `git_pillar` remotes having access to files in other repos which share the same environment can be disabled by setting *git\_pillar\_includes* to `False`. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

## Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
 'web*':
 - common
 - web.server.nginx
 - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that *git\_pillar\_includes* has not been set to `False`):

```
ext_pillar:
 - git:
 - master https://mydomain.tld/pillar-common.git
 - master https://mydomain.tld/pillar-nginx.git
 - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```
ext_pillar:
 - git:
 - master https://mydomain.tld/pillar-common.git
 - master https://mydomain.tld/pillar-nginx.git:
 - mountpoint: web/server/
 - master https://mydomain.tld/pillar-appdata.git:
 - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

**Note:**

- Leading and trailing slashes on the mountpoints are optional.
- Use of the `mountpoint` feature requires that `git_pillar_includes` is not disabled.
- Content from mounted `git_pillar` repos can only be referenced by a top file in the same pillar environment.
- Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.

**all\_saltenvs**

New in version 2018.3.4.

When `__env__` is specified as the branch name, `all_saltenvs` per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. `pillarenvs`). This allows a single branch/tag to appear in all saltenvs. Example:

```
ext_pillar:
- git:
 - __env__ https://mydomain.tld/top.git
 - all_saltenvs: master
 - __env__ https://mydomain.tld/pillar-nginx.git:
 - mountpoint: web/server/
 - __env__ https://mydomain.tld/pillar-appdata.git:
 - mountpoint: web/server/
```

**git\_pillar\_update\_interval**

New in version 3000.

This option defines the default update interval (in seconds) for `git_pillar` remotes. The update is handled within the global loop, hence `git_pillar_update_interval` should be a multiple of `loop_interval`.

```
git_pillar_update_interval: 120
```

**fallback**

New in version 3001.

Setting `fallback` per-remote or global configuration parameter will map non-existing environments to a default branch. Example:

```
ext_pillar:
- git:
 - __env__ https://mydomain.tld/top.git
 - all_saltenvs: master
 - __env__ https://mydomain.tld/pillar-nginx.git:
 - mountpoint: web/server/
 - fallback: master
 - __env__ https://mydomain.tld/pillar-appdata.git:
 - mountpoint: web/server/
 - fallback: master
```

`salt.pillar.git_pillar.ext_pillar(minion_id, pillar, *repos)`  
Checkout the `ext_pillar` sources and compile the resulting pillar SLS

### 21.12.17 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
- stack: /path/to/stack.cfg
- gpg: {}
```

Set `gpg_keydir` in your config to adjust the homedir the renderer uses.

`salt.pillar.gpg.ext_pillar(minion_id, pillar, *args, **kwargs)`

### 21.12.18 salt.pillar.hg\_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs_` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
- hg: ssh://hg@example.co/user/repo
```

**class** `salt.pillar.hg_pillar.Repo(repo_uri)`  
Deal with remote hg (mercurial) repository for Pillar

**close()**  
Cleanup mercurial command server

**pull()**

**update(branch='default')**  
Ensure we are using the latest revision in the hg repository

`salt.pillar.hg_pillar.ext_pillar(minion_id, pillar, repo, branch='default', root=None)`  
Extract pillar from an hg repository

`salt.pillar.hg_pillar.update(repo_uri)`  
Execute an hg pull on all the repos

### 21.12.19 salt.pillar.hiera

Use hiera data as a Pillar source

**salt.pillar.hiera.ext\_pillar**(*minion\_id, pillar, conf*)  
Execute hiera and return the data

### 21.12.20 salt.pillar.http\_json module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_JSON ext\_pillar

Set the following Salt config to setup http json result as external pillar source:

```
ext_pillar:
- http_json:
 url: http://example.com/api/minion_id
 ::TODO::
 username: username
 password: password
```

If the with\_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_json:
 url: http://example.com/api/<nodename>
 with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion\_id:

```
ext_pillar:
- http_json:
 url: http://example.com/api/%s
```

#### Module Documentation

**salt.pillar.http\_json.ext\_pillar**(*minion\_id, pillar, url, with\_grains=False*)

Read pillar data from HTTP response.

##### Parameters

- **url** (*str*) -- Url to request.
- **with\_grains** (*bool*) -- Whether to substitute strings in the url with their grain values.

**Returns** A dictionary of the pillar data to add.

**Return type** `dict`

### 21.12.21 salt.pillar.http\_yaml module

A module that adds data to the Pillar structure retrieved by an http request

#### Configuring the HTTP\_YAML ext\_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
- http_yaml:
 url: http://example.com/api/minion_id
 ::TODO::
 username: username
 password: password
```

If the `with_grains` parameter is set, grain keys wrapped in `<>` brackets in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_yaml:
 url: http://example.com/api/<nodename>
 with_grains: True
```

Changed in version 2018.3.0: If `%s` is present in the url, it will be automatically replaced by the `minion_id`:

```
ext_pillar:
- http_json:
 url: http://example.com/api/%s
```

#### Module Documentation

`salt.pillar.http_yaml.ext_pillar(minion_id, pillar, url, with_grains=False)`

Read pillar data from HTTP response.

##### Parameters

- **url** (*str*) -- Url to request.
- **with\_grains** (*bool*) -- Whether to substitute strings in the url with their grain values.

**Returns** A dictionary of the pillar data to add.

**Return type** `dict`

### 21.12.22 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

**depends** `certtool`

`salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)`

Read in the generated libvirt keys

`salt.pillar.libvirt.gen_hyper_keys(minion_id, country='US', state='Utah', locality='Salt Lake City', organization='Salted', expiration_days='365')`

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

### 21.12.23 salt.pillar.makostack module

Simple and flexible YAML `ext_pillar` which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack `ext_pillar` is a direct ripoff of the 'stack' `ext_pillar`, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- all these rendered files are then parsed as `yaml`.
- then all `yaml` dicts are merged in order, with support for the following. merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`.
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments.

#### Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure MakoStack in 3 different ways:

#### Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
- makostack: /path/to/stack.cfg
```

#### List of config files

You can also provide a list of config files:

```
ext_pillar:
- makostack:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
```

## Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- makostack:
 pillar:environment:
 dev: /path/to/dev/stack.cfg
 prod: /path/to/prod/stack.cfg
 grains:custom:grain:
 value:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
 opts:custom:opt:
 value: /path/to/stack0.cfg
```

## Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
- bar
- baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
 fur:
 foo:
 - bar
 - baz
```

## MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these `yaml` files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with '/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call

- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__['osarch'] }.yml
oscodenames/%{ __grains__['oscodename'] }.yml
% for role in pillar.get('roles', []):
roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── osarchs/
│ ├── amd64.yml
│ └── armhf.yml
├── oscodenames/
│ ├── wheezy.yml
│ └── jessie.yml
├── roles/
│ ├── web.yml
│ └── db.yml
└── minions/
 ├── test-1-dev.yml
 └── test-2-dev.yml
```

## Overall process

In the above MakoStack configuration, given that `test-1-dev` minion is an `amd64` platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- `core.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of `yaml` files:

- `stack`: the MakoStack pillar data object that has currently been merged (data from previous `yaml` files in MakoStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)

- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous `yaml` files in MakoStack configuration) through the `stack` variable.

Once a `yaml` file has been preprocessed by mako, we obtain a Python dict - let's call it `yaml_data` - then, MakoStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yaml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

### Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

#### **merge-last** (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

#### **merge-first** strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

### Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: merge-last   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - sysadmin       - developer   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: merge-first   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - developer       - sysadmin   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: remove   <b>tom:</b>   <b>mat:</b> </pre>	<pre> <b>users:</b>   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: overwrite   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: merge-last</li> <li>- mat</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> <li>- mat</li> </ul>
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: merge-first</li> <li>- mat</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- mat</li> <li>- tom</li> <li>- root</li> </ul>
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: remove</li> <li>- mat</li> <li>- tom</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- root</li> </ul>
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: overwrite</li> <li>- mat</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- mat</li> </ul>

`salt.pillar.makostack.ext_pillar(minion_id, pillar, *args, **kwargs)`

### 21.12.24 salt.pillar.mongo

Read Pillar data from a mongodb collection

**depends** pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

#### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

## Configuring the Mongo ext\_pillar

The Mongo ext\_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
 - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields:
 ↳ [customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

## Module Documentation

`salt.pillar.mongo.ext_pillar(minion_id, pillar, collection='pillar', id_field='_id', re_pattern=None, re_replace='', fields=None)`

Connect to a mongo database and read per-node pillar information.

### Parameters

- **collection** (\*) -- The mongodb collection to read data from. Defaults to 'pillar'.
- **id\_field** (\*) -- The field in the collection that represents an individual minion id. Defaults to '\_id'.
- **re\_pattern** (\*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re\_pattern* will be used to match the name, and *re\_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If *None*, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to *None*.
- **re\_replace** (\*) -- Use as the replacement value in node ids matched with *re\_pattern*. Defaults to *''*. Feel free to use backreferences here.
- **fields** (\*) -- The specific fields in the document to use for the pillar data. If *None*, will use the entire document. If using the entire document, the *\_id* field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to *None*.

### 21.12.25 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the `sql_base` ext\_pillar for MySQL.

**maturity** new

**depends** python-mysqldb

**platform** all

## Configuring the mysql ext\_pillar

Use the 'mysql' key under ext\_pillar for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

### Complete example

```
mysql:
 user: 'salt'
 pass: 'super_secret_password'
 db: 'salt_db'
 port: 3306
 ssl:
 cert: /etc/mysql/client-cert.pem
 key: /etc/mysql/client-key.pem

ext_pillar:
 - mysql:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE %s'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

### class salt.pillar.mysql.MySQLExtPillar

This class receives and processes the database rows from MySQL.

#### extract\_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.mysql.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against MySQL, merge and return as a dict

## 21.12.26 salt.pillar.nacl

Decrypt pillar data through the builtin NACL renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
nacl.config:
 keyfile: /root/.nacl

ext_pillar:
 - stack: /path/to/stack.cfg
 - nacl: {}
```

Set nacl.config in your config.

`salt.pillar.nacl.ext_pillar(minion_id, pillar, *args, **kwargs)`

### 21.12.27 salt.pillar.netbox

A module that adds data to the Pillar structure from a NetBox API.

New in version 2019.2.0.

#### Configuring the NetBox `ext_pillar`

```
ext_pillar:
- netbox:
 api_url: http://netbox_url.com/api/
 api_token: 123abc
```

Create a token in your NetBox instance at [http://netbox\\_url.com/user/api-tokens/](http://netbox_url.com/user/api-tokens/)

The following options are optional, and determine whether or not the module will attempt to configure the proxy pillar data for use with the napalm proxy-minion:

```
proxy_return: True
proxy_username: admin
```

By default, this module will query the NetBox API for the platform associated with the device, and use the 'NAPALM driver' field to set the napalm proxy-minion driver. (Currently only 'napalm' is supported for drivertype.)

This module currently only supports the napalm proxy minion and assumes you will use SSH keys to authenticate to the network device. If password authentication is desired, it is recommended to create another `proxy` key in `pillar_roots` (or `git_pillar`) with just the `passwd` key and use `salt.renderers.gpg` to encrypt the value. If any additional options for the proxy setup are needed they should also be configured in `pillar_roots`.

Other available options:

**site\_details: True** Whether should retrieve details of the site the device belongs to.

**site\_prefixes: True** Whether should retrieve the prefixes of the site the device belongs to.

`salt.pillar.netbox.ext_pillar` (*minion\_id, pillar, \*args, \*\*kwargs*)  
Query NetBox API for minion data

### 21.12.28 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

#### depends

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my openstack_config:
 keystone.user: 'admin'
 keystone.password: 'password'
 keystone.tenant: 'admin'
 keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
 keystone.region_name: 'RegionOne'
 keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
 - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
 - neutron: my_openstack_config
 - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
 • neutron: my_openstack_config neutron_networks
```

```
salt.pillar.neutron.ext_pillar(minion_id, pillar, conf)
Check neutron for all data
```

## 21.12.29 salt.pillar.nodegroups

### Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of *nodegroups* which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

### Command Line

```
salt-call pillar.get nodegroups
local:
 - class_infra
 - colo_sj
 - state_active
 - country_US
 - type_saltmaster
```

### Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
 - nodegroups:
 pillar_name: 'nodegroups'
```

```
salt.pillar.nodegroups.ext_pillar(minion_id, pillar, pillar_name=None)
```

A salt external pillar which provides the list of nodegroups of which the minion is a member.

#### Parameters

- **minion\_id** -- used for compound matching nodegroups
- **pillar** -- provided by salt, but not used by nodegroups ext\_pillar
- **pillar\_name** -- optional name to use for the pillar, defaults to 'nodegroups'

**Returns** a dictionary which is included by the salt master in the pillars returned to the minion

## 21.12.30 salt.pillar.pepa

### Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

### Configuring Pepa

```

extension_modules: /srv/salt/ext

ext_pillar:
 - pepa:
 resource: host # Name of resource directory and sub-key in
 ↳pillars
 sequence: # Sequence used for hierarchical substitution
 - hostname: # Name of key
 name: input # Alias used for template directory
 base_only: True # Only use templates from Base environment, i.e.
 ↳no staging
 - default:
 - environment:
 - location..region:
 name: region
 - location..country:
 name: country
 - location..datacenter:
 name: datacenter
 - roles:
 - osfinger:
 name: os
 - hostname:
 name: override
 base_only: True
 subkey: True # Create a sub-key in pillars, named after the
 ↳resource in this case [host]
 subkey_only: True # Only create a sub-key, and leave the top level
 ↳untouched

pepa_roots: # Base directory for each environment
 base: /srv/pepa/base # Path for base environment
 dev: /srv/pepa/base # Associate dev with base
 qa: /srv/pepa/qa
 prod: /srv/pepa/prod

Use a different delimiter for nested dictionaries, defaults to '..' since some keys
↳may use '.' in the name
#pepa_delimiter: ..

Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
environment: dev

Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
saltversion: 0.17.4

```

(continues on next page)

(continued from previous page)

```
Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
salt: warning
salt.loaded.ext.pillar.pepa: debug
```

Pepa can also be used in Master-less SaltStack setup.

## Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
 hostname

positional arguments:
 hostname Hostname

optional arguments:
 -h, --help show this help message and exit
 -c CONFIG, --config CONFIG
 Configuration file
 -d, --debug Print debug info
 -g GRAINS, --grains GRAINS
 Input Grains as YAML
 -p PILLAR, --pillar PILLAR
 Input Pillar as YAML
 -n, --no-color No color output
 -v, --validate Validate output
```

## Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test\_example\_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
 - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```
network..dns..servers:
- 10.0.0.1
- 10.0.0.2
time..ntp..servers:
- ntp1.amer.example.com
- ntp2.amer.example.com
- ntp3.amer.example.com
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

Example:

osfinger: Fedora-19

Would become:

fedora\_19.yaml

### Nested dictionaries

In order to create nested dictionaries as output you can use double dot “..” as a delimiter. You can change this using “pepa\_delimiter” we choose double dot since single dot is already used by key names in some modules, and using “:” requires quoting in the YAML.

Example:

```
network..dns..servers:
- 10.0.0.1
- 10.0.0.2
network..dns..options:
- timeout:2
- attempts:1
- ndots:1
network..dns..search:
- example.com
```

Would become:

```
network:
 dns:
 servers:
 - 10.0.0.1
 - 10.0.0.2
 options:
 - timeout:2
 - attempts:1
 - ndots:1
 search:
 - example.com
```

## Operators

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
<code>merge()</code>	Merge list or hash
<code>unset()</code>	Unset key
<code>immutable()</code>	Set the key as immutable, so it can't be changed
<code>imerge()</code>	Set immutable and merge
<code>iunset()</code>	Set immutable and unset

Example:

```
network..dns..search..merge():
- foobar.com
- dummy.nl
owner..immutable(): Operations
host..printers..unset():
```

## Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

## Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

**File Example:** `host/validation/network.yaml`

```
network..dns..search:
 type: list
 allowed:
 - example.com

network..dns..options:
 type: list
 allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
 type: list
 schema:
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
 type: string
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$
```

(continues on next page)

(continued from previous page)

```
{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
 type: boolean

network..interfaces..{{ interface }}..fqdn:
 type: string
 regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
 type: string
 regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
 type: string
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{{ interface }}..netmask:
 type: string
 regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}
```

## Links

Convert key/value to tree

`salt.pillar.pepa.validate`(*output*, *resource*)

Validate Pepa templates

### 21.12.31 salt.pillar.pillar\_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

## Configuring the LDAP ext\_pillar

The basic configuration is part of the [master configuration](#).

```
ext_pillar:
- pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

**Note:** When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the salt-master process will attempt to parse its content.

**Warning:** Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

## Configuring the LDAP searches

The file is processed using *Salt's Renderers* `<renderers>` which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the 'id' grain which is verified through the minion's key/cert.

## Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- filtering for: - members of the group `it-admins` - objects with `objectclass=user`
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

## Configuration

```
salt-users:
 server: ldap.company.tld
 port: 389
 tls: true
 dn: 'dc=company,dc=tld'
 binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
 bindpw: bi7ieBai5Ano
 referrals: false
 anonymous: false
 mode: map
 dn: 'ou=users,dc=company,dc=tld'
 filter: '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
```

(continues on next page)

(continued from previous page)

```
attrs:
- cn
- displayName
- givenName
- sn
lists:
- memberOf

search_order:
- salt-users
```

## Result

```
{
 'salt-users': [
 {
 'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',
 'displayName': 'John Doe'
 'givenName': 'John'
 'sn': 'Doe'
 'memberOf': [
 'cn=it-admins,ou=groups,dc=company,dc=tld',
 'cn=team01,ou=groups,dc=company'
]
 },
 {
 'cn': 'cn=janedoe,ou=users,dc=company,dc=tld',
 'displayName': 'Jane Doe',
 'givenName': 'Jane',
 'sn': 'Doe',
 'memberOf': [
 'cn=it-admins,ou=groups,dc=company,dc=tld',
 'cn=team02,ou=groups,dc=company'
]
 }
]
}
```

`salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)`

Execute LDAP searches and return the aggregated data

### 21.12.32 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

**maturity** new

**depends** psycpg2

**platform** all

## Complete Example

```
postgres:
 user: 'salt'
 pass: 'super_secret_password'
 db: 'salt_db'

ext_pillar:
 - postgres:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE %s'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

### class salt.pillar.postgres.POSTGRESExtPillar

This class receives and processes the database rows from POSTGRES.

#### extract\_queries(*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

`salt.pillar.postgres.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against POSTGRES, merge and return as a dict

### 21.12.33 salt.pillar.puppet

Execute an unmodified puppet\_node\_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.puppet.ext_pillar(minion_id, pillar, command)`

Execute an unmodified puppet\_node\_classifier and read the output as YAML

### 21.12.34 salt.pillar.reclass\_adapter

Use the "reclass" database as a Pillar source

This ext\_pillar plugin provides access to the **reclass** database, such that Pillar data for a specific minion are fetched using **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the ext\_pillar list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
ext_pillar:
 - reclass:
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as master\_tops plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for ext\_pillar and master\_tops):

```
reclass: &reclass
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
 reclass_source_path: ~/code/reclass

ext_pillar:
 - reclass: *reclass

master_tops:
 reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

`salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)`  
Obtain the Pillar data from reclass for the given minion\_id.

### 21.12.35 salt.pillar.redismod

#### Read pillar data from a Redis backend

New in version 2014.7.0.

##### depends

- redis Python module (on master)

#### Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

#### Configuring the Redis ext\_pillar

```
ext_pillar:
 - redis: {function: key_value}
```

`salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)`  
Grabs external pillar data based on configured function

`salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)`  
Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar\_key is not set.  
`pillar_key` Pillar key to return data into

`salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')`  
 Looks for key in redis matching `minion_id`, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.  
`pillar_key` Pillar key to return data into

### 21.12.36 salt.pillar.rethinkdb\_pillar

Provide external pillar data from RethinkDB

New in version 2018.3.0.

**depends** rethinkdb (on the salt-master)

#### salt master rethinkdb configuration

These variables must be configured in your master configuration file.

- `rethinkdb.host` - The RethinkDB server. Defaults to 'salt'
- `rethinkdb.port` - The port the RethinkDB server listens on. Defaults to '28015'
- `rethinkdb.database` - The database to connect to. Defaults to 'salt'
- `rethinkdb.username` - The username for connecting to RethinkDB. Defaults to ''
- `rethinkdb.password` - The password for connecting to RethinkDB. Defaults to ''

#### salt-master ext\_pillar configuration

The `ext_pillar` function arguments are given in single line dictionary notation.

```
ext_pillar:
- rethinkdb: {table: ext_pillar, id_field: minion_id, field: pillar_root, pillar_
 ↳key: external_pillar}
```

In the example above the following happens.

- The salt-master will look for external pillars in the 'ext\_pillar' table on the RethinkDB host
- The minion id will be matched against the 'minion\_id' field
- Pillars will be retrieved from the nested field 'pillar\_root'
- Found pillars will be merged inside a key called 'external\_pillar'

## Module Documentation

`salt.pillar.rethinkdb_pillar.ext_pillar(minion_id, pillar, table='pillar', id_field=None, field=None, pillar_key=None)`

Collect minion external pillars from a RethinkDB database

Arguments:

- `table`: The RethinkDB table containing external pillar information. Defaults to 'pillar'
- `id_field`: Field in document containing the minion id. If blank then we assume the table index matches minion ids
- `field`: Specific field in the document used for pillar data, if blank then the entire document will be used
- `pillar_key`: The salt-master will nest found external pillars under this key before merging into the minion pillars. If blank, external pillars will be merged at top level

### 21.12.37 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
- s3:
 bucket: my.fancy.pillar.bucket
 keyid: KASKFJWAKJASJKDAJKSD
 key: ksladfdLKDALSFKSD93q032sdDasdfasdfsadkf
 multiple_env: False
 environment: base
 prefix: somewhere/overthere
 verify_ssl: True
 service_url: s3.amazonaws.com
 kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
 s3_cache_expire: 30
 s3_sync_on_update: True
 path_style: False
 https_enable: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a 'subdirectory' of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to `False`. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to `True`. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the *prefix=* parameter and specify one entry in *ext\_pillar* for each environment rather than specifying *multiple\_env*. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```
class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True,
 kms_keyid=None, location=None, path_style=False,
 https_enable=True)
```

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True,
 location=None, multiple_env=False, environment='base', pre-
 fix="", service_url=None, kms_keyid=None, s3_cache_expire=30,
 s3_sync_on_update=True, path_style=False, https_enable=True)
```

Execute a command and read the output as YAML

### 21.12.38 salt.pillar.saltclass

#### SaltClass Pillar Module

```
ext_pillar:
- saltclass:
- path: /srv/saltclass
```

For additional configuration instructions, see the *saltclass* module

```
salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)
```

Compile pillar data

### 21.12.39 salt.pillar.sql\_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an *ext\_pillar*. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

**maturity** new

**platform** all

#### Theory of sql\_base ext\_pillar

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.

- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

### Configuring a `sql_base` `ext_pillar`

The `sql_base` `ext_pillar` cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql\_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
- sql_base:
 - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
- sql_base:
 main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```
ext_pillar:
- sql_base:
 - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 2
```

Or as a mapping

```
ext_pillar:
- sql_base:
 - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {"b": b, "c": c, "d": d}}
- With depth 2: {a: {b: {"c": c, "d": d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```
ext_pillar:
- sql_base:
 - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
↪minion_id != %s"
 depth: 2
```

(continues on next page)

(continued from previous page)

```
- query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
 depth: 2
 ignore_null: True
```

If you specify *as\_list*: *True* in the mapping expression it will convert collisions to lists.

If you specify *with\_lists*: *'...'* in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string *'1,3'* will result in:

```
a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
 ^ ^
```

These columns define list grouping

```
{a: [
 {c: [
 {e: 1},
 {g: 2}
]},
 {h: [
 {j: 3, k: 4 }
]}
]}
```

The range for *with\_lists* is 1 to *number\_of\_fields*, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your *minion\_id* is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

### More complete example for MySQL (to also show configuration)

```
mysql:
 user: 'salt'
 pass: 'super_secret_password'
 db: 'salt_db'

ext_pillar:
 - mysql:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE %s'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

**class** salt.pillar.sql\_base.SqlBaseExtPillar

This class receives and processes the database rows in a database agnostic way.

**as\_list** = False

**depth** = 0

**enter\_root**(*root*)

Set self.focus for kwarg queries

**extract\_queries**(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

**fetch**(*minion\_id*, *pillar*, *\*args*, *\*\*kwargs*)

Execute queries, merge and return as a dict.

**field\_names** = None

**focus** = None

**ignore\_null** = False

**num\_fields** = 0

**process\_fields**(*field\_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

**process\_results**(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

**result** = None

**with\_lists** = None

### 21.12.40 salt.pillar.sqlcipher module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLCipher.

**maturity** new

**depends** pysqlcipher (for py2) or pysqlcipher3 (for py3)

**platform** all

## Configuring the sqlcipher ext\_pillar

Use the 'sqlcipher' key under ext\_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:
 database: /var/lib/salt/pillar-sqlcipher.db
 pass: strong_pass_phrase
 timeout: 5.0
```

## Complete Example

```
sqlcipher:
 database: '/var/lib/salt/pillar-sqlcipher.db'
 pass: strong_pass_phrase
 timeout: 5.0

ext_pillar:
 - sqlcipher:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE ?'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

### **class** salt.pillar.sqlcipher.SQLCipherExtPillar

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

## 21.12.41 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

sqlite3 is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql\_base ext\_pillar for SQLite3.

**platform** all

### Configuring the sqlite3 ext\_pillar

Use the 'sqlite3' key under ext\_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

### Complete Example

```
sqlite3:
 database: '/var/lib/salt/pillar.db'
 timeout: 5.0

ext_pillar:
 - sqlite3:
 fromdb:
 query: 'SELECT col1,col2,col3,col4,col5,col6,col7
 FROM some_random_table
 WHERE minion_pattern LIKE ?'
 depth: 5
 as_list: True
 with_lists: [1,3]
```

#### **class** salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

`salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLite3, merge and return as a dict

### 21.12.42 salt.pillar.stack

Simple and flexible YAML ext\_pillar which can read pillar from within pillar.

New in version 2016.3.0.

`PillarStack` is a custom saltstack ext\_pillar which was inspired by `varstack` but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: <https://github.com/bbnet/pillarstack/issues>

It supports the following features:

- multiple config files that are jinja2 templates with support for pillar, \_\_grains\_\_, \_\_salt\_\_, \_\_opts\_\_ objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for stack, pillar, \_\_grains\_\_, \_\_salt\_\_, \_\_opts\_\_ objects
- all these rendered files are then parsed as yaml
- then all yaml dicts are merged in order with support for the following merging strategies: merge-first, merge-last, remove, and overwrite

- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments

## Installation

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.

Installing the PillarStack `ext_pillar` is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules` is set in your salt-master configuration, see: <http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules>

## Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure PillarStack in 3 different ways:

### Single config file

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
- stack: /path/to/stack.cfg
```

### List of config files

You can also provide a list of config files:

```
ext_pillar:
- stack:
 - /path/to/stack1.cfg
 - /path/to/stack2.cfg
```

### Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- stack:
 pillar:environment:
 dev: /path/to/dev/stack.cfg
 prod: /path/to/prod/stack.cfg
 grains:custom:grain:
 value:
```

(continues on next page)

(continued from previous page)

```

- /path/to/stack1.cfg
- /path/to/stack2.cfg
opts:custom:opt:
 value: /path/to/stack0.cfg

```

### PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

The path of these `yaml` files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module* <<https://docs.python.org/2/library/glob.html>>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```

$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml

```

And the whole directory structure could look like:

```

$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── common/
│ ├── xxx.yml
│ └── yyy.yml
├── osarchs/
│ ├── amd64.yml
│ └── armhf.yml
├── oscodenames/
│ ├── wheezy.yml
│ └── jessie.yml
└── roles/

```

(continues on next page)

(continued from previous page)

```

├── web.yml
├── db.yml
└── minions/
 ├── test-1-dev.yml
 └── test-2-dev.yml

```

## Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous yaml files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous yaml files in PillarStack configuration) through the `stack` variable.

Once a yaml file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse` salt `pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

## Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__ : <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

### `merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

### `merge-first` strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

### `remove` strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

### `overwrite` strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

## Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users:   tom:     uid: 500     roles:       - sysadmin   root:     uid: 0</pre>	<pre>users:   tom:     uid: 1000     roles:       - developer   mat:     uid: 1001</pre>	<pre>users:   tom:     uid: 1000     roles:       - sysadmin       - developer   mat:     uid: 1001   root:     uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: merge-last   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - sysadmin       - developer   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: merge-first   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - developer       - sysadmin   <b>mat:</b>     <b>uid:</b> 1001   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: remove   <b>tom:</b>   <b>mat:</b> </pre>	<pre> <b>users:</b>   <b>root:</b>     <b>uid:</b> 0 </pre>
<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 500     <b>roles:</b>       - sysadmin   <b>root:</b>     <b>uid:</b> 0 </pre>	<pre> <b>users:</b>   __: overwrite   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>	<pre> <b>users:</b>   <b>tom:</b>     <b>uid:</b> 1000     <b>roles:</b>       - developer   <b>mat:</b>     <b>uid:</b> 1001 </pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: merge-last</li> <li>- mat</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> <li>- mat</li> </ul>
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: merge-first</li> <li>- mat</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- mat</li> <li>- tom</li> <li>- root</li> </ul>
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: remove</li> <li>- mat</li> <li>- tom</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- root</li> </ul>
<b>users:</b> <ul style="list-style-type: none"> <li>- tom</li> <li>- root</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- __: overwrite</li> <li>- mat</li> </ul>	<b>users:</b> <ul style="list-style-type: none"> <li>- mat</li> </ul>

```
salt.pillar.stack.ext_pillar(minion_id, pillar, *args, **kwargs)
```

### 21.12.43 salt.pillar.svn\_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
 '*':
 - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo
- svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
 '*':
 - bar
```

**class** salt.pillar.svn\_pillar.**SvnPillar**(*branch, repo\_location, root, opts*)

Deal with the remote SVN repository for Pillar

**pillar\_dir**()

Returns the directory of the pillars (repo cache + branch + root)

**update**()

salt.pillar.svn\_pillar.**ext\_pillar**(*minion\_id, pillar, repo\_string*)

Execute a command and read the output as YAML

#### 21.12.44 salt.pillar.varstack\_pillar

Use [Varstack](#) data as a Pillar source

##### Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
 - varstack: /etc/varstack.yaml
```

Varstack will then use /etc/varstack.yaml to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of varstack on how this file is evaluated.

salt.pillar.varstack\_pillar.**ext\_pillar**(*minion\_id, pillar, conf*)

Parse varstack data and return the result

#### 21.12.45 salt.pillar.vault module

Vault Pillar Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the [execution module docs](#). Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext\_pillar section in the Salt master configuration.

```
ext_pillar:
 - vault: path=secret/salt
```

Each key needs to have all the key-value pairs with the names you require. Avoid naming every key 'password' as you they will collide:

If you want to nest results under a nesting\_key name use the following format:

**ext\_pillar:**

- **vault:** conf: path=secret/salt nesting\_key: vault\_key\_name

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, auth and master.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

**ext\_pillar:**

- **vault:** path=secret/salt
- **vault:** path=secret/root
- **vault:** path=secret/minions/{minion}/pass

You can also use nesting here as well. Identical nesting keys will get merged.

**ext\_pillar:**

- **vault:**
  - conf:** path=secret/salt
  - nesting\_key:** keyname1
- **vault:**
  - conf:** path=secret/root
  - nesting\_key:** keyname1
- **vault:**
  - conf:** path=secret/minions/{minion}/pass
  - nesting\_key:** keyname2

The difference between the return with and without the nesting key is shown below. This example takes the key value pairs returned from vault as follows:

path=secret/salt

Key Value --- ----- salt-passwd badpasswd1

path=secret/root

Key Value --- ----- root-passwd rootbadpasswd1

path=secret/minions/{minion}/pass

Key Value --- ----- minion-passwd minionbadpasswd1

*#Nesting Key not defined*

**local:**

-----

salt-passwd:  
badpasswd1

**root-passwd:**  
rootbadpasswd1

**minion-passwd:**

(continues on next page)

(continued from previous page)

```

minionbadpasswd1

#Nesting Key defined

local:

 keyname1:

 salt-passwd:
 badpasswd1
 root-passwd:
 rootbadpasswd1
 keyname2:

 minion-passwd:
 minionbadpasswd1

```

`salt.pillar.vault.ext_pillar(minion_id, pillar, conf, nesting_key=None)`  
 Get pillar data from Vault for the configuration `conf`.

### 21.12.46 salt.pillar.venafi module

Venafi Pillar Certificates

This module will only return pillar data if the `venafi` runner module has already been used to create certificates.

To configure this module, set `venafi` to `True` in the `ext_pillar` section of your master configuration file:

```

ext_pillar:
 - venafi: True

```

`salt.pillar.venafi.ext_pillar(minion_id, pillar, conf)`  
 Return an existing set of certificates

### 21.12.47 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

`salt.pillar.virtkey.ext_pillar(hyper_id, pillar, name, key)`  
 Accept the key for the VM on the hyper, if authorized.

### 21.12.48 salt.pillar.vmware\_pillar module

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

**depends**

- pyVmomi

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the 'os' or 'virtual' grain are not 'VMWare', 'ESXi', or 'VMWare ESXi'.

## Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the 'vmware' pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

## Configuring the VMWare pillar

The required minimal configuration in the salt master ext\_pillar setup:

```
ext_pillar:
- vmware:
 host: <vcenter/esx host>
 username: <user to connect with>
 password: <password>
```

Optionally, the following keyword arguments can be passed to the ext\_pillar for customized configuration:

**pillar\_key** Optionally set the pillar key to return the data into. Default is `vmware`.

**protocol** Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

**property\_name** Property name to match the minion id against. Defaults to `name`.

**property\_types** Optionally specify a list of pyVmomi vim types to search for the minion id in 'property\_name'. Default is `['VirtualMachine']`.

For example, to search both `vim.VirtualMachine` and `vim.HostSystem` object types:

```
ext_pillar:
- vmware:
 host: myesx
 username: root
 password: complex_password
 property_types:
 - VirtualMachine
 - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

---

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.

---

```
ext_pillar:
 - vmware:
 host: myvcenter
 username: my_user
 password: my_pass
 replace_default_attributes: True
 property_types:
 - VirtualMachine:
 - config:
 - bootOptions:
 - bootDelay
 - bootRetryDelay
 - HostSystem:
 - datastore:
 - name
```

The above `ext_pillar` example would return a pillar like the following for a `VirtualMachine` object that's name matched the minion id:

```
vmware:
 config:
 bootOptions:
 bootDelay: 1000
 bootRetryDelay: 1000
```

If you were to retrieve these virtual machine attributes via `pyVmomi` directly, this would be the same as

```
vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptions.bootRetryDelay
```

The above `ext_pillar` example would return a pillar like the following for a `HostSystem` object that's name matched the minion id:

```
vmware:
 datastore:
 - name: Datastore1
 - name: Datastore2
```

The 'datastore' property of a `HostSystem` object is a list of datastores, thus a list is returned.

**replace\_default\_attributes** If custom attributes are specified by the `property_types` parameter, `replace_default_attributes` determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

---

**Note:** vCenter "Custom Attributes" (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

---

```
salt.pillar.vmware_pillar.ext_pillar(minion_id, pillar, **kwargs)
```

Check vmware/vcenter for all data

## 21.13 proxy modules

<i>arista_pyeapi</i>	Arista pyeapi
<i>chronos</i>	Chronos
<i>cimc</i>	Proxy Minion interface module for managing Cisco Integrated Management Controller devices
<i>cisconso</i>	Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO).
<i>docker</i>	Docker Proxy Minion
<i>dummy</i>	This is the a dummy proxy-minion designed for testing the proxy minion subsystem.
<i>esxcluster</i>	Proxy Minion interface module for managing VMWare ESXi clusters.
<i>esxdatacenter</i>	Proxy Minion interface module for managing VMWare ESXi clusters.
<i>esxi</i>	Proxy Minion interface module for managing VMware ESXi hosts.
<i>esxvm</i>	Proxy Minion interface module for managing VMWare ESXi virtual machines.
<i>fx2</i>	Dell FX2 chassis
<i>junos</i>	Interface with a Junos device via proxy-minion.
<i>marathon</i>	Marathon
<i>napalm</i>	NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support
<i>netmiko_px</i>	Netmiko
<i>nxos</i>	Proxy Minion for Cisco NX-OS Switches
<i>nxos_api</i>	Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API
<i>panos</i>	Proxy Minion interface module for managing Palo Alto firewall devices
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>rest_sample</i>	This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in <a href="https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example">https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example</a>
<i>ssh_sample</i>	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.
<i>vcenter</i>	Proxy Minion interface module for managing VMWare vCenters.

### 21.13.1 salt.proxy.arista\_pyeapi

#### Arista pyeapi

New in version 2019.2.0.

Proxy module for managing Arista switches via the eAPI using the `pyeapi` library.

```
codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends pyeapi
platform unix
```

---

**Note:** To understand how to correctly enable the eAPI on your switch, please check <https://eos.arista.com/arista-eapi-101/>.

---

#### Dependencies

The `pyeapi` Proxy module requires `pyeapi` to be installed: `pip install pyeapi`.

#### Pillar

The `pyeapi` proxy configuration requires the following parameters in order to connect to the network device:

**transport:** **https** Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

**host:** **localhost** The IP address or DNS host name of the connection device.

**username:** **admin** The username to pass to the device to authenticate the eAPI connection.

**password** The password to pass to the device to authenticate the eAPI connection.

**port** The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**enablepwd** The enable mode password if required by the destination node.

All the arguments may be optional, depending on your setup.

#### Proxy Pillar Example

```
proxy:
 proxytype: pyeapi
 host: router1.example.com
 username: example
 password: example
```

`salt.proxy.arista_pyeapi.call(method, *args, **kwargs)`

Calls an arbitrary `pyeapi` method.

`salt.proxy.arista_pyeapi.conn()`

Return the connection object.

```

salt.proxy.arista_pyeapi.init(opts)
 Open the connection to the Arista switch over the eAPI.
salt.proxy.arista_pyeapi.initialized()
 Connection finished initializing?
salt.proxy.arista_pyeapi.ping()
 Connection open successfully?
salt.proxy.arista_pyeapi.shutdown(opts)
 Closes connection with the device.

```

### 21.13.2 salt.proxy.chronos module

#### Chronos

Proxy minion for managing a Chronos cluster.

#### Dependencies

- *chronos execution module (salt.modules.chronos)*

#### Pillar

The chronos proxy configuration requires a 'base\_url' property that points to the chronos endpoint:

```

proxy:
 proxytype: chronos
 base_url: http://my-chronos-master.mydomain.com:4400

```

New in version 2015.8.2.

```

salt.proxy.chronos.init(opts)
 Perform any needed setup.
salt.proxy.chronos.ping()
 Is the chronos api responding?
salt.proxy.chronos.shutdown(opts)
 For this proxy shutdown is a no-op

```

### 21.13.3 salt.proxy.cimc module

#### Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

```

codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix

```

This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices) to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```
proxy:
 proxytype: cimc
 host: <ip or dns name of cimc host>
 username: <cimc username>
 password: <cimc password>
 verify_ssl: True
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this cimc Proxy Module, set this to `cimc`.

### host

The location, or ip/dns, of the cimc host. Required.

### username

The username used to login to the cimc host. Required.

### password

The password used to login to the cimc host. Required.

`salt.proxy.cimc.get_config_resolver_class(cid=None, hierarchical=False)`

The `configResolveClass` method returns requested managed object in a given class.

`salt.proxy.cimc.grains()`

Get the grains from the proxied device

`salt.proxy.cimc.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.cimc.init(opts)`

This function gets called when the proxy starts up.

`salt.proxy.cimc.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.cimc.logon()`

Logs into the cimc device and returns the session cookie.

`salt.proxy.cimc.logout(cookie=None)`

Closes the session with the device.

`salt.proxy.cimc.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.cimc.prepare_return(x)`

Converts the etree to dict

`salt.proxy.cimc.set_config_modify(dn=None, inconfig=None, hierarchical=False)`

The `configConfMo` method configures the specified managed object in a single subtree (for example, DN).

`salt.proxy.cimc.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

#### 21.13.4 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

##### Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG

- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister
- Fortinet
- Nominum DCS
- Sonus SBC 5000 Series
- Allied Telesys
- Open vSwitch

New in version 2016.11.0.

**codeauthor** *Anthony Shaw* <[anthony.shaw@dimensiondata.com](mailto:anthony.shaw@dimensiondata.com)>

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

## Dependencies

- pynso Python module

## PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
 proxytype: ciscoconso
 host: <ip or dns name of host>
 port: 8080
 use_ssl: false
 username: <username>
 password: password
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `ciscoconso`.

### host

The location, or IP/dns, of the Cisco NSO API host. Required.

### username

The username used to login to the Cisco NSO host, such as `admin`. Required.

### passwords

The password for the given user. Required.

### use\_ssl

Whether to use HTTPS messaging to speak to the API.

## port

The port that the Cisco NSO API is running on, 8080 by default

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisco host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

**salt.proxy.cisconso.apply\_rollback**(*datastore*, *name*)

Apply a system rollback

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

**salt.proxy.cisconso.get\_data**(*datastore*, *path*)

Get the configuration of the device tree at the given path

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List of str OR tuple) -- The device path, a list of element names in order, comma separated

Returns The network configuration at that tree

Return type dict

```
salt cisco-nso cisconso.get_data devices
```

**salt.proxy.cisconso.get\_rollback**(*name*)

Get the backup of stored a configuration rollback

Parameters **name** (str) -- Typically an ID of the backup

**Return type** `str`

**Returns** the contents of the rollback snapshot

`salt.proxy.cisconso.get_rollbacks()`

Get a list of stored configuration rollbacks

`salt.proxy.cisconso.grains()`

Get the grains from the proxy device.

`salt.proxy.cisconso.init(opts)`

`salt.proxy.cisconso.ping()`

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

`salt.proxy.cisconso.set_data_value(datastore, path, data)`

Get a data entry in a datastore

**Parameters**

- **datastore** (`DatastoreType` (`str` `enum`)). -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`list` of `str` OR `tuple`) -- The device path to set the value at, a list of element names in order, comma separated
- **data** (`dict`) -- The new value at the given path

**Return type** `bool`

**Returns** True if successful, otherwise error.

`salt.proxy.cisconso.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.5 salt.proxy.docker module

Docker Proxy Minion

**depends** `docker`

This proxy minion is just a shim to the docker executor, which will use the *docker.call* for everything except state runs.

To configure the proxy minion:

```
proxy:
 proxytype: docker
 name: festive_leakey
```

It is also possible to just name the proxy minion the same name as the container, and use grains to configure the proxy minion:

```
proxy:
 proxytype: docker
 name: {{grains['id']}}
```

**name**

Name of the docker container

`salt.proxy.docker.init(opts)`

Always initialize

`salt.proxy.docker.initialized()`

This should always be initialized

`salt.proxy.docker.module_executors()`

List of module executors to use for this Proxy Minion

`salt.proxy.docker.shutdown(opts)`

Nothing needs to be done to shutdown

### 21.13.6 salt.proxy.dummy module

This is the a dummy proxy-minion designed for testing the proxy minion subsystem.

`salt.proxy.dummy.fns()`

`salt.proxy.dummy.grains()`

Make up some grains

`salt.proxy.dummy.grains_refresh()`

Refresh the grains

`salt.proxy.dummy.init(opts)`

`salt.proxy.dummy.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.dummy.package_install(name, **kwargs)`

Install a "package" on the REST server

`salt.proxy.dummy.package_list()`

List "packages" installed on the REST server

`salt.proxy.dummy.package_remove(name)`

Remove a "package" on the REST server

`salt.proxy.dummy.package_status(name)`

Check the installation status of a package on the REST server

`salt.proxy.dummy.ping()`

Degenerate ping

`salt.proxy.dummy.service_list()`

List "services" on the REST server

`salt.proxy.dummy.service_restart(name)`

Restart a "service" on the REST server

`salt.proxy.dummy.service_start(name)`

Start a "service" on the dummy server

`salt.proxy.dummy.service_status(name)`

Check if a service is running on the REST server

`salt.proxy.dummy.service_stop(name)`

Stop a "service" on the dummy server

`salt.proxy.dummy.shutdown(opts)`

For this proxy shutdown is a no-op

`salt.proxy.dummy.test_from_state()`

Test function so we have something to call from a state :return:

```
salt.proxy.dummy.upgrade()
```

”Upgrade” packages

```
salt.proxy.dummy.uptodate()
```

Call the REST endpoint to see if the packages on the ”server” are up to date.

### 21.13.7 salt.proxy.esxcluster module

Proxy Minion interface module for managing VMWare ESXi clusters.

#### Dependencies

- pyVmomi
- jsonschema

#### Configuration

To use this integration proxy module, please configure the following:

#### Pillar

Proxy minions get their configuration from Salt's Pillar. This can now happen from the proxy's configuration file.

Example pillars:

userpass mechanism:

```
proxy:
 proxytype: esxcluster
 cluster: <cluster name>
 datacenter: <datacenter name>
 vcenter: <ip or dns name of parent vcenter>
 mechanism: userpass
 username: <vCenter username>
 passwords: (required if userpass is used)
 - first_password
 - second_password
 - third_password
```

sspi mechanism:

```
proxy:
 proxytype: esxcluster
 cluster: <cluster name>
 datacenter: <datacenter name>
 vcenter: <ip or dns name of parent vcenter>
 mechanism: sspi
 domain: <user domain>
 principal: <host kerberos principal>
```

### **proxytype**

To use this Proxy Module, set this to `esxdatacenter`.

### **cluster**

Name of the managed cluster. Required.

### **datacenter**

Name of the datacenter the managed cluster is in. Required.

### **vcenter**

The location of the VMware vCenter server (host of ip) where the datacenter should be managed. Required.

### **mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

---

**Note:** Connections are attempted using all (username, password) combinations on proxy startup.

---

### **username**

The username used to login to the host, such as `root`. Required if mechanism is `userpass`.

### **passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`. When the proxy comes up, it will try the passwords listed in order.

### **domain**

User domain. Required if mechanism is `sspi`.

### principal

Kerberos principal. Required if mechanism is `sspi`.

### protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity `<id>`:

```
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the `<configuration_folder>` has to be specified when running the proxy: file with at least the following in it:

```
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

## Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```
Master - minion communication
salt <cluster_name> test.ping

Test vcenter connection
salt <cluster_name> vsphere.test_vcenter_connection
```

## States

Associated states are documented in `salt.states.esxcluster`. Look there to find an example structure for Pillar as well as an example `.sls` file for configuring an ESX cluster from scratch.

**`salt.proxy.esxcluster.find_credentials()`**

Cycle through all the possible credentials and return the first one that works.

**`salt.proxy.esxcluster.get_details()`**

Function that returns the cached details

`salt.proxy.esxcluster.init(opts)`

This function gets called when the proxy starts up. For login the protocol and port are cached.

`salt.proxy.esxcluster.ping()`

Returns True.

CLI Example:

```
salt esx-cluster test.ping
```

`salt.proxy.esxcluster.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.8 salt.proxy.esxdatacenter module

Proxy Minion interface module for managing VMWare ESXi clusters.

#### Dependencies

- pyVmomi
- jsonschema

#### Configuration

To use this integration proxy module, please configure the following:

#### Pillar

Proxy minions get their configuration from Salt's Pillar. This can now happen from the proxy's configuration file.

Example pillars:

userpass mechanism:

```
proxy:
 proxytype: esxdatacenter
 datacenter: <datacenter name>
 vcenter: <ip or dns name of parent vcenter>
 mechanism: userpass
 username: <vCenter username>
 passwords: (required if userpass is used)
 - first_password
 - second_password
 - third_password
```

sspi mechanism:

```
proxy:
 proxytype: esxdatacenter
 datacenter: <datacenter name>
 vcenter: <ip or dns name of parent vcenter>
 mechanism: sspi
 domain: <user domain>
 principal: <host kerberos principal>
```

**proxytype**

To use this Proxy Module, set this to `esxdatacenter`.

**datacenter**

Name of the managed datacenter. Required.

**vcenter**

The location of the VMware vCenter server (host of ip) where the datacenter should be managed. Required.

**mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

---

**Note:** Connections are attempted using all (username, password) combinations on proxy startup.

---

**username**

The username used to login to the host, such as `root`. Required if mechanism is `userpass`.

**passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`. When the proxy comes up, it will try the passwords listed in order.

**domain**

User domain. Required if mechanism is `sspi`.

**principal**

Kerberos principal. Required if mechanism is `sspi`.

## protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

## port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity `<id>`:

```
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the `<configuration_folder>` has to be specified when running the proxy: file with at least the following in it:

```
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

## Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```
Master - minion communication
salt <datacenter_name> test.ping

Test vcenter connection
salt <datacenter_name> vsphere.test_vcenter_connection
```

## States

Associated states are documented in `salt.states.esxdatacenter`. Look there to find an example structure for Pillar as well as an example `.sls` file for configuring an ESX datacenter from scratch.

**`salt.proxy.esxdatacenter.find_credentials()`**

Cycle through all the possible credentials and return the first one that works.

**`salt.proxy.esxdatacenter.get_details()`**

Function that returns the cached details

**`salt.proxy.esxdatacenter.init(opts)`**

This function gets called when the proxy starts up. All login details are cached.

**`salt.proxy.esxdatacenter.ping()`**

Returns True.

CLI Example:

```
salt dc_id test.ping
```

`salt.proxy.esxdatacenter.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.9 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the Salt Master. The master does not know nor care that the target is not a "real" Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

#### Dependencies

- pyVmomi Python Module
- ESXCLI

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
 proxytype: esxi
 host: <ip or dns name of esxi host>
 username: <ESXi username>
 passwords:
 - first_password
 - second_password
 - third_password
 credstore: <path to credential store>
```

### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

### host

The location, or ip/dns, of the ESXi host. Required.

### username

The username used to login to the ESXi host, such as `root`. Required.

### passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion--it should just pick up the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

---

**Note:** When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

---

### protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

### credstore

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

---

**Note:** `HOME` variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure `HOME` is set for the proxy process.

---

## Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `salt.modules.vsphere` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in `salt.modules.vsphere` instead of `salt.modules.esxi`.

## States

Associated states are thoroughly documented in [salt.states.esxi](#). Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

**salt.proxy.esxi.ch\_config**(*cmd*, \**args*, \*\**kwargs*)

This function is called by the [salt.modules.esxi.cmd](#) shim. It then calls whatever is passed in *cmd* inside the [salt.modules.vsphere](#) module. Passes the return through from the *vsphere* module.

**cmd** The command to call inside salt.modules.vsphere

**args** Arguments that need to be passed to that command.

**kwargs** Keyword arguments that need to be passed to that command.

**salt.proxy.esxi.find\_credentials**(*host*)

Cycle through all the possible credentials and return the first one that works.

**salt.proxy.esxi.get\_details**()

Return the proxy details

**salt.proxy.esxi.grains**()

Get the grains from the proxy device.

**salt.proxy.esxi.grains\_refresh**()

Refresh the grains from the proxy device.

**salt.proxy.esxi.init**(*opts*)

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

**salt.proxy.esxi.is\_connected\_via\_vcenter**()

**salt.proxy.esxi.ping**()

Returns True if connection is to be done via a vCenter (no connection is attempted). Check to see if the host is responding when connecting directly via an ESXi host.

CLI Example:

```
salt esxi-host test.ping
```

**salt.proxy.esxi.shutdown**()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.10 salt.proxy.esxvm module

Proxy Minion interface module for managing VMWare ESXi virtual machines.

#### Dependencies

- pyVmomi
- jsonschema

## Configuration

To use this integration proxy module, please configure the following:

### Pillar

Proxy minions get their configuration from Salt's Pillar. This can now happen from the proxy's configuration file.

Example pillars:

userpass mechanism:

```
proxy:
 proxytype: esxvm
 datacenter: <datacenter name>
 vcenter: <ip or dns name of parent vcenter>
 mechanism: userpass
 username: <vCenter username>
 passwords: (required if userpass is used)
 - first_password
 - second_password
 - third_password
```

sspi mechanism:

```
proxy:
 proxytype: esxvm
 datacenter: <datacenter name>
 vcenter: <ip or dns name of parent vcenter>
 mechanism: sspi
 domain: <user domain>
 principal: <host kerberos principal>
```

### proxytype

To use this Proxy Module, set this to `esxvm`.

### datacenter

Name of the datacenter where the virtual machine should be deployed. Required.

### vcenter

The location of the VMware vCenter server (host of ip) where the virtual machine should be managed. Required.

### **mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

---

**Note:** Connections are attempted using all (username, password) combinations on proxy startup.

---

### **username**

The username used to login to the host, such as `root`. Required if mechanism is `userpass`.

### **passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`. When the proxy comes up, it will try the passwords listed in order.

### **domain**

User realm domain. Required if mechanism is `sspi`.

### **principal**

Kerberos principal. Required if mechanism is `sspi`.

### **protocol**

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

### **port**

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

## **Salt Proxy**

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

To start a proxy minion one needs to establish its identity <id>:

```
salt-proxy --proxyid <proxy_id>
```

On the machine that will run the proxy, make sure there is a configuration file present. By default this is `/etc/salt/proxy`. If in a different location, the <configuration\_folder> has to be specified when running the proxy: file with at least the following in it:

```
salt-proxy --proxyid <proxy_id> -c <configuration_folder>
```

## Commands

Once the proxy is running it will connect back to the specified master and individual commands can be runs against it:

```
Master - minion communication
salt <proxy_id> test.ping

Test vcenter connection
salt <proxy_id> vsphere.test_vcenter_connection
```

## States

Associated states are documented in `salt.states.esxvm`. Look there to find an example structure for Pillar as well as an example `.sls` file for configuring an ESX virtual machine from scratch.

`salt.proxy.esxvm.find_credentials()`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxvm.get_details()`

Function that returns the cached details

`salt.proxy.esxvm.init(opts)`

This function gets called when the proxy starts up. For login the protocol and port are cached.

`salt.proxy.esxvm.ping()`

Returns True.

CLI Example:

```
salt esx-vm test.ping
```

`salt.proxy.esxvm.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.11 salt.proxy.fx2

#### Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

## Dependencies

- *iDRAC Remote execution module* (`salt.modules.dracr`)
- *Chassis command shim* (`salt.modules.chassis`)
- *Dell Chassis States* (`salt.states.dellchassis`)
- Dell's racadm command line interface to CMC and iDRAC devices.

**Special Note:** SaltStack thanks [Adobe Corporation](#) for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply "chassis", "CMC", or "FX2") chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found [in the Proxy Minion section](#) of Salt's documentation.

To configure this integration, follow these steps:

## Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar topfile that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
 host: <ip or dns name of chassis controller>
 admin_username: <iDRAC username for the CMC, usually 'root'>
 fallback_admin_username: <username to try if the first fails>
 passwords:
 - first_password
 - second_password
 - third_password
 proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion--it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of "I no longer know what the password is!!!". To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

## salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

## States

Associated states are thoroughly documented in [salt.states.dellchassis](#). Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

**salt.proxy.fx2.admin\_password()**

Return the admin\_password in the DETAILS dictionary, or 'calvin' (the Dell default) if there is none present

**salt.proxy.fx2.admin\_username()**

Return the admin\_username in the DETAILS dictionary, or root if there is none present

**salt.proxy.fx2.chconfig(cmd, \*args, \*\*kwargs)**

This function is called by the [salt.modules.chassis.cmd](#) shim. It then calls whatever is passed in cmd inside the [salt.modules.dracr](#) module.

### Parameters

- **cmd** -- The command to call inside salt.modules.dracr
- **args** -- Arguments that need to be passed to that command
- **kwargs** -- Keyword arguments that need to be passed to that command

**Returns** Passthrough the return from the dracr module.

**salt.proxy.fx2.find\_credentials()**

Cycle through all the possible credentials and return the first one that works

**salt.proxy.fx2.grains()**

Get the grains from the proxied device

**salt.proxy.fx2.grains\_refresh()**

Refresh the grains from the proxied device

**salt.proxy.fx2.host()**

**salt.proxy.fx2.init(opts)**

This function gets called when the proxy starts up. We check opts to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent DETAILS dictionary and will be used for further communication with the chassis.

**salt.proxy.fx2.ping()**

Is the chassis responding?

**Returns** Returns False if the chassis didn't respond, True otherwise.

**salt.proxy.fx2.shutdown(opts)**

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

### 21.13.12 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `'/srv/pillar/details.sls'`

```
proxy:
 proxytype: junos
 host: <ip or dns name of host>
 username: <username>
 port: 830
 password: <secret>
```

In `'/srv/pillar/top.sls'` map the device details with the proxy name.

```
base:
 'vmx':
 - details
```

After storing the device information in the pillar, configure the proxy in '/etc/salt/proxy'

```
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

**salt.proxy.junos.alive**(*opts*)

Validate and return the connection status with the remote device.

New in version 2018.3.0.

**salt.proxy.junos.conn**()

**salt.proxy.junos.get\_serialized\_facts**()

**salt.proxy.junos.init**(*opts*)

Open the connection to the Junos device, login, and bind to the Resource class

**salt.proxy.junos.initialized**()

**salt.proxy.junos.ping**()

Ping? Pong!

**salt.proxy.junos.proxytype**()

Returns the name of this proxy

**salt.proxy.junos.shutdown**(*opts*)

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

### 21.13.13 salt.proxy.marathon module

#### Marathon

Proxy minion for managing a Marathon cluster.

#### Dependencies

- *marathon execution module (salt.modules.marathon)*

#### Pillar

The marathon proxy configuration requires a 'base\_url' property that points to the marathon endpoint:

```
proxy:
 proxytype: marathon
 base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

**salt.proxy.marathon.init**(*opts*)  
Perform any needed setup.

**salt.proxy.marathon.ping**()  
Is the marathon api responding?

**salt.proxy.marathon.shutdown**(*opts*)  
For this proxy shutdown is a no-op

#### 21.13.14 salt.proxy.napalm

##### NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

New in version 2016.11.0.

Proxy minion for managing network devices via [NAPALM](#) library.

**codeauthor** Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)> & Jerome Fleury <[jf@cloudflare.com](mailto:jf@cloudflare.com)>

**maturity** new

**depends** napalm

**platform** unix

##### Dependencies

The `napalm` proxy module requires [NAPALM](#) library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

---

**Note:** Beginning with Salt release 2017.7.3, it is recommended to use `napalm >= 2.0.0`. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check [this document](#). While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main `napalm` package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM's base capabilities and configure the `provider` option (see below).

---

##### Pillar

The `napalm` proxy configuration requires the following parameters in order to connect to the network device:

**driver** Specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).

**host** The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: `hostname`, `fqdn`, `ip`.

**username** The username to be used when connecting to the device.

**passwd** The password needed to establish the connection.

---

**Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

---

**optional\_args** Dictionary with the optional arguments. Check the complete list of supported [optional arguments](#).

**always\_alive: True** In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to `false`. Default: `true` (maintains the connection with the remote network device).

New in version 2017.7.0.

**provider: napalm\_base** The library that provides the `get_network_device` function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the `get_network_device` function available.

New in version 2017.7.1.

**multiprocessing: False** Overrides the [multiprocessing](#) option, per proxy minion. The `multiprocessing` option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the `multiprocessing` option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```
proxy:
 proxytype: napalm
 driver: junos
 host: core05.nrt02
 username: my_username
 passwd: my_password
 optional_args:
 port: 12201
```

Example using a user-specific library, extending NAPALM's capabilities, e.g. `custom_napalm_base`:

```
proxy:
 proxytype: napalm
 driver: ios
 fqdn: cr1.th2.par.as1234.net
 username: salt
 password: ''
 provider: custom_napalm_base
```

- *NTP operational and configuration management module*
- *BGP operational and configuration management module*
- *Routes details*

- *SNMP configuration module*
- *Users configuration management*

**Note:** Beginning with release codename 2019.2.0, any NAPALM command executed when running under a NAPALM Proxy Minion supports the `force_reconnect` magic argument.

Proxy Minions generally establish a connection with the remote network device at the time of the Minion startup and that connection is going to be used forever.

If one would need execute a command on the device but connecting using different parameters (due to various causes, e.g., unable to authenticate the user specified in the Pillar as the authentication system - say TACACS+ is not available, or the DNS resolver is currently down and would like to temporarily use the IP address instead, etc.), it implies updating the Pillar data and restarting the Proxy Minion process restart. In particular cases like that, you can pass the `force_reconnect=True` keyword argument, together with the alternative connection details, to enforce the command to be executed over a separate connection.

For example, if the usual command is `salt '*' net.arp`, you can use the following to connect using a different username instead: `salt '*' net.arp username=my-alt-usr force_reconnect=True`.

`salt.proxy.napalm.alive(opts)`

Return the connection status with the remote device.

New in version 2017.7.0.

`salt.proxy.napalm.call(method, *args, **kwargs)`

Calls a specific method from the network driver instance. Please check the [readthedocs](#) page for the updated list of getters.

**Parameters**

- **method** -- specifies the name of the method to be called
- **params** -- contains the mapping between the name and the values of the parameters needed to call the method

**Returns** A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call
- **comment** (string): provides more details in case the call failed
- **traceback** (string): complete traceback in case of exception. Please submit an issue including this traceback on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'
 **{
 'commands': [
 'show version',
 'show chassis fan'
]
 })
```

`salt.proxy.napalm.fns()`

Method called by NAPALM grains module.

`salt.proxy.napalm.get_device()`

Returns the network device object.

`salt.proxy.napalm.get_grains()`

Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh()`  
Refresh the grains.

`salt.proxy.napalm.init(opts)`  
Opens the connection with the network device.

`salt.proxy.napalm.initialized()`  
Connection finished initializing?

`salt.proxy.napalm.ping()`  
Connection open successfully?

`salt.proxy.napalm.shutdown(opts)`  
Closes connection with the device.

### 21.13.15 salt.proxy.netmiko\_px

#### Netmiko

New in version 2019.2.0.

Proxy module for managing network devices via [Netmiko](#).

**codeauthor** Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)> & Kirk Byers <[ktbyers@twb-tech.com](mailto:ktbyers@twb-tech.com)>

**maturity** new

**depends** netmiko

**platform** unix

#### Dependencies

The `netmiko` proxy modules requires Netmiko to be installed: `pip install netmiko`.

#### Pillar

The `netmiko` proxy configuration requires the following parameters in order to connect to the network device:

- **device\_type** - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron

- brocade\_netiron: Brocade Netiron
- brocade\_nos: Brocade NOS
- brocade\_vdx: Brocade NOS
- brocade\_vyos: VyOS
- checkpoint\_gaia: Check Point GAIa
- calix\_b6: Calix B6
- ciena\_saos: Ciena SAOS
- cisco\_asa: Cisco SA
- cisco\_ios: Cisco IOS
- cisco\_nxos: Cisco NX-os
- cisco\_s300: Cisco S300
- cisco\_tp: Cisco TpTcCe
- cisco\_wlc: Cisco WLC
- cisco\_xe: Cisco IOS
- cisco\_xr: Cisco XR
- coriant: Coriant
- dell\_force10: Dell Force10
- dell\_os10: Dell OS10
- dell\_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme\_wing: Extreme Wing
- f5\_ltm: F5 LTM
- fortinet: Fortinet
- generic\_termserver: TerminalServer
- hp\_comware: HP Comware
- hp\_procurve: HP Procurve
- huawei: Huawei
- huawei\_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper\_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv\_optiswitch: MrvOptiswitch
- netapp\_cdot: NetAppcDot

- netcaler: Netcaler
  - ovs\_linux: OvsLinux
  - paloalto\_panos: PaloAlto Panos
  - pluribus: Pluribus
  - quanta\_mesh: Quanta Mesh
  - ruckus\_fastiron: Ruckus Fastiron
  - ubiquiti\_edge: Ubiquiti Edge
  - ubiquiti\_edgeswitch: Ubiquiti Edge
  - vyatta\_vyos: VyOS
  - vyos: VyOS
  - brocade\_fastiron\_telnet: Brocade Fastiron over Telnet
  - brocade\_netiron\_telnet: Brocade Netiron over Telnet
  - cisco\_ios\_telnet: Cisco IOS over Telnet
  - apresia\_aeos\_telnet: Apresia AEOS over Telnet
  - arista\_eos\_telnet: Arista EOS over Telnet
  - hp\_procurve\_telnet: HP Procurve over Telnet
  - hp\_comware\_telnet: HP Comware over Telnet
  - juniper\_junos\_telnet: Juniper Junos over Telnet
  - calix\_b6\_telnet: Calix B6 over Telnet
  - dell\_powerconnect\_telnet: Dell PowerConnect over Telnet
  - generic\_termserver\_telnet: TerminalServer over Telnet
  - extreme\_telnet: Extreme Networks over Telnet
  - ruckus\_fastiron\_telnet: Ruckus Fastiron over Telnet
  - cisco\_ios\_serial: Cisco IOS over serial port
- ip - IP address of target device (not required if host is provided)
  - host - Hostname of target device (not required if ip is provided)
  - username - Username to authenticate against target device, if required
  - password - Password to authenticate against target device, if required
  - secret - The enable password if target device requires one
  - port - The destination port used to connect to the target device
  - global\_delay\_factor - Multiplication factor affecting Netmiko delays (default: 1)
  - use\_keys - Connect to target device using SSH keys (default: False)
  - key\_file - Filename path of the SSH key file to use
  - allow\_agent - Enable use of SSH key-agent
  - ssh\_strict - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)

- `system_host_keys` - Load host keys from the user's "known\_hosts" file (default: `False`)
- `alt_host_keys` - If `True`, host keys will be loaded from the file specified in `alt_key_file` (default: `False`)
- `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file` - File name of OpenSSH configuration file
- `timeout` - Connection timeout, in seconds (default: 90)
- `session_timeout` - Set a timeout for parallel requests, in seconds (default: 60)
- `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
- `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)
- `always_alive` - In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by setting this option to `False`. By default this option is set to `True` (maintains the connection with the remote network device)
- `multiprocessing` - Overrides the `multiprocessing` option, per proxy minion, as the Netmiko communication channel is mainly SSH (default: `False`)

### Proxy Pillar Example

```
proxy:
 proxytype: netmiko
 device_type: juniper_junos
 host: router1.example.com
 username: example
 password: example
```

```
proxy:
 proxytype: netmiko
 device_type: cisco_ios
 ip: 1.2.3.4
 username: test
 use_keys: true
 secret: w3@k
```

`salt.proxy.netmiko_px.alive(opts)`  
Return the connection status with the network device.

`salt.proxy.netmiko_px.args()`  
Return the Netmiko device args.

`salt.proxy.netmiko_px.call(method, *args, **kwargs)`  
Calls an arbitrary netmiko method.

`salt.proxy.netmiko_px.conn()`  
Return the connection object.

`salt.proxy.netmiko_px.init(opts)`  
Open the connection to the network device managed through netmiko.

```
salt.proxy.netmiko_px.initialized()
```

Connection finished initializing?

```
salt.proxy.netmiko_px.ping()
```

Connection open successfully?

```
salt.proxy.netmiko_px.shutdown(opts)
```

Closes connection with the device.

### 21.13.16 salt.proxy.nxos module

Proxy Minion for Cisco NX-OS Switches

The Cisco NX-OS Proxy Minion is supported on NX-OS devices for the following connection types: 1) Connection Type SSH 2) Connection Type NX-API (If Supported By The Device and Image Version).

**maturity** new

**platform** nxos

SSH uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion for ssh:

```
proxy:
 proxytype: nxos
 connection: ssh
 host: 192.168.187.100
 username: admin
 password: admin
 prompt_name: nxos-switch
 ssh_args: '-o PubkeyAuthentication=no'
 key_accept: True
```

To configure the proxy minion for nxapi:

```
proxy:
 proxytype: nxos
 connection: nxapi
 host: 192.168.187.100
 username: admin
 password: admin
 transport: http
 port: 80
 verify: False
 save_config: False
```

**proxytype:** (REQUIRED) Use this proxy minion *nxos*

**connection:** (REQUIRED) connection transport type. Choices: *ssh*, *nxapi* Default: *ssh*

**host:** (REQUIRED) login ip address or dns hostname.

**username:** (REQUIRED) login username.

**password:** (REQUIRED) login password.

**save\_config:** If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the *save\_running\_config* function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

Connection SSH Args:

**prompt\_name:** (REQUIRED when *connection* is *ssh*) (REQUIRED, this or *prompt\_regex* below, but not both) The name in the prompt on the switch. Recommended to use your device's hostname.

**prompt\_regex:** (REQUIRED when *connection* is *ssh*) (REQUIRED, this or *prompt\_name* above, but not both) A regular expression that matches the prompt on the switch and any other possible prompt at which you need the proxy minion to continue sending input. This feature was specifically developed for situations where the switch may ask for confirmation. *prompt\_name* above would not match these, and so the session would timeout.

Example:

```
nxos-switch#.*|\(y\/n\)\/\?.*
```

This should match

```
nxos-switch#
```

or

```
Flash complete. Reboot this switch (y/n)? [n]
```

If neither *prompt\_name* nor *prompt\_regex* is specified the prompt will be defaulted to

```
.+##$
```

which should match any number of characters followed by a # at the end of the line. This may be far too liberal for most installations.

**ssh\_args:** Extra optional arguments used for connecting to switch.

**key\_accept:** Whether or not to accept the host key of the switch on initial login. Default: *False*

Connection NXAPI Args:

**transport:** (REQUIRED) when *connection* is *nxapi*. Choices: *http*, *https* Default: *https*

**port:** (REQUIRED) when *connection* is *nxapi*. Default: *80*

**verify:** (REQUIRED) when *connection* is *nxapi*. Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Default: *True*

When there is no certificate configuration on the device and this option is set as *True* (default), the commands will fail with the following error: `SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as *False* with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

The functions from the proxy minion can be run from the salt commandline using the `salt.modules.nxos` execution module.

`salt.proxy.nxos.grains()`

Helper function for nxos execution module functions that need to retrieve nxos grains using the proxy minion.

**salt.proxy.nxos.grains\_refresh()**

Helper function for nxos execution module functions that need to refresh nxos grains using the proxy minion.

**salt.proxy.nxos.init**(*opts=None*)

Required. Initialize device connection using ssh or nxapi connection type.

**salt.proxy.nxos.initialized()**

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether the init() function has been called.

**salt.proxy.nxos.ping()**

Helper function for nxos execution module functions that need to ping the nxos device using the proxy minion.

**salt.proxy.nxos.proxy\_config**(*commands, save\_config=None*)

Helper function for nxos execution module functions that need to configure an nxos device using the proxy minion.

**salt.proxy.nxos.sendline**(*commands, method='cli\_show\_ascii', \*\*kwargs*)

Helper function for nxos execution module functions that need to send commands to an nxos device using the proxy minion.

**salt.proxy.nxos.shutdown()**

Not supported. Only used as a place holder to satisfy shutdown function requirement.

### 21.13.17 salt.proxy.nxos\_api module

Proxy Minion to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Proxy module for managing Cisco Nexus switches via the NX-API.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**platform** any

#### Usage

---

**Note:** To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_7000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_0101.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html) for more details.

---

## Pillar

The `nxos_api` proxy configuration requires the following parameters in order to connect to the network switch:

**transport: https** Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host: localhost** The IP address or DNS host name of the connection device.

**username: admin** The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout: 60** Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify: True** Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLerror: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

Check [https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6\\_x/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide/b\\_Cisco\\_Nexus\\_3000\\_Series\\_NX-OS\\_Programmability\\_Guide\\_chapter\\_01.html](https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html) to see how to properly configure the certificate.

All the arguments may be optional, depending on your setup.

## Proxy Pillar Example

```
proxy:
 proxytype: nxos_api
 host: switch1.example.com
 username: example
 password: example
```

`salt.proxy.nxos_api.get_conn_args()`  
Returns the connection arguments of the Proxy Minion.

`salt.proxy.nxos_api.init(opts)`  
Open the connection to the Nexsu switch over the NX-API.

As the communication is HTTP based, there is no connection to maintain, however, in order to test the connectivity and make sure we are able to bring up this Minion, we are executing a very simple command (`show clock`) which doesn't come with much overhead and it's sufficient to confirm we are indeed able to connect to the NX-API endpoint as configured.

`salt.proxy.nxos_api.initialized()`

Connection finished initializing?

`salt.proxy.nxos_api.ping()`

Connection open successfully?

`salt.proxy.nxos_api.rpc(commands, method='cli', **kwargs)`

Executes an RPC request over the NX-API.

`salt.proxy.nxos_api.shutdown(opts)`

Closes connection with the device.

### 21.13.18 salt.proxy.panos module

#### Proxy Minion interface module for managing Palo Alto firewall devices

New in version 2018.3.0.

**codeauthor** Spencer Ervin <spencer\_ervin@hotmail.com>

**maturity** new

**depends** none

**platform** unix

This proxy minion enables Palo Alto firewalls (hereafter referred to as simply 'panos') to be treated individually like a Salt Minion.

The panos proxy leverages the XML API functionality on the Palo Alto firewall. The Salt proxy must have access to the Palo Alto firewall on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

#### Configuration

To use this integration proxy module, please configure the following:

#### Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. There are four connection options available for the panos proxy module.

- Direct Device (Password)
- Direct Device (API Key)
- Panorama Pass-Through (Password)
- Panorama Pass-Through (API Key)

### Direct Device (Password)

The direct device configuration configures the proxy to connect directly to the device with username and password.

```
proxy:
 proxytype: panos
 host: <ip or dns name of panos host>
 username: <panos username>
 password: <panos password>
 verify_ssl: True
```

#### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

#### host

The location, or ip/dns, of the panos host. Required.

#### username

The username used to login to the panos host. Required.

#### password

The password used to login to the panos host. Required.

### Direct Device (API Key)

Palo Alto devices allow for access to the XML API with a generated 'API key' \_ instead of username and password.

```
proxy:
 proxytype: panos
 host: <ip or dns name of panos host>
 apikey: <panos generated api key>
```

#### proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

## host

The location, or ip/dns, of the panos host. Required.

## apikey

The generated XML API key for the panos host. Required.

## Panorama Pass-Through (Password)

The Panorama pass-through method sends all connections through the Panorama management system. It passes the connections to the appropriate device using the serial number of the Palo Alto firewall.

This option will reduce the number of connections that must be present for the proxy server. It will only require a connection to the Panorama server.

The username and password will be for authentication to the Panorama server, not the panos device.

```
proxy:
 proxytype: panos
 serial: <serial number of panos host>
 host: <ip or dns name of the panorama server>
 username: <panorama server username>
 password: <panorama server password>
```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

## serial

The serial number of the panos host. Required.

## host

The location, or ip/dns, of the Panorama server. Required.

## username

The username used to login to the Panorama server. Required.

## password

The password used to login to the Panorama server. Required.

## Panorama Pass-Through (API Key)

The Panorama server can also utilize a generated 'API key' for authentication.

```

proxy:
 proxytype: panos
 serial: <serial number of panos host>
 host: <ip or dns name of the panorama server>
 apikey: <panos generated api key>

```

## proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

## serial

The serial number of the panos host. Required.

## host

The location, or ip/dns, of the Panorama server. Required.

## apikey

The generated XML API key for the Panorama server. Required.

`salt.proxy.panos.call(payload=None)`

This function captures the query string and sends it to the Palo Alto device.

`salt.proxy.panos.grains()`

Get the grains from the proxied device

`salt.proxy.panos.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.panos.init(opts)`

This function gets called when the proxy starts up. For panos devices, a determination is made on the connection type and the appropriate connection details that must be cached.

`salt.proxy.panos.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.panos.is_required_version(required_version='0.0.0')`

Because different versions of Palo Alto support different command sets, this function will return true if the current version of Palo Alto supports the required command.

`salt.proxy.panos.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.panos.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

### 21.13.19 salt.proxy.philips\_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

First create a new user on the Hue bridge by following the [Meet hue](#) instructions.

To configure the proxy minion:

```
proxy:
 proxytype: philips_hue
 host: [hostname or ip]
 user: [username]
```

**class** `salt.proxy.philips_hue.Const`

Constants for the lamp operations.

**COLOR\_BLUE** = {'hue': 46920, 'sat': 254}

**COLOR\_DAYLIGHT** = {'xy': [0.3806, 0.3576]}

**COLOR\_GREEN** = {'hue': 25500, 'sat': 254}

**COLOR\_ORANGE** = {'hue': 12000, 'sat': 254}

**COLOR\_PINK** = {'xy': [0.3688, 0.2095]}

**COLOR\_PURPLE** = {'xy': [0.3787, 0.1724]}

**COLOR\_RED** = {'hue': 0, 'sat': 254}

**COLOR\_WHITE** = {'xy': [0.3227, 0.329]}

**COLOR\_YELLOW** = {'xy': [0.4432, 0.5154]}

**LAMP\_OFF** = {'on': False, 'transitiontime': 0}

**LAMP\_ON** = {'on': True, 'transitiontime': 0}

`salt.proxy.philips_hue.call_alert(*args, **kwargs)`

Lamp alert

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

`salt.proxy.philips_hue.call_blink(*args, **kwargs)`

Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

- **pause:** Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

**salt.proxy.philips\_hue.call\_brightness(\*args, \*\*kwargs)**

Set an effect to the lamp.

Arguments:

- **value:** 0~255 brightness of the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **transition:** Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

**salt.proxy.philips\_hue.call\_color(\*args, \*\*kwargs)**

Set a color to the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color:** Fixed color. Values are: red, green, blue, orange, pink, white, yellow, daylight, purple. Default white.
- **transition:** Transition 0~200.

Advanced:

- **gamut:** XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

**salt.proxy.philips\_hue.call\_effect(\*args, \*\*kwargs)**

Set an effect to the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type:** Type of the effect. Possible values are "none" or "colorloop". Default "none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

**salt.proxy.philips\_hue.call\_lights(\*args, \*\*kwargs)**

Get info about all available lamps.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

**salt.proxy.philips\_hue.call\_ping(\*args, \*\*kwargs)**

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

**salt.proxy.philips\_hue.call\_rename(\*args, \*\*kwargs)**

Rename a device.

Options:

- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

**salt.proxy.philips\_hue.call\_status(\*args, \*\*kwargs)**

Return the status of the lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

**salt.proxy.philips\_hue.call\_switch(\*args, \*\*kwargs)**

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

**salt.proxy.philips\_hue.call\_temperature(\*args, \*\*kwargs)**

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- **value**: 150~500.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

```

salt.proxy.philips_hue.init(cnf)
 Initialize the module.

salt.proxy.philips_hue.ping(*args, **kw)
 Ping the lamps.

salt.proxy.philips_hue.shutdown(opts, *args, **kw)
 Shuts down the service.

```

### 21.13.20 salt.proxy.rest\_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in [https://github.com/saltstack/salt-contrib/tree/master/proxyminion\\_rest\\_example](https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example)

```

salt.proxy.rest_sample.alive(opts)
salt.proxy.rest_sample.fix_outage()
salt.proxy.rest_sample.fns()
salt.proxy.rest_sample.grains()
 Get the grains from the proxied device
salt.proxy.rest_sample.grains_refresh()
 Refresh the grains from the proxied device
salt.proxy.rest_sample.id(opts)
 Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is
 running the salt-master will get really confused and may stop talking to this minion
salt.proxy.rest_sample.init(opts)
salt.proxy.rest_sample.initialized()
 Since grains are loaded in many different places and some of those places occur before the proxy can be
 initialized, return whether our init() function has been called
salt.proxy.rest_sample.package_install(name, **kwargs)
 Install a "package" on the REST server
salt.proxy.rest_sample.package_list()
 List "packages" installed on the REST server
salt.proxy.rest_sample.package_remove(name)
 Remove a "package" on the REST server
salt.proxy.rest_sample.package_status(name)
 Check the installation status of a package on the REST server
salt.proxy.rest_sample.ping()
 Is the REST server up?
salt.proxy.rest_sample.service_list()
 List "services" on the REST server
salt.proxy.rest_sample.service_restart(name)
 Restart a "service" on the REST server
salt.proxy.rest_sample.service_start(name)
 Start a "service" on the REST server
salt.proxy.rest_sample.service_status(name)
 Check if a service is running on the REST server

```

`salt.proxy.rest_sample.service_stop(name)`  
Stop a "service" on the REST server

`salt.proxy.rest_sample.shutdown(opts)`  
For this proxy shutdown is a no-op

`salt.proxy.rest_sample.test_from_state()`  
Test function so we have something to call from a state :return:

`salt.proxy.rest_sample.uptodate(name)`  
Call the REST endpoint to see if the packages on the "server" are up to date.

### 21.13.21 salt.proxy.ssh\_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

`salt.proxy.ssh_sample.fns()`

`salt.proxy.ssh_sample.grains()`  
Get the grains from the proxied device

`salt.proxy.ssh_sample.grains_refresh()`  
Refresh the grains from the proxied device

`salt.proxy.ssh_sample.init(opts)`  
Required. Can be used to initialize the server connection.

`salt.proxy.ssh_sample.initialized()`  
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.ssh_sample.package_install(name, **kwargs)`  
Install a "package" on the ssh server

`salt.proxy.ssh_sample.package_list()`  
List "packages" by executing a command via ssh This function is called in response to the salt command  
..code-block::bash salt target\_minion pkg.list\_pkgs

`salt.proxy.ssh_sample.package_remove(name)`  
Remove a "package" on the ssh server

`salt.proxy.ssh_sample.parse(out)`  
Extract json from out.  
**Parameter** out: Type string. The data returned by the ssh command.

`salt.proxy.ssh_sample.ping()`  
Required. Ping the device on the other end of the connection

`salt.proxy.ssh_sample.service_list()`  
Start a "service" on the ssh server  
  
New in version 2015.8.2.

`salt.proxy.ssh_sample.service_restart(name)`  
Restart a "service" on the ssh server  
  
New in version 2015.8.2.

`salt.proxy.ssh_sample.service_start(name)`  
Start a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`  
Stop a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`  
Disconnect

### 21.13.22 salt.proxy.vcenter module

Proxy Minion interface module for managing VMWare vCenters.

**codeauthor** Rod McKenzie (*roderick.mckenzie@morganstanley.com*)

**codeauthor** Alexandru Bleotu (*alexandru.bleotu@morganstanley.com*)

#### Dependencies

- pyVmomi Python Module

#### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

#### Configuration

To use this proxy module, please use on of the following configurations:

```
proxy:
 proxytype: vcenter
 vcenter: <ip or dns name of parent vcenter>
 username: <vCenter username>
 mechanism: userpass
 passwords:
 - first_password
 - second_password
```

(continues on next page)

(continued from previous page)

```
- third_password
```

**proxy:**

```
proxytype: vcenter
vcenter: <ip or dns name of parent vcenter>
username: <vCenter username>
domain: <user domain>
mechanism: sspi
principal: <host kerberos principal>
```

**proxytype**

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Proxy Module, set this to `vcenter`.

**vcenter**

The location of the VMware vCenter server (host of ip). Required

**username**

The username used to login to the vcenter, such as `root`. Required only for `userpass`.

**mechanism**

The mechanism used to connect to the vCenter server. Supported values are `userpass` and `sspi`. Required.

**passwords**

A list of passwords to be used to try and login to the vCenter server. At least one password in this list is required if mechanism is `userpass`

The proxy integration will try the passwords listed in order.

**domain**

User domain. Required if mechanism is `sspi`

**principal**

Kerberos principal. Required if mechanism is `sspi`

**protocol**

If the vCenter is not using the default protocol, set this value to an alternate protocol. Default is `https`.

**port**

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

**Salt Proxy**

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the vCenter server in the pillar. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id of the cluster>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the vcenter host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the vcenter. For example, you can get if the proxy can actually connect to the vCenter:

```
salt <id> vsphere.test_vcenter_connection
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `Salt.modules.vsphere` is a standard Salt execution module.

If you pull up the docs for it you'll see that almost every function in the module takes credentials and a targets either a vcenter or a host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the

local machine. If you wanted, you could run functions from this module on any host where an appropriate version of pyVmomi is installed, and that host would reach out over the network and communicate with the ESXi host.

**salt.proxy.vcenter.find\_credentials()**

Cycle through all the possible credentials and return the first one that works.

**salt.proxy.vcenter.get\_details()**

Function that returns the cached details

**salt.proxy.vcenter.init(opts)**

This function gets called when the proxy starts up. For login the protocol and port are cached.

**salt.proxy.vcenter.ping()**

Returns True.

CLI Example:

```
salt vcenter test.ping
```

**salt.proxy.vcenter.shutdown()**

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

## 21.14 queue modules

---

*pgjsonb\_queue*

New in version 2016.3.0.

---

*sqlite\_queue*

New in version 2014.7.0.

---

### 21.14.1 salt.queues.pgjsonb\_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

**depends** python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.password: 'salt'
queue.pgjsonb.dbname: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';

--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
 id SERIAL PRIMARY KEY,
```

(continues on next page)

(continued from previous page)

```
data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'
↪ backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

```
salt.queues.pgjsonb_queue.delete(queue, items)
```

Delete an item or items from a queue

```
salt.queues.pgjsonb_queue.handle_queue_creation(queue)
```

```
salt.queues.pgjsonb_queue.insert(queue, items)
```

Add an item or items to a queue

```
salt.queues.pgjsonb_queue.list_items(queue)
```

List contents of a queue

```
salt.queues.pgjsonb_queue.list_length(queue)
```

Provide the number of items in a queue

```
salt.queues.pgjsonb_queue.list_queues()
```

Return a list of Salt Queues on the Salt Master

```
salt.queues.pgjsonb_queue.pop(queue, quantity=1, is_runner=False)
```

Pop one or more or all items from the queue return them.

### 21.14.2 salt.queues.sqlite\_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

```
salt.queues.sqlite_queue.delete(queue, items)
```

Delete an item or items from a queue

```
salt.queues.sqlite_queue.insert(queue, items)
```

Add an item or items to a queue

```
salt.queues.sqlite_queue.list_items(queue)
```

List contents of a queue

```
salt.queues.sqlite_queue.list_length(queue)
```

Provide the number of items in a queue

```
salt.queues.sqlite_queue.list_queues()
```

Return a list of Salt Queues on the Salt Master

```
salt.queues.sqlite_queue.pop(queue, quantity=1, is_runner=False)
```

Pop one or more or all items from the queue return them.

## 21.15 roster modules

<i>ansible</i>	Read in an Ansible inventory file or script
<i>cache</i>	The <i>cache</i> roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over <i>salt-ssh</i> .
<i>cloud</i>	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
<i>clustershell</i>	This roster resolves hostname in a <i>pdsh/clustershell</i> style.
<i>flat</i>	Read in the roster from a flat file using the renderer system
<i>range</i>	This roster resolves targets from a range server.
<i>scan</i>	Scan a netmask or ipaddr for open ssh ports
<i>sshconfig</i>	Parses roster entries out of Host directives from SSH config
<i>terraform</i>	Dynamic roster from terraform current state

### 21.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
↳port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
↳ansible_ssh_pass='password'

[computers:children]
desktop
servers

[names:vars]
http_port=80
```

then *salt-ssh* can be used to hit any of them

```
[~]# salt-ssh -N all test.ping
salt.gtmanfred.com:
 True
home:
 True
[~]# salt-ssh -N desktop test.ping
home:
 True
[~]# salt-ssh -N computers test.ping
salt.gtmanfred.com:
 True
home:
 True
```

(continues on next page)

(continued from previous page)

```
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
 True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
 "servers": [
 "salt.gtmanfred.com"
],
 "desktop": [
 "home"
],
 "computers": {
 "hosts": [],
 "children": [
 "desktop",
 "servers"
]
 },
 "_meta": {
 "hostvars": {
 "salt.gtmanfred.com": {
 "ansible_ssh_user": "gtmanfred",
 "ansible_ssh_host": "127.0.0.1",
 "ansible_sudo_pass": "password",
 "ansible_ssh_port": 22
 },
 "home": {
 "ansible_ssh_user": "gtmanfred",
 "ansible_ssh_host": "12.34.56.78",
 "ansible_sudo_pass": "password",
 "ansible_ssh_port": 23
 }
 }
 }
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
 True
```

Any of the [groups] or direct hostnames will return. The 'all' is special, and returns everything.

**salt.roster.ansible.targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the ansible inventory\_file Default: /etc/salt/roster

## 21.15.2 salt.roster.cache

The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over salt-ssh.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster\_order per config key default order changed to industry-wide best practices CIDR range selection

### Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

### The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

```
• roster_order:
 host: id # use the minion id as hostname
```

You can define lists of parameters as well, the first result from the list will become the value.

### Selecting a host

```
default
roster_order:
 host:
 - ipv6-private # IPv6 addresses in private ranges
 - ipv6-global # IPv6 addresses in global ranges
 - ipv4-private # IPv4 addresses in private ranges
 - ipv4-public # IPv4 addresses in public ranges
 - ipv4-local # loopback addresses
```

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```
roster_order:
 host:
 - global|public|private|local # Both IPv6 and IPv4 addresses in that range
 - 2000::/3 # CIDR networks, both IPv4 and IPv6 are supported
```

## Using cached data

Several cached libraries can be selected using the `library: ``` prefix, followed by the library key. This can be referenced using the same `` syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
host:
 - grain: fqdn_ip4 # Lookup this grain
 - mine: network.ip_addrs # Mine data lookup works the same

password: sdb://vault/ssh_pass # Salt SDB URLs are also supported

user:
 - pillar: ssh:auth:user # Lookup this pillar key
 - sdb://osenv/USER # Lookup this env var through sdb

priv:
 - pillar: # Lists are also supported
 - salt:ssh:private_key
 - ssh:auth:private_key
```

`salt.roster.cache.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

### 21.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at `/etc/salt/cloud`. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.extract_ip4(roster_order, ipv4)`

Extract the preferred IP address from the `ipv4` grain

`salt.roster.cloud.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the flat yaml file, checks `opts` for location but defaults to `/etc/salt/roster`

### 21.15.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

**depends** clustershell, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

**salt.roster.clustershell.targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets

### 21.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

**salt.roster.flat.targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.6 salt.roster.range module

This roster resolves targets from a range server.

**depends** seco.range, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%%example.range.cluster' test.ping
```

**salt.roster.range.target\_glob**(tgt, hosts)

**salt.roster.range.target\_range**(tgt, hosts)

**salt.roster.range.targets**(tgt, tgt\_type='range', \*\*kwargs)

Return the targets from a range query

### 21.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

**class** salt.roster.scan.RosterMatcher(tgt, tgt\_type)

Matcher for the roster data structure

**targets**()

Return ip addrs based on netmask, sitting in the "glob" spot because it is the default

**salt.roster.scan.targets**(tgt, tgt\_type='glob', \*\*kwargs)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.8 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```
salt-ssh --roster sshconfig '*' -r "echo hi"
```

**class** salt.roster.sshconfig.**RosterMatcher**(*raw*, *tgt*, *tgt\_type*)

Matcher for the roster data structure

**get\_data**(*minion*)

Return the configured ip

**ret\_glob\_minions**()

Return minions that match via glob

**targets**()

Execute the correct tgt\_type routine and return

salt.roster.sshconfig.**parse\_ssh\_config**(*lines*)

Parses lines from the SSH config to create roster targets.

**Parameters** **lines** -- Individual lines from the ssh config file

**Returns** Dictionary of targets in similar style to the flat roster

salt.roster.sshconfig.**targets**(*tgt*, *tgt\_type*='glob', *\*\*kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

### 21.15.9 salt.roster.terraform

#### Dynamic roster from terraform current state

This roster module allows you dynamically generate the roster from the terraform resources defined with the [Terraform Salt](#) provider.

It exposes all salt\_host resources with the same attributes to the salt-ssh roster, making it completely independent of the type of terraform resource, and providing the integration using terraform constructs with interpolation.

#### Basic Example

Given a simple salt-ssh tree with a Saltfile:

```
salt-ssh:
 config_dir: etc/salt
 max_procs: 30
 wipe_ssh: True
```

and etc/salt/master:

```
root_dir: .
file_roots:
 base:
 - srv/salt
pillar_roots:
 base:
 - srv/pillar
roster: terraform
```

In the same folder as your `Saltfile`, create terraform file with resources like cloud instances, virtual machines, etc. For every single one of those that you want to manage with Salt, create a `salt_host` resource:

```
resource "salt_host" "dbminion" {
 salt_id = "dbserver"
 host = "${libvirt_domain.vm-db.network_interface.0.addresses.0}"
 user = "root"
 passwd = "linux"
}
```

You can use the `count` attribute to create multiple roster entries with a single definition. Please refer to the [Terraform Salt provider](#) for more detailed examples.

`salt.roster.terraform.targets` (*tgt*, *tgt\_type*='glob', *\*\*kwargs*)

Returns the roster from the terraform state file, checks `opts` for location, but defaults to `terraform.tfstate`

## 21.16 runner modules

<i>asam</i>	Novell ASAM Runner
<i>auth</i>	Authentication runner for creating, deleting, and managing eauth tokens.
<i>bgp</i>	BGP Finder
<i>cache</i>	Return cached data from minions
<i>cloud</i>	The Salt Cloud Runner
<i>config</i>	This runner is designed to mirror the execution module <code>config.py</code> , but for master settings
<i>ddns</i>	Dynamic DNS Runner
<i>digicertapi</i>	Support for Digicert.
<i>doc</i>	A runner module to collect and display the inline documentation from the various module types
<i>drac</i>	Manage Dell DRAC from the Master
<i>error</i>	Error generator to enable integration testing of salt runner error handling
<i>event</i>	Module for sending events using the runner system.
<i>f5</i>	Runner to provide F5 Load Balancer functionality
<i>filesERVER</i>	Directly manage the Salt filesERVER plugins
<i>git-pillar</i>	Runner module to directly manage the git external pillar
<i>http</i>	Module for making various web calls.
<i>jobs</i>	A convenience system to manage jobs, both active and already run
<i>launchd</i>	Manage launchd plist files
<i>lxc</i>	Control Linux Containers via Salt
<i>manage</i>	General management functions for salt, tools like seeing what hosts are up and what hosts are down
<i>mattermost</i>	Module for sending messages to Mattermost
<i>mine</i>	A runner to access data from the salt mine
<i>nacl</i>	This module helps include encrypted passwords in pillars, grains and salt state files.
<i>net</i>	NET Finder
<i>network</i>	Network tools to run from the Master

continues on next page

Table 17 – continued from previous page

<i>pagerduty</i>	Runner Module for Firing Events via PagerDuty
<i>pillar</i>	Functions to interact with the pillar compiler on the master
<i>pkg</i>	Package helper functions using <code>salt.modules.pkg</code>
<i>queue</i>	General management and processing of queues.
<i>reactor</i>	A convenience system to manage reactors
<i>salt</i>	This runner makes Salt's execution modules available on the salt master.
<i>saltutil</i>	The Saltutil runner is used to sync custom types to the Master.
<i>sdb</i>	Runner for setting and querying data via the sdb API on the master
<i>smartos_vmadm</i>	Runner for SmartOS minions control vmadm
<i>spacewalk</i>	Spacewalk Runner
<i>ssh</i>	A Runner module interface on top of the salt-ssh Python API.
<i>state</i>	Execute orchestration functions
<i>survey</i>	A general map/reduce style salt runner for aggregating results returned by several different minions.
<i>test</i>	This runner is used only for test purposes and servers no production purpose
<i>thin</i>	The thin runner is used to manage the salt thin systems.
<i>vault</i>	
<b>maintainer</b> SaltStack	
<i>venafiapi</i>	Support for Venafi
<i>virt</i>	Control virtual machines via Salt
<i>vistara</i>	Vistara Runner
<i>winrepo</i>	Runner to manage Windows software repo

### 21.16.1 salt.runners.asam

#### Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

**codeauthor** Nitin Madhok <[nmadhok@clemson.edu](mailto:nmadhok@clemson.edu)>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
 prov1.domain.com
 username: "testuser"
 password: "verybadpass"
 verify_ssl: true
 prov2.domain.com
 username: "testuser"
 password: "verybadpass"
 verify_ssl: true
```

**Note:** Optionally, protocol and port can be specified if the Fan-Out Driver server is not using the defaults. Default is protocol: https and port: 3451.

---

`salt.runners.asam.add_platform(name, platform_set, server_url)`

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.list_platform_sets(server_url)`

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

`salt.runners.asam.list_platforms(server_url)`

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

`salt.runners.asam.remove_platform(name, server_url)`

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

### 21.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

`salt.runners.auth.del_token(token)`

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.mk_token(**load)`

Create an eauth token using provided credentials

Non-root users may specify an expiration date -- if allowed via the `token_expire_user_override` setting -- by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
```

(continues on next page)

(continued from previous page)

```
token_expire=94670856

Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
 token_expire=$(expr \(365 * 24 * 60 * 60 \) * 3)
```

### 21.16.3 salt.runners.bgp

#### BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

#### Configuration

- Minion (proxy) config

The `bgp.neighbors` function must be appened in the list of `mine_functions`:

```
mine_functions:
 bgp.neighbors: []
```

Which instructs Salt to cache the data returned by the `neighbors` function from the *NAPALM BGP module*.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

**tgt:** *★* From what minions will collect the mine data. Default: *★* (collect mine data from all minions)

**tgt\_type:** **glob** Minion matching expression form. Default: `glob`.

**return\_fields** What fields to return in the output. It can display all the fields from the `neighbors` function from the *NAPALM BGP module*.

Some fields cannot be removed:

- `as_number`: the AS number of the neighbor
- `device`: the minion ID
- `neighbor_address`: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- `connection_stats`: connection stats, as described below
- `import_policy`: the name of the import policy
- `export_policy`: the name of the export policy

Special fields:

- `vrf`: return the name of the VRF.
- `connection_stats`: returning an output of the form `<State> <Active>/<Received>/<Accepted>/<Damped>`, e.g. `Established 398/399/399/0` similar to the usual output from network devices.
- `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.
- `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.

**display: True** Display on the screen or return structured object? Default: `True` (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

Configuration example:

```
runners:
 bgp:
 tgt: 'edge*'
 tgt_type: 'glob'
 return_fields:
 - up
 - connection_state
 - previous_connection_state
 - suppress_4byte_as
 - holdtime
 - flap_count
 outputter: yaml
```

`salt.runners.bgp.neighbors(*asns, **kwargs)`

Search for BGP neighbors details in the mines of the `bgp.neighbors` function.

Arguments:

**asns** A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

**device** Filter by device name (minion ID).

**ip** Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

**network** Search neighbors within a certain IP network.

**title** Custom title.

**display: True** Display on the screen or return structured object? Default: `True` (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

In addition, any field from the output of the `neighbors` function from the `NAPALM BGP module` can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

BGP Neighbors for 13335, 15169					
Device	AS Number	Neighbor Address	State	#Active/	
Received/Accepted/Damped		Policy IN		Policy OUT	
edge01.bjm01	13335	172.17.109.11	Established		
0/398/398/0		import-policy		export-policy	
edge01.bjm01	13335	172.17.109.12	Established		
397/398/398/0		import-policy		export-policy	
edge01.flw01	13335	192.168.172.11	Established		
1/398/398/0		import-policy		export-policy	
edge01.oua01	13335	172.17.109.17			
Established 0/0/0/0		import-policy		export-	
policy					
edge01.bjm01	15169	2001::1	Established		
102/102/102/0		import-policy		export-policy	
edge01.bjm01	15169	2001::2	Established		
102/102/102/0		import-policy		export-policy	
edge01.tbg01	13335	192.168.172.17			
Established 0/1/1/0		import-policy		export-	
policy					

#### 21.16.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all(tgt=None, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock(role, remote=None, **kwargs)`

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git\_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.

---

**Note:** Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a role of gitfs is equivalent to running `salt-run fileserver.clear_lock backend=git`.

---

**role** Which type of lock to remove (gitfs, git\_pillar, or winrepo)

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of `github` will remove the lock from all github.com remotes.

**type** [update,checkout,mountpoint] The types of lock to clear. Can be one or more of update, checkout, and mountpoint, and can be passed either as a comma-separated or Python list.

New in version 2015.8.8.

Changed in version 2018.3.0: mountpoint lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

`salt.runners.cache.clear_grains(tgt=None, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine(tgt=None, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func(tgt=None, tgt_type='glob', clear_mine_func_flag=None)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.clear_pillar(tgt=None, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.cloud(tgt, provider=None)`

Return cloud cache data for target.

---

**Note:** Only works with glob matching

---

**tgt** Glob Target to match minion ids

**provider** Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

`salt.runners.cache.fetch(bank, key, cachedir=None)`

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.flush(bank, key=None, cachedir=None)`

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.grains(tgt, tgt_type='glob', **kwargs)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions.

**tgt** Target to match minion ids.

Changed in version 2017.7.5, 2018.3.0: The `tgt` argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt 3001 release.

**tgt\_type** The type of targeting to use for matching, such as `glob`, `list`, etc.

CLI Example:

```
salt-run cache.grains '*'
```

`salt.runners.cache.list_(bank, cachedir=None)`

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.mine`(*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar`(*tgt=None, tgt\_type='glob', \*\*kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions if `tgt` is set. If `tgt` is not set will return cached pillars for all minions.

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.store`(*bank, key, data, cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

## 21.16.5 salt.runners.cloud

### The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

`salt.runners.cloud.action`(*func=None, cloudmap=None, instances=None, provider=None, instance=None, opts=None, \*\*kwargs*)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

`salt.runners.cloud.create`(*provider, instances, opts=None, \*\*kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance \
 image=ami-1624987f size='t1.micro' ssh_username=ec2-user \
 securitygroup=default delvol_on_destroy=True
```

`salt.runners.cloud.destroy`(*instances, opts=None*)

Destroy the named vm(s)

`salt.runners.cloud.full_query`(*query\_type='list\_nodes\_full'*)

List all available cloud provider data

`salt.runners.cloud.list_images(provider='all')`

List cloud provider images for the given providers

`salt.runners.cloud.list_locations(provider='all')`

List cloud provider sizes for the given providers

`salt.runners.cloud.list_sizes(provider='all')`

List cloud provider sizes for the given providers

`salt.runners.cloud.map_run(path=None, opts=None, **kwargs)`

Execute a salt cloud map file

`salt.runners.cloud.profile(prof=None, instances=None, opts=None, **kwargs)`

Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

`salt.runners.cloud.query(query_type='list_nodes')`

List cloud provider data for all providers

`salt.runners.cloud.select_query(query_type='list_nodes_select')`

List selected nodes

### 21.16.6 salt.runners.config

This runner is designed to mirror the execution module `config.py`, but for master settings

`salt.runners.config.get(key, default="", delimiter=':')`

Retrieve master config options, with optional nesting via the delimiter argument.

#### Arguments

default

If the key is not found, the default will be returned instead

delimiter

Override the delimiter used to separate nested levels of a data structure.

CLI Example:

```
salt-run config.get gitfs_remotes
salt-run config.get file_roots:base
salt-run config.get file_roots,base delimiter=','
```

### 21.16.7 salt.runners.ddns

#### Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>

`salt.runners.ddns.add_host(zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5')`

Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↳ salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.create**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳ salt/tsig.keyring 10.0.0.1 5
```

**salt.runners.ddns.delete**(*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↳ 0.0.1 5 A
```

**salt.runners.ddns.delete\_host**(*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↳ keyring 10.0.0.1 5
```

**salt.runners.ddns.update**(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

---

**Note:** If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

---

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳ salt/tsig.keyring 10.0.0.1 5
```

## 21.16.8 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall ([jphall@saltstack.com](mailto:jphall@saltstack.com)).

Before using this module you need to register an account with Digicert's CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the Account item in the left sidebar, and select Account Access. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
 api_key: ❏
 ↪ ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMN
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
 api_key: ❏
 ↪ ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMN
 shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.

`salt.runners.digicertapi.del_cached_domain(domains)`

Delete cached domains from the master

CLI Example:

```
salt-run digicert.del_cached_domain domain1.example.com, domain2.example.com
```

`salt.runners.digicertapi.gen_csr(minion_id, dns_name, organization_id, ou_name=None, key_len=2048, shatype='sha256', password=None)`

CLI Example:

```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

`salt.runners.digicertapi.gen_key(minion_id, dns_name=None, password=None, key_len=2048)`

Generate and return a private\_key. If a `dns_name` is passed in, the private\_key will be cached under that name.

CLI Example:

```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

`salt.runners.digicertapi.get_certificate(order_id=None, certificate_id=None, minion_id=None, cert_format='pem_all', filename=None)`

Retrieve a certificate by `order_id` or `certificate_id` and write it to stdout or a filename.

A list of permissible `cert_formats` is here: <https://www.digicert.com/services/v2/documentation/appendix-certificate-formats>

CLI Example:

```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a 'filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs\_csr, and needs\_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the `filename` argument and make sure to include `--no-color` so there will be no terminal ANSI escape sequences.

`salt.runners.digicertapi.get_org_details(organization_id)`

Return the details for an organization

CLI Example:

```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with 'error' and 'status' keys.

`salt.runners.digicertapi.list_domain_cache()`

List domains that have been cached

CLI Example:

```
salt-run digicert.list_domain_cache
```

`salt.runners.digicertapi.list_domains(container_id=None)`

List domains that CertCentral knows about. You can filter by `container_id` (also known as "Division") by passing a `container_id`.

CLI Example:

```
salt-run digicert.list_domains
```

`salt.runners.digicertapi.list_orders(status=None)`

List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

`salt.runners.digicertapi.list_organizations(container_id=None, include_validation=True)` *in-*

List organizations that CertCentral knows about. You can filter by `container_id` (also known as "Division") by passing a `container_id`. This function returns validation information by default; pass `include_validation=False` to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

`salt.runners.digicertapi.list_requests(status=None)`

List certificate requests made to CertCentral. You can filter by status: pending, approved, rejected

CLI Example:

```
salt-run digicert.list_requests pending
```

`salt.runners.digicertapi.order_certificate(minion_id, common_name, organization_id, validity_years, cert_key_passphrase=None, signature_hash=None, key_len=2048, dns_names=None, organization_units=None, server_platform=None, custom_expiration_date=None, comments=None, disable_renewal_notifications=False, product_type_hint=None, renewal_of_order_id=None)` *re-*

Order a certificate. Requires that an Organization has been created inside Digicert's CertCentral.

See here for API documentation: <https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator>

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10 3
→signature_hash=sha256 dns_names=['this.domain.com', 'that.domain.com']
→' organization_units='My Domain Org Unit' comments=
→'Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing *renewal\_of\_order\_id*. Previous order details can be retrieved with `digicertapi.list_orders`.

`salt.runners.digicertapi.show_csrs()`

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```

`salt.runners.digicertapi.show_organization(domain)`

Show organization information, especially the company id

CLI Example:

```
salt-run digicert.show_company example.com
```

`salt.runners.digicertapi.show_rsa(minion_id, dns_name)`

Show a private RSA key

CLI Example:

```
salt-run digicert.show_rsa myminion domain.example.com
```

### 21.16.9 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.execution()`

Collect all the sys.doc output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.runner()`

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.wheel()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

### 21.16.10 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

```
drac:
 username: admin
 password: secret
```

**salt.runners.drac.poweroff**(*hostname, timeout=20, username=None, password=None*)

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

**salt.runners.drac.poweron**(*hostname, timeout=20, username=None, password=None*)

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

**salt.runners.drac.pxe**(*hostname, timeout=20, username=None, password=None*)

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

**salt.runners.drac.reboot**(*hostname, timeout=20, username=None, password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

**salt.runners.drac.version**(*hostname, timeout=20, username=None, password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

### 21.16.11 salt.runners.error

Error generator to enable integration testing of salt runner error handling

**salt.runners.error.error**(*name=None, message=""*)

If name is None Then return empty dict

Otherwise raise an exception with \_\_name\_\_ from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

### 21.16.12 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.send(tag, data=None)`

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

#### Parameters

- **tag** -- the tag to send with the event
- **data** -- an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
orch/command.sls

run_a_command:
 salt.function:
 - name: cmd.run
 - tgt: my_minion
 - arg:
 - exit {{ pillar['exit_code'] }}

send_success_event:
 salt.runner:
 - name: event.send
 - tag: my_event/success
 - data:
 foo: bar

salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

### 21.16.13 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends

- pycontrol Python module

**configuration** In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
 bigip1.example.com:
 username: admin
 password: secret
 bigip2.example.com:
 username: admin
 password: secret
```

**class** salt.runners.f5.F5Mgmt(*lb, username, password*)

**add\_pool\_member**(*name, port, pool\_name*)

Add a node to a pool

**check\_member\_pool**(*member, pool\_name*)

Check a pool member exists in a specific pool

**check\_pool**(*name*)

Check to see if a pool exists

**check\_virtualserver**(*name*)

Check to see if a virtual server exists

**create\_pool**(*name, method='ROUND\_ROBIN'*)

Create a pool on the F5 load balancer

**create\_vs**(*name, ip, port, protocol, profile, pool\_name*)

Create a virtual server

**lbmethods**()

List all the load balancer methods

salt.runners.f5.add\_pool\_member(*lb, name, port, pool\_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

salt.runners.f5.check\_member\_pool(*lb, member, pool\_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

salt.runners.f5.check\_pool(*lb, name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

**salt.runners.f5.check\_virtualserver**(*lb, name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

**salt.runners.f5.create\_pool**(*lb, name, method='ROUND\_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

**salt.runners.f5.create\_vs**(*lb, name, ip, port, protocol, profile, pool\_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbancer vs_name 10.0.0.1 80 tcp http poolname
```

#### 21.16.14 salt.runners.fileserver

Directly manage the Salt fileserver plugins

**salt.runners.fileserver.clear\_cache**(*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*git*, *hg*, *svn*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the **backend** argument.

**backend** Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: **backend=-roots,git**) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

**salt.runners.fileserver.clear\_file\_list\_cache**(*saltenv=None, backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

**saltenv** By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

**backend** Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
Clear just the 'base' saltenv file list caches from just the 'roots'
fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

**Note:** In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See [this GitHub issue](#) for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

Clear all file list caches
opts['arg'] = [] # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

Clear just the 'base' saltenv file list caches from just the 'roots'
fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
Clear all file list caches
salt-run fileserver.clear_file_list_cache
```

(continues on next page)

(continued from previous page)

```
Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
Clear just the 'base' saltenv file list caches from just the 'roots'
fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

`salt.runners.fileserver.clear_lock(backend=None, remote=None)`

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git*, *hg*, *svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

**backend** Only clear the update lock for the specified backend(s).

**remote** If specified, then any remotes which contain the passed string will have their lock cleared. For example, a **remote** value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.dir_list(saltenv='base', backend=None)`

Return a list of directories in the given environment

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.empty_dir_list(saltenv='base', backend=None)`

New in version 2015.5.0.

Return a list of empty directories in the given environment

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

---

**Note:** Some backends (such as *git* and *hg*) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

---

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

**salt.runners.fileserver.envs**(*backend=None, sources=False*)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

**backend** Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=['roots', 'git']`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

**salt.runners.fileserver.file\_list**(*saltenv='base', backend=None*)

Return a list of files from the salt fileserver

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

**salt.runners.fileserver.lock**(*backend=None, remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git*, *hg*, *svn*).

---

**Note:** This will only operate on enabled backends (those configured in *fileserver\_backend*).

---

**backend** Only set the update lock for the specified backend(s).

**remote** If not None, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.symlink_list(saltenv='base', backend=None)`

Return a list of symlinked files and dirs

**saltenv** [base] The salt fileserver environment to be listed

**backend** Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.update(backend=None)`

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

**backend** Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["roots", "git"]`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

### 21.16.15 salt.runners.git\_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.update(branch=None, repo=None)`

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the [git\\_pillar configuration schema](#) introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git\_pillar remotes. The return data has also changed to a dictionary. The values will be `True` only if new commits were fetched, and `False` if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given git\_pillar remote will now be `None` when no changes were fetched. `False` now is reserved only for instances in which there were errors.

Changed in version 3001: The repo parameter also matches against the repo name.

Fetch one or all configured git\_pillar remotes.

**Note:** This will *not* fast-forward the git\_pillar cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches git\_pillar repos roughly every 60 seconds (or whatever [loop\\_interval](#) is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh

pillar data using `saltutil.refresh_pillar` and then use `pillar.item` to check if the pillar data has changed as expected.

---

CLI Example:

```
Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
Update specific repo, by name
salt-run git_pillar.update repo=myrepo
Update all repos
salt-run git_pillar.update
Run with debug logging
salt-run git_pillar.update -l debug
```

### 21.16.16 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.query(url, output=True, **kwargs)`

Query a resource, and decode the return data

Passes through all the parameters described in the `utils.http.query` function:

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST params=
↪ 'key1=val1&key2=val2'
salt-run http.query http://somelink.com/ method=POST data='<xml>
↪ somecontent</xml>'
```

`salt.runners.http.update_ca_bundle(target=None, source=None, merge_files=None)`

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

### 21.16.17 salt.runners.jobs

A convenience system to manage jobs, both active and already run

**salt.runners.jobs.active**(*display\_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

**salt.runners.jobs.exit\_success**(*jid, ext\_source=None*)

Check if a job has been executed and exit successfully

**jid** The jid to look up.

**ext\_source** The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.exit_success 20160520145827701627
```

**salt.runners.jobs.last\_run**(*ext\_source=None, outputter=None, metadata=None, function=None, target=None, display\_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{ 'foo': 'bar' }"
```

**salt.runners.jobs.list\_job**(*jid, ext\_source=None, display\_progress=False*)

List a specific job given by its jid

**ext\_source** If provided, specifies which external job cache to use.

**display\_progress** [False] If True, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

**salt.runners.jobs.list\_jobs**(*ext\_source=None, outputter=None, search\_metadata=None, search\_function=None, search\_target=None, start\_time=None, end\_time=None, display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source** If provided, specifies which external job cache to use.

**FILTER OPTIONS**

---

**Note:** If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

---

**search\_metadata** Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{ "foo": "bar", "baz": "qux" }'
```

**search\_function** Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function=['test.*', 'pkg.install']
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

**search\_target** Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target=['db*', 'myminion']
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

**start\_time** Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

**end\_time** Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↪ metadata='{ "bar": "foo" }'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18
↪ 22:00'
```

**salt.runners.jobs.list\_jobs\_filter**(*count*, *filter\_find\_job=True*, *ext\_source=None*, *output-*  
*ter=None*, *display\_progress=False*)

List all detectable jobs and associated functions

**ext\_source** The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

**salt.runners.jobs.lookup\_jid**(*jid*, *ext\_source=None*, *returned=True*, *missing=False*, *dis-*  
*play\_progress=False*)

Return the printout from a previously executed job

**jid** The jid to look up.

**ext\_source** The external job cache to use. Default: *None*.

**returned** [True] If True, include the minions that did return from the command.

New in version 2015.8.0.

**missing** [False] If True, include the minions that did *not* return from the command.

**display\_progress** [False] If True, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

**salt.runners.jobs.master()**

Return the actively executing runners for the master

CLI Example:

```
salt-run jobs.master
```

**salt.runners.jobs.print\_job(jid, ext\_source=None)**

Print a specific job's detail given by its jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

### 21.16.18 salt.runners.launchd

Manage launchd plist files

**salt.runners.launchd.write\_launchd\_plist(program)**

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

### 21.16.19 salt.runners.lxc

Control Linux Containers via Salt

**depends** lxc execution module

**salt.runners.lxc.cloud\_init(names, host=None, quiet=False, \*\*kwargs)**

Wrapper for using lxc.init in saltcloud compatibility mode

**names** Name of the containers, supports a single name or a comma delimited list of names.

**host** Minion to start the container on. Required.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode** init the container with the saltcloud opts format instead

**salt.runners.lxc.find\_guest(name, quiet=False, path=None)**

Returns the host for a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

**salt.runners.lxc.find\_guests(names, path=None)**

Return a dict of hosts and named guests

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

`salt.runners.lxc.freeze(name, quiet=False, path=None)`

Freeze the named container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

`salt.runners.lxc.info(name, quiet=False, path=None)`

Returns information about a container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

`salt.runners.lxc.init(names, host=None, saltcloud_mode=False, quiet=False, **kwargs)`

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
 [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
 [template=lxc_template_name] [clone=original name] \
 [profile=lxc_profile] [network_profile=network_profile] \
 [nic=network_profile] [nic_opts=nic_opts] \
 [start=(true|false)] [seed=(true|false)] \
 [install=(true|false)] [config=minion_config] \
 [snapshot=(true|false)]
```

**names** Name of the containers, supports a single name or a comma delimited list of names.

**host** Minion on which to initialize the container (**required**)

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**saltcloud\_mode** init the container with the saltcloud opts format instead See lxc.init\_interface module documentation

**cpuset** cgroups cpuset.

**cpushare** cgroups cpu shares.

**memory** cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

**template** Name of LXC template on which to base this container

**clone** Clone this container from an existing container

**profile** A LXC profile (defined in config or pillar).

**network\_profile** Network profile to use for the container

New in version 2015.5.2.

**nic** Deprecated since version 2015.5.0: Use `network_profile` instead

**nic\_opts** Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
 "2001:db8::ff00:42:8329"}}
```

**start** Start the newly created container.

**seed** Seed the container with the minion config and autosign its key. Default: true

**install** If salt-minion is not already installed, install it. Default: true

**config** Optional config parameters. By default, the id is set to the name of the container.

`salt.runners.lxc.list_`(*host=None, quiet=False, path=None*)

List defined containers (running, stopped, and frozen) for the named (or all) host(s).

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

`salt.runners.lxc.purge`(*name, delete\_key=True, quiet=False, path=None*)

Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

`salt.runners.lxc.start`(*name, quiet=False, path=None*)

Start the named container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

`salt.runners.lxc.stop`(*name, quiet=False, path=None*)

Stop the named container.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

`salt.runners.lxc.unfreeze`(*name, quiet=False, path=None*)

Unfreeze the named container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

## 21.16.20 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

`salt.runners.manage.alived`(*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

`salt.runners.manage.allowed` (*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

`salt.runners.manage.bootstrap` (*version='develop', script=None, hosts="", script\_args="", roster='flat', ssh\_user=None, ssh\_password=None, ssh\_priv\_key=None, tmp\_dir='/tmp/.bootstrap', http\_backend='tornado'*)

Bootstrap minions with salt-bootstrap

**version** [develop] Git tag of version to install

**script** [<https://bootstrap.saltstack.com>] URL containing the script to execute

**hosts** Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

**script\_args** Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

**roster** [flat] The roster to use for Salt SSH. More information about roster files can be found in [Salt's Roster Documentation](#).

A full list of roster types, see the [builtin roster modules](#) documentation.

New in version 2016.11.0.

**ssh\_user** If user isn't found in the roster, a default SSH user can be set here. Keep in mind that ssh\_user will not override the roster user value if it is already defined.

New in version 2016.11.0.

**ssh\_password** If passwd isn't found in the roster, a default SSH password can be set here. Keep in mind that ssh\_password will not override the roster passwd value if it is already defined.

New in version 2016.11.0.

**ssh\_privkey** If priv isn't found in the roster, a default SSH private key can be set here. Keep in mind that ssh\_password will not override the roster passwd value if it is already defined.

New in version 2016.11.0.

**tmp\_dir** [/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have <uuid4> appended to it. For example: /tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/

New in version 2016.11.0.

**http\_backend** [tornado] The backend library to use to download the script. If you need to use a file:/// URL, then you should set this to urllib2.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script=
↪ 'https://bootstrap.saltstack.com/develop'
```

(continues on next page)

(continued from previous page)

```
salt.runners.manage.bootstrap_psexec(hosts="", master=None, version=None, arch='win32', installer_url=None, username=None, password=None)
```

Bootstrap Windows minions via PsExec.

**hosts** Comma separated list of hosts to deploy the Windows Salt minion.

**master** Address of the Salt master passed as an argument to the installer.

**version** Point release of installer to download. Defaults to the most recent.

**arch** Architecture of installer to download. Defaults to win32.

**installer\_url** URL of minion installer executable. Defaults to the latest version from <https://repo.saltstack.com/windows/>

**username** Optional user name for login on remote computer.

**password** Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↳ 'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↳ exampledomain/salt-installer.exe'
```

```
salt.runners.manage.down(removekeys=False, tgt='*', tgt_type='glob', timeout=None,
gather_job_timeout=None)
```

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webserver" tgt_type="nodegroup"
```

```
salt.runners.manage.joined(subset=None, show_ip=False, show_ipv4=None)
```

New in version 2015.8.0.

Changed in version 2019.2.0: The `'show_ipv4'` argument has been renamed to `'show_ip'` as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

```
salt.runners.manage.key_regen()
```

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The `key_regen` routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a `salt-key -A` command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

**salt.runners.manage.list\_not\_state**(*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_not_state
```

**salt.runners.manage.list\_state**(*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.list_state
```

**salt.runners.manage.not\_alive**(*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_alive
```

**salt.runners.manage.not\_allowed**(*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_allowed
```

**salt.runners.manage.not\_joined** (*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_joined
```

**salt.runners.manage.not\_present** (*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.5.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_present
```

**salt.runners.manage.not\_reaped** (*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

**salt.runners.manage.present** (*subset=None, show\_ip=False, show\_ipv4=None*)

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

**salt.runners.manage.reaped** (*subset=None, show\_ip=False, show\_ipv4=None*)

New in version 2015.8.0.

Changed in version 2019.2.0: The 'show\_ipv4' argument has been renamed to 'show\_ip' as it now includes IPv6 addresses for IPv6-connected minions.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

**subset** [None] Pass in a CIDR range to filter minions by IP address.

**show\_ip** [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.safe_accept(target, tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

`salt.runners.manage.status(output=True, tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

`salt.runners.manage.up(tgt='*', tgt_type='glob', timeout=None, gather_job_timeout=None)`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

`salt.runners.manage.versions()`

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

### 21.16.21 salt.runners.mattermost

Note for 2017.7 releases!

Due to the `salt.runners.config` module not being available in this release series, importing the `salt.runners.config` module from the master branch is required to make this module work.

Ref: [Mattermost runner failing to retrieve config values due to unavailable config runner #43479](#)

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration** This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
 hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
 api_url: https://example.com
```

`salt.runners.mattermost.post_event(event, channel=None, username=None, api_url=None, hook=None)`

Send an event to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param event: The event to send to the Mattermost channel. :param api\_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

`salt.runners.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)`

Send a message to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param message: The message to send to the Mattermost channel. :param api\_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

CLI Example:

```
salt-run mattermost.post_message message='Build is done'
```

### 21.16.22 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.get(tgt, fun, tgt_type='glob')`

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.update(tgt, tgt_type='glob', clear=False, mine_functions=None)`

New in version 2017.7.0.

Update the mine data on a certain group of minions.

**tgt** Which minions to target for the execution.

**tgt\_type: glob** The type of tgt.

**clear: False** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).

**mine\_functions** Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

### 21.16.23 salt.runners.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

**depends** libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

**configuration** The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have `pillar_opts=True`:

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
 # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
 # also `box_type` default changed from secretbox to sealedbox.
 box_type: sealedbox (default)
 sk_file: /etc/salt/pki/master/nacl (default)
 pk_file: /etc/salt/pki/master/nacl.pub (default)
 sk: None
 pk: None
```

Usage can override the config defaults:

```
salt-run nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
↳ pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your `sk_file` and `pk_file` use:

```
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
or if you want to work without files.
salt-run nacl.keygen
local:

pk:
 /kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
sk:
 SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, `sealedbox` or `secretbox`.

SecretBox is data encrypted using private key `pk`. Sealedbox is encrypted using public key `pk`.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-run nacl.enc asecretpass pk=/kfGX7PbWeu099702PBbKWLPg/9p06IQRswkdWHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdklMbfbGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-run nacl.dec data=
↳ 'tqXzeIJnTAM9Xf0mdLcpEdklMbfbGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/+cYsk6m5WhGdk58='
↳ sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
 sk_file: /etc/salt/pki/master/nacl
 pk: 'cTIqXwnUiD1ulg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec 'tqXzeIJnTAM9Xf0mdLcpEdklMbfbGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/
↳ +cYsk6m5WhGdk58='
```

```
a salt developers minion could have pillar data that includes a nacl public key
nacl.config:
 pk: '/kfGX7PbWeu099702PBbKWLPg/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-run nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
 user: root
 password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hlbWj0llUA+uaVyvou3vJ4=')}|json}}
 cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')}|json}}
 cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl')}|json}}
```

Larger files like certificates can be encrypted with:

```
salt-run nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

**salt.runners.nacl.dec**(data, \*\*kwargs)

Alias to `{box_type}_decrypt`

box\_type: secretbox, sealedbox(default)

**salt.runners.nacl.dec\_file**(name, out=None, \*\*kwargs)

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using *out*

*name* can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_
↳ file=/etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.enc(data, **kwargs)`

Alias to `{box_type}_encrypt`

`box_type`: `secretbox`, `sealedbox`(default)

`salt.runners.nacl.enc_file(name, out=None, **kwargs)`

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using `out`

`name` can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_file=/
↳etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.keygen(sk_file=None, pk_file=None, **kwargs)`

Use `libnacl` to generate a keypair.

If no `sk_file` is defined return a keypair.

If only the `sk_file` is defined `pk_file` will use the same name with a postfix `.pub`.

When the `sk_file` is already existing, but `pk_file` is not. The `pk_file` will be generated using the `sk_file`.

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/
↳master/nacl.pub
salt-run nacl.keygen
```

`salt.runners.nacl.sealedbox_decrypt(data, **kwargs)`

Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```
salt-run nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/
↳master/nacl
salt-run nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.sealedbox_encrypt(data, **kwargs)`

Encrypt data using a public key generated from `nacl.keygen`. The encrypted data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
```

`salt.runners.nacl.secretbox_decrypt(data, **kwargs)`

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```

salt-run nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/
↪master/nacl
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='

```

`salt.runners.nacl.secretbox_encrypt(data, **kwargs)`

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```

salt-run nacl.secretbox_encrypt datatoenc
salt-run nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='

```

## 21.16.24 salt.runners.net

### NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

### Configuration

- Minion (proxy) config

To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

```

mine_functions:
 net.ipaddrs: []
 net.lldp: []
 net.mac: []
 net.arp: []
 net.interfaces: []

```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

**target:** ★ From what minions will collect the mine data. Default: ★ (collect from all minions).

**expr\_form:** **glob** Minion matching expression form. Default: **glob**.

**ignore\_interfaces** A list of interfaces name to ignore. By default will consider all interfaces.

**display:** **True** Display on the screen or return structured object? Default: **True** (return on the CLI).

**outputter: table** Specify the outputter name when displaying on the CLI. Default: `table`.

Configuration example:

```
runners:
 net.find:
 target: 'edge*'
 expr_form: 'glob'
 ignore_interfaces:
 - lo0
 - em1
 - jsrv
 - fxp0
 outputter: yaml
```

`salt.runners.net.find(addr, best=True, display=True)`

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- `net.mac`
- `net.arp`
- `net.lldp`
- `net.ipaddrs`
- `net.interfaces`

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

**best: True** Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display: True** Display on the screen or return structured object? Default: `True` (return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match
↳ returned

↳ -----
| Device | Interface | Interface Description | UP | Enabled | Speed
↳ [Mbps] | MAC Address | IP Addresses |

↳ -----
| edge01.flw01 | irb | | True | True | -1
↳ | 5C:5E:AB:AC:52:B4 | 10.10.10.1/22 |

↳ -----
ARP Entries for IP 10.10.10.7

| Device | Interface | MAC | IP | Age |

| edge01.flw01 | irb.349 [ae0.349] | 2C:60:0C:2A:4C:0A | 10.10.10.7 | 832.0 |

```

`salt.runners.net.findarp(device=None, interface=None, mac=None, ip=None, display=True)`

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**mac** Search using a specific MAC Address.

**ip** Search using a specific IP Address.

**display: True** Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

ARP Entries for MAC 8C:60:0F:78:EC:41

Device	Interface	MAC	IP	Age
edge01.bjm01	irb.171 [ae0.171]	8C:60:0F:78:EC:41	172.172.17.19	956.0

`salt.runners.net.findmac(device=None, mac=None, interface=None, vlan=None, display=True)`

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**mac** Search using a specific MAC Address.

**vlan** Search using a VLAN ID.

**display: True** Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

MAC Address(es)

Device	Interface	MAC	VLAN	Static	Active	Moves	
edge01.bjm01	ae0.171	8C:60:0F:78:EC:41	171	False	True	0	

`salt.runners.net.interfaces(device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True)`

Search for interfaces details in the following mine functions:

- net.interfaces
- net.ipaddr

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**pattern** Return interfaces that contain a certain pattern in their description.

**ipnet** Return interfaces whose IP networks associated include this IP network.

**best: True** When `ipnet` is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: `True` (return only the best match).

**display: True** Display on the screen or return structured object? Default: `True` (return on the CLI).

**title** Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

Details for interface xe-0/0/0						
Device	Interface	Interface Description	UP	Enabled	Speed	
[Mbps]	MAC Address	IP Addresses				
edge01.bjm01	vt-0/0/10		True	True	1000	✖
edge01.flw01	vt-0/0/10		True	True	1000	✖
edge01.pos01	vt-0/0/10		True	True	1000	✖
edge01.oua01	vt-0/0/10		True	True	1000	✖

**salt.runners.net.lldp**(*device=None, interface=None, title=None, pattern=None, chassis=None, display=True*)

Search in the LLDP neighbors, using the following mine functions:

- `net.lldp`

Optional arguments:

**device** Return interface data from a certain device only.

**interface** Return data selecting by interface name.

**pattern** Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID
- Remote Port Description
- Remote System Name
- Remote System Description

**chassis** Search using a specific Chassis ID.

**display: True** Display on the screen or return structured object? Default: `True` (return on the CLI).

**display: True** Display on the screen or return structured object? Default: `True` (return on the CLI).

**title** Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

Pattern "Ethernet1/48" found in one of the following LLDP details

Device	Interface	Parent Interface	Remote Chassis ID	Remote Port
ID	Remote Port Description	Remote System Name		Remote
System Description				
edge01.bjm01	xe-2/3/4	ae0	8C:60:4F:3B:52:19

`salt.runners.net.multi_find(*patterns, **kwargs)`

Execute multiple search tasks. This function is based on the *find* function. Depending on the search items,

some information might overlap.

Optional arguments:

**best: True** Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

**display: True** Display on the screen or return structured object? Default: *True* (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details

↪-----
↪-----
↪ | Device | Interface | Parent Interface | Remote Chassis ID | Remote
↪Port Description | Remote Port ID | Remote System Description

(continued from previous page)

### 21.16.25 salt.runners.network

Network tools to run from the Master

`salt.runners.network.wol(mac, bcast='255.255.255.255', destport=9)`

Send a "Magic Packet" to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

`salt.runners.network.wolllist(maclist, bcast='255.255.255.255', destport=9)`

Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wolllist '/path/to/maclist'
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
```

`salt.runners.network.wolmatch(tgt, tgt_type='glob', bcast='255.255.255.255', destport=9)`

Send a "Magic Packet" to wake up Minions that are matched in the grains cache

CLI Example:

```
salt-run network.wolmatch minion_id
salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.255.255
→destport=7
```

### 21.16.26 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the master config.

For example:

```
my-pagerduty-account:
 pagerduty.api_key: F3Rbyjbve43rfFWf2214
 pagerduty.subdomain: mysubdomain
```

`salt.runners.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)`

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt-run pagerduty.create_event <service_key> <description> <details>
→profile=my-pagerduty-account
```

The following parameters are required:

**service\_key** This key can be found by using `pagerduty.list_services`.

**description** This is a short description of the event.

**details** This can be a more detailed description of the event.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.list_escalation_policies(profile=None, api_key=None)`

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account
```

`salt.runners.pagerduty.list_incidents(profile=None, api_key=None)`

List incidents belonging to this account

CLI Example:

```
salt-run pagerduty.list_incidents my-pagerduty-account
```

`salt.runners.pagerduty.list_maintenance_windows(profile=None, api_key=None)`

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

`salt.runners.pagerduty.list_policies(profile=None, api_key=None)`

List escalation policies belonging to this account

CLI Example:

```
salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies
my-pagerduty-account
```

`salt.runners.pagerduty.list_schedules(profile=None, api_key=None)`

List schedules belonging to this account

CLI Example:

```
salt-run pagerduty.list_schedules my-pagerduty-account
```

`salt.runners.pagerduty.list_services(profile=None, api_key=None)`

List services belonging to this account

CLI Example:

```
salt-run pagerduty.list_services my-pagerduty-account
```

`salt.runners.pagerduty.list_users(profile=None, api_key=None)`

List users belonging to this account

CLI Example:

```
salt-run pagerduty.list_users my-pagerduty-account
```

`salt.runners.pagerduty.list_windows(profile=None, api_key=None)`

List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

### 21.16.27 salt.runners.pillar

Functions to interact with the pillar compiler on the master

**salt.runners.pillar.show\_pillar**(*minion='\*', \*\*kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id \*. Function also accepts pillarenv as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for 'dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option pillar\_source\_merging\_strategy.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for 'dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

**salt.runners.pillar.show\_top**(*minion=None, saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

### 21.16.28 salt.runners.pkg

Package helper functions using salt.modules.pkg

New in version 2015.8.0.

**salt.runners.pkg.list\_upgrades**(*jid, style='group', outputter='nested', ext\_source=None*)

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

## 21.16.29 salt.runners.queue

### General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process\_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process\_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the *process\_queue* runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

### Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: *pgjsonb*).

Once the queue is setup, the *runner\_queue* will need to be configured.

```
runner_queue:
 queue: runners
 backend: pgjsonb
```

---

**Note:** only the queue is required, this defaults to using pgjsonb

---

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
 runner_queue:
 schedule:
 function: queue.process_runner
 minutes: 1
 kwargs:
 quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the process\_runner task was executed.

**salt.runners.queue.delete**(*queue, items, backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue ["item1", 'item2', 'item3']"
```

**salt.runners.queue.insert**(*queue, items, backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue ["item1", 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue ["item1", 'item2', 'item3']" backend=sqlite
```

**salt.runners.queue.insert\_runner**(*fun, args=None, kwargs=None, queue=None, backend=None*)

Insert a reference to a runner into the queue so that it can be run later.

**fun** The runner function that is going to be run

**args** list or comma-separated string of args to send to fun

**kwargs** dictionary of keyword arguments to send to fun

**queue** queue to insert the runner reference into

**backend** backend that to use for the queue

CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data": {"foo
↪": "bar"}}'
```

**salt.runners.queue.list\_items**(*queue, backend='sqlite'*)

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

**salt.runners.queue.list\_length**(*queue, backend='sqlite'*)

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

**salt.runners.queue.list\_queues**(*backend='sqlite'*)

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

**salt.runners.queue.pop**(*queue, quantity=1, backend='sqlite', is\_runner=False*)

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
```

(continues on next page)

(continued from previous page)

```
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

**salt.runners.queue.process\_queue**(*queue*, *quantity*=1, *backend*='sqlite', *is\_runner*=False)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

**salt.runners.queue.process\_runner**(*quantity*=1, *queue*=None, *backend*=None)

Process queued runners

**quantity** number of runners to process

**queue** queue to insert the runner reference into

**backend** backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

### 21.16.30 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including `reactor` in the engine configuration for the Salt master.

**engines:**

- reactor

**salt.runners.reactor.add**(*event*, *reactors*, *saltenv*='base', *test*=None)

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls'
```

**salt.runners.reactor.delete**(*event*, *saltenv*='base', *test*=None)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

**salt.runners.reactor.is\_leader**()

Return whether the running reactor is acting as a leader (responding to events).

CLI Example:

```
salt-run reactor.is_leader
```

`salt.runners.reactor.list_`(*saltenv='base', test=None*)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

`salt.runners.reactor.set_leader`(*value=True*)

Set the current reactor to act as a leader (responding to events). Defaults to True

CLI Example:

```
salt-run reactor.set_leader True
```

### 21.16.31 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.cmd`(*fun, \*args, \*\*kwargs*)

Changed in version 2018.3.0: Added `with_pillar` argument

Execute *fun* with the given *args* and *kwargs*. Parameter *fun* should be the string *name* of the execution module to call.

---

**Note:** Execution modules will be loaded *every time* this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using `salt-run saltutil.sync_modules`, otherwise they will not be available.

---

**with\_pillar** [False] If True, pillar data will be compiled for the master

---

**Note:** To target the master in the pillar top file, keep in mind that the default `id` for the master is `<hostname>_master`. This can be overridden by setting an `id` configuration parameter in the master config file.

---

CLI example:

```
salt-run salt.cmd test.ping
call functions with arguments and keyword arguments
```

(continues on next page)

(continued from previous page)

```
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

`salt.runners.salt.execute`(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", jid="", kwarg=None, \*\*kwargs*)

New in version 2017.7.0.

Execute *fun* on all minions matched by *tgt* and *tgt\_type*. Parameter *fun* is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
 collect_bgp_stats:
 function: salt.execute
 args:
 - edge-routers
 - bgp.neighbors
 kwargs:
 tgt_type: nodegroup
 days: 1
 returner: redis
```

### 21.16.32 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the *saltutil module* for documentation on managing updates to minions.

New in version 2016.3.0.

`salt.runners.saltutil.sync_all`(*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

Sync all custom types

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] dictionary of modules to sync based on type

**extmod\_blacklist** [None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'], 'grains
↪': []}
```

`salt.runners.saltutil.sync_cache`(*saltenv='base', extmod\_whitelist=None, extmod\_blacklist=None*)

New in version 2017.7.0.

Sync cache modules from `salt://_cache` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync  
**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type  
 CLI Example:

```
salt-run saltutil.sync_cache
```

**salt.runners.saltutil.sync\_clouds** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_clouds` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

**salt.runners.saltutil.sync\_eauth\_tokens** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 2018.3.0.

Sync eauth token modules from `salt://_tokens` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_eauth_tokens
```

**salt.runners.saltutil.sync\_engines** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

Sync engines from `salt://_engines` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

**salt.runners.saltutil.sync\_executors** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 3000.

Sync executor modules from `salt://_executors` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_executors
```

**salt.runners.saltutil.sync\_fileserver** (*saltenv='base'*, *extmod\_whitelist=None*,  
*extmod\_blacklist=None*)

New in version 2018.3.0.

Sync fileserver modules from `salt://_fileservers` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_fileserver
```

```
salt.runners.saltutil.sync_grains(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync grains modules from `salt://_grains` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_grains
```

```
salt.runners.saltutil.sync_modules(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync execution modules from `salt://_modules` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_modules
```

```
salt.runners.saltutil.sync_output(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync output modules from `salt://_output` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_output
```

```
salt.runners.saltutil.sync_pillar(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync pillar modules from `salt://_pillar` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_pillar
```

```
salt.runners.saltutil.sync_proxymodules(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync proxy modules from `salt://_proxy` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_proxymodules
```

```
salt.runners.saltutil.sync_queues(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync queue modules from `salt://_queues` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_queues
```

```
salt.runners.saltutil.sync_renderers(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync renderer modules from `salt://_renderers` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_renderers
```

```
salt.runners.saltutil.sync_returners(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync returner modules from `salt://_returners` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_returners
```

```
salt.runners.saltutil.sync_roster(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

New in version 2017.7.0.

Sync roster modules from `salt://_roster` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_roster
```

```
salt.runners.saltutil.sync_runners(saltenv='base', extmod_whitelist=None,
 extmod_blacklist=None)
```

Sync runners from `salt://_runners` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_runners
```

`salt.runners.saltutil.sync_sdb(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)`

New in version 2017.7.0.

Sync sdb modules from `salt://_sdb` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

`salt.runners.saltutil.sync_serializers(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)`

New in version 2019.2.0.

Sync serializer modules from `salt://_serializers` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_states(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)`

Sync state modules from `salt://_states` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.sync_thorium(saltenv='base', extmod_whitelist=None, extmod_blacklist=None)`

New in version 2018.3.0.

Sync Thorium from `salt://_thorium` to the master

**saltenv: base** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** comma-separated list of modules to sync

**extmod\_blacklist** comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_thorium
```

`salt.runners.saltutil.sync_tops` (*saltenv*='base', *extmod\_blacklist*=None, *extmod\_whitelist*=None)

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master\_tops modules from `salt://_tops` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.sync_utils` (*saltenv*='base', *extmod\_blacklist*=None, *extmod\_whitelist*=None)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_wheel` (*saltenv*='base', *extmod\_blacklist*=None, *extmod\_whitelist*=None)

Sync wheel modules from `salt://_wheel` to the master

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**extmod\_whitelist** [None] comma-separated list of modules to sync

**extmod\_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wheel
```

### 21.16.33 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return False.

CLI Example:

```
salt-run sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.get` (*uri*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt-run sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$$%^&*(_+=+)'')`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.runners.sdb.set(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt-run sdb.set sdb://mymemcached/foo bar
```

### 21.16.34 salt.runners.smartos\_vmadm

Runner for SmartOS minions control vmadm

`salt.runners.smartos_vmadm.get(search, one=True)`

Return information for vms

**search** [string] filter vms, see the execution module.

**one** [boolean] return only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

`salt.runners.smartos_vmadm.is_running(search)`

Return true if vm is running

**search** [string] filter vms, see the execution module.

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

---

**Note:** If multiple vms are matched, the result will be true of ALL vms are running

---

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

`salt.runners.smartos_vmadm.list_vms`(*search=None, verbose=False*)

List all vms

**search** [string] filter vms, see the execution module

**verbose** [boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

`salt.runners.smartos_vmadm.nodes`(*verbose=False*)

List all compute nodes

**verbose** [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

`salt.runners.smartos_vmadm.reboot`(*search, one=True, force=False*)

Reboot one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] reboot only one vm

**force** [boolean] force reboot, faster but no graceful shutdown

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.start`(*search, one=True*)

Start one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] start only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

`salt.runners.smartos_vmadm.stop`(*search, one=True*)

Stop one or more vms

**search** [string] filter vms, see the execution module.

**one** [boolean] stop only one vm

---

**Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

---

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

## 21.16.35 salt.runners.spacewalk

### Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

**codeauthor** Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwner@gmail.com>

**maintainer** Benedikt Werner <1benediktwner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
 spacewalk01.domain.com:
 username: 'testuser'
 password: 'verybadpass'
 spacewalk02.domain.com:
 username: 'testuser'
 password: 'verybadpass'
```

---

**Note:** Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

---

**salt.runners.spacewalk.addGroupsToKey**(*server, activation\_key, groups*)

Add server groups to a activation key

CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1,
↪group2]'
```

**salt.runners.spacewalk.api**(*server, command, \*args, \*\*kwargs*)

Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup
↪Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[
↪"MyGroup", "Description"]'
```

State Example:

```
create_group:
 salt.runner:
 - name: spacewalk.api
 - server: spacewalk01.domain.com
 - command: systemgroup.create
 - arguments:
 - MyGroup
 - Description
```

`salt.runners.spacewalk.deleteAllActivationKeys(server)`

Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

`salt.runners.spacewalk.deleteAllGroups(server)`

Delete all server groups from Spacewalk

`salt.runners.spacewalk.deleteAllSystems(server)`

Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

`salt.runners.spacewalk.unregister(name, server_url)`

Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

### 21.16.36 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None)`

New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the `SSHClient.cmd` method.

### 21.16.37 salt.runners.state

Execute orchestration functions

`salt.runners.state.event`(*tagmatch*='\*', *count*-- 1, *quiet*=False, *sock\_dir*=None, *pretty*=False, *node*='master')

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

Changed in version 2019.2.0: *tagmatch* can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

#### Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the *tagmatch* parameter; pass -1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock\_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
- **node** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \
 salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \
 salt 'jerry' state.highstate

Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \
 salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \
 salt -L 'kevin,stewart,dave' state.highstate

Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
 echo $tag
 echo $data | jq --color-output .
done
```

See also:

See <https://github.com/saltstack/salt/blob/master/tests/eventlisten.sh> for an example of usage within a shell script.

`salt.runners.state.orchestrate`(*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *pillar\_enc*=None, *orchestration\_jid*=None)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the `pillar_enc` variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

`salt.runners.state.orchestrate_high(data, test=None, queue=False, pillar=None, **kwargs)`

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
 stage_one:
 {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
 stage_two:
 {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
 require: [{salt: stage_one}],
 }]},
 }'
```

`salt.runners.state.orchestrate_show_sls(mods, saltenv='base', test=None, queue=False, pillar=None, pillarenv=None, pillar_enc=None)`

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a `"_master"` suffix to its minion id.

See also:

The `state.show_sls` module function

CLI Example: .. code-block:: bash

```
salt-run state.orch_show_sls my-orch-formula.my-orch-state 'pillar={ nodegroup: ng1 }'
```

`salt.runners.state.orchestrate_single(fun, name, test=None, queue=False, pillar=None, **kwargs)`

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

`salt.runners.state.pause(jid, state_id=None, duration=None)`

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the `jid` of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.resume(jid, state_id=None)`

Remove a pause from a jid, allowing it to continue

`salt.runners.state.rm_pause(jid, state_id=None)`

This function is an alias of `resume`.

Remove a pause from a jid, allowing it to continue

`salt.runners.state.set_pause(jid, state_id=None, duration=None)`

This function is an alias of `pause`.

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.soft_kill(jid, state_id=None)`

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a `state_id` is not passed then the jid referenced will be safely exited at the beginning of the next state run.

### 21.16.38 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: *"some of these things are not like the others..."* when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.diff(*args, **kwargs)`

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the "diffs" as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
 <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.hash(*args, **kwargs)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
 <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

### 21.16.39 salt.runners.test

This runner is used only for test purposes and servers no production purpose

`salt.runners.test.arg(*args, **kwargs)`

Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

`salt.runners.test.get_opts()`

New in version 2018.3.0.

Return the configuration options of the master.

CLI Example:

```
salt-run test.get_opts
```

`salt.runners.test.metasyntactic(locality='us')`

Return common metasyntactic variables for the given locality

`salt.runners.test.raw_arg(*args, **kwargs)`

Output the given args and kwargs

`salt.runners.test.sleep(s_time=10)`

Sleep t seconds, then return True

`salt.runners.test.stdout_print()`

Print 'foo' and return 'bar'

`salt.runners.test.stream()`

Return True

### 21.16.40 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.generate(extra_mods=",", overwrite=False, so_mods=",", python2_bin='python2',  
python3_bin='python3', absonly=True, compress='gzip')`

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

```
salt.runners.thin.generate_min(extra_mods="", overwrite=False, so_mods="",
 python2_bin='python2', python3_bin='python3')
```

Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

### 21.16.41 salt.runners.vault

**maintainer** SaltStack

**maturity** new

**platform** all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

```
salt.runners.vault.generate_token(minion_id, signature, impersonated_by_master=False,
 ttl=None, uses=None)
```

Generate a Vault token for minion `minion_id`

**minion\_id** The id of the minion that requests a token

**signature** Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see `impersonated_by_master`).

**impersonated\_by\_master** If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

**ttl** Ticket time to live in seconds, 1m minutes, or 2h hrs

**uses** Number of times a token can be used

```
salt.runners.vault.show_policies(minion_id)
```

Show the Vault policies that are applied to tokens for the given minion

**minion\_id** The minions id

CLI Example:

```
salt-run vault.show_policies myminion
```

```
salt.runners.vault.unseal()
```

Unseal Vault server

This function uses the 'keys' from the 'vault' configuration to unseal vault server

**vault:**

**keys:**

- n63/TbrQuL3xaIW7ZZpuXj/tlfnK1/MbVxO4vT3wYD2A
- S9OwCvMRhErEA4NVVELYBs6w/Me6+urgUr24xGK44Uy3
- F1j4b7JKq850NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
- 1cYtvjKJNDVam9c7HNqJUfInk4PYyAXIpkpN/sIuzPv
- 3pPK5X6vGtwLhNOFv1U2elahECz3HpRufNXJFYlw6lid

CLI Examples:

```
salt-run vault.unseal
```

### 21.16.42 salt.runners.venafiapi

Support for Venafi

#### depends

- vcert Python module

**configuration** In order to connect to Venafi services you need to specify it in Salt master configuration.

Example for Venafi Cloud (using env variables):

**venafi:** api\_key: "sdb://osenv/CLOUDAPIKEY"

Example for Venafi Platform (using env variables):

**venafi:** base\_url: "https://tpp.example.com/" tpp\_user: admin tpp\_password:  
"sdb://osenv/TPP\_PASSWORD" trust\_bundle: "/opt/venafi/bundle.pem"

**salt.runners.venafiapi.del\_cached\_domain**(domains)

Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com, domain2.example.com
```

**salt.runners.venafiapi.list\_domain\_cache**()

List domains that have been cached

CLI Example:

```
salt-run venafi.list_domain_cache
```

**salt.runners.venafiapi.renew**(minion\_id, dns\_name=None, zone=None, country=None, state=None,  
loc=None, org=None, org\_unit=None, key\_password=None,  
csr\_path=None, pkey\_path=None)

Request a new certificate

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

**salt.runners.venafiapi.request**(minion\_id, dns\_name=None, zone=None, country=None,  
state=None, loc=None, org=None, org\_unit=None,  
key\_password=None, csr\_path=None, pkey\_path=None)

Request a new certificate

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

**salt.runners.venafiapi.show\_cert**(dns\_name)

Show issued certificate for domain

CLI Example:

```
salt-run venafi.show_cert example.com
```

### 21.16.43 salt.runners.virt

Control virtual machines via Salt

**salt.runners.virt.force\_off**(*name*)

Force power down the named virtual machine

**salt.runners.virt.host\_info**(*host=None*)

Return information about the host connected to this master

**salt.runners.virt.init**(*name*, *cpu*, *mem*, *image*, *hypervisor='kvm'*, *host=None*, *seed=True*, *nic='default'*, *install=True*, *start=True*, *disk='default'*, *saltenv='base'*, *enable\_vnc=False*, *seed\_cmd='seed.apply'*, *enable\_qcow=False*, *serial\_type='None'*)

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

**name** The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

**cpu** The number of cpus to allocate to this new virtual machine.

**mem** The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

**image** The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

**hypervisor** The hypervisor to use for the new virtual machine. Default is *kvm*.

**host** The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

**seed** Set to *False* to prevent Salt from seeding the new virtual machine.

**nic** The nic profile to use, defaults to the "default" nic profile which assumes a single network interface per VM associated with the "br0" bridge on the master.

**install** Set to *False* to prevent Salt from installing a minion on the new VM before it spins up.

**disk** The disk profile to use

**saltenv** The Salt environment to use

**enable\_vnc** Whether a VNC screen is attached to resulting VM. Default is *False*.

**seed\_cmd** If seed is *True*, use this execution module function to seed new VM. Default is *seed.apply*.

**enable\_qcow** Clone disk image as a copy-on-write qcow2 image, using downloaded *image* as backing file.

**serial\_type** Enable serial console. Set to 'pty' for serial console or 'tcp' for telnet. Default is 'None'

**salt.runners.virt.list**(*host=None*, *quiet=False*, *hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

**salt.runners.virt.migrate**(*name*, *target=""*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

**salt.runners.virt.next\_host**()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math the determine the most "available" next host.

**salt.runners.virt.pause**(*name*)

Pause the named VM

**salt.runners.virt.purge**(*name*, *delete\_key=True*)

Destroy the named VM

`salt.runners.virt.query`(*host=None, quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

`salt.runners.virt.reset`(*name*)

Force power down and restart an existing VM

`salt.runners.virt.resume`(*name*)

Resume a paused VM

`salt.runners.virt.start`(*name*)

Start a named virtual machine

`salt.runners.virt.vm_info`(*name, quiet=False*)

Return the information on the named VM

#### 21.16.44 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (<http://www.vistarait.com/>) REST API

**codeauthor** Brad Thurber <[brad.thurber@gmail.com](mailto:brad.thurber@gmail.com)>

To use this runner, the Vistara `client_id` and Vistara `oauth2 client_key` and `client_secret` must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

```
vistara:
 client_id: client_012345
 client_key: N0tReallyaR3alKeyButShouldB12345
 client_secret: ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00
```

`salt.runners.vistara.delete_device`(*name, safety\_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, `delete_device` will only perform the delete if a single host is returned. Set `safety_on=False` to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

#### 21.16.45 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.genrepo`(*opts=None, fire\_event=True*)

Generate `winrepo_cachefile` based on `sls` files in the `winrepo_dir`

**opts** Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

**fire\_event** [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.update_git_repos` (*opts=None, clean=False, masterless=False*)

Checkout git repos containing Windows Software Package Definitions

**opts** Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

**clean** [False] Clean repo cachedirs which are not configured under *winrepo\_remotes*.

**Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

## 21.17 sdb modules

<i>cache</i>	cache Module
<i>confidant</i>	An SDB module for getting credentials from confidant.
<i>consul</i>	Consul sdb Module
<i>couchdb</i>	CouchDB sdb Module
<i>env</i>	Environment sdb Module
<i>etcd_db</i>	etcd Database Module
<i>keyring_db</i>	Keyring Database Module
<i>memcached</i>	Memcached sdb Module
<i>redis_sdb</i>	Redis SDB module
<i>rest</i>	Generic REST API SDB Module
<i>sqlite3</i>	SQLite sdb Module
<i>tism</i>	tISM - the Immutable Secrets Manager SDB Module
<i>vault</i>	Vault SDB Module
<i>yaml</i>	Pull sdb values from a YAML file

### 21.17.1 salt.sdb.cache module

cache Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2017.7.0.

This module provides access to Salt's cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
 driver: cache
```

(continues on next page)

(continued from previous page)

```
bank: cloud/active/ec2/my-ec2-conf/saltmaster
cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
master_ip: sdb://mastercloudcache/public_ips?cachedir=/var/cache/salt
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
master_ip: sdb://mastercloudcache/public_ips?bank=cloud/active/ec2/my-ec2-conf/
↪saltmaster
```

```
salt.sdb.cache.delete(key, service=None, profile=None)
```

Get a value from the cache service

```
salt.sdb.cache.get(key, service=None, profile=None)
```

Get a value from the cache service

```
salt.sdb.cache.set_(key, value, service=None, profile=None)
```

Set a key/value pair in the cache service

## 21.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.

### Configuring the Confidant module

The module can be configured via `sdb` in the minion config:

```
confidant:
 driver: confidant
 # The URL of the confidant web service
 url: 'https://confidant-production.example.com'
 # The context to use for KMS authentication
 auth_context:
 from: example-production-iad
 to: confidant-production-iad
 user_type: service
 # The KMS master key to use for authentication
 auth_key: "alias/authnz"
 # Cache file for KMS auth token
 token_cache_file: /run/confidant/confidant_token
 # The duration of the validity of a token, in minutes
 token_duration: 60
 # key, keyid and region can be defined in the profile, but it's generally
 # best to use IAM roles or environment variables for AWS auth.
 keyid: 98nh9h9h908h09kjjk
 key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
 region: us-east-1
```

**depends** confidant-common, confidant-client

## Module Documentation

**salt.sdb.confidant.get**(*key*, *profile=None*)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get 'sdb://confidant/credentials'
```

Valid keys are: `credentials`, `credentials_metadata`, `result`. `credentials` returns a dict of joined `credential_pairs`, `credentials_metadata` returns a dict of metadata relevant to the credentials mapped to the confidant service, and `result` returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in `credentials` or `credentials_metadata` can't be trusted.

### 21.17.3 salt.sdb.consul module

Consul sdb Module

**maintainer** SaltStack

**maturity** New

**platform** all

This module allows access to Consul using an `sdb://` URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
myconsul:
 driver: consul
 host: 127.0.0.1
 port: 8500
 token: b6376760-a8bb-edd5-fcda-33bc13bfc556
 scheme: http
 consistency: default
 dc: dev
 verify: True
```

The driver refers to the Consul module, all other options are optional. For option details see: <https://python-consul.readthedocs.io/en/latest/#consul>

**salt.sdb.consul.get**(*key*, *profile=None*)

**salt.sdb.consul.get\_conn**(*profile*)

Return a client object for accessing consul

**salt.sdb.consul.set\_**(*key*, *value*, *profile=None*)

### 21.17.4 salt.sdb.couchdb

CouchDB sdb Module

```

maintainer SaltStack
maturity New
depends python2-couchdb
platform all

```

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's *sdb* system to allow for inserts and retrievals using the *sdb://* prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

```

couchdb_sdb:
 driver: couchdb
 host: localhost
 port: 5984
 database: salt_sdb

```

One could then query the CouchDB instance via an *sdb://* URI such as the following:

```

password: sdb://couchdb_sdb/mykey

```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

```

salt.sdb.couchdb.get(key, profile=None)
 Get a value from couchdb by id

```

```

salt.sdb.couchdb.set_(key, value, profile=None)
 Set a key/value pair in couchdb

```

### 21.17.5 salt.sdb.env module

Environment sdb Module

```

maintainer SaltStack
maturity New
depends None
platform all

```

This module allows access to environment variables using an *sdb://* URI.

Example configuration for this module:

```

osenv:
 driver: env

```

**WARNING:**

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:
 cmd.run:
 - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
 - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
 test.succeed_with_changes:
 - name: foo
{% else %}
always-changes-and-fails:
 test.fail_with_changes:
 - name: foo
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named compute (and have osenv defined). The example below will look for the salt cloud config key compute\_name in the environment:

```
my-openstack-config:
 compute_name: sdb://osenv/compute
 ..snip
```

`salt.sdb.env.get(key, profile=None)`  
Get a value

`salt.sdb.env.set_(key, value, profile=None)`  
Set a key/value pair

### 21.17.6 salt.sdb.etcd\_db

etcd Database Module

**maintainer** SaltStack

**maturity** New

**depends** python-etcd

**platform** all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-etcd>.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
 driver: etcd
 etcd.host: 127.0.0.1
 etcd.port: 2379
```

The `driver` refers to the `etcd` module, `etcd.host` refers to the host that is hosting the `etcd` database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

```
salt.sdb.etcd_db.delete(key, service=None, profile=None)
```

Get a value from the `etcd` service

```
salt.sdb.etcd_db.get(key, service=None, profile=None)
```

Get a value from the `etcd` service

```
salt.sdb.etcd_db.set_(key, value, service=None, profile=None)
```

Set a key/value pair in the `etcd` service

### 21.17.7 salt.sdb.keyring\_db

Keyring Database Module

**maintainer** SaltStack

**maturity** New

**depends** keyring

**platform** all

This module allows access to the keyring package using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/keyring>.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The `keyczar` backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the `salt-minion` and `salt-master` daemons, especially in production) or an agent is written for it.

Like all `sdb` modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
 driver: keyring
 service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

<https://pypi.python.org/pypi/keyring>

New in version 2014.1.4.

```
salt.sdb.keyring_db.get(key, service=None, profile=None)
```

Get a value from a keyring service

```
salt.sdb.keyring_db.set_(key, value, service=None, profile=None)
```

Set a key/value pair in a keyring service

### 21.17.8 salt.sdb.memcached

Memcached sdb Module

**maintainer** SaltStack

**maturity** New

**depends** python-memcached

**platform** all

This module allows access to memcached using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-memcached>.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
 driver: memcached
 memcached.host: localhost
 memcached.port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

```
salt.sdb.memcached.get(key, profile=None)
```

Get a value from memcached

```
salt.sdb.memcached.set_(key, value, profile=None)
```

Set a key/value pair in memcached

### 21.17.9 salt.sdb.redis\_sdb module

#### Redis SDB module

New in version 2019.2.0.

This module allows access to Redis using an `sdb://` URI.

Like all SDB modules, the Redis module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
sdb_redis:
 driver: redis
 host: 127.0.0.1
 port: 6379
 password: pass
 db: 1
```

The `driver` refers to the Redis module, all other options are optional. For option details see: <https://redis-py.readthedocs.io/en/latest/>.

```
salt.sdb.redis_sdb.delete(key, profile=None)
```

Delete a key from the Redis SDB.

```
salt.sdb.redis_sdb.get(key, profile=None)
```

Get a value from the Redis SDB.

```
salt.sdb.redis_sdb.set_(key, value, profile=None)
```

Set a value into the Redis SDB.

### 21.17.10 salt.sdb.rest module

Generic REST API SDB Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
 driver: rest
 urls:
 url: https://api.github.com/
 keys:
 url: https://api.github.com/users/{{user}}/keys
 backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
 driver: rest
 user_data:
 url: https://api.example.com/users/
 params:
 user: myuser
```

`salt.sdb.rest.get(key, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.query(key, value=None, service=None, profile=None)`

Get a value from the REST interface

`salt.sdb.rest.set_(key, value, service=None, profile=None)`

Set a key/value pair in the REST interface

### 21.17.11 salt.sdb.sqlite3

SQLite sdb Module

**maintainer** SaltStack

**maturity** New

**platform** all

This module allows access to sqlite3 using an `sdb://` URI

Like all sdb modules, the sqlite3 module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
 driver: sqlite3
 database: /tmp/sdb.sqlite
 table: sdb
 create_table: True
```

The `driver` refers to the sqlite3 module, `database` refers to the sqlite3 database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

#### Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

```
myadvanced
 driver: sqlite3
 database: /tmp/sdb-advanced.sqlite
 create_statements:
 - "CREATE TABLE advanced (a text, b text, c blob, d blob)"
 - "CREATE INDEX myidx ON advanced (a)"
 get_query: "SELECT d FROM advanced WHERE a=:key"
 set_query: "INSERT OR REPLACE INTO advanced (a, d) VALUES (:key, :value)"
```

`salt.sdb.sqlite3.get(key, profile=None)`

Get a value from sqlite3

`salt.sdb.sqlite3.set_(key, value, profile=None)`

Set a key/value pair in sqlite3

### 21.17.12 salt.sdb.tism module

tISM - the Immutable Secrets Manager SDB Module

**maintainer** tISM

**maturity** New

**platform** all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>
```

```
sdb://tism/
```

```
→ hQEMAZJ+GfdAB3KqAQf9E3cyvrPEWR1sf1tMvH0nrJ0bZa9kDFLPxvtwA0qlRiNp0F7IpiVRF+h+sW5Mb4ffb1TElMzQ+/

→ H30L/r50+CBkuI/u4M2pXDcMYsvvt4ajCbJn91qaQ7BDI=
```

A profile must be setup in the minion configuration or pillar. If you want to use sdb in a runner or pillar you must also place a profile in the master configuration.

```
tism:
```

```
 driver: tism
```

```
 url: https://my.tismd:8080/decrypt
```

```
 token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
```

```
→ eyJhZG1pb2I6MSwiZXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWNiMWdtdm4Iiwia2V5cyI6WyJBTEwiXX0.
```

```
→ RtAhG6Uorf5xnSf4Ya_GwJnoHkCsqr4r1_hi0eDSLzo
```

**salt.sdb.tism.get**(*key*, *service=None*, *profile=None*)

Get a decrypted secret from the tISMd API

### 21.17.13 salt.sdb.vault module

Vault SDB Module

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the sdb module, but the base configuration must also be completed.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```
myvault:
```

```
 driver: vault
```

Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords/mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

```
salt.sdb.vault.get(key, profile=None)
```

Get a value from the vault service

```
salt.sdb.vault.set_(key, value, profile=None)
```

Set a key/value pair in the vault service

#### 21.17.14 salt.sdb.yaml module

Pull sdb values from a YAML file

**maintainer** SaltStack

**maturity** New

**platform** all

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
driver: yaml
files:
- /path/to/foo.yaml
- /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
driver: yaml
files:
- /path/to/foo.yaml
- /path/to/bar.yaml
merge:
 strategy: smart
 merge_list: false
gpg: true
```

New in version 2018.3.0.

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the [GPG renderer](#).

```
salt.sdb.yaml.get(key, profile=None)
```

Get a value from the dictionary

```
salt.sdb.yaml.set_(*args, **kwargs)
```

Setting a value is not supported; edit the YAML files directly

## 21.18 serializer modules

<i>configparser</i>	<code>salt.serializers.configparser</code>
<i>json</i>	<code>salt.serializers.json</code>
<i>msgpack</i>	<code>salt.serializers.msgpack</code>
<i>plist</i>	<code>salt.serializers.plist</code>
<i>python</i>	<code>salt.serializers.python</code>
<i>toml</i>	<code>salt.serializers.toml</code>
<i>yaml</i>	<code>salt.serializers.yaml</code>
<i>yamlex</i>	<code>salt.serializers.yamlex</code>

### 21.18.1 salt.serializers.configparser module

#### `salt.serializers.configparser`

New in version 2016.3.0.

Implements a configparser serializer.

`salt.serializers.configparser.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

`salt.serializers.configparser.serialize(obj, **options)`

Serialize Python data to a configparser formatted string or file.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

### 21.18.2 salt.serializers.json

#### `salt.serializers.json`

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower json/simplejson module.

`salt.serializers.json.serialize(obj, **options)`

Serialize Python data to JSON.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower json/simplejson module.

### 21.18.3 salt.serializers.msgpack

#### salt.serializers.msgpack

Implements MsgPack serializer.

**salt.serializers.msgpack.deserialize**(*stream\_or\_string*, *\*\*options*)

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower msgpack module.

**salt.serializers.msgpack.serialize**(*obj*, *\*\*options*)

Serialize Python data to MsgPack.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

### 21.18.4 salt.serializers.plist

#### salt.serializers.plist

New in version 3001.

Implements plist serializer.

Wrapper around plistlib.

**salt.serializers.plist.deserialize**(*stream\_or\_string*, *\*\*options*)

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower plist module.

**Returns** Deserialized data structure.

**salt.serializers.plist.serialize**(*value*, *\*\*options*)

Serialize Python data to plist. To create a binary plist pass **fmt: FMT\_BINARY** as an option.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower plist module.

**Returns** bytes of serialized plist.

### 21.18.5 salt.serializers.python module

#### salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

**salt.serializers.python.serialize**(*obj*, *\*\*options*)

Serialize Python data to a Python string representation (via pprint.format)

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to pprint.format

## 21.18.6 salt.serializers.toml

### salt.serializers.toml

Implements TOML serializer.

It's just a wrapper around pytoml module.

`salt.serializers.toml.deserialize(stream_or_string, **options)`

Deserialize from TOML into Python data structure.

Parameters

- **stream\_or\_string** -- toml stream or string to deserialize.
- **options** -- options given to lower pytoml module.

`salt.serializers.toml.serialize(obj, **options)`

Serialize Python data to TOML.

Parameters

- **obj** -- the data structure to serialize.
- **options** -- options given to lower pytoml module.

## 21.18.7 salt.serializers.yaml

### salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

`salt.serializers.yaml.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yaml.serialize(obj, **options)`

Serialize Python data to YAML.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 21.18.8 salt.serializers.yamlex

### salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file `states.sls` has this contents:

```
foo:
 bar: 42
 baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
 obj = yamlex.deserialize(stream)
```

Check that obj is an OrderedDict

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex `__repr__` and `__str__` objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yaml_obj = yaml.deserialize(str(obj))
assert yaml_obj == obj
```

yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

`!reset`

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

**Parameters**

- **stream\_or\_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

`salt.serializers.yamlex.serialize(obj, **options)`

Serialize Python data to YAML.

**Parameters**

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

## 21.19 state modules

<i>acme</i>	ACME / Let's Encrypt certificate management state
<i>alias</i>	Configuration of email aliases
<i>alternatives</i>	Configuration of the alternatives system
<i>ansiblegate</i>	Execution of Ansible modules from within states
<i>apache</i>	Apache state
<i>apache_conf</i>	Manage Apache Confs
<i>apache_module</i>	Manage Apache Modules
<i>apache_site</i>	Manage Apache Sites
<i>aptpkg</i>	Package management operations specific to APT- and DEB-based systems
<i>archive</i>	Extract an archive
<i>artifactory</i>	This state downloads artifacts from artifactory.
<i>at</i>	Configuration disposable regularly scheduled tasks for at.
<i>augeas</i>	Configuration management using Augeas
<i>aws_sqs</i>	Manage SQS Queues
<i>azurearm_compute</i>	Azure (ARM) Compute State Module
<i>azurearm_dns</i>	Azure (ARM) DNS State Module
<i>azurearm_network</i>	Azure (ARM) Network State Module
<i>azurearm_resource</i>	Azure (ARM) Resource State Module
<i>beacon</i>	Management of the Salt beacons
<i>bigip</i>	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
<i>blockdev</i>	Management of Block Devices
<i>boto3_elasticache</i>	Manage Elasticache with boto3
<i>boto3_elasticsearch</i>	Manage Elasticsearch Service
<i>boto3_route53</i>	Manage Route53 records with Boto 3
<i>boto3_sns</i>	Manage SNS Topics
<i>boto_apigateway</i>	Manage Apigateway Rest APIs
<i>boto_asg</i>	Manage Autoscale Groups
<i>boto_cfn</i>	Connection module for Amazon Cloud Formation
<i>boto_cloudfront</i>	Manage CloudFront distributions
<i>boto_cloudtrail</i>	Manage CloudTrail Objects
<i>boto_cloudwatch_alarm</i>	Manage Cloudwatch alarms
<i>boto_cloudwatch_event</i>	Manage CloudTrail Objects
<i>boto_cognitoidentity</i>	Manage CognitoIdentity Functions
<i>boto_datapipeline</i>	Manage Data Pipelines
<i>boto_dynamodb</i>	Manage DynamoDB Tables

continues on next page

Table 20 – continued from previous page

<i>boto_ec2</i>	Manage EC2
<i>boto_elasticache</i>	Manage Elasticache
<i>boto_elasticsearch_domain</i>	Manage Elasticsearch Domains
<i>boto_elb</i>	Manage ELBs
<i>boto_elbv2</i>	Manage AWS Application Load Balancer
<i>boto_iam</i>	Manage IAM objects
<i>boto_iam_role</i>	Manage IAM roles
<i>boto_iot</i>	Manage IoT Objects
<i>boto_kinesis</i>	Manage Kinesis Streams
<i>boto_kms</i>	Manage KMS keys, key policies and grants.
<i>boto_lambda</i>	Manage Lambda Functions
<i>boto_lc</i>	Manage Launch Configurations
<i>boto_rds</i>	Manage RDSs
<i>boto_route53</i>	Manage Route53 records
<i>boto_s3</i>	Manage S3 Resources
<i>boto_s3_bucket</i>	Manage S3 Buckets
<i>boto_secgroup</i>	Manage Security Groups
<i>boto_sns</i>	Manage SNS Topics
<i>boto_sqs</i>	Manage SQS Queues
<i>boto_vpc</i>	Manage VPCs
<i>bower</i>	Installation of Bower Packages
<i>btrfs</i>	
	<b>maintainer</b> Alberto Planas <aplanas@suse.com>
<i>cabal</i>	Installation of Cabal Packages
<i>ceph</i>	Manage ceph with salt.
<i>chef</i>	Execute Chef client runs
<i>chocolatey</i>	Manage Chocolatey package installs ..
<i>chronos_job</i>	Configure Chronos jobs via a salt proxy.
<i>cimc</i>	A state module to manage Cisco UCS chassis devices.
<i>cisconso</i>	State module for Cisco NSO Proxy minions
<i>cloud</i>	Using states instead of maps to deploy clouds
<i>cmd</i>	Execution of arbitrary commands
<i>composer</i>	Installation of Composer Packages
<i>cron</i>	Management of cron, the Unix command scheduler
<i>cryptdev</i>	Opening of Encrypted Devices
<i>csf</i>	CSF Ip tables management
<i>cyg</i>	Installation of Cygwin packages.
<i>ddns</i>	Dynamic DNS updates
<i>debconfmod</i>	Management of debconf selections
<i>dellchassis</i>	Manage chassis via Salt Proxies.
<i>disk</i>	Disk monitoring state
<i>docker_container</i>	Management of Docker containers
<i>docker_image</i>	Management of Docker images
<i>docker_network</i>	Management of Docker networks
<i>docker_volume</i>	Management of Docker volumes
<i>drac</i>	Management of Dell DRAC

continues on next page

Table 20 – continued from previous page

<i>dvs</i>	Manage VMware distributed virtual switches (DVSs) and their distributed virtual portgroups (DVportgroups).
<i>elasticsearch</i>	State module to manage Elasticsearch.
<i>elasticsearch_index</i>	State module to manage Elasticsearch indices
<i>elasticsearch_index_template</i>	State module to manage Elasticsearch index templates
<i>environ</i>	Support for getting and setting the environment variables of the current salt process.
<i>eselect</i>	Management of Gentoo configuration using eselect
<i>esxcluster</i>	Manage VMware ESXi Clusters.
<i>esxdatacenter</i>	Salt states to create and manage VMware vSphere datacenters (datacenters).
<i>esxi</i>	Manage VMware ESXi Hosts.
<i>esxvm</i>	Salt state to create, update VMware ESXi Virtual Machines.
<i>etcd_mod</i>	Manage etcd Keys
<i>ethtool</i>	Configuration of network device
<i>event</i>	Send events through Salt's event system during state runs
<i>file</i>	Operations on regular files, special files, directories, and symlinks
<i>firewall</i>	State to check firewall configurations
<i>firewalld</i>	Management of firewalld
<i>gem</i>	Installation of Ruby modules packaged as gems
<i>git</i>	States to manage git repositories and git configuration
<i>github</i>	Github User State Module
<i>glance</i>	Managing Images in OpenStack Glance
<i>glance_image</i>	Management of OpenStack Glance Images
<i>glassfish</i>	Manage Glassfish/Payara server ..
<i>glusterfs</i>	Manage GlusterFS pool.
<i>gnomedesktop</i>	Configuration of the GNOME desktop
<i>gpg</i>	Management of the GPG keychains
<i>grafana</i>	Manage Grafana Dashboards
<i>grafana4_dashboard</i>	Manage Grafana v4.0 Dashboards
<i>grafana4_datasource</i>	Manage Grafana v4.0 data sources
<i>grafana4_org</i>	Manage Grafana v4.0 orgs
<i>grafana4_user</i>	Manage Grafana v4.0 users
<i>grafana_dashboard</i>	Manage Grafana v2.0 Dashboards
<i>grafana_datasource</i>	Manage Grafana v2.0 data sources
<i>grains</i>	Manage grains on the minion
<i>group</i>	Management of user groups
<i>heat</i>	Management of Heat
<i>helm</i>	
<i>hg</i>	Interaction with Mercurial repositories
<i>highstate_doc</i>	To be used with processors in module <i>highstate_doc</i> .
<i>host</i>	Management of addresses and names in hosts file
<i>http</i>	HTTP monitoring states
<i>icinga2</i>	Icinga2 state
<i>ifttt</i>	Trigger an event in IFTTT
<i>incron</i>	Management of incron, the inotify cron

Table 20 – continued from previous page

<i>influxdb08_database</i>	Management of Influxdb 0.8 databases
<i>influxdb08_user</i>	Management of InfluxDB 0.8 users
<i>influxdb_continuous_query</i>	Management of Influxdb continuous queries
<i>influxdb_database</i>	Management of Influxdb databases
<i>influxdb_retention_policy</i>	Management of Influxdb retention policies
<i>influxdb_user</i>	Management of InfluxDB users
<i>infoblox_a</i>	Infoblox A record management.
<i>infoblox_cname</i>	Infoblox CNAME management.
<i>infoblox_host_record</i>	Infoblox host record management.
<i>infoblox_range</i>	Infoblox host record management.
<i>ini_manage</i>	Manage ini files
<i>ipmi</i>	Manage IPMI devices over LAN
<i>ipset</i>	Management of ipsets
<i>iptables</i>	Management of iptables
<i>jboss7</i>	Manage JBoss 7 Application Server via CLI interface
<i>jenkins</i>	Management of Jenkins
<i>junos</i>	State modules to interact with Junos devices.
<i>kapacitor</i>	Kapacitor state module.
<i>kernelpkg</i>	Manage kernel packages and active kernel version
<i>keyboard</i>	Management of keyboard layouts
<i>keystone</i>	Management of Keystone users
<i>keystone_domain</i>	Management of OpenStack Keystone Domains
<i>keystone_endpoint</i>	Management of OpenStack Keystone Endpoints
<i>keystone_group</i>	Management of OpenStack Keystone Groups
<i>keystone_project</i>	Management of OpenStack Keystone Projects
<i>keystone_role</i>	Management of OpenStack Keystone Roles
<i>keystone_role_grant</i>	Management of OpenStack Keystone Role Grants
<i>keystone_service</i>	Management of OpenStack Keystone Services
<i>keystone_user</i>	Management of OpenStack Keystone Users
<i>keystore</i>	State management of a java keystore
<i>kmod</i>	Loading and unloading of kernel modules
<i>kubernetes</i>	Manage kubernetes resources as salt states
<i>layman</i>	Management of Gentoo Overlays using layman
<i>ldap</i>	Manage entries in an LDAP database
<i>libcloud_dns</i>	Manage DNS records and zones using libcloud
<i>libcloud_loadbalancer</i>	Apache Libcloud Load Balancer State
<i>libcloud_storage</i>	Apache Libcloud Storage State
<i>linux_acl</i>	Linux File Access Control Lists
<i>locale</i>	Management of languages/locales
<i>logadm</i>	Management of logs using Solaris logadm.
<i>logrotate</i>	Module for managing logrotate.
<i>loop</i>	Loop state
<i>lvm</i>	Management of Linux logical volumes
<i>lvs_server</i>	Management of LVS (Linux Virtual Server) Real Server
<i>lvs_service</i>	Management of LVS (Linux Virtual Server) Service
<i>lxc</i>	Manage Linux Containers
<i>lxd</i>	Manage LXD profiles.
<i>lxd_container</i>	Manage LXD containers.
<i>lxd_image</i>	Manage LXD images.
<i>lxd_profile</i>	Manage LXD profiles.

Table 20 – continued from previous page

<i>mac_assistive</i>	Allows you to manage assistive access on macOS minions with 10.9+
<i>mac_keychain</i>	Installing of certificates to the keychain
<i>mac_xattr</i>	Allows you to manage extended attributes on files or directories
<i>macdefaults</i>	Writing/reading defaults from a macOS minion
<i>macpackage</i>	Installing of mac pkg files
<i>makeconf</i>	Management of Gentoo make.conf
<i>marathon_app</i>	Configure Marathon apps via a salt proxy.
<i>mdadm RAID</i>	Managing software RAID with mdadm
<i>memcached</i>	States for Management of Memcached Keys
<i>modjk</i>	State to control Apache modjk
<i>modjk_worker</i>	Manage modjk workers
<i>module</i>	Execution of Salt modules from within states
<i>mongodb_database</i>	Management of MongoDB Databases
<i>mongodb_user</i>	Management of MongoDB Users
<i>monit</i>	Monit state
<i>mount</i>	Mounting of filesystems
<i>mssql_database</i>	Management of Microsoft SQLServer Databases
<i>mssql_login</i>	Management of Microsoft SQLServer Logins
<i>mssql_role</i>	Management of Microsoft SQLServer Databases
<i>mssql_user</i>	Management of Microsoft SQLServer Users
<i>msteams</i>	Send a message card to Microsoft Teams
<i>mysql_database</i>	Management of MySQL databases (schemas)
<i>mysql_grants</i>	Management of MySQL grants (user permissions)
<i>mysql_query</i>	Execution of MySQL queries
<i>mysql_user</i>	Management of MySQL users
<i>net_napalm_yang</i>	NAPALM YANG state
<i>netacl</i>	Network ACL
<i>netconfig</i>	Network Config
<i>netntp</i>	Network NTP
<i>netsnmp</i>	Network SNMP
<i>netusers</i>	Network Users
<i>network</i>	Configuration of network interfaces
<i>neutron_network</i>	Management of OpenStack Neutron Networks
<i>neutron_secgroup</i>	Management of OpenStack Neutron Security Groups
<i>neutron_secgroup_rule</i>	Management of OpenStack Neutron Security Group Rules
<i>neutron_subnet</i>	Management of OpenStack Neutron Subnets
<i>nexus</i>	This state downloads artifacts from Nexus 3.x.
<i>nfs_export</i>	Management of NFS exports
<i>nftables</i>	Management of nftables
<i>npm</i>	Installation of NPM Packages
<i>ntp</i>	Management of NTP servers
<i>nxos</i>	State module for Cisco NX-OS Switch Proxy and Native minions
<i>nxos_upgrade</i>	Manage NX-OS System Image Upgrades.
<i>openstack_config</i>	Manage OpenStack configuration file settings.
<i>openvswitch_bridge</i>	Management of Open vSwitch bridges.
<i>openvswitch_port</i>	Management of Open vSwitch ports.

<i>opsgenie</i>	Create/Close an alert in OpsGenie
<i>pagerduty</i>	Create an Event in PagerDuty
<i>pagerduty_escalation_policy</i>	Manage PagerDuty escalation policies.
<i>pagerduty_schedule</i>	Manage PagerDuty schedules.
<i>pagerduty_service</i>	Manage PagerDuty services
<i>pagerduty_user</i>	Manage PagerDuty users.
<i>panos</i>	A state module to manage Palo Alto network devices.
<i>pbm</i>	Manages VMware storage policies (called pbm because the vCenter endpoint is /pbm)
<i>pcs</i>	Management of Pacemaker/Corosync clusters with PCS
<i>pdbedit</i>	Manage accounts in Samba's passdb using pdbedit
<i>pecl</i>	Installation of PHP Extensions Using pecl
<i>pip_state</i>	Installation of Python Packages Using pip
<i>pkg</i>	Installation of packages using OS package managers such as yum or apt-get
<i>pkgbuild</i>	The pkgbuild state is the front of Salt package building backend.
<i>pkgng</i>	Manage package remote repo using FreeBSD pkgng
<i>pkgrepo</i>	Management of APT/DNF/YUM/Zypper package repos
<i>portage_config</i>	Management of Portage package configuration on Gentoo
<i>ports</i>	Manage software from FreeBSD ports
<i>postgres_cluster</i>	Management of PostgreSQL clusters
<i>postgres_database</i>	Management of PostgreSQL databases
<i>postgres_extension</i>	Management of PostgreSQL extensions
<i>postgres_group</i>	Management of PostgreSQL groups (roles)
<i>postgres_initdb</i>	Initialization of PostgreSQL data directory
<i>postgres_language</i>	Management of PostgreSQL languages
<i>postgres_privileges</i>	Management of PostgreSQL Privileges
<i>postgres_schema</i>	Management of PostgreSQL schemas
<i>postgres_tablespace</i>	Management of PostgreSQL tablespace
<i>postgres_user</i>	Management of PostgreSQL users (roles)

<i>redismod</i>	Management of Redis server
<i>reg</i>	Manage the Windows registry
<i>rsync</i>	State to synchronize files and directories with rsync.
<i>rvm</i>	Managing Ruby installations and gemsets with Ruby Version Manager (RVM)
<i>salt_proxy</i>	Salt proxy state
<i>saltmod</i>	Control the Salt command interface
<i>saltutil</i>	Saltutil State
<i>schedule</i>	Management of the Salt scheduler
<i>selinux</i>	Management of SELinux rules
<i>serverdensity_device</i>	Monitor Server with Server Density
<i>service</i>	Starting or restarting of services and daemons
<i>slack</i>	Send a message to Slack
<i>smartos</i>	Management of SmartOS Standalone Compute Nodes
<i>smtp</i>	Sending Messages via SMTP
<i>snapper</i>	Managing implicit state and baselines using snapshots
<i>solrcloud</i>	States for solrcloud alias and collection configuration
<i>splunk</i>	Splunk User State Module
<i>splunk_search</i>	Splunk Search State Module
<i>sqlite3</i>	Management of SQLite3 databases
<i>ssh_auth</i>	Control of entries in SSH authorized_key files
<i>ssh_known_hosts</i>	Control of SSH known_hosts entries
<i>stateconf</i>	Stateconf System
<i>status</i>	Minion status monitoring
<i>statuspage</i>	StatusPage
<i>supervisord</i>	Interaction with the Supervisor daemon
<i>svn</i>	Manage SVN repositories
<i>sysctl</i>	Configuration of the kernel using sysctl
<i>syslog_ng</i>	State module for syslog_ng
<i>sysrc</i>	State to work with sysrc
<i>telemetry_alert</i>	Manage Telemetry alert configurations
<i>test</i>	Test States
<i>testinframod</i>	
<i>timezone</i>	Management of timezones
<i>tls</i>	Enforce state for SSL/TLS
<i>tomcat</i>	Manage Apache Tomcat web applications
<i>trafficserver</i>	Control Apache Traffic Server
<i>tuned</i>	Interface to Red Hat tuned-adm module
<i>uptime</i>	Monitor Web Server with Uptime
<i>user</i>	Management of user accounts
<i>vagrant</i>	Manage Vagrant VMs
<i>vault</i>	States for managing Hashicorp Vault.
<i>vbox_guest</i>	VirtualBox Guest Additions installer state
<i>victorops</i>	Create an Event in VictorOps
<i>virt</i>	Manage virt
<i>virtualenv_mod</i>	Setup of Python virtualenv sandboxes.
<i>webutil</i>	Support for htpasswd module.
<i>win_certutil</i>	Installing of certificates to the Windows Certificate Manager
<i>win_dacl</i>	Windows Object Access Control Lists

Table 20 – continued from previous page

<i>win_dism</i>	Installing of Windows features using DISM
<i>win_dns_client</i>	Module for configuring DNS Client on Windows systems
<i>win_firewall</i>	State for configuring Windows Firewall
<i>win_iis</i>	Microsoft IIS site management
<i>win_lgpo</i>	Manage Windows Local Group Policy
<i>win_license</i>	Installation and activation of windows licenses
<i>win_network</i>	Configuration of network interfaces on Windows hosts
<i>win_path</i>	Manage the Windows System PATH
<i>win_pki</i>	Microsoft certificate management via the Pki PowerShell module.
<i>win_powercfg</i>	This module allows you to control the power settings of a windows minion via powercfg.
<i>win_servermanager</i>	Manage Windows features via the ServerManager powershell module.
<i>win_smtp_server</i>	Module for managing IIS SMTP server configuration on Windows servers.
<i>win_snmp</i>	Module for managing SNMP service settings on Windows servers.
<i>win_system</i>	Management of Windows system information
<i>win_wua</i>	Installation of Windows Updates using the Windows Update Agent
<i>win_wusa</i>	Microsoft Updates (KB) Management
<i>winrepo</i>	Manage Windows Package Repository
<i>wordpress</i>	This state module is used to manage Wordpress installations
<i>x509</i>	Manage X509 Certificates
<i>xml</i>	XML Manager
<i>xmpp</i>	Sending Messages over XMPP
<i>zabbix_action</i>	New in version 2017.7.
<i>zabbix_host</i>	Management of Zabbix hosts.
<i>zabbix_hostgroup</i>	Management of Zabbix host groups.
<i>zabbix_mediatype</i>	Management of Zabbix mediatypes.
<i>zabbix_template</i>	New in version 2017.7.
<i>zabbix_user</i>	Management of Zabbix users.
<i>zabbix_usergroup</i>	Management of Zabbix user groups.
<i>zabbix_usermacro</i>	Management of Zabbix usermacros.
<i>zabbix_valuemap</i>	New in version 2017.7.
<i>zcbuildout</i>	Management of zc.buildout
<i>zenoss</i>	State to manage monitoring in Zenoss.
<i>zfs</i>	States for managing zfs datasets
<i>zk_concurrency</i>	Control concurrency of steps within state execution using zookeeper
<i>zone</i>	Management of Solaris Zones
<i>zookeeper</i>	<b>depends</b> kazoo
<i>zpool</i>	States for managing zpools

## 21.19.1 salt.states.acme module

### ACME / Let's Encrypt certificate management state

See also the module documentation

```
reload-gitlab:
 cmd.run:
 - name: gitlab-ctl hup

dev.example.com:
 acme.cert:
 - aliases:
 - gitlab.example.com
 - email: acmemaster@example.com
 - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
 - renew: 14
 - fire_event: acme/dev.example.com
 - onchanges_in:
 - cmd: reload-gitlab
```

`salt.states.acme.cert`(*name*, *aliases*=None, *email*=None, *webroot*=None, *test\_cert*=False, *renew*=None, *keysize*=None, *server*=None, *owner*='root', *group*='root', *mode*='0640', *certname*=None, *preferred\_challenges*=None, *tls\_sni\_01\_port*=None, *tls\_sni\_01\_address*=None, *http\_01\_port*=None, *http\_01\_address*=None, *dns\_plugin*=None, *dns\_plugin\_credentials*=None)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

#### Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to webroot. Otherwise use standalone mode
- **test\_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of the private key file
- **group** -- group of the private key file
- **mode** -- mode of the private key file
- **certname** -- Name of the certificate to save
- **preferred\_challenges** -- A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls\_sni\_01\_port** -- Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls\_sni\_01\_address** -- The address the server listens to during tls-sni-01 challenge.
- **http\_01\_port** -- Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https\_01\_address** -- The address the server listens to during http-01 challenge.
- **dns\_plugin** -- Name of a DNS plugin to use (currently only 'cloudflare')
- **dns\_plugin\_credentials** -- Path to the credentials file if required by the spec-

ified DNS plugin

### 21.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
 alias.present:
 - target: user@example.com
```

```
thomas:
 alias.present:
 - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

`salt.states.alias.absent(name)`

Ensure that the named alias is absent

**name** The alias to remove

`salt.states.alias.present(name, target)`

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

**name** The local user/address to assign an alias to

**target** The forwarding address

### 21.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
 file.directory

hadoop-0.20-conf:
 alternatives.install:
 - name: hadoop-0.20-conf
 - link: /etc/hadoop-0.20/conf
 - path: {{ my_hadoop_conf }}
 - priority: 30
 - require:
 - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
 alternatives.remove:
 - name: hadoop-0.20-conf
 - path: {{ my_hadoop_conf }}
```

`salt.states.alternatives.auto(name)`

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

**name** is the master name for this link group (e.g. pager)

`salt.states.alternatives.install(name, link, path, priority)`

Install new alternative for defined <name>

**name** is the master name for this link group (e.g. pager)

**link** is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

**path** is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

**priority** is an integer; options with higher numbers have higher priority in automatic mode.

`salt.states.alternatives.remove(name, path)`

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

`salt.states.alternatives.set_(name, path)`

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

**name** is the master name for this link group (e.g. pager)

**path** is the location of one of the alternative target files. (e.g. /usr/bin/less)

```
foo:
 alternatives.set:
 - path: /usr/bin/foo-2.0
```

## 21.19.4 salt.states.ansiblegate

### Execution of Ansible modules from within states

With `ansible.call` these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```
some_set_of_tasks:
 ansible:
 - system.ping
 - packaging.os.zypper
 - name: emacs
 - state: installed
```

**class** `salt.states.ansiblegate.AnsibleState`

Ansible state caller.

**get\_args**(argset)

Get args and kwargs from the argset.

Parameters **argset** --

Returns

`salt.states.ansiblegate.playbooks(name, rundir=None, git_repo=None, git_kwargs=None, ansible_kwargs=None)`

Run Ansible Playbooks

Parameters

- **name** -- path to playbook. This can be relative to rundir or the git repo
- **rundir** -- location to run ansible-playbook from.
- **git\_repo** -- git repository to clone for ansible playbooks. This is cloned using the *git.latest* state, and is cloned to the *rundir* if specified, otherwise it is clone to the *cache\_dir*
- **git\_kwargs** -- extra kwargs to pass to *git.latest* state module besides the *name* and *target*
- **ansible\_kwargs** -- extra kwargs to pass to *ansible.playbooks* execution module besides the *name* and *target*

Returns Ansible playbook output.

```
run nginx install:
 ansible.playbooks:
 - name: install.yml
 - git_repo: git://github.com/gituser/playbook.git
 - git_kwargs:
 rev: master
```

### 21.19.5 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
 apache.configfile:
 - config:
 - VirtualHost:
 this: '*:80'
 ServerName:
 - website.com
 ServerAlias:
 - www.website.com
 - dev.website.com
 ErrorLog: logs/website.com-error_log
 CustomLog: logs/website.com-access_log combined
 DocumentRoot: /var/www/vhosts/website.com
 Directory:
 this: /var/www/vhosts/website.com
 Order: Deny,Allow
 Deny from: all
 Allow from:
 - 127.0.0.1
 - 192.168.100.0/24
 Options:
 - Indexes
 - FollowSymlinks
 AllowOverride: All
```

Changed in version 2018.3.

Allows having the same section container multiple times (e.g. <Directory /path/to/dir>).

YAML structure stays the same only replace dictionary with a list.

When a section container does not have mandatory attribute, such as <Else>, it still needs keyword `this` with empty string (or `""` if nicer output is required - without space).

```
/etc/httpd/conf.d/website.com.conf:
apache.configfile:
- config:
- VirtualHost:
- this: '*'80'
- ServerName:
- website.com
- DocumentRoot: /var/www/vhosts/website.com
- Directory:
this: /var/www/vhosts/website.com
Order: Deny,Allow
Deny from: all
Allow from:
- 127.0.0.1
- 192.168.100.0/24
Options:
- Indexes
- FollowSymlinks
AllowOverride: All
- Directory:
- this: /var/www/vhosts/website.com/private
- Order: Deny,Allow
- Deny from: all
- Allow from:
- 127.0.0.1
- 192.168.100.0/24
- If:
this: some condition
do: something
- Else:
this:
do: something else
- Else:
this: ""
do: another thing
```

`salt.states.apache.configfile(name, config)`

### 21.19.6 salt.states.apache\_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
apache_conf.enabled:
- name: security

Disable security conf:
apache_conf.disabled:
- name: security
```

`salt.states.apache_conf.disabled(name)`

Ensure an Apache conf is disabled.

**name** Name of the Apache conf

`salt.states.apache_conf.enabled(name)`

Ensure an Apache conf is enabled.

**name** Name of the Apache conf

### 21.19.7 salt.states.apache\_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

**Enable cgi module:**

**apache\_module.enabled:**

- **name:** cgi

**Disable cgi module:**

**apache\_module.disabled:**

- **name:** cgi

`salt.states.apache_module.disabled(name)`

Ensure an Apache module is disabled.

New in version 2016.3.0.

**name** Name of the Apache module

`salt.states.apache_module.enabled(name)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

**name** Name of the Apache module

### 21.19.8 salt.states.apache\_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

**Enable default site:**

**apache\_site.enabled:**

- **name:** default

**Disable default site:**

**apache\_site.disabled:**

- **name:** default

`salt.states.apache_site.disabled(name)`

Ensure an Apache site is disabled.

**name** Name of the Apache site

`salt.states.apache_site.enabled(name)`

Ensure an Apache site is enabled.

**name** Name of the Apache site

### 21.19.9 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

`salt.states.aptpkg.held(name)`

Set package in 'hold' state, meaning it will not be upgraded.

**name** The name of the package, e.g., 'tmux'

### 21.19.10 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_files_list_verify=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, clean_parent=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)`

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

---

#### Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
 archive.extracted:
 - name: /var/www
 - source: salt://apps/src/myapp-16.2.4.tar.gz
 - user: www
 - group: www
 - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
 archive.extracted:
 - name: /var/www/myapp-16.2.4
 - source: salt://apps/src/myapp-16.2.4.tar.gz
 - user: www
 - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
 archive.extracted:
 - name: /var/www
 - source: salt://apps/src/myapp-16.2.4.tar.gz
 - user: www
 - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

---

### Important: ZIP Archive Handling

*Note: this information applies to 2016.11.0 and later.*

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
 archive.extracted:
 - source: salt://foo/bar/myapp.zip
 - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
 archive.extracted:
```

(continues on next page)

(continued from previous page)

- **source:** salt://foo/bar/myapp.zip
- **extract\_perms:** False

**name** Directory into which the archive should be extracted

**source** Archive to be extracted

**Note:** This argument uses the same syntax as its counterpart in the *file.managed* state.

**source\_hash** Hash of source file, or file with list of hash-to-file mappings

**Note:** This argument uses the same syntax as its counterpart in the *file.managed* state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
 archive.extracted:
 - name: /var/www
 - source: https://mydomain.tld/foo.tar.gz
 - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
 archive.extracted:
 - name: /var/www
 - source: https://mydomain.tld/bar.tar.gz
 - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

**source\_hash\_name** When **source\_hash** refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8 ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
 archive.extracted:
 - source: https://mydomain.tld/dir2/foo.tar.gz
 - source_hash: https://mydomain.tld/hashes
 - source_hash_name: ./dir2/foo.tar.gz
```

---

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.11.0.

**source\_hash\_update** [False] Set this to `True` if archive should be extracted if `source_hash` has changed and there is a difference between the archive and the local files. This would extract regardless of the `if_missing` parameter.

Note that this is only checked if the `source` value has not changed. If it has (e.g. to increment a version number in the path) then the archive will not be extracted even if the hash has changed.

---

**Note:** Setting this to `True` along with `keep_source` set to `False` will result the source re-download to do a archive file list check. If it's not desirable please consider the `skip_files_list_verify` argument.

---

New in version 2016.3.0.

**skip\_files\_list\_verify** [False] Set this to `True` if archive should be extracted if `source_hash` has changed but only checksums of the archive will be checked to determine if the extraction is required.

It will try to find a local cache of the `source` and check its hash against the `source_hash`. If there is no local cache available, for example if you set the `keep_source` to `False`, it will try to find a cached source hash file in the Minion archives cache directory.

---

**Note:** The current limitation of this logic is that you have to set minions `hash_type` config option to the same one that you're going to pass via `source_hash` argument.

---

**Warning:** With this argument set to `True` Salt will only check for the `source_hash` against the local hash of the source. So if you, for example, remove extracted files without clearing the Salt Minion cache next time you execute the state Salt will not notice that extraction is required if the hashes are still match.

New in version 3000.

**skip\_verify** [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

**keep\_source** [True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

**keep** [True] Same as `keep_source`, kept for backward-compatibility.

---

**Note:** If both `keep_source` and `keep` are used, `keep` will be ignored.

---

**password** For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

**options** For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the tar/unzip implementation on the minion's OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

---

**Note:** For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

---

**list\_options** For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` "just works". Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

**force** [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

**Warning:** Use this option *very* carefully.

New in version 2016.11.0.

**overwrite** [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

**clean** [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

---

**Note:** Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

---

New in version 2016.11.1.

**clean\_parent** [False] If `True`, and the archive is extracted, delete the parent directory (i.e. the directory into which the archive is extracted), and then re-create that directory before extracting. Note that `clean` and `clean_parent` are mutually exclusive.

New in version 3000.

**user** The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**group** The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

**if\_missing** If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

**trim\_output** [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

**use\_cmd\_unzip** [False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

**extract\_perms** [True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

**enforce\_toplevel** [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

**enforce\_ownership\_on** When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

---

**Note:** This path must be within the path specified by the `name` argument.

---

New in version 2016.11.0.

**archive\_format** One of tar, zip, or rar.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the source argument. If the minion is running a release older than 2016.11.0, this option is required.

#### Examples

1. tar with lmza (i.e. xz) compression:

```
graylog2-server:
 archive.extracted:
 - name: /opt/
 - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
 ↪server-0.9.6p1.tar.lzma
 - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2. tar archive with flag for verbose output, and enforcement of user/group ownership:

```
graylog2-server:
 archive.extracted:
 - name: /opt/
 - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
 ↪server-0.9.6p1.tar.gz
 - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
 - options: v
 - user: foo
 - group: foo
```

3. tar archive, with source\_hash\_update set to True to prevent state from attempting extraction unless the source\_hash differs from the previous time the archive was extracted:

```
graylog2-server:
 archive.extracted:
 - name: /opt/
 - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
 ↪server-0.9.6p1.tar.lzma
 - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
 - source_hash_update: True
```

### 21.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

**salt.states.artifactory.downloaded**(name, artifact, target\_dir='/tmp', target\_file=None, use\_literal\_group\_id=False)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from artifactory. Various options are:

- artifactory\_url: URL of the artifactory instance
- repository: Repository in artifactory
- artifact\_id: Artifact ID
- group\_id: Group ID
- packaging: Packaging
- classifier: Classifier .. versionadded:: 2015.8.0
- **version: Version** One of the following: - Version to download - **latest** - Download the latest release of this artifact - **latest\_snapshot** - Download the latest snapshot for this artifact
- username: Artifactory username .. versionadded:: 2015.8.0

- password: Artifactory password .. versionadded:: 2015.8.0

**target\_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target\_file** Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```
jboss_module_downloaded:
 artifactory.downloaded:
 - artifact:
 artifactory_url: http://artifactory.intranet.example.com/artifactory
 repository: 'libs-release-local'
 artifact_id: 'module'
 group_id: 'com.company.module'
 packaging: 'jar'
 classifier: 'sources'
 version: '1.0'
 - target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
 artifactory.downloaded:
 - artifact:
 artifactory_url: http://artifactory.intranet.example.com/artifactory
 repository: 'libs-release-local'
 artifact_id: 'module'
 group_id: 'com.company.module'
 packaging: 'jar'
 classifier: 'sources'
 version: '1.0'
 - target_dir: /opt/jboss7/modules/com/company/lib
```

### 21.19.12 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

**salt.states.at.absent** (*name*, *jobid=None*, *\*\*kwargs*)

Changed in version 2017.7.0.

Remove a job from queue

**jobid**: string|int Specific jobid to remove

**tag** [string] Job's tag

**runas** [string] Runs user-specified jobs

**kwargs** Addition kwargs can be provided to filter jobs. See output of *at.jobcheck* for more.

```
example1:
 at.absent:
```

Warning: this will remove all jobs!

```
example2:
 at.absent:
 - year: 13
```

```
example3:
 at.absent:
 - tag: rose
```

```
example4:
 at.absent:
 - tag: rose
 - day: 13
 - hour: 16
```

```
example5:
 at.absent:
 - jobid: 4
```

`salt.states.at.mod_watch(name, **kwargs)`

The at watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

**name** The name of the atjob

`salt.states.at.present(name, timespec, tag=None, user=None, job=None, unique_tag=False)`

Changed in version 2017.7.0.

Add a job to queue.

**job** [string] Command to run.

**timespec** [string] The 'timespec' follows the format documented in the at(1) manpage.

**tag** [string] Make a tag for the job.

**user** [string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag** [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
rose:
 at.present:
 - job: 'echo "I love saltstack" > love'
 - timespec: '9:09 11/09/13'
 - tag: love
 - user: jam
```

`salt.states.at.watch(name, timespec, tag=None, user=None, job=None, unique_tag=False)`

New in version 2017.7.0.

Add an at job if trigger by watch

**job** [string] Command to run.

**timespec** [string] The 'timespec' follows the format documented in the at(1) manpage.

**tag** [string] Make a tag for the job.

**user** [string] The user to run the at job .. versionadded:: 2014.1.4

**unique\_tag** [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
minion_restart:
 at.watch:
 - job: 'salt-call --local service.restart salt-minion'
 - timespec: 'now +1 min'
 - tag: minion_restart
```

(continues on next page)

(continued from previous page)

```
- unique_tag: trye
- watch:
 - file: /etc/salt/minion
```

### 21.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

`Augeas` can be used to manage configuration files.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.change`(*name*, *context*=None, *changes*=None, *lens*=None, *load\_path*=None, *\*\*kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

**name** State name

**context** A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
augeas.change:
- context: /files/etc/redis/redis.conf
- changes:
 - set bind 0.0.0.0
 - set maxmemory 1G
```

**changes** List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

**lens** The lens to use, needs to be suffixed with `.lens`, e.g.: `Nginx.lens`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

**load\_path** A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
 augeas.change:
 - changes:
 - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

**Note:** Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
 augeas.change:
 - context: /files/etc/redis/redis.conf
 - changes:
 - set bind 0.0.0.0
 - set databases 4
 - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
 augeas.change:
 - lens: redis.lns
 - context: /files/etc/redis/redis.conf
 - changes:
 - set bind 0.0.0.0
```

**Note:** Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
 augeas.change:
 - lens: services.lns
 - context: /files/etc/services
 - changes:
 - ins service-name after service-name[last()]
 - set service-name[last()] "zabbix-agent"
 - set "service-name[. = 'zabbix-agent']/port" 10050
 - set "service-name[. = 'zabbix-agent']/protocol" tcp
 - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
 - rm "service-name[. = 'im-obsolete']"
 - unless: grep "zabbix-agent" /etc/services
```

**Warning:** Don't forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing `service-name[. = 'zabbix-agent']` otherwise `augeas_cfg` execute will fail because it will receive more parameters than expected.

---

**Note:** Order is important when defining a service with Augeas, in this case it's `port`, `protocol` and `#comment`. For more info about the lens check [services lens documentation](#).

---

<http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record>

### 21.19.14 salt.states.aws\_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the `awscli` tool provided by Amazon. This can be downloaded from `pip`. Also check the documentation for `awscli` for configuration information.

```
myqueue:
 aws_sqs.exists:
 - region: eu-west-1
```

`salt.states.aws_sqs.absent(name, region, user=None, opts=False)`

Remove the named SQS queue if it exists.

**name** Name of the SQS queue.

**region** Region to remove the queue from

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the aws command line

`salt.states.aws_sqs.exists(name, region, user=None, opts=False)`

Ensure the SQS queue exists.

**name** Name of the SQS queue.

**region** Region to create the queue

**user** Name of the user performing the SQS operations

**opts** Include additional arguments and options to the aws command line

### 21.19.15 salt.states.azurearm\_compute

Azure (ARM) Compute State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- `azure` >= 2.0.0
- `azure-common` >= 1.1.8
- `azure-mgmt` >= 1.0.0
- `azure-mgmt-compute` >= 1.0.0

- `azure-mgmt-network` `>= 1.7.1`
- `azure-mgmt-resource` `>= 1.1.0`
- `azure-mgmt-storage` `>= 1.0.0`
- `azure-mgmt-web` `>= 0.32.0`
- `azure-storage` `>= 0.34.3`
- `msrestazure` `>= 0.4.21`

**platform** `linux`

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

**cloud\_environment:** Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure availability set exists:
 azurearm_compute.availability_set_present:
 - name: my_avail_set
 - resource_group: my_rg
 - virtual_machines:
 - my_vm1
 - my_vm2
 - tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}

Ensure availability set is absent:
 azurearm_compute.availability_set_absent:
 - name: other_avail_set
 - resource_group: my_rg
 - connection_auth: {{ profile }}
```

`salt.states.azurearm_compute.availability_set_absent`(*name*, *resource\_group*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure an availability set does not exist in a resource group.

#### Parameters

- **name** -- Name of the availability set.
- **resource\_group** -- Name of the resource group containing the availability set.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_compute.availability_set_present`(*name*, *resource\_group*, *tags*=None, *platform\_update\_domain\_count*=None, *platform\_fault\_domain\_count*=None, *virtual\_machines*=None, *sku*=None, *connection\_auth*=None, *\*\*kwargs*)

New in version 2019.2.0.

Ensure an availability set exists.

#### Parameters

- **name** -- Name of the availability set.
- **resource\_group** -- The resource group assigned to the availability set.
- **tags** -- A dictionary of strings can be passed as tag metadata to the availability set object.
- **platform\_update\_domain\_count** -- An optional parameter which indicates groups of virtual machines and underlying physical hardware that can be rebooted at the same time.
- **platform\_fault\_domain\_count** -- An optional parameter which defines the group of virtual machines that share a common power source and network switch.
- **virtual\_machines** -- A list of names of existing virtual machines to be included in the availability set.
- **sku** -- The availability set SKU, which specifies whether the availability set is managed or not. Possible values are 'Aligned' or 'Classic'. An 'Aligned' availability set is managed, 'Classic' is not.
- **connection\_auth** -- A dict with subscription and authentication parameters to

be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure availability set exists:
 azurearm_compute.availability_set_present:
 - name: aset1
 - resource_group: group1
 - platform_update_domain_count: 5
 - platform_fault_domain_count: 3
 - sku: aligned
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists
```

### 21.19.16 salt.states.azurearm\_dns module

Azure (ARM) DNS State Module

New in version 3000.

**maintainer** <devops@eitr.tech>

**maturity** new

**depends**

- `azure` >= 2.0.0
- `azure-common` >= 1.1.8
- `azure-mgmt` >= 1.0.0
- `azure-mgmt-compute` >= 1.0.0
- `azure-mgmt-dns` >= 1.0.1
- `azure-mgmt-network` >= 1.7.1
- `azure-mgmt-resource` >= 1.1.0
- `azure-mgmt-storage` >= 1.0.0
- `azure-mgmt-web` >= 0.32.0
- `azure-storage` >= 0.34.3
- `msrestazure` >= 0.4.21

**platform** linux

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

**cloud\_environment:** Used to point the cloud driver to different API endpoints, such as Azure GovCloud.  
Possible values:

Possible values:

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure DNS zone exists:
 azurearm_dns.zone_present:
 - name: contoso.com
 - resource_group: my_rg
 - tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}

Ensure DNS record set exists:
 azurearm_dns.record_set_present:
 - name: web
 - zone_name: contoso.com
 - resource_group: my_rg
 - record_type: A
 - ttl: 300
 - arecords:
 - ipv4_address: 10.0.0.1
 - tags:
 how_awesome: very
```

(continues on next page)

(continued from previous page)

```

 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}

Ensure DNS record set is absent:
 azurearm_dns.record_set_absent:
 - name: web
 - zone_name: contoso.com
 - resource_group: my_rg
 - record_type: A
 - connection_auth: {{ profile }}

Ensure DNS zone is absent:
 azurearm_dns.zone_absent:
 - name: contoso.com
 - resource_group: my_rg
 - connection_auth: {{ profile }}

```

`salt.states.azurearm_dns.record_set_absent`(*name*, *zone\_name*, *resource\_group*, *connection\_auth*=None)

New in version 3000.

Ensure a record set does not exist in the DNS zone.

#### Parameters

- **name** -- Name of the record set.
- **zone\_name** -- Name of the DNS zone.
- **resource\_group** -- The resource group assigned to the DNS zone.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_dns.record_set_present`(*name*, *zone\_name*, *resource\_group*, *record\_type*, *if\_match*=None, *if\_none\_match*=None, *etag*=None, *meta-data*=None, *ttl*=None, *arecords*=None, *aaaa\_records*=None, *mx\_records*=None, *ns\_records*=None, *ptr\_records*=None, *srv\_records*=None, *txt\_records*=None, *cname\_record*=None, *soa\_record*=None, *caa\_records*=None, *connection\_auth*=None, **\*\*kwargs**)

New in version 3000.

Ensure a record set exists in a DNS zone.

#### Parameters

- **name** -- The name of the record set, relative to the name of the zone.
- **zone\_name** -- Name of the DNS zone (without a terminating dot).
- **resource\_group** -- The resource group assigned to the DNS zone.
- **record\_type** -- The type of DNS record in this record set. Record sets of type SOA can be updated but not created (they are created when the DNS zone is created). Possible values include: 'A', 'AAAA', 'CAA', 'CNAME', 'MX', 'NS', 'PTR', 'SOA', 'SRV', 'TXT'
- **if\_match** -- The etag of the record set. Omit this value to always overwrite the current record set. Specify the last-seen etag value to prevent accidentally overwriting any concurrent changes.
- **if\_none\_match** -- Set to '\*' to allow a new record set to be created, but to prevent updating an existing record set. Other values will be ignored.
- **etag** -- The etag of the record set. [Etags](#) are used to handle concurrent changes to

the same resource safely.

- **metadata** -- A dictionary of strings can be passed as tag metadata to the record set object.
- **ttl** -- The TTL (time-to-live) of the records in the record set. Required when specifying record information.
- **arecords** -- The list of A records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **aaaa\_records** -- The list of AAAA records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **mx\_records** -- The list of MX records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **ns\_records** -- The list of NS records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **ptr\_records** -- The list of PTR records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **srv\_records** -- The list of SRV records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **txt\_records** -- The list of TXT records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **cname\_record** -- The CNAME record in the record set. View the [Azure SDK documentation](#) to create a dictionary representing the record object.
- **soa\_record** -- The SOA record in the record set. View the [Azure SDK documentation](#) to create a dictionary representing the record object.
- **caa\_records** -- The list of CAA records in the record set. View the [Azure SDK documentation](#) to create a list of dictionaries representing the record objects.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure record set exists:
 azurearm_dns.record_set_present:
 - name: web
 - zone_name: contoso.com
 - resource_group: my_rg
 - record_type: A
 - ttl: 300
 - arecords:
 - ipv4_address: 10.0.0.1
 - metadata:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
```

`salt.states.azurearm_dns.zone_absent(name, resource_group, connection_auth=None)`

New in version 3000.

Ensure a DNS zone does not exist in the resource group.

#### Parameters

- **name** -- Name of the DNS zone.
- **resource\_group** -- The resource group assigned to the DNS zone.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_dns.zone_present(name, resource_group, etag=None,
 if_match=None, if_none_match=None, reg-
 istration_virtual_networks=None, resolu-
 tion_virtual_networks=None, tags=None,
 zone_type='Public', connection_auth=None, **kwargs)
```

New in version 3000.

Ensure a DNS zone exists.

#### Parameters

- **name** -- Name of the DNS zone (without a terminating dot).
- **resource\_group** -- The resource group assigned to the DNS zone.
- **etag** -- The etag of the zone. [Etags](#) are used to handle concurrent changes to the same resource safely.
- **if\_match** -- The etag of the DNS zone. Omit this value to always overwrite the current zone. Specify the last-seen etag value to prevent accidentally overwriting any concurrent changes.
- **if\_none\_match** -- Set to '\*' to allow a new DNS zone to be created, but to prevent updating an existing zone. Other values will be ignored.
- **registration\_virtual\_networks** -- A list of references to virtual networks that register hostnames in this DNS zone. This is only when zone\_type is Private. (requires [azure-mgmt-dns](#) >= 2.0.0rc1)
- **resolution\_virtual\_networks** -- A list of references to virtual networks that resolve records in this DNS zone. This is only when zone\_type is Private. (requires [azure-mgmt-dns](#) >= 2.0.0rc1)
- **tags** -- A dictionary of strings can be passed as tag metadata to the DNS zone object.
- **zone\_type** --  
The type of this DNS zone (Public or Private). Possible values include: 'Public', 'Private'. Default value: 'Public'. (requires [azure-mgmt-dns](#) >= 2.0.0rc1)
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure DNS zone exists:
azurearm_dns.zone_present:
- name: contoso.com
- resource_group: my_rg
- zone_type: Private
- registration_virtual_networks:
 - /subscriptions/{{ sub }}/resourceGroups/my_rg/providers/Microsoft.
 ↳ Network/virtualNetworks/test_vnet
- tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}
```

### 21.19.17 salt.states.azurearm\_network

Azure (ARM) Network State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- `azure` `>= 2.0.0`
- `azure-common` `>= 1.1.8`
- `azure-mgmt` `>= 1.0.0`
- `azure-mgmt-compute` `>= 1.0.0`
- `azure-mgmt-network` `>= 1.7.1`
- `azure-mgmt-resource` `>= 1.1.0`
- `azure-mgmt-storage` `>= 1.0.0`
- `azure-mgmt-web` `>= 0.32.0`
- `azure-storage` `>= 0.34.3`
- `msrestazure` `>= 0.4.21`

**platform** linux

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

**cloud\_environment**: Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure virtual network exists:
 azurearm_network.virtual_network_present:
 - name: my_vnet
 - resource_group: my_rg
 - address_prefixes:
 - '10.0.0.0/8'
 - '192.168.0.0/16'
 - dns_servers:
 - '8.8.8.8'
 - tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}

Ensure virtual network is absent:
 azurearm_network.virtual_network_absent:
 - name: other_vnet
 - resource_group: my_rg
 - connection_auth: {{ profile }}
```

`salt.states.azurearm_network.load_balancer_absent(name, resource_group, connection_auth=None)`

New in version 2019.2.0.

Ensure a load balancer does not exist in the resource group.

#### Parameters

- **name** -- Name of the load balancer.
- **resource\_group** -- The resource group assigned to the load balancer.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.load_balancer_present(name, resource_group, sku=None, frontend_ip_configurations=None, backend_address_pools=None, load_balancing_rules=None, probes=None, inbound_nat_rules=None, inbound_nat_pools=None, outbound_nat_rules=None, tags=None, connection_auth=None, **kwargs)`

New in version 2019.2.0.

Ensure a load balancer exists.

#### Parameters

- **name** -- Name of the load balancer.
- **resource\_group** -- The resource group assigned to the load balancer.
- **sku** -- The load balancer SKU, which can be 'Basic' or 'Standard'.
- **tags** -- A dictionary of strings can be passed as tag metadata to the load balancer object.
- **frontend\_ip\_configurations** -- An optional list of dictionaries representing valid FrontendIPConfiguration objects. A frontend IP configuration can be either private (using private IP address and subnet parameters) or public (using a reference to a public IP address object). Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **private\_ip\_address**: The private IP address of the IP configuration. Required if 'private\_ip\_allocation\_method' is 'Static'.
  - **private\_ip\_allocation\_method**: The Private IP allocation method. Possible values are: 'Static' and 'Dynamic'.
  - **subnet**: Name of an existing subnet inside of which the frontend IP will reside.
  - **public\_ip\_address**: Name of an existing public IP address which will be assigned to the frontend IP object.
- **backend\_address\_pools** -- An optional list of dictionaries representing valid BackendAddressPool objects. Only the 'name' parameter is valid for a BackendAddressPool dictionary. All other parameters are read-only references from other objects linking to the backend address pool. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- **probes** -- An optional list of dictionaries representing valid Probe objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **protocol**: The protocol of the endpoint. Possible values are 'Http' or 'Tcp'. If 'Tcp' is specified, a received ACK is required for the probe to be successful. If 'Http' is specified, a 200 OK response from the specified URI is required for the probe to be successful.
  - **port**: The port for communicating the probe. Possible values range from 1 to 65535, inclusive.
  - **interval\_in\_seconds**: The interval, in seconds, for how frequently to probe the endpoint for health status. Typically, the interval is slightly less than half the allocated timeout period (in seconds) which allows two full probes before taking the instance out of rotation. The default value is 15, the minimum value is 5.
  - **number\_of\_probes**: The number of probes where if no response, will result in stopping further traffic from being delivered to the endpoint. This values allows endpoints to be taken out of rotation faster or slower than the typical times used in Azure.
  - **request\_path**: The URI used for requesting health status from the VM. Path is required if a protocol is set to 'Http'. Otherwise, it is not allowed. There is no default value.
- **load\_balancing\_rules** -- An optional list of dictionaries representing valid LoadBalancingRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **load\_distribution**: The load distribution policy for this rule. Possible values are 'Default', 'SourceIP', and 'SourceIPProtocol'.
  - **frontend\_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values are between

- 0 and 65534. Note that value 0 enables 'Any Port'.
- **backend\_port**: The port used for internal connections on the endpoint. Acceptable values are between 0 and 65535. Note that value 0 enables 'Any Port'.
- **idle\_timeout\_in\_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
- **enable\_floating\_ip**: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
- **disable\_outbound\_snat**: Configures SNAT for the VMs in the backend pool to use the public IP address specified in the frontend of the load balancing rule.
- **frontend\_ip\_configuration**: Name of the frontend IP configuration object used by the load balancing rule object.
- **backend\_address\_pool**: Name of the backend address pool object used by the load balancing rule object. Inbound traffic is randomly load balanced across IPs in the backend IPs.
- **probe**: Name of the probe object used by the load balancing rule object.
- **inbound\_nat\_rules** -- An optional list of dictionaries representing valid InboundNatRule objects. Defining inbound NAT rules on your load balancer is mutually exclusive with defining an inbound NAT pool. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an Inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend\_ip\_configuration**: Name of the frontend IP configuration object used by the inbound NAT rule object.
  - **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.
  - **frontend\_port**: The port for the external endpoint. Port numbers for each rule must be unique within the Load Balancer. Acceptable values range from 1 to 65534.
  - **backend\_port**: The port used for the internal endpoint. Acceptable values range from 1 to 65535.
  - **idle\_timeout\_in\_minutes**: The timeout for the TCP idle connection. The value can be set between 4 and 30 minutes. The default value is 4 minutes. This element is only used when the protocol is set to TCP.
  - **enable\_floating\_ip**: Configures a virtual machine's endpoint for the floating IP capability required to configure a SQL AlwaysOn Availability Group. This setting is required when using the SQL AlwaysOn Availability Groups in SQL server. This setting can't be changed after you create the endpoint.
- **inbound\_nat\_pools** -- An optional list of dictionaries representing valid InboundNatPool objects. They define an external port range for inbound NAT to a single backend port on NICs associated with a load balancer. Inbound NAT rules are created automatically for each NIC associated with the Load Balancer using an external port from this range. Defining an Inbound NAT pool on your Load Balancer is mutually exclusive with defining inbound NAT rules. Inbound NAT pools are referenced from virtual machine scale sets. NICs that are associated with individual virtual machines cannot reference an inbound NAT pool. They have to reference individual inbound NAT rules. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend\_ip\_configuration**: Name of the frontend IP configuration object used by the inbound NAT pool object.
  - **protocol**: Possible values include 'Udp', 'Tcp', or 'All'.

- **frontend\_port\_range\_start**: The first port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65534.
- **frontend\_port\_range\_end**: The last port number in the range of external ports that will be used to provide Inbound NAT to NICs associated with a load balancer. Acceptable values range between 1 and 65535.
- **backend\_port**: The port used for internal connections to the endpoint. Acceptable values are between 1 and 65535.
- **outbound\_nat\_rules** -- An optional list of dictionaries representing valid OutboundNatRule objects. Valid parameters are:
  - **name**: The name of the resource that is unique within a resource group.
  - **frontend\_ip\_configuration**: Name of the frontend IP configuration object used by the outbound NAT rule object.
  - **backend\_address\_pool**: Name of the backend address pool object used by the outbound NAT rule object. Outbound traffic is randomly load balanced across IPs in the backend IPs.
  - **allocated\_outbound\_ports**: The number of outbound ports to be used for NAT.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure load balancer exists:
 azurearm_network.load_balancer_present:
 - name: lb1
 - resource_group: group1
 - location: eastus
 - frontend_ip_configurations:
 - name: lb1_feip1
 public_ip_address: pub_ip1
 - backend_address_pools:
 - name: lb1_bepool1
 - probes:
 - name: lb1_webprobe1
 protocol: tcp
 port: 80
 interval_in_seconds: 5
 number_of_probes: 2
 - load_balancing_rules:
 - name: lb1_webprobe1
 protocol: tcp
 frontend_port: 80
 backend_port: 80
 idle_timeout_in_minutes: 4
 frontend_ip_configuration: lb1_feip1
 backend_address_pool: lb1_bepool1
 probe: lb1_webprobe1
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists
 - azurearm_network: Ensure public IP exists
```

`salt.states.azurearm_network.network_interface_absent`(*name, resource\_group, connection\_auth=None*)

New in version 2019.2.0.

Ensure a network interface does not exist in the resource group.

#### Parameters

- **name** -- Name of the network interface.
- **resource\_group** -- The resource group assigned to the network interface.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```

salt.states.azurearm_network.network_interface_present(name, ip_configurations,
subnet, virtual_network,
resource_group, tags=None,
virtual_machine=None, network_security_group=None,
dns_settings=None,
mac_address=None,
primary=None, enable_accelerated_networking=None,
enable_ip_forwarding=None,
connection_auth=None,
**kwargs)

```

New in version 2019.2.0.

Ensure a network interface exists.

#### Parameters

- **name** -- Name of the network interface.
- **ip\_configurations** -- A list of dictionaries representing valid NetworkInterfaceIPConfiguration objects. The 'name' key is required at minimum. At least one IP Configuration must be present.
- **subnet** -- Name of the existing subnet assigned to the network interface.
- **virtual\_network** -- Name of the existing virtual network containing the subnet.
- **resource\_group** -- The resource group assigned to the virtual network.
- **tags** -- A dictionary of strings can be passed as tag metadata to the network interface object.
- **network\_security\_group** -- The name of the existing network security group to assign to the network interface.
- **virtual\_machine** -- The name of the existing virtual machine to assign to the network interface.
- **dns\_settings** -- An optional dictionary representing a valid NetworkInterfaceDnsSettings object. Valid parameters are:
  - **dns\_servers**: List of DNS server IP addresses. Use 'AzureProvidedDNS' to switch to Azure provided DNS resolution. 'AzureProvidedDNS' value cannot be combined with other IPs, it must be the only value in dns\_servers collection.
  - **internal\_dns\_name\_label**: Relative DNS name for this NIC used for internal communications between VMs in the same virtual network.
  - **internal\_fqdn**: Fully qualified DNS name supporting internal communications between VMs in the same virtual network.
  - **internal\_domain\_name\_suffix**: Even if internal\_dns\_name\_label is not specified, a DNS entry is created for the primary NIC of the VM. This DNS name can be constructed by concatenating the VM name with the value of internal\_domain\_name\_suffix.
- **mac\_address** -- Optional string containing the MAC address of the network interface.
- **primary** -- Optional boolean allowing the interface to be set as the primary network interface on a virtual machine with multiple interfaces attached.
- **enable\_accelerated\_networking** -- Optional boolean indicating whether

accelerated networking should be enabled for the interface.

- **enable\_ip\_forwarding** -- Optional boolean indicating whether IP forwarding should be enabled for the interface.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure network interface exists:
 azurearm_network.network_interface_present:
 - name: iface1
 - subnet: vnet1_sn1
 - virtual_network: vnet1
 - resource_group: group1
 - ip_configurations:
 - name: iface1_ip1
 public_ip_address: pub_ip2
 - dns_settings:
 internal_dns_name_label: decisionlab-int-test-label
 - primary: True
 - enable_accelerated_networking: True
 - enable_ip_forwarding: False
 - network_security_group: nsg1
 - connection_auth: {{ profile }}
 - require:
 - azurearm_network: Ensure subnet exists
 - azurearm_network: Ensure network security group exists
 - azurearm_network: Ensure another public IP exists
```

`salt.states.azurearm_network.network_security_group_absent(name, re-source_group, connection_auth=None)`

New in version 2019.2.0.

Ensure a network security group does not exist in the resource group.

#### Parameters

- **name** -- Name of the network security group.
- **resource\_group** -- The resource group assigned to the network security group.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.network_security_group_present(name, re-source_group, tags=None, security_rules=None, connection_auth=None, **kwargs)`

New in version 2019.2.0.

Ensure a network security group exists.

#### Parameters

- **name** -- Name of the network security group.
- **resource\_group** -- The resource group assigned to the network security group.
- **tags** -- A dictionary of strings can be passed as tag metadata to the network security group object.
- **security\_rules** -- An optional list of dictionaries representing valid SecurityRule objects. See the documentation for the `security_rule_present` state or `security_rule_create_or_update` execution module for more information on required and

optional parameters for security rules. The rules are only managed if this parameter is present. When this parameter is absent, implemented rules will not be removed, and will merely become unmanaged.

- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure network security group exists:
 azurearm_network.network_security_group_present:
 - name: nsg1
 - resource_group: group1
 - security_rules:
 - name: nsg1_rule1
 priority: 100
 protocol: tcp
 access: allow
 direction: outbound
 source_address_prefix: virtualnetwork
 destination_address_prefix: internet
 source_port_range: '*'
 destination_port_range: '*'
 - name: nsg1_rule2
 priority: 101
 protocol: tcp
 access: allow
 direction: inbound
 source_address_prefix: internet
 destination_address_prefix: virtualnetwork
 source_port_range: '*'
 destination_port_ranges:
 - '80'
 - '443'
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists
```

`salt.states.azurearm_network.public_ip_address_absent`(*name*, *resource\_group*, *connection\_auth*=None)

New in version 2019.2.0.

Ensure a public IP address does not exist in the resource group.

Parameters

- **name** -- Name of the public IP address.
- **resource\_group** -- The resource group assigned to the public IP address.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_network.public_ip_address_present`(*name*, *resource\_group*, *tags*=None, *sku*=None, *public\_ip\_allocation\_method*=None, *public\_ip\_address\_version*=None, *dns\_settings*=None, *idle\_timeout\_in\_minutes*=None, *connection\_auth*=None, *\*\*kwargs*)

New in version 2019.2.0.

Ensure a public IP address exists.

#### Parameters

- **name** -- Name of the public IP address.
- **resource\_group** -- The resource group assigned to the public IP address.
- **dns\_settings** -- An optional dictionary representing a valid `PublicIPAddressDnsSettings` object. Parameters include 'domain\_name\_label' and 'reverse\_fqdn', which accept strings. The 'domain\_name\_label' parameter is concatenated with the region-ized DNS zone make up the fully qualified domain name associated with the public IP address. If a domain name label is specified, an A DNS record is created for the public IP in the Microsoft Azure DNS system. The 'reverse\_fqdn' parameter is a user-visible, fully qualified domain name that resolves to this public IP address. If the reverse FQDN is specified, then a PTR DNS record is created pointing from the IP address in the in-addr.arpa domain to the reverse FQDN.
- **sku** -- The public IP address SKU, which can be 'Basic' or 'Standard'.
- **public\_ip\_allocation\_method** -- The public IP allocation method. Possible values are: 'Static' and 'Dynamic'.
- **public\_ip\_address\_version** -- The public IP address version. Possible values are: 'IPv4' and 'IPv6'.
- **idle\_timeout\_in\_minutes** -- An integer representing the idle timeout of the public IP address.
- **tags** -- A dictionary of strings can be passed as tag metadata to the public IP address object.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure public IP exists:
azurearm_network.public_ip_address_present:
- name: pub_ip1
- resource_group: group1
- dns_settings:
 domain_name_label: decisionlab-ext-test-label
- sku: basic
- public_ip_allocation_method: static
- public_ip_address_version: ipv4
- idle_timeout_in_minutes: 4
- tags:
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}
- require:
 - azurearm_resource: Ensure resource group exists
```

```
salt.states.azurearm_network.route_absent(name, route_table, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

#### Parameters

- **name** -- Name of the route table.
- **route\_table** -- The name of the existing route table containing the route.
- **resource\_group** -- The resource group assigned to the route table.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.route_present(name, address_prefix, next_hop_type,
 route_table, resource_group,
 next_hop_ip_address=None,
 connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a route exists within a route table.

#### Parameters

- **name** -- Name of the route.
- **address\_prefix** -- The destination CIDR to which the route applies.
- **next\_hop\_type** -- The type of Azure hop the packet should be sent to. Possible values are: 'VirtualNetworkGateway', 'VnetLocal', 'Internet', 'VirtualAppliance', and 'None'.
- **next\_hop\_ip\_address** -- The IP address packets should be forwarded to. Next hop values are only allowed in routes where the next hop type is 'VirtualAppliance'.
- **route\_table** -- The name of the existing route table which will contain the route.
- **resource\_group** -- The resource group assigned to the route table.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure route exists:
azurearm_network.route_present:
- name: rtl_route2
- route_table: rtl
- resource_group: group1
- address_prefix: '192.168.0.0/16'
- next_hop_type: vnetlocal
- connection_auth: {{ profile }}
- require:
 - azurearm_network: Ensure route table exists
```

```
salt.states.azurearm_network.route_table_absent(name, resource_group,
 connection_auth=None)
```

New in version 2019.2.0.

Ensure a route table does not exist in the resource group.

#### Parameters

- **name** -- Name of the route table.
- **resource\_group** -- The resource group assigned to the route table.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.route_table_present(name, resource_group,
 tags=None, routes=None,
 disable_bgp_route_propagation=None,
 connection_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a route table exists.

#### Parameters

- **name** -- Name of the route table.
- **resource\_group** -- The resource group assigned to the route table.
- **routes** -- An optional list of dictionaries representing valid Route objects contained within a route table. See the documentation for the route\_present state or route\_create\_or\_update execution module for more information on required and optional parameters for routes. The routes are only managed if this parameter is present.

When this parameter is absent, implemented routes will not be removed, and will merely become unmanaged.

- **disable\_bgp\_route\_propagation** -- An optional boolean parameter setting whether to disable the routes learned by BGP on the route table.
- **tags** -- A dictionary of strings can be passed as tag metadata to the route table object.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure route table exists:
 azurearm_network.route_table_present:
 - name: rt1
 - resource_group: group1
 - routes:
 - name: rt1_route1
 address_prefix: '0.0.0.0/0'
 next_hop_type: internet
 - name: rt1_route2
 address_prefix: '192.168.0.0/16'
 next_hop_type: vnetlocal
 - tags:
 contact_name: Elmer Fudd Gantry
 - connection_auth: {{ profile }}
 - require:
 - azurearm_resource: Ensure resource group exists
```

```
salt.states.azurearm_network.security_rule_absent(name, security_group, re-
 source_group, connec-
 tion_auth=None)
```

New in version 2019.2.0.

Ensure a security rule does not exist in the network security group.

#### Parameters

- **name** -- Name of the security rule.
- **security\_group** -- The network security group containing the security rule.
- **resource\_group** -- The resource group assigned to the network security group.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.security_rule_present(name, access, direction, prior-
 ity, protocol, security_group,
 resource_group, destina-
 tion_address_prefix=None,
 destination_port_range=None,
 source_address_prefix=None,
 source_port_range=None,
 description=None, destina-
 tion_address_prefixes=None,
 destination_port_ranges=None,
 source_address_prefixes=None,
 source_port_ranges=None, connec-
 tion_auth=None, **kwargs)
```

New in version 2019.2.0.

Ensure a security rule exists.

#### Parameters

- **name** -- Name of the security rule.

- **access** -- 'allow' or 'deny'
- **direction** -- 'inbound' or 'outbound'
- **priority** -- Integer between 100 and 4096 used for ordering rule application.
- **protocol** -- 'tcp', 'udp', or '\*'
- **security\_group** -- The name of the existing network security group to contain the security rule.
- **resource\_group** -- The resource group assigned to the network security group.
- **description** -- Optional description of the security rule.
- **destination\_address\_prefix** -- The CIDR or destination IP range. Asterix '\*' can also be used to match all destination IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **destination\_port\_range** -- The destination port or range. Integer or range between 0 and 65535. Asterix '\*' can also be used to match all ports.
- **source\_address\_prefix** -- The CIDR or source IP range. Asterix '\*' can also be used to match all source IPs. Default tags such as 'VirtualNetwork', 'AzureLoadBalancer' and 'Internet' can also be used. If this is an ingress rule, specifies where network traffic originates from.
- **source\_port\_range** -- The source port or range. Integer or range between 0 and 65535. Asterix '\*' can also be used to match all ports.
- **destination\_address\_prefixes** -- A list of destination\_address\_prefix values. This parameter overrides destination\_address\_prefix and will cause any value entered there to be ignored.
- **destination\_port\_ranges** -- A list of destination\_port\_range values. This parameter overrides destination\_port\_range and will cause any value entered there to be ignored.
- **source\_address\_prefixes** -- A list of source\_address\_prefix values. This parameter overrides source\_address\_prefix and will cause any value entered there to be ignored.
- **source\_port\_ranges** -- A list of source\_port\_range values. This parameter overrides source\_port\_range and will cause any value entered there to be ignored.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure security rule exists:
 azurearm_network.security_rule_present:
 - name: nsg1_rule2
 - security_group: nsg1
 - resource_group: group1
 - priority: 101
 - protocol: tcp
 - access: allow
 - direction: inbound
 - source_address_prefix: internet
 - destination_address_prefix: virtualnetwork
 - source_port_range: '*'
 - destination_port_ranges:
 - '80'
 - '443'
 - connection_auth: {{ profile }}
 - require:
 - azurearm_network: Ensure network security group exists

```

```

salt.states.azurearm_network.subnet_absent(name, virtual_network, resource_group, connection_auth=None)

```

New in version 2019.2.0.

Ensure a virtual network does not exist in the virtual network.

**Parameters**

- **name** -- Name of the subnet.
- **virtual\_network** -- Name of the existing virtual network containing the subnet.
- **resource\_group** -- The resource group assigned to the virtual network.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_network.subnet_present(name, address_prefix, virtual_network,
 resource_group, security_group=None,
 route_table=None, connection_auth=None,
 **kwargs)
```

New in version 2019.2.0.

Ensure a subnet exists.

**Parameters**

- **name** -- Name of the subnet.
- **address\_prefix** -- A CIDR block used by the subnet within the virtual network.
- **virtual\_network** -- Name of the existing virtual network to contain the subnet.
- **resource\_group** -- The resource group assigned to the virtual network.
- **security\_group** -- The name of the existing network security group to assign to the subnet.
- **route\_table** -- The name of the existing route table to assign to the subnet.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure subnet exists:
azurearm_network.subnet_present:
- name: vnet1_sn1
- virtual_network: vnet1
- resource_group: group1
- address_prefix: '192.168.1.0/24'
- security_group: nsg1
- route_table: rtl
- connection_auth: {{ profile }}
- require:
- azurearm_network: Ensure virtual network exists
- azurearm_network: Ensure network security group exists
- azurearm_network: Ensure route table exists
```

```
salt.states.azurearm_network.virtual_network_absent(name, resource_group, connection_auth=None)
```

New in version 2019.2.0.

Ensure a virtual network does not exist in the resource group.

**Parameters**

- **name** -- Name of the virtual network.
- **resource\_group** -- The resource group assigned to the virtual network.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```

salt.states.azurearm_network.virtual_network_present(name, address_prefixes,
 resource_group,
 dns_servers=None, tags=None,
 connection_auth=None,
 **kwargs)

```

New in version 2019.2.0.

Ensure a virtual network exists.

#### Parameters

- **name** -- Name of the virtual network.
- **resource\_group** -- The resource group assigned to the virtual network.
- **address\_prefixes** -- A list of CIDR blocks which can be used by subnets within the virtual network.
- **dns\_servers** -- A list of DNS server addresses.
- **tags** -- A dictionary of strings can be passed as tag metadata to the virtual network object.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure virtual network exists:
azurearm_network.virtual_network_present:
- name: vnet1
- resource_group: group1
- address_prefixes:
 - '10.0.0.0/8'
 - '192.168.0.0/16'
- dns_servers:
 - '8.8.8.8'
- tags:
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}
- require:
 - azurearm_resource: Ensure resource group exists

```

## 21.19.18 salt.states.azurearm\_resource

Azure (ARM) Resource State Module

New in version 2019.2.0.

**maintainer** <devops@decisionlab.io>

**maturity** new

**depends**

- azure >= 2.0.0
- azure-common >= 1.1.8
- azure-mgmt >= 1.0.0
- azure-mgmt-compute >= 1.0.0
- azure-mgmt-network >= 1.7.1
- azure-mgmt-resource >= 1.1.0
- azure-mgmt-storage >= 1.0.0

- `azure-mgmt-web` `>= 0.32.0`
- `azure-storage` `>= 0.34.3`
- `msrestazure` `>= 0.4.21`

**platform** `linux`

**configuration** This module requires Azure Resource Manager credentials to be passed as a dictionary of keyword arguments to the `connection_auth` parameter in order to work properly. Since the authentication parameters are sensitive, it's recommended to pass them to the states via pillar.

Required provider parameters:

if using username and password:

- `subscription_id`
- `username`
- `password`

if using a service principal:

- `subscription_id`
- `tenant`
- `client_id`
- `secret`

Optional provider parameters:

**cloud\_environment:** Used to point the cloud driver to different API endpoints, such as Azure GovCloud. Possible val

- `AZURE_PUBLIC_CLOUD` (default)
- `AZURE_CHINA_CLOUD`
- `AZURE_US_GOV_CLOUD`
- `AZURE_GERMAN_CLOUD`

Example Pillar for Azure Resource Manager authentication:

```
azurearm:
 user_pass_auth:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 username: fletch
 password: 123pass
 mysubscription:
 subscription_id: 3287abc8-f98a-c678-3bde-326766fd3617
 tenant: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 client_id: ABCDEFAB-1234-ABCD-1234-ABCDEFABCDEF
 secret: XXXXXXXXXXXXXXXXXXXXXXXXXX
 cloud_environment: AZURE_PUBLIC_CLOUD
```

Example states using Azure Resource Manager authentication:

```
{% set profile = salt['pillar.get']('azurearm:mysubscription') %}
Ensure resource group exists:
 azurearm_resource.resource_group_present:
 - name: my_rg
```

(continues on next page)

(continued from previous page)

```

- location: westus
- tags:
 how_awesome: very
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}

Ensure resource group is absent:
azurearm_resource.resource_group_absent:
- name: other_rg
- connection_auth: {{ profile }}

```

```

salt.states.azurearm_resource.policy_assignment_absent(name, scope, connection_auth=None)

```

New in version 2019.2.0.

Ensure a policy assignment does not exist in the provided scope.

#### Parameters

- **name** -- Name of the policy assignment.
- **scope** -- The scope of the policy assignment.

**connection\_auth** A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```

salt.states.azurearm_resource.policy_assignment_present(name, scope, definition_name, display_name=None, description=None, assignment_type=None, parameters=None, connection_auth=None, **kwargs)

```

New in version 2019.2.0.

Ensure a security policy assignment exists.

#### Parameters

- **name** -- Name of the policy assignment.
- **scope** -- The scope of the policy assignment.
- **definition\_name** -- The name of the policy definition to assign.
- **display\_name** -- The display name of the policy assignment.
- **description** -- The policy assignment description.
- **assignment\_type** -- The type of policy assignment.
- **parameters** -- Required dictionary if a parameter is used in the policy rule.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```

Ensure policy assignment exists:
azurearm_resource.policy_assignment_present:
- name: testassign
- scope: /subscriptions/bc75htn-a0fhsi-349b-56gh-4fghti-f84852
- definition_name: testpolicy
- display_name: Test Assignment
- description: Test assignment for testing assignments.
- connection_auth: {{ profile }}

```

```

salt.states.azurearm_resource.policy_definition_absent(name, connection_auth=None)

```

New in version 2019.2.0.

Ensure a policy definition does not exist in the current subscription.

**Parameters**

- **name** -- Name of the policy definition.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

```
salt.states.azurearm_resource.policy_definition_present(name, policy_rule=None,
 policy_type=None,
 mode=None,
 display_name=None,
 description=None,
 metadata=None,
 parameters=None,
 policy_rule_json=None,
 policy_rule_file=None,
 template='jinja',
 source_hash=None,
 source_hash_name=None,
 skip_verify=False,
 connection_auth=None,
 **kwargs)
```

New in version 2019.2.0.

Ensure a security policy definition exists.

**Parameters**

- **name** -- Name of the policy definition.
- **policy\_rule** -- A YAML dictionary defining the policy rule. See [Azure Policy Definition documentation](#) for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used.
- **policy\_rule\_json** -- A text field defining the entirety of a policy definition in JSON. See [Azure Policy Definition documentation](#) for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **policy\_rule\_file** -- The source of a JSON file defining the entirety of a policy definition. See [Azure Policy Definition documentation](#) for details on the structure. One of `policy_rule`, `policy_rule_json`, or `policy_rule_file` is required, in that order of precedence for use if multiple parameters are used. Note that the `name` field in the JSON will override the `name` parameter in the state.
- **skip\_verify** -- Used for the `policy_rule_file` parameter. If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.
- **source\_hash** -- This can be a source hash string or the URI of a file that contains source hash strings.
- **source\_hash\_name** -- When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash.
- **policy\_type** -- The type of policy definition. Possible values are `NotSpecified`, `BuiltIn`, and `Custom`. Only used with the `policy_rule` parameter.
- **mode** -- The policy definition mode. Possible values are `NotSpecified`, `Indexed`, and `All`. Only used with the `policy_rule` parameter.
- **display\_name** -- The display name of the policy definition. Only used with the `policy_rule` parameter.
- **description** -- The policy definition description. Only used with the

- policy\_rule parameter.
- **metadata** -- The policy definition metadata defined as a dictionary. Only used with the policy\_rule parameter.
- **parameters** -- Required dictionary if a parameter is used in the policy rule. Only used with the policy\_rule parameter.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure policy definition exists:
 azurearm_resource.policy_definition_present:
 - name: testpolicy
 - display_name: Test Policy
 - description: Test policy for testing policies.
 - policy_rule:
 if:
 allOf:
 - equals: Microsoft.Compute/virtualMachines/write
 source: action
 - field: location
 in:
 - eastus
 - eastus2
 - centralus
 then:
 effect: deny
 - connection_auth: {{ profile }}
```

`salt.states.azurearm_resource.resource_group_absent(name, connection_auth=None)`

New in version 2019.2.0.

Ensure a resource group does not exist in the current subscription.

#### Parameters

- **name** -- Name of the resource group.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

`salt.states.azurearm_resource.resource_group_present(name, location, managed_by=None, tags=None, connection_auth=None, **kwargs)`

New in version 2019.2.0.

Ensure a resource group exists.

#### Parameters

- **name** -- Name of the resource group.
- **location** -- The Azure location in which to create the resource group. This value cannot be updated once the resource group is created.
- **managed\_by** -- The ID of the resource that manages this resource group. This value cannot be updated once the resource group is created.
- **tags** -- A dictionary of strings can be passed as tag metadata to the resource group object.
- **connection\_auth** -- A dict with subscription and authentication parameters to be used in connecting to the Azure Resource Manager API.

Example usage:

```
Ensure resource group exists:
 azurearm_resource.resource_group_present:
```

(continues on next page)

(continued from previous page)

```
- name: group1
- location: eastus
- tags:
 contact_name: Elmer Fudd Gantry
- connection_auth: {{ profile }}
```

### 21.19.19 salt.states.beacon

#### Management of the Salt beacons

New in version 2015.8.0.

```
ps:
 beacon.present:
 - save: True
 - enable: False
 - services:
 salt-master: running
 apache2: stopped

sh:
 beacon.present: []

load:
 beacon.present:
 - averages:
 1m:
 - 0.0
 - 2.0
 5m:
 - 0.0
 - 1.5
 15m:
 - 0.1
 - 1.0
```

```
.. versionadded:: 3000
```

Beginning in the 3000 release, multiple copies of a beacon can be configured using the ``beacon\_module`` parameter.

```
inotify_infs:
 beacon.present:
 - save: True
 - enable: True
 - files:
 /etc/infs.conf:
 mask:
 - create
 - delete
 - modify
 recurse: True
 auto_add: True
 - interval: 10
```

(continues on next page)

(continued from previous page)

```

- beacon_module: inotify
- disable_during_state_run: True

inotify_ntp:
 beacon.present:
 - save: True
 - enable: True
 - files:
 /etc/ntp.conf:
 mask:
 - create
 - delete
 - modify
 recurse: True
 auto_add: True
 - interval: 10
 - beacon_module: inotify
 - disable_during_state_run: True

```

**salt.states.beacon.absent**(*name*, *save=False*, *\*\*kwargs*)

Ensure beacon is absent.

**name** The name of the beacon that is ensured absent.

**save** True/False, if True the beacons.conf file be updated too. Default is False.

Example:

```

remove_beacon:
 beacon.absent:
 - name: ps
 - save: True

```

**salt.states.beacon.disabled**(*name*, *\*\*kwargs*)

Disable a beacon.

**name** The name of the beacon to disable.

Example:

```

disable_beacon:
 beacon.disabled:
 - name: psp

```

**salt.states.beacon.enabled**(*name*, *\*\*kwargs*)

Enable a beacon.

**name** The name of the beacon to enable.

Example:

```

enable_beacon:
 beacon.enabled:
 - name: ps

```

**salt.states.beacon.present**(*name*, *save=False*, *\*\*kwargs*)

Ensure beacon is configured with the included beacon data.

**name** The name of the beacon to ensure is configured.

**save** True/False, if True the beacons.conf file be updated too. Default is False.

Example:

```
ps_beacon:
 beacon.present:
 - name: ps
 - save: True
 - enable: False
 - services:
 salt-master: running
 apache2: stopped
```

### 21.19.20 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

maturity develop

platform f5\_bigip\_11.6

**salt.states.bigip.add\_pool\_member** (*hostname, username, password, name, member*)

A function to connect to a bigip device and add a new member to an existing pool.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to modify

**member** The member to add to the pool

**salt.states.bigip.create\_monitor** (*hostname, username, password, monitor\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a monitor.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

**salt.states.bigip.create\_node** (*hostname, username, password, name, address*)

Create a new node if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to create

**address** The address of the node

**salt.states.bigip.create\_pool** (*hostname, username, password, name, members=None, allow\_nat=None, allow\_snat=None, description=None, gateway\_failsafe\_device=None, ignore\_persisted\_weight=None, ip\_tos\_to\_client=None, ip\_tos\_to\_server=None, link\_qos\_to\_client=None, link\_qos\_to\_server=None, load\_balancing\_mode=None, min\_active\_members=None, min\_up\_members=None, min\_up\_members\_action=None, min\_up\_members\_checking=None, monitor=None, profiles=None, queue\_depth\_limit=None, queue\_on\_connection\_limit=None, queue\_time\_limit=None, reselect\_tries=None, service\_down\_action=None, slow\_ramp\_time=None*)

Create a new node if it does not already exist.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**members** List of members to be added to the pool

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**queue\_depth\_limit** [integer]

**queue\_on\_connection\_limit** [enabled | disabled]

**queue\_time\_limit** [integer]

**reselect\_tries** [integer]

**service\_down\_action** [drop | none | reselect | reset]

**slow\_ramp\_time** [integer]

**salt.states.bigip.create\_profile**(*hostname, username, password, profile\_type, name, \*\*kwargs*)

A function to connect to a bigip device and create a profile.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**profile\_type** The type of profile to create

**name** The name of the profile to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

Special Characters | , , and : must be escaped using \ when used within strings.

```
salt.states.bigip.create_virtual(hostname, username, password, name, destination,

     **vlan\_ids** [ list]  
     **enabled** [ true | false ]

**salt.states.bigip.delete\_monitor** (*hostname, username, password, monitor\_type, name*)

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to create  
**name** The name of the monitor to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

**salt.states.bigip.delete\_node** (*hostname, username, password, name*)

Delete an existing node.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node which will be deleted.

**salt.states.bigip.delete\_pool** (*hostname, username, password, name*)

Delete an existing pool.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool which will be deleted

**salt.states.bigip.delete\_pool\_member** (*hostname, username, password, name, member*)

Delete an existing pool member.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to be modified  
**member** The name of the member to delete from the pool

**salt.states.bigip.delete\_profile** (*hostname, username, password, profile\_type, name*)

Modify an existing profile. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to create  
**name** The name of the profile to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

**salt.states.bigip.delete\_virtual** (*hostname, username, password, name*)

Delete an existing virtual.

**hostname** The host/address of the bigip device

**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual which will be deleted

**salt.states.bigip.list\_monitor**(*hostname, username, password, monitor\_type, name*)

A function to list an existing monitor.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to list  
**name** The name of the monitor to list

**salt.states.bigip.list\_node**(*hostname, username, password, name*)

A function to connect to a bigip device and list a specific node.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the node to list.

**salt.states.bigip.list\_pool**(*hostname, username, password, name*)

A function to connect to a bigip device and list a specific pool.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to list.

**salt.states.bigip.list\_profile**(*hostname, username, password, profile\_type, name*)

A function to list an existing profile.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to list  
**name** The name of the profile to list

**salt.states.bigip.list\_virtual**(*hostname, username, password, name*)

A function to list a specific virtual.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the virtual to list

**salt.states.bigip.manage\_monitor**(*hostname, username, password, monitor\_type, name,*  
*\*\*kwargs*)

Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**monitor\_type** The type of monitor to create  
**name** The name of the monitor to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```
salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)
```

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to manage.

**address** The address of the node

**connection\_limit** [integer]

**description** [string]

**dynamic\_ratio**: [integer]

**logging** [enabled | disabled]

**monitor** [[name] | none | default]

**rate\_limit** [integer]

**ratio** [integer]

**session** [user-enabled | user-disabled]

**node\_state (state)** [user-down | user-up ]

```
salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)
```

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the pool to create

**allow\_nat** [yes | no]

**allow\_snat** [yes | no]

**description** [string]

**gateway\_failsafe\_device** [string]

**ignore\_persisted\_weight** [enabled | disabled]

**ip\_tos\_to\_client** [pass-through | [integer]]

**ip\_tos\_to\_server** [pass-through | [integer]]

**link\_qos\_to\_client** [pass-through | [integer]]

**link\_qos\_to\_server** [pass-through | [integer]]

**load\_balancing\_mode** [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

**min\_active\_members** [integer]

**min\_up\_members** [integer]

**min\_up\_members\_action** [failover | reboot | restart-all]

**min\_up\_members\_checking** [enabled | disabled]  
**monitor** [name]  
**profiles** [none | profile\_name]  
**queue\_depth\_limit** [integer]  
**queue\_on\_connection\_limit** [enabled | disabled]  
**queue\_time\_limit** [integer]  
**reselect\_tries** [integer]  
**service\_down\_action** [drop | none | reselect | reset]  
**slow\_ramp\_time** [integer]

**salt.states.bigip.manage\_pool\_members**(*hostname, username, password, name, members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**name** The name of the pool to modify  
**members** list of pool members to manage.

**salt.states.bigip.manage\_profile**(*hostname, username, password, profile\_type, name, \*\*kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device  
**username** The iControl REST username  
**password** The iControl REST password  
**profile\_type** The type of profile to create  
**name** The name of the profile to create  
**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

**salt.states.bigip.manage\_virtual**(*hostname, username, password, name, destination,*

```

salt.states.bigip.modify_monitor(hostname, username, password, monitor_type, name,
 **kwargs)

```

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**monitor\_type** The type of monitor to create

**name** The name of the monitor to create

**kwargs** [ arg=val ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```
salt.states.bigip.modify_node(hostname, username, password, name, connection_limit=None,
 description=None, dynamic_ratio=None, logging=None, mon-
 itor=None, rate_limit=None, ratio=None, session=None,
 node_state=None)
```

Modify an existing node. Only a node which already exists will be modified and only the parameters specified will be enforced.

**hostname** The host/address of the bigip device

**username** The iControl REST username

**password** The iControl REST password

**name** The name of the node to modify

 vlan_ids [list]
 enabled [true | false]

```

### 21.19.21 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```

/dev/sda:
 blockdev.tuned:
 - read-only: True

master-data:
 blockdev.tuned:
 - name: /dev/vg/master-data
 - read-only: True
 - read-ahead: 1024

```

New in version 2014.7.0.

`salt.states.blockdev.formatted(name, fs_type='ext4', force=False, **kwargs)`

Manage filesystems of partitions.

**name** The name of the block device

**fs\_type** The filesystem it should be formatted as

**force** Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned(name, **kwargs)`

Manage options of block device

**name** The name of the block device

**opts:**

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

## 21.19.22 salt.states.boto3\_elasticache module

### Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use <http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html> as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKRB08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKRB08H
 key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
 region: us-east-1
```

```
Ensure myelasticache exists:
 boto3_elasticache.present:
 - name: myelasticache
 - engine: redis
 - cache_node_type: cache.t1.micro
 - num_cache_nodes: 1
 - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKRB08H
 - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
Using a profile from pillars
Ensure myelasticache exists:
 boto3_elasticache.present:
 - name: myelasticache
 - engine: redis
 - cache_node_type: cache.t1.micro
 - num_cache_nodes: 1
 - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
```

(continues on next page)

(continued from previous page)

- **region:** us-east-1
- **profile:** myprofile

```
Passing in a profile
Ensure myelasticache exists:
 boto3_elasticache.present:
 - name: myelasticache
 - engine: redis
 - cache_node_type: cache.t1.micro
 - num_cache_nodes: 1
 - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkgjlsdfjajkghs
```

`salt.states.boto3_elasticache.cache_cluster_absent`(*name*, *wait*=600, *region*=None, *key*=None, *keyid*=None, *profile*=None, *\*\*args*)

Ensure a given cache cluster is deleted.

**name** Name of the cache cluster.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**CacheClusterId** The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**FinalSnapshotIdentifier** The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_elasticache.cache_cluster_present`(*name*, *wait*=900, *security\_groups*=None, *region*=None, *key*=None, *keyid*=None, *profile*=None, *\*\*args*)

Ensure a given cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

---

**CacheClusterId** The node group (shard) identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

---

**ReplicationGroupId** The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

**AZMode** Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

---

**Note:** This parameter is ONLY supported for Memcached cache clusters.

---

**PreferredAvailabilityZone** The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

**PreferredAvailabilityZones** A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

---

**Note:** This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

---

**NumCacheNodes** The initial (integer) number of cache nodes that the cache cluster has.

---

**Note:** For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

---

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at <https://aws.amazon.com/elasticache/pricing/>

---

**Note:**

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

---

**Engine** The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

**EngineVersion** The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

---

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

---

**CacheParameterGroupName** The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

**CacheSubnetGroupName** The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

---

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

---

**CacheSecurityGroupNames** A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

**SecurityGroupIds** One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**SnapshotName** The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

**Port** The port number on which each of the cache nodes accepts connections.

Default: 6379

**NotificationTopicArn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

---

**Note:** The Amazon SNS topic owner must be the same as the cache cluster owner.

---

**AutoMinorVersionUpgrade** This (boolean) parameter is currently disabled.

**SnapshotRetentionLimit** The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

---

**Note:** This parameter is ONLY valid if the Engine parameter is redis.

---

**AuthToken** The password used to access a password protected server.

Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

**CacheNodeIdsToRemove** A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

**NewAvailabilityZones** The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

**NotificationTopicStatus** The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None,
 key=None, keyid=None,
 profile=None, **args)
```

Ensure a given cache subnet group is deleted.

**name** Name of the cache subnet group.

**CacheSubnetGroupName** A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None,
 region=None, key=None,
 keyid=None, pro-
 file=None, **args)
```

Ensure cache subnet group exists.

**name** A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

**subnets** A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

**CacheSubnetGroupName** A name for the cache subnet group. This value is stored as a lowercase string.

Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**CacheSubnetGroupDescription** A description for the cache subnet group.

**SubnetIds** A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_absent(name, wait=600, re-
 gion=None, key=None,
 keyid=None, profile=None,
 **args)
```

Ensure a given replication group is deleted.

**name** Name of the replication group.

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**ReplicationGroupId** The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

**RetainPrimaryCluster** If set to true, all of the read replicas are deleted, but the primary node is retained.

**FinalSnapshotIdentifier** The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_present(name, wait=900, se-
 curity_groups=None,
 region=None, key=None,
 keyid=None, profile=None,
 **args)
```

Ensure a replication group exists and is in the given state.

**name** Name of replication group

**wait** Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

**security\_groups** One or more VPC security groups (names and/or IDs) associated with the cache cluster.

---

**Note:** This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

---

**ReplicationGroupId** The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

---

**Note:** In general this parameter is not needed, as 'name' is used if it's not provided.

---

**ReplicationGroupDescription** A user-created description for the replication group.

**PrimaryClusterId** The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

**AutomaticFailoverEnabled** Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group.

Default: False

---

**Note:** AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
  - Redis (cluster mode disabled): T1 and T2 node types.
  - Redis (cluster mode enabled): T2 node types.
- 

**NumCacheClusters** The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

**PreferredCacheClusterAZs** A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

---

**Note:** If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

---

**NumNodeGroups** An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

**ReplicasPerNodeGroup** An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

**NodeGroupConfiguration** A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fully details of the expected data layout of this param, see [http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create\\_replication\\_group](http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group)

**CacheNodeType** The compute and memory capacity of the nodes in the node group (shard). See <https://aws.amazon.com/elasticache/pricing/> for current sizing, prices, and constraints.

**Engine** The name of the cache engine to be used for the cache clusters in this replication group.

**EngineVersion** The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

---

**Note:** You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

---

**CacheParameterGroupName** The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

---

**Note:** If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

---

**CacheSubnetGroupName** The name of the cache subnet group to be used for the replication group.

---

**Note:** If you're going to launch your cluster in an Amazon VPC, you need to create a `s` group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

---

**CacheSecurityGroupNames** A list of cache security group names to associate with this replication group.

**SecurityGroupIds** One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

**Tags** A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

**SnapshotArns** A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

**SnapshotName** The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

**PreferredMaintenanceWindow** Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format `ddd:hh24:mi-ddd:hh24:mi` (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for `ddd` are: sun, mon, tue, wed, thu, fri, sat

Example: `sun:23:00-mon:01:30`

**Port** The port number on which each member of the replication group accepts connections.

**NotificationTopicArn** The ARN of an SNS topic to which notifications are sent.

---

**Note:** The SNS topic owner must be the same as the cache cluster owner.

---

**AutoMinorVersionUpgrade** This parameter is currently disabled.

**SnapshotRetentionLimit** The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

**SnapshotWindow** The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

---

**Note:** This parameter is only valid if the Engine parameter is redis.

---

**AuthToken** The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

**SnapshottingClusterId** The cache cluster ID that is used as the daily snapshot source for the replication group.

**NotificationTopicStatus** The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.23 salt.states.boto3\_elasticsearch module

#### Manage Elasticsearch Service

New in version Natrium.

**configuration** This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

**codeauthor** Herbert Buurman <herbert.buurman@ogd.nl>

**depends** boto3

**salt.states.boto3\_elasticsearch.absent**(*name*, *blocking=True*, *region=None*, *keyid=None*,  
*key=None*, *profile=None*)

Ensure the Elasticsearch Domain specified does not exist.

**Parameters**

- **name** (*str*) -- The name of the Elasticsearch domain to be made absent.
- **blocking** (*bool*) -- Whether or not the state should wait for the deletion to be completed. Default: True

New in version Natrium.

Example:

```
Remove Elasticsearch Domain:
boto3_elasticsearch.absent:
- name: my_domain
- region: eu-west-1
```

**salt.states.boto3\_elasticsearch.latest**(*name*, *minor\_only=True*, *region=None*, *keyid=None*,  
*key=None*, *profile=None*)

Ensures the Elasticsearch domain specifies runs on the latest compatible version of elasticsearch, upgrading it if it is not.

Note that this operation is blocking until the upgrade is complete.

**Parameters**

- **name** (*str*) -- The name of the Elasticsearch domain to upgrade.
- **minor\_only** (*bool*) -- Only upgrade to the latest minor version.

New in version Natrium.

Example:

The following example will ensure the elasticsearch domain `my_domain` is upgraded to the latest minor version. So if it is currently 5.1 it will be upgraded to 5.6.

```
Upgrade Elasticsearch Domain:
boto3_elasticsearch.latest:
- name: my_domain
- minor_only: True
- region: eu-west-1
```

**salt.states.boto3\_elasticsearch.present**(*name*, *elasticsearch\_version=None*, *elasticsearch\_cluster\_config=None*, *ebs\_options=None*,  
*access\_policies=None*, *snapshot\_options=None*, *vpc\_options=None*, *cognito\_options=None*,  
*encryption\_at\_rest\_options=None*, *node\_to\_node\_encryption\_options=None*,  
*advanced\_options=None*, *log\_publishing\_options=None*, *blocking=True*,  
*tags=None*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensure an Elasticsearch Domain exists.

**Parameters**

- **name** (*str*) -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

- **elasticsearch\_version** (*str*) -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- **elasticsearch\_cluster\_config** (*dict*) -- Dict specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (*str*): The instance type for an Elasticsearch cluster.
  - InstanceCount (*int*): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (*bool*): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (*bool*): Indicate whether zone awareness is enabled.
  - ZoneAwarenessConfig (*dict*): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - \* AvailabilityZoneCount (*int*): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
  - DedicatedMasterType (*str*): The instance type for a dedicated master node.
  - DedicatedMasterCount (*int*): Total number of dedicated master nodes, active and on standby, for the cluster.
- **ebs\_options** (*dict*) -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (*bool*): Specifies whether EBS-based storage is enabled.
  - VolumeType (*str*): Specifies the volume type for EBS-based storage.
  - VolumeSize (*int*): Integer to specify the size of an EBS volume.
  - Iops (*int*): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- **access\_policies** (*str or dict*) -- Dict or JSON string with the IAM access policy.
- **snapshot\_options** (*dict*) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (*int*): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- **vpc\_options** (*dict*) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (*list*): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (*list*): The list of security groups for the VPC endpoint.
- **cognito\_options** (*dict*) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (*bool*): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (*str*): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (*str*): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (*str*): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- **encryption\_at\_rest\_options** (*dict*) -- Dict specifying the encryption at rest options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (*bool*): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (*str*): Specifies the KMS Key ID for Encryption At Rest options.
- **node\_to\_node\_encryption\_options** (*dict*) -- Dict specifying the node to node encryption options. This option can only be used for the creation of a new Elasticsearch domain. Keys (case sensitive) in here are:
  - Enabled (*bool*): Specify True to enable node-to-node encryption.
- **advanced\_options** (*dict*) -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring ac-

cess to individual sub-resources. By default, the value is True. See <http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options> for more information.

- **log\_publishing\_options** (*dict*) -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX\_SLOW\_LOGS
  - SEARCH\_SLOW\_LOGS
  - ES\_APPLICATION\_LOGS
 The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.
- **blocking** (*bool*) -- Whether or not the state should wait for all operations (create/update/upgrade) to be completed. Default: True
- **tags** (*dict*) -- Dict of tags to ensure are present on the Elasticsearch domain.

New in version Natrium.

Example:

This will create an elasticsearch domain consisting of a single t2.small instance in the eu-west-1 region (Ireland) and will wait until the instance is available before returning from the state.

```
Create new domain:
boto3_elasticsearch.present:
- name: my_domain
- elasticsearch_version: '5.1'
- elasticsearch_cluster_config:
 InstanceType: t2.small.elasticsearch
 InstanceCount: 1
 DedicatedMasterEnabled: False
 ZoneAwarenessEnabled: False
- ebs_options:
 EBSEnabled: True
 VolumeType: gp2
 VolumeSize: 10
- snapshot_options:
 AutomatedSnapshotStartHour: 3
- vpc_options:
 SubnetIds:
 - subnet-12345678
 SecurityGroupIds:
 - sg-12345678
- node_to_node_encryption_options:
 Enabled: False
- region: eu-west-1
- tags:
 foo: bar
 baz: qux
```

```
salt.states.boto3_elasticsearch.tagged(name, tags=None, replace=False, region=None,
 keyid=None, key=None, profile=None)
```

Ensures the Elasticsearch domain has the tags provided. Adds tags to the domain unless `replace` is set to True, in which case all existing tags will be replaced with the tags provided in `tags`. (This will remove all tags if `replace` is True and `tags` is empty).

Parameters

- **name** (*str*) -- The Elasticsearch domain to work with.

- **tags** (*dict*) -- The tags to add to/replace on the Elasticsearch domain.
- **replace** (*bool*) -- Whether or not to replace (True) all existing tags on the Elasticsearch domain, or add (False) tags to the ES domain.

New in version Natrium.

`salt.states.boto3_elasticsearch.upgraded`(*name*, *elasticsearch\_version*, *blocking=True*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Ensures the Elasticsearch domain specified runs on the specified version of elasticsearch. Only upgrades are possible as downgrades require a manual snapshot and an S3 bucket to store them in.

Note that this operation is blocking until the upgrade is complete.

#### Parameters

- **name** (*str*) -- The name of the Elasticsearch domain to upgrade.
- **elasticsearch\_version** (*str*) -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

New in version Natrium.

Example:

```
Upgrade Elasticsearch Domain:
boto3_elasticsearch.upgraded:
- name: my_domain
- elasticsearch_version: '7.2'
- region: eu-west-1
```

## 21.19.24 salt.states.boto3\_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgshs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgshs
 region: us-east-1
```

```
An exciting new AWS Route 53 Hosted Zone:
boto_route53.hosted_zone_present:
- Name: example.com.
- PrivateZone: true
- VPCs:
 - VPCName: MyLittleVPC
```

(continues on next page)

(continued from previous page)

```

 VPCRegion: us-east-1
 - VPCId: vpc-12345678
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdflgjsdfjajkghs

mycnamerecord:
 boto_route53_rr_present:
 - Name: test.example.com.
 - ResourceRecords:
 - my-elb.us-east-1.elb.amazonaws.com.
 - DomainName: example.com.
 - TTL: 60
 - Type: CNAME
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdflgjsdfjajkghs

```

**salt.states.boto3\_route53.hosted\_zone\_absent**(*name*, *Name=None*, *PrivateZone=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of *name* will be used.

**PrivateZone** Set True if deleting a private hosted zone.

**salt.states.boto3\_route53.hosted\_zone\_present**(*name*, *Name=None*, *PrivateZone=False*, *CallerReference=None*, *Comment=None*, *VPCs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a hosted zone exists with the given attributes.

**name** The name of the state definition.

**Name** The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of *name* will be used.

**PrivateZone** Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

**Comment** Any comments you want to include about the hosted zone.

**CallerReference** A unique string that identifies the request and that allows `create_hosted_zone()` calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same *CallerReference*. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

**VPCs** A list of dicts, each dict composed of a *VPCRegion*, and either a *VPCId* or a *VPCName*. Note that this param is ONLY used if *PrivateZone* == True

**VPCId** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with *VPCName*.

**VPCName** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with *VPCId*.

**VPCRegion** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from *VPCId* or *VPCName*, if possible. This will fail if a given *VPCName* exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for *VPCRegion*.

`salt.states.boto3_route53.rr_absent` (*name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 record is deleted.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId** The ID of the zone to delete the record from. Exclusive with DomainName.

**DomainName** The domain name of the zone to delete the record from. Exclusive with HostedZoneId.

**PrivateZone** Set to True if the RR to be removed is in a private zone, False if public.

**Name** Name of the resource record.

**Type** The record type (A, NS, MX, TXT, etc.)

**SetIdentifier** Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

`salt.states.boto3_route53.rr_present` (*name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, Weight=None, Region=None, Geolocation=None, Failover=None, TTL=None, ResourceRecords=None, AliasTarget=None, HealthCheckId=None, TrafficPolicyInstanceId=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 record is present.

**name** The name of the state definition. This will be used for Name if the latter is not provided.

**HostedZoneId** The ID of a zone to create the record in. Exclusive with DomainName.

**DomainName** The domain name of a zone to create the record in. Exclusive with HostedZoneId.

**PrivateZone** Set to True if the resource record should be in a private zone, False if public.

**Name** Name of the Route 53 resource record being managed.

**Type** The record type (A, NS, MX, TXT, etc.)

**SetIdentifier** Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

**Weight** Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record

sets. For more information, see [Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover](#) in the Amazon Route 53 Developer Guide.

**Region** Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

**GeoLocation** Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a Type of A and a ContinentCode of AF.

```
ContinentCode
 The two-letter code for the continent.
 Valid values: AF | AN | AS | EU | OC | NA | SA
 Constraint: Specifying ContinentCode with either CountryCode or
 → SubdivisionCode
 returns an InvalidInput error.
CountryCode
 The two-letter code for the country.
SubdivisionCode
 The code for the subdivision, for example, a state in the United States
 → or a
 province in Canada.
```

#### Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value \* in the CountryCode element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of CountryCode is \*, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you don't create a \* resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.
- You can't create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

**TTL** The resource record cache time to live (TTL), in seconds. Note the following:

- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type.

Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

**ResourceRecords** A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see [Supported DNS Resource Record Types](#) in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

```
'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
```

This tells salt to lookup an EC2 instance with a tag 'some\_tag\_name' which has the value 'some\_string' and substitute the 'some\_instance\_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to `getattr(instance, 'attribute')` as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automatically create Route 53 records for them.

**AliasTarget** The rules governing how to define an AliasTarget for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the [Boto 3 Route 53 page](#) and/or the [AWS Route 53 docs](#) and suss them for yourself - I sure won't claim to understand them particularly well.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

### 21.19.25 salt.states.boto3\_sns module

#### Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsd fjkgHwupUjasdf lkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsd fjkgHwupUjasdf lkdfklgjsdfjajkghs
 region: us-east-1
```

```
mytopic:
 boto3_sns.topic_present:
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

### Using a profile from pillars

```
mytopic:
 boto3_sns.topic_present:
 - region: us-east-1
 - profile: mysnsprofile
```

### Passing in a profile

```
mytopic:
 boto3_sns.topic_present:
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto3_sns.topic_absent` (*name*, *unsubscribe=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named sns topic is deleted.

**name** Name of the SNS topic.

**unsubscribe** If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto3_sns.topic_present` (*name*, *subscriptions=None*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

**name** Name of the SNS topic.

**subscriptions** List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
subscriptions:
- Protocol: https
 Endpoint: https://www.example.com/sns-endpoint
- Protocol: sqs
 Endpoint: arn:aws:sqs:us-west-2:123456789012:MyQueue
```

**attributes** Dictionary of attributes to set on the SNS topic Valid attribute keys are:

- **Policy**: the JSON serialization of the topic's access control policy
- **DisplayName**: the human-readable name used in the "From" field for notifications to email and email-json endpoints
- **DeliveryPolicy**: the JSON serialization of the topic's delivery policy

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.26 salt.states.boto\_apigateway module

#### Manage Apigateway Rest APIs

New in version 2016.11.0.

##### depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

##### Ensure Apigateway API exists:

###### boto\_apigateway.present:

- **name:** myfunction
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs

`salt.states.boto_apigateway.absent(name, api_name, stage_name, nuke_api=False, region=None, key=None, keyid=None, profile=None)`

Ensure the stage\_name associated with the given api\_name deployed by boto\_apigateway's present state is removed. If the currently associated deployment to the given stage\_name has no other stages associated with it, the deployment will also be removed.

**name** Name of the swagger file in YAML format

**api\_name** Name of the rest api on AWS ApiGateway to ensure is absent.

**stage\_name** Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage\_name has no other stages associated with it, the deployment will also be removed.

**nuke\_api** If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage\_name is removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name,
 api_key_required, lambda_integration_role,
 lambda_region=None, stage_variables=None, re-
 gion=None, key=None, keyid=None, profile=None,
 lambda_funcname_format='{stage}_{api}_{resource}_{method}',
 authorization_type='NONE', er-
 ror_response_template=None, response_template=None)
```

Ensure the specified api\_name with the corresponding swaggerfile is deployed to the given stage\_name in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{
 "api_name": api_name,
 "swagger_file": basename_of_swagger_file
 "swagger_file_md5sum": md5sum_of_swagger_file,
 "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided lambda\_funcname\_format parameters:

- the default lambda\_funcname\_format is a string with the following substitutable keys: "{stage}\_{api}\_{resource}\_{method}". The user can choose to reorder the known keys.
- the stage key corresponds to the stage\_name passed in.
- the api key corresponds to the api\_name passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.

For the default lambda\_funcname\_format, given the following input:

```
api_name = ' Test Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: 'test\_service\_alpha\_a\_b\_c\_post'

The canonicalization of these input parameters is done in the following order:

1. lambda\_funcname\_format is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with '\_'
5. consecutive '\_' are replaced with '\_'

Please note that for error response handling, the swagger file must have an error response model with the fol-

lowing schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in errorMessage field to aid the response mapping from Lambda to the proper error return status codes.

```

Error:
 type: object
 properties:
 stackTrace:
 type: array
 items:
 type: array
 items:
 type: string
 description: call stack
 errorType:
 type: string
 description: error type
 errorMessage:
 type: string
 description: |
 Error message, will be matched based on pattern.
 If no pattern is specified, the default pattern used for response mapping
 ↪ will be +*.

```

**name** The name of the state definition

**api\_name** The name of the rest api that we want to ensure exists in AWS API Gateway

**swagger\_file** Name of the location of the swagger rest api definition file in YAML format.

**stage\_name** Name of the stage we want to be associated with the given api\_name and swagger\_file definition

**api\_key\_required** True or False - whether the API Key is required to call API methods

**lambda\_integration\_role** The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

**lambda\_region** The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. lambda\_region as passed in (is not None)
2. if lambda\_region is None, use the region as if a boto\_lambda function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by boto\_apigateway functions, a final lookup will be attempted using the boto\_apigateway region.

**stage\_variables** A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. {'string': 'string'}

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**lambda\_funcname\_format** Please review the earlier example for the usage. The only substituable keys in the funcname format are {stage}, {api}, {resource}, {method}. Any other keys or positional substitution parameters will be flagged as an invalid input.

**authorization\_type** This field can be either 'NONE', or 'AWS\_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'

**error\_response\_template** String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: <http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html>

If set to None, the following default value is used:

```
'#set($inputRoot = $input.path('$'))\n'
'{\n'
' "errorMessage" : "$inputRoot.errorMessage",\n'
' "errorType" : "$inputRoot.errorType",\n'
' "stackTrace" : [\n'
'#foreach($stackTrace in $inputRoot.stackTrace)\n'
' [\n'
'#foreach($elem in $stackTrace)\n'
' "$elem"\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
']\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
']\n'
```

New in version 2017.7.0.

**response\_template** String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({} ) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

**salt.states.boto\_apigateway.usage\_plan\_absent**(*name*, *plan\_name*, *region=None*,  
*key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to remove

```
usage plan absent:
boto_apigateway.usage_plan_absent:
- plan_name: my_usage_plan
- profile: my_profile
```

**salt.states.boto\_apigateway.usage\_plan\_association\_absent**(*name*, *plan\_name*,  
*api\_stages*, *re-*  
*gion=None*, *key=None*,  
*keyid=None*, *pro-*  
*file=None*)

Ensures usage plan identified by name is removed from provided api\_stages If a plan is associated to stages not listed in api\_stages parameter, those associations remain intact.

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to use

**api\_stages** list of dictionaries, where each dictionary consists of the following keys:

**apiId** apiId of the api to detach usage plan from

**stage** stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
boto_apigateway.usage_plan_association_absent:
- plan_name: my_plan
- api_stages:
- apiId: 9kb0404ec0
stage: my_stage
```

(continues on next page)

(continued from previous page)

```

- apiId: l9v7o2aj90
 stage: my_stage
- profile: my_profile

```

```

salt.states.boto_apigateway.usage_plan_association_present(name, plan_name,
 api_stages, region=None, key=None,
 keyid=None, profile=None)

```

Ensures usage plan identified by name is added to provided api\_stages

New in version 2017.7.0.

**name** name of the state

**plan\_name** name of the plan to use

**api\_stages** list of dictionaries, where each dictionary consists of the following keys:

**apiId** apiId of the api to attach usage plan to

**stage** stage name of the api to attach usage plan to

```

UsagePlanAssociationPresent:
 boto_apigateway.usage_plan_association_present:
 - plan_name: my_plan
 - api_stages:
 - apiId: 9kb0404ec0
 stage: my_stage
 - apiId: l9v7o2aj90
 stage: my_stage
 - profile: my_profile

```

```

salt.states.boto_apigateway.usage_plan_present(name, plan_name, description=None,
 throttle=None, quota=None, re-
 gion=None, key=None, keyid=None,
 profile=None)

```

Ensure the specified usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

**name** name of the state

**plan\_name** [Required] name of the usage plan

**throttle** [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

**rateLimit** rate per second at which capacity bucket is populated

**burstLimit** maximum rate allowed

**quota** [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

**limit** [Required] number of calls permitted per quota period

**offset** [Optional] number of calls to be subtracted from the limit at the beginning of the period

**period** [Required] period to which quota applies. Must be DAY, WEEK or MONTH

```

UsagePlanPresent:
 boto_apigateway.usage_plan_present:
 - plan_name: my_usage_plan
 - throttle:
 rateLimit: 70
 burstLimit: 100
 - quota:
 limit: 1000

```

(continues on next page)

(continued from previous page)

```

 offset: 0
 period: DAY
- profile: my_profile

```

## 21.19.27 salt.states.boto\_asg

### Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```

asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgshs

```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```

myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgshs
 region: us-east-1

```

```

Ensure myasg exists:
boto_asg.present:
- name: myasg
- launch_config_name: mylc
- availability_zones:
 - us-east-1a
 - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
 - myelb
- suspended_processes:
 - AddToLoadBalancer
 - AlarmNotification
- scaling_policies:
 - adjustment_type: ChangeInCapacity
 - as_name: api-production-iad
 - cooldown: 1800
 - min_adjustment_step: None
 - name: ScaleDown
 - scaling_adjustment: -1

```

(continues on next page)

(continued from previous page)

```

- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs

Using a profile from pillars.
Ensure myasg exists:
 boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1
 - desired_capacity: 1
 - load_balancers:
 - myelb
 - profile: myprofile

Passing in a profile.
Ensure myasg exists:
 boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1
 - desired_capacity: 1
 - load_balancers:
 - myelb
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
 region: us-east-1

Deleting an autoscale group with running instances.
Ensure myasg is deleted:
 boto_asg.absent:
 - name: myasg
 - # If instances exist, we must force the deletion of the asg.
 - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
 boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1

```

(continues on next page)

(continued from previous page)

```

- desired_capacity: 1
- load_balancers:
 - myelb
- profile: myprofile
- alarms:
 CPU:
 name: 'ASG CPU **MANAGED BY SALT**'
 attributes:
 metric: CPUUtilization
 namespace: AWS/EC2
 statistic: Average
 comparison: '>='
 threshold: 65.0
 period: 60
 evaluation_periods: 30
 unit: null
 description: 'ASG CPU'
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_asg\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
 CPU:
 name: 'ASG CPU **MANAGED BY SALT**'
 attributes:
 metric: CPUUtilization
 namespace: AWS/EC2
 statistic: Average
 comparison: '>='
 threshold: 65.0
 period: 60
 evaluation_periods: 30
 unit: null
 description: 'ASG CPU'
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
 boto_asg.present:
 - name: myasg
 - launch_config_name: mylc
 - availability_zones:
 - us-east-1a
 - us-east-1b
 - min_size: 1
 - max_size: 1
 - desired_capacity: 1
 - load_balancers:

```

(continues on next page)

(continued from previous page)

```

- myelb
- profile: myprofile
- alarms_from_pillar: my_asg_alarm
override CPU:attributes:threshold
- alarms:
 CPU:
 attributes:
 threshold: 50.0

```

**salt.states.boto\_asg.absent**(*name, force=False, region=None, key=None, keyid=None, profile=None, remove\_lc=False*)

Ensure the named autoscale group is deleted.

**name** Name of the autoscale group.

**force** Force deletion of autoscale group.

**remove\_lc** Delete the launch config as well.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_asg.present**(*name, launch\_config\_name, availability\_zones, min\_size, max\_size, launch\_config=None, desired\_capacity=None, load\_balancers=None, default\_cooldown=None, health\_check\_type=None, health\_check\_period=None, placement\_group=None, vpc\_zone\_identifier=None, subnet\_names=None, tags=None, termination\_policies=None, termination\_policies\_from\_pillar='boto\_asg\_termination\_policies', suspended\_processes=None, scaling\_policies=None, scaling\_policies\_from\_pillar='boto\_asg\_scaling\_policies', scheduled\_actions=None, scheduled\_actions\_from\_pillar='boto\_asg\_scheduled\_actions', alarms=None, alarms\_from\_pillar='boto\_asg\_alarms', region=None, key=None, keyid=None, profile=None, notification\_arn=None, notification\_arn\_from\_pillar='boto\_asg\_notification\_arn', notification\_types=None, notification\_types\_from\_pillar='boto\_asg\_notification\_types'*)

Ensure the autoscale group exists.

**name** Name of the autoscale group.

**launch\_config\_name** Name of the launch config to use for the group. Or, if **launch\_config** is specified, this will be the launch config name's prefix. (see below)

**launch\_config** A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the **launch\_config\_name** followed by a hyphen followed by a hash of the **launch\_config** dict contents. Example:

```

my_asg:
 boto_asg.present:
 - launch_config:
 - ebs_optimized: false
 - instance_profile_name: my_iam_profile
 - kernel_id: ''
 - ramdisk_id: ''
 - key_name: my_ssh_key
 - image_name: aws2015091-hvm

```

(continues on next page)

(continued from previous page)

```
- instance_type: c3.xlarge
- instance_monitoring: false
- security_groups:
 - my_sec_group_01
 - my_sec_group_02
```

**availability\_zones** List of availability zones for the group.

**min\_size** Minimum size of the group.

**max\_size** Maximum size of the group.

**desired\_capacity** The desired capacity of the group.

**load\_balancers** List of load balancers for the group. Once set this can not be updated (Amazon restriction).

**default\_cooldown** Number of seconds after a Scaling Activity completes before any further scaling activities can start.

**health\_check\_type** The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

**health\_check\_period** Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

**placement\_group** Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

**vpc\_zone\_identifier** A list of the subnet identifiers of the Virtual Private Cloud.

**subnet\_names** For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with `vpc_zone_identifier`.

**tags** A list of tags. Example:

```
- key: 'key'
 value: 'value'
 propagate_at_launch: true
```

**termination\_policies** A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

**termination\_policies\_from\_pillar**: name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

**suspended\_processes** List of processes to be suspended. see [http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US\\_SuspendResume.html](http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html)

**scaling\_policies** List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

**scaling\_policies\_from\_pillar**: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

**scheduled\_actions**: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
 scale_up_at_10:
 desired_capacity: 4
 min_size: 3
 max_size: 5
 recurrence: "0 9 * * 1-5"
 scale_down_at_7:
 desired_capacity: 1
 min_size: 1
```

(continues on next page)

(continued from previous page)

```
max_size: 1
recurrence: "0 19 * * 1-5"
```

**scheduled\_actions\_from\_pillar:** name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

**alarms:** a dictionary of name->`boto_cloudwatch_alarm` sections to be associated with this ASG. All attributes should be specified except for `dimension` which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include `":self:"` this will be replaced with the asg name. For example, `alarm_actions` reading `"[scaling_policy:self:ScaleUp]"` will map to the arn for this asg's scaling policy named `"ScaleUp"`. In addition, any alarms that have only `scaling_policy` as actions will be ignored if `min_size` is equal to `max_size` for this ASG.

**alarms\_from\_pillar:** name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**notification\_arn** The AWS arn that notifications will be sent to

**notification\_arn\_from\_pillar** name of the pillar dict that contains `notification_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

**notification\_types** A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`
- `autoscaling:EC2_INSTANCE_LAUNCH_ERROR`
- `autoscaling:EC2_INSTANCE_TERMINATE`
- `autoscaling:EC2_INSTANCE_TERMINATE_ERROR`
- `autoscaling:TEST_NOTIFICATION`

**notification\_types\_from\_pillar** name of the pillar dict that contains `notification_types` settings. `notification_types` defined for this specific state will override those from the pillar.

### 21.19.28 salt.states.boto\_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

**depends** boto

**configuration** This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgghs
```

```
stack-present:
 boto_cfn.present:
 - name: mystack
 - template_body: salt://base/mytemplate.json
```

(continues on next page)

(continued from previous page)

```
- disable_rollback: true
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
stack-absent:
 boto_cfn.absent:
 - name: mystack
```

**salt.states.boto\_cfn.absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is absent.

*name* (string) – The name of the stack to delete.

*region* (string) - Region to connect to.

*key* (string) - Secret key to be used.

*keyid* (string) - Access key to be used.

*profile* (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_cfn.present**(*name*, *template\_body=None*, *template\_url=None*, *parameters=None*, *notification\_arns=None*, *disable\_rollback=None*, *timeout\_in\_minutes=None*, *capabilities=None*, *tags=None*, *on\_failure=None*, *stack\_policy\_body=None*, *stack\_policy\_url=None*, *use\_previous\_template=None*, *stack\_policy\_during\_update\_body=None*, *stack\_policy\_during\_update\_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is present.

*name* (string) - Name of the stack.

*template\_body* (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

*template\_url* (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

*parameters* (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

*notification\_arns* (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the [SNS\\_console](#) or your Command Line Interface (CLI).

*disable\_rollback* (bool) – Indicates whether or not to rollback on failure.

*timeout\_in\_minutes* (integer) – The amount of time that can pass before the stack status becomes CREATE\_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

*capabilities* (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY\_IAM'.

*tags* (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

*on\_failure* (string) – Determines what action will be taken if stack creation fails. This must be one of: DO\_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

`stack_policy_body` (string) – Structure containing the stack policy body. Can also be loaded from a file by using `salt://`.

`stack_policy_url` (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyBody` and `StackPolicyURL`, only `StackPolicyBody` is used.

`use_previous_template` (boolean) – Used only when templates are not the same. Set to `True` to use the previous template instead of uploading a new one via `TemplateBody` or `TemplateURL`.

`stack_policy_during_update_body` (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used. Can also be loaded from a file by using `salt://`.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

### 21.19.29 salt.states.boto\_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them, either in a pillar file or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgghs
```

It's also possible to specify `key`, `keyid`, and `region` via a profile, either passed in as a dict, or a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkgghs
 region: us-east-1
```

```
aws:
 region:
 us-east-1:
 profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```
key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
region: us-east-1
```

**depends** boto3

**salt.states.boto\_cloudfront.present**(*name, config, tags, region=None, key=None, keyid=None, profile=None*)

Ensure the CloudFront distribution is present.

**name** (string) Name of the CloudFront distribution

**config** (dict) Configuration for the distribution

**tags** (dict) Tags to associate with the distribution

**region** (string) Region to connect to

**key** (string) Secret key to use

**keyid** (string) Access key to use

**profile** (dict or string) A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:

```
Manage my_distribution CloudFront distribution:
boto_cloudfront.present:
- name: my_distribution
- config:
 Comment: 'partial config shown, most parameters elided'
 Enabled: True
- tags:
 testing_key: testing_value
```

### 21.19.30 salt.states.boto\_cloudtrail module

#### Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
Ensure trail exists:
 boto_cloudtrail.present:
 - Name: mytrail
 - S3BucketName: mybucket
 - S3KeyPrefix: prefix
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

```
salt.states.boto_cloudtrail.absent(name, Name, region=None, key=None, keyid=None, profile=None)
```

Ensure trail with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the trail.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cloudtrail.present(name, Name, S3BucketName, S3KeyPrefix=None,
 SnsTopicName=None, IncludeGlobalServiceEvents=True,
 IsMultiRegionTrail=None, EnableLogFileValidation=False,
 CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None,
 KmsKeyId=None, LoggingEnabled=True, Tags=None, region=None,
 key=None, keyid=None, profile=None)
```

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the trail.

**S3BucketName** Specifies the name of the Amazon S3 bucket designated for publishing log files.

**S3KeyPrefix** Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

**SnsTopicName** Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

**IncludeGlobalServiceEvents** Specifies whether the trail is publishing events from global services such as IAM to the log files.

**EnableLogFileValidation** Specifies whether log file integrity validation is enabled. The default is false.

**CloudWatchLogsLogGroupArn** Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

**CloudWatchLogsRoleArn** Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

**KmsKeyId** Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be a an alias name prefixed by "alias/", a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

**LoggingEnabled** Whether logging should be enabled for the trail

**Tags** A dictionary of tags that should be set on the trail

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.31 salt.states.boto\_cloudwatch\_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjakghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdflkdfklgjsdfjakghs
 region: us-east-1
```

```
my test alarm:
 boto_cloudwatch_alarm.present:
 - name: my test alarm
 - attributes:
 metric: ApproximateNumberOfMessagesVisible
 namespace: AWS/SQS
 statistic: Average
 comparison: ">="
 threshold: 20000.0
 period: 60
 evaluation_periods: 1
 description: test alarm via salt
 dimensions:
 QueueName:
 - the-sqs-queue-name
 alarm_actions:
 - arn:aws:sns:us-east-1:1111111:myalerting-action
```

**salt.states.boto\_cloudwatch\_alarm.absent** (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named cloudwatch alarm is deleted.

**name** Name of the alarm.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.present`(*name*, *attributes*, *region=None*, *key=None*,  
*keyid=None*, *profile=None*)

Ensure the cloudwatch alarm exists.

**name** Name of the alarm

**attributes** A dict of key/value cloudwatch alarm attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.32 salt.states.boto\_cloudwatch\_event module

#### Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

```
Ensure event rule exists:
boto_cloudwatch_event.present:
- Name: mytrail
- ScheduleExpression: 'rate(120 minutes)'
- State: 'DISABLED'
- Targets:
 - Id: "target1"
 Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
 Input: '{"arbitrary": "json"}'
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

```
salt.states.boto_cloudwatch_event.absent(name, Name=None, region=None, key=None,
 keyid=None, profile=None)
```

Ensure CloudWatch event rule with passed properties is absent.

**name** The name of the state definition.

**Name** Name of the event rule. Defaults to the value of the 'name' param if not provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cloudwatch_event.present(name, Name=None, ScheduleExpression=None,
 EventPattern=None, Description=None,
 RoleArn=None, State=None, Targets=None,
 region=None, key=None, keyid=None, profile=None)
```

Ensure trail exists.

**name** The name of the state definition

**Name** Name of the event rule. Defaults to the value of the 'name' param if not provided.

**ScheduleExpression** The scheduling expression. For example, `cron(0 20 * * ? *)`, "rate(5 minutes)"

**EventPattern** The event pattern.

**Description** A description of the rule

**State** Indicates whether the rule is ENABLED or DISABLED.

**RoleArn** The Amazon Resource Name (ARN) of the IAM role associated with the rule.

**Targets** A list of rresources to be invoked when the rule is triggered.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.33 salt.states.boto\_cognitoidentity module

#### Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

**Ensure function exists:****boto\_cognitoidentity.pool\_present:**

- **PoolName:** my\_identity\_pool
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```
salt.states.boto_cognitoidentity.pool_absent(name, IdentityPoolName, RemoveAll-
 Matched=False, region=None, key=None,
 keyid=None, profile=None)
```

Ensure cognito identity pool with passed properties is absent.

**name** The name of the state definition.

**IdentityPoolName** Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

**RemoveAllMatched** If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, Authenticat-
 edRole, AllowUnauthenticatedIdenti-
 ties=False, UnauthenticatedRole=None,
 SupportedLoginProviders=None, Devel-
 operProviderName=None, OpenIdCon-
 nectProviderARNs=None, region=None,
 key=None, keyid=None, profile=None)
```

Ensure Cognito Identity Pool exists.

**name** The name of the state definition

**IdentityPoolName** Name of the Cognito Identity Pool

**AuthenticatedRole** An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

**AllowUnauthenticatedIdentities** Whether to allow anonymous user identities

**UnauthenticatedRole** An IAM role name or ARN that will be associated with anonymous user identities

**SupportedLoginProviders** A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

**DeveloperProviderName** A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

**OpenIdConnectProviderARNs** A list or pillar name that contains a list of OpenID Connect provider ARNs.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.34 salt.states.boto\_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure daily data pipeline exists:
boto_datapipeline.present:
- name: my-datapipeline
- pipeline_objects:
 DefaultSchedule:
 name: Every 1 day
 fields:
 period: 1 Day
 type: Schedule
 startAt: FIRST_ACTIVATION_DATE_TIME
- parameter_values:
 myDDBTableName: my-dynamo-table
```

`salt.states.boto_datapipeline.absent(name, region=None, key=None, keyid=None, profile=None)`

Ensure a pipeline with the service\_name does not exist

**name** Name of the service to ensure a data pipeline does not exist for.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_datapipeline.present(name, pipeline_objects=None, pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects', parameter_objects=None, parameter_objects_from_pillars='boto_datapipeline_parameter_objects', parameter_values=None, parameter_values_from_pillars='boto_datapipeline_parameter_values', region=None, key=None, keyid=None, profile=None)`

Ensure the data pipeline exists with matching definition.

**name** Name of the service to ensure a data pipeline exists for.

**pipeline\_objects** Pipeline objects to use. Will override objects read from pillars.  
**pipeline\_objects\_from\_pillars** The pillar key to use for lookup.  
**parameter\_objects** Parameter objects to use. Will override objects read from pillars.  
**parameter\_objects\_from\_pillars** The pillar key to use for lookup.  
**parameter\_values** Parameter values to use. Will override values read from pillars.  
**parameter\_values\_from\_pillars** The pillar key to use for lookup.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.35 salt.states.boto\_dynamodb

#### Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgghs
 region: us-east-1
```

#### Ensure DynamoDB table does not exist:

```
boto_dynamodb.absent:
- table_name: new_table
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgghs
- region: us-east-1
```

#### Ensure DynamoDB table exists:

```
boto_dynamodb.present:
- table_name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
```

(continues on next page)

(continued from previous page)

```

- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflgjsdfjajkghs
- region: us-east-1
- local_indexes:
 - index:
 - name: "primary_id_end_timestamp_index"
 - hash_key: primary_id
 - hash_key_data_type: N
 - range_key: end_timestamp
 - range_key_data_type: N
- global_indexes:
 - index:
 - name: "name_end_timestamp_index"
 - hash_key: name
 - hash_key_data_type: S
 - range_key: end_timestamp
 - range_key_data_type: N
 - read_capacity_units: 3
 - write_capacity_units: 4

```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

#### Ensure DynamoDB table exists:

```

boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
 ConsumedWriteCapacityUnits:
 name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
 attributes:
 metric: ConsumedWriteCapacityUnits
 namespace: AWS/DynamoDB
 statistic: Sum
 comparison: '>='
 # threshold_percent is used to calculate the actual threshold
 # based on the provisioned capacity for the table.
 threshold_percent: 0.75
 period: 300
 evaluation_periods: 2
 unit: Count
 description: 'DynamoDB ConsumedWriteCapacityUnits'
 alarm_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflgjsdfjajkghs
- region: us-east-1

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_dynamodb\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
boto_dynamodb_alarms:
ConsumedWriteCapacityUnits:
 name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
 attributes:
 metric: ConsumedWriteCapacityUnits
 namespace: AWS/DynamoDB
 statistic: Sum
 comparison: '>='
 # threshold_percent is used to calculate the actual threshold
 # based on the provisioned capacity for the table.
 threshold_percent: 0.75
 period: 300
 evaluation_periods: 2
 unit: Count
 description: 'DynamoDB ConsumedWriteCapacityUnits'
 alarm_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:1234:my-alarm']

Ensure DynamoDB table exists:
boto_dynamodb.present:
 - name: new_table
 - read_capacity_units: 1
 - write_capacity_units: 2
 - hash_key: primary_id
 - hash_key_data_type: N
 - range_key: start_timestamp
 - range_key_data_type: N
 - alarms:
 ConsumedWriteCapacityUnits:
 attributes:
 threshold_percent: 0.90
 period: 900
```

### **exception** salt.states.boto\_dynamodb.GsiNotUpdatableError

Raised when a global secondary index cannot be updated.

**salt.states.boto\_dynamodb.absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the DynamoDB table does not exist.

**name** Name of the DynamoDB table.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_dynamodb.present**(*name=None*, *table\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *read\_capacity\_units=None*, *write\_capacity\_units=None*, *alarms=None*, *alarms\_from\_pillar='boto\_dynamodb\_alarms'*, *hash\_key=None*, *hash\_key\_data\_type=None*, *range\_key=None*, *range\_key\_data\_type=None*, *local\_indexes=None*, *global\_indexes=None*, *backup\_configs\_from\_pillars='boto\_dynamodb\_backup\_configs'*)

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

**name** Name of the DynamoDB table

**table\_name** Name of the DynamoDB table (deprecated)

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**read\_capacity\_units** The read throughput for this table

**write\_capacity\_units** The write throughput for this table

**hash\_key** The name of the attribute that will be used as the hash key for this table

**hash\_key\_data\_type** The DynamoDB datatype of the hash key

**range\_key** The name of the attribute that will be used as the range key for this table

**range\_key\_data\_type** The DynamoDB datatype of the range key

**local\_indexes** The local indexes you would like to create

**global\_indexes** The global indexes you would like to create

**backup\_configs\_from\_pillars** Pillars to use to configure DataPipeline backups

### 21.19.36 salt.states.boto\_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
 boto_ec2.key_present:
 - name: mykeypair
 - save_private: /root/
 - region: eu-west-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

```
import-key-pair:
 boto_ec2.key_present:
 - name: mykeypair
 - upload_public: 'ssh-rsa AAAA'
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
 boto_ec2.key_present:
 - name: mykeypair
 - upload_public: salt://mybase/public_key.pub
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

The below code deletes a key pair:

```
delete-key-pair:
 boto_ec2.key_absent:
 - name: mykeypair
 - region: eu-west-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHwupUjasdfklfdklgjsdfjajkghs
```

`salt.states.boto_ec2.eni_absent`(*name*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**release\_eip** True/False - release any EIP associated with the ENI

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.eni_present`(*name*, *subnet\_id=None*, *subnet\_name=None*, *private\_ip\_address=None*, *description=None*, *groups=None*, *source\_dest\_check=True*, *allocate\_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

**name** Name tag associated with the ENI.

**subnet\_id** The VPC subnet ID the ENI will exist within.

**subnet\_name** The VPC subnet name the ENI will exist within.

**private\_ip\_address** The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

**description** Description of the key.

**groups** A list of security groups to apply to the ENI.

**source\_dest\_check** Boolean specifying whether source/destination checking is enabled on the ENI.

**allocate\_eip** allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

**arecords** A list of arecord dicts with attributes needed for the DNS add\_record state. By default the boto\_route53.add\_record state will be used, which requires: name, zone, ttl, and identifier. See the boto\_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.instance_absent`(*name*, *instance\_name=None*, *instance\_id=None*, *release\_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

**name** (string) - The name of the state definition.  
**instance\_name** (string) - The name of the instance.  
**instance\_id** (string) - The ID of the instance.  
**release\_eip** (bool) - Release any associated EIPs during termination.  
**region** (string) - Region to connect to.  
**key** (string) - Secret key to be used.  
**keyid** (string) - Access key to be used.  
**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.  
**filters** (dict) - A dict of additional filters to use in matching the instance to delete.  
 YAML example fragment:

```
- filters:
 vpc-id: vpc-abcdef12
```

```

salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None,
 image_id=None, image_name=None,
 tags=None, key_name=None, security_groups=None,
 user_data=None, instance_type=None, placement=None,
 kernel_id=None, ramdisk_id=None, vpc_id=None,
 vpc_name=None, monitoring_enabled=None,
 subnet_id=None, subnet_name=None, private_ip_address=None,
 block_device_map=None, disable_api_termination=None,
 instance_initiated_shutdown_behavior=None,
 placement_group=None, client_token=None,
 security_group_ids=None, security_group_names=None,
 additional_info=None, tenancy=None, instance_profile_arn=None,
 instance_profile_name=None, ebs_optimized=None,
 network_interfaces=None, network_interface_name=None,
 network_interface_id=None, attributes=None,
 target_state=None, public_ip=None, allocation_id=None,
 allocate_eip=False, region=None, key=None,
 keyid=None, profile=None)

```

Ensure an EC2 instance is running with the given attributes and state.

**name** (string) - The name of the state definition. Recommended that this match the `instance_name` attribute (generally the FQDN of the instance).

**instance\_name** (string) - The name of the instance, generally its FQDN. Exclusive with 'instance\_id'.

**instance\_id** (string) - The ID of the instance (if known). Exclusive with 'instance\_name'.

**image\_id** (string) - The ID of the AMI image to run.

**image\_name** (string) - The name of the AMI image to run.

**tags** (dict) - Tags to apply to the instance.

**key\_name** (string) - The name of the key pair with which to launch instances.

**security\_groups** (list of strings) - The names of the EC2 classic security groups with which to associate instances

**user\_data** (string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

**instance\_type** (string) - The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

**placement** (string) - The Availability Zone to launch the instance into.

**kernel\_id** (string) - The ID of the kernel with which to launch the instances.

**ramdisk\_id** (string) – The ID of the RAM disk with which to launch the instances.

**vpc\_id** (string) – The ID of a VPC to attach the instance to.

**vpc\_name** (string) – The name of a VPC to attach the instance to.

**monitoring\_enabled** (bool) – Enable detailed CloudWatch monitoring on the instance.

**subnet\_id** (string) – The ID of the subnet within which to launch the instances for VPC.

**subnet\_name** (string) – The name of the subnet within which to launch the instances for VPC.

**private\_ip\_address** (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).

**block\_device\_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.

**disable\_api\_termination** (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

**instance\_initiated\_shutdown\_behavior** (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:

- 'stop'
- 'terminate'

**placement\_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

**client\_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

**security\_group\_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.

**security\_group\_names** (list of strings) – The names of the VPC security groups with which to associate instances.

**additional\_info** (string) – Specifies additional information to make available to the instance(s).

**tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: “default” or “dedicated”. NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance\_profile\_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance\_profile\_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs\_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network\_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network\_interface\_name**  
(string) – The name of Elastic Network Interface to attach  
New in version 2016.11.0.

**network\_interface\_id**  
(string) – The id of Elastic Network Interface to attach  
New in version 2016.11.0.

**attributes** (dict) – Instance attributes and value to be applied to the instance. Available options are:

- instanceType – A valid instance type (m1.small)
- kernel – Kernel ID (None)
- ramdisk – Ramdisk ID (None)
- userData – Base64 encoded String (None)
- disableApiTermination – Boolean (true)
- instanceInitiatedShutdownBehavior – stop|terminate
- blockDeviceMapping – List of strings - ie: ['/dev/sda=false']
- sourceDestCheck – Boolean (true)
- groupSet – Set of Security Groups or IDs
- ebsOptimized – Boolean (false)
- sriovNetSupport – String - ie: ‘simple’

**target\_state** (string) – The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

**public\_ip:** (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an `allocation_id` instead.

**allocation\_id:** (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a `public_ip` instead.

**allocate\_eip:** (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the 'release\_eip' flag to 'instance\_absent'.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent(name, region=None, key=None, keyid=None, profile=None)`

Deletes a key pair

`salt.states.boto_ec2.key_present(name, save_private=None, upload_public=None, region=None, key=None, keyid=None, profile=None)`

Ensure key pair is present.

`salt.states.boto_ec2.private_ips_absent(name, network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None)`

Ensure an ENI does not have secondary private ip addresses associated with it

**name** (String) - State definition name

**network\_interface\_id** (String) - The EC2 network interface id, example eni-123456789

**private\_ip\_addresses** (List or String) - The secondary private ip address(es) that should be absent on the ENI.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.private_ips_present(name, network_interface_name=None, network_interface_id=None, private_ip_addresses=None, allow_reassignment=False, region=None, key=None, keyid=None, profile=None)`

Ensure an ENI has secondary private ip addresses associated with it

**name** (String) - State definition name

**network\_interface\_id** (String) - The EC2 network interface id, example eni-123456789

**private\_ip\_addresses** (List or String) - The secondary private ip address(es) that should be present on the ENI.

**allow\_reassignment** (Boolean) - If true, will reassign a secondary private ip address associated with another ENI. If false, state will fail if the secondary private ip address is associated with another ENI.

**region** (string) - Region to connect to.

**key** (string) - Secret key to be used.

**keyid** (string) - Access key to be used.

**profile** (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.snapshot_created(name, ami_name, instance_name, wait_until_available=True, wait_timeout_seconds=300, **kwargs)`

Create a snapshot from the given instance

New in version 2016.3.0.

```
salt.states.boto_ec2.volume_absent(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

**name** State definition name.

**volume\_name** Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

**volume\_id** Resource ID of the volume.

**instance\_name** Only remove volume if it is attached to instance with this Name tag. Exclusive with 'instance\_id'. Requires 'device'.

**instance\_id** Only remove volume if it is attached to this instance. Exclusive with 'instance\_name'. Requires 'device'.

**device** Match by device rather than ID. Requires one of 'instance\_name' or 'instance\_id'.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_ec2.volume_present(name, volume_name=None, volume_id=None, instance_name=None, instance_id=None, device=None, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the EC2 volume is present and attached.

**name** State definition name.

**volume\_name** The Name tag value for the volume. If no volume with that matching name tag is found, a new volume will be created. If multiple volumes are matched, the state will fail.

**volume\_id** Resource ID of the volume. Exclusive with 'volume\_name'.

**instance\_name** Attach volume to instance with this Name tag. Exclusive with 'instance\_id'.

**instance\_id** Attach volume to instance with this ID. Exclusive with 'instance\_name'.

**device** The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**size** The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**snapshot\_id** The snapshot ID from which the new Volume will be created. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**volume\_type** The type of the volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'. Valid volume types for AWS can be found here: <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html>

**iops** The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**encrypted** Specifies whether the volume should be encrypted. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'.

**kms\_key\_id** If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume\_name'. e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.volumes_tagged(name, tag_maps, authoritative=False, region=None, key=None, keyid=None, profile=None)`

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

**name** State definition name.

**tag\_maps** List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of `boto_ec2.get_all_volumes()`, and 'tags' is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

```
- filters:
 attachment.instance_id: i-abcdef12
 tags:
 Name: dev-int-abcdef12.aws-foo.com
- filters:
 attachment.device: /dev/sdf
 tags:
 ManagedSnapshots: true
 BillingGroup: bubba.hotep@aws-foo.com

 tags:
 BillingGroup: infra-team@aws-foo.com
```

**authoritative** Should un-declared tags currently set on matched volumes be deleted? Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.37 salt.states.boto\_elasticache

#### Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

```
Ensure myelasticache exists:
 boto_elasticache.present:
 - name: myelasticache
 - engine: redis
 - cache_node_type: cache.t1.micro
 - num_cache_nodes: 1
 - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

*# Using a profile from pillars*

```
Ensure myelasticache exists:
 boto_elasticache.present:
 - name: myelasticache
 - engine: redis
 - cache_node_type: cache.t1.micro
 - num_cache_nodes: 1
 - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
 - region: us-east-1
 - profile: myprofile
```

*# Passing in a profile*

```
Ensure myelasticache exists:
 boto_elasticache.present:
 - name: myelasticache
 - engine: redis
 - cache_node_type: cache.t1.micro
 - num_cache_nodes: 1
 - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

`salt.states.boto_elasticache.absent(name, wait=True, region=None, key=None, keyid=None, profile=None)`

Ensure the named elasticache cluster is deleted.

**name** Name of the cache cluster.

**wait** Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.cache_cluster_absent(*args, **kwargs)
```

```
salt.states.boto_elasticache.cache_cluster_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.creategroup(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the a replication group is create.

**name** Name of replication group

**wait** Waits for the group to be available

**primary\_cluster\_id** Name of the master cache node

**replication\_group\_description** Description for the group

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None, num_cache_nodes=None, preferred_availability_zone=None, cache_parameter_group_name=None, cache_security_group_names=None, replication_group_id=None, auto_minor_version_upgrade=True, security_group_ids=None, cache_subnet_group_name=None, engine_version=None, notification_topic_arn=None, preferred_maintenance_window=None, wait=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the cache cluster exists.

**name** Name of the cache cluster (cache cluster id).

**engine** The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

**cache\_node\_type** The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: [https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.Layer1.ElastiCacheConnection.create\\_cache\\_cluster](https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.Layer1.ElastiCacheConnection.create_cache_cluster)

**num\_cache\_nodes** The number of cache nodes that the cache cluster will have.

**preferred\_availability\_zone** The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

**port** The port number on which each of the cache nodes will accept connections.

**cache\_parameter\_group\_name** The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

**cache\_security\_group\_names** A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

**replication\_group\_id** The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

**auto\_minor\_version\_upgrade** Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

**security\_group\_ids** One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**cache\_subnet\_group\_name** The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

**engine\_version** The version number of the cache engine to be used for this cluster.

**notification\_topic\_arn** The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

**wait** Boolean. Wait for confirmation from boto that the cluster is in the available state.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.replication_group_absent(name, tags=None, re-
 gion=None, key=None,
 keyid=None, profile=None)
```

```
salt.states.boto_elasticache.replication_group_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None,
 key=None, keyid=None, pro-
 file=None)
```

```
salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, sub-
 net_names=None, description=None,
 tags=None, region=None, key=None,
 keyid=None, profile=None)
```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

**name** The name for the ElastiCache subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet\_names.

**subnet\_names** A list of VPC subnet names for the cache subnet group. Exclusive with subnet\_ids.

**description** Subnet group description.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.38 salt.states.boto\_elasticsearch\_domain module

#### Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs
 region: us-east-1
```

```
Ensure domain exists:
 boto_elasticsearch_domain.present:
 - DomainName: mydomain
 - profile: 'user-credentials'
 - ElasticsearchVersion: "2.3"
 - ElasticsearchClusterConfig:
 InstanceType: "t2.micro.elasticsearch"
 InstanceCount: 1
 DedicatedMasterEnabled: False
 ZoneAwarenessEnabled: False
 - EBSOptions:
 EBSEnabled: True
 VolumeType: "gp2"
 VolumeSize: 10
 Iops: 0
 - AccessPolicies:
 Version: "2012-10-17"
 Statement:
 - Effect: "Allow"
 - Principal:
 AWS: "*"
 - Action:
 - "es:*"
 - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
 - Condition:
 IpAddress:
 "aws:SourceIp":
 - "127.0.0.1"
 - "127.0.0.2"
 - SnapshotOptions:
 AutomatedSnapshotStartHour: 0
 - AdvancedOptions:
 rest.action.multi.allow_explicit_index: "true"
 - Tags:
 a: "b"
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkgghs
```

```
salt.states.boto_elasticsearch_domain.absent(name, DomainName, region=None,
 key=None, keyid=None, profile=None)
```

Ensure domain with passed properties is absent.

**name** The name of the state definition.

**DomainName** Name of the domain.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present`(*name*, *DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *ElasticsearchVersion='1.5'*)

Ensure domain exists.

**name** The name of the state definition

**DomainName** Name of the domain.

**ElasticsearchClusterConfig** Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) -- The instance type for an Elasticsearch cluster.

InstanceCount (integer) -- The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) -- A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) -- A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) -- The instance type for a dedicated master node.

DedicatedMasterCount (integer) -- Total number of dedicated master nodes, active and on standby, for the cluster.

**EBSOptions** Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) -- Specifies whether EBS-based storage is enabled.

VolumeType (string) -- Specifies the volume type for EBS-based storage.

VolumeSize (integer) -- Integer to specify the size of an EBS volume.

Iops (integer) -- Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

**AccessPolicies** IAM access policy

**SnapshotOptions** Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) -- Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

**AdvancedOptions** Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**ElasticsearchVersion** String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

### 21.19.39 salt.states.boto\_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - availability_zones:
 - us-east-1a
 - us-east-1c
 - us-east-1d
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 - listeners:
 - elb_port: 443
 instance_port: 80
 elb_protocol: HTTPS
 instance_protocol: HTTP
 certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
 policies:
 - my-ssl-policy
 - cookie-policy
 - elb_port: 8210
 instance_port: 8210
 elb_protocol: TCP
 - backends:
 - instance_port: 80
 policies:
 - enable-proxy-protocol
 - health_check:
 target: 'HTTP:80/'
 - attributes:
 cross_zone_load_balancing:
 enabled: true
 access_log:
```

(continues on next page)

(continued from previous page)

```

 enabled: true
 s3_bucket_name: 'mybucket'
 s3_bucket_prefix: 'my-logs'
 emit_interval: 5
 connecting_settings:
 idle_timeout: 60
- cnames:
 - name: mycname.example.com.
 zone: example.com.
 ttl: 60
 - name: myothercname.example.com.
 zone: example.com.
- security_groups:
 - my-security-group
- policies:
 - policy_name: my-ssl-policy
 policy_type: SSLNegotiationPolicyType
 policy:
 Protocol-TLSv1.2: true
 Protocol-SSLv3: false
 Server-Defined-Cipher-Order: true
 ECDHE-ECDSA-AES128-GCM-SHA256: true
 - policy_name: cookie-policy
 policy_type: LBCookieStickinessPolicyType
 policy: {} # no policy means this is a session cookie
 - policy_name: enable-proxy-protocol
 policy_type: ProxyProtocolPolicyType
 policy:
 ProxyProtocol: true

Using a profile from pillars
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile

Passing in a profile
Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs

```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key 'boto\_elb\_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```

my_elb_attributes:
 cross_zone_load_balancing:
 enabled: true
 connection_draining:
 enabled: true

```

(continues on next page)

(continued from previous page)

```

 timeout: 20
 access_log:
 enabled: true
 s3_bucket_name: 'mybucket'
 s3_bucket_prefix: 'my-logs'
 emit_interval: 5

```

Overriding the attribute values on the resource:

```

Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - attributes_from_pillar: my_elb_attributes
 # override cross_zone_load_balancing:enabled
 - attributes:
 cross_zone_load_balancing:
 enabled: false
 - profile: myelbprofile

```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```

Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile
 - alarms:
 UnHealthyHostCount:
 name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
 attributes:
 metric: UnHealthyHostCount
 namespace: AWS/ELB
 statistic: Average
 comparison: '>='
 threshold: 1.0
 period: 600
 evaluation_periods: 6
 unit: null
 description: ELB UnHealthyHostCount
 alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
 insufficient_data_actions: []
 ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto\_elb\_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

my_elb_alarm:
 UnHealthyHostCount:
 name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
 attributes:
 metric: UnHealthyHostCount
 namespace: AWS/ELB

```

(continues on next page)

(continued from previous page)

```

statistic: Average
comparison: '>='
threshold: 1.0
period: 600
evaluation_periods: 6
unit: null
description: ELB UnHealthyHostCount
alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
insufficient_data_actions: []
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

Overriding the alarm values on the resource:

```

Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile
 - alarms_from_pillar: my_elb_alarm
 # override UnHealthyHostCount:attributes:threshold
 - alarms:
 UnHealthyHostCount:
 attributes:
 threshold: 2.0

```

Tags can also be set:

New in version 2016.3.0.

```

Ensure myelb ELB exists:
 boto_elb.present:
 - name: myelb
 - region: us-east-1
 - profile: myelbprofile
 - tags:
 MyTag: 'My Tag Value'
 OtherTag: 'My Other Value'

```

**salt.states.boto\_elb.absent**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

**name** name of the ELB

**salt.states.boto\_elb.present**(*name, listeners, availability\_zones=None, subnets=None, subnet\_names=None, security\_groups=None, scheme='internet-facing', health\_check=None, attributes=None, attributes\_from\_pillar='boto\_elb\_attributes', cnames=None, alarms=None, alarms\_from\_pillar='boto\_elb\_alarms', policies=None, policies\_from\_pillar='boto\_elb\_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait\_for\_sync=True, tags=None, instance\_ids=None, instance\_names=None*)

Ensure the ELB exists.

**name** Name of the ELB.

**availability\_zones** A list of availability zones for this ELB.

**listeners** A list of listener lists; example:

```
[
 ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
 ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/
→mycert']
]
```

**subnets** A list of subnet IDs in your VPC to attach to your LoadBalancer.

**subnet\_names** A list of subnet names in your VPC to attach to your LoadBalancer.

**security\_groups** The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
 - secgroup-one
 - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

**scheme** The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

**health\_check** A dict defining the health check for this ELB.

**attributes** A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the [salt.modules.boto\\_elb.set\\_attributes](#) function for recognized attributes.

**attributes\_from\_pillar** name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

**cnames** A list of cname dicts with attributes needed for the DNS add\_record state. By default the `boto_route53.add_record` state will be used, which requires: name, zone, ttl, and identifier. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as kwargs.

See the [salt.states.boto\\_route53](#) state for information about these attributes.

**alarms**: a dictionary of name->boto\_cloudwatch\_alarm sections to be associated with this ELB. All attributes should be specified except for dimension which will be automatically set to this ELB.

See the [salt.states.boto\\_cloudwatch\\_alarm](#) state for information about these attributes.

**alarms\_from\_pillar**: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**tags** dict of tags

**instance\_ids** list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_names`.

**instance\_names** list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_ids`.

**salt.states.boto\_elb.register\_instances**(name, instances, region=None, key=None, keyid=None, profile=None)

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

**name** The name of the Elastic Load Balancer to add EC2 instances to.

**instances** A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will

only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```
add-instances:
 boto_elb.register_instances:
 - name: myloadbalancer
 - instances:
 - instance-id1
 - instance-id2
```

## 21.19.40 salt.states.boto\_elbv2 module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkghs
 region: us-east-1
```

```
salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, re-
 gion=None, key=None, keyid=None, pro-
 file=None, health_check_protocol='HTTP',
 health_check_port='traffic-
 port', health_check_path='/',
 health_check_interval_seconds=30,
 health_check_timeout_seconds=5,
 healthy_threshold_count=5, un-
 healthy_threshold_count=2, **kwargs)
```

New in version 2017.11.0.

Create target group if not present.

**name** (string) - The name of the target group.

**protocol** (string) - The protocol to use for routing traffic to the targets

**port** (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

**vpc\_id** (string) - The identifier of the virtual private cloud (VPC).

**health\_check\_protocol** (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

**health\_check\_port** (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

**health\_check\_path** (string) - The ping path that is the destination on the targets for health checks. The default is /.

**health\_check\_interval\_seconds** (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

**health\_check\_timeout\_seconds** (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

**healthy\_threshold\_count** (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

**unhealthy\_threshold\_count** (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

**returns** (bool) - True on success, False on failure.

CLI example: .. code-block:: yaml

```
create-target:
 boto_elb2.create_targets_group:
 - name: myALB
 - protocol: https
 - port: 443
 - vpc_id: myVPC
```

**salt.states.boto\_elbv2.delete\_target\_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.

**name** (string) - The Amazon Resource Name (ARN) of the resource.

**returns** (bool) - True on success, False on failure.

CLI example:

```
check-target:
 boto_elb2.delete_targets_group:
 - name: myALB
 - protocol: https
 - port: 443
 - vpc_id: myVPC
```

**salt.states.boto\_elbv2.targets\_deregistered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*kwargs*)

Remove targets to an Application Load Balancer target group.

**name** The ARN of the Application Load Balancer Target Group to remove targets from.

**targets** A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```
remove-targets:
 boto_elb.targets_deregistered:
 - name: arn:myloadbalancer
 - targets:
 - instance-id1
 - instance-id2
```

**salt.states.boto\_elbv2.targets\_registered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *\*\*kwargs*)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

**name** The ARN of the Application Load Balancer Target Group to add targets to.

**targets** A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
 boto_elb.targets_registered:
 - name: arn:myloadbalancer
 - targets:
 - instance-id1
 - instance-id2
```

### 21.19.41 salt.states.boto\_iam

#### Manage IAM objects

New in version 2015.8.0.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
 boto_iam.user_absent:
 - name: myuser
 - delete_keys: true
```

```
delete-keys:
 boto_iam.keys_absent:
 - access_keys:
 - 'AKIAJHTMIQ2ASDFLASDF'
 - 'PQIAJHTMIQ2ASRTLASFR'
 - user_name: myuser
```

```
create-user:
 boto_iam.user_present:
 - name: myuser
 - policies:
 mypolicy: |
 {
 "Version": "2012-10-17",
 "Statement": [{
 "Effect": "Allow",
 "Action": "*",
 "Resource": "*"
 }]
 }
 - password: NewPassword$$1
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'fdkjsafkljsASSADfalkfjasdf'
```

```
create-group:
 boto_iam.group_present:
 - name: mygroup
 - users:
```

(continues on next page)

(continued from previous page)

```

- myuser
- myuser1
- policies:
 mypolicy: |
 {
 "Version": "2012-10-17",
 "Statement": [{
 "Effect": "Allow",
 "Action": "*",
 "Resource": "*"}]
 }
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'safsdosal;fdkjsafkljsASSADFalkfj'

```

```

change-policy:
 boto_iam.account_policy:
 - change_password: True
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'safsdosal;fdkjsafkljsASSADFalkfj'

```

```

create server certificate:
 boto_iam.server_cert_present:
 - name: mycert
 - public_key: salt://base/mycert.crt
 - private_key: salt://base/mycert.key
 - cert_chain: salt://base/mycert_chain.crt
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'fdkjsafkljsASSADFalkfjasdf'

```

```

delete server certificate:
 boto_iam.server_cert_absent:
 - name: mycert

```

```

create keys for user:
 boto_iam.keys_present:
 - name: myusername
 - number: 2
 - save_dir: /root
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'fdkjsafkljsASSADFalkfjasdf'

```

```

create policy:
 boto_iam.policy_present:
 - name: myname
 - policy_document: '{"MyPolicy": "Statement": [{"Action": ["sqs:*"], "Effect":
↪ "Allow", "Resource": ["arn:aws:sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
 - region: eu-west-1
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'fdkjsafkljsASSADFalkfjasdf'

```

```
add-saml-provider:
 boto_iam.saml_provider_present:
 - name: my_saml_provider
 - saml_metadata_document: salt://base/files/provider.xml
 - keyid: 'AKIAJHTMIQ2ASDFLASDF'
 - key: 'safsdfsalsfdkjsafkljsASSADFalkfj'
```

```
salt.states.boto_iam.account_policy(name=None, allow_users_to_change_password=None,
 hard_expiry=None, max_password_age=None,
 minimum_password_length=None, password_reuse_prevention=None,
 require_lowercase_characters=None, require_numbers=None,
 require_symbols=None, require_uppercase_characters=None,
 key=None, keyid=None, profile=None)
```

Change account policy.

New in version 2015.8.0.

**name (string)** The name of the account policy

**allow\_users\_to\_change\_password (bool)** Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

**hard\_expiry (bool)** Prevents IAM users from setting a new password after their password has expired.

**max\_password\_age (int)** The number of days that an IAM user password is valid.

**minimum\_password\_length (int)** The minimum number of characters allowed in an IAM user password.

**password\_reuse\_prevention (int)** Specifies the number of previous passwords that IAM users are prevented from reusing.

**require\_lowercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

**require\_numbers (bool)** Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

**require\_symbols (bool)** Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ # \$ % ^ & \* ( ) \_ + - = [ ] { } | ' .

**require\_uppercase\_characters (bool)** Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string)

```
salt.states.boto_iam.group_absent(name, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM group is absent.

**name (string)** The name of the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.group_present(name, policies=None, policies_from_pillars=None,
 managed_policies=None, users=None, path='/',
 region=None, key=None, keyid=None, profile=None,
 delete_policies=True)
```

New in version 2015.8.0.

Ensure the IAM group is present

**name (string)** The name of the new group.

**path (string)** The path for the group, defaults to '/'

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)** A list of policy names or ARNs that should be attached to this group.

**users (list)** A list of users to be added to the group.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies (boolean)** Delete or detach existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

`salt.states.boto_iam.keys_absent` (*access\_keys*, *user\_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM user access\_key\_id is absent.

**access\_key\_id (list)** A list of access key ids

**user\_name (string)** The username of the user

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.keys_present` (*name*, *number*, *save\_dir*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *save\_format='{2}\n{0}\n{3}\n{1}\n'*)

New in version 2015.8.0.

Ensure the IAM access keys are present.

**name (string)** The name of the new user.

**number (int)** Number of keys that user should have.

**save\_dir (string)** The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**save\_format (dict)** Save format is repeated for each key. Default format is "{2}\n{0}\n{3}\n{1}\n", where {0} and {1} are placeholders for new key\_id and key respectively, whereas {2} and {3} are "key\_id-{number}" and 'key-{number}' strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

**name (string)** The name of the new policy.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iam.policy\_present** (*name, policy\_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy is present

**name (string)** The name of the new policy.

**policy\_document (dict)** The document of the new policy

**path (string)** The path in which the policy will be created. Default is '/'.

**description (string)** Description

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iam.saml\_provider\_absent** (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.

**name (string)** The name of the SAML provider.

**saml\_metadata\_document (string)** The xml document of the SAML provider.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iam.saml\_provider\_present** (*name, saml\_metadata\_document, region=None, key=None, keyid=None, profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.

**name (string)** The name of the SAML provider.

**saml\_metadata\_document (string)** The xml document of the SAML provider.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iam.server\_cert\_absent** (*name, region=None, key=None, keyid=None, profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect

**keyid (string)** The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.server_cert_present(name, public_key, private_key, cert_chain=None,
 path=None, region=None, key=None, keyid=None,
 profile=None)
```

Create server certificate.

New in version 2015.8.0.

**name (string)** The name for the server certificate. Do not include the path in this value.

**public\_key (string)** The contents of the public key certificate in PEM-encoded format.

**private\_key (string)** The contents of the private key in PEM-encoded format.

**cert\_chain (string)** The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

**path (string)** The path for the server certificate.

**region (string)** The name of the region to connect to.

**key (string)** The key to be used in order to connect

**keyid (string)** The keyid to be used in order to connect

**profile (string)** The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.user_absent(name, delete_keys=True, delete_mfa_devices=True,
 delete_profile=True, region=None, key=None, keyid=None,
 profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

**name (string)** The name of the new user.

**delete\_keys (bool)** Delete all keys from user.

**delete\_mfa\_devices (bool)** Delete all mfa devices from user.

New in version 2016.3.0.

**delete\_profile (bool)** Delete profile from user.

New in version 2016.3.0.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.user_present(name, policies=None, policies_from_pillars=None, managed_policies=None,
 password=None, path=None, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is present

**name (string)** The name of the new user.

**policies (dict)** A dict of IAM group policy documents.

**policies\_from\_pillars (list)** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies\_from\_pillars.

**managed\_policies (list)** A list of managed policy names or ARNs that should be attached to this user.

**password (string)** The password for the new user. Must comply with account policy.

**path (string)** The path of the user. Default is '/'.

New in version 2015.8.2.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.42 salt.states.boto\_iam\_role

#### Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
 boto_iam_role.present:
 - region: us-east-1
 - key: GKTADJGHEIQSXMKKRBJ08H
 - keyid: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 - policies_from_pillars:
 - shared_iam_bootstrap_policy
 - policies:
 MySQLSPolicy:
 Statement:
 - Action:
 - sqs:*
 Effect: Allow
 Resource:
 - arn:aws:sqs:*:*:*
 Sid: MyPolicySQS1
 MyS3Policy:
 Statement:
 - Action:
 - s3:GetObject
 Effect: Allow
 Resource:
 - arn:aws:s3:*:*:mybucket/*

Using a credentials profile from pillars
myrole:
```

(continues on next page)

(continued from previous page)

```

boto_iam_role.present:
 - profile: myiamprofile

Passing in a credentials profile
myrole:
 boto_iam_role.present:
 - profile:
 key: GKTADJGHEIQSXMKKRBJ08H
 keyid: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs
 region: us-east-1

```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

**salt.states.boto\_iam\_role.absent** (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the IAM role is deleted.

**name** Name of the IAM role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iam\_role.present** (*name*, *policy\_document=None*, *policy\_document\_from\_pillars=None*, *path=None*, *policies=None*, *policies\_from\_pillars=None*, *managed\_policies=None*, *create\_instance\_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete\_policies=True*)

Ensure the IAM role exists.

**name** Name of the IAM role.

**policy\_document** The policy that grants an entity permission to assume the role. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policy\_document\_from\_pillars** A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the `policy_document` argument.

New in version 2017.7.0.

**path** The path to the role/instance profile. (See [https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create\\_role](https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role))

**policies** A dict of IAM role policies.

**policies\_from\_pillars** A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

**managed\_policies** A list of (AWS or Customer) managed policies to be attached to the role.

**create\_instance\_profile** A boolean of whether or not to create an instance profile and associate it with this role.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**delete\_policies** Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

### 21.19.43 salt.states.boto\_iot module

#### Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure policy exists:
 boto_iot.policy_present:
 - policyName: mypolicy
 - policyDocument:
 Version: "2012-10-17"
 Statement:
 Action:
 - iot:Publish
 Resource:
 - "*"
 Effect: "Allow"
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

**Ensure topic rule exists:**

(continues on next page)

(continued from previous page)

```

boto_iot.topic_rule_present:
 - ruleName: myrule
 - sql: "SELECT * FROM 'iot/test'"
 - description: 'test rule'
 - ruleDisabled: false
 - actions:
 - lambda:
 functionArn: "arn:aws:us-east-1:1234:function/functionname"
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkgghs

```

**salt.states.boto\_iot.policy\_absent**(*name, policyName, region=None, key=None, keyid=None, profile=None*)

Ensure policy with passed properties is absent.

**name** The name of the state definition.

**policyName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.policy\_attached**(*name, policyName, principal, region=None, key=None, keyid=None, profile=None*)

Ensure policy is attached to the given principal.

**name** The name of the state definition

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.policy\_detached**(*name, policyName, principal, region=None, key=None, keyid=None, profile=None*)

Ensure policy is attached to the given principal.

**name** The name of the state definition.

**policyName** Name of the policy.

**principal** The principal which can be a certificate ARN or a Cognito ID.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.policy\_present**(*name, policyName, policyDocument, region=None, key=None, keyid=None, profile=None*)

Ensure policy exists.

**name** The name of the state definition

**policyName** Name of the policy.

**policyDocument** The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.thing\_type\_absent**(*name, thingTypeName, region=None, key=None, keyid=None, profile=None*)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

**name** The name of the state definition.

**thingTypeName** Name of the thing type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.thing\_type\_present**(*name, thingTypeName, thingTypeDescription, searchableAttributesList, region=None, key=None, keyid=None, profile=None*)

Ensure thing type exists.

New in version 2016.11.0.

**name** The name of the state definition

**thingTypeName** Name of the thing type

**thingTypeDescription** Description of the thing type

**searchableAttributesList** List of string attributes that are searchable for the thing type

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used

**profile** A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

**salt.states.boto\_iot.topic\_rule\_absent**(*name, ruleName, region=None, key=None, keyid=None, profile=None*)

Ensure topic rule with passed properties is absent.

**name** The name of the state definition.

**ruleName** Name of the policy.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_iot.topic\_rule\_present**(*name, ruleName, sql, actions, description="", ruleDisabled=False, region=None, key=None, keyid=None, profile=None*)

Ensure topic rule exists.

**name** The name of the state definition

**ruleName** Name of the rule.

**sql** The SQL statement used to query the topic.

**actions** The actions associated with the rule.

**description** The description of the rule.

**ruleDisable** Specifies whether the rule is disabled.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

keyid.

## 21.19.44 salt.states.boto\_kinesis module

### Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 region: us-east-1
```

```
Ensure Kinesis stream does not exist:
boto_kinesis.absent:
 - name: new_stream
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 - region: us-east-1
```

```
Ensure Kinesis stream exists:
boto_kinesis.present:
 - name: new_stream
 - retention_hours: 168
 - enhanced_monitoring: ['ALL']
 - num_shards: 2
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 - region: us-east-1
```

`salt.states.boto_kinesis.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the kinesis stream, if it exists.

**name** (string) Stream name

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_kinesis.present(name, retention_hours=None, enhanced_monitoring=None,
 num_shards=None, do_reshard=True, region=None, key=None,
 keyid=None, profile=None)
```

Ensure the kinesis stream is properly configured and scaled.

**name (string)** Stream name

**retention\_hours (int)** Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

**enhanced\_monitoring (list of string)** Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

**num\_shards (int)** Reshard stream (if necessary) to this number of shards !!!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g.  $2^N$  to  $2^{N+1}$ ) !!!!!

**do\_reshard (boolean)** If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

**region (string)** Region to connect to.

**key (string)** Secret key to be used.

**keyid (string)** Access key to be used.

**profile (dict)** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.45 salt.states.boto\_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
 region: us-east-1
```

```
Ensure mykey key exists:
```

```
 boto_kms.key_present:
```

- **name:** mykey
- **region:** us-east-1

```
Using a profile from pillars
```

```
Ensure mykey key exists:
```

(continues on next page)

(continued from previous page)

```

boto_kms.key_present:
- name: mykey
- region: us-east-1
- profile: myprofile

Passing in a profile
Ensure mykey key exists:
boto_key.key_present:
- name: mykey
- region: us-east-1
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs

```

```

salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None,
 grants=None, manage_grants=False, key_rotation=False,
 enabled=True, region=None, key=None, keyid=None, profile=None)

```

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

**name** Name of the key.

**policy** Key usage policy.

**description** Description of the key.

**key\_usage** Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT\_DECRYPT, which is also the only supported option.

**grants** A list of grants to apply to the key. Not currently implemented.

**manage\_grants** Whether or not to manage grants. False by default, which will not manage any grants.

**key\_rotation** Whether or not key rotation is enabled for the key. False by default.

**enabled** Whether or not the key is enabled. True by default.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.46 salt.states.boto\_lambda module

### Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
 region: us-east-1
```

```
Ensure function exists:
 boto_lambda.function_present:
 - FunctionName: myfunction
 - Runtime: python2.7
 - Role: iam_role_name
 - Handler: entry_function
 - ZipFile: code.zip
 - S3Bucket: bucketname
 - S3Key: keyname
 - S3ObjectVersion: version
 - Description: "My Lambda Function"
 - Timeout: 3
 - MemorySize: 128
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
```

```
salt.states.boto_lambda.alias_absent(name, FunctionName, Name, region=None, key=None,
 keyid=None, profile=None)
```

Ensure alias with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**Name** Name of the alias.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.alias_present(name, FunctionName, Name, FunctionVersion, De-
 scription=", region=None, key=None, keyid=None, pro-
 file=None)
```

Ensure alias exists.

**name** The name of the state definition.

**FunctionName** Name of the function for which you want to create an alias.

**Name** The name of the alias to be created.

**FunctionVersion** Function version for which you are creating the alias.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent`(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

**name** The name of the state definition.

**EventSourceArn** ARN of the event source.

**FunctionName** Name of the lambda function.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_present`(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

**name** The name of the state definition.

**EventSourceArn** The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

**FunctionName** The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:function:ThumbNail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:Thumbnail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

**StartingPosition** The position in the stream where AWS Lambda should start reading. (TRIM\_HORIZON | LATEST)

**Enabled** Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

**BatchSize** The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.function_absent`(*name*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure function with passed properties is absent.

**name** The name of the state definition.

**FunctionName** Name of the function.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler,
 ZipFile=None, S3Bucket=None, S3Key=None,
 S3ObjectVersion=None, Description="", Timeout=3,
 MemorySize=128, Permissions=None, RoleRe-
 tries=5, region=None, key=None, keyid=None, pro-
 file=None, VpcConfig=None, Environment=None)
```

Ensure function exists.

**name** The name of the state definition

**FunctionName** Name of the Function.

**Runtime** The Runtime environment for the function. One of 'nodejs', 'java8', or 'python2.7'

**Role** The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

**Handler** The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.\*export\* value in your function. For Java, it can be package.classname::handler or package.class-name.

**ZipFile** A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

**S3Bucket** Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3Key** The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

**S3ObjectVersion** The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

**Description** A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

**Timeout** The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

**MemorySize** The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

**VpcConfig** If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

```
VpcConfig:
 SecurityGroupNames:
 - mysecgroup1
 - mysecgroup2
 SecurityGroupIds:
 - sg-abcdef1234
 SubnetNames:
 - mysubnet1
 SubnetIds:
 - subnet-1234abcd
 - subnet-abcd1234
```

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

**Permissions** A list of permission definitions to be added to the function's policy

**RoleRetries** IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

**Environment** The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
 'Variables': {
 'VariableName': 'VariableValue'
 }
}
```

New in version 2017.7.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

### 21.19.47 salt.states.boto\_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
 region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
 boto_lc.present:
 - name: mylc
 - image_id: ami-0b9c9f62
 - key_name: mykey
```

(continues on next page)

(continued from previous page)

```

- security_groups:
 - mygroup
- instance_type: m1.small
- instance_monitoring: true
- block_device_mappings:
 - '/dev/sda1':
 size: 20
 volume_type: 'io1'
 iops: 220
 delete_on_termination: true
- cloud_init:
 boothooks:
 'disable-master.sh': |
 #!/bin/bash
 echo "manual" > /etc/init/salt-master.override
 scripts:
 'run_salt.sh': |
 #!/bin/bash

 add-apt-repository -y ppa:saltstack/salt
 apt-get update
 apt-get install -y salt-minion
 salt-call state.highstate
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs

Using a profile from pillars.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile: myprofile

Passing in a profile.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfjgjsdfjajkghs
 region: us-east-1

```

`salt.states.boto_lc.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named launch configuration is deleted.

**name** Name of the launch configuration.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_lc.present(name, image_id, key_name=None, vpc_id=None, vpc_name=None,
 security_groups=None, user_data=None, cloud_init=None, in-
 stance_type='m1.small', kernel_id=None, ramdisk_id=None,
 block_device_mappings=None, delete_on_termination=None,
 instance_monitoring=False, spot_price=None, in-
 stance_profile_name=None, ebs_optimized=False, asso-
 ciate_public_ip_address=None, region=None, key=None, keyid=None,
 profile=None)

```

Ensure the launch configuration exists.

**name** Name of the launch configuration.

**image\_id** AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

**key\_name** Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

**vpc\_id** The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc\_name.

**vpc\_name** Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc\_id.

**security\_groups** List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

**user\_data** The user data available to launched EC2 instances.

**cloud\_init** A dict of cloud\_init configuration. Currently supported keys: boothooks, scripts and cloud-config. Mutually exclusive with user\_data.

**instance\_type** The instance type. ex: m1.small.

**kernel\_id** The kernel id for the instance.

**ramdisk\_id** The RAM disk ID for the instance.

**block\_device\_mappings** A dict of block device mappings that contains a dict with volume\_type, delete\_on\_termination, iops, size, encrypted, snapshot\_id.

**volume\_type** Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

**delete\_on\_termination** Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.

**iops** For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.

**size** Desired volume size (in GiB).

**encrypted** Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

**instance\_monitoring** Whether instances in group are launched with detailed monitoring.

**spot\_price** The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

**instance\_profile\_name** The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

**ebs\_optimized** Specifies whether the instance is optimized for EBS I/O (true) or not (false).

**associate\_public\_ip\_address** Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.48 salt.states.boto\_rds

### Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

```
Ensure myrds RDS exists:
boto_rds.present:
- name: myrds
- allocated_storage: 5
- storage_type: standard
- db_instance_class: db.t2.micro
- engine: MySQL
- master_username: myuser
- master_user_password: mypass
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
- tags:
 key: value
```

```
Ensure parameter group exists:
create-parameter-group:
 boto_rds.parameter_present:
 - name: myparametergroup
 - db_parameter_group_family: mysql5.6
 - description: "parameter group family"
 - parameters:
 - binlog_cache_size: 32768
 - binlog_checksum: CRC32
 - region: eu-west-1
```

`depends boto3`

`salt.states.boto_rds.absent`(*name*, *skip\_final\_snapshot=None*, *final\_db\_snapshot\_identifier=None*, *tags=None*, *wait\_for\_deletion=True*, *timeout=180*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure RDS instance is absent.

**name** Name of the RDS instance.

**skip\_final\_snapshot** Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

**final\_db\_snapshot\_identifier** If a final snapshot is requested, this is the identifier used for that snapshot.

**tags** A dict of tags.

**wait\_for\_deletion (bool)** Wait for the RDS instance to be deleted completely before finishing the state.

**timeout (in seconds)** The amount of time that can pass before raising an Exception.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.parameter_present(name, db_parameter_group_family, description,
 parameters=None, apply_method='pending-reboot',
 tags=None, region=None, key=None, keyid=None,
 profile=None)
```

Ensure DB parameter group exists and update parameters.

**name** The name for the parameter group.

**db\_parameter\_group\_family** The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

**description** Parameter group description.

**parameters** The DB parameters that need to be changed of type dictionary.

**apply\_method** The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

**tags** A dict of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username,
 master_user_password, db_name=None, storage_type=None, db_security_groups=None,
 vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None,
 db_subnet_group_name=None, preferred_maintenance_window=None,
 db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None,
 tde_credential_password=None, storage_encrypted=None, kms_keyid=None,
 backup_retention_period=None, preferred_backup_window=None, port=None,
 multi_az=None, engine_version=None, auto_minor_version_upgrade=None,
 license_model=None, iops=None, option_group_name=None, character_set_name=None,
 publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None,
 region=None, domain=None, key=None, keyid=None, monitoring_interval=None,
 monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)
```

Ensure RDS instance exists.

**name** Name of the RDS state definition.

**allocated\_storage** The amount of storage (in gigabytes) to be initially allocated for the database instance.

**db\_instance\_class** The compute and memory capacity of the Amazon RDS DB instance.

**engine** The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

**master\_username** The name of master user for the client DB instance.

**master\_user\_password** The password for the master database user. Can be any printable ASCII character except `"/", "'",` or `"@"`.

**db\_name** The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. [https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create\\_db\\_instance](https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance)

**storage\_type** Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the `Iops` parameter.

**db\_security\_groups** A list of DB security groups to associate with this DB instance.

**vpc\_security\_group\_ids** A list of EC2 VPC security group IDs to associate with this DB instance.

**vpc\_security\_groups** A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

**availability\_zone** The EC2 Availability Zone that the database instance will be created in.

**db\_subnet\_group\_name** A DB subnet group to associate with this DB instance.

**preferred\_maintenance\_window** The weekly time range (in UTC) during which system maintenance can occur.

**db\_parameter\_group\_name** A DB parameter group to associate with this DB instance.

**db\_cluster\_identifier** If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

**tde\_credential\_arn** The ARN from the Key Store with which the instance is associated for TDE encryption.

**tde\_credential\_password** The password to use for TDE encryption if an encryption key is not used.

**storage\_encrypted** Specifies whether the DB instance is encrypted.

**kms\_keyid** If `storage_encrypted` is true, the KMS key identifier for the encrypted DB instance.

**backup\_retention\_period** The number of days for which automated backups are retained.

**preferred\_backup\_window** The daily time range during which automated backups are created if automated backups are enabled.

**port** The port number on which the database accepts connections.

**multi\_az** Specifies if the DB instance is a Multi-AZ deployment. You cannot set the `AvailabilityZone` parameter if the `MultiAZ` parameter is set to true.

**engine\_version** The version number of the database engine to use.

**auto\_minor\_version\_upgrade** Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

**license\_model** License model information for this DB instance.

**iops** The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

**option\_group\_name** Indicates that the DB instance should be associated with the specified option group.

**character\_set\_name** For supported engines, indicates that the DB instance should be associated with the specified `CharacterSet`.

**publicly\_accessible** Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

**wait\_status** Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

**tags** A dict of tags.

**copy\_tags\_to\_snapshot** Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

**region** Region to connect to.

**domain** The identifier of the Active Directory Domain.

**key** AWS secret key to be used.

**keyid** AWS access key to be used.

**monitoring\_interval** The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

**monitoring\_role\_arn** The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

**domain\_iam\_role\_name** Specify the name of the IAM role to be used when making API calls to the Directory Service.

**promotion\_tier** A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
 availability_zone=None, port=None,
 auto_minor_version_upgrade=None, iops=None, op-
 tion_group_name=None, publicly_accessible=None,
 tags=None, region=None, key=None, keyid=None,
 profile=None, db_parameter_group_name=None)
```

Ensure RDS replica exists.

**Ensure myrds replica RDS exists:**  
**boto\_rds.create\_replica:**  
 - **name:** myreplica  
 - **source:** mydb

```
salt.states.boto_rds.subnet_group_absent(name, tags=None, region=None, key=None,
 keyid=None, profile=None)
```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, sub-
 net_names=None, tags=None, region=None,
 key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

**name** The name for the DB subnet group. This value is stored as a lowercase string.

**subnet\_ids** A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**subnet\_names** A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

**description** Subnet group description.

**tags** A dict of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.49 salt.states.boto\_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration

is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
 region: us-east-1
```

```
mycnamerecord:
 boto_route53.present:
 - name: test.example.com.
 - value: my-elb.us-east-1.elb.amazonaws.com.
 - zone: example.com.
 - ttl: 60
 - record_type: CNAME
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

*# Using a profile from pillars*

```
myarecord:
 boto_route53.present:
 - name: test.example.com.
 - value: 1.1.1.1
 - zone: example.com.
 - ttl: 60
 - record_type: A
 - region: us-east-1
 - profile: myprofile
```

*# Passing in a profile*

```
myarecord:
 boto_route53.present:
 - name: test.example.com.
 - value: 1.1.1.1
 - zone: example.com.
 - ttl: 60
 - record_type: A
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkgHwupUjasdfldfklgjsdfjajkgHs
```

```
salt.states.boto_route53.absent(name, zone, record_type, identifier=None, region=None,
 key=None, keyid=None, profile=None, wait_for_sync=True,
 split_dns=False, private_zone=False)
```

Ensure the Route53 record is deleted.

**name** Name of the record.

**zone** The zone to delete the record from.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**identifier** An identifier to match for deletion.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53.

**split\_dns** Route53 supports a public and private DNS zone with the same names.

**private\_zone** If using split\_dns, specify if this is the private zone.

```
salt.states.boto_route53.hosted_zone_absent(name, domain_name=None, region=None,
 key=None, keyid=None, profile=None)
```

Ensure the Route53 Hosted Zone described is absent

**name** The name of the state definition.

**domain\_name** The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

```
salt.states.boto_route53.hosted_zone_present(name, domain_name=None, private_zone=False, caller_ref=None, comment="", vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- private\_zone (AWS API limitation).
- comment (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- vpc\_id (same story - we really need to rewrite this module with boto3)
- vpc\_name (really just a pointer to vpc\_id anyway).
- vpc\_region (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer boto3\_route53 module instead.

**name** The name of the state definition.

**domain\_name** The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

**private\_zone** Set True if creating a private hosted zone.

**caller\_ref** A unique string that identifies the request and that allows create\_hosted\_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same caller\_ref. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

**comment** Any comments you want to include about the hosted zone.

**vpc\_id** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_name. Ignored when creating a non-private zone.

**vpc\_name** When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc\_id. Ignored when creating a non-private zone.

**vpc\_region** When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc\_id or vpc\_name, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

```
salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False)
```

Ensure the Route53 record is present.

**name** Name of the record.

**value**

**Value of the record.** As a special case, you can pass in: *private:<Name tag>* to have the function autodetermine the private IP *public:<Name tag>* to have the function autodetermine the public IP

**zone** The zone to create the record in.

**record\_type** The record type (A, NS, MX, TXT, etc.)

**ttl** The time to live for the record.

**identifier** The unique identifier to use for this record.

**region** The region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_sync** Wait for an INSYNC change status from Route53 before returning success.

**split\_dns** Route53 supports parallel public and private DNS zones with the same name.

**private\_zone** If using split\_dns, specify if this is the private zone.

```
salt.states.boto_route53.rr_absent(*args, **kwargs)
```

```
salt.states.boto_route53.rr_present(*args, **kwargs)
```

### 21.19.50 salt.states.boto\_s3 module

#### Manage S3 Resources

New in version 2018.3.0.

Manage S3 resources. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 region: us-east-1
```

```
Ensure s3 object exists:
boto_s3.object_present:
- name: s3-bucket/s3-key
- source: /path/to/local/file
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
- profile: my-profile
```

depends boto3

```
salt.states.boto_s3.object_present(name, source=None, hash_type=None, extra_args=None,
 extra_args_from_pillar='boto_s3_object_extra_args',
 region=None, key=None, keyid=None, profile=None)
```

Ensure object exists in S3.

**name** The name of the state definition. This will be used to determine the location of the object in S3, by splitting on the first slash and using the first part as the bucket name and the remainder as the S3 key.

**source** The source file to upload to S3, currently this only supports files hosted on the minion's local file system (starting with /).

**hash\_type** Hash algorithm to use to check that the object contents are correct. Defaults to the value of the `hash_type` config option.

**extra\_args** A dictionary of extra arguments to use when uploading the file. Note that these are only enforced if new objects are uploaded, and not modified on existing objects. The supported args are those in the `ALLOWED_UPLOAD_ARGS` list at <http://boto3.readthedocs.io/en/latest/reference/customizations/s3.html>. However, Note that the 'ACL', 'GrantFullControl', 'GrantRead', 'GrantReadACP', and 'GrantWriteACL' keys are currently not supported.

**extra\_args\_from\_pillar** Name of pillar dict that contains extra arguments. Extra arguments defined for this specific state will be merged over those from the pillar.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.51 salt.states.boto\_s3\_bucket module

### Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

#### depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
Ensure bucket exists:

```

**salt.states.boto\_s3\_bucket.absent**(*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

**name** The name of the state definition.

**Bucket** Name of the bucket.

**Force** Empty the bucket first if necessary - Boolean.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_s3\_bucket.present**(*name*, *Bucket*, *LocationConstraint=None*, *ACL=None*, *CORSRules=None*, *LifecycleConfiguration=None*, *Logging=None*, *NotificationConfiguration=None*, *Policy=None*, *Replication=None*, *RequestPayment=None*, *Tagging=None*, *Versioning=None*, *Website=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket exists.

**name** The name of the state definition

**Bucket** Name of the bucket.

**LocationConstraint** 'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

**ACL** The permissions on a bucket using access control lists (ACL).

**CORSRules** The cors configuration for a bucket.

**LifecycleConfiguration** Lifecycle configuration for your bucket

**Logging** The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

**NotificationConfiguration** notifications of specified events for a bucket

**Policy** Policy on the bucket

**Replication** Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

**RequestPayment** The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

**Tagging** A dictionary of tags that should be set on the bucket

**Versioning** The versioning state of the bucket

**Website** The website configuration of the bucket

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.52 salt.states.boto\_secgroup

### Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkgsh
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgjsdfjajkgsh
 region: us-east-1
```

```
Ensure mysecgroup exists:
 boto_secgroup.present:
```

(continues on next page)

(continued from previous page)

```

- name: mysecgroup
- description: My security group
- vpc_name: myvpc
- rules:
 - ip_protocol: tcp
 from_port: 80
 to_port: 80
 cidr_ip:
 - 10.0.0.0/8
 - 192.168.0.0/16
 - ip_protocol: tcp
 from_port: 8080
 to_port: 8090
 cidr_ip:
 - 10.0.0.0/8
 - 192.168.0.0/16
 - ip_protocol: icmp
 from_port: -1
 to_port: -1
 source_group_name: mysecgroup
 - ip_protocol: tcp
 from_port: 8080
 to_port: 8080
 source_group_name: MyOtherSecGroup
 source_group_name_vpc: MyPeeredVPC
- rules_egress:
 - ip_protocol: all
 from_port: -1
 to_port: -1
 cidr_ip:
 - 10.0.0.0/8
 - 192.168.0.0/16
- tags:
 SomeTag: 'My Tag Value'
 SomeOtherTag: 'Other Tag Value'
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

*# Using a profile from pillars*

**Ensure mysecgroup exists:**

**boto\_secgroup.present:**

```

- name: mysecgroup
- description: My security group
- profile: myprofile

```

*# Passing in a profile*

**Ensure mysecgroup exists:**

**boto\_secgroup.present:**

```

- name: mysecgroup
- description: My security group
- profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1

```

**Note:** When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

---

`salt.states.boto_secgroup.absent(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)`

Ensure a security group with the specified name does not exist.

**name** Name of the security group.

**vpc\_id** The ID of the VPC to remove the security group from, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to remove the security group from, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

New in version 2016.3.0.

`salt.states.boto_secgroup.present(name, description, vpc_id=None, vpc_name=None, rules=None, rules_egress=None, delete_ingress_rules=True, delete_egress_rules=True, region=None, key=None, keyid=None, profile=None, tags=None)`

Ensure the security group exists with the specified rules.

**name** Name of the security group.

**description** A description of this security group.

**vpc\_id** The ID of the VPC to create the security group in, if any. Exclusive with `vpc_name`.

**vpc\_name** The name of the VPC to create the security group in, if any. Exclusive with `vpc_id`.

New in version 2016.3.0.

New in version 2015.8.2.

**rules** A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

**rules\_egress** A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

**delete\_ingress\_rules** Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to `False` to avoid deleting rules which were added outside of salt.

**delete\_egress\_rules** Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to `False` to avoid deleting rules which were added outside of salt.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key`, and `keyid`.

**tags** List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

### 21.19.53 salt.states.boto\_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
 region: us-east-1
```

```
mytopic:
 boto_sns.present:
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

Using a profile from pillars
mytopic:
 boto_sns.present:
 - region: us-east-1
 - profile: mysnsprofile

Passing in a profile
mytopic:
 boto_sns.present:
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_sns.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

**name** Name of the SNS topic.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**unsubscribe** If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

```
salt.states.boto_sns.present(name, subscriptions=None, region=None, key=None, keyid=None,
 profile=None)
```

Ensure the SNS topic exists.

**name** Name of the SNS topic.

**subscriptions** List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
 {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
 {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.54 salt.states.boto\_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 region: us-east-1
```

```
myqueue:
 boto_sqs.present:
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
 - attributes:
 ReceiveMessageWaitTimeSeconds: 20

Using a profile from pillars
myqueue:
 boto_sqs.present:
 - region: us-east-1
```

(continues on next page)

(continued from previous page)

```

- profile: mysqspofile

Passing in a profile
myqueue:
 boto_sqs.present:
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

**salt.states.boto\_sqs.absent**(*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named sqs queue is deleted.

**name** Name of the SQS queue.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_sqs.present**(*name, attributes=None, region=None, key=None, keyid=None, profile=None*)

Ensure the SQS queue exists.

**name** Name of the SQS queue.

**attributes** A dict of key/value SQS attributes.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

## 21.19.55 salt.states.boto\_vpc

### Manage VPCs

New in version 2015.8.0.

#### depends

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

```
aws:
 region:
 us-east-1:
 profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
 region: us-east-1
```

```
Ensure VPC exists:
 boto_vpc.present:
 - name: myvpc
 - cidr_block: 10.10.11.0/24
 - dns_hostnames: True
 - region: us-east-1
 - keyid: GKTADJGHEIQSXMKKRBJ08H
 - key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs

Ensure subnet exists:
 boto_vpc.subnet_present:
 - name: mysubnet
 - vpc_id: vpc-123456
 - cidr_block: 10.0.0.0/16
 - region: us-east-1
 - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile') %}
Ensure internet gateway exists:
 boto_vpc.internet_gateway_present:
 - name: myigw
 - vpc_name: myvpc
 - profile: {{ profile }}

Ensure route table exists:
 boto_vpc.route_table_present:
 - name: my_route_table
 - vpc_id: vpc-123456
 - routes:
 - destination_cidr_block: 0.0.0.0/0
 instance_id: i-123456
 - subnet_names:
 - subnet1
 - subnet2
 - region: us-east-1
 - profile:
 keyid: GKTADJGHEIQSXMKKRBJ08H
 key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```

accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
 - conn_name: salt_vpc_peering
 - region: us-west-2
 - require:
 - boto_vpc: request a vpc peering connection

request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
 - requester_vpc_id: vpc-4a3d522e
 - peer_vpc_id: vpc-ae81e9ca
 - region: us-west-2
 - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```

accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
 - conn_id: pcx-1873c371
 - region: us-west-2

```

VPC peering connections can be deleted, as shown below.

```

delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
 - conn_name: salt_vpc_peering

```

Delete also accepts a VPC peering connection id.

```

delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
 - conn_id: pcx-1873c371

```

**salt.states.boto\_vpc.absent**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

**name** Name of the VPC.

**tags** A list of tags. All tags must match.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_vpc.accept\_vpc\_peering\_connection**(*name=None*, *conn\_id=None*, *conn\_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

**name** Name of this state

**conn\_id** The connection ID to accept. Exclusive with **conn\_name**. String type.

**conn\_name** The name of the VPC peering connection to accept. Exclusive with **conn\_id**. String type.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
- conn_name: salt_peering_connection

usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
- conn_id: pbx-1873d472
- region: us-west-2
```

```
salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None,
 conn_name=None, region=None,
 key=None, keyid=None, profile=None)
```

**name** Name of the state

**conn\_id** ID of the peering connection to delete. Exclusive with conn\_name.

**conn\_name** The name of the peering connection to delete. Exclusive with conn\_id.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- region: us-west-2
- conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn\_name and conn\_id will result in an error.

```
delete a vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- conn_name: salt_vpc_peering
```

```
salt.states.boto_vpc.dhcp_options_absent(name=None, dhcp_options_id=None, region=None,
 key=None, keyid=None, profile=None)
```

Ensure a set of DHCP options with the given settings exist.

**name** (string) Name of the DHCP options set.

**dhcp\_options\_id** (string) Id of the DHCP options set.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```

salt.states.boto_vpc.dhcp_options_present(name, dhcp_options_id=None, vpc_name=None,
 vpc_id=None, domain_name=None, domain_name_servers=None, ntp_servers=None,
 netbios_name_servers=None, netbios_node_type=None, tags=None, region=None,
 key=None, keyid=None, profile=None)

```

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp\_options\_id param.

**name** (string) Name of the DHCP options.

**vpc\_name** (string) Name of a VPC to which the options should be associated. Either vpc\_name or vpc\_id must be provided.

**vpc\_id** (string) Id of a VPC to which the options should be associated. Either vpc\_name or vpc\_id must be provided.

**domain\_name** (string) Domain name to be associated with this option set.

**domain\_name\_servers** (list of strings) The IP address(es) of up to four domain name servers.

**ntp\_servers** (list of strings) The IP address(es) of up to four desired NTP servers.

**netbios\_name\_servers** (list of strings) The IP address(es) of up to four NetBIOS name servers.

**netbios\_node\_type** (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

**tags** (dict of key:value pairs) A set of tags to be added.

**region** (string) Region to connect to.

**key** (string) Secret key to be used.

**keyid** (string) Access key to be used.

**profile** (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```

salt.states.boto_vpc.internet_gateway_absent(name, detach=False, region=None,
 key=None, keyid=None, profile=None)

```

Ensure the named internet gateway is absent.

**name** Name of the internet gateway.

**detach** First detach the internet gateway from a VPC, if attached.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_vpc.internet_gateway_present(name, vpc_name=None, vpc_id=None,
 tags=None, region=None, key=None,
 keyid=None, profile=None)

```

Ensure an internet gateway exists.

**name** Name of the internet gateway.

**vpc\_name** Name of the VPC to which the internet gateway should be attached.

**vpc\_id** Id of the VPC to which the internet\_gateway should be attached. Only one of vpc\_name or vpc\_id may be provided.

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.nat_gateway_absent(name=None, subnet_name=None, subnet_id=None,
 region=None, key=None, keyid=None, profile=None,
 wait_for_delete_retries=0)
```

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

**name** Name of the state.

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**wait\_for\_delete\_retries** NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

```
salt.states.boto_vpc.nat_gateway_present(name, subnet_name=None, subnet_id=None, re-
 gion=None, key=None, keyid=None, profile=None,
 allocation_id=None)
```

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
- subnet_name: my-subnet
```

**name** Name of the state

**subnet\_name** Name of the subnet within which the nat gateway should exist

**subnet\_id** Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

**allocation\_id** If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None,
 dns_hostnames=None, tags=None, region=None, key=None,
 keyid=None, profile=None)
```

Ensure VPC exists.

**name** Name of the VPC.

**cidr\_block** The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**instance\_tenancy** Instances launched in this VPC will be in single-tenant or dedicated hardware.

**dns\_support** Indicates whether the DNS resolution is supported for the VPC.

**dns\_hostnames** Indicates whether the instances launched in the VPC get DNS hostnames.

**tags** A list of tags.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None,
 requester_vpc_name=None,
 peer_vpc_id=None,
 peer_vpc_name=None,
 conn_name=None,
 peer_owner_id=None, region=None,
 key=None, keyid=None, profile=None)
```

**name** Name of the state  
**requester\_vpc\_id** ID of the requesting VPC. Exclusive with requester\_vpc\_name. String type.  
**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with requester\_vpc\_id. String type.  
**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer\_vpc\_name. String type.  
**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC the same account. Exclusive with peer\_vpc\_id. String type.  
**conn\_name** The (optional) name to use for this VPC peering connection. String type.  
**peer\_owner\_id** ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection
```

```
salt.states.boto_vpc.route_table_absent(name, region=None, key=None, keyid=None, profile=None)
```

Ensure the named route table is absent.

**name** Name of the route table.  
**region** Region to connect to.  
**key** Secret key to be used.  
**keyid** Access key to be used.  
**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.route_table_present(name, vpc_name=None, vpc_id=None,
 routes=None, subnet_ids=None, subnet_names=None,
 tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```
boto_vpc.route_table_present:
- name: my_route_table
- vpc_id: vpc-123456
- routes:
 - destination_cidr_block: 0.0.0.0/0
 internet_gateway_name: InternetGateway
 - destination_cidr_block: 10.10.11.0/24
 instance_id: i-123456
 - destination_cidr_block: 10.10.12.0/24
 interface_id: eni-123456
 - destination_cidr_block: 10.10.13.0/24
 instance_name: mygatewayserver
- subnet_names:
 - subnet1
 - subnet2
```

**name** Name of the route table.

**vpc\_name** Name of the VPC with which the route table should be associated.

**vpc\_id** Id of the VPC with which the route table should be associated. Either **vpc\_name** or **vpc\_id** must be provided.

**routes** A list of routes. Each route has a **cidr** and a **target**.

**subnet\_ids** A list of subnet ids to associate

**subnet\_names** A list of subnet names to associate

**tags** A list of tags.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_vpc.subnet\_absent**(*name=None, subnet\_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.

**name** Name of the subnet.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**salt.states.boto\_vpc.subnet\_present**(*name, cidr\_block, vpc\_name=None, vpc\_id=None, availability\_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route\_table\_id=None, route\_table\_name=None, auto\_assign\_public\_ipv4=False*)

Ensure a subnet exists.

**name** Name of the subnet.

**cidr\_block** The range of IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

**vpc\_name** Name of the VPC in which the subnet should be placed. Either **vpc\_name** or **vpc\_id** must be provided.

**vpc\_id** Id of the VPC in which the subnet should be placed. Either **vpc\_name** or **vpc\_id** must be provided.

**availability\_zone** AZ in which the subnet should be placed.

**tags** A list of tags.

**route\_table\_id** A route table ID to explicitly associate the subnet with. If both **route\_table\_id** and

`route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

**route\_table\_name** A route table name to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.vpc_peering_connection_absent(name, conn_id=None,
 conn_name=None, region=None,
 key=None, keyid=None, profile=None)
```

```
salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None,
 requester_vpc_name=None,
 peer_vpc_id=None,
 peer_vpc_name=None,
 conn_name=None,
 peer_owner_id=None, region=None,
 key=None, keyid=None, profile=None)
```

**name** Name of the state

**requester\_vpc\_id** ID of the requesting VPC. Exclusive with `requester_vpc_name`.

**requester\_vpc\_name** Name tag of the requesting VPC. Exclusive with `requester_vpc_id`.

**peer\_vpc\_id** ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with `peer_vpc_name`.

**peer\_vpc\_name** Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with `peer_vpc_id`.

**conn\_name** The name to use for this VPC peering connection.

**peer\_owner\_id** ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**region** Region to connect to.

**key** Secret key to be used.

**keyid** Access key to be used.

**profile** A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
 boto_vpc.vpc_peering_connection_present:
 - requester_vpc_name: my_local_vpc
 - peer_vpc_name: some_other_guys_vpc
 - conn_name: peering_from_here_to_there
 - peer_owner_id: 012345654321
```

## 21.19.56 salt.states.bower

### Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```
npm:
 pkg.installed
git:
 pkg.installed
bower:
 npm.installed
 require:
 - pkg: npm
 - pkg: git

underscore:
 bower.installed:
 - dir: /path/to/project
 - require:
 - npm: bower
```

**salt.states.bower.bootstrap**(*name*, *user=None*)

Bootstraps a frontend distribution.

Will execute 'bower install' on the specified directory.

**user** The user to run Bower with

**salt.states.bower.installed**(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
underscore:
 bower.installed:
 - dir: /path/to/project
 - user: someuser

jquery#2.0:
 bower.installed:
 - dir: /path/to/project
```

**name** The package to install

**dir** The target directory in which to install the package

**pkgs** A list of packages to install with a single Bower invocation; specifying this argument will ignore the name argument

**user** The user to run Bower with

**env** A list of environment variables to be set prior to execution. The format is the same as the *cmd.run* state function.

**salt.states.bower.pruned**(*name*, *user=None*, *env=None*)

New in version 2017.7.0.

Cleans up local bower\_components directory.

Will execute 'bower prune' on the specified directory (param: name)

**user** The user to run Bower with

`salt.states.bower.removed`(*name*, *dir*, *user=None*)  
 Verify that the given package is not installed.  
**dir** The target directory in which to install the package  
**user** The user to run Bower with

### 21.19.57 salt.states.btrfs

**maintainer** Alberto Planas <aplanas@suse.com>  
**maturity** new  
**depends** None  
**platform** Linux

`salt.states.btrfs.properties`(*name*, *device*, *use\_default=False*, *\_\_dest=None*, *\*\*properties*)  
 Makes sure that a list of properties are set in a subvolume, file or device.  
**name** Name of the object to change  
**device** Device where the object lives, if None, the device will be in name  
**use\_default** If True, this subvolume will be resolved to the default subvolume assigned during the create operation  
**properties** Dictionary of properties  
 Valid properties are 'ro', 'label' or 'compression'. Check the documentation to see where those properties are valid for each object.

`salt.states.btrfs.subvolume_created`(*name*, *device*, *qgroupids=None*, *set\_default=False*, *copy\_on\_write=True*, *force\_set\_default=True*, *\_\_dest=None*)  
 Makes sure that a btrfs subvolume is present.  
**name** Name of the subvolume to add  
**device** Device where to create the subvolume  
**qgroupids** Add the newly created subvolume to a qgroup. This parameter is a list  
**set\_default** If True, this new subvolume will be set as default when mounted, unless subvol option in mount is used  
**copy\_on\_write** If false, set the subvolume with chattr +C  
**force\_set\_default** If false and the subvolume is already present, it will not force it as default if **set\_default** is True

`salt.states.btrfs.subvolume_deleted`(*name*, *device*, *commit=False*, *\_\_dest=None*)  
 Makes sure that a btrfs subvolume is removed.  
**name** Name of the subvolume to remove  
**device** Device where to remove the subvolume  
**commit** Wait until the transaction is over

### 21.19.58 salt.states.cabal

#### Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (cabal-install in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

cabal-install: pkg.installed

ShellCheck:

cabal.installed:

- require: - pkg: cabal-install

`salt.states.cabal.installed(name, pkgs=None, user=None, install_global=False, env=None)`

Verify that the given package is installed and is at the correct version (if specified).

**ShellCheck-0.3.5:**

**cabal:**

- **installed:**

**name** The package to install

**user** The user to run cabal install with

**install\_global** Install package globally instead of locally

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed(name, user=None, env=None)`

Verify that given package is not installed.

## 21.19.59 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.quorum(name, **kwargs)`

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

**quorum:**

**sesceph.quorum:**

- **require:**
- **sesceph:** mon\_running

## 21.19.60 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

**my-chef-run:**

**chef.client:**

- **override-runlist:** 'demo1,demo2'
- **server:** 'https://chef.domain.com'

**default-chef-run:**

**chef.client:** []

(continues on next page)

(continued from previous page)

```
my-solo-run:
 chef.solo:
 - environment: dev
```

`salt.states.chef.client(name, **kwargs)`

- name** Unique identifier for the state. Does not affect the Chef run.
- server** The chef server URL
- client\_key** Set the client key file location
- config** The configuration file to use
- config-file-jail** Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
- environment** Set the Chef Environment on the node
- group** Group to set privilege to
- json-attributes** Load attributes from a JSON file or URL
- localmode** Point chef-client at local repository if True
- log\_level** Set the log level (debug, info, warn, error, fatal)
- logfile** Set the log file location
- node-name** The node name for this client
- override-runlist** Replace current run list with specified items for a single run
- pid** Set the PID file location, defaults to /tmp/chef-client.pid
- run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.
- runlist** Permanently replace current run list with specified items
- user** User to set privilege to
- validation\_key** Set the validation key file location, used for registering new clients

`salt.states.chef.solo(name, **kwargs)`

- name** Unique identifier for the state. Does not affect the Chef run.
- config** The configuration file to use
- environment** Set the Chef Environment on the node
- group** Group to set privilege to
- json-attributes** Load attributes from a JSON file or URL
- log\_level** Set the log level (debug, info, warn, error, fatal)
- logfile** Set the log file location
- node-name** The node name for this client
- override-runlist** Replace current run list with specified items for a single run
- recipe-url** Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
- run-lock-timeout** Set maximum duration to wait for another client run to finish, default is indefinitely.
- user** User to set privilege to

### 21.19.61 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

---

**Note:** Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

---

`salt.states.chocolatey.installed(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False)`

Installs a package if not already installed

Parameters

- **name** (*str*) -- The name of the package to be installed. Required.

- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **pre\_versions** (*bool*) -- Include pre-release packages. Default is False.
- **install\_args** (*str*) -- Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override\_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments. Default is False.
- **force\_x86** (*bool*) -- Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package\_args** (*str*) -- Arguments you want to pass to the package. Default is None.
- **allow\_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

New in version 2017.7.0.

```
Install some package:
chocolatey.install:
- name: packagename
- version: '12.04'
- source: 'mychocolatey/source'
- force: True
```

```
salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None,
 override_args=False)
```

Uninstalls a package

**name** The name of the package to be uninstalled

**version** Uninstalls a specific version of the package. Defaults to latest version installed.

**uninstall\_args** A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

**override\_args** Set to true if you want to override the original uninstall arguments ( for the native uninstaller) in the package and use your own. When this is set to False `uninstall_args` will be appended to the end of the default arguments

```
Remove my package:
chocolatey.uninstalled:
- name: mypackage
- version: '21.5'
```

```
salt.states.chocolatey.upgraded(name, version=None, source=None, force=False,
 pre_versions=False, install_args=None, override_args=False,
 force_x86=False, package_args=None)
```

Upgrades a package. Will install the package if not installed.

New in version 2018.3.0.

Parameters

- **name** (*str*) -- The name of the package to be installed. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is None.

- **source** (*str*) -- Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is `None`.
- **force** (*bool*) -- True will reinstall an existing package with the same version. Default is `False`.
- **pre\_versions** (*bool*) -- True will include pre-release packages. Default is `False`.
- **install\_args** (*str*) -- Install arguments you want to pass to the installation process, i.e product key or feature list. Default is `None`.
- **override\_args** (*bool*) -- True will override the original install arguments (for the native installer) in the package and use those specified in `install_args`. `False` will append `install_args` to the end of the default arguments. Default is `False`.
- **force\_x86** (*bool*) -- True forces 32bit installation on 64 bit systems. Default is `False`.
- **package\_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.

```
upgrade_some_package:
 chocolatey.upgraded:
 - name: packagename
 - version: '12.04'
 - source: 'mychocolatey/source'
```

### 21.19.62 salt.states.chronos\_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
 chronos_job.config:
 - config:
 schedule: "R//PT2S"
 command: "echo 'hi'"
 owner: "me@example.com"
```

New in version 2015.8.2.

**salt.states.chronos\_job.absent**(*name*)

Ensure that the chronos job with the given name is not present.

Parameters **name** -- The app name

Returns A standard Salt changes dictionary

**salt.states.chronos\_job.config**(*name*, *config*)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters

• **name** -- The job name

• **config** -- The configuration to apply (dict)

Returns A standard Salt changes dictionary

### 21.19.63 salt.states.cimc

A state module to manage Cisco UCS chassis devices.

```
codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new
depends none
platform unix
```

#### About

This state module was designed to handle connections to a Cisco Unified Computing System (UCS) chassis. This module relies on the CIMC proxy module to interface with the device.

See also:

*CIMC Proxy Module*

**salt.states.cimc.hostname**(*name*, *hostname=None*)

Ensures that the hostname is set to the specified value.

New in version 2019.2.0.

name: The name of the module function to execute.

hostname(str): The hostname of the server.

SLS Example:

```
set_name:
 cimc.hostname:
 - hostname: foobar
```

**salt.states.cimc.logging\_levels**(*name*, *remote=None*, *local=None*)

Ensures that the logging levels are set on the device. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.

New in version 2019.2.0.

name: The name of the module function to execute.

remote(str): The logging level for SYSLOG logs.

local(str): The logging level for the local device.

SLS Example:

```
logging_levels:
 cimc.logging_levels:
 - remote: informational
 - local: notice
```

**salt.states.cimc.ntp**(*name*, *servers*)

Ensures that the NTP servers are configured. Servers are provided as an individual string or list format. Only four NTP servers will be reviewed. Any entries past four will be ignored.

name: The name of the module function to execute.

servers(str, list): The IP address or FQDN of the NTP servers.

SLS Example:

```

ntp_configuration_list:
 cimc.ntp:
 - servers:
 - foo.bar.com
 - 10.10.10.10

ntp_configuration_str:
 cimc.ntp:
 - servers: foo.bar.com

```

`salt.states.cimc.power_configuration(name, policy=None, delayType=None, delayValue=None)`

Ensures that the power configuration is configured on the system. This is only available on some C-Series servers.

New in version 2019.2.0.

**name:** The name of the module function to execute.

**policy(str):** The action to be taken when chassis power is restored after an unexpected power loss. This can be one of the following:

**reset:** The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.

**stay-off:** The server remains off until it is manually restarted.

**last-state:** The server restarts and the system attempts to restore any processes that were running before power was lost.

**delayType(str):** If the selected policy is reset, the restart can be delayed with this option. This can be one of the following:

**fixed:** The server restarts after a fixed delay.

**random:** The server restarts after a random delay.

**delayValue(int):** If a fixed delay is selected, once chassis power is restored and the Cisco IMC has finished rebooting, the system waits for the specified number of seconds before restarting the server. Enter an integer between 0 and 240.

SLS Example:

```

reset_power:
 cimc.power_configuration:
 - policy: reset
 - delayType: fixed
 - delayValue: 0

power_off:
 cimc.power_configuration:
 - policy: stay-off

```

`salt.states.cimc.syslog(name, primary=None, secondary=None)`

Ensures that the syslog servers are set to the specified values. A value of None will be ignored.

**name:** The name of the module function to execute.

**primary(str):** The IP address or FQDN of the primary syslog server.

**secondary(str):** The IP address or FQDN of the secondary syslog server.

SLS Example:

```
syslog_configuration:
 cimc.syslog:
 - primary: 10.10.10.10
 - secondary: foo.bar.com
```

`salt.states.cimc.user` (*name*, *id*="", *user*="", *priv*="", *password*="", *status*='active')

Ensures that a user is configured on the device. Due to being unable to verify the user password. This is a forced operation.

New in version 2019.2.0.

*name*: The name of the module function to execute.

*id*(int): The user ID slot on the device.

*user*(str): The username of the user.

*priv*(str): The privilege level of the user.

*password*(str): The password of the user.

*status*(str): The status of the user. Can be either active or inactive.

SLS Example:

```
user_configuration:
 cimc.user:
 - id: 11
 - user: foo
 - priv: admin
 - password: mypassword
 - status: active
```

## 21.19.64 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for [\*salt.proxy.cisconso\*](#).

`salt.states.cisconso.value_present` (*name*, *datastore*, *path*, *config*)

Ensure a specific value exists at a given path

Parameters

- **name** (str) -- The name for this rule
- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
- **config** (dict) -- The new value at the given path

Examples:

```
enable pap auth:
 cisconso.config_present:
 - name: enable_pap_auth
 - datastore: running
 - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
 - config:
 authentication:
```

(continues on next page)

(continued from previous page)

```
method: pap
"list-name": foobar
```

## 21.19.65 salt.states.cloud

### Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
 cloud.profile:
 my-ec2-config
```

**salt.states.cloud.absent**(*name*, *onlyif*=None, *unless*=None)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

**name** The name of the instance to destroy

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**salt.states.cloud.present**(*name*, *cloud\_provider*, *onlyif*=None, *unless*=None, *opts*=None, *\*\*kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

**name** The name of the instance to create

**cloud\_provider** The name of the cloud provider to use

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**opts** Any extra opts that need to be used

**salt.states.cloud.profile**(*name*, *profile*, *onlyif*=None, *unless*=None, *opts*=None, *\*\*kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

**name** The name of the instance to create

**profile** The name of the cloud profile to use

**onlyif** Do run the state only if is unless succeed

**unless** Do not run the state at least unless succeed

**kwargs** Any profile override or addition

**opts** Any extra opts that need to be used

**salt.states.cloud.volume\_absent**(*name*, *provider*=None, *\*\*kwargs*)

Check that a block volume exists.

**salt.states.cloud.volume\_attached**(*name*, *server\_name*, *provider*=None, *\*\*kwargs*)

Check if a block volume is attached.

`salt.states.cloud.volume_detached(name, server_name=None, provider=None, **kwargs)`

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.volume_present(name, provider=None, **kwargs)`

Check that a block volume exists.

## 21.19.66 salt.states.cmd

### Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
Store the current date in a file
'date > /tmp/salt-run':
 cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/:
 cmd.run:
 - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch `/tmp/foo` if it does not exist:

```
touch /tmp/foo:
 cmd.run:
 - creates: /tmp/foo
```

`creates` also accepts a list of files, in which case this state will run if **any** of the files do not exist:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
 cmd.run:
 - creates:
 - /tmp/bar
 - /tmp/baz
```

---

**Note:** The `creates` option was added to the cmd state in version 2014.7.0, and made a global requisite in 3001.

---

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
 cmd.run:
 - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the cmd state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

## Using the "Stateful" Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {}).** If it's key=value pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state.**

Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
 cmd.run:
 - name: /path/to/myscript
 - cwd: /
 - stateful: True

Run only if myscript changed something:
 cmd.run:
 - name: echo hello
 - cwd: /
 - onchanges:
 - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. The stateful argument can optionally include a `test_name` parameter.

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```
Run myscript:
 cmd.run:
 - name: /path/to/myscript
 - cwd: /
 - stateful:
 - test_name: /path/to/myscript test

Run masterscript:
 cmd.script:
 - name: masterscript
 - source: salt://path/to/masterscript
 - cwd: /
 - stateful:
 - test_name: masterscript test
```

### Should I use `cmd.run` or `cmd.wait`?

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to `watch` other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
 cmd.wait:
 - watch:
 - pkg: mycustompkg
 file.managed:
 - source: salt://utils/scripts/postinstall.sh

mycustompkg:
 pkg.installed:
 - require:
 - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself do not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the `onchanges Requisite`, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
 cmd.run:
 - onchanges:
 - pkg: mycustompkg
 file.managed:
 - source: salt://utils/scripts/postinstall.sh
```

(continues on next page)

(continued from previous page)

```
mycustompkg:
 pkg.installed:
 - require:
 - file: /usr/local/bin/postinstall.sh
```

### How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
 cmd.run:
 - env: {{ salt['pillar.get']('example:key', {}) }}
```

```
salt.states.cmd.call(name, func, args=(), kws=None, output_loglevel='debug', hide_output=False,
 use_vt=False, **kwargs)
```

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
 'name': name
 'changes': {'retval': result},
 'result': True if result is None else bool(result),
 'comment': result if isinstance(result, six.string_types) else ''
}
```

```
salt.states.cmd.mod_watch(name, **kwargs)
```

Execute a `cmd` function based on a watch call

---

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

```
salt.states.cmd.run(name, cwd=None, root=None, runas=None, shell=None, env=None,
 prepend_path=None, stateful=False, umask=None, output_loglevel='debug',
 hide_output=False, timeout=None, ignore_timeout=False, use_vt=False,
 success_retcodes=None, **kwargs)
```

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**cwd** The current working directory to execute the command in, defaults to `/root`

**root** Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell grain

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
 cmd.run:
 - env:
 - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
 cmd.run:
 - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**prepend\_path** `$PATH` segment to prepend (trailing `:` not necessary) to `$PATH`. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**umask** The umask (in octal) to use when running the command.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**timeout** If the command has not terminated after `timeout` seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

**ignore\_timeout** Ignore the timeout of commands, which is useful for running `nohup` processes.

New in version 2015.8.0.

**creates** Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

**use\_vt** [False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**bg** [False] If True, run command in background and do not await or deliver its results.

New in version 2016.3.6.

**success\_retcodes**: This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

**Note:** `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
 cmd.run:
 - name: /usr/bin/python /usr/local/sbin/get-pip.py
 - unless: which pip
 - require:
 - pkg: python
 - file: /usr/local/sbin/get-pip.py
 - reload_modules: True
```

`salt.states.cmd.script` (*name*, *source*=None, *template*=None, *cwd*=None, *runas*=None, *password*=None, *shell*=None, *env*=None, *stateful*=False, *umask*=None, *timeout*=None, *use\_vt*=False, *output\_loglevel*='debug', *hide\_output*=False, *defaults*=None, *context*=None, *success\_retcodes*=None, *\*\*kwargs*)

Download a script and execute it with specified arguments.

**source** The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently `jinja`, `mako`, and `wempy` are supported

**name** Either `"cmd arg1 arg2 arg3..."` (`cmd` is not used) or a source `"salt://..."`.

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Note:** For Window's users, specifically Server users, it may be necessary to specify your `runas` user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

`Domain/user`

In the event this causes issues when executing scripts, use the UPN format which looks like the following.  
`user@domain.local`

More information <<https://github.com/saltstack/salt/issues/55080>>

`password`

New in version 3000: Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

**shell** The shell to use for execution. The default is set in `grains['shell']`

**env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
 cmd.script:
 - env:
 - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
salt://scripts/bar.sh:
 cmd.script:
 - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**saltenv** [base] The Salt environment to use

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**timeout** If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

**args** String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: "arg1 'arg two' arg3"

**creates** Only run if the file specified by *creates* do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**context** New in version 2016.3.0.

Overrides default context variables passed to the template.

**defaults** New in version 2016.3.0.

Default context passed to the template.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**success\_retcodes:** This parameter will allow a list of

non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```
salt.states.cmd.wait(name, cwd=None, root=None, runas=None, shell=None, env=(), stateful=False,
 umask=None, output_loglevel='debug', hide_output=False, use_vt=False, suc-
 cess_retcodes=None, **kwargs)
```

Run the given command only if the watch statement calls it.

---

**Note:** Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

---

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**cwd** The current working directory to execute the command in, defaults to `/root`

**root** Path to the root of the jail to use. If this parameter is set, the command will run inside a chroot

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to `/bin/sh`

**env** A list of environment variables to be set prior to execution. Example:

```
script-foo:
 cmd.wait:
 - env:
 - BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
 cmd.wait:
 - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the [Using the "Stateful" Argument](#) section.

**creates** Only run if the file specified by `creates` do not exist. If you specify a list of files then this state will only run if **any** of the files do not exist.

New in version 2014.7.0.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**success\_retcodes:** This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

```
salt.states.cmd.wait_call(name, func, args=(), kws=None, stateful=False, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs)
```

```
salt.states.cmd.wait_script(name, source=None, template=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs)
```

Download a script from a remote source and execute it only if a watch statement calls it.

**source** The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`

**template** If this setting is applied then the named templating engine will be used to render the downloaded file, currently `jinja`, `mako`, and `wempy` are supported

**name** The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

**cwd** The current working directory to execute the command in, defaults to `/root`

**runas** The user name to run the command as

**shell** The shell to use for execution, defaults to the shell grain

**env** A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
cmd.wait_script:
- env:
- BATCH: 'yes'
```

**Warning:** The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
salt://scripts/bar.sh:
cmd.wait_script:
- env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
 cmd.run:
 - name: ls -l /
 - env:
 - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

**umask** The umask (in octal) to use when running the command.

**stateful** The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

**use\_vt** Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**output\_loglevel** [debug] Control the loglevel at which the output from the command is logged to the minion log.

---

**Note:** The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

---

**hide\_output** [False] Suppress stdout and stderr in the state's results.

---

**Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

---

New in version 2018.3.0.

**success\_retcodes:** This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

## 21.19.67 salt.states.composer

### Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```
get-composer:
 cmd.run:
 - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
 - unless: test -f /usr/local/bin/composer
 - cwd: /root/

install-composer:
 cmd.wait:
 - name: mv /root/composer.phar /usr/local/bin/composer
 - cwd: /root/
 - watch:
 - cmd: get-composer

/path/to/project:
 composer.installed:
```

(continues on next page)

(continued from previous page)

```

- no_dev: true
- require:
 - cmd: install-composer

Without composer installed in your PATH
Note: composer.phar must be executable for state to work properly
/path/to/project:
 composer.installed:
 - composer: /path/to/composer.phar
 - php: /usr/local/bin/php
 - no_dev: true

```

```

salt.states.composer.installed(name, composer=None, php=None, user=None, pre-
 fer_source=None, prefer_dist=None, no_scripts=None,
 no_plugins=None, optimize=None, no_dev=None, quiet=False,
 composer_home='/root', always_check=True, env=None)

```

Verify that the correct versions of composer dependencies are present.

**name** Directory location of the `composer.json` file.

**composer** Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php** Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** `--prefer-source` option of composer.

**prefer\_dist** `--prefer-dist` option of composer.

**no\_scripts** `--no-scripts` option of composer.

**no\_plugins** `--no-plugins` option of composer.

**optimize** `--optimize-autoloader` option of composer. Recommended for production.

**no\_dev** `--no-dev` option for composer. Recommended for production.

**quiet** `--quiet` option for composer. Whether or not to return output from composer.

**composer\_home** `$COMPOSER_HOME` environment variable

**always\_check** If True, *always* run `composer install` in the directory. This is the default behavior. If False, only run `composer install` if there is no vendor directory present.

**env** A list of environment variables to be set prior to execution.

```

salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None,
 prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None,
 no_dev=None, quiet=False, composer_home='/root', env=None)

```

Composer update the directory to ensure we have the latest versions of all project dependencies.

**name** Directory location of the `composer.json` file.

**composer** Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

**php** Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

**user** Which system user to run composer as.

New in version 2014.1.4.

**prefer\_source** `--prefer-source` option of composer.

**prefer\_dist** `--prefer-dist` option of composer.

**no\_scripts** `--no-scripts` option of composer.

**no\_plugins** `--no-plugins` option of composer.

**optimize** `--optimize-autoloader` option of composer. Recommended for production.

**no\_dev** `--no-dev` option for composer. Recommended for production.

**quiet** `--quiet` option for composer. Whether or not to return output from composer.

**composer\_home** \$COMPOSER\_HOME environment variable  
**env** A list of environment variables to be set prior to execution.

## 21.19.68 salt.states.cron

### Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- **minute**
- **hour**
- **daymonth**
- **month**
- **dayweek** (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

**Warning:** Any timing arguments not specified take a value of `*`. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x` minutes very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
cron.present:
- user: root
- minute: random
- hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `'@reboot'` or `'@hourly'`. Quotes must be used, otherwise PyYAML will strip the `'@'` sign.

```
/path/to/cron/script:
cron.present:
- user: root
- special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
cron.absent:
- user: root
- special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.absent(name, user='root', identifier=False, special=None, **kwargs)`

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

**name** The command that should be absent in the user crontab.  
**user** The name of the user whose crontab needs to be modified, defaults to the root user  
**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name  
**special** The special keyword used in the job (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

`salt.states.cron.env_absent(name, user='root')`

Verifies that the specified environment variable is absent from the crontab for the specified user

**name** The name of the environment variable to remove from the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.env_present(name, value=None, user='root')`

Verifies that the specified environment variable is present in the crontab for the specified user.

**name** The name of the environment variable to set in the user crontab

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**value** The value to set for the given environment variable

`salt.states.cron.file(name, source_hash="", source_hash_name=None, user='root', template=None, context=None, replace=True, defaults=None, backup="", **kwargs)`

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

**name** The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

**source\_hash** This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
 cron.file:
 - name: https://mydomain.tld/dir2/foo.txt
 - source_hash: https://mydomain.tld/hashes
 - source_hash_name: ./dir2/foo.txt
```

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

**user** The user to whom the crontab should be assigned. This defaults to root.

**template** If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

**context** Overrides default context variables passed to the template.

**replace** If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for the user's crontab.

```
salt.states.cron.present(name, user='root', minute='*', hour='*', daymonth='*', month='*', day-
 week='*', comment=None, commented=False, identifier=False, spe-
 cial=None)
```

Verifies that the specified cron job is present for the specified user. It is recommended to use *identifier*. Otherwise the cron job is installed twice if you change the name. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

**name** The command that should be executed by the cron job.

**user** The name of the user whose crontab needs to be modified, defaults to the root user

**minute** The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is \*

**hour** The information to be set in the hour section. Default is \*

**daymonth** The information to be set in the day of month section. Default is \*

**month** The information to be set in the month section. Default is \*

**dayweek** The information to be set in the day of week section. Default is \*

**comment** User comment to be added on line previous the cron job

**commented** The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

**identifier** Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

**special** A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

## 21.19.69 salt.states.cryptdev module

### Opening of Encrypted Devices

Ensure that an encrypted device is mapped with the *mapped* function:

```
mappedname:
 cryptdev.mapped:
 - device: /dev/sdb1
 - keyfile: /etc/keyfile.key
 - opts:
 - size=256

swap:
 cryptd.mapped:
 - device: /dev/sdx4
 - keyfile: /dev/urandom
 - opts: swap,cipher=aes-cbc-essiv:sha256,size=256

mappedbyuuid:
```

(continues on next page)

(continued from previous page)

**cryptdev.mapped:**

- **device:** UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
- **keyfile:** /etc/keyfile.key
- **config:** /etc/alternate-crypttab

New in version 2018.3.0.

**salt.states.cryptdev.mapped**(*name, device, keyfile=None, opts=None, config='/etc/crypttab', persist=True, immediate=False, match\_on='name'*)

Verify that a device is mapped

**name** The name under which the device is to be mapped

**device** The device name, typically the device node, such as /dev/sdb1 or UUID=066e0200-2867-4ebe-b9e6-f30026ca2314.

**keyfile** Either None if the password is to be entered manually on boot, or an absolute path to a keyfile. If the password is to be asked interactively, the mapping cannot be performed with **immediate=True**.

**opts** A list object of options or a comma delimited list

**config** Set an alternative location for the crypttab, if the map is persistent, Default is /etc/crypttab

**persist** Set if the map should be saved in the crypttab, Default is **True**

**immediate** Set if the device mapping should be executed immediately. Requires that the keyfile not be None, because the password cannot be asked interactively. Note that options are not passed through on the initial mapping. Default is **False**.

**match\_on** A name or list of crypttab properties on which this state should be applied. Default is **name**, meaning that the line is matched only by the name parameter. If the desired configuration requires two devices mapped to the same name, supply a list of parameters to match on.

**salt.states.cryptdev.unmapped**(*name, config='/etc/crypttab', persist=True, immediate=False*)

Ensure that a device is unmapped

**name** The name to ensure is not mapped

**config** Set an alternative location for the crypttab, if the map is persistent, Default is /etc/crypttab

**persist** Set if the map should be removed from the crypttab. Default is **True**

**immediate** Set if the device should be unmapped immediately. Default is **False**.

## 21.19.70 salt.states.csf module

### CSF Ip tables management

**depends**

- csf utility

**configuration** See <http://download.configserver.com/csf/install.txt> for setup instructions.

#### Simply allow/deny rules:

##### csf.rule\_present:

- ip:** 1.2.3.4
- method:** allow

**salt.states.csf.nics\_skip**(*name, nics, ipv6*)

Alias for *csf.nics\_skipped*

**salt.states.csf.nics\_skipped**(*name, nics, ipv6=False*)

**name** Meaningless arg, but required for state.

**nics** A list of nics to skip.

**ipv6** Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

`salt.states.csf.option_present(name, value, reload=False)`

Ensure the state of a particular option/setting in csf.

**name** The option name in csf.conf

**value** The value it should be set to.

**reload** Boolean. If set to true, csf will be reloaded after.

`salt.states.csf.ports_open(name, ports, proto='tcp', direction='in')`

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP\_IN in the csf.conf file.

**ports** A list of ports that should be open.

**proto** The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

**direction** Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

`salt.states.csf.rule_absent(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, reload=False)`

Ensure iptable is not present.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either 'allow' or 'deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.temppdeny()` are used.

**reload** Reload the csf service after applying this rule. Default false.

`salt.states.csf.rule_present(name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment="", reload=False)`

Ensure iptable rule exists.

**name** The ip address or CIDR for the rule.

**method** The type of rule. Either 'allow' or 'deny'.

**port** Optional port to be open or closed for the iptables rule.

**proto** The protocol. Either 'tcp', or 'udp'. Only applicable if port is specified.

**direction** The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

**port\_origin** Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

**ip\_origin** Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

**ttl** How long the rule should exist. If supplied, `csf.tempallow()` or `csf.temppdeny()` are used.

**comment** An optional comment to appear after the rule as a `#comment`.

**reload** Reload the csf service after applying this rule. Default false.

`salt.states.csf.testing_off(name, reload=False)`

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

`salt.states.csf.testing_on(name, reload=False)`

Ensure testing mode is enabled in csf.

**reload** Reload CSF after changing the testing status. Default false.

### 21.19.71 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
 cyg.installed
```

**class** salt.states.cyg.DictDiffer(*current\_dict*, *past\_dict*)

Calculate the difference between two dictionaries.

- (1) items added
- (2) items removed
- (3) keys same in both but changed values
- (4) keys same in both and unchanged values

**added()**

Return a set of additions to *past\_dict*.

**changed()**

Return a set of the keys with changed values.

**removed()**

Return a set of things removed from *past\_dict*.

**same()**

True if the two dicts are the same.

**unchanged()**

Return a set of the keys with unchanged values.

**salt.states.cyg.installed**(*name*, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure that a package is installed.

**name** The name of the package to install

**cyg\_arch** [x86\_64] The cygwin architecture to install the package into. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
 cyg.installed:
 - mirrors:
 - http://mirror/without/public/key: ""
 - http://mirror/with/public/key: http://url/of/public/key
```

**salt.states.cyg.removed**(*name*, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure that a package is not installed.

**name** The name of the package to uninstall

**cyg\_arch** [x86\_64] The cygwin architecture to remove the package from. Current options are x86 and x86\_64

**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
 cyg.removed:
 - mirrors:
 - http://mirror/without/public/key: ""
 - http://mirror/with/public/key: http://url/of/public/key
```

**salt.states.cyg.updated**(*name*=None, *cyg\_arch*='x86\_64', *mirrors*=None)

Make sure all packages are up to date.

**name** [None] No affect, salt fails poorly without the arg available  
**cyg\_arch** [x86\_64] The cygwin architecture to update. Current options are x86 and x86\_64  
**mirrors** [None] List of mirrors to check. None will use a default mirror (kernel.org)  
CLI Example:

```
rsync:
 cyg.updated:
 - mirrors:
 - http://mirror/without/public/key: ""
 - http://mirror/with/public/key: http://url/of/public/key
```

## 21.19.72 salt.states.ddns

### Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

**depends**

- [dnspython](#)

---

**Note:** The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

---

Example:

```
webserver:
 ddns.present:
 - zone: example.com
 - ttl: 60
 - data: 111.222.333.444
 - nameserver: 123.234.345.456
 - keyfile: /srv/salt/dnspsy_tsig_key.txt
```

`salt.states.ddns.absent(name, zone, data=None, rdtype=None, **kwargs)`

Ensures that the named DNS record is absent.

**name** The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check

**data** Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

**rdtype** DNS resource type. If omitted, all types will be purged.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the [dnspython](#) spec.

`salt.states.ddns.present(name, zone, ttl, data, rdtype='A', **kwargs)`

Ensures that the named DNS record is present with the given `ttl`.

**name** The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

**zone** The zone to check/update

**ttl** TTL for the record

**data** Data for the DNS record. E.g., the IP address for an A record.

**rdtype** DNS resource type. Default 'A'.

**\*\*kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the keyfile and other arguments must follow the `dnspython` spec.

### 21.19.73 salt.states.debconfmod

#### Management of debconf selections

##### depends

- `debconf-utils` package

The `debconfmod` state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

#### Available Functions

The `debconfmod` state has two functions, the `set` and `set_file` functions

**set** Set debconf selections from the state itself

**set\_file** Set debconf selections from a file

```

nullmailer-debconf:
 debconf.set:
 - name: nullmailer
 - data:
 'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
 'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
 debconf.set:
 - name: ferm
 - data:
 'ferm/enable': {'type': 'boolean', 'value': True}

```

**Note:** Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

If you're setting debconf values that requires `dpkg-reconfigure`, you can use the `onchanges` requisite to reconfigure your package:

```

set-default-shell:
 debconf.set:
 - name: dash
 - data:
 'dash/sh': {'type': 'boolean', 'value': false}

reconfigure-dash:
 cmd.run:
 - name: dpkg-reconfigure -f noninteractive dash
 - onchanges:
 - debconf: set-default-shell

```

Every time the `set-default-shell` state changes, the `reconfigure-dash` state will also run.

---

**Note:** For boolean types, the value should be `true` or `false`, not `'true'` or `'false'`.

---

`salt.states.debconfmod.set(name, data, **kwargs)`

Set debconf selections

```
<state_id>:
 debconf.set:
 - name: <name>
 - data:
 <question>: {'type': <type>, 'value': <value>}
 <question>: {'type': <type>, 'value': <value>}

<state_id>:
 debconf.set:
 - name: <name>
 - data:
 <question>: {'type': <type>, 'value': <value>}
 <question>: {'type': <type>, 'value': <value>}
```

**name:** The package name to set answers for.

**data:** A set of questions/answers for debconf. Note that everything under this must be indented twice.

**question:** The question the is being pre-answered

**type:** The type of question that is being asked (string, boolean, select, etc.)

**value:** The answer to the question

`salt.states.debconfmod.set_file(name, source, template=None, context=None, defaults=None, **kwargs)`

Set debconf selections from a file or a template

```
<state_id>:
 debconf.set_file:
 - source: salt://pathto/pkg.selections

<state_id>:
 debconf.set_file:
 - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
 debconf.set_file:
 - source: salt://pathto/pkg.selections.jinja2
 - template: jinja
 - context:
 some_value: "false"
```

**source:** The location of the file containing the package selections

**template** If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

## 21.19.74 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
 dellchassis.chassis:
 - chassis_name: my-dell-chassis
 - datacenter: dc-1-us
 - location: my-location
 - mode: 2
 - idrac_launch: 1
 - slot_names:
 - server-1: my-slot-name
 - server-2: my-other-slot-name
 - blade_power_states:
 - server-1: on
 - server-2: off
 - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
 host: 10.27.20.18
 admin_username: root
 fallback_admin_username: root
 passwords:
 - super-secret
 - old-secret
 proxytype: fx2

chassis:
 name: fx2-1
 username: root
 password: saltstack1
 datacenter: london
 location: rack-1-shelf-3
 management_mode: 2
 idrac_launch: 0
 slot_names:
 - 'server-1': blade1
 - 'server-2': blade2

servers:
 server-1:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.132
 netmask: 255.255.0.0
 gateway: 172.17.17.1
 server-2:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.2
 netmask: 255.255.0.0
```

(continues on next page)

(continued from previous page)

```

 gateway: 172.17.17.1
server-3:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.20
 netmask: 255.255.0.0
 gateway: 172.17.17.1
server-4:
 idrac_password: saltstack1
 ipmi_over_lan: True
 ip: 172.17.17.2
 netmask: 255.255.0.0
 gateway: 172.17.17.1

switches:
 switch-1:
 ip: 192.168.1.2
 netmask: 255.255.255.0
 gateway: 192.168.1.1
 snmp: nonpublic
 password: saltstack1
 switch-2:
 ip: 192.168.1.3
 netmask: 255.255.255.0
 gateway: 192.168.1.1
 snmp: nonpublic
 password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
 dellchassis.chassis:
 - name: {{ details['name'] }}
 - location: {{ details['location'] }}
 - mode: {{ details['management_mode'] }}
 - idrac_launch: {{ details['idrac_launch'] }}
 - slot_names:
 {% for entry details['slot_names'] %}
 - {{ next(iter(entry)) }}: {{ entry[next(iter(entry))] }}
 {% endfor %}

blade_powercycle:
 dellchassis.chassis:
 - blade_power_states:
 - server-1: powercycle
 - server-2: powercycle
 - server-3: powercycle
 - server-4: powercycle

Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
{{ k }}:
 dellchassis.blade_idrac:
 - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

```

(continues on next page)

(continued from previous page)

```
Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
{{ k }}-switch-setup:
 dellchassis.switch:
 - name: {{ k }}
 - ip: {{ v['ip'] }}
 - netmask: {{ v['netmask'] }}
 - gateway: {{ v['gateway'] }}
 - password: {{ v['password'] }}
 - snmp: {{ v['snmp'] }}
{% endfor %}
```

**Note:** This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chassis-state-name -t 60
```

**Note:** The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```
salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None,
 idrac_ip=None, idrac_netmask=None,
 idrac_gateway=None, idrac_dnsname=None,
 idrac_dhcp=None)
```

Set parameters for iDRAC in a blade.

#### Parameters

- **idrac\_password** -- Password to use to connect to the iDRACs directly (idrac\_ipmi and idrac\_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac\_ipmi** -- Enable/Disable IPMI over LAN
- **idrac\_ip** -- Set IP address for iDRAC
- **idrac\_netmask** -- Set netmask for iDRAC
- **idrac\_gateway** -- Set gateway for iDRAC
- **idrac\_dhcp** -- Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

**Returns** A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

```
salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None,
 location=None, mode=None, idrac_launch=None,
 slot_names=None, blade_power_states=None)
```

Manage a Dell Chassis.

**chassis\_name** The name of the chassis.

**datacenter** The datacenter in which the chassis is located

**location** The location of the chassis.

**password** Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades.

If the password for the blades should be distinct, they should be set separately with the `blade_idrac` function.

**mode** The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

**idrac\_launch** The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

**slot\_names** The names of the slots, provided as a list identified by their slot numbers.

**blade\_power\_states** The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
 dellchassis.chassis:
 - chassis_name: my-dell-chassis
 - location: my-location
 - datacenter: london
 - mode: 2
 - idrac_launch: 1
 - slot_names:
 - 1: my-slot-name
 - 2: my-other-slot-name
 - blade_power_states:
 - server-1: on
 - server-2: off
 - server-3: powercycle
```

`salt.states.dellchassis.firmware_update` (*hosts=None, directory=""*)

State to update the firmware on host using the `racadm` command

**firmwarefile** filename (string) starting with `salt://`

**host** string representing the hostname supplied to the `racadm` command

**directory** Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
 dellchassis.firmware_update:
 hosts:
 cmc:
 salt://firmware_cmc.exe
 server-1:
 salt://firmware.exe
 directory: /opt/firmwares
```

`salt.states.dellchassis.switch` (*name, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None*)

Manage switches in a Dell Chassis.

**name** The switch designation (e.g. switch-1, switch-2)

**ip** The Static IP Address of the switch

**netmask** The netmask for the static IP

**gateway** The gateway for the static IP

**dhcp** True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

**password** The access (root) password for the switch

**snmp** The SNMP community string for the switch

Example:

```
my-dell-chassis:
 dellchassis.switch:
 - switch: switch-1
 - ip: 192.168.1.1
 - netmask: 255.255.255.0
 - gateway: 192.168.1.254
 - dhcp: True
 - password: secret
 - snmp: public
```

### 21.19.75 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
 disk.status:
 - name: /dev/xda1
 - maximum: 79%
 - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:
 disk.status:
 - name: /dev/xda1
 - maximum: 97%

clear_cache:
 cmd.run:
 - name: rm -r /var/cache/app
 - onfail:
 - disk: storage_threshold
```

To use kilobytes (KB) for minimum and maximum rather than percents, specify the `absolute` flag:

```
used_space:
 disk.status:
 - name: /dev/xda1
 - minimum: 1024 KB
 - maximum: 1048576 KB
 - absolute: True
```

**salt.states.disk.status**(*name*, *maximum=None*, *minimum=None*, *absolute=False*, *free=False*)

Return the current disk usage stats for the named mount point

**name** Disk mount or directory for which to check used space

**maximum** The maximum disk utilization

**minimum** The minimum disk utilization

**absolute** By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

**free** By default, *minimum* & *maximum* refer to the amount of used space. Set to *True* to evaluate the free space instead.

### 21.19.76 salt.states.docker\_container

Management of Docker containers

New in version 2017.7.0.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq 1.6.0$  are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release. When running the `docker_container.running` state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is `None`. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

---

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

---

`salt.states.docker_container.absent(name, force=False)`

Ensure that a container is absent

**name** Name of the container

**force** [False] Set to `True` to remove the container even if it is running

Usage Examples:

```
mycontainer:
 docker_container.absent

multiple_containers:
 docker_container.absent:
 - names:
 - foo
 - bar
 - baz
```

`salt.states.docker_container.mod_watch(name, sfun=None, **kwargs)`

The `docker_container` watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly. Parameters for this function should be set by the state being triggered.

---

```
salt.states.docker_container.run(name, image=None, bg=False, failhard=True, replace=False,
 force=False, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs)
```

New in version 2018.3.0.

---

**Note:** If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is not implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

---

Like the `cmd.run` state, only for Docker. Does the equivalent of a `docker run` and returns information about the container that was created, as well as its output.

This state accepts the same arguments as `docker_container.running`, with the exception of `watch_action`, `start`, and `shutdown_timeout` (though the `force` argument has a different meaning in this state).

In addition, this state accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned.

Additionally, the following arguments are supported:

**creates** A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.

**bg** [False] If True, run container in background and do not await or deliver its results.

---

**Note:** This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if `auto_remove` is set to True, so keep this in mind.

---

**failhard** [True] If True, the state will return a False result if the exit code of the container is non-zero. When this argument is set to False, the state will return a True result regardless of the container's exit code.

---

**Note:** This has no effect if `bg` is set to True.

---

**replace** [False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

**force** [False] If True, and the named container already exists, *and* `replace` is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a False result.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
↪ sh
```

## USAGE EXAMPLE

```
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}
build_package:
 docker_container.run:
 - image: myuser/builder:latest
 - binds: /home/myuser/builds:/build_dir
 - command: /scripts/build.sh {{ pkg_version }}
```

(continues on next page)

(continued from previous page)

```

- creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
- replace: True
- networks:
 - mynet
- require:
 - docker_network: mynet

```

```

salt.states.docker_container.running(name, image=None, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, force=False, watch_action='force', start=True, shutdown_timeout=None, client_timeout=60, net_works=None, **kwargs)

```

Ensure that a container with a specific configuration is present and running

**name** Name of the container

**image** Image to use for the container

---

**Note:** This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

---

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker.pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is no longer implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

**skip\_translate** This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```

mycontainer:
 docker_container.running:
 - image: 7.3.1611
 - port_bindings:
 - 10.2.9.10:8080:80

```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format `docker-py` needs:

```

mycontainer:
 docker_container.running:
 - image: 7.3.1611
 - skip_translate: port_bindings
 - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}

```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

**ignore\_collisions** [False] Since many of [docker-py](#)'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the [docker-py](#) version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the [docker-py](#) version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the [docker-py](#) version of the argument.

**validate\_ip\_addrs** [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

**force** [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

**watch\_action** [force] Control what type of action is taken when this state [watches](#) another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
 docker_container.running:
 - image: busybox
 - watch_action: SIGHUP
 - watch:
 - file: some_file
```

---

**Note:** If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

---

**start** [True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the `Django migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

**shutdown\_timeout** If the container needs to be replaced, the container will be stopped using [docker.stop](#). If a `shutdown_timeout` is not set, and the container was created using `stop_timeout`, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

**client\_timeout** [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

---

**Note:** This is only used if Salt needs to pull the requested image.

---

## NETWORK MANAGEMENT

New in version 2018.3.0.

Changed in version 2019.2.0: If the `networks` option is used, any networks (including the default bridge network) which are not specified will be disconnected.

The `networks` argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, `net1` is being configured with arguments, while `net2` and `bridge` are being configured *without* arguments:

```
foo:
 docker_container.running:
 - image: myuser/myimage:foo
 - networks:
 - net1:
 - aliases:
 - bar
 - baz
 - ipv4_address: 10.0.20.50
 - net2
 - bridge
 - require:
 - docker_network: net1
 - docker_network: net2
```

The supported arguments are the ones from the docker-py's `connect_container_to_network` function (other than `container` and `net_id`).

---

**Important:** Unlike with the arguments described in the **CONTAINER CONFIGURATION PARAMETERS** section below, these network configuration parameters are not translated at all. Consult the `connect_container_to_network` documentation for the correct type/format of data to pass.

---

To start a container with no network connectivity (only possible in 2019.2.0 and later) pass this option as an empty list. For example:

```
foo:
 docker_container.running:
 - image: myuser/myimage:foo
 - networks: []
```

#### CONTAINER CONFIGURATION PARAMETERS

**auto\_remove** (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - auto_remove: True
```

**binds** Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

<read\_only> can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

<selinux\_context> can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

**Note:** When both <read\_only> and <selinux\_context> are specified, there must be a comma before <selinux\_context>.

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds:
 - /srv/www:/var/www:ro
 - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both `ro/rw` and an `selinux` context are combined, the only option is to use a YAML list, like so:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds:
 - /srv/www:/var/www:ro,Z
 - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - binds:
 - /srv/www:/var/www:ro,Z
 - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

**blkio\_weight** Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - blkio_weight: 100
```

**blkio\_weight\_device** Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - blkio_weight_device: /dev/sda:100
```

**cap\_add** List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_add: SYS_ADMIN,MKNOD
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_add:
 - SYS_ADMIN
 - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**cap\_drop** List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cap_drop:
 - SYS_ADMIN
 - MKNOD
```

---

**Note:** This option requires Docker 1.2.0 or newer.

---

**command (or *cmd*)** Command to run in the container

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - command: bash
```

**cpuset\_cpus (or *cpuset*)** CPUs on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpuset_cpus: "0,1"
```

**cpuset\_mems** Memory nodes on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0,1). Only effective on NUMA systems.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpuset_mems: "0,1"
```

**cpu\_group** The length of a CPU period in microseconds

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpu_group: 100000
```

**cpu\_period** Microseconds of CPU time that the container can get in a CPU period

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpu_period: 50000
```

**cpu\_shares** CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - cpu_shares: 512
```

**detach** [False] If True, run the container's command in the background (daemon mode)

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - detach: True
```

**devices** List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices:
 - /dev/net/tun
 - /dev/xvda1:/dev/xvda1
 - /dev/xvdb1:/dev/xvdb1:r
```

**device\_read\_bps** Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_read_bps:
 - /dev/sda:1mb
 - /dev/sdb:5mb
```

**device\_read\_iops** Limit read rate (I/O per second) from a device, specified as a list of expressions in the format

**PATH:RATE**, where **RATE** is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_read_iops:
 - /dev/sda:1000
 - /dev/sdb:500
```

**device\_write\_bps** Limit write rate (bytes per second) from a device, specified as a list of expressions in the format **PATH:RATE**, where **RATE** is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_write_bps:
 - /dev/sda:1mb
 - /dev/sdb:5mb
```

**device\_write\_iops** Limit write rate (I/O per second) from a device, specified as a list of expressions in the format **PATH:RATE**, where **RATE** is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_write_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - devices_write_iops:
 - /dev/sda:1000
 - /dev/sdb:500
```

**dns** List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - dns: 8.8.8.8,8.8.4.4
```

```
foo:
 docker_container.running:
```

(continues on next page)

(continued from previous page)

```

- image: bar/baz:latest
- dns:
 - 8.8.8.8
 - 8.8.4.4

```

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

**dns\_opt** Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - dns_opt: ndots:9

```

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - dns_opt:
 - ndots:9

```

**dns\_search** List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - dns_search: foo1.domain.tld,foo2.domain.tld

```

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - dns_search:
 - foo1.domain.tld
 - foo2.domain.tld

```

**domainname** The domain name to use for the container

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - domainname: domain.tld

```

**entrypoint** Entrypoint for the container

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - entrypoint: "mycmd --arg1 --arg2"

```

This argument can also be specified as a list:

```

foo:
 docker_container.running:
 - image: bar/baz:latest
 - entrypoint:

```

(continues on next page)

(continued from previous page)

```
- mycmd
- --arg1
- --arg2
```

**environment** Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - environment:
 - VAR1: value
 - VAR2: value
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - environment: 'VAR1=value,VAR2=value'
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - environment:
 - VAR1=value
 - VAR2=value
```

**extra\_hosts** Additional hosts to add to the container's `/etc/hosts` file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - extra_hosts:
 - web1:10.9.8.7
 - web2:10.9.8.8
```

---

**Note:** To skip IP address validation, use `validate_ip_addrs=False`

---

---

**Note:** This option requires Docker 1.3.0 or newer.

---

**group\_add** List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - group_add: web,network
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - group_add:
 - web
 - network
```

**hostname** Hostname of the container. If not provided, the value passed as the container's ``name`` will be used for the hostname.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - hostname: web1
```

Warning: hostname cannot be set if network\_mode is set to host. The below example will result in an error:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - hostname: web1
 - network_mode: host
```

**interactive (or *stdin\_open*)** [False] Leave stdin open, even if not attached

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - interactive: True
```

**ipc\_mode (or *ipc*)** Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- **container:**<container\_name\_or\_id> reuses another container shared memory, semaphores and message queues
- **host:** use the host's shared memory, semaphores and message queues

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ipc_mode: container:foo
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ipc_mode: host
```

Warning: Using host gives the container full access to local shared memory and is therefore considered insecure.

**isolation** Specifies the type of isolation technology used by containers

```
foo:
 docker_container.running:
```

(continues on next page)

(continued from previous page)

- **image:** bar/baz:latest
- **isolation:** hyperv

**Note:** The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

**labels** Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
 docker_network.present:
 - labels:
 - foo
 - bar=baz
 - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
 docker_network.present:
 - labels:
 foo: ''
 bar: baz
 hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**links** Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - links:
 - web1: link1
 - web2: link2
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - links: web1:link1,web2:link2
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - links:
 - web1:link1
 - web2:link2
```

**log\_driver** and **log\_opt** Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - log_driver: syslog
 - log_opt:
 - syslog-address: tcp://192.168.0.42
 - syslog-facility: daemon
```

The `log_opt` can also be expressed as a comma-separated or YAML list of `key=value` pairs. The below two examples are equivalent to the above one:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - log_driver: syslog
 - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - log_driver: syslog
 - log_opt:
 - syslog-address=tcp://192.168.0.42
 - syslog-facility=daemon
```

---

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's [Configure logging drivers](#) documentation for more information.

---

**lxc\_conf** Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - lxc_conf:
 - lxc.utsname: docker
 - lxc.arch: x86_64
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - lxc_conf: lxc.utsname=docker,lxc.arch=x86_64
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - lxc_conf:
 - lxc.utsname=docker
 - lxc.arch=x86_64
```

---

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

**mac\_address** MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - mac_address: 01:23:45:67:89:0a
```

**mem\_limit (or *memory*)** [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - mem_limit: 512M
```

**mem\_swappiness** Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - mem_swappiness: 60
```

**memswap\_limit (or *memory\_swap*)** [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - memswap_limit: 1G
```

**network\_disabled** [False] If True, networking will be disabled within the container

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - network_disabled: True
```

**network\_mode** [bridge] One of the following:

- **bridge** - Creates a new network stack for the container on the docker bridge
- **none** - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's None.
- **container:<name\_or\_id>** - Reuses another container's network stack
- **host** - Use the host's network stack inside the container

**Warning:** Using host mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - network_mode: "none"
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - network_mode: container:web1
```

**oom\_kill\_disable** Whether to disable OOM killer

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - oom_kill_disable: False
```

**oom\_score\_adj** An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - oom_score_adj: 500
```

**pid\_mode** Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - pid_mode: host
```

---

**Note:** This option requires Docker 1.5.0 or newer.

---

**pids\_limit** Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - pids_limit: 2000
```

**port\_bindings (or *publish*)** Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - port_bindings:
 - 4505-4506:14505-14506
 - 2123:2123/udp
 - 8080
```

---

**Note:** When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

**ports** A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ports: 1111,2222/udp
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ports:
 - 1111
 - 2222/udp
```

**privileged** [False] If True, runs the exec process with extended privileges

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - privileged: True
```

**publish\_all\_ports** (or *publish\_all*) [False] Publish all ports to the host

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ports: 8080
 - publish_all_ports: True
```

**read\_only** [False] If True, mount the container's root filesystem as read only

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - read_only: True
```

**restart\_policy** (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - restart_policy: on-failure:5

bar:
 docker_container.running:
 - image: bar/baz:latest
 - restart_policy: always
```

**security\_opt** (or *security\_opts*): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - security_opt: apparmor:unconfined
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - security_opt:
 - apparmor:unconfined
```

---

**Important:** Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

---

---

**Note:** See the documentation for `security_opt` at <https://docs.docker.com/engine/reference/run/#security-configuration>

---

**shm\_size** Size of /dev/shm

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - shm_size: 128M
```

**stop\_signal** Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - stop_signal: SIGRTMIN+3
```

---

**Note:** This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

---

New in version 2016.11.0.

**stop\_timeout** Timeout to stop the container, in seconds

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - stop_timeout: 5
```

---

**Note:** In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refers to the container's configured stop timeout.

---

**storage\_opt** Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - storage_opt:
 - dm.basesize: 40G
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - storage_opt: dm.basesize=40G
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - storage_opt:
 - dm.basesize=40G
```

**sysctls** (or **sysctl**) Set sysctl options for the container. Can be either a list of strings in the format option=value, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - sysctls:
 - fs.nr_open: 1048576
 - kernel.pid_max: 32768
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - sysctls: fs.nr_open=1048576,kernel.pid_max=32768
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - sysctls:
 - fs.nr_open=1048576
 - kernel.pid_max=32768
```

**tmpfs** A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - tmpfs:
 - /run: rw,noexec,nosuid,size=65536k
```

**tty** [False] Attach TTYS

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - tty: True
```

**ulimits** List of ulimits. These limits should be passed in the format <ulimit\_name>:<soft\_limit>:<hard\_limit>, with the hard limit being optional. Can be

expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - ulimits:
 - nofile=1024:1024
 - nproc=60
```

**user** User under which to run exec process

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - user: foo
```

**usersns\_mode** (or **user\_ns\_mode**) Sets the user namespace mode, when the user namespace remapping option is enabled

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - usersns_mode: host
```

**volumes** (or **volume**) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - volumes:
 - /mnt/vol1
 - /mnt/vol2
```

**volumes\_from** Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - volumes_from: foo
```

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - volumes_from:
 - foo
```

**volume\_driver** sets the container's volume driver

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - volume_driver: foobar
```

`working_dir` (or *workdir*) Working directory inside the container

```
foo:
 docker_container.running:
 - image: bar/baz:latest
 - working_dir: /var/log/nginx
```

```
salt.states.docker_container.stopped(name=None, containers=None, shutdown_timeout=None, unpause=False, error_on_absent=True, **kwargs)
```

Ensure that a container (or containers) is stopped

**name** Name or ID of the container

**containers** Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
 docker_container.stopped:
 - names:
 - foo
 - bar
 - baz
```

```
stopped_containers:
 docker_container.stopped:
 - containers:
 - foo
 - bar
 - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

**shutdown\_timeout** Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container's configured `stop_timeout` will be observed. If `stop_timeout` was also unset on the container, then a timeout of 10 seconds will be used.

**unpause** [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

**error\_on\_absent** [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

### 21.19.77 salt.states.docker\_image

Management of Docker images

New in version 2017.7.0.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` `>= 1.6.0` are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

**Note:** To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_image.absent` (*name=None, images=None, force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

**images** Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
 docker_image.absent:
 - names:
 - busybox
 - centos:6
 - nginx
```

```
remove_images:
 docker_image.absent:
 - images:
 - busybox
 - centos:6
 - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

**force** [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

**Note:** This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.mod_watch` (*name, sfun=None, \*\*kwargs*)

The `docker_image` watcher, called to invoke the watch command.

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

```
salt.states.docker_image.present(name, tag=None, build=None, load=None, force=False, insecure_registry=False, client_timeout=60, dockerfile=None,
 sls=None, base='opensuse/python', saltenv='base', pillarenv=None, pillar=None, **kwargs)
```

Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the [configured registries](#). If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:
 docker_image.present:
 - tag: mytag
```

**tag** Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

**build** Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:
 docker_image.present:
 - build: /home/myuser/docker/myimage
 - tag: mytag

myuser/myimage:
 docker_image.present:
 - build: /home/myuser/docker/myimage
 - tag: mytag
 - dockerfile: Dockerfile.alternative
```

The image will be built using `docker.build` and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**load** Loads a tar archive created with `docker.save` (or the `docker save` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:
 docker_image.present:
 - load: salt://path/to/image.tar
 - tag: mytag
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**force** [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.  
**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

**dockerfile** Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

**sls** Allow for building of image with `docker.sls_build` by specifying the SLS files with which to build. This can be a list or comma-separated string.

```
myuser/myimage:
 docker_image.present:
 - tag: latest
 - sls:
 - webapp1
 - webapp2
 - base: centos
 - saltenv: base
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**base** Base image with which to start `docker.sls_build`

New in version 2017.7.0.

**saltenv** Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, `base` was assumed as a default.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

New in version 2018.3.0.

## 21.19.78 salt.states.docker\_network

Management of Docker networks

New in version 2017.7.0.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` `>= 1.6.0` are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

**salt.states.docker\_network.absent**(*name*)

Ensure that a network is absent.

**name** Name of the network

Usage Example:

```
network_foo:
 docker_network.absent
```

```
salt.states.docker_network.present(name, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, containers=None, reconnect=True,
 **kwargs)
```

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Ensure that a network is present

---

**Note:** This state supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the [NETWORK CONFIGURATION](#) and [IP ADDRESS MANAGEMENT \(IPAM\)](#) sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of docker-py (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

---

**name** Network name

**skip\_translate** This function translates Salt SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

New in version 2018.3.0.

**ignore\_collisions** [False] Since many of docker-py's arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

**validate\_ip\_addrs** [True] For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

**containers** A list of containers which should be connected to this network.

---

**Note:** As of the 2018.3.0 release, this is not the recommended way of managing a container's membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container's IP configuration.

2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have `require` requisites to ensure that the network is present, this means that the `docker_network.present` state ends up being run *before* the `docker_container.running`, leaving the container unattached at the end of the Salt run.

For these reasons, it is recommended to use *docker\_container.running's network management support*.

**reconnect** [True] If containers is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to `False` to keep Salt from trying to reconnect containers. This can be useful in some cases when *managing static IPs in docker\_container.running*. For instance, if a network's subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network *again* and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

## NETWORK CONFIGURATION ARGUMENTS

**driver** Network driver

```
mynet:
 docker_network.present:
 - driver: macvlan
```

**driver\_opts** (or *driver\_opt*, or *options*) Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts: macvlan_mode=bridge,parent=eth0
```

```
mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts:
 - macvlan_mode=bridge
 - parent=eth0
```

```
mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts:
 - macvlan_mode: bridge
 - parent: eth0
```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts:
 macvlan_mode: bridge
 parent: eth0
```

**check\_duplicate** [True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```
mynet:
 docker_network.present:
 - check_duplicate: False
```

**internal** [False] If True, restricts external access to the network

```
mynet:
 docker_network.present:
 - internal: True
```

**labels** Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
 docker_network.present:
 - labels:
 - foo
 - bar=baz
 - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
 docker_network.present:
 - labels:
 foo: ''
 bar: baz
 hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**enable\_ipv6** (or *ipv6*) [False] Enable IPv6 on the network

```
mynet:
 docker_network.present:
 - enable_ipv6: True
```

---

**Note:** While it should go without saying, this argument must be set to `True` to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the [Docker IPv6 docs](#) for information on how to do this.

---

**attachable** [False] If True, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

```
mynet:
 docker_network.present:
 - attachable: True
```

**Note:** This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope** Specify the network's scope (`local`, `global` or `swarm`)

```
mynet:
 docker_network.present:
 - scope: local
```

**ingress** [False] If True, create an ingress network which provides the routing-mesh in swarm mode

```
mynet:
 docker_network.present:
 - ingress: True
```

## IP ADDRESS MANAGEMENT (IPAM)

This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the *IPAM pool arguments* below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument (click [here](#) for some examples). [These docs](#) also have more information on these arguments.

### IPAM ARGUMENTS

**ipam\_driver** IPAM driver to use, if different from the default one

```
mynet:
 docker_network.present:
 - ipam_driver: foo
```

**ipam\_opts** Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
 docker_network.present:
 - ipam_driver: foo
 - ipam_opts: foo=bar,baz=qux
```

```
mynet:
 docker_network.present:
 - ipam_driver: foo
 - ipam_opts:
 - foo=bar
 - baz=qux
```

```
mynet:
 docker_network.present:
 - ipam_driver: foo
```

(continues on next page)

(continued from previous page)

- **ipam\_opts:**
- **foo:** bar
- **baz:** qux

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
mynet:
 docker_network.present:
 - ipam_driver: macvlan
 - ipam_opts:
 foo: bar
 baz: qux
```

#### IPAM POOL ARGUMENTS

**subnet** Subnet in CIDR format that represents a network segment

**iprange (or *ip\_range*)** Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

**gateway** IPv4 or IPv6 gateway for the master subnet

**aux\_addresses (or *aux\_address*)** A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

#### IPAM CONFIGURATION EXAMPLES

Below is an example of an IPv4-only network (keep in mind that **subnet** is the only required argument).

```
mynet:
 docker_network.present:
 - subnet: 10.0.20.0/24
 - iprange: 10.0.20.128/25
 - gateway: 10.0.20.254
 - aux_addresses:
 foo.bar.tld: 10.0.20.50
 hello.world.tld: 10.0.20.51
```

**Note:** The `aux_addresses` can be passed differently, in the same way that `driver_opts` and `ipam_opts` can.

This same network could also be configured this way:

```
mynet:
 docker_network.present:
 - ipam_pools:
 subnet: 10.0.20.0/24
 iprange: 10.0.20.128/25
 gateway: 10.0.20.254
 aux_addresses:
 foo.bar.tld: 10.0.20.50
 hello.world.tld: 10.0.20.51
```

Here is an example of a mixed IPv4/IPv6 subnet.

```
mynet:
 docker_network.present:
```

(continues on next page)

(continued from previous page)

```
- ipam_pools:
 - subnet: 10.0.20.0/24
 gateway: 10.0.20.1
 - subnet: fe3f:2180:26:1::/123
 gateway: fe3f:2180:26:1::1
```

## 21.19.79 salt.states.docker\_volume

Management of Docker volumes

New in version 2017.7.0.

**depends** `docker` Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq 1.6.0$  are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

**salt.states.docker\_volume.absent**(*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from `docker.volume_absent` to `docker_volume.absent`

**name** Name of the volume

Usage Examples:

```
volume_foo:
 docker_volume.absent
```

**salt.states.docker\_volume.present**(*name*, *driver=None*, *driver\_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from `docker.volume_present` to `docker_volume.present`

**name** Name of the volume

**driver** Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

**driver\_opts** Options for the volume driver

**force** [False] If the volume already exists but the existing volume's driver does not match the driver specified by the **driver** parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
 docker_volume.present
```

```
volume_bar:
 docker_volume.present
 - name: bar
 - driver: local
 - driver_opts:
 foo: bar
```

```
volume_bar:
 docker_volume.present
 - name: bar
 - driver: local
 - driver_opts:
 - foo: bar
 - option: value
```

### 21.19.80 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
 drac.present:
 - name: damian
 - password: secret
 - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
 drac.absent:
 - name: damian
```

Ensure DRAC network is in a consistent state

```
my_network:
 drac.network:
 - ip: 10.225.108.29
 - netmask: 255.255.255.224
 - gateway: 10.225.108.1
```

**salt.states.drac.absent**(*name*)

Ensure a user does not exist on the Dell DRAC

**name:** The users username

`salt.states.drac.network(ip, netmask, gateway)`

Ensure the DRAC network settings are consistent

`salt.states.drac.present(name, password, permission)`

Ensure the user exists on the Dell DRAC

**name:** The users username

**password** The password used to authenticate

**permission** The permissions that should be assigned to a user

### 21.19.81 salt.states.dvs module

Manage VMware distributed virtual switches (DVSs) and their distributed virtual portgroups (DVportgroups).

**codeauthor** Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

#### Examples

Several settings can be changed for DVSs and DVportgroups. Here are two examples covering all of the settings. Fewer settings can be used

#### DVS

```
'name': 'dvs1',
'max_mtu': 1000,
'uplink_names': [
 'dvUplink1',
 'dvUplink2',
 'dvUplink3'
],
'capability': {
 'portgroup_operation_supported': false,
 'operation_supported': true,
 'port_operation_supported': false
},
'lacp_api_version': 'multipleLag',
'contact_email': 'foo@email.com',
'product_info': {
 'version':
 '6.0.0',
 'vendor':
 'VMware,
 Inc.',
 'name':
 'DVS'
},
'network_resource_management_enabled': true,
'contact_name': 'me@email.com',
'infrastructure_traffic_resource_pools': [
 {
 'reservation': 0,
 'limit': 1000,
 'share_level': 'high',
 'key': 'management',
 'num_shares': 100
 }
]
```

(continues on next page)

(continued from previous page)

```
 },
 {
 'reservation': 0,
 'limit': -1,
 'share_level': 'normal',
 'key': 'faultTolerance',
 'num_shares': 50
 },
 {
 'reservation': 0,
 'limit': 32000,
 'share_level': 'normal',
 'key': 'vmotion',
 'num_shares': 50
 },
 {
 'reservation': 10000,
 'limit': -1,
 'share_level': 'normal',
 'key': 'virtualMachine',
 'num_shares': 50
 },
 {
 'reservation': 0,
 'limit': -1,
 'share_level': 'custom',
 'key': 'iSCSI',
 'num_shares': 75
 },
 {
 'reservation': 0,
 'limit': -1,
 'share_level': 'normal',
 'key': 'nfs',
 'num_shares': 50
 },
 {
 'reservation': 0,
 'limit': -1,
 'share_level': 'normal',
 'key': 'hbr',
 'num_shares': 50
 },
 {
 'reservation': 8750,
 'limit': 15000,
 'share_level': 'high',
 'key': 'vsan',
 'num_shares': 100
 },
 {
 'reservation': 0,
 'limit': -1,
 'share_level': 'normal',
 'key': 'vdp',
 'num_shares': 50
 }
```

(continues on next page)

(continued from previous page)

```

 }
],
 'link_discovery_protocol': {
 'operation':
 'listen',
 'protocol':
 'cdp'
 },
 'network_resource_control_version': 'version3',
 'description': 'Managed by Salt. Random settings.'
```

Note: The mandatory attribute is: name.

### Portgroup

```

'security_policy': {
 'allow_promiscuous': true,
 'mac_changes': false,
 'forged_transmits': true
},
'name': 'vmotion-v702',
'out_shaping': {
 'enabled': true,
 'average_bandwidth': 1500,
 'burst_size': 4096,
 'peak_bandwidth': 1500
},
'num_ports': 128,
'teaming': {
 'port_order': {
 'active': [
 'dvUplink2'
],
 'standby': [
 'dvUplink1'
]
 },
 'notify_switches': false,
 'reverse_policy': true,
 'rolling_order': false,
 'policy': 'failover_explicit',
 'failure_criteria': {
 'check_error_percent': true,
 'full_duplex': false,
 'check_duplex': false,
 'percentage': 50,
 'check_speed': 'minimum',
 'speed': 20,
 'check_beacon': true
 }
},
'type': 'earlyBinding',
'vlan_id': 100,
'description': 'Managed by Salt. Random settings.'
```

Note: The mandatory attributes are: name, type.

## Dependencies

- pyVmomi Python Module

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

**salt.states.dvs.dvs\_configured**(*name*, *dvs*)

Configures a DVS.

Creates a new DVS, if it doesn't exist in the provided datacenter or reconfigures it if configured differently.

**dvs** DVS dict representations (see module sysdocs)

**salt.states.dvs.portgroups\_configured**(*name*, *dvs*, *portgroups*)

Configures portgroups on a DVS.

Creates/updates/removes portgroups in a provided DVS

**dvs** Name of the DVS

**portgroups** Portgroup dict representations (see module sysdocs)

**salt.states.dvs.uplink\_portgroup\_configured**(*name*, *dvs*, *uplink\_portgroup*)

Configures the uplink portgroup on a DVS. The state assumes there is only one uplink portgroup.

**dvs** Name of the DVS

**uplink\_portgroup** Uplink portgroup dict representations (see module sysdocs)

## 21.19.82 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

**salt.states.elasticsearch.alias\_absent**(*name*, *index*)

Ensure that the index alias is absent.

**name** Name of the index alias to remove

**index** Name of the index for the alias

**salt.states.elasticsearch.alias\_present**(*name*, *index*, *definition=None*)

Ensure that the named index alias is present.

**name** Name of the alias

**index** Name of the index

**definition** Optional dict for filters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

**Example:**

```
mytestalias:
 elasticsearch.alias_present:
 - index: testindex
 - definition:
 filter:
 term:
 user: kimchy
```

**salt.states.elasticsearch.index\_absent**(*name*)

Ensure that the named index is absent.

**name** Name of the index to remove

**salt.states.elasticsearch.index\_present**(*name*, *definition=None*)

Ensure that the named index is present.

**name** Name of the index to add

**definition** Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

**Example:**

```
Default settings
mytestindex:
 elasticsearch_index.present

Extra settings
mytestindex2:
 elasticsearch_index.present:
 - definition:
 settings:
 index:
 number_of_shards: 10
```

**salt.states.elasticsearch.index\_template\_absent**(*name*)

Ensure that the named index template is absent.

**name** Name of the index to remove

**salt.states.elasticsearch.index\_template\_present**(*name*, *definition*, *check\_definition=False*)

Ensure that the named index template is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**check\_definition** If the template already exists and the definition is up to date

**Example:**

```
mytestindex2_template:
 elasticsearch.index_template_present:
 - definition:
 template: logstash-*
 order: 1
 settings:
 number_of_shards: 1
```

**salt.states.elasticsearch.pipeline\_absent**(*name*)

Ensure that the named pipeline is absent

**name** Name of the pipeline to remove

`salt.states.elasticsearch.pipeline_present(name, definition)`

Ensure that the named pipeline is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

Example:

```
test_pipeline:
 elasticsearch.pipeline_present:
 - definition:
 description: example pipeline
 processors:
 - set:
 field: collector_timestamp_millis
 value: '{{ '{{' }}_ingest.timestamp{{ '{{' }}' }}'
```

`salt.states.elasticsearch.search_template_absent(name)`

Ensure that the search template is absent

**name** Name of the search template to remove

`salt.states.elasticsearch.search_template_present(name, definition)`

Ensure that the named search template is present.

**name** Name of the search template to add

**definition** Required dict for creation parameters as per <http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html>

Example:

```
test_pipeline:
 elasticsearch.search_template_present:
 - definition:
 inline:
 size: 10
```

### 21.19.83 salt.states.elasticsearch\_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

`salt.states.elasticsearch_index.absent(name)`

Ensure that the named index is absent.

**name** Name of the index to remove

`salt.states.elasticsearch_index.present(name, definition=None)`

New in version 2015.8.0.

Changed in version 2017.3.0: Marked `definition` as optional.

Ensure that the named index is present.

**name** Name of the index to add

**definition** Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

Example:

```
Default settings
mytestindex:
 elasticsearch_index.present

Extra settings
mytestindex2:
 elasticsearch_index.present:
 - definition:
 settings:
 index:
 number_of_shards: 10
```

### 21.19.84 salt.states.elasticsearch\_index\_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

**salt.states.elasticsearch\_index\_template.absent**(*name*)

Ensure that the named index template is absent.

**name** Name of the index to remove

**salt.states.elasticsearch\_index\_template.present**(*name*, *definition*)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked *definition* as required.

Ensure that the named index template is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

Example:

```
mytestindex2_template:
 elasticsearch_index_template.present:
 - definition:
 template: logstash-*
 order: 1
 settings:
 number_of_shards: 1
```

### 21.19.85 salt.states.envron

Support for getting and setting the environment variables of the current salt process.

**salt.states.envron.setenv**(*name*, *value*, *false\_unsets=False*, *clear\_all=False*, *update\_minion=False*, *permanent=False*)

Set the salt process environment variables.

**name** The environment key to set. Must be a string.

**value** Either a string or dict. When string, it will be the value set for the environment key of 'name' above. When a dict, each key/value pair represents an environment variable to set.

**false\_unsets** If a key's value is False and *false\_unsets* is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and *false\_unsets* is not True, then the key's value will be set to an empty string. Default: False

**clear\_all** USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If **clear\_all** is True, then any environment variables not defined in the **environ** dict will be deleted. Default: False

**update\_minion** If True, apply these **environ** changes to the main salt-minion process. If False, the **environ** changes will only affect the current salt subprocess. Default: False

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored.

Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
 environ.setenv:
 - name: foo
 - value: bar
 - update_minion: True

a_dict_env:
 environ.setenv:
 - name: does_not_matter
 - value:
 foo: bar
 baz: quux
```

### 21.19.86 salt.states.eselect

#### Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

**salt.states.eselect.set\_**(*name, target, module\_parameter=None, action\_parameter=None*)

Verify that the given module is set to the given target

**name** The name of the module

**target** The target to be set for this module

**module\_parameter** additional params passed to the defined module

**action\_parameter** additional params passed to the defined action

```
profile:
 eselect.set:
 - target: hardened/linux/amd64
```

## 21.19.87 salt.states.esxcluster module

Manage VMware ESXi Clusters.

### Dependencies

- pyVmomi Python Module

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

**salt.states.esxcluster.cluster\_configured**(*name*, *cluster\_config*)

Configures a cluster. Creates a new cluster, if it doesn't exist on the vCenter or reconfigures it if configured differently

Supported proxies: esxdatacenter, esxcluster

**name** Name of the state. If the state is run in by an esxdatacenter proxy, it will be the name of the cluster.

**cluster\_config** Configuration applied to the cluster. Complex datastructure following the ESXClusterConfigSchema. Valid example is:

**salt.states.esxcluster.licenses\_configured**(*name*, *licenses=None*)

Configures licenses on the cluster entity

**Checks if each license exists on the server:**

- if it doesn't, it creates it

**Check if license is assigned to the cluster:**

- if it's not assigned to the cluster:
  - assign it to the cluster if there is space
  - error if there's no space
- if it's assigned to the cluster nothing needs to be done

**salt.states.esxcluster.vsan\_datastore\_configured**(*name*, *datastore\_name*)

Configures the cluster's VSAN datastore

**WARNING:** The VSAN datastore is created automatically after the first ESXi host is added to the cluster; the state assumes that the datastore exists and errors if it doesn't.

### 21.19.88 salt.states.esxdatacenter module

Salt states to create and manage VMware vSphere datacenters (datacenters).

**codeauthor** *Alexandru Bleotu* <[alexandru.bleotu@morganstaley.com](mailto:alexandru.bleotu@morganstaley.com)>

#### Dependencies

- pyVmomi Python Module

#### States

##### **datacenter\_configured**

Makes sure a datacenter exists and is correctly configured.

If the state is run by an `esxdatacenter` minion, the name of the datacenter is retrieved from the proxy details, otherwise the datacenter has the same name as the state.

Supported proxies: `esxdatacenter`

Example:

1. Make sure that a datacenter named `target_dc` exists on the vCenter, using a `esxdatacenter` proxy:

Proxy minion configuration (connects passthrough to the vCenter):

```
proxy:
 proxytype: esxdatacenter
 datacenter: target_dc
 vcenter: vcenter.fake.com
 mechanism: sspi
 domain: fake.com
 principal: host
```

State configuration:

```
datacenter_state:
 esxdatacenter.datacenter_configured
```

`salt.states.esxdatacenter.datacenter_configured(name)`

Makes sure a datacenter exists.

If the state is run by an `esxdatacenter` minion, the name of the datacenter is retrieved from the proxy details, otherwise the datacenter has the same name as the state.

Supported proxies: `esxdatacenter`

**name:** Datacenter name. Ignored if the proxytype is `esxdatacenter`.

## 21.19.89 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

### Dependencies

- pyVmomi Python Module
- ESXCLI

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

### ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

**Note:** Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

---

## About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the *ESXi Proxy Minion Tutorial* for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0',
 dump_port=6500)
```

Ensures a host's core dump configuration.

**name** Name of the state.

**enabled** Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many old references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system `coredump` network configuration command returns data.

**dump\_ip** The IP address of host that will accept the dump.

**host\_vnic** Host VNIC port through which to communicate. Defaults to `vmk0`.

**dump\_port** TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
 esxi.coredump_configured:
 - enabled: True
 - dump_ip: 'my-coredump-ip.example.com'
```

```
salt.states.esxi.diskgroups_configured(name, diskgroups, erase_disks=False)
```

Configures the disk groups to use for vsan.

This function will do the following:

1. Check whether or not all disks in the diskgroup spec exist, and raises an error if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn't exist
3. Adds extra capacity disks to the existing diskgroup

Example:

```
{
 'cache_scsi_addr': 'vmhba1:C0:T0:L0',
 'capacity_scsi_addrs': [
 'vmhba2:C0:T0:L0',
 'vmhba3:C0:T0:L0',
 'vmhba4:C0:T0:L0',
]
}
```

**name** Mandatory state name

**diskgroups** Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup:

**erase\_disks** Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is False.

```
salt.states.esxi.host_cache_configured(name, enabled, datastore, swap_size='100%',
 dedicated_backing_disk=False,
 erase_backing_disk=False)
```

Configures the host cache used for swapping.

It will do the following:

1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn't exist (datastore partition will be created and use the entire disk)
3. Raises an error if `dedicated_backing_disk` is True and partitions already exist on the backing disk
4. Configures `host_cache` to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

Examples

Percentage swap size (can't be 100%)

```
{
 'enabled': true,
 'datastore': {
 'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
 'vmfs_version': 5,
 'name': 'hostcache'
 }
 'dedicated_backing_disk': false
 'swap_size': '98%',
}
```

Fixed sized swap size

```
{
 'enabled': true,
 'datastore': {
 'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
 'vmfs_version': 5,
 'name': 'hostcache'
 }
 'dedicated_backing_disk': true
 'swap_size': '10GiB',
}
```

**name** Mandatory state name.

**enabled** Specifies whether the host cache is enabled.

**datastore** Specifies the host cache datastore.

**swap\_size** Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is 100%.

**dedicated\_backing\_disk** Specifies whether the backing disk is dedicated to the host cache which means it must have no other partitions. Default is False

**erase\_backing\_disk** Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is False.

```
salt.states.esxi.ntp_configured(name, service_running, ntp_servers=None, service_policy=None,
 service_restart=False, update_datetime=False)
```

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

**name** Name of the state.

**service\_running** Ensures the running state of the ntp daemon for the host. Boolean value where `True` indicates that ntpd should be running and `False` indicates that it should be stopped.

**ntp\_servers** A list of servers that should be added to the ESXi host's NTP configuration.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to `True`, the ntp daemon will be restarted, regardless of its previous running state. Default is `False`.

**update\_datetime** If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skew.

Example:

```
configure-host-ntp:
 esxi.ntp_configured:
 - service_running: True
 - ntp_servers:
 - 192.174.1.100
 - 192.174.1.200
 - service_policy: 'on'
 - service_restart: True
```

`salt.states.esxi.password_present(name, password)`

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

**name** Name of the state.

**password** The new password to change on the host.

Example:

```
configure-host-password:
 esxi.password_present:
 - password: 'new-bad-password'
```

`salt.states.esxi.ssh_configured(name, service_running, ssh_key=None, ssh_key_file=None, service_policy=None, service_restart=False, certificate_verify=None)`

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**name** Name of the state.

**service\_running** Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

**ssh\_key** Public SSH key to added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

**ssh\_key\_file** File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

**service\_policy** The policy to set for the NTP service.

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the `yaml` parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

**service\_restart** If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

**certificate\_verify** If set to `True`, the SSL connection must present a valid certificate. Default is `True`.

Example:

```
configure-host-ssh:
 esxi.ssh_configured:
 - service_running: True
 - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
 - service_policy: 'on'
 - service_restart: True
 - certificate_verify: True
```

`salt.states.esxi.syslog_configured(name, syslog_configs, firewall=True, reset_service=True, reset_syslog_config=False, reset_configs=None)`

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

**name** Name of the state.

**syslog\_configs** Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (--))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**firewall** Enable the firewall rule set for syslog. Defaults to `True`.

**reset\_service** After a successful parameter set, reset the service. Defaults to `True`.

**reset\_syslog\_config** Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

**reset\_configs** A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```
configure-host-syslog:
 esxi.syslog_configured:
 - syslog_configs:
 loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
 default-timeout: 120
 - firewall: True
```

(continues on next page)

(continued from previous page)

```
- reset_service: True
- reset_syslog_config: True
- reset_configs: loghost,default-timeout
```

`salt.states.esxi.vmotion_configured(name, enabled, device='vmk0')`

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

**name** Name of the state.

**enabled** Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

**device** The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```
configure-vmotion:
esxi.vmotion_configured:
- enabled: True
- device: sample-device
```

`salt.states.esxi.vsan_configured(name, enabled, add_disks_to_vsan=False)`

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

**name** Name of the state.

**enabled** Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

**add\_disks\_to\_vsan** If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```
configure-host-vsan:
esxi.vsan_configured:
- enabled: True
- add_disks_to_vsan: True
```

## 21.19.90 salt.states.esxvm module

Salt state to create, update VMware ESXi Virtual Machines.

## Dependencies

- pyVmomi
- jsonschema

## States

### vm\_configured

Enforces correct virtual machine configuration. Creates, updates and registers a virtual machine.

This state identifies the action which should be taken for the virtual machine and applies that action via the create, update, register state functions.

Supported proxies: esxvm

Example:

1. Get the virtual machine `my_vm` status with an `esxvm` proxy:

Proxy minion configuration for `esxvm` proxy:

```
proxy:
 proxytype: esxvm
 datacenter: my_dc
 vcenter: vcenter.fake.com
 mechanism: sspi
 domain: fake.com
 principal: host
```

State configuration:

```
myvm_state:
 esxvm.vm_configured:
 - vm_name: my_vm
 - cpu: [{ {'count': 4, 'cores_per_socket': 2} }]
 - memory: [{ {'size': 16384, 'unit': 'MB'} }]
 - image: rhel7_64Guest
 - version: vmx-12
 - interfaces: [{ [{
 'adapter': 'Network adapter 1',
 'name': 'my_pg1',
 'switch_type': 'distributed',
 'adapter_type': 'vmxnet3',
 'mac': '00:50:56:00:01:02',
 'connectable': { 'start_connected': true,
 'allow_guest_control': true,
 'connected': true}},
 {
 'adapter': 'Network adapter 2',
 'name': 'my_pg2',
 'switch_type': 'distributed',
 'adapter_type': 'vmxnet3',
 'mac': '00:50:56:00:01:03',
 'connectable': { 'start_connected': true,
 'allow_guest_control': true,
 'connected': true}}}]
```

(continues on next page)

(continued from previous page)

```

] }}
- disks: {{ [{
 'adapter': 'Hard disk 1',
 'unit': 'MB',
 'size': 51200,
 'filename': 'my_vm/sda.vmdk',
 'datastore': 'my_datastore',
 'address': '0:0',
 'thin_provision': true,
 'eagerly_scrub': false,
 'controller': 'SCSI controller 0'},
 {
 'adapter': 'Hard disk 2',
 'unit': 'MB',
 'size': 10240,
 'filename': 'my_vm/sdb.vmdk',
 'datastore': 'my_datastore',
 'address': '0:1',
 'thin_provision': true,
 'eagerly_scrub': false,
 'controller': 'SCSI controller 0'}
] }}
- scsi_devices: {{ [{
 'adapter': 'SCSI controller 0',
 'type': 'paravirtual',
 'bus_sharing': 'no_sharing',
 'bus_number': 0
] }}
- serial_ports: {{ [{
 'adapter': 'Serial port 1',
 'type': 'network',
 'yield': false,
 'backing': {
 'uri': 'my_uri',
 'direction': 'server',
 'filename': 'my_file'},
 'connectable': {
 'start_connected': true,
 'allow_guest_control': true,
 'connected': true}}
] }}
- datacenter: {{ 'my_dc' }}
- datastore: 'my_datastore'
- placement: {{ {'cluster': 'my_cluster'} }}
- cd_dvd_drives: {{ [] }}
- advanced_configs: {{ {'my_param': '1'} }}
- template: false
- tools: false
- power_on: false
- deploy: false

```

## vm\_updated

Updates a virtual machine to a given configuration.

## vm\_created

Creates a virtual machine with a given configuration.

## vm\_registered

Registers a virtual machine with its configuration file path.

## Dependencies

### pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==6.0.0.2016.4
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against. To be able to connect through SSPI you must use pyvmomi 6.0.0.2016.4 or above. The ESXVM State Module was tested with this version.

## About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the [ESXi Proxy Minion Tutorial](#) for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

**salt.states.esxvm.vm\_cloned**(name)

Clones a virtual machine from a template virtual machine if it doesn't exist and a template is defined.

**salt.states.esxvm.vm\_configured**(name, vm\_name, cpu, memory, image, version, interfaces, disks, scsi\_devices, serial\_ports, datacenter, datastore, placement, cd\_dvd\_drives=None, sata\_controllers=None, advanced\_configs=None, template=None, tools=True, power\_on=False, deploy=False)

Selects the correct operation to be executed on a virtual machine, non existing machines will be created,

existing ones will be updated if the config differs.

```
salt.states.esxvm.vm_created(name, vm_name, cpu, memory, image, version, interfaces,
 disks, scsi_devices, serial_ports, datacenter, datastore, placement,
 ide_controllers=None, sata_controllers=None, cd_dvd_drives=None,
 advanced_configs=None, power_on=False)
```

Creates a virtual machine with the given properties if it doesn't exist.

```
salt.states.esxvm.vm_registered(vm_name, datacenter, placement, vm_file, power_on=False)
```

Registers a virtual machine if the machine files are available on the main datastore.

```
salt.states.esxvm.vm_updated(name, vm_name, cpu, memory, image, version, interfaces, disks,
 scsi_devices, serial_ports, datacenter, datastore, cd_dvd_drives=None,
 sata_controllers=None, advanced_configs=None, power_on=False)
```

Updates a virtual machine configuration if there is a difference between the given and deployed configuration.

## 21.19.91 salt.states.etcd\_mod

### Manage etcd Keys

New in version 2015.8.0.

**depends**

- python-etcd

This state module supports setting and removing keys from etcd.

### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

---

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar\_opts* must be set to *True*.

Be aware that setting *pillar\_opts* to *True* has security implications as this makes all master configuration settings available in all minion's pillars.

---

Etcd profile configuration can be overridden using following arguments: *host*, *port*, *username*, *password*, *ca*, *client\_key* and *client\_cert*.

```
my-value:
 etcd.set:
 - name: /path/to/key
```

(continues on next page)

(continued from previous page)

```
- value: value
- host: 127.0.0.1
- port: 2379
- username: user
- password: pass
```

## Available Functions

- **set**

This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
etcd.set:
- value: foo
- profile: my_etcd_config
```

- **wait\_set**

Performs the same functionality as **set** but only if a watch requisite is **True**.

```
/some/file.txt:
file.managed:
- source: salt://file.txt

/foo/bar/baz:
etcd.wait_set:
- value: foo
- profile: my_etcd_config
- watch:
- file: /some/file.txt
```

- **rm**

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
etcd.rm:
- profile: my_etcd_config
```

- **wait\_rm**

Performs the same functionality as **rm** but only if a watch requisite is **True**.

```
/some/file.txt:
file.managed:
- source: salt://file.txt

/foo/bar/baz:
etcd.wait_rm:
- profile: my_etcd_config
- watch:
- file: /some/file.txt
```

`salt.states.etcd_mod.directory(name, profile=None, **kwargs)`

Create a directory in etcd.

**name** The etcd directory name, for example: `/foo/bar/baz`.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

`salt.states.etcd_mod.mod_watch(name, **kwargs)`

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

---

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

`salt.states.etcd_mod.rm(name, recurse=False, profile=None, **kwargs)`

Deletes a key from etcd

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

`salt.states.etcd_mod.set_(name, value, profile=None, **kwargs)`

Set a key in etcd

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

`salt.states.etcd_mod.wait_rm(name, recurse=False, profile=None, **kwargs)`

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

**profile** Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

`salt.states.etcd_mod.wait_set(name, value, profile=None, **kwargs)`

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

### 21.19.92 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

**codeauthor** Krzysztof Pawlowski <msciciel@msciciel.eu>

**maturity** new

**depends** python-ethtool

**platform** linux

```
eth0:
 ethtool.coalesce:
 - name: eth0
 - rx_usecs: 24
 - tx_usecs: 48

eth0:
 ethtool.ring:
 - name: eth0
 - rx: 1024
 - tx: 1024

eth0:
 ethtool.offload:
 - name: eth0
 - tcp_segmentation_offload: on
```

**salt.states.ethtool.coalesce**(*name*, *\*\*kwargs*)

Manage coalescing settings of network device

**name** Interface name to apply coalescing settings

```
eth0:
 ethtool.coalesce:
 - name: eth0
 - adaptive_rx: on
 - adaptive_tx: on
 - rx_usecs: 24
 - rx_frame: 0
 - rx_usecs_irq: 0
 - rx_frames_irq: 0
 - tx_usecs: 48
 - tx_frames: 0
 - tx_usecs_irq: 0
 - tx_frames_irq: 0
 - stats_block_usecs: 0
 - pkt_rate_low: 0
```

(continues on next page)

(continued from previous page)

```

- rx_usecs_low: 0
- rx_frames_low: 0
- tx_usecs_low: 0
- tx_frames_low: 0
- pkt_rate_high: 0
- rx_usecs_high: 0
- rx_frames_high: 0
- tx_usecs_high: 0
- tx_frames_high: 0
- sample_interval: 0

```

`salt.states.ethtool.offload(name, **kwargs)`

Manage protocol offload and other features of network device

**name** Interface name to apply coalescing settings

```

eth0:
 ethtool.offload:
 - name: eth0
 - tcp_segmentation_offload: on

```

`salt.states.ethtool.ring(name, **kwargs)`

Manage rx/tx ring parameters of network device

Use 'max' word to set with factory maximum

**name** Interface name to apply ring parameters

```

eth0:
 ethtool.ring:
 - name: eth0
 - rx: 1024
 - rx_mini: 0
 - rx_jumbo: 0
 - tx: max

```

### 21.19.93 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.send(name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, show_changed=True, **kwargs)`

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name, with the additional argument:

Parameters **show\_changed** -- If `True`, state will show as changed with the data argument as the change value. If `False`, shows as unchanged.

Example:

```

...snip bunch of states above

mycompany/mystaterun/status/update:
 event.send:
 - data:

```

(continues on next page)

(continued from previous page)

```

status: "Half-way through the state run!"

...snip bunch of states below

```

`salt.states.event.wait(name, sfun=None)`

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```

Stand up a new web server.
apache:
 pkg:
 - installed
 - name: httpd
 service:
 - running
 - enable: True
 - name: httpd

Notify the load balancer to update the pool once Apache is running.
refresh_pool:
 event:
 - wait
 - name: mycompany/loadbalancer/pool/update
 - data:
 new_web_server_ip: {{ grains['ipv4'] | first() }}
 - watch:
 - pkg: apache

```

## 21.19.94 salt.states.file

### Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the `file.managed` state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of `file.managed` which makes use of the jinja templating system would look like this:

```

/etc/http/conf/http.conf:
 file.managed:
 - source: salt://apache/http.conf
 - user: root
 - group: root
 - mode: 644
 - attrs: ai
 - template: jinja
 - defaults:
 custom_var: "default value"
 other_var: 123
 {% if grains['os'] == 'Ubuntu' %}
 - context:

```

(continues on next page)

(continued from previous page)

```
 custom_var: "override"
{% endif %}
```

It is also possible to use the *py renderer* as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
 lines = ['foo', 'bar', 'baz']
 lines.extend([source, name, user, context]) # Arguments as globals
 return '\n\n'.join(lines)
```

---

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. [More information.](#)

---

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
 file.managed:
 - source:
 - salt://foo.conf.{{ grains['fqdn'] }}
 - salt://foo.conf.fallback
 - user: foo
 - group: users
 - mode: 644
 - attrs: i
 - backup: minion
```

---

**Note:** Salt supports backing up managed files via the `backup` option. For more details on this functionality please review the [backup\\_mode documentation](#).

---

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
 file.managed:
 - source:
 - 'salt://foo.conf?saltenv=dev'
 - user: foo
 - group: users
 - mode: '0644'
 - attrs: i
```

**Warning:** When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

```
salt_master_conf:
 file.managed:
 - user: root
 - group: root
 - mode: '0644'
 - names:
 - /etc/salt/master.d/master.conf:
 - source: salt://saltmaster/master.conf
 - /etc/salt/minion.d/minion-99.conf:
 - source: salt://saltmaster/minion.conf
```

**Note:** There is more documentation about this feature in the [Names declaration](#) section of the *Highstate docs*.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
 file.mknod:
 - ntype: c
 - major: 1
 - minor: 8
 - user: named
 - group: named
 - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
 file.mknod:
 - ntype: b
 - major: 7
 - minor: 0
 - user: named
 - group: named
 - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
 file.mknod:
 - ntype: p
 - user: named
```

(continues on next page)

(continued from previous page)

- **group**: named
- **mode**: 660

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
 file.directory:
 - user: fred
 - group: users
 - mode: 755
 - makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
 file.directory:
 - user: fred
 - group: users
 - mode: 755
 - makedirs: True
 - recurse:
 - user
 - group
 - mode
```

As a default, mode will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
 file.directory:
 - user: fred
 - group: users
 - file_mode: 744
 - dir_mode: 755
 - makedirs: True
 - recurse:
 - user
 - group
 - mode
```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```
/etc/grub.conf:
 file.symlink:
 - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
 file.recurse:
 - source: salt://code/flask
 - include_empty: True
```

A more complex recurse example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
 file.recurse:
 - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
 - user: {{ site_user }}
 - dir_mode: 2775
 - file_mode: '0644'
 - template: jinja
 - source: salt://project/templates_dir
 - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
 file.retention_schedule:
 - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
 - retain:
 most_recent: 5
 first_of_hour: 4
 first_of_day: 14
 first_of_week: 6
 first_of_month: 6
 first_of_year: all
```

`salt.states.file.absent(name, **kwargs)`

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

**name** The path which should be deleted

`salt.states.file.accumulated(name, filename, text, **kwargs)`

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

**name** Accumulator name

**filename** Filename which would receive this accumulator (see file.managed state documentation about **name**)

**text** String or list for adding in accumulator

**require\_in / watch\_in** One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
 file.accumulated:
 - filename: /tmp/animal_file.txt
 - text: ' jumps over the lazy dog.'
 - require_in:
 - file: animal_file

animal_file:
 file.managed:
 - name: /tmp/animal_file.txt
```

(continues on next page)

(continued from previous page)

```
- source: salt://animal_file.txt
- template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{%
↪animal %}{{endfor %}}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

---

**Note:** The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

---

```
salt.states.file.append(name, text=None, makedirs=False, source=None, source_hash=None, tem-
 plate='jinja', sources=None, source_hashes=None, defaults=None, con-
 text=None, ignore_whitespace=True)
```

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file. Defaults to `False`.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
=====	=====
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for *file.managed* function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source\_hashes** A list of `source_hashes` corresponding to the sources list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore\_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.append:
- text: |
 Thou hadst better eat salt with the Philosophers of Greece,
 than sugar with the Courtiers of Italy.
- Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.append:
- text:
 - Trust no one unless you have eaten much salt with him.
 - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
file:
- append
- template: jinja
- sources:
 - salt://motd/devops-messages.tpl
 - salt://motd/hr-messages.tpl
 - salt://motd/general-messages.tpl
```

New in version 0.9.5.

```
salt.states.file.blockreplace(name, marker_start='#-- start managed zone --', marker_end='#-
- end managed zone --', source=None, source_hash=None,
template='jinja', sources=None, source_hashes=None, de-
faults=None, context=None, content="", append_if_not_found=False,
prepend_if_not_found=False, backup='.bak', show_changes=True,
append_newline=None)
```

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

---

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use `file.accumulated` and target this state. All accumulated data dictionaries' content will be added in the content block.

---

**name** Filesystem path to the file to be edited

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end** The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

**content** The content to be used between the two lines identified by `marker_start` and `marker_end`

**source** The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
 file.blockreplace:
 - name: /etc/example.conf
 - source:
 - salt://file_that_does_not_exist
 - salt://file_that_exists
```

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
=====	=====
sha512	128
sha384	96

(continues on next page)

(continued from previous page)

sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for *file.managed* function for more details and examples.

**template** [jinja] Templating engine to be used to render the downloaded file. The following engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**context** Overrides default context variables passed to the template

**defaults** Default context passed to the template

**append\_if\_not\_found** [False] If markers are not found and this option is set to `True`, the content block will be appended to the file.

**prepend\_if\_not\_found** [False] If markers are not found and this option is set to `True`, the content block will be prepended to the file.

**backup** The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

**dry\_run** [False] If `True`, do not make any edits to the file and simply return the changes that *would* be made.

**show\_changes** [True] Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If `False`, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

**append\_newline** Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5, 2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
 file.blockreplace:
 - name: /etc/hosts
 - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
 - marker_end: "# END managed zone {{ myvar }} --"
 - content: 'First line of content'
 - append_if_not_found: True
 - backup: '.bak'
 - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
 file.accumulated:
 - filename: /etc/hosts
 - name: my-accumulator-{{ myvar }}
 - text: "text 2"
 - require_in:
 - file: hosts-config-block-{{ myvar }}
```

(continues on next page)

(continued from previous page)

```

hosts-config-block-{{ myvar }}-accumulated2:
 file.accumulated:
 - filename: /etc/hosts
 - name: my-accumulator-{{ myvar }}
 - text: |
 text 3
 text 4
 - require_in:
 - file: hosts-config-block-{{ myvar }}

```

will generate and maintain a block of content in /etc/hosts:

```

START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
END managed zone 42 --

```

`salt.states.file.cached(name, source_hash="", source_hash_name=None, skip_verify=False, saltenv='base')`

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name** The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

---

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

---

**source\_hash** See the documentation for this same argument in the *file.managed* state.

---

**Note:** For remote files not originating from the `salt://` fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

---

**source\_hash\_name** See the documentation for this same argument in the *file.managed* state.

**skip\_verify** See the documentation for this same argument in the *file.managed* state.

---

**Note:** Setting this to True will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

---

**saltenv** Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the `archive.extracted` state:

```

result = __states__['file.cached'](source_match,
 source_hash=source_hash,

```

(continues on next page)

(continued from previous page)

```
source_hash_name=source_hash_name,
skip_verify=skip_verify,
saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a `try/except`.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using `cp.is_cached`:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

**salt.states.file.comment**(*name, regex, char='#, backup='.bak')*

Comment out specified lines in a file.

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing `^` or `$` characters outside the parenthesis (e.g., the pattern `^foo$` will be rewritten as `^(foo)$`) Note that you need the leading `^`, otherwise each time you run highstate, another comment char will be inserted.

**char** [#] The character to be inserted at the beginning of a line in order to comment it out

**backup** [.bak] The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to `False/None` to not keep a backup.

Usage:

```
/etc/fstab:
file.comment:
- regex: ^bind 127.0.0.1
```

New in version 0.9.5.

**salt.states.file.copy\_**(*name, source, force=False, makedirs=False, preserve=False, user=None, group=None, mode=None, subdir=False, \*\*kwargs*)

If the file defined by the `source` option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the `force` option is set to `True`.

**Note:** This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a `file.managed` state.

**name** The location of the file to copy to

**source** The location of the file to copy to the location specified with `name`

**force** If the target location is present then the file will not be moved, specify `"force: True"` to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

**preserve** New in version 2015.5.0.

Set **preserve**: True to preserve user/group ownership and mode after copying. Default is False. If **preserve** is set to True, then user/group/mode attributes will be ignored.

**user** New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If **preserve** is set to True, then this will be ignored

**group** New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If **preserve** is set to True or on Windows this will be ignored

**mode** New in version 2015.5.0.

The permissions to set on the copied file, aka 644, '0775', '4664'. If **preserve** is set to True, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**subdir** New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

**Note:** The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by [states.file.managed](#) and [states.file.recurse](#).

---

**salt.states.file.decode**(*name*, *encoded\_data*=None, *contents\_pillar*=None, *encoding\_type*='base64',  
                          *checksum*='md5')

Decode an encoded file and write it to disk

New in version 2016.3.0.

**name** Path of the file to be written.

**encoded\_data** The encoded file. Either this option or **contents\_pillar** must be specified.

**contents\_pillar** A Pillar path to the encoded file. Uses the same path syntax as [pillar.get](#). The [hashutil.base64\\_encodefile](#) function can load encoded content into Pillar. Either this option or **encoded\_data** must be specified.

**encoding\_type** [base64] The type of encoding.

**checksum** [md5] The hashing algorithm to use to generate checksums. Wraps the [hashutil.digest](#) execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
 file.decode:
 - name: /tmp/new_file
 - encoding_type: base64
 - contents_pillar: mypillar:thefile

or

write_base64_encoded_string_to_a_file:
 file.decode:
 - name: /tmp/new_file
 - encoding_type: base64
 - encoded_data: |
 Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```

write_base64_encoded_string_to_a_file:
 file.decode:
 - name: /tmp/new_file
 - encoding_type: base64
 - encoded_data: |
 {{ salt.pillar.get('path:to:data') | indent(8) }}

```

**salt.states.file.directory**(*name*, *user*=None, *group*=None, *recurse*=None, *max\_depth*=None, *dir\_mode*=None, *file\_mode*=None, *makedirs*=False, *clean*=False, *require*=None, *exclude\_pat*=None, *follow\_symlinks*=False, *force*=False, *backupname*=None, *allow\_symlink*=True, *children\_only*=False, *win\_owner*=None, *win\_perms*=None, *win\_deny\_perms*=None, *win\_inheritance*=True, *win\_perms\_reset*=False, *\*\*kwargs*)

Ensure that a named directory is present and has the right perms

**name** The location to create or manage a directory, as an absolute path

**user** The user to own the directory; this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

**recurse** Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If *mode* is defined, will recurse on both *file\_mode* and *dir\_mode* if they are defined. If *ignore\_files* or *ignore\_dirs* is included, files or directories will be left unchanged respectively. If *silent* is defined, individual file/directory change notifications will be suppressed.

Example:

```

/var/log/httpd:
 file.directory:
 - user: root
 - group: root
 - dir_mode: 755
 - file_mode: 644
 - recurse:
 - user
 - group
 - mode

```

Leave files or directories unchanged:

```

/var/log/httpd:
 file.directory:
 - user: root
 - group: root
 - dir_mode: 755
 - file_mode: 644
 - recurse:
 - user
 - group
 - mode
 - ignore_dirs

```

New in version 2015.5.0.

**max\_depth** Limit the recursion depth. The default is no limit=None. 'max\_depth' and 'clean' are mutually exclusive.

New in version 2016.11.0.

**dir\_mode / mode** The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**file\_mode** The permissions mode to set any files created if 'mode' is run in 'recurse'. This defaults to `dir_mode`. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**makedirs** If the directory is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. 'clean' and 'max\_depth' are mutually exclusive.

**require** Require other resources such as packages or files

**exclude\_pat** When 'clean' is set to `True`, exclude this pattern from removal list and preserve in the destination.

**follow\_symlinks** [`False`] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

**force** If the name of the directory exists and is not a directory and force is set to `False`, the state will fail. If force is set to `True`, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

**backupname** If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is `False`, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

**allow\_symlink** [`True`] If `allow_symlink` is `True` and the specified path is a symlink, it will be allowed to remain if it points to a directory. If `allow_symlink` is `False` then the state will fail, unless force is also set to `True`, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

**children\_only** [`False`] If `children_only` is `True` the base of a path is excluded when performing a recursive operation. In case of `/path/to/base`, base will be ignored while all of `/path/to/base/*` are still operated on.

**win\_owner** [`None`] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

**win\_perms** [`None`] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms. perms must be specified. `applies_to` is optional and defaults to `this_folder_subfolder_files`.

New in version 2017.7.0.

**win\_deny\_perms** [`None`] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control', 'applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

**win\_inheritance** [`True`] `True` to inherit permissions from the parent directory, `False` not to inherit permission.

New in version 2017.7.0.

**win\_perms\_reset** [`False`] If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Here's an example using the above `win_*` parameters:

```

create_config_dir:
 file.directory:
 - name: 'C:\config\'
 - win_owner: Administrators
 - win_perms:
 # Basic Permissions
 dev_ops:
 perms: full_control
 # List of advanced permissions
 appuser:
 perms:
 - read_attributes
 - read_ea
 - create_folders
 - read_permissions
 applies_to: this_folder_only
 joe_snuffy:
 perms: read
 applies_to: this_folder_files
 - win_deny_perms:
 fred_snuffy:
 perms: full_control
 - win_inheritance: False

```

`salt.states.file.exists(name, **kwargs)`

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

This function does not create the file if it doesn't exist, it will return an error.

**name** Absolute path which must exist

`salt.states.file.hardlink(name, target, force=False, makedirs=False, user=None, group=None, dir_mode=None, **kwargs)`

Create a hard link If the file already exists and is a hard link pointing to any location other than the specified target, the hard link will be replaced. If the hard link is a regular file or directory then the state will return False. If the regular file is desired to be replaced with a hard link pass force: True

**name** The location of the hard link to create

**target** The location that the hard link points to

**force** If the name of the hard link exists and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the hard link file will be deleted to make room for the hard link, unless backupname is set, when it will be renamed

**makedirs** If the location of the hard link does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own any directories made if makedirs is set to true. This defaults to the user salt is running as on the minion

**group** The group ownership set on any directories made if makedirs is set to true. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode** If directories are to be created, passing this option specifies the permissions for those directories.

`salt.states.file.keyvalue(name, key=None, value=None, key_values=None, separator='=', append_if_not_found=False, prepend_if_not_found=False, search_only=False, show_changes=True, ignore_if_missing=False, count=1, uncomment=None, key_ignore_case=False, value_ignore_case=False)`

Key/Value based editing of a file.

New in version 3001.

This function differs from `file.replace` in that it is able to search for keys, followed by a customizable separator, and replace the value with the given value. Should the value be the same as the one already in the file, no changes will be made.

Either supply both `key` and `value` parameters, or supply a dictionary with `key / value` pairs. It is an error to supply both.

**name** Name of the file to search/replace in.

**key** Key to search for when ensuring a value. Use in combination with a `value` parameter.

**value** Value to set for a given key. Use in combination with a `key` parameter.

**key\_values** Dictionary of `key / value` pairs to search for and ensure values for. Used to specify multiple `key / value`s at once.

**separator** ["="] Separator which separates key from value.

**append\_if\_not\_found** [False] Append the `key/value` to the end of the file if not found. Note that this takes precedence over `prepend_if_not_found`.

**prepend\_if\_not\_found** [False] Prepend the `key/value` to the beginning of the file if not found. Note that `append_if_not_found` takes precedence.

**show\_changes** [True] Show a diff of the resulting removals and inserts.

**ignore\_if\_missing** [False] Return with success even if the file is not found (or not readable).

**count** [1] Number of occurrences to allow (and correct), default is 1. Set to -1 to replace all, or set to 0 to remove all lines with this key regardless of its value.

---

**Note:** Any additional occurrences after `count` are removed. A count of -1 will only replace all occurrences that are currently uncommented already. Lines commented out will be left alone.

---

**uncomment** [None] Disregard and remove supplied leading characters when finding keys. When set to None, lines that are commented out are left for what they are.

---

**Note:** The argument to `uncomment` is not a prefix string. Rather; it is a set of characters, each of which are stripped.

---

**key\_ignore\_case** [False] Keys are matched case insensitively. When a value is changed the matched key is kept as-is.

**value\_ignore\_case** [False] Values are checked case insensitively, trying to set e.g. 'Yes' while the current value is 'yes', will not result in changes when `value_ignore_case` is set to True.

An example of using `file.keyvalue` to ensure `sshd` does not allow for root to login with a password and at the same time setting the `login-gracetime` to 1 minute and disabling all forwarding:

```
sshd_config_harden:
 file.keyvalue:
 - name: /etc/ssh/sshd_config
 - key_values:
 permitrootlogin: 'without-password'
 LoginGraceTime: '1m'
 DisableForwarding: 'yes'
 - separator: ' '
 - uncomment: '#'
 - key_ignore_case: True
 - append_if_not_found: True
```

The same example, except for only ensuring `PermitRootLogin` is set correctly. Thus being able to use the shorthand `key` and `value` parameters instead of `key_values`.

```

sshd_config_harden:
 file.keyvalue:
 - name: /etc/ssh/sshd_config
 - key: PermitRootLogin
 - value: without-password
 - separator: ' '
 - uncomment: '#'
 - key_ignore_case: True
 - append_if_not_found: True

```

---

**Note:** Notice how the key is not matched case-sensitively, this way it will correctly identify both 'PermitRootLogin' as well as 'permitrootlogin'.

---

`salt.states.file.line`(*name*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show\_changes=True*, *backup=False*, *quiet=False*, *indent=True*, *create=False*, *user=None*, *group=None*, *file\_mode=None*)

Line-focused editing of a file.

New in version 2015.8.0.

---

**Note:** `file.line` exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find `file.replace` to be more suitable.

---

`file.line` is most useful if you have single lines in a file, potentially a config file, that you would like to manage. It can remove, add, and replace lines.

**name** Filesystem path to the file to be edited.

**content** Content of the line. Allowed to be empty if `mode=delete`.

**match** Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, `match` falls back to the `content` value.

**mode** Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. If `before` and `after` are specified either zero lines, or lines that contain the `content` line are allowed to be in between `before` and `after`. If there are lines, and none of them match then it will produce an error.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, if found.
- **insert** Nearly identical to `ensure`. If a line does not exist, it will be added.

The differences are that multiple (and non-matching) lines are allowed between `before` and `after`, if they are specified. The line will always be inserted right before `before`. `insert` also allows the use of `location` to specify that the line should be added at the beginning or end of the file.

---

**Note:** If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

**location** In `mode=insert` only, whether to place the `content` at the beginning or end of a the file. If `location` is provided, `before` and `after` are ignored. Valid locations:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

**before** Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex and a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure`

and `insert` modes. The `content` will be inserted just before this line, matching its `indent` unless `indent=False`.

**after** Regular expression or an exact case-sensitive fragment of the string. Will be tried as **both** a regex **and** a part of the line. Must match **exactly** one line in the file. This value is only used in `ensure` and `insert` modes. The `content` will be inserted directly after this line, unless `before` is also provided. If `before` is not matched, indentation will match this line, unless `indent=False`.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

---

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

**backup** Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

**quiet** Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

**indent** Keep indentation with the previous line. This option is not considered when the `delete` mode is specified. Default is `True`.

**create** Create an empty file if doesn't exist.

New in version 2016.11.0.

**user** The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored.

New in version 2016.11.0.

**file\_mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
update_config:
 file.line:
 - name: /etc/myconfig.conf
 - mode: ensure
 - content: my key = my value
 - before: somekey.*?
```

#### Examples:

Here's a simple config file.

```
[some_config]
Some config file
this line will go away

here=False
away=True
goodybe=away
```

And an sls file:

```
remove_lines:
 file.line:
```

(continues on next page)

(continued from previous page)

```
- name: /some/file.conf
- mode: delete
- match: away
```

This will produce:

```
[some_config]
Some config file

here=False
away=True
goodbye=away
```

If that state is executed 2 more times, this will be the result:

```
[some_config]
Some config file

here=False
```

Given that original file with this state:

```
replace_things:
 file.line:
 - name: /some/file.conf
 - mode: replace
 - match: away
 - content: here
```

Three passes will this state will result in this file:

```
[some_config]
Some config file
here

here=False
here
here
```

Each pass replacing the first line found.

Given this file:

```
insert after me
something
insert before me
```

The following state:

```
insert_a_line:
 file.line:
 - name: /some/file.txt
 - mode: insert
 - after: insert after me
 - before: insert before me
 - content: thrice
```

If this state is executed 3 times, the result will be:

```
insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is `ensure` instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
insert after me
insert before me
```

With an `ensure` mode, this will insert `thrice` the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

```
Begin SomeBlock
 foo = bar
End

Begin AnotherBlock
 another = value
End
```

And given this state:

```
ensure_someblock:
 file.line:
 - name: /some/file.conf
 - mode: ensure
 - after: Begin SomeBlock
 - content: this = should be my content
 - before: End
```

This will fail because there are multiple `End` lines. Without that problem, it still would fail because there is a non-matching line, `foo = bar`. `Ensure` **only** allows either zero, or the matching line present to be present in between before and after.

```
salt.states.file.managed(name, source=None, source_hash="", source_hash_name=None,
 keep_source=True, user=None, group=None, mode=None, attrs=None,
 template=None, makedirs=False, dir_mode=None, context=None, re-
 place=True, defaults=None, backup="", show_changes=True, create=True,
 contents=None, tmp_dir="", tmp_ext="", contents_pillar=None, con-
 tents_grains=None, contents_newline=True, contents_delimiter=':',
 encoding=None, encoding_errors='strict', allow_empty=True, fol-
 low_symlinks=True, check_cmd=None, skip_verify=False, selinux=None,
 win_owner=None, win_perms=None, win_deny_perms=None,
 win_inheritance=True, win_perms_reset=False, **kwargs)
```

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

**name** The location of the file to manage, as an absolute path.

**source** The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File

retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed. If source is left blank or `None`, please also set `replaced` to `False` to make your intention explicit.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
 file.managed:
 - source:
 - salt://file_that_does_not_exist
 - salt://file_that_exists
```

#### source\_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
=====	=====
sha512	128
sha384	96
sha256	64
sha224	56
sha1	40
md5	32

**Using a Source Hash File** The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the `source_hash` argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a /
↪etc/resolv.conf
```

(continues on next page)

(continued from previous page)

```
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

### Inserting the Source Hash in the SLS Data

The `source_hash` can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
 ↪src-0.7.3.tar.gz
 - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

**Note:** Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
 ↪src-0.7.3.tar.gz
 - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

**Known issues:** If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
 file.managed:
 - name: /tmp/tomdroid-src-0.7.3.tar.gz
 - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
 - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz/+md5
```

**source\_hash\_name** When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8 foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2 ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8 ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88 ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
 file.managed:
 - source: https://mydomain.tld/dir2/foo.txt
 - source_hash: https://mydomain.tld/hashe
 - source_hash_name: ./dir2/foo.txt
```

---

**Note:** This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

---

New in version 2016.3.5.

**keep\_source** [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

---

**Note:** `keep` does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

**attrs** The attributes to have on this file, e.g. `a`, `i`. The attributes can be any or a combination of the following characters: `aAccDDeijPsStTu`.

---

**Note:** This option is **not** supported on Windows.

---

New in version 2018.3.0.

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**makedirs** [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**replace** [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**backup** Overrides the default backup mode for this specific file. See [backup\\_mode documentation](#) for more details.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** [True] If set to `False`, then the file will only be managed if the file already exists on the system.

**contents** Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
 file.managed:
 - contents:
 - This is line 1
 - This is line 2

/path/to/file2:
 file.managed:
 - contents: |
 This is line 1
 This is line 2
```

**contents\_pillar** New in version 0.17.0.

Changed in version 2016.11.0: `contents_pillar` can also be a list, and the pillars will be concatenated together to form one file.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in [pillar.get](#). This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
 file.managed:
 - user: deployer
 - group: deployer
 - mode: 600
 - attrs: a
 - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
 deployer:
 id_rsa: |
 -----BEGIN RSA PRIVATE KEY-----
```

(continues on next page)

(continued from previous page)

```

MIIeowIBAAKCAQEAOQiw03JhBquPAalQF9qP1LLZXVjYMIswrMe2HcWUVBgh+vY
U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGl1vgAObJAnMT623dMXjVKwnEagZPRJIXDy
B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpVwlgGrfgz70m0pqxu+UyFbAGLin+
GpxzZAMaFpZw4sSbIlRuissXZj/sHpQb8p9M5Ie04Z3rjkCP1cxI
-----END RSA PRIVATE KEY-----

```

**Note:** The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the multiline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the *file\_tree external pillar* can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

**contents\_grains** New in version 2014.7.0.

Operates like **contents**, but draws from a value stored in grains, using the grains path syntax used in *grains.get*. This functionality works similarly to **contents\_pillar**, but with grains.

For example, the following could be used to deploy a "message of the day" file:

```

write_motd:
 file.managed:
 - name: /etc/motd
 - contents_grains: motd

```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

**contents\_newline** [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If True, files managed using **contents**, **contents\_pillar**, or **contents\_grains** will have a newline added to the end of the file if one is not present. Setting this option to False will ensure the final line, or entry, does not contain a new line. If the last line, or entry in the file does contain a new line already, this option will not remove it.

**contents\_delimiter** New in version 2015.8.4.

Can be used to specify an alternate delimiter for **contents\_pillar** or **contents\_grains**. This delimiter will be passed through to *pillar.get* or *grains.get* when retrieving the contents.

**encoding** If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

**encoding\_errors** ['strict'] Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

**allow\_empty** [True] New in version 2015.8.4.

If set to False, then the state will fail if the contents specified by **contents\_pillar** or **contents\_grains** are empty.

**follow\_symlinks** [True] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.  
**check\_cmd** New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
 file.managed:
 - user: root
 - group: root
 - mode: 0440
 - attrs: i
 - source: salt://sudoers/files/sudoers.jinja
 - template: jinja
 - check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This check\_cmd functions differently than the requisite check\_cmd.

**tmp\_dir** Directory for temp file created by check\_cmd. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

```
/etc/dhcp/dhcpd.conf:
 file.managed:
 - user: root
 - group: root
 - mode: 0755
 - tmp_dir: '/etc/dhcp'
 - contents: "# Managed by Salt"
 - check_cmd: dhcpd -t -cf
```

**tmp\_ext** Suffix for temp file created by check\_cmd. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

```
/etc/init/test.conf:
 file.managed:
 - user: root
 - group: root
 - mode: 0440
 - tmp_ext: '.conf'
 - contents:
 - 'description "Salt Minion"'
 - 'start on started mountall'
 - 'stop on shutdown'
 - 'respawn'
 - 'exec salt-minion'
 - check_cmd: init-checkconf -f
```

**skip\_verify** [False] If True, hash verification of remote file sources (<http://>, <https://>, <ftp://>) will be skipped, and the source\_hash argument will be ignored.

New in version 2016.3.0.

**selinux** [None] Allows setting the selinux user, role, type, and range of a managed file

```
/tmp/selinux.test
 file.managed:
 - user: root
```

(continues on next page)

(continued from previous page)

```
- selinux:
 seuser: system_u
 serole: object_r
 setype: system_conf_t
 serange: s0
```

New in version Neon.

**win\_owner** [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

**win\_perms** [None] A dictionary containing permissions to grant and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

New in version 2017.7.0.

**win\_deny\_perms** [None] A dictionary containing permissions to deny and their propagation. For example: {'Administrators': {'perms': 'full\_control'}} Can be a single basic perm or a list of advanced perms. perms must be specified. applies\_to does not apply to file objects.

New in version 2017.7.0.

**win\_inheritance** [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

**win\_perms\_reset** [False] If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Here's an example using the above win\_\* parameters:

```
create_config_file:
file.managed:
- name: C:\config\settings.cfg
- source: salt://settings.cfg
- win_owner: Administrators
- win_perms:
 # Basic Permissions
 dev_ops:
 perms: full_control
 # List of advanced permissions
 appuser:
 perms:
 - read_attributes
 - read_ea
 - create_folders
 - read_permissions
 joe_snuffy:
 perms: read
- win_deny_perms:
 fred_snuffy:
 perms: full_control
- win_inheritance: False
```

**salt.states.file.missing**(name, \*\*kwargs)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

**name** Absolute path which must NOT exist

`salt.states.file.mknod(name, ntype, major=0, minor=0, user=None, group=None, mode='0600')`

Create a special file similar to the 'nix mknod command. The supported device types are **p** (fifo pipe), **c** (character device), and **b** (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of 'nix mknod. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

**name** name of the file

**ntype** node type 'p' (fifo pipe), 'c' (character device), or 'b' (block device)

**major** major number of the device does not apply to a fifo pipe

**minor** minor number of the device does not apply to a fifo pipe

**user** owning user of the device/pipe

**group** owning group of the device/pipe

**mode** permissions on the device/pipe

Usage:

```
/dev/chr:
file.mknod:
- ntype: c
- major: 180
- minor: 31
- user: root
- group: root
- mode: 660

/dev/blk:
file.mknod:
- ntype: b
- major: 8
- minor: 999
- user: root
- group: root
- mode: 660

/dev/fifo:
file.mknod:
- ntype: p
- user: root
- group: root
- mode: 660
```

New in version 0.17.0.

`salt.states.file.mod_run_check_cmd(cmd, filename, **check_cmd_opts)`

Execute the check\_cmd logic.

Return a result dict if check\_cmd succeeds (check\_cmd == 0) otherwise return True

`salt.states.file.not_cached(name, saltenv='base')`

New in version 2017.7.3.

Ensures that a file is not present in the minion's cache, deleting it if found. This state is primarily invoked by other states to ensure that a fresh copy is fetched.

**name** The URL of the file to be removed from cache. To remove a file from cache in an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf?saltenv=dev).

---

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state will take no action.

---

**saltenv** Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

```
salt.states.file.patch(name, source=None, source_hash=None, source_hash_name=None,
 skip_verify=False, template=None, context=None, defaults=None, options="",
 reject_file=None, strip=None, saltenv=None, **kwargs)
```

Ensure that a patch has been applied to the specified file or directory

Changed in version 2019.2.0: The `hash` and `dry_run_first` options are now ignored, as the logic which determines whether or not the patch has already been applied no longer requires them. Additionally, this state now supports patch files that modify more than one file. To use these sort of patches, specify a directory (and, if necessary, the `strip` option) instead of a file.

---

**Note:** A suitable `patch` executable must be available on the minion. Also, keep in mind that the pre-check this state does to determine whether or not changes need to be made will create a temp file and send all patch output to that file. This means that, in the event that the patch would not have applied cleanly, the comment included in the state results will reference a temp file that will no longer exist once the state finishes running.

---

**name** The file or directory to which the patch should be applied

**source** The patch file to apply

Changed in version 2019.2.0: The source can now be from any file source supported by Salt (`salt://`, `http://`, `https://`, `ftp://`, etc.). Templating is also now supported.

**source\_hash** Works the same way as in *file.managed*.

New in version 2019.2.0.

**source\_hash\_name** Works the same way as in *file.managed*

New in version 2019.2.0.

**skip\_verify** Works the same way as in *file.managed*

New in version 2019.2.0.

**template** Works the same way as in *file.managed*

New in version 2019.2.0.

**context** Works the same way as in *file.managed*

New in version 2019.2.0.

**defaults** Works the same way as in *file.managed*

New in version 2019.2.0.

**options** Extra options to pass to patch. This should not be necessary in most cases.

---

**Note:** For best results, short opts should be separate from one another. The `-N` and `-r`, and `-o` options are used internally by this state and cannot be used here. Additionally, instead of using `-pN` or `--strip=N`, use the `strip` option documented below.

---

**reject\_file** If specified, any rejected hunks will be written to this file. If not specified, then they will be written to a temp file which will be deleted when the state finishes running.

---

**Important:** The parent directory must exist. Also, this will overwrite the file if it is already present.

---

New in version 2019.2.0.

**strip** Number of directories to strip from paths in the patch file. For example, using the below SLS would instruct Salt to use `-p1` when applying the patch:

```
/etc/myfile.conf:
file.patch:
- source: salt://myfile.patch
- strip: 1
```

New in version 2019.2.0: In previous versions, `-p1` would need to be passed as part of the `options` value.

**saltenv** Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

---

**Note:** Ignored when the patch file is from a non-`salt://` source.

---

Usage:

```
Equivalent to ``patch --forward /opt/myfile.txt myfile.patch``
/opt/myfile.txt:
file.patch:
- source: salt://myfile.patch
```

`salt.states.file.prepend(name, text=None, makedirs=False, source=None, source_hash=None, template='jinja', sources=None, source_hashes=None, defaults=None, context=None, header=None)`

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If `makedirs` is set to `True`, then the parent directories will be created to facilitate the creation of the named file. Defaults to `False`.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

**source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

Type	Length
=====	=====
sha512	128

(continues on next page)

(continued from previous page)

sha384	96
sha256	64
sha224	56
sha1	40
md5	32

See the `source_hash` parameter description for *file.managed* function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source\_hashes** A list of source\_hashes corresponding to the sources list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore\_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.prepend:
- text: |
 Thou hadst better eat salt with the Philosophers of Greece,
 than sugar with the Courtiers of Italy.
 - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
file.prepend:
- text:
 - Trust no one unless you have eaten much salt with him.
 - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
file.prepend:
- header: True
- text:
 - This will be the very first line in the file.
 - The 2nd line, regardless of duplicates elsewhere in the file.
 - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
file:
- prepend
- template: jinja
- sources:
 - salt://motd/devops-messages.tmpl
 - salt://motd/hr-messages.tmpl
 - salt://motd/general-messages.tmpl
```

New in version 2014.7.0.

`salt.states.file.recurse`(*name*, *source*, *keep\_source*=True, *clean*=False, *require*=None, *user*=None, *group*=None, *dir\_mode*=None, *file\_mode*=None, *sym\_mode*=None, *template*=None, *context*=None, *replace*=True, *defaults*=None, *include\_empty*=False, *backup*="", *include\_pat*=None, *exclude\_pat*=None, *maxdepth*=None, *keep\_symlinks*=False, *force\_symlinks*=False, *win\_owner*=None, *win\_perms*=None, *win\_deny\_perms*=None, *win\_inheritance*=True, *\*\*kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

**name** The directory to set the recursion in

**source** The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

**keep\_source** [True] Set to False to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

**clean** Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

**require** Require other resources such as packages or files

**user** The user to own the directory. This defaults to the user salt is running as on the minion

**group** The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

**dir\_mode** The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**file\_mode** The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

**sym\_mode** The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**template** If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

---

**Note:** The template option is required when recursively applying templates.

---

**replace** [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**context** Overrides default context variables passed to the template.

**defaults** Default context passed to the template.

**include\_empty** Set this to `True` if empty directories should also be created (default is `False`)

**backup** Overrides the default backup mode for all replaced files. See [backup\\_mode documentation](#) for more details.

**include\_pat** When copying, include only this pattern, or list of patterns, from the source. Default is glob match; if prefixed with 'E@', then regexp match. Example:

```
- include_pat: hello* :: glob matches 'hello01', 'hello02'
 ... but not 'otherhello'
- include_pat: E@hello :: regexp matches 'otherhello',
 'hello01' ...
```

Changed in version 3001: List patterns are now supported

```
- include_pat:
 - hello01
 - hello02
```

**exclude\_pat** Exclude this pattern, or list of patterns, from the source when copying. If both *include\_pat* and *exclude\_pat* are supplied, then it will apply conditions cumulatively. i.e. first select based on *include\_pat*, and then within that result apply *exclude\_pat*.

Also, when 'clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA* :: glob matches APPDATA.01,
 APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
 or TEMPDATA for exclusion
```

Changed in version 3001: List patterns are now supported

```
- exclude_pat:
 - APPDATA.01
 - APPDATA.02
```

**maxdepth** When copying, only copy paths which are of depth *maxdepth* from the source path. Example:

- maxdepth: 0	:: Only include files located in the source directory
- maxdepth: 1	:: Only include files located in the source or immediate subdirectories

**keep\_symlinks** Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True.

**force\_symlinks** Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

**win\_owner** [None] The owner of the symlink and directories if `makedirs` is True. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win\_perms** [None] A dictionary containing permissions to grant

New in version 2017.7.7.

**win\_deny\_perms** [None] A dictionary containing permissions to deny

New in version 2017.7.7.

**win\_inheritance** [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

**salt.states.file.rename**(*name*, *source*, *force=False*, *makedirs=False*, *\*\*kwargs*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

**name** The location of the file to rename to

**source** The location of the file to move to the location specified with name

**force** If the target location is present then the file will not be moved, specify "force: True" to overwrite the target file

**makedirs** If the target subdirectories don't exist create them

**salt.states.file.replace**(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append\_if\_not\_found=False*, *prepend\_if\_not\_found=False*, *not\_found\_content=None*, *backup='.bak'*, *show\_changes=True*, *ignore\_if\_missing=False*, *backslash\_literal=False*)

Maintain an edit in a file.

New in version 0.17.0.

**name** Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern** A regular expression, to be matched using Python's `re.search()`.

---

**Note:** If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `regex_escape`.

<code>{{ 'http://example.com?foo=bar%20baz'   regex_escape }}</code>
----------------------------------------------------------------------

**repl** The replacement text

**count** Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags** A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., [ 'IGNORECASE', 'MULTILINE' ]. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which equates to [ 'MULTILINE' ]).

---

**Note:** `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore,

when using anchors such as `^` or `$` in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to `['MULTILINE']`. When overriding the default value for `flags`, if `'MULTILINE'` is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add `'MULTILINE'` to the list of flags.

**bufsize** How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found** [False] If set to `True`, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

**prepend\_if\_not\_found** [False] If set to `True` and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

**not\_found\_content** Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

**backup** The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

**show\_changes** [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

**ignore\_if\_missing** [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

**backslash\_literal** [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
 file.replace:
 # <...snip...>
 - pattern: |
 CentOS \((2.6.32[^\n]+\)\n\s+root[^\n]+\n\)+
```

**Note:** When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might lose line feeds.

When regex capture groups are used in `pattern:`, their captured value is available for reuse in the `repl:` part as a backreference (ex. `\1`).

```
add_login_group_to_winbind_ssh_access_list:
 file.replace:
 - name: '/etc/security/pam_winbind.conf'
 - pattern: '^(require_membership_of =)(.*)$'
 - repl: '\1\2,append-new-group-to-line'
```

**Note:** The `file.replace` state uses Python's `re` module. For more advanced options, see <https://docs.python.org/2/library/re.html>.

[python.org/2/library/re.html](https://python.org/2/library/re.html)

---

`salt.states.file.retention_schedule(name, retain, strptime_format=None, timezone=None)`

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

#### Parameters

- **name** -- The filesystem path to the directory containing backups to be managed.
- **retain** -- Delete the backups, except for the ones we want to keep. The `N` below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to `None`, which means to not keep files based on this criteria.
  - most\_recent** `N` Keep the most recent `N` files.
  - first\_of\_hour** `N` For the last `N` hours from now, keep the first file after the hour.
  - first\_of\_day** `N` For the last `N` days from now, keep the first file after midnight. See also `timezone`.
  - first\_of\_week** `N` For the last `N` weeks from now, keep the first file after Sunday midnight.
  - first\_of\_month** `N` For the last `N` months from now, keep the first file after the start of the month.
  - first\_of\_year** `N` For the last `N` years from now, keep the first file after the start of the year.
- **strptime\_format** -- A python strptime format string used to first match the file-names of backups and then parse the filename to determine the datetime of the file. <https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime> Defaults to `None`, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** -- The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

Usage example:

```
/var/backups/example_directory:
file.retention_schedule:
- retain:
 most_recent: 5
 first_of_hour: 4
 first_of_day: 7
 first_of_week: 6 # NotImplemented yet.
 first_of_month: 6
 first_of_year: all
- strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
- timezone: None
```

`salt.states.file.serialize(name, dataset=None, dataset_pillar=None, user=None, group=None, mode=None, backup="", makedirs=False, show_changes=True, create=True, merge_if_exists=False, encoding=None, encoding_errors='strict', serializer_opts=None, deserializer_opts=None, **kwargs)`

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

**name** The location of the file to create

**dataset** The dataset that will be serialized

**dataset\_pillar** Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in `pillar.get`. This is useful when the pillar value contains newlines, as referencing a pillar

variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

**formatter** Write the data as this format. See the list of *serializer modules* for supported output formats.

**encoding** If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

New in version 2017.7.0.

**encoding\_errors** ['strict'] Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

New in version 2017.7.0.

**user** The user to own the directory, this defaults to the user salt is running as on the minion

**group** The group ownership set for the directory, this defaults to the group salt is running as on the minion

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

---

**Note:** This option is **not** supported on Windows.

---

**backup** Overrides the default backup mode for this specific file.

**makedirs** Create parent directories for destination file.

New in version 2014.1.3.

**show\_changes** Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

**create** Default is `True`, if `create` is set to `False` then the file will only be managed if the file already exists on the system.

**merge\_if\_exists** Default is `False`, if `merge_if_exists` is `True` then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

**serializer\_opts** Pass through options to serializer. For example:

```
/etc/dummy/package.yaml
file.serialize:
 - formatter: yaml
 - serializer_opts:
 - explicit_start: True
 - default_flow_style: True
 - indent: 4
```

The valid opts are the additional opts (i.e. not the data being serialized) for the function used to serialize the data. Documentation for the these functions can be found in the list below:

- For **yaml**: `yaml.dump()`
- For **json**: `json.dumps()`
- For **python**: `pprint.pformat()`

**deserializer\_opts** Like `serializer_opts` above, but only used when merging with an existing file (i.e. when `merge_if_exists` is set to `True`).

The options specified here will be passed to the deserializer to load the existing data, before merging with the specified data and re-serializing.

```
/etc/dummy/package.yaml
file.serialize:
 - formatter: yaml
 - serializer_opts:
 - explicit_start: True
 - default_flow_style: True
 - indent: 4
 - deserializer_opts:
 - encoding: latin-1
 - merge_if_exists: True
```

The valid opts are the additional opts (i.e. not the data being deserialized) for the function used to deserialize the data. Documentation for these functions can be found in the list below:

- For **yaml**: `yaml.load()`
- For **json**: `json.loads()`

However, note that not all arguments are supported. For example, when deserializing JSON, arguments like `parse_float` and `parse_int` which accept a callable object cannot be handled in an SLS file.

New in version 2019.2.0.

For example, this state:

```
/etc/dummy/package.json:
file.serialize:
 - dataset:
 name: naive
 description: A package using naive versioning
 author: A confused individual <iam@confused.com>
 dependencies:
 express: '>= 1.2.0'
 optimist: '>= 0.1.0'
 engine: node 0.4.1
 - formatter: json
```

will manage the file `/etc/dummy/package.json`:

```
{
 "author": "A confused individual <iam@confused.com>",
 "dependencies": {
 "express": ">= 1.2.0",
 "optimist": ">= 0.1.0"
 },
 "description": "A package using naive versioning",
 "engine": "node 0.4.1",
 "name": "naive"
}
```

`salt.states.file.shortcut`(*name*, *target*, *arguments=None*, *working\_dir=None*, *description=None*, *icon\_location=None*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *\*\*kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass `force: True`, if it is to be renamed, pass a `backupname`.

**name** The location of the shortcut to create. Must end with either `".lnk"` or `".url"`

**target** The location that the shortcut points to

**arguments** Any arguments to pass in the shortcut

**working\_dir** Working directory in which to execute target

**description** Description to set on shortcut

**icon\_location** Location of shortcut's icon

**force** If the name of the shortcut exists and is not a file and force is set to False, the state will fail. If force is set to True, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless backupname is set, when it will be renamed

**backupname** If the name of the shortcut exists and is not a file, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

**makedirs** If the location of the shortcut does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory. Setting this to True will also create the parent for backupname if necessary.

**user** The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

```
salt.states.file.symlink(name, target, force=False, backupname=None, makedirs=False, user=None,
 group=None, mode=None, win_owner=None, win_perms=None,
 win_deny_perms=None, win_inheritance=None, **kwargs)
```

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If an entry with the same name exists then the state will return False. If the existing entry is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

**name** The location of the symlink to create

**target** The location that the symlink points to

**force** If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the existing entry in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

Changed in version Neon: Force will now remove all types of existing file system entries, not just files, directories and symlinks.

**backupname** If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first. An absolute path OR a basename file/directory name must be provided. The latter will be placed relative to the symlink destination's parent directory.

**makedirs** If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**win\_owner** [None] The owner of the symlink and directories if makedirs is True. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

**win\_perms** [None] A dictionary containing permissions to grant

New in version 2017.7.7.

**win\_deny\_perms** [None] A dictionary containing permissions to deny

New in version 2017.7.7.

**win\_inheritance** [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

`salt.states.file.tidied`(*name*, *age*=0, *matches*=None, *rmdirs*=False, *size*=0, *\*\*kwargs*)

Remove unwanted files based on specific criteria. Multiple criteria are OR'd together, so a file that is too large but is not old enough will still get tidied.

If neither age nor size is given all files which match a pattern in matches will be removed.

**name** The directory tree that should be tidied

**age** Maximum age in days after which files are considered for removal

**matches** List of regular expressions to restrict what gets removed. Default: ['\*']

**rmdirs** Whether or not it's allowed to remove directories

**size** Maximum allowed file size. Files greater or equal to this size are removed. Doesn't apply to directories or symbolic links

```
cleanup:
 file.tidied:
 - name: /tmp/salt_test
 - rmdirs: True
 - matches:
 - foo
 - b.*r
```

`salt.states.file.touch`(*name*, *atime*=None, *mtime*=None, *makedirs*=False)

Replicate the 'nix "touch" command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source/template/contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

**name** name of the file

**atime** atime of the file

**mtime** mtime of the file

**makedirs** whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
 file.touch
```

New in version 0.9.5.

`salt.states.file.uncomment`(*name*, *regex*, *char*='#', *backup*='.bak')

Uncomment specified commented lines in a file

**name** The full path to the file to be edited

**regex** A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between `comment()` and `uncomment()`). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend '^ [ t]\*')

**char** [#] The character to remove in order to uncomment a line

**backup** [.bak] The file will be backed up before edit with this file extension;

**Warning:** This backup will be overwritten each time `sed / comment / uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
file.uncomment:
- regex: EXTRA_GROUPS
```

New in version 0.9.5.

### 21.19.95 salt.states.firewall module

State to check firewall configurations

New in version 2016.3.0.

**salt.states.firewall.check**(*name*, *port=None*, *\*\*kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

**name** host name or ip address to test connection to

**port** The port to test the connection on

**kwargs**

Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
firewall.check:
- name: 'google.com'
- port: 80
- proto: 'tcp'
```

### 21.19.96 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
firewalld.present:
- name: public
- block_icmp:
 - echo-reply
 - echo-request
- default: False
- masquerade: True
- ports:
 - 22/tcp
 - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
firewalld.present:
- name: public
- masquerade: True
- port_fwd:
```

(continues on next page)

(continued from previous page)

```
- 22:2222:tcp
- 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
 firewallld.present:
 - name: public
 - interfaces:
 - eth0
 - sources:
 - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
 firewallld.service:
 - name: saltmaster
 - ports:
 - 4505/tcp
 - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
 firewallld.present:
 - name: saltzone
 - services:
 - saltmaster
 - sources:
 - 10.0.0.0/8
```

**class** salt.states.firewalld.**ForwardingMapping**(srcport, destport, protocol, destaddr)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

**todict**()

Returns a pretty dictionary meant for command line output.

```
salt.states.firewalld.present(name, block_icmp=None, prune_block_icmp=False, default=None, masquerade=False, ports=None, prune_ports=False, port_fwd=None, prune_port_fwd=False, services=None, prune_services=False, interfaces=None, prune_interfaces=False, sources=None, prune_sources=False, rich_rules=None, prune_rich_rules=False)
```

Ensure a zone has specific attributes.

**name** The zone to modify.

**default** [None] Set this zone as the default zone if True.

**masquerade** [False] Enable or disable masquerade for a zone.

**block\_icmp** [None] List of ICMP types to block in the zone.

**prune\_block\_icmp** [False] If True, remove all but the specified block\_icmp from the zone.

**ports** [None] List of ports to add to the zone.

**prune\_ports** [False] If True, remove all but the specified ports from the zone.

**port\_fwd** [None] List of port forwards to add to the zone.

**prune\_port\_fwd** [False] If `True`, remove all but the specified `port_fwd` from the zone.

**services** [None] List of services to add to the zone.

**prune\_services** [False] If `True`, remove all but the specified services from the zone. .. note:: Currently defaults to `True` for compatibility, but will be changed to `False` in a future release.

**interfaces** [None] List of interfaces to add to the zone.

**prune\_interfaces** [False] If `True`, remove all but the specified interfaces from the zone.

**sources** [None] List of sources to add to the zone.

**prune\_sources** [False] If `True`, remove all but the specified sources from the zone.

**rich\_rules** [None] List of rich rules to add to the zone.

**prune\_rich\_rules** [False] If `True`, remove all but the specified rich rules from the zone.

`salt.states.firewalld.service(name, ports=None, protocols=None)`

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

## 21.19.97 salt.states.gem

### Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
 gem.installed:
 - user: rvm
 - ruby: jruby@jgemset
```

`salt.states.gem.installed(name, ruby=None, gem_bin=None, user=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)`

Make sure that a gem is installed.

**name** The name of the gem to install

**ruby:** `None` Only for RVM or rbenv installations: the ruby version and gemset to target.

**gem\_bin:** `None` Custom `gem` command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the `ruby` argument instead.

**user:** `None` The user under which to run the `gem` command

New in version 0.17.0.

**version** [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once

**rdoc** [False] Generate RDoc documentation for the gem(s).

**ri** [False] Generate RI documentation for the gem(s).

**pre\_releases** [False] Install pre-release version of gem(s) if available.

**proxy** [None] Use the specified HTTP proxy server for all outgoing traffic. Format: `http://hostname[{}:port]`

**source** [None] Use the specified HTTP gem source server to download gem. Format: `http://hostname[{}:port]`

`salt.states.gem.removed(name, ruby=None, user=None, gem_bin=None)`

Make sure that a gem is not installed.

**name** The name of the gem to uninstall

**gem\_bin** [None] Full path to `gem` binary to use.

**ruby** [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

**user:** `None` The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_add(name, ruby=None, user=None)`

Make sure that a gem source is added.

**name** The URL of the gem source to be added  
**ruby: None** For RVM or rbenv installations: the ruby version and gemset to target.  
**user: None** The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.sources_remove(name, ruby=None, user=None)`

Make sure that a gem source is removed.

**name** The URL of the gem source to be removed  
**ruby: None** For RVM or rbenv installations: the ruby version and gemset to target.  
**user: None** The user under which to run the `gem` command

New in version 0.17.0.

## 21.19.98 salt.states.git

States to manage git repositories and git configuration

---

**Important:** Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

---

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.cloned(name, target, branch=None, user=None, password=None, identity=None, https_user=None, https_pass=None, output_encoding=None)`

New in version 2018.3.3, 2019.2.0.

Ensure that a repository has been cloned to the specified target directory. If not, clone that repository. No fetches will be performed once cloned.

**name** Address of the remote repository  
**target** Name of the target directory where repository should be cloned  
**branch** Remote branch to check out. If unspecified, the default branch (i.e. the one to the remote HEAD points) will be checked out.

---

**Note:** The local branch name will match the remote branch name. If the branch name is changed, then that branch will be checked out locally, but keep in mind that remote repository will not be fetched. If your use case requires that you keep the clone up to date with the remote repository, then consider using `git.latest`.

---

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

**identity** Path to a private key to use for ssh URLs. Works the same way as in `git.latest`, see that state's documentation for more information.

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

**output\_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

`salt.states.git.config_set(name, value=None, multivar=None, repo=None, user=None, password=None, output_encoding=None, **kwargs)`

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)

**name** Name of the git config value to set

**value** Set a single value for the config item

**multivar** Set multiple values for the config item

---

**Note:** The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

---

New in version 2015.8.0.

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, the commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

**output\_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

**Local Config Example:**

```
Single value
mylocalrepo:
 git.config_set:
 - name: user.email
 - value: foo@bar.net
 - repo: /path/to/repo

Multiple values
mylocalrepo:
 git.config_set:
 - name: mysection.myattribute
 - multivar:
 - foo
 - bar
 - baz
 - repo: /path/to/repo
```

**Global Config Example (User ``foo``):**

```
mylocalrepo:
 git.config_unset:
 - name: user.name
 - value: Foo Bar
 - user: foo
 - global: True
```

`salt.states.git.config_unset(name, value_regex=None, repo=None, user=None, password=None, output_encoding=None, **kwargs)`

New in version 2015.8.0.

Ensure that the named config key is not present

**name** The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

**value\_regex** Regex indicating the values to unset for the matching key(s)

---

**Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

---

**all** [False] If `True`, unset all matches

**repo** Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**global** [False] If `True`, this will set a global git config option

**output\_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

Examples:

```
Value matching 'baz'
mylocalrepo:
 git.config_unset:
 - name: foo.bar
 - value_regex: 'baz'
 - repo: /path/to/repo

Ensure entire multivar is unset
mylocalrepo:
 git.config_unset:
 - name: foo.bar
 - all: True

Ensure all variables in 'foo' section are unset, including multivars
```

(continues on next page)

(continued from previous page)

```

mylocalrepo:
 git.config_unset:
 - name: 'foo\..+'
 - all: True

Ensure that global config value is unset
mylocalrepo:
 git.config_unset:
 - name: foo.bar
 - global: True

```

```

salt.states.git.detached(name, rev, target, remote='origin', user=None, password=None,
 force_clone=False, force_checkout=False, fetch_remote=True,
 hard_reset=False, submodules=False, identity=None, https_user=None,
 https_pass=None, output_encoding=None, **kwargs)

```

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `rev`.

**name** Address of the remote repository.

**rev** The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

**target** Name of the target directory where repository is about to be cloned.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_checkout** [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**fetch\_remote** [True] If `False` a fetch will not be performed and only local refs will be reachable.

**hard\_reset** [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

---

**Note:** Changes resulting from a hard reset will not trigger requisites.

---

**submodules** [False] Update submodules

**identity** A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`) to a private key to use for SSH authentication.

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

**output\_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

```
salt.states.git.latest(name, target, rev='HEAD', branch=None, user=None, password=None, update_head=True, force_checkout=False, force_clone=False, force_fetch=False, force_reset=False, submodules=False, bare=False, mirror=False, remote='origin', fetch_tags=True, sync_tags=True, depth=None, identity=None, https_user=None, https_pass=None, refspec_branch='*', refspec_tag='*', output_encoding=None, **kwargs)
```

Make sure the repository is cloned to the given directory and is up-to-date.

**name** Address of the remote repository, as passed to `git clone`

---

**Note:** From the [Git documentation](#), there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
ssh:// URL
ssh://user@server/project.git

SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh:// URL`, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on [Atlasian Stash/BitBucket Server](#). In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

**rev** [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

**target** Name of the target directory where repository is about to be cloned

**branch** Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

---

**Note:** If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
 git.latest:
 - name: https://mydomain.tld/apps/foo.git
 - target: /var/www/foo
 - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
 git.latest:
 - name: https://mydomain.tld/apps/foo.git
 - target: /var/www/foo
 - user: www
 - rev: dev
 - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
 git.latest:
 - name: https://mydomain.tld/apps/foo.git
 - target: /var/www/foo
 - user: www
 - rev: dev
 - branch: dev
 - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

---

**user** Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

---

**Note:** This is not to be confused with the username for http(s)/SSH authentication.

---

New in version 0.17.0.

**password** Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**update\_head** [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

**force\_checkout** [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

**force\_clone** [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

**force\_fetch** [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

**force\_reset** [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

Changed in version 2019.2.0: This option can now be set to `remote-changes`, which will instruct Salt not to discard local changes if the repo is up-to-date with the remote repository.

**submodules** [False] Update submodules on clone or branch change

**bare** [False] Set to `True` if the repository is to be a bare clone of the remote repository.

**mirror** Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

**remote** [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

**fetch\_tags** [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

**sync\_tags** [True] If `True`, then Salt will delete tags which exist in the local clone but are not found on the remote repository.

New in version 2018.3.4.

**depth** Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use `rev` to specify branch or tag. This is not compatible with revision IDs.

Changed in version 2019.2.0: This option now supports tags as well as branches, on Git 1.8.0 and newer.

**identity** Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```
Single key
git@github.com:user/repo.git:
 git.latest:
 - user: deployer
 - identity: /home/deployer/.ssh/id_rsa

Two keys
git@github.com:user/repo.git:
 git.latest:
 - user: deployer
 - identity:
 - /home/deployer/.ssh/id_rsa
 - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

**https\_user** HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

**https\_pass** HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

**refspec\_branch** [\*] A glob expression defining which branches to retrieve when fetching. See [git-fetch\(1\)](#) for more information on how refsspecs work.

New in version 2017.7.0.

**refspec\_tag** [\*] A glob expression defining which tags to retrieve when fetching. See [git-fetch\(1\)](#) for more information on how refsspecs work.

New in version 2017.7.0.

**output\_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

**Note:** Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
 ssh_known_hosts:
 - present
 - user: root
 - enc: ecdsa
 - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
 git.latest:
 - name: git@gitlab.example.com:user/website.git
 - rev: gh-pages
 - target: /usr/share/nginx/staging
 - identity: /root/.ssh/website_id_rsa
 - require:
 - pkg: git
 - ssh_known_hosts: gitlab.example.com

git-website-staging:
 git.latest:
 - name: git@gitlab.example.com:user/website.git
 - rev: gh-pages
 - target: /usr/share/nginx/staging
 - identity: salt://website/id_rsa
 - require:
 - pkg: git
 - ssh_known_hosts: gitlab.example.com

git-website-prod:
 git.latest:
 - name: git@gitlab.example.com:user/website.git
 - rev: gh-pages-prod
 - target: /usr/share/nginx/prod
 - identity: /root/.ssh/website_id_rsa
 - require:
 - pkg: git
 - ssh_known_hosts: gitlab.example.com
```

---

`salt.states.git.present(name, force=False, bare=True, template=None, separate_git_dir=None, shared=None, user=None, password=None, output_encoding=None)`

Ensure that a repository exists in the given directory

**Warning:** If the minion has Git 2.5 or later installed, `name` points to a `worktree`, and `force` is set to `True`, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

**name** Path to the directory

Changed in version 2015.8.0: This path must now be absolute

**force** [False] If `True`, and if `name` points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

**bare** [True] If `True`, and a repository must be initialized, then the repository will be a bare repository.

---

**Note:** This differs from the default behavior of `git.init`, make sure to set this value to `False` if a bare repo is not desired.

---

**template** If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

**separate\_git\_dir** If a new repository is initialized, this argument will specify an alternate `$GIT_DIR`

New in version 2015.8.0.

**shared** Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.5.0.

**user** User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**output\_encoding** Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

New in version 2018.3.1.

## 21.19.99 salt.states.github module

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
github.present:
- name: 'Example TestUser1'
- email: example@domain.com
- username: 'gitexample'
```

`salt.states.github.absent(name, profile='github', **kwargs)`

Ensure a github user is absent

```
ensure user test is absent in github:
 github.absent:
 - name: 'Example TestUser1'
 - email: example@domain.com
 - username: 'gitexample'
```

The following parameters are required:

**name** Github handle of the user in organization

```
salt.states.github.present(name, profile='github', **kwargs)
```

Ensure a user is present

```
ensure user test is present in github:
 github.present:
 - name: 'gitexample'
```

The following parameters are required:

**name** This is the github handle of the user in the organization

```
salt.states.github.repo_absent(name, profile='github', **kwargs)
```

Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
 github.repo_absent:
 - name: 'test'
```

The following parameters are required:

**name** This is the name of the repository in the organization.

New in version 2016.11.0.

```
salt.states.github.repo_present(name, description=None, homepage=None, private=None,
 has_issues=None, has_wiki=None, has_downloads=None,
 auto_init=False, gitignore_template=None, li-
 cense_template=None, teams=None, profile='github', **kwargs)
```

Ensure a repository is present

**name** This is the name of the repository.

**description** The description of the repository.

**homepage** The URL with more information about the repository.

**private** The visibility of the repository. Note that private repositories require a paid GitHub account.

**has\_issues** Whether to enable issues for this repository.

**has\_wiki** Whether to enable the wiki for this repository.

**has\_downloads** Whether to enable downloads for this repository.

**auto\_init** Whether to create an initial commit with an empty README.

**gitignore\_template** The desired language or platform for a .gitignore, e.g "Haskell".

**license\_template** The desired LICENSE template to apply, e.g "mit" or "mozilla".

**teams** The teams for which this repo should belong to, specified as a dict of team name to permission ('pull', 'push' or 'admin').

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
 github.repo_present:
 - name: 'my-repo'
 - description: 'My very important repository'
```

New in version 2016.11.0.

`salt.states.github.team_absent(name, profile='github', **kwargs)`

Ensure a team is absent.

Example:

```
ensure team test is present in github:
 github.team_absent:
 - name: 'test'
```

The following parameters are required:

**name** This is the name of the team in the organization.

New in version 2016.11.0.

`salt.states.github.team_present(name, description=None, repo_names=None, privacy='secret', permission='pull', members=None, enforce_mfa=False, no_mfa_grace_seconds=0, profile='github', **kwargs)`

Ensure a team is present

**name** This is the name of the team in the organization.

**description** The description of the team.

**repo\_names** The names of repositories to add the team to.

**privacy** The level of privacy for the team, can be 'secret' or 'closed'. Defaults to secret.

**permission** The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'. Defaults to pull.

**members** The members belonging to the team, specified as a dict of member name to optional configuration. Options include 'enforce\_mfa\_from' and 'mfa\_exempt'.

**enforce\_mfa** Whether to enforce MFA requirements on members of the team. If True then all members without *mfa\_exempt: True* configured will be removed from the team. Note that *no\_mfa\_grace\_seconds* may be set to allow members a grace period.

**no\_mfa\_grace\_seconds** The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce\_mfa\_from* on the member configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
 github.team_present:
 - name: 'test'
 - members:
 user1: {}
 user2: {}

Ensure team test_mfa is present in github:
 github.team_present:
 - name: 'test_mfa'
 - members:
 user1:
 enforce_mfa_from: 2016/06/15
 - enforce_mfa: True
```

New in version 2016.11.0.

## 21.19.100 salt.states.glance

### Managing Images in OpenStack Glance

**salt.states.glance.image\_present**(*name*, *visibility*='public', *protected*=None, *checksum*=None, *location*=None, *disk\_format*='raw', *wait\_for*=None, *timeout*=30)

Checks if given image is present with properties set as specified.

An image should go through the stages 'queued', 'saving' before becoming 'active'. The attribute 'checksum' can only be checked once the image is active. If you don't specify 'wait\_for' but 'checksum' the function will wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached 'saving'. The default timeout for both is 30 seconds.

**Supported properties:**

- *visibility* ('public' or 'private')
- *protected* (bool)
- *checksum* (string, md5sum)
- *location* (URL, to copy from)
- *disk\_format* ('raw' (default), 'vhd', 'vhdx', 'vmdk', 'vdi', 'iso', 'qcow2', 'aki', 'ari' or 'ami')

## 21.19.101 salt.states.glance\_image

### Management of OpenStack Glance Images

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.glanceng* for setup instructions

Example States

```
create image:
 glance_image.present:
 - name: cirros
 - filename: cirros.raw
 - image_format: raw

delete image:
 glance_image.absent:
 - name: cirros
```

**salt.states.glance\_image.absent**(*name*, *auth*=None)

Ensure image does not exist

**name** Name of the image

**salt.states.glance\_image.present**(*name*, *auth*=None, *\*\*kwargs*)

Ensure image exists and is up-to-date

**name** Name of the image

**enabled** Boolean to control if image is enabled

**description** An arbitrary description of the image

### 21.19.102 salt.states.glassfish module

Manage Glassfish/Payara server .. versionadded:: Carbon

Management of glassfish using its RESTful API You can setup connection parameters like this

```
- server:
- ssl: true
- url: localhost
- port: 4848
- user: admin
- password: changeit
```

**salt.states.glassfish.connection\_factory\_absent**(*name*, *both=True*, *server=None*)

Ensures the transaction factory is absent.

**name** Name of the connection factory

**both** Delete both the pool and the resource, defaults to true

**salt.states.glassfish.connection\_factory\_present**(*name*, *restype='connection\_factory'*,  
*description="*, *enabled=True*,  
*min\_size=1*, *max\_size=250*, *re-*  
*size\_quantity=2*, *idle\_timeout=300*,  
*wait\_timeout=60*, *recon-*  
*nect\_on\_failure=False*, *trans-*  
*action\_support="*, *connec-*  
*tion\_validation=False*, *server=None*)

Ensures that the Connection Factory is present

**name** Name of the connection factory

**restype** Type of the connection factory, can be either `connection_factory`,  
`queue_connection_factory` or `topic_connection_factory`, defaults to  
`connection_factory`

**description** Description of the connection factory

**enabled** Is the connection factory enabled? defaults to true

**min\_size** Minimum and initial number of connections in the pool, defaults to 1

**max\_size** Maximum number of connections that can be created in the pool, defaults to 250

**resize\_quantity** Number of connections to be removed when `idle_timeout` expires, defaults to 2

**idle\_timeout** Maximum time a connection can remain idle in the pool, in seconds, defaults to 300

**wait\_timeout** Maximum time a caller can wait before timeout, in seconds, defaults to 60

**reconnect\_on\_failure** Close all connections and reconnect on failure (or reconnect only when used), defaults  
to false

**transaction\_support** Level of transaction support, can be either `XATransaction`, `LocalTransaction`  
or `NoTransaction`

**connection\_validation** Connection validation is required, defaults to false

**salt.states.glassfish.destination\_absent**(*name*, *server=None*)

Ensures that the JMS Destination doesn't exist

**name** Name of the JMS Destination

**salt.states.glassfish.destination\_present**(*name*, *physical*, *restype='queue'*, *description="*,  
*enabled=True*, *server=None*)

Ensures that the JMS Destination Resource (queue or topic) is present

**name** The JMS Queue/Topic name

**physical** The Physical destination name

**restype** The JMS Destination resource type, either `queue` or `topic`, defaults is `queue`

**description** A description of the resource

**enabled** Defaults to True

```
salt.states.glassfish.jdbc_datasource_absent(name, both=True, server=None)
```

Ensures the JDBC Datasource doesn't exists

**name** Name of the datasource

**both** Delete both the pool and the resource, defaults to true

```
salt.states.glassfish.jdbc_datasource_present(name, description="", enabled=True,
 restype='datasource', vendor='mysql',
 sql_url="", sql_user="", sql_password="",
 min_size=8, max_size=32,
 resize_quantity=2, idle_timeout=300,
 wait_timeout=60, non_transactional=False,
 transaction_isolation="", isolation_guaranteed=True,
 server=None)
```

Ensures that the JDBC Datasource exists

**name** Name of the datasource

**description** Description of the datasource

**enabled** Is the datasource enabled? defaults to true

**restype** Resource type, can be `datasource`, `xa_datasource`, `connection_pool_datasource` or `driver`, defaults to `datasource`

**vendor** SQL Server type, currently supports `mysql`, `postgresql` and `mssql`, defaults to `mysql`

**sql\_url** URL of the server in jdbc form

**sql\_user** Username for the server

**sql\_password** Password for that username

**min\_size** Minimum and initial number of connections in the pool, defaults to 8

**max\_size** Maximum number of connections that can be created in the pool, defaults to 32

**resize\_quantity** Number of connections to be removed when `idle_timeout` expires, defaults to 2

**idle\_timeout** Maximum time a connection can remain idle in the pool, in seconds, defaults to 300

**wait\_timeout** Maximum time a caller can wait before timeout, in seconds, defaults to 60

**non\_transactional** Return non-transactional connections

**transaction\_isolation** Defaults to the JDBC driver default

**isolation\_guaranteed** All connections use the same isolation level

```
salt.states.glassfish.system_properties_absent(name, server=None)
```

Ensures that the system property doesn't exists

**name** Name of the system property

```
salt.states.glassfish.system_properties_present(server=None, **kwargs)
```

Ensures that the system properties are present

**properties** The system properties

### 21.19.103 salt.states.glusterfs

Manage GlusterFS pool.

```
salt.states.glusterfs.add_volume_bricks(name, bricks)
```

Add brick(s) to an existing volume

**name** Volume name

**bricks** List of bricks to add to the volume

```
myvolume:
 glusterfs.add_volume_bricks:
 - bricks:
 - host1:/srv/gluster/drive1
 - host2:/srv/gluster/drive2
```

(continues on next page)

(continued from previous page)

```
Replicated Volume:
glusterfs.add_volume_bricks:
- name: volume2
- bricks:
- host1:/srv/gluster/drive2
- host2:/srv/gluster/drive3
```

`salt.states.glusterfs.max_op_version(name)`

New in version 2019.2.0.

Add brick(s) to an existing volume

**name** Volume name

```
myvolume:
glusterfs.max_op_version:
- name: volume1
- version: 30707
```

`salt.states.glusterfs.op_version(name, version)`

New in version 2019.2.0.

Add brick(s) to an existing volume

**name** Volume name

**version** Version to which the cluster.op-version should be set

```
myvolume:
glusterfs.op_version:
- name: volume1
- version: 30707
```

`salt.states.glusterfs.peered(name)`

Check if node is peered.

**name** The remote host with which to peer.

```
peer-cluster:
glusterfs.peered:
- name: two

peer-clusters:
glusterfs.peered:
- names:
- one
- two
- three
- four
```

`salt.states.glusterfs.started(name)`

Check if volume has been started

**name** name of the volume

```
mycluster:
glusterfs.started: []
```

`salt.states.glusterfs.volume_present(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False)`

Ensure that the volume exists

**name** name of the volume

**bricks** list of brick paths

**replica** replica count for volume

**arbiter** use every third brick as arbiter (metadata only)

New in version 2019.2.0.

**start** ensure that the volume is also started

```
myvolume:
 glusterfs.volume_present:
 - bricks:
 - host1:/srv/gluster/drive1
 - host2:/srv/gluster/drive2

Replicated Volume:
 glusterfs.volume_present:
 - name: volume2
 - bricks:
 - host1:/srv/gluster/drive2
 - host2:/srv/gluster/drive3
 - replica: 2
 - start: True

Replicated Volume with arbiter brick:
 glusterfs.volume_present:
 - name: volume3
 - bricks:
 - host1:/srv/gluster/drive2
 - host2:/srv/gluster/drive3
 - host3:/srv/gluster/drive4
 - replica: 3
 - arbiter: True
 - start: True
```

## 21.19.104 salt.states.gnomedesktop

### Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
 gnomedesktop.wm_preferences:
 - user: username
 - audible_bell: false
 - action_double_click_titlebar: 'toggle-maximize'
 - visual_bell: true
 - num_workspaces: 6

localdesktop_lockdown:
 gnomedesktop.desktop_lockdown:
 - user: username
 - disable_user_switching: true

localdesktop_interface:
 gnomedesktop.desktop_interface:
 - user: username
```

(continues on next page)

(continued from previous page)

```
- clock_show_date: true
- clock_format: 12h
```

```
salt.states.gnomedesktop.desktop_interface(name, user=None, auto-
 matic_mnemonics=None,
 buttons_have_icons=None,
 can_change_accels=None,
 clock_format=None, clock_show_date=None,
 clock_show_seconds=None, cursor_blink=None, cursor_blink_time=None,
 cursor_blink_timeout=None, cursor_size=None, cursor_theme=None,

bar_font=None, titlebar_uses_system_font=None,
visual_bell=None, visual_bell_type=None,
workspace_names=None, **kwargs)

```

wm\_preferences: sets values in the org.gnome.desktop.wm.preferences schema

### 21.19.105 salt.states.gpg module

#### Management of the GPG keychains

New in version 2016.3.0.

```

salt.states.gpg.absent(name, keys=None, user=None, gnupghome=None, **kwargs)

```

Ensure GPG public key is absent in keychain

**name** The unique name or keyid for the GPG public key.

**keys** The keyId or keyIds to add to the GPG keychain.

**user** Remove GPG keys from the specified user's keychain

**gnupghome** Override GNUPG Home directory

```

salt.states.gpg.present(name, keys=None, user=None, keyserver=None, gnupghome=None,
trust=None, **kwargs)

```

Ensure GPG public key is present in keychain

**name** The unique name or keyid for the GPG public key.

**keys** The keyId or keyIds to add to the GPG keychain.

**user** Add GPG keys to the specified user's keychain

**keyserver** The keyserver to retrieve the keys from.

**gnupghome** Override GNUPG Home directory

**trust** Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not\_trusted, marginally, fully, ultimately

### 21.19.106 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify elasticsearch hosts directly to the module, or you can use an elasticsearch profile via pillars:

```

mygrafanaprofile:

```

```

 hosts:

```

```

 - es1.example.com:9200

```

```

 - es2.example.com:9200

```

```

 index: grafana-dash

```

```
Basic usage (uses default pillar profile key 'grafana')
Ensure myservice dashboard is managed:
grafana.dashboard_present:
 - name: myservice
 - dashboard_from_pillar: default
 - rows_from_pillar:
 - systemhealth
 - requests

Passing hosts in
Ensure myservice dashboard is managed:
grafana.dashboard_present:
 - name: myservice
 - dashboard_from_pillar: default
 - rows:
 - collapse: false
 editable: true
 height: 150px
 title: System Health
 panels:
 - aliasColors: {}
 id: 200000
 annotate:
 enable: false

- profile: mygrafanaprofile

```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

**salt.states.grafana.dashboard\_absent** (*name, hosts=None, profile='grafana'*)

Ensure the named grafana dashboard is deleted.

**name** Name of the grafana dashboard.

**profile** A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

**salt.states.grafana.dashboard\_present** (*name, dashboard=None, dashboard\_from\_pillar=None, rows=None, rows\_from\_pillar=None, profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**dashboard** A dict that defines a dashboard that should be managed.

**dashboard\_from\_pillar** A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

**rows** A list of grafana rows.

**rows\_from\_pillar** A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

**profile** A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

## 21.19.107 salt.states.grafana4\_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

**configuration** This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_user: admin
 grafana_password: admin
 grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_token: token
 grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

```
Ensure minimum dashboard is managed:
grafana4_dashboard.present:
- name: insightful-dashboard
- base_dashboards_from_pillar:
 - default_dashboard
- base_rows_from_pillar:
 - default_row
- base_panels_from_pillar:
 - default_panel
- dashboard:
 rows:
 - title: Usage
 panels:
 - targets:
 - target: alias(constantLine(50), 'max')
 title: Imaginary
 type: graph
```

**salt.states.grafana4\_dashboard.absent**(*name*, *orgname*=None, *profile*='grafana')

Ensure the named grafana dashboard is absent.

**name** Name of the grafana dashboard.

**orgname** Name of the organization in which the dashboard should be present.

**profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

**salt.states.grafana4\_dashboard.present**(*name*, *base\_dashboards\_from\_pillar*=None, *base\_panels\_from\_pillar*=None, *base\_rows\_from\_pillar*=None, *dashboard*=None, *orgname*=None, *profile*='grafana')

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**base\_dashboards\_from\_pillar** A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar** A pillar key that contains a list of panels to inherit from  
**base\_rows\_from\_pillar** A pillar key that contains a list of rows to inherit from  
**dashboard** A dict that defines a dashboard that should be managed.  
**orgname** Name of the organization in which the dashboard should be present.  
**profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 21.19.108 salt.states.grafana4\_datasource module

Manage Grafana v4.0 data sources

New in version 2017.7.0.

**configuration** This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_user: admin
 grafana_password: admin
 grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_token: token
 grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

**Ensure influxdb data source is present:**

```
grafana4_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

**salt.states.grafana4\_datasource.absent**(name, orgname=None, profile='grafana')

Ensure that a data source is present.

**name** Name of the data source to remove.

**orgname** Name of the organization from which the data source should be absent.

**profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

**salt.states.grafana4\_datasource.present**(name, type, url, access=None, user=None, password=None, database=None, basic\_auth=None, basic\_auth\_user=None, basic\_auth\_password=None, tls\_auth=None, json\_data=None, is\_default=None, with\_credentials=None, type\_logo\_url=None, orgname=None, profile='grafana')

Ensure that a data source is present.

**name** Name of the data source.  
**type** Type of the datasource ('graphite', 'influxdb' etc.).  
**access** Use proxy or direct. Default: proxy  
**url** The URL to the data source API.  
**user** Optional - user to authenticate with the data source.  
**password** Optional - password to authenticate with the data source.  
**database** Optional - database to use with the data source.  
**basic\_auth** Optional - set to True to use HTTP basic auth to authenticate with the data source.  
**basic\_auth\_user** Optional - HTTP basic auth username.  
**basic\_auth\_password** Optional - HTTP basic auth password.  
**json\_data** Optional - additional json data to post (eg. "timeInterval").  
**is\_default** Optional - set data source as default.  
**with\_credentials** Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.  
**type\_logo\_url** Optional - Logo to use for this datasource.  
**orgname** Name of the organization in which the data source should be present.  
**profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

### 21.19.109 salt.states.grafana4\_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

**configuration** This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_user: admin
 grafana_password: admin
 grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_token: token
 grafana_timeout: 3
```

**Ensure foobar org is present:**

```
grafana4_org.present:
- name: foobar
- theme: ""
- home_dashboard_id: 0
- timezone: "utc"
- address1: ""
- address2: ""
- city: ""
- zip_code: ""
- state: ""
- country: ""
```

**salt.states.grafana4\_org.absent**(*name*, *profile*='grafana')

Ensure that a org is present.

**name** Name of the org to remove.

**profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

```
salt.states.grafana4_org.present(name, users=None, theme=None, home_dashboard_id=None,
 timezone=None, address1=None, address2=None, city=None,
 zip_code=None, address_state=None, country=None, pro-
 file='grafana')
```

Ensure that an organization is present.

**name** Name of the org.

**users** Optional - Dict of user/role associated with the org. Example:

```
users:
 foo: Viewer
 bar: Editor
```

**theme** Optional - Selected theme for the org.

**home\_dashboard\_id** Optional - Home dashboard for the org.

**timezone** Optional - Timezone for the org (one of: "browser", "utc", or "").

**address1** Optional - address1 of the org.

**address2** Optional - address2 of the org.

**city** Optional - city of the org.

**zip\_code** Optional - zip\_code of the org.

**address\_state** Optional - state of the org.

**country** Optional - country of the org.

**profile** Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

## 21.19.110 salt.states.grafana4\_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

**configuration** This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_user: admin
 grafana_password: admin
 grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
 grafana_url: http://grafana.localhost
 grafana_token: token
 grafana_timeout: 3
```

**Ensure foobar user is present:**

**grafana4\_user.present:**

- **name:** foobar
- **password:** mypass
- **email:** "foobar@localhost"
- **fullname:** Foo Bar
- **is\_admin:** true

```
salt.states.grafana4_user.absent(name, profile='grafana')
 Ensure that a user is present.
 name Name of the user to remove.
 profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.
```

```
salt.states.grafana4_user.present(name, password, email, is_admin=False, fullname=None,
 theme=None, profile='grafana')
 Ensure that a user is present.
 name Name of the user.
 password Password of the user.
 email Email of the user.
 is_admin Optional - Set user as admin user. Default: False
 fullname Optional - Full name of the user.
 theme Optional - Selected theme of the user.
 profile Configuration profile used to connect to the Grafana instance. Default is 'grafana'.
```

### 21.19.111 salt.states.grafana\_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
 grafana_timeout: 3
 grafana_token: qwertyuiop
 grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
grafana_dashboard.present:
- name: insightful-dashboard
- base_dashboards_from_pillar:
 - default_dashboard
- base_rows_from_pillar:
 - default_row
- base_panels_from_pillar:
 - default_panel
- dashboard:
 rows:
 - title: Usage
 panels:
 - targets:
 - target: alias(constantLine(50), 'max')
 title: Imaginary
 type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

```
salt.states.grafana_dashboard.absent(name, profile='grafana')
 Ensure the named grafana dashboard is absent.
 name Name of the grafana dashboard.
 profile A pillar key or dict that contains grafana information
```

```
salt.states.grafana_dashboard.present(name, base_dashboards_from_pillar=None,
 base_panels_from_pillar=None,
 base_rows_from_pillar=None, dashboard=None,
 profile='grafana')
```

Ensure the grafana dashboard exists and is managed.

**name** Name of the grafana dashboard.

**base\_dashboards\_from\_pillar** A pillar key that contains a list of dashboards to inherit from

**base\_panels\_from\_pillar** A pillar key that contains a list of panels to inherit from

**base\_rows\_from\_pillar** A pillar key that contains a list of rows to inherit from

**dashboard** A dict that defines a dashboard that should be managed.

**profile** A pillar key or dict that contains grafana information

### 21.19.112 salt.states.grafana\_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
 grafana_timeout: 3
 grafana_token: qwertyuiop
 grafana_url: 'https://url.com'
```

```
Ensure influxdb data source is present:
```

```
grafana_datasource.present:
- name: influxdb
- type: influxdb
- url: http://localhost:8086
- access: proxy
- basic_auth: true
- basic_auth_user: myuser
- basic_auth_password: mypass
- is_default: true
```

```
salt.states.grafana_datasource.absent(name, profile='grafana')
```

Ensure that a data source is present.

**name** Name of the data source to remove.

```
salt.states.grafana_datasource.present(name, type, url, access='proxy', user="", password="",
 database="", basic_auth=False, basic_auth_user="",
 basic_auth_password="", is_default=False,
 json_data=None, profile='grafana')
```

Ensure that a data source is present.

**name** Name of the data source.

**type** Which type of data source it is ('graphite', 'influxdb' etc.).

**url** The URL to the data source API.

**user** Optional - user to authenticate with the data source

**password** Optional - password to authenticate with the data source

**basic\_auth** Optional - set to True to use HTTP basic auth to authenticate with the data source.

**basic\_auth\_user** Optional - HTTP basic auth username.

**basic\_auth\_password** Optional - HTTP basic auth password.

**is\_default** Default: False

### 21.19.113 salt.states.grains

#### Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the 'grains' file on the minions, By default, this file is located at: /etc/salt/grains

---

**Note:** This does NOT override any grains set in the minion config file.

---

**salt.states.grains.absent**(*name, destructive=False, delimiter=':', force=False*)

New in version 2014.7.0.

Delete a grain from the grains config file

**name** The grain name

**destructive** If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

**force** If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

<b>grain_name:</b> grains.absent
-------------------------------------

**salt.states.grains.append**(*name, value, convert=False, delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (*name*) must exist before the new value can be added.

**name** The grain name

**value** The value to append

**convert** If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

<b>grain_name:</b> <b>grains.append:</b> - <b>value:</b> to_be_appended
-------------------------------------------------------------------------------

**salt.states.grains.exists**(*name, delimiter=':'*)

Ensure that a grain is set

**name** The grain name

**delimiter** A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

**salt.states.grains.list\_absent**(*name, value, delimiter=':'*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

**name** The grain name.

**value** The value to delete from the grain list.

**delimiter** A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be [list type](#)

```
roles:
 grains.list_absent:
 - value: db
```

For multiple grains, the syntax looks like:

```
roles:
 grains.list_absent:
 - value:
 - web
 - dev
```

`salt.states.grains.list_present(name, value, delimiter=':')`

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in `name` is not present on the system, this new grain will be created with the corresponding provided value.

**name** The grain name.

**value** The value is present in the list type grain.

**delimiter** A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be [list type](#)

```
roles:
 grains.list_present:
 - value: web
```

For multiple grains, the syntax looks like:

```
roles:
 grains.list_present:
 - value:
 - web
 - dev
```

`salt.states.grains.make_hashable(list_grain, result=None)`

Ensure that a list grain is hashable.

**list\_grain** The list grain that should be hashable

**result** This function is recursive, so it must be possible to use a sublist as parameter to the function. Should not be used by a caller outside of the function.

Make it possible to compare two list grains to each other if the list contains complex objects.

`salt.states.grains.present(name, value, delimiter=':', force=False)`

Ensure that a grain is set

Changed in version v2015.8.2.

**name** The grain name

**value** The value to set on the grain

**force** If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

**delimiter** A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
 grains.present:
 - value: edam

nested_grain_with_complex_value:
 grains.present:
 - name: icinga:Apache SSL
 - value:
 - command: check_https
 - params: -H localhost -p 443 -S

with,a,custom,delimiter:
 grains.present:
 - value: yay
 - delimiter: ','
```

## 21.19.114 salt.states.group

### Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (i.e. `DOMAIN\username`) the module will assume a local user or group.

```
cheese:
 group.present:
 - gid: 7648
 - system: True
 - addusers:
 - user1
 - users2
 - delusers:
 - foo

cheese:
 group.present:
 - gid: 7648
 - system: True
 - members:
 - foo
 - bar
```

(continues on next page)

(continued from previous page)

```
- user1
- user2
```

`salt.states.group.absent(name)`

Ensure that the named group is absent

Parameters **name** (*str*) -- The name of the group to remove

Example:

```
Removes the local group `db_admin`
db_admin:
 group.absent
```

`salt.states.group.present(name, gid=None, system=False, addusers=None, delusers=None, members=None)`

Ensure that a group is present

Parameters

- **name** (*str*) -- The name of the group to manage
- **gid** (*str*) -- The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** (*bool*) -- Whether or not the named group is a system group. This is essentially the 'r' option of 'groupadd'. Ignored on Windows
- **addusers** (*list*) -- List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- **delusers** (*list*) -- Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- **members** (*list*) -- Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.

Example:

```
Adds DOMAIN\db_admins and Administrators to the local db_admin group
Removes Users
db_admin:
 group.present:
 - addusers:
 - DOMAIN\db_admins
 - Administrators
 - delusers:
 - Users

Ensures only DOMAIN\domain_admins and the local Administrator are
members of the local Administrators group. All other users are
removed
Administrators:
 group.present:
 - members:
 - DOMAIN\domain_admins
 - Administrator
```

## 21.19.115 salt.states.heat module

### Management of Heat

New in version 2017.7.0.

#### depends

- heat Python module

**configuration** See `salt.modules.heat` for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```
heat.deployed:
- name:
- template: #Required
- environment:
- params: {}
- poll: 5
- rollback: False
- timeout: 60

heat.absent:
- name:
- poll: 5
```

mysql:

#### heat.deployed:

- template: salt://templates/mysql.heat.yaml
- params: image: Debian 7
- rollback: True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

**salt.states.heat.absent**(*name*, *poll*=5, *timeout*=60, *profile*=None)

Ensure that the named stack is absent

**name** The name of the stack to remove

**poll** Poll(in sec.) and report events until stack complete

**timeout** Stack creation timeout in minutes

**profile** Profile to use

**salt.states.heat.deployed**(*name*, *template*=None, *environment*=None, *params*=None, *poll*=5, *rollback*=False, *timeout*=60, *update*=False, *profile*=None, *\*\*connection\_args*)

Deploy stack with the specified properties

**name** The name of the stack

**template** File of template

**environment** File of environment

**params** Parameter dict used to create the stack

**poll** Poll (in sec.) and report events until stack complete

**rollback** Enable rollback on create failure

**timeout** Stack creation timeout in minutes

**profile** Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

### 21.19.116 salt.states.helm module

**salt.states.helm.release\_absent**(*name, namespace=None, flags=None, kvflags=None*)

Make sure the release name is absent.

**name** (string) The release name to uninstall.

**namespace** (string) The namespace scope for this request.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_release_is_absent:
 helm.release_absent:
 - name: release_name

In dry-run mode.
helm_release_is_absent_dry-run:
 helm.release_absent:
 - name: release_name
 - flags:
 - dry-run
```

**salt.states.helm.release\_present**(*name, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None*)

Make sure the release name is present.

**name** (string) The release name to install.

**chart** (string) The chart to install.

**values** (string) Absolute path to the values.yaml file.

**version** (string) The exact chart version to install. If this is not specified, the latest version is installed.

**namespace** (string) The namespace scope for this request.

**set** (string or list) Set a values on the command line.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_release_is_present:
 helm.release_present:
 - name: release_name
 - chart: repo/chart

In dry-run mode.
helm_release_is_present_dry-run:
 helm.release_present:
 - name: release_name
 - chart: repo/chart
 - flags:
 - dry-run

With values.yaml file.
helm_release_is_present_values:
 helm.release_present:
 - name: release_name
 - chart: repo/chart
 - kvflags:
 values: /path/to/values.yaml
```

**salt.states.helm.repo\_managed**(*name, present=None, absent=None, prune=False, repo\_update=False, namespace=None, flags=None, kvflags=None*)

Make sure the repository is updated.

**name** (string) Not used.

**present** (list) List of repository to be present. It's a list of dict: [{'name': 'local\_name', 'url': 'repository\_url'}]

**absent** (list) List of local name repository to be absent.

**prune** (boolean - default: False) If True, all repository already present but not in the present list would be removed.

**repo\_update** (boolean - default: False) If True, the Helm repository is updated after a repository add or remove.

**namespace** (string) The namespace scope for this request.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_repository_is_managed:
 helm.repo_managed:
 - present:
 - name: local_name_1
 url: repository_url
 - absent:
 - local_name_2
```

**salt.states.helm.repo\_updated**(*name, namespace=None, flags=None, kvflags=None*)

Make sure the repository is updated. To execute after a repository changes.

**name** (string) Not used.

**namespace** (string) The namespace scope for this request.

**flags** (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags** (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

Example:

```
helm_repository_is_updated:
 helm.repo_updated
```

## 21.19.117 salt.states.hg

### Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known\_hosts, and the remote host has this host's public key.

```
https://bitbucket.org/example_user/example_repo:
 hg.latest:
 - rev: tip
 - target: /tmp/example_repo
```

**salt.states.hg.latest**(*name, rev=None, target=None, clean=False, user=None, identity=None, force=False, opts=False, update\_head=True*)

Make sure the repository is cloned to the given directory and is up to date

**name** Address of the remote repository as passed to "hg clone"

**rev** The remote branch, tag, or revision hash to clone/pull

**target** Target destination directory path on minion to clone into

**clean** Force a clean update with -C (Default: False)

**user** Name of the user performing repository management operations

New in version 0.17.0.

**identity** Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

**force** Force hg to clone into pre-existing directories (deletes contents)

**opts** Include additional arguments and options to the hg command line

**update\_head** Should we update the head if new changes are found? Defaults to True

New in version 2017.7.0.

### 21.19.118 salt.states.highstate\_doc module

To be used with processors in module *highstate\_doc*.

`salt.states.highstate_doc.note(name, source=None, contents=None, **kwargs)`

Add content to a document generated using *highstate\_doc.render*.

This state does not preform any tasks on the host. It only is used in *highstate\_doc* lowstate processors to include extra documents.

```
{{sls}} example note:
 highstate_doc.note:
 - name: example note
 - require_in:
 - pkg: somepackage
 - contents: |
 example `highstate_doc.note`

 This state does not do anything to the system! It is only used by a
 ↪`processor`
 you can use `requisites` and `order` to move your docs around the
 ↪rendered file.
 .. this message appare above the `pkg: somepackage` state.
 - source: salt://{{tpldir}}/also_include_a_file.md

{{sls}} extra help:
 highstate_doc.note:
 - name: example
 - order: 0
 - source: salt://{{tpldir}}/HELP.md
```

### 21.19.119 salt.states.host

#### Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```
salt-master:
 host.present:
 - ip: 192.168.0.42
```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
 host.present:
 - ip: 192.168.0.42
 - names:
```

(continues on next page)

(continued from previous page)

```
- server1
- florida
```

**Note:** Changing the names in `host.present` does not cause an update to remove the old entry.

```
server1:
 host.present:
 - ip:
 - 192.168.0.42
 - 192.168.0.43
 - 192.168.0.44
 - names:
 - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
 host.only:
 - hostnames:
 - foo.example.com
 - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
 host.only:
 - hostnames: []
```

You can also include comments:

```
server1:
 host.present:
 - ip: 192.168.0.42
 - names:
 - server1
 - florida
 - comment: A very important comment
```

`salt.states.host.absent(name, ip)`

Ensure that the named host is absent

**name** The host to remove

**ip** The ip addr(s) of the host to remove

`salt.states.host.only(name, hostnames)`

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

**name** The IP address to associate with the given hostnames.

**hostnames** Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

`salt.states.host.present(name, ip, comment="", clean=False)`

Ensures that the named host is present with the given ip

**name** The host to assign an ip to

**ip** The ip addr(s) to apply to the host. Can be a single IP or a list of IP addresses.

**comment** A comment to include for the host entry

New in version 3001.

**clean** Remove any entries which don't match those configured in the `ip` option. Default is `False`.

New in version 2018.3.4.

### 21.19.120 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.query(name, match=None, match_type='string', status=None, status_type='string', wait_for=None, **kwargs)`

Perform an HTTP query and statefully return the result

Passes through all the parameters described in the [utils.http.query function](#):

**name** The name of the query.

**match** Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of `match` in the return text.

**match\_type** Specifies the type of pattern matching to use on `match`. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.

---

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

**status** The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting. This can be passed as an individual status code or a list of status codes.

**status\_type** Specifies the type of pattern matching to use for `status`. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required. Additionally, if a list of strings representing statuses is given, the type `list` can be used.

New in version 3000.

---

**Note:** Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the [HTTP Tutorial](#).

```
query_example:
 http.query:
 - name: 'http://example.com/'
 - status: 200

query_example2:
 http.query:
 - name: 'http://example.com/'
 - status:
```

(continues on next page)

(continued from previous page)

```

- 200
- 201
- status_type: list

```

`salt.states.http.wait_for_successful_query(name, wait_for=300, **kwargs)`

Like query but, repeat and wait until match/match\_type or status is fulfilled. State returns result from last query state in case of success or if no successful query was made within wait\_for timeout.

**name** The name of the query.

**wait\_for** Total time to wait for requests that succeed.

**request\_interval** Optional interval to delay requests by N seconds to reduce the number of requests sent.

---

**Note:** All other arguments are passed to the http.query state.

---

### 21.19.121 salt.states.icinga2 module

#### Icinga2 state

New in version 2017.7.0.

**depends**

- Icinga2 Python module

**configuration** See `salt.modules.icinga2` for setup instructions.

The icinga2 module is used to execute commands. Its output may be stored in a file or in a grain.

```

command_id:
 icinga2.generate_ticket:
 - name: domain.tld
 - output: "/tmp/query_id.txt"

```

`salt.states.icinga2.generate_cert(name)`

Generate an icinga2 certificate and key on the client.

**name** The domain name for which this certificate and key will be generated

`salt.states.icinga2.generate_ticket(name, output=None, grain=None, key=None, overwrite=True)`

Generate an icinga2 ticket on the master.

**name** The domain name for which this ticket will be generated

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:** grain to store the output (need output=grain)

**key:** the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:** The file or grain will be overwritten if it already exists (default)

`salt.states.icinga2.node_setup(name, master, ticket)`

Setup the icinga2 node.

**name** The domain name for which this certificate will be saved

**master** Icinga2 master node for which this certificate will be saved

**ticket** Authentication ticket generated on icinga2 master

`salt.states.icinga2.request_cert(name, master, ticket, port='5665')`

Request CA certificate from master icinga2 node.

**name** The domain name for which this certificate will be saved

**master** Icinga2 master node for which this certificate will be saved  
**ticket** Authentication ticket generated on icinga2 master  
**port** Icinga2 port, defaults to 5665

`salt.states.icinga2.save_cert(name, master)`

Save the certificate on master icinga2 node.

**name** The domain name for which this certificate will be saved

**master** Icinga2 master node for which this certificate will be saved

### 21.19.122 salt.states.ifttt

#### Trigger an event in IFTTT

This state is useful for triggering events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
 ifttt.trigger_event:
 - event: TestEvent
 - value1: 'This state was executed successfully.'
 - value2: 'Another value we can send.'
 - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6
```

`salt.states.ifttt.trigger_event(name, event, value1=None, value2=None, value3=None)`

Trigger an event in IFTTT

```
ifttt-event:
 ifttt.trigger_event:
 - event: TestEvent
 - value1: 'A value that we want to send.'
 - value2: 'A second value that we want to send.'
 - value3: 'A third value that we want to send.'
```

The following parameters are required:

**name** The unique name for this event.

**event** The name of the event to trigger in IFTTT.

The following parameters are optional:

**value1** One of the values that we can send to IFTT.

**value2** One of the values that we can send to IFTT.

**value3** One of the values that we can send to IFTT.

### 21.19.123 salt.states.incron

#### Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
 incron.present:
 - user: root
 - path: /home/user
 - mask:
 - IN_MODIFY
 - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
 incron.present:
 - user: root
 - path: /home/user
 - mask:
 - IN_MODIFY
 - IN_ACCESS
 - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

**salt.states.incron.absent**(*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

**name** Unique comment describing the entry

**path** The path that should be watched

**user** The name of the user who's crontab needs to be modified, defaults to the root user

**mask** The mask of events that should be monitored for

**cmd** The cmd that should be executed

**salt.states.incron.present**(*name, path, mask, cmd, user='root'*)

Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.

**name** Unique comment describing the entry

**path** The path that should be watched

**user** The name of the user who's crontab needs to be modified, defaults to the root user

**mask** The mask of events that should be monitored for

**cmd** The cmd that should be executed

## 21.19.124 salt.states.influxdb08\_database module

### Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

**salt.states.influxdb08\_database.absent**(*name*, *user=None*, *password=None*, *host=None*,  
*port=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**user** The user to connect as (must be able to remove the database)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

**salt.states.influxdb08\_database.present**(*name*, *user=None*, *password=None*, *host=None*,  
*port=None*)

Ensure that the named database is present

**name** The name of the database to create

**user** The user to connect as (must be able to remove the database)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

## 21.19.125 salt.states.influxdb08\_user module

### Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

**salt.states.influxdb08\_user.absent**(*name*, *database=None*, *user=None*, *password=None*,  
*host=None*, *port=None*)

Ensure that the named cluster admin or database user is absent.

**name** The name of the user to remove

**database** The database to remove the user from

**user** The user to connect as (must be able to remove the user)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

**salt.states.influxdb08\_user.present**(*name*, *passwd*, *database=None*, *user=None*, *password=None*,  
*host=None*, *port=None*)

Ensure that the cluster admin or database user is present.

**name** The name of the user to manage

**passwd** The password of the user

**database** The database to create the user in

**user** The user to connect as (must be able to create the user)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

### 21.19.126 salt.states.influxdb\_continuous\_query module

#### Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_continuous_query.absent(name, database, **client_args)`

Ensure that given continuous query is absent.

**name** Name of the continuous query to remove.

**database** Name of the database that the continuous query was defined on.

`salt.states.influxdb_continuous_query.present(name, database, query, resample_time=None, coverage_period=None, **client_args)`

Ensure that given continuous query is present.

**name** Name of the continuous query to create.

**database** Database to create continuous query on.

**query** The query content

**resample\_time** [None] Duration between continuous query resampling.

**coverage\_period** [None] Duration specifying time period per sample.

### 21.19.127 salt.states.influxdb\_database

#### Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_database.absent(name, **client_args)`

Ensure that given database is absent.

**name** Name of the database to remove.

`salt.states.influxdb_database.present(name, **client_args)`

Ensure that given database is present.

**name** Name of the database to create.

### 21.19.128 salt.states.influxdb\_retention\_policy module

#### Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_retention_policy.absent(name, database, **client_args)`

Ensure that given retention policy is absent.

**name** Name of the retention policy to remove.

**database** Name of the database that the retention policy was defined on.

`salt.states.influxdb_retention_policy.convert_duration(duration)`

Convert the a duration string into XXhYYmZZs format

**duration** Duration to convert

**Returns:** **duration\_string** String representation of duration in XXhYYmZZs format

`salt.states.influxdb_retention_policy.present`(*name*, *database*, *duration*='7d', *replication*=1, *default*=False, *\*\*client\_args*)

Ensure that given retention policy is present.

**name** Name of the retention policy to create.

**database** Database to create retention policy on.

### 21.19.129 salt.states.influxdb\_user

#### Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

`salt.states.influxdb_user.absent`(*name*, *\*\*client\_args*)

Ensure that given user is absent.

**name** The name of the user to manage

`salt.states.influxdb_user.present`(*name*, *passwd*, *admin*=False, *grants*=None, *\*\*client\_args*)

Ensure that given user is present.

**name** Name of the user to manage

**passwd** Password of the user

**admin** [False] Whether the user should have cluster administration privileges or not.

**grants** Optional - Dict of database:privilege items associated with the user. Example:

`grants: foo_db: read bar_db: all`

Example:

```
example user present in influxdb:
influxdb_user.present:
- name: example
- passwd: somepassword
- admin: False
- grants:
 foo_db: read
 bar_db: all
```

### 21.19.130 salt.states.infoblox\_a

Infoblox A record management.

functions accept `api_opts`:

`api_verifyssl`: verify SSL [default to True or pillar value] `api_url`: server to connect to [default to pillar value] `api_username`: [default to pillar value] `api_password`: [default to pillar value]

`salt.states.infoblox_a.absent`(*name*=None, *ipv4addr*=None, *\*\*api\_opts*)

Ensure infoblox A record is removed.

State example:

```
infoblox_a.absent:
- name: example-ha-0.domain.com

infoblox_a.absent:
- name:
- ipv4addr: 127.0.23.23
```

```
salt.states.infoblox_a.present(name=None, ipv4addr=None, data=None, ensure_data=True,
 **api_opts)
```

Ensure infoblox A record.

When you wish to update a hostname ensure *name* is set to the hostname of the current record. You can give a new name in the *data.name*.

State example:

```
infoblox_a.present:
- name: example-ha-0.domain.com
- data:
 name: example-ha-0.domain.com
 ipv4addr: 123.0.31.2
 view: Internal
```

### 21.19.131 salt.states.infoblox\_cname

Infoblox CNAME management.

functions accept api\_opts:

api\_verifyssl: verify SSL [default to True or pillar value] api\_url: server to connect to [default to pillar value] api\_username: [default to pillar value] api\_password: [default to pillar value]

```
salt.states.infoblox_cname.absent(name=None, canonical=None, **api_opts)
```

Ensure the CNAME with the given name or canonical name is removed

```
salt.states.infoblox_cname.present(name=None, data=None, ensure_data=True, **api_opts)
```

Ensure the CNAME with the given data is present.

**name** CNAME of record

**data** raw CNAME api data see: <https://INFOBLOX/wapidoc>

State example:

```
infoblox_cname.present:
- name: example-ha-0.domain.com
- data:
 name: example-ha-0.domain.com
 canonical: example.domain.com
 zone: example.com
 view: Internal
 comment: Example comment

infoblox_cname.present:
- name: example-ha-0.domain.com
- data:
 name: example-ha-0.domain.com
 canonical: example.domain.com
 zone: example.com
 view: Internal
 comment: Example comment
- api_url: https://INFOBLOX/wapi/v1.2.1
- api_username: username
- api_password: passwd
```

### 21.19.132 salt.states.infoblox\_host\_record

Infoblox host record management.

functions accept api\_opts:

api\_verifyssl: verify SSL [default to True or pillar value] api\_url: server to connect to [default to pillar value] api\_username: [default to pillar value] api\_password: [default to pillar value]

`salt.states.infoblox_host_record.absent` (*name=None, ipv4addr=None, mac=None, \*\*api\_opts*)

Ensure the host with the given Name ipv4addr or mac is removed.

State example:

```
infoblox_host_record.absent:
- name: hostname.of.record.to.remove

infoblox_host_record.absent:
- name:
- ipv4addr: 192.168.0.1

infoblox_host_record.absent:
- name:
- mac: 12:02:12:31:23:43
```

`salt.states.infoblox_host_record.present` (*name=None, data=None, ensure\_data=True, \*\*api\_opts*)

This will ensure that a host with the provided name exists. This will try to ensure that the state of the host matches the given data If the host is not found then one will be created.

When trying to update a hostname ensure *name* is set to the hostname of the current record. You can give a new name in the *data.name*.

Avoid race conditions, use `func:nextavailableip`:

- `func:nextavailableip:network/ZG54dfgsrDFEFfsLzA:10.0.0.0/8/default`
- `func:nextavailableip:10.0.0.0/8`
- `func:nextavailableip:10.0.0.0/8,externalconfigure_for_dns`
- `func:nextavailableip:10.0.0.3-10.0.0.10`

State Example:

```
this would update `original_hostname.example.ca` to changed `data`.
infoblox_host_record.present:
- name: original_hostname.example.ca
- data: {'namhostname.example.cae': 'hostname.example.ca',
 'aliases': ['hostname.math.example.ca'],
 'extattrs': [{'Business Contact': {'value': 'EXAMPLE@example.ca'}}],
 'ipv4addrs': [{'configure_for_dhcp': True,
 'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
 'mac': '00:50:56:84:6e:ae'}],
 'ipv6addrs': [], }
```

### 21.19.133 salt.states.infoblox\_range

Infoblox host record management.

functions accept api\_opts:

api\_verifyssl: verify SSL [default to True or pillar value] api\_url: server to connect to [default to pillar value] api\_username: [default to pillar value] api\_password: [default to pillar value]

**salt.states.infoblox\_range.absent**(*name=None, start\_addr=None, end\_addr=None, data=None, \*\*api\_opts*)

Ensure the range is removed

Supplying the end of the range is optional.

State example:

```
infoblox_range.absent:
- name: 'vlan10'

infoblox_range.absent:
- name:
- start_addr: 127.0.1.20
```

**salt.states.infoblox\_range.present**(*name=None, start\_addr=None, end\_addr=None, data=None, \*\*api\_opts*)

Ensure range record is present.

**infoblox\_range.present:** start\_addr: '129.97.150.160', end\_addr: '129.97.150.170',

Verbose state example:

```
infoblox_range.present:
 data: {
 'always_update_dns': False,
 'authority': False,
 'comment': 'range of IP addresses used for salt.. was used for ghost
→images deployment',
 'ddns_generate_hostname': True,
 'deny_all_clients': False,
 'deny_bootp': False,
 'disable': False,
 'email_list': [],
 'enable_ddns': False,
 'enable_dhcp_thresholds': False,
 'enable_email_warnings': False,
 'enable_ifmap_publishing': False,
 'enable_snmp_warnings': False,
 'end_addr': '129.97.150.169',
 'exclude': [],
 'extattrs': {},
 'fingerprint_filter_rules': [],
 'high_water_mark': 95,
 'high_water_mark_reset': 85,
 'ignore_dhcp_option_list_request': False,
 'lease_scavenge_time': -1,
 'logic_filter_rules': [],
 'low_water_mark': 0,
 'low_water_mark_reset': 10,
 'mac_filter_rules': [],
 'member': {'_struct': 'dhcpmember',
```

(continues on next page)

(continued from previous page)

```

 'ipv4addr': '129.97.128.9',
 'name': 'cn-dhcp-mc.example.ca'},
 'ms_options': [],
 'nac_filter_rules': [],
 'name': 'ghost-range',
 'network': '129.97.150.0/24',
 'network_view': 'default',
 'option_filter_rules': [],
 'options': [{ 'name': 'dhcp-lease-time',
 'num': 51,
 'use_option': False,
 'value': '43200',
 'vendor_class': 'DHCP' }],
 'recycle_leases': True,
 'relay_agent_filter_rules': [],
 'server_association_type': 'MEMBER',
 'start_addr': '129.97.150.160',
 'update_dns_on_lease_renewal': False,
 'use_authority': False,
 'use_bootfile': False,
 'use_bootserver': False,
 'use_ddns_domainname': False,
 'use_ddns_generate_hostname': True,
 'use_deny_bootp': False,
 'use_email_list': False,
 'use_enable_ddns': False,
 'use_enable_dhcp_thresholds': False,
 'use_enable_ifmap_publishing': False,
 'use_ignore_dhcp_option_list_request': False,
 'use_known_clients': False,
 'use_lease_scavenge_time': False,
 'use_nextserver': False,
 'use_options': False,
 'use_recycle_leases': False,
 'use_unknown_clients': False,
 'use_update_dns_on_lease_renewal': False
}

```

### 21.19.134 salt.states.ini\_manage

#### Manage ini files

**maintainer** <akilesh1597@gmail.com>

**maturity** new

**depends** re

**platform** all

**salt.states.ini\_manage.options\_absent**(*name*, *sections=None*, *separator='='*)

```

/home/saltminion/api-paste.ini:
ini.options_absent:
- separator: '='

```

(continues on next page)

(continued from previous page)

```
- sections:
 test:
 - testkey
 - secondoption
 test1:
 - testkey1
```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

`salt.states.ini_manage.options_present(name, sections=None, separator='=', strict=False)`

```
/home/saltminion/api-paste.ini:
ini.options_present:
- separator: '='
- strict: True
- sections:
 test:
 testkey: 'testval'
 secondoption: 'secondvalue'
 test1:
 testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless *strict: True* flag is used

changes dict will contain the list of changes made

`salt.states.ini_manage.sections_absent(name, sections=None, separator='=')`

```
/home/saltminion/api-paste.ini:
ini.sections_absent:
- separator: '='
- sections:
 - test
 - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

`salt.states.ini_manage.sections_present(name, sections=None, separator='=')`

```
/home/saltminion/api-paste.ini:
ini.sections_present:
- separator: '='
- sections:
 - section_one
 - section_two
```

This will only create empty sections. To also create options, use `options_present` state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

## 21.19.135 salt.states.ipmi

### Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```
ipmi.config:
 api_host: 127.0.0.1
 api_user: admin
 api_pass: apassword
 api_port: 623
 api_kg: None
```

Every call can override the config defaults:

```
ensure myipmi system is set to network boot:
 ipmi.boot_device:
 - name: network
 - api_host: myipmi.hostname.com
 - api_user: root
 - api_pass: apassword
 - api_kg: None

ensure myipmi system is powered on:
 ipmi.power:
 - name: boot
 - api_host: myipmi.hostname.com
 - api_user: root
 - api_pass: apassword
```

`salt.states.ipmi.boot_device(name='default', **kwargs)`

Request power state change

**name = default**

- network -- Request network boot
- hd -- Boot from hard drive
- safe -- Boot from hard drive, requesting 'safe mode'
- optical -- boot from CD/DVD/BD drive
- setup -- Boot into setup utility
- default -- remove any IPMI directed boot device request

**kwargs**

- api\_host=localhost
- api\_user=admin
- api\_pass=
- api\_port=623
- api\_kg=None

`salt.states.ipmi.power(name='power_on', wait=300, **kwargs)`

Request power state change

**name**

**Ensure power state one of:**

- power\_on -- system turn on
- power\_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then 'on', else 'reset'

**wait** wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

**kwargs**

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

`salt.states.ipmi.user_absent(name, channel=14, **kwargs)`

Remove user Delete all user (uid) records having the matching name.

**name** string name of user to delete

**channel** channel to remove user access from defaults to 14 for auto.

**kwargs**

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

`salt.states.ipmi.user_present(name, uid, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)`

Ensure IPMI user and user privileges.

**name** name of user (limit 16 bytes)

**uid** user id number (1 to 7)

**password** user password (limit 16 bytes)

**channel** ipmi channel defaults to 14 for auto

**callback** User Restricted to Callback

**False** = User Privilege Limit is determined by the User Privilege Limit parameter `privilege_level`, for both callback and non-callback connections.

**True** = User Privilege Limit is determined by the `privilege_level` parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

**link\_auth** User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

**ipmi\_msg** User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) `ipmi_msg`

**privilege\_level**

- `callback`
- `user`
- `operator`
- `administrator`
- `proprietary`
- `no_access`

**kwargs**

- `api_host=localhost`
- `api_user=admin`
- `api_pass=`
- `api_port=623`
- `api_kg=None`

## 21.19.136 salt.states.ipset

### Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```
setname:
 ipset.set_present:
 - set_type: bitmap:ip
 - range: 192.168.0.0/16
 - comment: True

setname:
 ipset.set_absent:
 - set_type: bitmap:ip
 - range: 192.168.0.0/16
 - comment: True

setname_entries:
 ipset.present:
 - set_name: setname
 - entry: 192.168.0.3
 - comment: Hello
 - require:
 - ipset: baz

setname_entries:
 ipset.present:
 - set_name: setname
 - entry:
 - 192.168.0.3
 - 192.168.1.3
 - comment: Hello
 - require:
 - ipset: baz

setname_entries:
 ipset.absent:
 - set_name: setname
 - entry:
 - 192.168.0.3
 - 192.168.1.3
 - comment: Hello
 - require:
 - ipset: baz

setname:
 ipset.flush:
```

`salt.states.ipset.absent`(*name*, *entry*=None, *entries*=None, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

**name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**family** Network family, ipv4 or ipv6.

`salt.states.ipset.flush`(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 2014.7.0.

Flush current ipset set

**family** Networking family, either ipv4 or ipv6

`salt.states.ipset.present(name, entry=None, family='ipv4', **kwargs)`

New in version 2014.7.0.

Append a entry to a set

**name** A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

**entry** A single entry to add to a set or a list of entries to add to a set

**family** Network family, ipv4 or ipv6.

`salt.states.ipset.set_absent(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Verify the set is absent.

**family** Networking family, either ipv4 or ipv6

`salt.states.ipset.set_present(name, set_type, family='ipv4', **kwargs)`

New in version 2014.7.0.

Verify the set exists.

**name** A user-defined set name.

**set\_type** The type for the set.

**family** Networking family, either ipv4 or ipv6

## 21.19.137 salt.states.iptables

### Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

**httpd:**

**iptables.append:**

- **table:** filter
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:**

**iptables.append:**

- **table:** filter
- **chain:** INPUT
- **jump:** ACCEPT
- **match:**
  - state
  - comment
- **comment:** "Allow HTTP"
- **connstate:** NEW
- **dport:** 80

(continues on next page)

(continued from previous page)

```
- protocol: tcp
- sport: 1025:65535
- save: True

httpd:
 iptables.append:
 - table: filter
 - chain: INPUT
 - jump: ACCEPT
 - match:
 - state
 - comment
 - comment: "Allow HTTP"
 - connstate: NEW
 - source: '127.0.0.1'
 - dport: 80
 - protocol: tcp
 - sport: 1025:65535
 - save: True

.. Invert Rule
httpd:
 iptables.append:
 - table: filter
 - chain: INPUT
 - jump: ACCEPT
 - match:
 - state
 - comment
 - comment: "Allow HTTP"
 - connstate: NEW
 - source: '! 127.0.0.1'
 - dport: 80
 - protocol: tcp
 - sport: 1025:65535
 - save: True

httpd:
 iptables.append:
 - table: filter
 - chain: INPUT
 - jump: ACCEPT
 - match:
 - state
 - comment
 - comment: "Allow HTTP"
 - connstate: NEW
 - source: 'not 127.0.0.1'
 - dport: 80
 - protocol: tcp
 - sport: 1025:65535
 - save: True

httpd:

 - table: filter
```

(continues on next page)

(continued from previous page)

- **family:** ipv6
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.append:**

- **table:** filter
- **family:** ipv4
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dports:**
  - 80
  - 443
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.insert:**

- **position:** 1
- **table:** filter
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.insert:**

- **position:** 1
- **table:** filter
- **family:** ipv6
- **chain:** INPUT
- **jump:** ACCEPT
- **match:** state
- **connstate:** NEW
- **dport:** 80
- **protocol:** tcp
- **sport:** 1025:65535
- **save:** True

**httpd:****iptables.delete:**

- **table:** filter
- **chain:** INPUT

(continues on next page)

(continued from previous page)

```
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True
```

**httpd:**

```
iptables.delete:
- position: 1
- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True
```

**httpd:**

```
iptables.delete:
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- protocol: tcp
- sport: 1025:65535
- save: True
```

**default to accept:**

```
iptables.set_policy:
- chain: INPUT
- policy: ACCEPT
```

---

**Note:** Whereas iptables will accept `-p, --proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the `iptables-extensions(8)` man page).

---

Example rules for IPSec policy:

```
accept_esp_in:
iptables.append:
- table: filter
- chain: INPUT
- jump: ACCEPT
- source: 10.20.0.0/24
- destination: 10.10.0.0/24
- in-interface: eth0
- match: policy
```

(continues on next page)

(continued from previous page)

```

- dir: in
- pol: ipsec
- reqid: 1
- proto: esp
accept_esp_forward_in:
 iptables.append:
 - use:
 - iptables: accept_esp_in
 - chain: FORWARD

accept_esp_out:
 iptables.append:
 - table: filter
 - chain: OUTPUT
 - jump: ACCEPT
 - source: 10.10.0.0/24
 - destination: 10.20.0.0/24
 - out-interface: eth0
 - match: policy
 - dir: out
 - pol: ipsec
 - reqid: 1
 - proto: esp
accept_esp_forward_out:
 iptables.append:
 - use:
 - iptables: accept_esp_out
 - chain: FORWARD

```

**Note:** Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of `iptables-save`. This may have unintended consequences on legacy releases of `iptables`.

`salt.states.iptables.append(name, table='filter', family='ipv4', **kwargs)`

New in version 0.17.0.

Add a rule to the end of the specified chain.

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain which should be modified

**family** Network family, `ipv4` or `ipv6`.

All other arguments are passed in with the same name as the long option that would normally be used for `iptables`, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.chain_absent(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is absent.

**table** The table to remove the chain from

**family** Networking family, either `ipv4` or `ipv6`

`salt.states.iptables.chain_present(name, table='filter', family='ipv4')`

New in version 2014.1.0.

Verify the chain is exist.

**name** A user-defined chain name.

**table** The table to own the chain.

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.delete(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.flush(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Flush current iptables state

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

`salt.states.iptables.insert(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**position** The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.mod_aggregate(low, chunks, running)`

The `mod_aggregate` function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

`salt.states.iptables.set_policy(name, table='filter', family='ipv4', **kwargs)`

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

**table** The table that owns the chain that should be modified

**family** Networking family, either ipv4 or ipv6

**policy** The requested table policy

### 21.19.138 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the jboss-cli.sh script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a jboss\_config dictionary with the following properties must be passed:

```
jboss:
 cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
 controller: 10.11.12.13:9999
 cli_user: 'jbossadm'
 cli_password: 'jbossadm'
```

If the controller doesn't require a password, then the cli\_user and cli\_password parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```
application_deployed:
 jboss7.deployed:
 - salt_source:
 target_file: '/tmp/webapp.war'
 - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that jboss\_config is contained in the pillar.

**salt.states.jboss7.bindings\_exist**(name, jboss\_config, bindings, profile=None)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.

**jboss\_config**: Dict with connection properties (see state description)

**bindings**: Dict with bindings to set.

**profile**: The profile name (domain mode only)

Example:

```
jndi_entries_created:
 jboss7.bindings_exist:
 - bindings:
 'java:global/sampleapp/environment': 'DEV'
 'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
 ↪properties'
 - jboss_config: {{ pillar['jboss'] }}
```

**salt.states.jboss7.datasource\_exists**(name, jboss\_config, datasource\_properties, recreate=False, profile=None)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.

**name** Datasource property name

**jboss\_config** Dict with connection properties (see state description)

**datasource\_properties** Dict with datasource properties

**recreate** [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not be possible to remove it.

**profile** [None] The profile name for this datasource (domain mode only)

Example:

```
sampleDS:
 jboss7.datasource_exists:
 - recreate: False
 - datasource_properties:
 driver-name: mysql
 connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
 jndi-name: 'java:jboss/datasources/sampleDS'
 user-name: sampleuser
 password: secret
 min-pool-size: 3
 use-java-context: True
 - jboss_config: {{ pillar['jboss'] }}
 - profile: full-ha
```

`salt.states.jboss7.deployed(name, jboss_config, salt_source=None)`

Ensures that the given application is deployed on server.

**jboss\_config:** Dict with connection properties (see state description)

**salt\_source:**

How to find the artifact to be deployed.

**target\_file:** Where to look in the minion's file system for the artifact to be deployed (e.g. '/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.

**source:** (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in **target\_file** will be used for the deployment.

**undeploy:** (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

**undeploy\_force:** (optional) If True, the artifact will be undeployed although it has not changed.

Examples:

Deployment of a file from minion's local file system:

```
application_deployed:
 jboss7.deployed:
 - salt_source:
 target_file: '/tmp/webapp.war'
 - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```
application_deployed:
 jboss7.deployed:
 - salt_source:
 source: salt://application-web-0.39.war
 target_file: '/tmp/application-web-0.39.war'
 undeploy: 'application-web-.*'
 - jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches 'application-web-.\*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt\_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

**salt.states.jboss7.reloaded**(name, jboss\_config, timeout=60, interval=5)

Reloads configuration of jboss server.

**jboss\_config**: Dict with connection properties (see state description)

**timeout**: Time to wait until jboss is back in running state. Default timeout is 60s.

**interval**: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
 jboss7.reloaded:
 - jboss_config: {{ pillar['jboss'] }}
```

### 21.19.139 salt.states.jenkins module

#### Management of Jenkins

New in version 2016.3.0.

**salt.states.jenkins.absent**(name, \*\*kwargs)

Ensure the job is absent from the Jenkins configured jobs

**name** The name of the Jenkins job to remove

**salt.states.jenkins.present**(name, config=None, \*\*kwargs)

Ensure the job is present in the Jenkins configured jobs

**name** The unique name for the Jenkins job

**config** The Salt URL for the file to use for configuring the job

### 21.19.140 salt.states.junos module

#### State modules to interact with Junos devices.

**maturity** new

**dependencies** junos-eznc, jxmlease

---

**Note:** Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

---

Refer to [junos](#) for information on connecting to junos proxy.

**salt.states.junos.cli**(name, \*\*kwargs)

Executes the CLI commands and reuturns the text output.

```
show version:
 junos.cli:
 - format: xml

get software version of device:
 junos.cli:
 - name: show version
 - format: text
 - dest: /home/user/show_version.log
```

**Parameters**

- **Required** --
  - name: The command that need to be executed on Junos CLI.
- **Optional** --
  - kwargs: Keyworded arguments which can be provided like-
    - \* format: Format in which to get the CLI output. (text or xml, default = 'text')
    - \* timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - \* dest: The destination file where the CLI output can be stored. (default = None)

`salt.states.junos.commit(name, **kwargs)`

Commits the changes loaded into the candidate configuration.

```
commit the changes:
 junos.commit:
 - confirm: 10
```

**Parameters** **Optional** --

- kwargs: Keyworded arguments which can be provided like-
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines. (default = False)
  - force\_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - full: When set to True requires all the daemons to check and evaluate the new configuration.
  - detail: When true return commit detail.

`salt.states.junos.commit_check(name)`

Perform a commit check on the configuration.

```
perform commit check:
 junos.commit_check
```

`salt.states.junos.diff(name, d_id=0, **kwargs)`

Changed in version 3001.

Gets the difference between the candidate and the current configuration.

```
get the diff:
junos.diff:
- d_id: 10
```

Parameters **Optional** --

- d\_id: The rollback diff id (d\_id) value [0-49]. (default = 0)

`salt.states.junos.file_copy(name, dest=None, **kwargs)`  
Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
junos.file_copy:
- dest: info_copy.txt
```

Parameters **Required** --

- src: The source path where the file is kept.
- dest: The destination path where the file will be copied.

`salt.states.junos.get_table(name, table, table_file, **kwargs)`  
New in version 3001.

Retrieve data from a Junos device using Tables/Views

```
get route details:
junos.get_table:
- table: RouteTable
- table_file: routes.yml

get interface details:
junos.get_table:
- table: EthPortTable
- table_file: ethport.yml
- table_args:
 interface_name: ge-0/0/0
```

**name (required)** task definition

**table (required)** Name of PyEZ Table

**file** YAML file that has the table specified in table parameter

**path:** Path of location of the YAML file. defaults to op directory in jnpr.junos.op

**target:** if command need to run on FPC, can specify fpc target

**key:** To overwrite key provided in YAML

**key\_items:** To select only given key items

**filters:** To select only filter for the dictionary from columns

**template\_args:** key/value pair which should render Jinja template command

`salt.states.junos.install_config(name, **kwargs)`  
Loads and commits the configuration provided.

```
Install the mentioned config:
junos.install_config:
- name: salt://configs/interface.set
- timeout: 100
- diffs_file: '/var/log/diff'
```

```
Install the mentioned config:
junos.install_config:
- path: salt://configs/interface.set
```

(continues on next page)

(continued from previous page)

```
- timeout: 100
- template_vars:
 interface_name: lo0
 description: Creating interface via SaltStack.
```

**name** Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands

**template\_vars** The dictionary of data for the jinja variables present in the jinja template

**timeout** [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

**overwrite** [False] Set to True if you want this file is to completely replace the configuration file. Sets action to override

---

**Note:** This option cannot be used if **format** is "set".

---

**merge** [False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**comment** Provide a comment to the commit. (default = None)

**confirm** Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

**diffs\_file** Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

---

**Note:** The file will be stored on the proxy minion. To push the files to the master use `cp.push`.

---

`salt.states.junos.install_os(name, **kwargs)`

Installs the given image on the device. After the installation is complete the device is rebooted, if `reboot=True` is given as a keyworded argument.

```
salt://images/junos_image.tgz:
junos.install_os:
- timeout: 100
- reboot: True
```

#### Parameters

- **Required** --

- **path**: Path where the image file is present on the proxy minion.

- **Optional** --

- **kwargs**: keyworded arguments to be given such as **timeout**, **reboot** etc

- \* **timeout**: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)

- \* **reboot**: Whether to reboot after installation (default = False)

- \* **no\_copy**: When True the software package will not be SCP'd to the device. (default = False)

`salt.states.junos.load(name, **kwargs)`

Loads the configuration provided onto the junos device.

```
Install the mentioned config:
junos.load:
- name: salt://configs/interface.set
```

```

Install the mentioned config:
junos.load:
- name: salt://configs/interface.set
- template_vars:
 interface_name: lo0
 description: Creating interface via SaltStack.

```

Sample template:

```
set interfaces {{ interface_name }} unit 0
```

**name** Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.

**overwrite** [False] Set to True if you want this file is to completely replace the configuration file.

---

**Note:** This option cannot be used if **format** is "set".

---

**merge** [False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**update** [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)

**template\_vars** Variables to be passed into the template processing engine in addition to those present in `__pillar__`, `__opts__`, `__grains__`, etc. You may reference these variables in your template like so: `{{ template_vars["var_name"] }}`

`salt.states.junos.lock(name)`

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

---

**Note:** Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure `unlock` is called in the same orchestration run in which the lock is called.

---

```

lock the config:
junos.lock

```

`salt.states.junos.resultdecorator(function)`

`salt.states.junos.rollback(name, id, **kwargs)`

Rollbacks the committed changes.

```

rollback the changes:
junos.rollback:
- id: 5

```

Parameters **Optional** --

- **id:** The rollback id value [0-49]. (default = 0)
- **kwargs:** Keyworded arguments which can be provided like-
  - **timeout:** Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - **comment:** Provide a comment to the commit. (default = None)

- confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.
- diffs\_file: Path to the file where any diffs will be written. (default = None)

`salt.states.junos.rpc(name, dest=None, format='xml', args=None, **kwargs)`

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with `dest` as an argument

```
get-interface-information:
 junos.rpc:
 - dest: /home/user/rpc.log
 - interface_name: lo0

fetch interface information with terse:
 junos.rpc:
 - name: get-interface-information
 - terse: True
```

#### Parameters

- **Required** --
  - name: The rpc to be executed. (default = None)
- **Optional** --
  - dest: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: [cp.push](#)
  - format: The format in which the rpc reply must be stored in file specified in the dest (used only when dest is specified) (default = xml)
  - kwargs: keyworded arguments taken by rpc call like-
    - \* timeout: 30 Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
    - \* filter: Only to be used with 'get-config' rpc to get specific configuration.
    - \* terse: Amount of information you want.
    - \* interface\_name: Name of the interface whose information you want.

`salt.states.junos.set_hostname(name, **kwargs)`

Changes the hostname of the device.

```
device_name:
 junos.set_hostname:
 - comment: "Host-name set via saltstack."
```

#### Parameters

- **Required** --
  - hostname: The name to be set. (default = None)
- **Optional** --
  - kwargs: Keyworded arguments which can be provided like-
    - \* timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - \* comment: Provide a comment to the commit. (default = None)
    - \* confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

`salt.states.junos.shutdown(name, **kwargs)`

Shuts down the device.

```
shut the device:
junos.shutdown:
- in_min: 10
```

Parameters **Optional** --

- **kwargs:**
  - **reboot:** Whether to reboot instead of shutdown. (default=False)
  - **at:** Specify time for reboot. (To be used only if reboot=yes)
  - **in\_min:** Specify delay in minutes for shutdown

`salt.states.junos.unlock(name)`

Unlocks the candidate configuration.

```
unlock the config:
junos.unlock
```

`salt.states.junos.zeroize(name)`

Resets the device to default factory settings.

```
reset my device:
junos.zeroize
```

name: can be anything

### 21.19.141 salt.states.kapacitor module

Kapacitor state module.

**configuration** This module accepts connection configuration details either as parameters or as configuration settings in `/etc/salt/minion` on the relevant minions:

```
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar.

New in version 2016.11.0.

`salt.states.kapacitor.task_absent(name)`

Ensure that a task is absent from Kapacitor.

**name** Name of the task.

`salt.states.kapacitor.task_present(name, tick_script, task_type='stream', database=None, retention_policy='default', enable=True, dbrps=None)`

Ensure that a task is present and up-to-date in Kapacitor.

**name** Name of the task.

**tick\_script** Path to the TICK script for the task. Can be a salt:// source.

**task\_type** Task type. Defaults to 'stream'

**dbrps** A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention\_policy' will be merged as part of dbrps.

New in version 2019.2.0.

**database** Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

**retention\_policy** Which retention policy to fetch data from. Defaults to 'default'.

**enable** Whether to enable the task or not. Defaults to True.

### 21.19.142 salt.states.kernelpkg

#### Manage kernel packages and active kernel version

Example state to install the latest kernel from package repositories:

```
install-latest-kernel:
 kernelpkg.latest_installed: []
```

Example state to boot the system if a new kernel has been installed:

```
boot-latest-kernel:
 kernelpkg.latest_active:
 - at_time: 1
```

Example state chaining the install and reboot operations:

```
install-latest-kernel:
 kernelpkg.latest_installed: []

boot-latest-kernel:
 kernelpkg.latest_active:
 - at_time: 1
 - onchanges:
 - kernelpkg: install-latest-kernel
```

Chaining can also be achieved using wait/listen requisites:

```
install-latest-kernel:
 kernel.latest_installed: []

boot-latest-kernel:
 kernel.latest_wait:
 - at_time: 1
 - listen:
 - kernel: install-latest-kernel
```

`salt.states.kernelpkg.latest_active(name, at_time=None, **kwargs)`

Initiate a reboot if the running kernel is not the latest one installed.

---

**Note:** This state does not install any patches. It only compares the running kernel version number to other kernel versions also installed in the system. If the running version is not the latest one installed, this state will reboot the system.

See [kernelpkg.upgrade](#) and [latest\\_installed\(\)](#) for ways to install new kernel packages.

This module does not attempt to understand or manage boot loader configurations it is possible to have a new kernel installed, but a boot loader configuration that will never activate it. For this reason, it would not be advisable to schedule this state to run automatically.

Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run. See [latest\\_wait\(\)](#) for a waitable state that can be called with the *listen* requisite.

---

**name** Arbitrary name for the state. Does not affect behavior.  
**at\_time** The wait time in minutes before the system will be rebooted.

`salt.states.kernelpkg.latest_installed(name, **kwargs)`  
 Ensure that the latest version of the kernel available in the repositories is installed.

---

**Note:** This state only installs the kernel, but does not activate it. The new kernel should become active at the next reboot. See [kernelpkg.needs\\_reboot](#) for details on how to detect this condition, and [latest\\_active\(\)](#) to initiate a reboot when needed.

---

**name** Arbitrary name for the state. Does not affect behavior.

`salt.states.kernelpkg.latest_wait(name, at_time=None, **kwargs)`  
 Initiate a reboot if the running kernel is not the latest one installed. This is the waitable version of [latest\\_active\(\)](#) and will not take any action unless triggered by a watch or listen requisite.

---

**Note:** Because this state function may cause the system to reboot, it may be preferable to move it to the very end of the state run using [listen](#) or [listen\\_in](#) requisites.

---

```
system-up-to-date:
 pkg.uptodate:
 - refresh: true

boot-latest-kernel:
 kernelpkg.latest_wait:
 - at_time: 1
 - listen:
 - pkg: system-up-to-date
```

**name** Arbitrary name for the state. Does not affect behavior.  
**at\_time** The wait time in minutes before the system will be rebooted.

`salt.states.kernelpkg.mod_watch(name, sfun, **kwargs)`  
 Execute a kernelpkg state based on a watch or listen call

### 21.19.143 salt.states.keyboard

#### Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
 keyboard.system
```

Or it can be managed for XOrg:

```
us:
 keyboard.xorg
```

`salt.states.keyboard.system(name)`  
 Set the keyboard layout for the system  
**name** The keyboard layout to use

`salt.states.keyboard.xorg(name)`  
Set the keyboard layout for XOrg  
`layout` The keyboard layout to use

### 21.19.144 salt.states.keystone

#### Management of Keystone users

`depends`

- keystoneclient Python module

`configuration` See *salt.modules.keystone* for setup instructions.

##### Keystone tenants:

###### `keystone.tenant_present:`

- `names:`
  - admin
  - demo
  - service

##### Keystone roles:

###### `keystone.role_present:`

- `names:`
  - admin
  - Member

##### admin:

###### `keystone.user_present:`

- `password:` R00T\_4CC3SS
- `email:` admin@domain.com
- `roles:`
  - `admin:` # tenants
    - admin # roles
  - `service:`
    - admin
    - Member
- `require:`
  - `keystone:` Keystone tenants
  - `keystone:` Keystone roles

##### nova:

###### `keystone.user_present:`

- `password:` '\$up3rn0v4'
- `email:` nova@domain.com
- `tenant:` service
- `roles:`
  - `service:`
    - admin
- `require:`
  - `keystone:` Keystone tenants
  - `keystone:` Keystone roles

##### demo:

###### `keystone.user_present:`

- `password:` 'd3m0n\$trati0n'
- `email:` demo@domain.com

(continues on next page)

(continued from previous page)

```

- tenant: demo
- roles:
 demo:
 - Member
- require:
 - keystone: Keystone tenants
 - keystone: Keystone roles

nova service:
 keystone.service_present:
 - name: nova
 - service_type: compute
 - description: OpenStack Compute Service

```

**salt.states.keystone.endpoint\_absent**(*name, region=None, profile=None, interface=None, \*\*connection\_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

**name** The name of the service whose endpoints should not exist

**region (optional)** The region of the endpoint. Defaults to `RegionOne`.

**interface** The interface type, which describes the visibility of the endpoint. (for V3 API)

**salt.states.keystone.endpoint\_present**(*name, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, \*\*connection\_args*)

Ensure the specified endpoints exists for service

**name** The Service name

**publicurl** The public url of service endpoint (for V2 API)

**internalurl** The internal url of service endpoint (for V2 API)

**adminurl** The admin url of the service endpoint (for V2 API)

**region** The region of the endpoint

**url** The endpoint URL (for V3 API)

**interface** The interface type, which describes the visibility of the endpoint. (for V3 API)

**salt.states.keystone.project\_absent**(*name, profile=None, \*\*connection\_args*)

Ensure that the keystone project is absent. Alias for `tenant_absent` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name** The name of the project that should not exist

```

delete_nova:
 keystone.project_absent:
 - name: nova

```

**salt.states.keystone.project\_present**(*name, description=None, enabled=True, profile=None, \*\*connection\_args*)

Ensures that the keystone project exists Alias for `tenant_present` from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

**name** The name of the project to manage

**description** The description to use for this project

**enabled** Availability state for this project

```

nova:
 keystone.project_present:

```

(continues on next page)

(continued from previous page)

```
- enabled: True
- description: 'Nova Compute Service'
```

```
salt.states.keystone.role_absent(name, profile=None, **connection_args)
```

Ensure that the keystone role is absent.

**name** The name of the role that should not exist

```
salt.states.keystone.role_present(name, profile=None, **connection_args)
```

Ensures that the keystone role exists

**name** The name of the role that should be present

```
salt.states.keystone.service_absent(name, profile=None, **connection_args)
```

Ensure that the service doesn't exist in Keystone catalog

**name** The name of the service that should not exist

```
salt.states.keystone.service_present(name, service_type, description=None, profile=None,
 **connection_args)
```

Ensure service present in Keystone catalog

**name** The name of the service

**service\_type** The type of Openstack Service

**description (optional)** Description of the service

```
salt.states.keystone.tenant_absent(name, profile=None, **connection_args)
```

Ensure that the keystone tenant is absent.

**name** The name of the tenant that should not exist

```
salt.states.keystone.tenant_present(name, description=None, enabled=True, profile=None,
 **connection_args)
```

Ensures that the keystone tenant exists

**name** The name of the tenant to manage

**description** The description to use for this tenant

**enabled** Availability state for this tenant

```
salt.states.keystone.user_absent(name, profile=None, **connection_args)
```

Ensure that the keystone user is absent.

**name** The name of the user that should not exist

```
salt.states.keystone.user_present(name, password, email, tenant=None, enabled=True,
 roles=None, profile=None, password_reset=True,
 project=None, **connection_args)
```

Ensure that the keystone user is present with the specified properties.

**name** The name of the user to manage

**password** The password to use for this user.

---

**Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

---

**password\_reset** Whether or not to reset password after initial set. Defaults to `True`.

**email** The email address for this user

**tenant** The tenant (name) for this user

**project** The project (name) for this user (overrides tenant in api v3)

**enabled** Availability state for this user

**roles** The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
 admin: # tenant
 - admin # role
 service:
 - admin
 - Member
```

### 21.19.145 salt.states.keystone\_domain

#### Management of OpenStack Keystone Domains

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.keystoneng* for setup instructions

Example States

```
create domain:
 keystone_domain.present:
 - name: domain1

create domain with optional params:
 keystone_domain.present:
 - name: domain1
 - enabled: False
 - description: 'my domain'

delete domain:
 keystone_domain.absent:
 - name: domain1
```

**salt.states.keystone\_domain.absent**(*name, auth=None*)

Ensure domain does not exist

**name** Name of the domain

**salt.states.keystone\_domain.present**(*name, auth=None, \*\*kwargs*)

Ensure domain exists and is up-to-date

**name** Name of the domain

**enabled** Boolean to control if domain is enabled

**description** An arbitrary description of the domain

### 21.19.146 salt.states.keystone\_endpoint

#### Management of OpenStack Keystone Endpoints

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.keystoneng* for setup instructions

Example States

```
create endpoint:
 keystone_endpoint.present:
 - name: public
 - url: https://example.org:9292
 - region: RegionOne
 - service_name: glance

destroy endpoint:
 keystone_endpoint.absent:
 - name: public
 - url: https://example.org:9292
 - region: RegionOne
 - service_name: glance

create multiple endpoints:
 keystone_endpoint.absent:
 - names:
 - public
 - admin
 - internal
 - url: https://example.org:9292
 - region: RegionOne
 - service_name: glance
```

`salt.states.keystone_endpoint.absent` (*name*, *service\_name*, *auth=None*, *\*\*kwargs*)

Ensure an endpoint does not exists

**name** Interface name

**url** URL of the endpoint

**service\_name** Service name or ID

**region** The region name to assign the endpoint

`salt.states.keystone_endpoint.present` (*name*, *service\_name*, *auth=None*, *\*\*kwargs*)

Ensure an endpoint exists and is up-to-date

**name** Interface name

**url** URL of the endpoint

**service\_name** Service name or ID

**region** The region name to assign the endpoint

**enabled** Boolean to control if endpoint is enabled

### 21.19.147 salt.states.keystone\_group

#### Management of OpenStack Keystone Groups

New in version 2018.3.0.

**depends** shade

**configuration** see `salt.modules.keystoneng` for setup instructions

Example States

```
create group:
 keystone_group.present:
 - name: group1

delete group:
```

(continues on next page)

(continued from previous page)

```

keystone_group.absent:
 - name: group1

create group with optional params:
keystone_group.present:
 - name: group1
 - domain: domain1
 - description: 'my group'

```

`salt.states.keystone_group.absent(name, auth=None, **kwargs)`

Ensure group does not exist

**name** Name of the group

**domain** The name or id of the domain

`salt.states.keystone_group.present(name, auth=None, **kwargs)`

Ensure an group exists and is up-to-date

**name** Name of the group

**domain** The name or id of the domain

**description** An arbitrary description of the group

## 21.19.148 salt.states.keystone\_project

### Management of OpenStack Keystone Projects

New in version 2018.3.0.

**depends** shade

**configuration** see `salt.modules.keystoneng` for setup instructions

Example States

```

create project:
keystone_project.present:
 - name: project1

delete project:
keystone_project.absent:
 - name: project1

create project with optional params:
keystone_project.present:
 - name: project1
 - domain: domain1
 - enabled: False
 - description: 'my project'

```

`salt.states.keystone_project.absent(name, auth=None, **kwargs)`

Ensure a project does not exists

**name** Name of the project

**domain** The name or id of the domain

`salt.states.keystone_project.present(name, auth=None, **kwargs)`

Ensure a project exists and is up-to-date

**name** Name of the project

**domain** The name or id of the domain

**description** An arbitrary description of the project

### 21.19.149 salt.states.keystone\_role

#### Management of OpenStack Keystone Roles

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.keystoneng* for setup instructions

Example States

```
create role:
 keystone_role.present:
 - name: role1

delete role:
 keystone_role.absent:
 - name: role1

create role with optional params:
 keystone_role.present:
 - name: role1
 - description: 'my group'
```

**salt.states.keystone\_role.absent**(*name*, *auth=None*, *\*\*kwargs*)

Ensure role does not exist

**name** Name of the role

**salt.states.keystone\_role.present**(*name*, *auth=None*, *\*\*kwargs*)

Ensure an role exists

**name** Name of the role

**description** An arbitrary description of the role

### 21.19.150 salt.states.keystone\_role\_grant

#### Management of OpenStack Keystone Role Grants

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.keystoneng* for setup instructions

Example States

```
create group:
 keystone_group.present:
 - name: group1

delete group:
 keystone_group.absent:
 - name: group1

create group with optional params:
```

(continues on next page)

(continued from previous page)

```

keystone_group.present:
- name: group1
- domain: domain1
- description: 'my group'

```

```

salt.states.keystone_role_grant.absent(name, auth=None, **kwargs)

```

```

salt.states.keystone_role_grant.present(name, auth=None, **kwargs)

```

### 21.19.151 salt.states.keystone\_service

#### Management of OpenStack Keystone Services

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.keystoneng* for setup instructions

Example States

```

create service:
 keystone_service.present:
 - name: glance
 - type: image

delete service:
 keystone_service.absent:
 - name: glance

create service with optional params:
 keystone_service.present:
 - name: glance
 - type: image
 - enabled: False
 - description: 'OpenStack Image'

```

```

salt.states.keystone_service.absent(name, auth=None)

```

Ensure service does not exist

**name** Name of the service

```

salt.states.keystone_service.present(name, auth=None, **kwargs)

```

Ensure an service exists and is up-to-date

**name** Name of the group

**type** Service type

**enabled** Boolean to control if service is enabled

**description** An arbitrary description of the service

## 21.19.152 salt.states.keystone\_user

### Management of OpenStack Keystone Users

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.keystoneng* for setup instructions

Example States

```
create user:
 keystone_user.present:
 - name: user1

delete user:
 keystone_user.absent:
 - name: user1

create user with optional params:
 keystone_user.present:
 - name: user1
 - domain: domain1
 - enabled: False
 - password: password123
 - email: "user1@example.org"
 - description: 'my user'
```

**salt.states.keystone\_user.absent**(*name, auth=None, \*\*kwargs*)

Ensure user does not exists

**name** Name of the user

**domain** The name or id of the domain

**salt.states.keystone\_user.present**(*name, auth=None, \*\*kwargs*)

Ensure domain exists and is up-to-date

**name** Name of the domain

**domain** The name or id of the domain

**enabled** Boolean to control if domain is enabled

**description** An arbitrary description of the domain

**password** The user password

**email** The users email address

## 21.19.153 salt.states.keystore

State management of a java keystore

**salt.states.keystore.managed**(*name, passphrase, entries, force\_remove=False*)

Create or manage a java keystore.

**name** The path to the keystore file

**passphrase** The password to the keystore

**entries** A list containing an alias, certificate, and optional private\_key. The certificate and private\_key can be a file or a string

```
- entries:
 - alias: hostname2
```

(continues on next page)

(continued from previous page)

```

certificate: /path/to/cert.crt
private_key: /path/to/key.key
- alias: stringhost
certificate: |
 -----BEGIN CERTIFICATE-----
 MIICEjCCAXsCAG36MA0GCSqGSIb3DQEBBQUAMIGbMQswCQYDVQQGEwJKUDEOMAwG
 ...
 2VguKv4SWjRFoRkIfiLHX0qVviMhSlNy2ioFLy7JcPZb+v3ftDGywUqcBiVDoea0
 -----END CERTIFICATE-----

```

**force\_remove** If True will cause the state to remove any entries found in the keystore which are not defined in the state. The default is False.

Example

```

define_keystore:
 keystore.managed:
 - name: /path/to/keystore
 - passphrase: changeit
 - force_remove: True
 - entries:
 - alias: hostname1
 certificate: /path/to/cert.crt
 - alias: remotehost
 certificate: /path/to/cert2.crt
 - private_key: /path/to/key2.key
 - alias: pillarhost
 certificate: {{ salt.pillar.get('path:to:cert') }}

```

### 21.19.154 salt.states.kmod

#### Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```

add_kvm:
 kmod.present:
 - name: kvm_amd
remove_beep:
 kmod.absent:
 - name: pcspkr

```

Multiple modules can be specified for both kmod.present and kmod.absent.

```

add_sound:
 kmod.present:
 - mods:
 - snd_hda_codec_hdmi
 - snd_hda_codec
 - snd_hwdep
 - snd_hda_core
 - snd_pcm
 - snd_timer
 - snd

```

**salt.states.kmod.absent**(*name*, *persist=False*, *comment=True*, *mods=None*)

Verify that the named kernel module is not loaded

**name** The name of the kernel module to verify is not loaded  
**persist** Remove module from `/etc/modules`  
**comment** Comment out module in `/etc/modules` rather than remove it  
**mods** A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

`salt.states.kmod.present(name, persist=False, mods=None)`

Ensure that the specified kernel module is loaded

**name** The name of the kernel module to verify is loaded

**persist** Also add module to `/etc/modules`

**mods** A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

## 21.19.155 salt.states.kubernetes

### Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See `salt.modules.kubernetesmod` for more information.

**Warning:** Configuration options will change in 2019.2.0.

The kubernetes module is used to manage different kubernetes resources.

```
my-nginx:
 kubernetes.deployment_present:
 - namespace: default
 metadata:
 app: frontend
 spec:
 replicas: 1
 template:
 metadata:
 labels:
 run: my-nginx
 spec:
 containers:
 - name: my-nginx
 image: nginx
 ports:
 - containerPort: 80

my-mariadb:
 kubernetes.deployment_absent:
 - namespace: default

kubernetes deployment as specified inside of
a file containing the definition of the the
deployment using the official kubernetes format
redis-master-deployment:
 kubernetes.deployment_present:
 - name: redis-master
```

(continues on next page)

(continued from previous page)

```

- source: salt://k8s/redis-master-deployment.yml
require:
- pip: kubernetes-python-module

kubernetes service as specified inside of
a file containing the definition of the the
service using the official kubernetes format
redis-master-service:
 kubernetes.service_present:
 - name: redis-master
 - source: salt://k8s/redis-master-service.yml
 require:
 - kubernetes.deployment_present: redis-master

kubernetes deployment as specified inside of
a file containing the definition of the the
deployment using the official kubernetes format
plus some jinja directives
nginx-source-template:
 kubernetes.deployment_present:
 - source: salt://k8s/nginx.yml.jinja
 - template: jinja
 require:
 - pip: kubernetes-python-module

Kubernetes secret
k8s-secret:
 kubernetes.secret_present:
 - name: top-secret
 data:
 key1: value1
 key2: value2
 key3: value3

```

**salt.states.kubernetes.configmap\_absent**(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named configmap is absent from the given namespace.

**name** The name of the configmap

**namespace** The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

**salt.states.kubernetes.configmap\_present**(*name*, *namespace='default'*, *data=None*, *source=None*, *template=None*, *\*\*kwargs*)

Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

**name** The name of the configmap.

**namespace** The namespace holding the configmap. The 'default' one is going to be used unless a different one is specified.

**data** The dictionary holding the configmaps.

**source** A file containing the data of the configmap in plain format.

**template** Template engine to be used to render the source file.

**salt.states.kubernetes.deployment\_absent**(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named deployment is absent from the given namespace.

**name** The name of the deployment

**namespace** The name of the namespace

**salt.states.kubernetes.deployment\_present**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name** The name of the deployment.

**namespace** The namespace holding the deployment. The 'default' one is going to be used unless a different one is specified.

**metadata** The metadata of the deployment object.

**spec** The spec of the deployment object.

**source** A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.

**template** Template engine to be used to render the source file.

**salt.states.kubernetes.namespace\_absent**(*name*, *\*\*kwargs*)

Ensures that the named namespace is absent.

**name** The name of the namespace

**salt.states.kubernetes.namespace\_present**(*name*, *\*\*kwargs*)

Ensures that the named namespace is present.

**name** The name of the namespace.

**salt.states.kubernetes.node\_label\_absent**(*name*, *node*, *\*\*kwargs*)

Ensures that the named label is absent from the node.

**name** The name of the label

**node** The name of the node

**salt.states.kubernetes.node\_label\_folder\_absent**(*name*, *node*, *\*\*kwargs*)

Ensures the label folder doesn't exist on the specified node.

**name** The name of label folder

**node** The name of the node

**salt.states.kubernetes.node\_label\_present**(*name*, *node*, *value*, *\*\*kwargs*)

Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.

**name** The name of the label.

**value** Value of the label.

**node** Node to change.

**salt.states.kubernetes.pod\_absent**(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named pod is absent from the given namespace.

**name** The name of the pod

**namespace** The name of the namespace

**salt.states.kubernetes.pod\_present**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, *\*\*kwargs*)

Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If the pod exists it will be replaced.

**name** The name of the pod.

**namespace** The namespace holding the pod. The 'default' one is going to be used unless a different one is specified.

**metadata** The metadata of the pod object.

**spec** The spec of the pod object.

**source** A file containing the definition of the pod (metadata and spec) in the official kubernetes format.

**template** Template engine to be used to render the source file.

**salt.states.kubernetes.secret\_absent**(*name*, *namespace='default'*, *\*\*kwargs*)

Ensures that the named secret is absent from the given namespace.

**name** The name of the secret

**namespace** The name of the namespace

`salt.states.kubernetes.secret_present`(*name*, *namespace*='default', *data*=None, *source*=None, *template*=None, *\*\*kwargs*)

Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.

**name** The name of the secret.

**namespace** The namespace holding the secret. The 'default' one is going to be used unless a different one is specified.

**data** The dictionary holding the secrets.

**source** A file containing the data of the secret in plain format.

**template** Template engine to be used to render the source file.

`salt.states.kubernetes.service_absent`(*name*, *namespace*='default', *\*\*kwargs*)

Ensures that the named service is absent from the given namespace.

**name** The name of the service

**namespace** The name of the namespace

`salt.states.kubernetes.service_present`(*name*, *namespace*='default', *metadata*=None, *spec*=None, *source*="", *template*="", *\*\*kwargs*)

Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

**name** The name of the service.

**namespace** The namespace holding the service. The 'default' one is going to be used unless a different one is specified.

**metadata** The metadata of the service object.

**spec** The spec of the service object.

**source** A file containing the definition of the service (metadata and spec) in the official kubernetes format.

**template** Template engine to be used to render the source file.

## 21.19.156 salt.states.layman

### Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

#### **sunrise:**

layman.present

`salt.states.layman.absent`(*name*)

Verify that the overlay is absent

**name** The name of the overlay to delete

`salt.states.layman.present`(*name*)

Verify that the overlay is present

**name** The name of the overlay to add

## 21.19.157 salt.states.ldap

### Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.managed(name, entries, connect_spec=None)`  
Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldapi:///:
 ldap.managed:
 - connect_spec:
 bind:
 method: sasl

 - entries:

 # make sure the entry doesn't exist
 - cn=foo,ou=users,dc=example,dc=com:
 - delete_others: True

 # make sure the entry exists with only the specified
 # attribute values
 - cn=admin,dc=example,dc=com:
 - delete_others: True
 - replace:
 cn:
 - admin
 description:
 - LDAP administrator
 objectClass:
 - simpleSecurityObject
 - organizationalRole
 userPassword:
 - {{pillar.ldap_admin_password}}

 # make sure the entry exists, its olcRootDN attribute
 # has only the specified value, the olcRootDN attribute
 # doesn't exist, and all other attributes are ignored
 - 'olcDatabase={1}hdb,cn=config':
 - replace:
 olcRootDN:
 - cn=admin,dc=example,dc=com
 # the admin entry has its own password attribute
 olcRootPW: []

 # note the use of 'default'. also note how you don't
 # have to use list syntax if there is only one attribute
 # value
 - cn=foo,ou=users,dc=example,dc=com:
 - delete_others: True
 - default:
 userPassword: changeme
 shadowLastChange: 0
```

(continues on next page)

(continued from previous page)

```

keep sshPublicKey if present, but don't create
the attribute if it is missing
sshPublicKey: []
- replace:
 cn: foo
 uid: foo
 uidNumber: 1000
 gidNumber: 1000
 gecos: Foo Bar
 givenName: Foo
 sn: Bar
 homeDirectory: /home/foo
 loginShell: /bin/bash
 objectClass:
 - inetOrgPerson
 - posixAccount
 - top
 - ldapPublicKey
 - shadowAccount

```

#### Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** -- A description of the desired state of zero or more LDAP entries.

`entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

The DN's are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

The structure of `entries` looks like this:

```

[{'dn1': [{'directive1': directive1_state,
 directive2': directive2_state},
 {'directive3': directive3_state}],
 'dn2': [{'directive4': directive4_state,
 directive5': directive5_state}]},
 {'dn3': [{'directive6': directive6_state}]}]

```

These are the directives:

- **'delete\_others'** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the `'default'` directive or the `'add'` directive with an empty value list.

- **'default'** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'add'** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.

- **'delete'** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.
- **'replace'** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be `None`, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect\_spec** -- See the description of the `connect_spec` parameter of the `ldap3.connect` function in the `ldap3` execution module. If this is a dict and the `'url'` entry is not specified, the `'url'` entry is set to the value of the `name` parameter.

## Returns

A dict with the following keys:

- **'name'** This is the same object passed to the `name` parameter.
- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

- **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to `None`. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
- **'new'** The state of the entry after modification. If the entry was deleted, this key maps to `None`. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

Example `'changes'` dict where a new entry was created with a single attribute containing two values:

```
{'dn1': {'old': None,
 'new': {'attr1': ['val1', 'val2']}}}
```

Example `'changes'` dict where a new attribute was added to an existing entry:

```
{'dn1': {'old': {},
 'new': {'attr2': ['val3']}}}
```

- **'result'** One of the following values:
  - True if no changes were necessary or if all changes were applied successfully.
  - False if at least one change was unable to be applied.
  - None if changes would be applied but it is in test mode.

### 21.19.158 salt.states.libcloud\_dns module

Manage DNS records and zones using libcloud

**codeauthor** Anthony Shaw <[anthonyshaw@apache.org](mailto:anthonyshaw@apache.org)>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

**configuration** This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
 profile1:
 driver: godaddy
 key: 2orgk34kgk34g
 profile2:
 driver: route53
 key: blah
 secret: blah
```

Example:

```
my-zone:
 libcloud_dns.zone_present:
 - name: mywebsite.com
 - profile: profile1
my-website:
 libcloud_dns.record_present:
 - name: www
 - zone: mywebsite.com
 - type: A
 - data: 12.34.32.3
 - profile: profile1
 - require:
 - libcloud_dns: my-zone
```

**depends** apache-libcloud

**salt.states.libcloud\_dns.record\_absent**(*name, zone, type, data, profile*)

Ensures a record is absent.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

`salt.states.libcloud_dns.record_present(name, zone, type, data, profile)`

Ensures a record is present.

**Parameters**

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (") for this argument.
- **zone** (str) -- Zone where the requested record is created, the domain name
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

`salt.states.libcloud_dns.state_result(result, message, name, changes=None)`

`salt.states.libcloud_dns.zone_absent(domain, profile)`

Ensures a record is absent.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **profile** (str) -- The profile key

`salt.states.libcloud_dns.zone_present(domain, type, profile)`

Ensures a record is present.

**Parameters**

- **domain** (str) -- Zone name, i.e. the domain name
- **type** (str) -- Zone type (master / slave), defaults to master
- **profile** (str) -- The profile key

## 21.19.159 salt.states.libcloud\_loadbalancer module

### Apache Libcloud Load Balancer State

Manage load balancers using libcloud

**codeauthor** Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud load balancer management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/loadbalancer/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html)

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

**configuration** This module uses a configuration profile for one or multiple Cloud providers

```
libcloud_loadbalancer:
 profile_test1:
 driver: gce
 key: G00G0123456789ABCXYZ
 secret: mysecret
 profile_test2:
 driver: alb
 key: 12345
 secret: mysecret
```

Example:

Using States to deploy a load balancer with extended arguments to specify region

```
lb_test:
 libcloud_loadbalancer.balancer_present:
 - name: example
 - port: 80
 - protocol: http
 - profile: google
 - ex_region: us-east1
```

`depends` apache-libcloud

`salt.states.libcloud_loadbalancer.balancer_absent`(*name*, *profile*, *\*\*libcloud\_kwargs*)

Ensures a load balancer is absent.

Parameters

- **name** (str) -- Load Balancer name
- **profile** (str) -- The profile key

`salt.states.libcloud_loadbalancer.balancer_present`(*name*, *port*, *protocol*, *profile*, *algorithm=None*, *members=None*, *\*\*libcloud\_kwargs*)

Ensures a load balancer is present.

Parameters

- **name** (str) -- Load Balancer name
- **port** (str) -- Port the load balancer should listen on, defaults to 80
- **protocol** (str) -- Loadbalancer protocol, defaults to http.
- **profile** (str) -- The profile key
- **algorithm** (str) -- Load balancing algorithm, defaults to ROUND\_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **members** (list of dict (ip, port)) -- An optional list of members to create on deployment

`salt.states.libcloud_loadbalancer.member_absent`(*ip*, *port*, *balancer\_id*, *profile*, *\*\*libcloud\_kwargs*)

Ensure a load balancer member is absent, based on IP and Port

Parameters

- **ip** (str) -- IP address for the member
- **port** (int) -- Port for the member
- **balancer\_id** (str) -- id of a load balancer you want to detach the member from
- **profile** (str) -- The profile key

`salt.states.libcloud_loadbalancer.member_present`(*ip*, *port*, *balancer\_id*, *profile*, *\*\*libcloud\_kwargs*)

Ensure a load balancer member is present

Parameters

- **ip** (str) -- IP address for the new member
- **port** (int) -- Port for the new member
- **balancer\_id** (str) -- id of a load balancer you want to attach the member to
- **profile** (str) -- The profile key

`salt.states.libcloud_loadbalancer.state_result`(*result*, *message*, *name*, *changes=None*)

## 21.19.160 salt.states.libcloud\_storage module

### Apache Libcloud Storage State

Manage cloud storage using libcloud

**codeauthor** Anthony Shaw <anthonyshaw@apache.org>

Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/storage/supported\\_providers.html](http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html)

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

**configuration** This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
 profile_test1:
 driver: google_storage
 key: G00G0123456789ABCXYZ
 secret: mysecret
 profile_test2:
 driver: s3
 key: 12345
 secret: mysecret
```

### Examples

#### Creating a container and uploading a file

```
web_things:
 libcloud_storage.container_present:
 name: my_container_name
 profile: profile1
 libcloud_storage.object_present:
 name: my_file.jpg
 container: my_container_name
 path: /path/to/local/file.jpg
 profile: profile1
```

#### Downloading a file

This example will download the file from the remote cloud and keep it locally

```
web_things:
 libcloud_storage.file_present:
 name: my_file.jpg
 container: my_container_name
 path: /path/to/local/file.jpg
 profile: profile1
```

**depends** apache-libcloud

**salt.states.libcloud\_storage.container\_absent**(*name*, *profile*)

Ensures a container is absent.

**Parameters**

- **name** (str) -- Container name
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.container_present(name, profile)`

Ensures a container is present.

**Parameters**

- **name** (str) -- Container name
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.file_present(container, name, path, profile, overwrite_existing=False)`

Ensures a object is downloaded locally.

**Parameters**

- **container** (str) -- Container name
- **name** (str) -- Object name in cloud
- **path** (str) -- Local path to file
- **profile** (str) -- The profile key
- **overwrite\_existing** (bool) -- Replace if already exists

`salt.states.libcloud_storage.object_absent(container, name, profile)`

Ensures a object is absent.

**Parameters**

- **container** (str) -- Container name
- **name** (str) -- Object name in cloud
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.object_present(container, name, path, profile)`

Ensures a object is present.

**Parameters**

- **container** (str) -- Container name
- **name** (str) -- Object name in cloud
- **path** (str) -- Local path to file
- **profile** (str) -- The profile key

`salt.states.libcloud_storage.state_result(result, message, name, changes)`

## 21.19.161 salt.states.linux\_acl

Linux File Access Control Lists

The Linux ACL state module requires the *getfacl* and *setfacl* binaries.

Ensure a Linux ACL is present

```
root:
 acl.present:
 - name: /root
 - acl_type: user
 - acl_name: damian
 - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
 acl.absent:
 - name: /root
```

(continues on next page)

(continued from previous page)

```
- acl_type: user
- acl_name: damian
- perms: rwx
```

Ensure a Linux ACL list is present

```
root:
 acl.list_present:
 - name: /root
 - acl_type: user
 - acl_names:
 - damian
 - homer
 - perms: rwx
```

Ensure a Linux ACL list does not exist

```
root:
 acl.list_absent:
 - name: /root
 - acl_type: user
 - acl_names:
 - damian
 - homer
 - perms: rwx
```

**salt.states.linux\_acl.absent**(*name*, *acl\_type*, *acl\_name*="", *perms*="", *recurse*=False)

Ensure a Linux ACL does not exist

**name** The acl path

**acl\_type** The type of the acl is used for, it can be 'user' or 'group'

**acl\_name** The user or group

**perms** Remove the permissions eg.: rwx

**recurse** Set the permissions recursive in the path

**salt.states.linux\_acl.list\_absent**(*name*, *acl\_type*, *acl\_names*=None, *recurse*=False)

Ensure a Linux ACL list does not exist

Takes a list of acl names and remove them from the given path

**name** The acl path

**acl\_type** The type of the acl is used for, it can be 'user' or 'group'

**acl\_names** The list of users or groups

**perms** Remove the permissions eg.: rwx

**recurse** Set the permissions recursive in the path

**salt.states.linux\_acl.list\_present**(*name*, *acl\_type*, *acl\_names*=None, *perms*="", *recurse*=False, *force*=False)

Ensure a Linux ACL list is present

Takes a list of acl names and add them to the given path

**name** The acl path

**acl\_type** The type of the acl is used for it can be 'user' or 'group'

**acl\_names** The list of users or groups

**perms** Set the permissions eg.: rwx

**recurse** Set the permissions recursive in the path

**force** Wipe out old permissions and ensure only the new permissions are set

```
salt.states.linux_acl.present(name, acl_type, acl_name="", perms="", recurse=False, force=False)
```

Ensure a Linux ACL is present

**name** The acl path

**acl\_type** The type of the acl is used for it can be 'user' or 'group'

**acl\_name** The user or group

**perms** Set the permissions eg.: rwx

**recurse** Set the permissions recursive in the path

**force** Wipe out old permissions and ensure only the new permissions are set

### 21.19.162 salt.states.locale

#### Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
 locale.present:
 - name: en_US.UTF-8

default_locale:
 locale.system:
 - name: en_US.UTF-8
 - require:
 - locale: us_locale
```

```
salt.states.locale.present(name)
```

Generate a locale if it is not present

New in version 2014.7.0.

**name** The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

```
salt.states.locale.system(name)
```

Set the locale for the system

**name** The name of the locale to use

### 21.19.163 salt.states.logadm module

Management of logs using Solaris logadm.

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.modulus.logadm

**platform** Oracle Solaris, Sun Solaris, illumos

New in version nitrogen.

```
.. note::
 TODO
```

```
salt.states.logadm.remove(name, log_file=None)
```

Remove a log from the logadm configuration

**name** [string] entryname

**log\_file** [string] (optional) log file path

---

**Note:** If `log_file` is specified it will be used instead of the entry name.

---

`salt.states.logadm.rotate(name, **kwargs)`  
Add a log to the logadm configuration  
**name** [string] alias for entryname  
**kwargs** [boolean|string|int] optional additional flags and parameters

### 21.19.164 salt.states.logrotate module

Module for managing logrotate.

New in version 2017.7.0.

`salt.states.logrotate.set_(name, key, value, setting=None, conf_file='/etc/logrotate.conf')`  
Set a new value for a specific configuration line.

**Parameters**

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf\_file** (*str*) -- The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
 logrotate.set:
 - key: rotate
 - value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
 logrotate.set:
 - key: /var/log/wtmp
 - value: rotate
 - setting: 2
 - conf_file: /etc/logrotate.conf
```

### 21.19.165 salt.states.loop module

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

In both examples below, the execution module function `boto_elb.get_instance_health` returns a list of dicts. The condition checks the `state`-key of the first dict in the returned list and compares its value to the string `InService`.

```
wait_for_service_to_be_healthy:
 loop.until:
 - name: boto_elb.get_instance_health
 - condition: m_ret[0]['state'] == 'InService'
```

(continues on next page)

(continued from previous page)

```

- period: 5
- timeout: 20
- m_args:
 - {{ elb }}
- m_kwargs:
 keyid: {{ access_key }}
 key: {{ secret_key }}
 instances: "{{ instance }}"

```

**Warning:** This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

Changed in version 3000.

A version that does not use eval is now available. It uses either the python operator to compare the result of the function called in name, which can be one of the following: lt, le, eq (default), ne, ge, gt. Alternatively, *compare\_operator* can be filled with a function from an execution module in `__salt__` or `__utils__` like the example below. The function `data.subdict_match` checks if the expected expression matches the data returned by calling the name function (with passed args and kwargs).

```

Wait for service to be healthy:
loop.until_no_eval:
 - name: boto_elb.get_instance_health
 - expected: '0:state:InService'
 - compare_operator: data.subdict_match
 - period: 5
 - timeout: 20
 - args:
 - {{ elb }}
 - kwargs:
 keyid: {{ access_key }}
 key: {{ secret_key }}
 instances: "{{ instance }}"

```

```

salt.states.loop.until(name, m_args=None, m_kwargs=None, condition=None, period=1, timeout=60)

```

Loop over an execution module until a condition is met.

#### Parameters

- **name** (*str*) -- The name of the execution module
- **m\_args** (*list*) -- The execution module's positional arguments
- **m\_kwargs** (*dict*) -- The execution module's keyword arguments
- **condition** (*str*) -- The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.
- **period** (*int or float*) -- The number of seconds to wait between executions
- **timeout** (*int or float*) -- The timeout in seconds

```

salt.states.loop.until_no_eval(name, expected, compare_operator='eq', timeout=60, period=1, init_wait=0, args=None, kwargs=None)

```

Generic waiter state that waits for a specific salt function to produce an expected result. The state fails if the function does not exist or raises an exception, or does not produce the expected result within the allotted retries.

#### Parameters

- **name** (*str*) -- Name of the module.function to call
- **expected** -- Expected return value. This can be almost anything.

- **compare\_operator** (*str*) -- Operator to use to compare the result of the module.function call with the expected value. This can be anything present in `__salt__` or `__utils__`. Will be called with 2 args: result, expected.
- **timeout** (*int or float*) -- Abort after this amount of seconds (excluding `init_wait`).
- **period** (*int or float*) -- Time (in seconds) to wait between attempts.
- **init\_wait** (*int or float*) -- Time (in seconds) to wait before trying anything.
- **args** (*list*) -- args to pass to the salt module.function.
- **kwargs** (*dict*) -- kwargs to pass to the salt module.function.

New in version 3000.

## 21.19.166 salt.states.lvm

### Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
 lvm.pv_present

my_vg:
 lvm.vg_present:
 - devices: /dev/sda

lvroot:
 lvm.lv_present:
 - vgname: my_vg
 - size: 10G
 - stripes: 5
 - stripesize: 8K
```

**salt.states.lvm.lv\_absent**(*name*, *vgname=None*)

Remove a given existing Logical Volume from a named existing volume group

**name** The Logical Volume to remove

**vgname** The name of the Volume Group on which the Logical Volume resides

**salt.states.lvm.lv\_present**(*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv=""*, *thinvolume=False*, *thinpool=False*, *force=False*, *\*\*kwargs*)

Create a new Logical Volume

**name** The name of the Logical Volume

**vgname** The name of the Volume Group on which the Logical Volume resides

**size** The initial size of the Logical Volume

**extents** The number of logical extents to allocate

**snapshot** The name of the snapshot

**pv** The Physical Volume to use

**kwargs** Any supported options to `lvcreate`. See [linux\\_lvm](#) for more details.

New in version `to_complete`.

**thinvolume** Logical Volume is thinly provisioned

**thinpool** Logical Volume is a thin pool

New in version 2018.3.0.

**force** Assume yes to all prompts

**salt.states.lvm.pv\_absent**(*name*)

Ensure that a Physical Device is not being used by lvm

**name** The device name to initialize.

```

salt.states.lvm.pv_present(name, **kwargs)
 Set a Physical Device to be used as an LVM Physical Volume
 name The device name to initialize.
 kwargs Any supported options to pvcreate. See linux_lvm for more details.

salt.states.lvm.vg_absent(name)
 Remove an LVM volume group
 name The volume group to remove

salt.states.lvm.vg_present(name, devices=None, **kwargs)
 Create an LVM Volume Group
 name The Volume Group name to create
 devices A list of devices that will be added to the Volume Group
 kwargs Any supported options to vgcreate. See linux_lvm for more details.

```

### 21.19.167 salt.states.lvs\_server

#### Management of LVS (Linux Virtual Server) Real Server

```

salt.states.lvs_server.absent(name, protocol=None, service_address=None,
 server_address=None)
 Ensure the LVS Real Server in specified service is absent.
 name The name of the LVS server.
 protocol The service protocol(only support tcp, udp and fwmark service).
 service_address The LVS service address.
 server_address The LVS real server address.

salt.states.lvs_server.present(name, protocol=None, service_address=None,
 server_address=None, packet_forward_method='dr', weight=1)
 Ensure that the named service is present.
 name The LVS server name
 protocol The service protocol
 service_address The LVS service address
 server_address The real server address.
 packet_forward_method The LVS packet forwarding method(dr for direct routing, tunnel for tunneling,
 nat for network access translation).
 weight The capacity of a server relative to the others in the pool.

```

```

lvsrs:
 lvs_server.present:
 - protocol: tcp
 - service_address: 1.1.1.1:80
 - server_address: 192.168.0.11:8080
 - packet_forward_method: dr
 - weight: 10

```

## 21.19.168 salt.states.lvs\_service

### Management of LVS (Linux Virtual Server) Service

`salt.states.lvs_service.absent(name, protocol=None, service_address=None)`

Ensure the LVS service is absent.

**name** The name of the LVS service

**protocol** The service protocol

**service\_address** The LVS service address

`salt.states.lvs_service.present(name, protocol=None, service_address=None, scheduler='wlc')`

Ensure that the named service is present.

**name** The LVS service name

**protocol** The service protocol

**service\_address** The LVS service address

**scheduler** Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
 lvs_service.present:
 - service_address: 1.1.1.1:80
 - protocol: tcp
 - scheduler: rr
```

## 21.19.169 salt.states.lxc

### Manage Linux Containers

`salt.states.lxc.absent(name, stop=False, path=None)`

Ensure a container is not present, destroying it if present

**name** Name of the container to destroy

**stop** stop before destroying default: false

New in version 2015.5.2.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
 lxc.absent
```

`salt.states.lxc.edited_conf(name, lxc_conf=None, lxc_conf_unset=None)`

**Warning:** This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface).

[Issue #35523](#) was opened to track the addition of a suitable replacement or fix.

Edit LXC configuration options

Deprecated since version 2015.5.0.

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```

setconf:
 lxc.edited_conf:
 - name: ubuntu
 - lxc_conf:
 - network.ipv4.ip: 10.0.3.6
 - lxc_conf_unset:
 - lxc.utsname

```

`salt.states.lxc.frozen` (*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

---

**Note:** This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use [lxc.present](#).

---

**name** The name of the container

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**start** [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```

web01:
 lxc.frozen

web02:
 lxc.frozen:
 - start: False

```

`salt.states.lxc.present` (*name*, *running=None*, *clone\_from=None*, *snapshot=False*, *profile=None*, *network\_profile=None*, *template=None*, *options=None*, *image=None*, *config=None*, *fstype=None*, *size=None*, *backing=None*, *vgname=None*, *lvname=None*, *thinpool=None*, *path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

**name** The name of the container to be created

**path** path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**running** [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

**clone\_from** Create named container as a clone of the specified container

**snapshot** [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

**profile** Profile to use in container creation (see the [LXC Tutorial](#) for more information). Values in a profile will be overridden by the parameters listed below.

**network\_profile** Network Profile to use in container creation (see the [LXC Tutorial](#) for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

**Container Creation Arguments**

**template** The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the `lxc.images` function.

---

**options**

New in version 2015.5.0.

Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
 lxc.present:
 - template: download
 - options:
 dist: centos
 release: 6
 arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

For available template options, refer to the `lxc` template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image** A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing** The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype** Filesystem type to use on LVM logical volume

**size** Size of the volume to create. Only applicable if `backing` is set to `lvm`.

**vgname** [`lxc`] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**lvname** Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.

**thinpool** Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

**salt.states.lxc.running**(*name, restart=False, path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

---

**Note:** This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use `lxc.present`.

---

**name** The name of the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**restart** [`False`] Restart container if it is already running

```
web01:
 lxc.running

web02:
 lxc.running:
 - restart: True
```

`salt.states.lxc.set_pass(name, **kwargs)`

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that `lxc.set_password` uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
 module.run:
 - name: set_pass
 - m_name: root
 - password: secret
```

`salt.states.lxc.stopped(name, kill=False, path=None)`

Ensure that a container is stopped

**Note:** This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use `lxc.present`, or use the `lxc.absent` state to ensure that the container does not exist.

**name** The name of the container

**path** path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**kill** [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
 lxc.stopped
```

### 21.19.170 salt.states.lxd module

Manage LXD profiles.

New in version 2019.2.0.

**maintainer** René Jochum <rene@jochums.at>

**maturity** new

**depends** python-pylxd

**platform** Linux

`salt.states.lxd.authenticate(name, remote_addr, password, cert, key, verify_cert=True)`

Authenticate with a remote peer.

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

Examples: <https://myserver.lan:8443> /var/lib/mysocket.sock  
**password** : The PaSsW0rD  
**cert** : PEM Formatted SSL Zertifikate.  
Examples: /root/.config/lxc/client.crt  
**key** : PEM Formatted SSL Key.  
Examples: /root/.config/lxc/client.key  
**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.  
**name**: Ignore this. This is just here for salt.

**salt.states.lxd.config\_managed**(*name*, *value*, *force\_password=False*)

Manage a LXD Server config setting.

**name** : The name of the config key.

**value** : Its value.

**force\_password** [False] Set this to True if you want to set the password on every run.

As we can't retrieve the password from LXD we can't check if the current one is the same as the given one.

**salt.states.lxd.init**(*name*, *storage\_backend='dir'*, *trust\_password=None*, *network\_address=None*, *network\_port=None*, *storage\_create\_device=None*, *storage\_create\_loop=None*, *storage\_pool=None*, *done\_file='%SALT\_CONFIG\_DIR%/lxd\_initialized'*)

Initializes the LXD Daemon, as LXD doesn't tell if its initialized we touch the *done\_file* and check if it exist.

This can only be called once per host unless you remove the *done\_file*.

**name** : Ignore this. This is just here for salt.

**storage\_backend** : Storage backend to use (zfs or dir, default: dir)

**trust\_password** : Password required to add new clients

**network\_address** [None] Address to bind LXD to (default: none)

**network\_port** [None] Port to bind LXD to (Default: 8443)

**storage\_create\_device** [None] Setup device based storage using this DEVICE

**storage\_create\_loop** [None] Setup loop based storage with this SIZE in GB

**storage\_pool** [None] Storage pool to use or create

**done\_file** : Path where we check that this method has been called, as it can run only once and there's currently no way to ask LXD if init has been called.

### 21.19.171 salt.states.lxd\_container module

Manage LXD containers.

New in version 2019.2.0.

**maintainer** René Jochum <[rene@jochums.at](mailto:rene@jochums.at)>

**maturity** new

**depends** python-pylxd

**platform** Linux

**salt.states.lxd\_container.absent**(*name*, *stop=False*, *remote\_addr=None*, *cert=None*, *key=None*, *verify\_cert=True*)

Ensure a LXD container is not present, destroying it if present

**name** : The name of the container to destroy

**stop** : stop before destroying default: false

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide *remote\_addr*!

Examples: <https://myserver.lan:8443> /var/lib/mysocket.sock

**cert** : PEM Formatted SSL Zertifikate.

Examples: `~/.config/lxc/client.crt`  
**key** : PEM Formatted SSL Key.

Examples: `~/.config/lxc/client.key`  
**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**salt.states.lxd\_container.frozen**(*name, start=True, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Ensure a LXD container is frozen, start and freeze it if start is true

**name** : The name of the container to freeze

**start** : start and freeze it

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

Examples: `https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** : PEM Formatted SSL Zertifikate.

Examples: `~/.config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

Examples: `~/.config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**salt.states.lxd\_container.migrated**(*name, remote\_addr, cert, key, verify\_cert, src\_remote\_addr, stop\_and\_start=False, src\_cert=None, src\_key=None, src\_verify\_cert=None*)

Ensure a container is migrated to another host

If the container is running, it either must be shut down first (use `stop_and_start=True`) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate <salt.states.lxd.authenticate` to authenticate your cert(s).

**name** : The container to migrate

**remote\_addr** : An URL to the destination remote Server

Examples: `https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** : PEM Formatted SSL Zertifikate.

Examples: `~/.config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

Examples: `~/.config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**src\_remote\_addr** : An URL to the source remote Server

Examples: `https://myserver.lan:8443 /var/lib/mysocket.sock`

**stop\_and\_start** : Stop before migrating and start after

**src\_cert** : PEM Formatted SSL Zertifikate, if None we copy "cert"

Examples: `~/.config/lxc/client.crt`

**src\_key** : PEM Formatted SSL Key, if None we copy "key"

Examples: `~/.config/lxc/client.key`

**src\_verify\_cert** : Wherever to verify the cert, if None we copy "verify\_cert"

**salt.states.lxd\_container.present**(*name, running=None, source=None, profiles=None, config=None, devices=None, architecture='x86\_64', ephemeral=False, restart\_on\_change=False, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Create the named container if it does not exist

**name** The name of the container to be created

**running** [None]

- If True, ensure that the container is running
- If False, ensure that the container is stopped

- If None, do nothing with regards to the running state of the container

**source** [None] Can be either a string containing an image alias:

```
"xenial/amd64"
```

or an dict with type "image" with alias:

```
{"type": "image",
 "alias": "xenial/amd64"}
```

or image with "fingerprint":

```
{"type": "image",
 "fingerprint": "SHA-256"}
```

or image with "properties":

```
{"type": "image",
 "properties": {
 "os": "ubuntu",
 "release": "14.04",
 "architecture": "x86_64"
 }}
```

or none:

```
{"type": "none"}
```

or copy:

```
{"type": "copy",
 "source": "my-old-container"}
```

**profiles** [['default']] List of profiles to apply on this container

**config** : A config dict or None (None = unset).

Can also be a list:

```
[{'key': 'boot.autostart', 'value': 1},
 {'key': 'security.privileged', 'value': '1'}]
```

**devices** : A device dict or None (None = unset).

**architecture** ['x86\_64'] Can be one of the following:

- unknown
- i686
- x86\_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

**ephemeral** [False] Destroy this container after stop?

**restart\_on\_change** [False] Restart the container when we detect changes on the config or its devices?

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:** [https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert** : PEM Formatted SSL Zertifikate.

**Examples:** `~/config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

**Examples:** `~/config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.states.lxd_container.running(name, restart=False, remote_addr=None, cert=None,
 key=None, verify_cert=True)
```

Ensure a LXD container is running and restart it if restart is True

**name** : The name of the container to start/restart.

**restart** : restart the container if it is already started.

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:** `https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** : PEM Formatted SSL Zertifikate.

**Examples:** `~/config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

**Examples:** `~/config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.states.lxd_container.stopped(name, kill=False, remote_addr=None, cert=None, key=None,
 verify_cert=True)
```

Ensure a LXD container is stopped, kill it if kill is true else stop it

**name** : The name of the container to stop

**kill** : kill if true

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:** `https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** : PEM Formatted SSL Zertifikate.

**Examples:** `~/config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

**Examples:** `~/config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

## 21.19.172 salt.states.lxd\_image module

Manage LXD images.

New in version 2019.2.0.

**maintainer** René Jochum <rene@jochums.at>

**maturity** new

**depends** python-pylxd

**platform** Linux

```
salt.states.lxd_image.absent(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

**name** : An alias or fingerprint of the image to check and delete.

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:** `https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert** : PEM Formatted SSL Zertifikate.

**Examples:** `~/config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

**Examples:** `~/config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.states.lxd_image.present`(*name, source, aliases=None, public=None, auto\_update=None, remote\_addr=None, cert=None, key=None, verify\_cert=True*)

Ensure an image exists, copy it else from source

**name** : An alias of the image, this is used to check if the image exists and it will be added as alias to the image on copy/create.

**source** : Source dict.

For an LXD to LXD copy:

```
source:
 type: lxd
 name: ubuntu/xenial/amd64 # This can also be a fingerprint.
 remote_addr: https://images.linuxcontainers.org:8443
 cert: ~/.config/lxd/client.crt
 key: ~/.config/lxd/client.key
 verify_cert: False
```

From file:

```
source:
 type: file
 filename: salt://lxd/files/busybox.tar.xz
 saltenv: base
```

From simplestreams:

```
source:
 type: simplestreams
 server: https://cloud-images.ubuntu.com/releases
 name: xenial/amd64
```

From an URL:

```
source:
 type: url
 url: https://dl.stgraber.org/lxd
```

**aliases** : List of aliases to append, can be empty.

**public** :

Make this image public available on this instance? None on source\_type LXD means copy source  
None on source\_type file means False

**auto\_update** :

Try to auto-update from the original source? None on source\_type LXD means copy source  
source\_type file does not have auto-update.

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

Examples: [https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert** : PEM Formatted SSL Zertifikate.

Examples: `~/.config/lxc/client.crt`

**key** : PEM Formatted SSL Key.

Examples: `~/.config/lxc/client.key`

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

### 21.19.173 salt.states.lxd\_profile module

Manage LXD profiles.

New in version 2019.2.0.

**maintainer** René Jochum <rene@jochums.at>

**maturity** new

**depends** python-pylxd

**platform** Linux

**salt.states.lxd\_profile.absent**(name, remote\_addr=None, cert=None, key=None, verify\_cert=True)

Ensure a LXD profile is not present, removing it if present.

**name** : The name of the profile to remove.

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:** [https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert** : PEM Formatted SSL Zertifikate.

**Examples:** [~/config/lxc/client.crt](#)

**key** : PEM Formatted SSL Key.

**Examples:** [~/config/lxc/client.key](#)

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the *requests-docs* for the SSL stuff.

**salt.states.lxd\_profile.present**(name, description=None, config=None, devices=None, remote\_addr=None, cert=None, key=None, verify\_cert=True)

Creates or updates LXD profiles

**name** : The name of the profile to create/update

**description** : A description string

**config** : A config dict or None (None = unset).

Can also be a list:

**Examples:** `[[{'key': 'boot.autostart', 'value': 1}, {'key': 'security.privileged', 'value': '1'}]`

**devices** : A device dict or None (None = unset).

**remote\_addr** : An URL to a remote Server, you also have to give cert and key if you provide remote\_addr!

**Examples:** [https://myserver.lan:8443 /var/lib/mysocket.sock](https://myserver.lan:8443/var/lib/mysocket.sock)

**cert** : PEM Formatted SSL Zertifikate.

**Examples:** [~/config/lxc/client.crt](#)

**key** : PEM Formatted SSL Key.

**Examples:** [~/config/lxc/client.key](#)

**verify\_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the *lxd-docs* for the details about the config and devices dicts. See the *requests-docs* for the SSL stuff.

## 21.19.174 salt.states.mac\_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osascript:
assistive.installed:
- enabled: True
```

**salt.states.mac\_assistive.installed**(*name*, *enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

**name** The bundle ID or path to command

**enable** Should assistive access be enabled on this application?

## 21.19.175 salt.states.mac\_keychain module

Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:
keychain.installed:
- password: test123
```

**salt.states.mac\_keychain.default\_keychain**(*name*, *domain='user'*, *user=None*)

Set the default keychain to use

**name** The chain in which to use as the default

**domain** The domain to use valid values are user|system|common|dynamic, the default is user

**user** The user to run as

**salt.states.mac\_keychain.installed**(*name*, *password*, *keychain='/Library/Keychains/System.keychain'*,  
*\*\*kwargs*)

Install a p12 certificate file into the macOS keychain

**name** The certificate to install

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**keychain** The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

**allow\_any** Allow any application to access the imported certificate without warning

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

**salt.states.mac\_keychain.uninstalled**(*name*, *password*, *keychain='/Library/Keychains/System.keychain'*,  
*keychain\_password=None*)

Uninstall a p12 certificate file from the macOS keychain

**name** The certificate to uninstall, this can be a path for a .p12 or the friendly name

**password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

**cert\_name** The friendly name of the certificate, this can be used instead of giving a certificate

**keychain** The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

**keychain\_password** If your keychain is likely to be locked pass the password and it will be unlocked before running the import

## 21.19.176 salt.states.mac\_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```
/path/to/file:
 xattr.exists:
 - attributes:
 - com.file.attr=test
 - com.apple.quarantine=0x00001111
```

**salt.states.mac\_xattr.delete**(*name, attributes*)

Make sure the given attributes are deleted from the file/directory

**name** The path to the file/directory

**attributes** The attributes that should be removed from the file/directory, this is accepted as an array.

**salt.states.mac\_xattr.exists**(*name, attributes*)

Make sure the given attributes exist on the file/directory

**name** The path to the file/directory

**attributes** The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

## 21.19.177 salt.states.macdefaults

Writing/reading defaults from a macOS minion

**salt.states.macdefaults.absent**(*name, domain, user=None*)

Make sure the defaults value is absent

**name** The key of the given domain to remove

**domain** The name of the domain to remove from

**user** The user to write the defaults to

**salt.states.macdefaults.write**(*name, domain, value, vtype='string', user=None*)

Write a default to the system

**name** The key of the given domain to write to

**domain** The name of the domain to write to

**value** The value to write to the given key

**vtype** The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

**user** The user to write the defaults to

## 21.19.178 salt.states.macpackage

Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
 macpackage.installed:
 - store: True

/mnt/test.dmg:
```

(continues on next page)

(continued from previous page)

```

macpackage.installed:
- dmg: True

/mnt/xcode.dmg:
macpackage.installed:
- dmg: True
- app: True
- target: /Applications/Xcode.app
- version_check: xcodebuild -version=Xcode 7.1\n.*7B91b

```

```

salt.states.macpackage.installed(name, target='LocalSystem', dmg=False, store=False,
 app=False, mpkg=False, force=False, allow_untrusted=False,
 version_check=None)

```

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

**name** The pkg or dmg file to install

**target** The location in which to install the package. This can be a path or LocalSystem

**dmg** Is the given file a dmg file?

**store** Should the pkg be installed as if it was from the Mac OS Store?

**app** Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

**mpkg** Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

**force** Force the package to be installed even if its already been found installed

**allow\_untrusted** Allow the installation of untrusted packages

**version\_check** The command and version that we want to check against, the version number can use regex.

```

version_check: python --version_check=2.7.[0-9]

```

## 21.19.179 salt.states.makeconf

### Management of Gentoo make.conf

A state module to manage Gentoo's make.conf file

```

makeopts:
makeconf.present:
- value: '-j3'

```

```

salt.states.makeconf.absent(name)

```

Verify that the variable is not in the make.conf.

**name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

```

salt.states.makeconf.present(name, value=None, contains=None, excludes=None)

```

Verify that the variable is in the make.conf and has the provided settings. If value is set, contains and excludes will be ignored.

**name** The variable name. This will automatically be converted to upper case since variables in make.conf are in upper case

**value** Enforce that the value of the variable is set to the provided value

**contains** Enforce that the value of the variable contains the provided value

**excludes** Enforce that the value of the variable does not contain the provided value.

## 21.19.180 salt.states.marathon\_app module

Configure Marathon apps via a salt proxy.

```
my_app:
 marathon_app.config:
 - config:
 cmd: "while [true] ; do echo 'Hello Marathon' ; sleep 5 ; done"
 cpus: 0.1
 mem: 10
 instances: 3
```

New in version 2015.8.2.

**salt.states.marathon\_app.absent(name)**

Ensure that the marathon app with the given id is not present.

**Parameters** **name** -- The app name/id

**Returns** A standard Salt changes dictionary

**salt.states.marathon\_app.config(name, config)**

Ensure that the marathon app with the given id is present and is configured to match the given config values.

**Parameters**

- **name** -- The app name/id

- **config** -- The configuration to apply (dict)

**Returns** A standard Salt changes dictionary

**salt.states.marathon\_app.running(name, restart=False, force=True)**

Ensure that the marathon app with the given id is present and restart if set.

**Parameters**

- **name** -- The app name/id

- **restart** -- Restart the app

- **force** -- Override the current deployment

**Returns** A standard Salt changes dictionary

## 21.19.181 salt.states.mdadm RAID

Managing software RAID with mdadm

**depends** mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
 raid.present:
 - level: 5
 - devices:
 - /dev/xvdd
 - /dev/xvde
 - /dev/xvdf
 - chunk: 256
 - run: True
```

**salt.states.mdadm RAID.absent(name)**

Verify that the raid is absent

**name** The name of raid device to be destroyed

```
/dev/md0:
raid:
 - absent
```

`salt.states.mdadm_raid.present(name, level, devices, **kwargs)`

Verify that the raid is present

Changed in version 2014.7.0.

**name** The name of raid device to be created

**level** The RAID level to use when creating the raid.

**devices** A list of devices used to build the array.

**kwargs** Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
raid.present:
 - level: 5
 - devices:
 - /dev/xvdd
 - /dev/xvde
 - /dev/xvdf
 - chunk: 256
 - run: True
```

## 21.19.182 salt.states.memcached

### States for Management of Memcached Keys

New in version 2014.1.0.

`salt.states.memcached.absent(name, value=None, host='127.0.0.1', port=11211, time=0)`

Ensure that a memcached key is not present.

**name** The key

**value** [None] If specified, only ensure that the key is absent if it matches the specified value.

**host** The memcached server IP address

**port** The memcached server port

```
foo:
 memcached.absent

bar:
 memcached.absent:
 - host: 10.0.0.1
```

`salt.states.memcached.managed(name, value=None, host='127.0.0.1', port=11211, time=0, min_compress_len=0)`

Manage a memcached key.

**name** The key to manage

**value** The value to set for that key

**host** The memcached server IP address

**port** The memcached server port

```
foo:
 memcached.managed:
 - value: bar
```

### 21.19.183 salt.states.modjk

State to control Apache modjk

`salt.states.modjk.worker_activated(name, workers=None, profile='default')`

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
 modjk.worker_activated:
 - workers:
 - app1
 - app2
```

`salt.states.modjk.worker_disabled(name, workers=None, profile='default')`

Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
 modjk.worker_disabled:
 - workers:
 - app1
 - app2
```

`salt.states.modjk.worker_recover(name, workers=None, profile='default')`

Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
 modjk.worker_recover:
 - workers:
 - app1
 - app2
```

`salt.states.modjk.worker_stopped(name, workers=None, profile='default')`

Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
 modjk.worker_stopped:
 - workers:
 - app1
 - app2
```

### 21.19.184 salt.states.modjk\_worker

#### Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.\*** functions (see [here](#) for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module [documentation](#)

`salt.states.modjk_worker.activate(name, lbn, target, profile='default', tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
 modjk_worker.activate:
 - name: {{ grains['id'] }}
 - lbn: application
 - target: 'roles:balancer'
 - tgt_type: grain
```

`salt.states.modjk_worker.disable(name, lbn, target, profile='default', tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
 modjk_worker.disable:
 - name: {{ grains['id'] }}
 - lbn: application
 - target: 'roles:balancer'
 - tgt_type: grain
```

`salt.states.modjk_worker.stop(name, lbn, target, profile='default', tgt_type='glob')`

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
 modjk_worker.stop:
 - name: {{ grains['id'] }}
 - lbn: application
 - target: 'roles:balancer'
 - tgt_type: grain
```

## 21.19.185 salt.states.module

### Execution of Salt modules from within states

**Note:** There are two styles of calling `module.run`. The legacy style will no longer be available starting in the 3005 release. To opt-in early to the new style you must add the following to your `/etc/salt/minion` config file:

```
use_superseded:
- module.run
```

With `module.run` these states allow individual execution module calls to be made via states. Here's a contrived example, to show you how it's done:

```
New Style
test.random_hash:
 module.run:
 - test.random_hash:
 - size: 42
 - hash_type: sha256

Legacy Style
test.random_hash:
 module.run:
 - size: 42
 - hash_type: sha256
```

In the new style, the state ID (`test.random_hash`, in this case) is irrelevant when using `module.run`. It could have very well been written:

```
Generate a random hash:
 module.run:
 - test.random_hash:
 - size: 42
 - hash_type: sha256
```

For a simple state like that it's not a big deal, but if the module you're using has certain parameters, things can get cluttered, fast. Using the contrived custom module (stuck in `/srv/salt/_modules/foo.py`, or your configured `file_roots`):

```
def bar(name, names, fun, state, saltenv):
 return "Name: {name} Names: {names} Fun: {fun} State: {state} Saltenv: {saltenv}".
 ↪ format(**locals())
```

Your legacy state has to look like this:

```
Legacy style
Unfortunate example:
 module.run:
 - name: foo.bar
 - m_name: Some name
 - m_names:
 - Such names
 - very wow
```

(continues on next page)

(continued from previous page)

```
- m_state: Arkansas
- m_fun: Such fun
- m_saltenv: Salty
```

With the new style it's much cleaner:

```
New style
Better:
module.run:
- foo.bar:
 - name: Some name
 - names:
 - Such names
 - very wow
 - state: Arkansas
 - fun: Such fun
 - saltenv: Salty
```

The new style also allows multiple modules in one state. For instance, you can do this:

```
Do many things:
module.run:
- test.random_hash:
 - size: 10
 - hash_type: md5
 # Note the `:` at the end
- test.true:
- test.arg:
 - this
 - has
 - args
 - and: kwargs
 - isn't: that neat?
 # Note the `:` at the end, too
- test.version:
- test.fib:
 - 4
```

Where in the legacy style you would have had to split your states like this:

```
test.random_hash:
module.run:
 - size: 10
 - hash_type: md5

test.nop:
 module.run

test.arg:
module.run:
 - args:
 - this
 - has
 - args
 - kwargs:
 and: kwargs
```

(continues on next page)

(continued from previous page)

```

 isn't: that neat?

test.version:
 module.run

```

Another difference is that in the legacy style, unconsumed arguments to the `module` state were simply passed into the module function being executed:

```

show off module.run with args:
 module.run:
 - name: test.random_hash
 - size: 42
 - hash_type: sha256

```

The new style is much more explicit, with the arguments and keyword arguments being nested under the name of the function:

```

show off module.run with args:
 module.run:
 # Note the lack of `name: `, and trailing `:`
 - test.random_hash:
 - size: 42
 - hash_type: sha256

```

If the function takes `*args`, they can be passed in as well:

```

args and kwargs:
 module.run:
 - test.arg:
 - isn't
 - this
 - fun
 - this: that
 - salt: stack

```

## Modern Examples

Here are some other examples using the modern `module.run`:

```

fetch_out_of_band:
 module.run:
 - git.fetch:
 - cwd: /path/to/my/repo
 - user: myuser
 - opts: '--all'

```

A more complex example:

```

eventsviewer:
 module.run:
 - task.create_task:
 - name: events-viewer
 - user_name: System
 - action_type: Execute

```

(continues on next page)

(continued from previous page)

```
- cmd: 'c:\netops\scripts\events_viewer.bat'
- trigger_type: 'Daily'
- start_date: '2017-1-20'
- start_time: '11:59PM'
```

It is sometimes desirable to trigger a function call after a state is executed, for this the `module.wait` state can be used:

```
add example to hosts:
 file.append:
 - name: /etc/hosts
 - text: 203.0.113.13 example.com

New Style
mine.send:
 module.wait:
 # Again, note the trailing `:`
 - hosts.list_hosts:
 - watch:
 - file: add example to hosts
```

## Legacy (Default) Examples

If you're using the legacy `module.run`, due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- `fun`
- `name`
- `names`
- `state`
- `saltenv`

For example:

```
disable_nfs:
 module.run:
 - name: service.disable
 - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:
 module.run:
 - func: network.ip_addrs
 - kwargs:
 interface: eth0
```

```
cloud.create:
 module.run:
```

(continues on next page)

(continued from previous page)

```

- func: cloud.create
- provider: test-provider
- m_names:
 - test-vlad
- kwargs: {
 ssh_username: 'ubuntu',
 image: 'ami-8d6d9daa',
 securitygroup: 'default',
 size: 'c3.large',
 location: 'ap-northeast-1',
 delvol_on_destroy: 'True'
 }

```

Other modules take the keyword arguments using this style:

```

mac_enable_ssh:
 module.run:
 - name: system.set_remote_login
 - enable: True

```

Another example that creates a recurring task that runs a batch file on a Windows system:

```

eventsviewer:
 module.run:
 - name: task.create_task
 - m_name: 'events-viewer'
 - user_name: System
 - kwargs: {
 action_type: 'Execute',
 cmd: 'c:\netops\scripts\events_viewer.bat',
 trigger_type: 'Daily',
 start_date: '2017-1-20',
 start_time: '11:59PM'
 }

```

`salt.states.module.run(**kwargs)`

Run a single module function or a range of module functions in a batch. Supersedes `module.run` function, which requires `m_` prefix to function-specific parameters.

Parameters

- **returner** -- Specify a common returner for the whole batch to send the return data
- **kwargs** -- Pass any arguments needed to execute the function(s)

```

some_id_of_state:
 module.run:
 - network.ip_addrs:
 - interface: eth0
 - cloud.create:
 - names:
 - test-isbm-1
 - test-isbm-2
 - ssh_username: sles
 - image: sles12sp2
 - securitygroup: default
 - size: 'c3.large'
 - location: ap-northeast-1
 - delvol_on_destroy: True

```

### Returns

`salt.states.module.wait(name, **kwargs)`

Run a single module function only if the watch statement calls it

**name** The module function to execute

**\*\*kwargs** Pass any arguments needed to execute the function

---

**Note:** Like the `cmd.run` state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a `watch requisite`, and the state which it is watching changes.
  2. Another state has a `watch_in requisite` which references this state, and the state with the `watch_in` changes.
- 

## 21.19.186 salt.states.mongodb\_database

### Management of MongoDB Databases

#### depends

- pymongo Python module

Only deletion is supported, creation doesn't make sense and can be done using `mongodb_user.present`.

`salt.states.mongodb_database.absent(name, user=None, password=None, host=None, port=None, authdb=None)`

Ensure that the named database is absent. Note that creation doesn't make sense in MongoDB.

**name** The name of the database to remove

**user** The user to connect as (must be able to create the user)

**password** The password of the user

**host** The host to connect to

**port** The port to connect to

**authdb** The database in which to authenticate

## 21.19.187 salt.states.mongodb\_user

### Management of MongoDB Users

#### depends

- pymongo Python module

`salt.states.mongodb_user.absent(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)`

Ensure that the named user is absent

**name** The name of the user to remove

**user** MongoDB user with sufficient privilege to create the user

**password** Password for the admin user specified by the `user` parameter

**host** The hostname/IP address of the MongoDB server

**port** The port on which MongoDB is listening

**database** The database from which to remove the user specified by the `name` parameter

**authdb** The database in which to authenticate

`salt.states.mongodb_user.present(name, passwd, database='admin', user=None, password=None, host='localhost', port=27017, authdb=None, roles=None)`

Ensure that the user is present with the specified properties

**name** The name of the user to manage  
**passwd** The password of the user to manage  
**user** MongoDB user with sufficient privilege to create the user  
**password** Password for the admin user specified with the **user** parameter  
**host** The hostname/IP address of the MongoDB server  
**port** The port on which MongoDB is listening  
**database** The database in which to create the user

---

**Note:** If the database doesn't exist, it will be created.

---

**authdb** The database in which to authenticate  
**roles** The roles assigned to user specified with the **name** parameter  
 Example:

```

mongouser-myapp:
 mongodb_user.present:
 - name: myapp
 - passwd: password-of-myapp
 - database: admin
 # Connect as admin:sekrit
 - user: admin
 - password: sekret
 - roles:
 - readWrite
 - userAdmin
 - dbOwner

```

### 21.19.188 salt.states.monit

#### Monit state

Manage monit states

```

monit_enable_service_monitoring:
 monit.monitor:
 - name: service

monit_disable_service_monitoring:
 monit.unmonitor:
 - name: service

```

---

**Note:** Use of these states require that the *monit* execution module is available.

---

**salt.states.monit.monitor**(*name*)

Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

**salt.states.monit.unmonitor**(*name*)

Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

## 21.19.189 salt.states.mount

### Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
 mount.mounted:
 - device: /dev/sdb1
 - fstype: ext4
 - mkmnt: True
 - opts:
 - defaults

/srv/bigdata:
 mount.mounted:
 - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
 - fstype: xfs
 - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
 - dump: 0
 - pass_num: 2
 - persist: True
 - mkmnt: True

/var/lib/bigdata:
 mount.mounted:
 - device: /srv/bigdata
 - fstype: none
 - opts: bind
 - dump: 0
 - pass_num: 0
 - persist: True
 - mkmnt: True
```

**salt.states.mount.fstab\_absent**(*name*, *fs\_file*, *mount\_by*=None, *config*='/etc/fstab')

Makes sure that a fstab mount point is absent.

**name** The name of block device. Can be any valid fs\_spec value.

**fs\_file** Mount point (target) for the filesystem.

**mount\_by** Select the final value for fs\_spec. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for fs\_spec will be the parameter name, in other case will search the correct value based on the device name. For example, for uuid, the value for fs\_spec will be of type 'UUID=xxx' instead of the device name set in name.

**config** Place where the fstab file lives

**salt.states.mount.fstab\_present**(*name*, *fs\_file*, *fs\_vfstype*, *fs\_mntops*='defaults', *fs\_freq*=0, *fs\_passno*=0, *mount\_by*=None, *config*='/etc/fstab', *mount*=True, *match\_on*='auto', *not\_change*=False)

Makes sure that a fstab mount point is present.

**name** The name of block device. Can be any valid fs\_spec value.

**fs\_file** Mount point (target) for the filesystem.

**fs\_vfstype** The type of the filesystem (e.g. ext4, xfs, btrfs, ...)

**fs\_mntops** The mount options associated with the filesystem. Default is defaults.

**fs\_freq** Field is used by dump to determine which fs need to be dumped. Default is 0

**fs\_passno** Field is used by fsck to determine the order in which filesystem checks are done at boot time. Default is 0

**mount\_by** Select the final value for fs\_spec. Can be [None, device, label, uuid, partlabel, partuuid]. If None, the value for fs\_spec will be the parameter name, in other case will search

the correct value based on the device name. For example, for `uuid`, the value for `fs_spec` will be of type `'UUID=xxx'` instead of the device name set in `name`.

**config** Place where the `fstab` file lives. Default is `/etc/fstab`

**mount** Set if the mount should be mounted immediately. Default is `True`

**match\_on** A name or list of `fstab` properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on `fstype`. In general, `auto` matches on name for recognized special devices and device otherwise.

**not\_change** By default, if the entry is found in the `fstab` file but is different from the expected content (like different options), the entry will be replaced with the correct content. If this parameter is set to `True` and the line is found, the original content will be preserved.

`salt.states.mount.mod_watch(name, user=None, **kwargs)`

The mounted watcher, called to invoke the watch command.

---

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

**name** The name of the mount point

```
salt.states.mount.mounted(name, device, fstype, mkmnt=False, opts='defaults',
 dump=0, pass_num=0, config='/etc/fstab', persist=True,
 mount=True, user=None, match_on='auto', device_name_regex=None,
 extra_mount_invisible_options=None, extra_mount_invisible_keys=None,
 extra_mount_ignore_fs_keys=None, extra_mount_translate_options=None,
 hidden_opts=None, **kwargs)
```

Verify that a device is mounted

**name** The path to the location where the device is to be mounted

**device** The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`

**fstype** The filesystem type, this will be `xf`s, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of `nfs` mounts

**mkmnt** If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present

**opts** A list object of options or a comma delimited list

**dump** The dump value to be passed into the `fstab`, Default is `0`

**pass\_num** The pass value to be passed into the `fstab`, Default is `0`

**config** Set an alternative location for the `fstab`, Default is `/etc/fstab`

**persist** Set if the mount should be saved in the `fstab`, Default is `True`

**mount** Set if the mount should be mounted immediately, Default is `True`

**user** The account used to execute the mount; this defaults to the user salt is running as on the minion

**match\_on** A name or list of `fstab` properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on `fstype`. In general, `auto` matches on name for recognized special devices and device otherwise.

**device\_name\_regex** A list of device exact names or regular expressions which should not force a remount. For example, `glusterfs` may be mounted with a comma-separated list of servers in `fstab`, but the `/proc/self/mountinfo` will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
 mount.mounted:
 - name: /mnt/glusterfs_mount_point
 - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
```

(continues on next page)

(continued from previous page)

```

- fstype: glusterfs
- opts: _netdev,rw,defaults,direct-io-mode=disable
- mkmnt: True
- persist: True
- dump: 0
- pass_num: 0
- device_name_regex:
 - ({{ glusterfs_ip_list|join('|') }}):/volume_name

```

New in version 2016.11.0.

**extra\_mount\_invisible\_options** A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.

**extra\_mount\_invisible\_keys** A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

**extra\_mount\_ignore\_fs\_keys** A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
 'ramfs': ['size']
}
```

**extra\_mount\_translate\_options** A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
 'tcp': 'proto=tcp',
 'udp': 'proto=udp'
}
```

**hidden\_opts** A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

**salt.states.mount.swap**(*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
 mount.swap
```

**Note:** swap does not currently support LABEL

**salt.states.mount.unmounted**(*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*, *\*\*kwargs*)

New in version 0.17.0.

Verify that a device is not mounted

**name** The path to the location where the device is to be unmounted from

**device** The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

**config** Set an alternative location for the fstab, Default is `/etc/fstab`

**persist** Set if the mount should be purged from the fstab, Default is `False`

**user** The user to own the mount; this defaults to the user salt is running as on the minion

## 21.19.190 salt.states.mssql\_database module

### Management of Microsoft SQLServer Databases

The `mssql_database` module is used to create and manage SQL Server Databases

```
yolo:
 mssql_database.present
```

`salt.states.mssql_database.absent(name, **kwargs)`

Ensure that the named database is absent

**name** The name of the database to remove

`salt.states.mssql_database.present(name, containment='NONE', options=None, **kwargs)`

Ensure that the named database is present with the specified options

**name** The name of the database to manage

**containment** Defaults to `NONE`

**options** Can be a list of strings, a dictionary, or a list of dictionaries

## 21.19.191 salt.states.mssql\_login module

### Management of Microsoft SQLServer Logins

The `mssql_login` module is used to create and manage SQL Server Logins

```
frank:
 mssql_login.present
 - domain: mydomain
```

`salt.states.mssql_login.absent(name, **kwargs)`

Ensure that the named login is absent

**name** The name of the login to remove

`salt.states.mssql_login.present(name, password=None, domain=None, server_roles=None, options=None, **kwargs)`

Checks existence of the named login. If not present, creates the login with the specified roles and options.

**name** The name of the login to manage

**password** Creates a SQL Server authentication login Since hashed passwords are varbinary values, if the `new_login_password` is 'long', it will be considered to be `HASHED`.

**domain** Creates a Windows authentication login. Needs to be NetBIOS domain or hostname

**server\_roles** Add this login to all the server roles in the list

**options** Can be a list of strings, a dictionary, or a list of dictionaries

### 21.19.192 salt.states.mssql\_role module

#### Management of Microsoft SQLServer Databases

The mssql\_role module is used to create and manage SQL Server Roles

```
yolo:
 mssql_role.present
```

**salt.states.mssql\_role.absent**(*name*, *\*\*kwargs*)

Ensure that the named database is absent

**name** The name of the database to remove

**salt.states.mssql\_role.present**(*name*, *owner=None*, *grants=None*, *\*\*kwargs*)

Ensure that the named database is present with the specified options

**name** The name of the database to manage

**owner** Adds owner using AUTHORIZATION option

**Grants** Can only be a list of strings

### 21.19.193 salt.states.mssql\_user module

#### Management of Microsoft SQLServer Users

The mssql\_user module is used to create and manage SQL Server Users

```
frank:
 mssql_user.present:
 - database: yolo
```

**salt.states.mssql\_user.absent**(*name*, *\*\*kwargs*)

Ensure that the named user is absent

**name** The username of the user to remove

**salt.states.mssql\_user.present**(*name*, *login=None*, *domain=None*, *database=None*, *roles=None*, *options=None*, *\*\*kwargs*)

Checks existence of the named user. If not present, creates the user with the specified roles and options.

**name** The name of the user to manage

**login** If not specified, will be created WITHOUT LOGIN

**domain** Creates a Windows authentication user. Needs to be NetBIOS domain or hostname

**database** The database of the user (not the login)

**roles** Add this user to all the roles in the list

**options** Can be a list of strings, a dictionary, or a list of dictionaries

### 21.19.194 salt.states.msteams module

#### Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```
teams-message:
 msteams.post_card:
```

(continues on next page)

(continued from previous page)

```
- message: 'This state was executed successfully.'
- hook_url: https://outlook.office.com/webhook/837
```

The `hook_url` can be specified in the master or minion configuration like below:

```
msteams:
 hook_url: https://outlook.office.com/webhook/837
```

`salt.states.msteams.post_card(name, message, hook_url=None, title=None, theme_color=None)`  
Send a message to a Microsoft Teams channel

```
send-msteams-message:
 msteams.post_card:
 - message: 'This state was executed successfully.'
 - hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

**message** The message that is to be sent to the MS Teams channel.

The following parameters are optional:

**hook\_url** The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.

**title** The title for the card posted to the channel

**theme\_color** A hex code for the desired highlight color

### 21.19.195 salt.states.mysql\_database

#### Management of MySQL databases (schemas)

**depends**

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_database` module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
 mysql_database.present
```

`salt.states.mysql_database.absent(name, **connection_args)`

Ensure that the named database is absent

**name** The name of the database to remove

`salt.states.mysql_database.present(name, character_set=None, collate=None, **connection_args)`

Ensure that the named database is present with the specified properties

**name** The name of the database to manage

## 21.19.196 salt.states.mysql\_grants

### Management of MySQL grants (user permissions)

#### depends

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_grants` module is used to grant and revoke MySQL permissions.

The name you pass in purely symbolic and does not have anything to do with the grant itself.

The database parameter needs to specify a 'priv\_level' in the same specification as defined in the MySQL documentation:

- \*
- \*\*
- db\_name.\*
- db\_name.tbl\_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exampledb:
 mysql_grants.present:
 - grant: select,insert,update
 - database: exampledb.*
 - user: frank
 - host: localhost

frank_otherdb:
 mysql_grants.present:
 - grant: all privileges
 - database: otherdb.*
 - user: frank

restricted_singletable:
 mysql_grants.present:
 - grant: select
 - database: somedb.sometable
 - user: joe
```

`salt.states.mysql_grants.absent` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant\_option=False*, *escape=True*, *\*\*connection\_args*)

Ensure that the grant is absent

**name** The name (key) of the grant to add

**grant** The grant priv\_type (i.e. select,insert,update OR all privileges)

**database** The database priv\_level (i.e. db.tbl OR db.\*)

**user** The user to apply the grant to

**host** The network/host that the grant should apply to

`salt.states.mysql_grants.present` (*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant\_option=False*, *escape=True*, *revoke\_first=False*, *ssl\_option=False*, *\*\*connection\_args*)

Ensure that the grant is present with the specified properties

**name** The name (key) of the grant to add  
**grant** The grant `priv_type` (i.e. `select,insert,update` OR all privileges)  
**database** The database `priv_level` (i.e. `db.tbl` OR `db.*`)  
**user** The user to apply the grant to  
**host** The network/host that the grant should apply to  
**grant\_option** Adds the `WITH GRANT OPTION` to the defined grant. Default is `False`  
**escape** Defines if the database value gets escaped or not. Default is `True`  
**revoke\_first** By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a `db.table/user` pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `'revoke_first` options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

**ssl\_option** Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```

- SSL: True
- X509: True
- SUBJECT: <subject>
- ISSUER: <issuer>
- CIPHER: <cipher>

```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

## 21.19.197 salt.states.mysql\_query

### Execution of MySQL queries

New in version 2014.7.0.

#### depends

- MySQLdb Python module

**configuration** See `salt.modules.mysql` for setup instructions.

The `mysql_query` module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```

query_id:
 mysql_query.run
 - database: my_database
 - query: "SELECT * FROM table;"
 - output: "/tmp/query_id.txt"

```

`salt.states.mysql_query.run(name, database, query, output=None, grain=None, key=None, overwrite=True, check_db_exists=True, **connection_args)`

Execute an arbitrary query on the specified database

**name** Used only as an ID

**database** The name of the database to execute the query on

**query** The query to execute

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:** grain to store the output (need output=grain)

**key:** the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:** The file or grain will be overwritten if it already exists (default)

**check\_db\_exists:** The state run will check that the specified database exists (default=True) before running any queries

```
salt.states.mysql_query.run_file(name, database, query_file=None, output=None,
 grain=None, key=None, overwrite=True, saltenv=None,
 check_db_exists=True, **connection_args)
```

Execute an arbitrary query on the specified database

New in version 2017.7.0.

**name** Used only as an ID

**database** The name of the database to execute the query\_file on

**query\_file** The file of mysql commands to run

**output** grain: output in a grain other: the file to store results None: output to the result comment (default)

**grain:** grain to store the output (need output=grain)

**key:** the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

**overwrite:** The file or grain will be overwritten if it already exists (default)

**saltenv:** The saltenv to pull the query\_file from

**check\_db\_exists:** The state run will check that the specified database exists (default=True) before running any queries

## 21.19.198 salt.states.mysql\_user

### Management of MySQL users

**depends**

- MySQLdb Python module

**configuration** See *salt.modules.mysql* for setup instructions.

```
frank:
 mysql_user.present:
 - host: localhost
 - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
 mysql_user.present:
 - host: localhost
 - password: "bob@cat"
 - connection_user: someuser
 - connection_pass: somepass
```

(continues on next page)

(continued from previous page)

```
- connection_charset: utf8
- saltenv:
 - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See [salt.states.mysql\\_grants](#) for further instructions.

**salt.states.mysql\_user.absent**(*name*, *host*='localhost', *\*\*connection\_args*)

Ensure that the named user is absent

**name** The name of the user to remove

**salt.states.mysql\_user.present**(*name*, *host*='localhost', *password*=None, *password\_hash*=None, *allow\_passwordless*=False, *unix\_socket*=False, *password\_column*=None, *auth\_plugin*='mysql\_native\_password', *\*\*connection\_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting *password* and *password\_hash*, and setting *allow\_passwordless* to True.

**name** The name of the user to manage

**host** Host for which this user/password combo applies

**password** The password to use for this user. Will take precedence over the *password\_hash* option if both are specified.

**password\_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the \*. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-----+
| PASSWORD('mypass') |
+-----+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-----+
1 row in set (0.00 sec)
```

**allow\_passwordless** If True, then *password* and *password\_hash* can be omitted to permit a passwordless login.

New in version 0.16.2.

**unix\_socket** If True and *allow\_passwordless* is True, the *unix\_socket* auth plugin will be used.

## 21.19.199 salt.states.net\_napalm\_yang

### NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

## Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

`salt.states.net_napalm_yang.configured(name, data, **kwargs)`

Configure the network device, given the input data structured according to the YANG models.

---

**Note:** The main difference between this function and `managed` is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than the other. Additionally, the output of the `managed` is different, in such a way that the `pchange` field in the output contains structured data, rather than text.

---

**data** YANG structured data.

**models** A list of models to be used when generating the config.

**profiles:** **None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**test:** **False** Dry run? If set as **True**, will apply the config, discard and return the changes. Default: **False** and will commit the changes on the device.

**commit:** **True** Commit? Default: **True**.

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace:** **False** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
 napalm_yang.configured:
 - data: {{ expected_config | json }}
 - models:
 - models.openconfig_interfaces
 - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
 _kwargs:
 filter: true
 interfaces:
 interface:
 Et1:
 config:
 mtu: 9000
 Et2:
 config:
 description: "description example"
```

`salt.states.net_napalm_yang.managed(name, data, **kwargs)`

Manage the device configuration given the input data structured according to the YANG models.

**data** YANG structured data.

**models** A list of models to be used when generating the config.

**profiles: None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

**compliance\_report: False** Return the compliance report in the comment.

New in version 2017.7.3.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: False** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config = pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
 napalm_yang.managed:
 - data: {{ expected_config | json }}
 - models:
 - models.openconfig_interfaces
 - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
 _kwargs:
 filter: true
 interfaces:
 interface:
 Et1:
 config:
 mtu: 9000
 Et2:
 config:
 description: "description example"
```

## 21.19.200 salt.states.netacl

### Network ACL

Manage the firewall configuration on the network device managed through NAPALM. The firewall configuration is generated by [Capirca](#).

New in version 2017.7.0.

**codeauthor** Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)>

**maturity** new

**depends** capirca, napalm

**platform** unix

## Dependencies

### Capirca

To install Capirca, execute: `pip install capirca`.

### NAPALM

To be able to load configuration on network devices, it requires [NAPALM](#) library to be installed: `pip install napalm`. Please check [Installation](#) for complete details.

```
salt.states.netacl.filter(name, filter_name, filter_options=None, terms=None, prepend=True,
 pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=False,
 only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True,
 revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False)
```

Generate and load the configuration of a policy filter.

**filter\_name** The name of the policy filter.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**terms** Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with [pillarenv\\_from\\_saltenv](#), and is otherwise ignored.

**merge\_pillar: False** Merge terms with the corresponding value from the pillar. Default: `False`.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

---

**only\_lower\_merge: False** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**revision\_id** Add a comment in the filter config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date: True** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision\_date\_format: %Y/%m/%d** The date format to be used when generating the perforce data. Default: `%Y/%m/%d (<year>/<month>/<day>)`.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit? Default: `True`.

**debug: False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```
edge01.flw01:

 ID: my-filter
Function: netacl.filter
 Result: None
Comment: Testing mode: Configuration discarded.
Started: 12:24:40.598232
Duration: 2437.139 ms
Changes:

 ipv6 access-list my-filter
 remark $Id: my-filter_state $
 remark $Revision: 5 $
 remark my-other-term
 permit tcp any range 5678 5680 any
 exit

Summary for edge01.flw01

Succeeded: 1 (unchanged=1, changed=1)
Failed: 0

Total states run: 1
Total run time: 2.437 s
```

Pillar example:

```
acl:
- my-filter:
 options:
 - inet6
 terms:
 - my-term:
 source_port: [1234, 1235]
 protocol:
 - tcp
 - udp
```

(continues on next page)

(continued from previous page)

```

 source_address: 1.2.3.4
 action: reject
 - my-other-term:
 source_port:
 - [5678, 5680]
 protocol: tcp
 action: accept

```

State SLS Example:

```

{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key=
↳ 'firewall') -%}
my_first_filter_state:
 netacl.filter:
 - filter_name: {{ filter_name }}
 - options: {{ my_filter_cfg['options'] | json }}
 - terms: {{ my_filter_cfg['terms'] | json }}
 - revision_date: false
 - revision_no: 5
 - debug: true

```

Or:

```

my_first_filter_state:
 netacl.filter:
 - filter_name: my-filter
 - merge_pillar: true
 - pillar_key: firewall
 - revision_date: false
 - revision_no: 5
 - debug: true

```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json ``), instead of relying on the default Python serializer.

---

```

salt.states.netacl.managed(name, filters=None, prepend=True, pillar_key='acl', pillarenv=None,
 saltenv=None, merge_pillar=False, only_lower_merge=False, re-
 vision_id=None, revision_no=None, revision_date=True, revi-
 sion_date_format='%Y/%m/%d', test=False, commit=True, debug=False)

```

Manage the whole firewall configuration.

**filters** Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend: True** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while

existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar\_key:** `acl` The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar:** `False` Merge the `filters` will the corresponding values from the pillar. Default: `False`.

---

**Note:** By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

---

**only\_lower\_merge:** `False` Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

**test:** `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**revision\_id** Add a comment in the policy config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date:** `True` Boolean flag: display the date when the policy configuration was generated. Default: `True`.

**revision\_date\_format:** `%Y/%m/%d` The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

**commit:** `True` Commit? Default: `True`.

**debug:** `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:

 ID: netacl_example
 Function: netacl.managed
 Result: None
 Comment: Testing mode: Configuration discarded.
 Started: 12:03:24.807023

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json ``), instead of relying on the default Python serializer.

---

```

salt.states.netacl.term(name, filter_name, term_name, filter_options=None, pillar_key='acl',
 pillarenv=None, saltenv=None, merge_pillar=False, revision_id=None,
 revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d',
 test=False, commit=True, debug=False, source_service=None, destina-
 tion_service=None, **term_fields)

```

Manage the configuration of a specific policy term.

**filter\_name** The name of the policy filter.

**term\_name** The name of the term.

**filter\_options** Additional filter options. These options are platform-specific. See the complete list of [options](#).

**pillar\_key: acl** The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge\_pillar:** **False** Merge the CLI variables with the pillar. Default: **False**.

The properties specified through the state arguments have higher priority than the pillar.

**revision\_id** Add a comment in the term config having the description for the changes applied.

**revision\_no** The revision count.

**revision\_date:** **True** Boolean flag: display the date when the term configuration was generated. Default: **True**.

**revision\_date\_format:** **%Y/%m/%d** The date format to be used when generating the performce data. Default: **%Y/%m/%d** (<year>/<month>/<day>).

**test:** **False** Dry run? If set as **True**, will apply the config, discard and return the changes. Default: **False** and will commit the changes on the device.

**commit:** **True** Commit? Default: **True**.

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as **loaded\_config** containing the raw configuration loaded on the device.

**source\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a **source\_port** and **protocol**.

As this module is available on Unix platforms only, it reads the [IANA](#) port assignment from **/etc/services**.

If the user requires additional shortcuts to be referenced, they can add entries under **/etc/services**, which can be managed using the [file state](#).

**destination\_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a **destination\_port** and **protocol**. Allows the same options as **source\_service**.

**term\_fields** Term attributes. To see what fields are supported, please consult the list of supported [keywords](#). Some platforms have few other [optional](#) keywords.

---

**Note:** The following fields are accepted:

- action
- address
- address\_exclude
- comment
- counter
- expiration
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- log\_name
- loss\_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol\_except
- qos
- pan\_application
- routing\_instance
- source\_address
- source\_address\_exclude

- source\_port
  - source\_prefix
  - verbatim
  - packet\_length
  - fragment\_offset
  - hop\_limit
  - icmp\_type
  - ether\_type
  - traffic\_class\_count
  - traffic\_type
  - translated
  - dscp\_set
  - dscp\_match
  - dscp\_except
  - next\_ip
  - flexible\_match\_range
  - source\_prefix\_except
  - destination\_prefix\_except
  - vpn
  - source\_tag
  - destination\_tag
  - source\_interface
  - destination\_interface
  - flattened
  - flattened\_addr
  - flattened\_saddr
  - flattened\_daddr
  - priority
- 

**Note:** The following fields can be also a single value and a list of values:

- action
- address
- address\_exclude
- comment
- destination\_address
- destination\_address\_exclude
- destination\_port
- destination\_prefix
- forwarding\_class
- forwarding\_class\_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol\_except
- pan\_application
- source\_address
- source\_address\_exclude
- source\_port
- source\_prefix

- verbatim
- icmp\_type
- ether\_type
- traffic\_type
- dscp\_match
- dscp\_except
- flexible\_match\_range
- source\_prefix\_except
- destination\_prefix\_except
- source\_tag
- destination\_tag
- source\_service
- destination\_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
- ntp
- snmp
- ldap
- bgpd
```

---

**Note:** The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
- [1000, 2000]
- [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

---

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```
edge01.bjm01:

 ID: update_icmp_first_term
 Function: netacl.term
 Result: None
 Comment: Testing mode: Configuration discarded.
 Started: 12:49:09.174179
Duration: 5751.882 ms
```

(continues on next page)

(continued from previous page)

```

Changes:

diff:
[edit firewall]
+ family inet {
+ /*
+ ** $Id: update_icmp_first_term $
+ ** $Date: 2017/02/30 $
+ **
+ */
+ filter block-icmp {
+ term first-term {
+ from {
+ protocol icmp;
+ }
+ then {
+ reject;
+ }
+ }
+ }
+ }

```

Summary for edge01.bjm01

```

Succeeded: 1 (unchanged=1, changed=1)
Failed: 0

```

```

Total states run: 1
Total run time: 5.752 s

```

Pillar example:

```

firewall:
- block-icmp:
 terms:
 - first-term:
 protocol:
 - icmp
 action: reject

```

State SLS example:

```

{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
 netacl.term:
 - filter_name: {{ filter_name }}
 - filter_options:
 - not-interface-specific
 - term_name: {{ term_name }}
 - {{ my_term_cfg | json }}

```

Or directly referencing the pillar keys:

```
update_icmp_first_term:
 netacl.term:
 - filter_name: block-icmp
 - filter_options:
 - not-interface-specific
 - term_name: first-term
 - merge_pillar: true
```

---

**Note:** The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

---

---

**Note:** When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (``|json``), instead of relying on the default Python serializer.

---

## 21.19.201 salt.states.netconfig

### Network Config

Manage the configuration on a network device given a specific static config or template.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

### Dependencies

- *NAPALM proxy minion*
- *Network-related basic features execution module*

New in version 2017.7.0.

**salt.states.netconfig.commit\_cancelled**(*name*)

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the *net.load\_template* or *net.load\_config* execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
 netconfig.commit_cancelled
```

**salt.states.netconfig.commit\_confirmed**(*name*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the `net.load_template` or `net.load_config` execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

State SLS Example:

```
'20180726083540640360':
 netconfig.commit_confirmed
```

```
salt.states.netconfig.managed(name, template_name=None, template_source=None, template_hash=None,
 template_hash_name=None, saltenv='base',
 template_engine='jinja', skip_verify=False, context=None,
 defaults=None, test=False, commit=True, debug=False, replace=False,
 commit_in=None, commit_at=None, revert_in=None, revert_at=None,
 **template_vars)
```

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

**template\_name** Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
 base:
 - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template\_source:** `None` Inline config template to be rendered and loaded on the device.

**template\_hash:** `None` Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

**template\_hash\_name:** `None` When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

**saltenv:** `base` Specifies the template environment. This will influence the relative imports inside the templates.

**template\_engine:** `jinja` The following templates engines are supported:

- `cheetah`
- `genshi`

- *jinja*
- *mako*
- *py*
- *wempy*

**skip\_verify:** **False** If **True**, hash verification of remote file sources (<http://>, <https://>, <ftp://>) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

**test:** **False** Dry run? If set to **True**, will apply the config, discard and return the changes. Default: **False** (will commit the changes on the device).

**commit:** **True** Commit? Default: **True**.

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

---

**Note:** This argument cannot be used directly on the command line. Instead, it can be passed through the `pillar` variable when executing either of the `state.sls` or `state.apply` (see below for an example).

---

**commit\_in:** **None** Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit\_at:** **None** Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

---

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

---

---

**Note:** After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

---

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert\_in: None** Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert\_at: None** Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

---

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

---

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**replace: False** Load and replace the configuration. Default: `False` (will apply load merge).

**context: None** Overrides default context variables passed to the template.

New in version 2019.2.0.

**defaults:** `None` Default variables/context passed to the template.

**template\_vars** Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

---

**Note:** It is more recommended to use the `context` argument instead, to avoid any conflicts with other arguments.

---

SLS Example (e.g.: under `salt://router/config.sls`):

```
whole_config_example:
 netconfig.managed:
 - template_name: salt://path/to/complete_config.jinja
 - debug: True
 - replace: True
bgp_config_example:
 netconfig.managed:
 - template_name: /absolute/path/to/bgp_neighbors.mako
 - template_engine: mako
prefix_lists_example:
 netconfig.managed:
 - template_name: prefix_lists.cheetah
 - debug: True
 - template_engine: cheetah
ntp_peers_example:
 netconfig.managed:
 - template_name: http://bit.ly/2gK0j20
 - skip_verify: False
 - debug: True
 - peers:
 - 192.168.0.1
 - 192.168.0.1
ntp_peers_example_using_pillar:
 netconfig.managed:
 - template_name: http://bit.ly/2gK0j20
 - peers: {{ pillar.get('ntp.peers', []) }}
```

Multi template example:

```
hostname_and_ntp:
 netconfig.managed:
 - template_name:
 - https://bit.ly/20hSgqP
 - https://bit.ly/2M6C4Lx
 - https://bit.ly/20IWVTs
 - debug: true
 - context:
 hostname: {{ opts.id }}
 servers:
 - 172.17.17.1
 - 172.17.17.2
 peers:
 - 192.168.0.1
 - 192.168.0.2
```

Usage examples:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
$ sudo salt -N all-routers state.sls router.config pillar="{ 'debug': True}"
```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:

 ID: ntp_peers_example_using_pillar
 Function: netconfig.managed
 Result: None
 Comment: Testing mode: Configuration discarded.
 Started: 12:01:40.744535
 Duration: 8755.788 ms
 Changes:

 diff:
 [edit system ntp]

```

(continues on next page)

(continued from previous page)

```

 'result': None,
 'start_time': '12:09:09.811445'
 }
}
}

```

```

salt.states.netconfig.replace_pattern(name, pattern, repl, count=0, flags=8,
 bufsize=1, append_if_not_found=False,
 prepend_if_not_found=False,
 not_found_content=None, search_only=False,
 show_changes=True, backslash_literal=False,
 source='running', path=None, test=False, replace=True,
 debug=False, commit=True)

```

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

**pattern** A regular expression, to be matched using Python's `search()`.

**repl** The replacement text.

**count: 0** Maximum number of pattern occurrences to be replaced. If `count` is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

**flags (list or int): 8** A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize (int or str): 1** How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append\_if\_not\_found: False** If set to `True`, and pattern is not found, then the content will be appended to the file.

**prepend\_if\_not\_found: False** If set to `True` and pattern is not found, then the content will be prepended to the file.

**not\_found\_content** Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

**search\_only: False** If set to `true`, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

**show\_changes: True** If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

**backslash\_literal: False** Interpret backslashes as literal backslashes for the `repl` and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the `repl` on the second run of the state.

**source: running** The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

**path** Save the temporary configuration to a specific path, then read from there.

**test: False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit: True** Commit the configuration changes? Default: `True`.

**debug: False** Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**replace: True** Load and replace the configuration. Default: `True`.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

State SLS Example:

```
update_policy_name:
 netconfig.replace_pattern:
 - pattern: OLD-POLICY-NAME
 - repl: new-policy-name
 - debug: true
```

```
salt.states.netconfig.saved(name, source='running', user=None, group=None, mode=None,
 attrs=None, makedirs=False, dir_mode=None, replace=True,
 backup="", show_changes=True, create=True, tmp_dir="", tmp_ext="",
 encoding=None, encoding_errors='strict', allow_empty=False,
 follow_symlinks=True, check_cmd=None, win_owner=None,
 win_perms=None, win_deny_perms=None, win_inheritance=True,
 win_perms_reset=False, **kwargs)
```

New in version 2019.2.0.

Save the configuration to a file on the local file system.

**name** Absolute path to file where to save the configuration. To push the files to the Master, use [cp.push](#) Execution function.

**source: running** The configuration source. Choose from: running, candidate, startup. Default: running.

**user** The user to own the file, this defaults to the user salt is running as on the minion

**group** The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

**mode** The permissions to set on this file, e.g. 644, 0775, or 4664. The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if mode is specified.

---

**Note:** This option is **not** supported on Windows.

---

**attrs** The attributes to have on this file, e.g. a, i. The attributes can be any or a combination of the following characters: aAcCdDeijPsStTu.

---

**Note:** This option is **not** supported on Windows.

---

**makedirs: False** If set to True, then the parent directories will be created to facilitate the creation of the named file. If False, and the parent directory of the destination file doesn't exist, the state will fail.

**dir\_mode** If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

**replace: True** If set to False and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

**backup** Overrides the default backup mode for this specific file. See [backup\\_mode documentation](#) for more details.

**show\_changes: True** Output a unified diff of the old file and the new file. If False return a boolean if any changes were made.

**create: True** If set to False, then the file will only be managed if the file already exists on the system.

**encoding** If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See <https://docs.python.org/3/library/codecs.html#standard-encodings> for the list of available encodings.

**encoding\_errors:** **'strict'** Error encoding scheme. Default is `'strict'`. See <https://docs.python.org/2/library/codecs.html#codec-base-classes> for the list of available schemes.

**allow\_empty:** **True** If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

**follow\_symlinks:** **True** If the desired path is a symlink follow it and make changes to the file to which the symlink points.

**check\_cmd** The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

**tmp\_dir** Directory for temp file created by `check_cmd`. Useful for checkers dependent on config file location (e.g. daemons restricted to their own config directories by an apparmor profile).

**tmp\_ext** Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the `init-checkconf` upstart config checker).

**win\_owner:** **None** The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

**win\_perms:** **None** A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. perms must be specified. `applies_to` does not apply to file objects.

**win\_deny\_perms:** **None** A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. perms must be specified. `applies_to` does not apply to file objects.

**win\_inheritance:** **True** True to inherit permissions from the parent directory, False not to inherit permission.

**win\_perms\_reset:** **False** If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is `False`.

State SLS Example:

```
/var/backups/{% opts.id %}/{% salt.status.time('%s') %}.cfg:
netconfig.saved:
- source: running
- makedirs: true
```

The state SLS above would create a backup config grouping the files by the Minion ID, in chronological files. For example, if the state is executed at on the 3rd of August 2018, at 5:15PM, on the Minion `core1.lon01`, the configuration would saved in the file: `/var/backups/core1.lon01/1533316558.cfg`

## 21.19.202 salt.states.netntp

### Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

**codeauthor** Mircea Ulinic <[ping@mirceaulinic.net](mailto:ping@mirceaulinic.net)> & Jerome Fleury <[jf@cloudflare.com](mailto:jf@cloudflare.com)>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

- Requires `netaddr` to be installed: *pip install netaddr* to check if IP Addresses are correctly specified
- Requires `dnspython` to be installed: *pip install dnspython* to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- *NAPALM proxy minion*
- *NTP operational and configuration management module*

`salt.states.netntp.managed(name, peers=None, servers=None)`

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
 netntp.managed:
 - peers:
 - 192.168.0.1
 - 172.17.17.1
 - servers:
 - 24.124.0.251
 - 138.236.128.36
```

Output example:

```
{
 'edge01.nrt04': {
 'netntp_|-netntp_example_|-netntp_example_|-managed': {
 'comment': 'NTP servers already configured as needed.',
 'name': 'netntp_example',
 'start_time': '12:45:24.056659',
 'duration': 2938.857,
 'changes': {
 'peers': {
 'removed': [
 '192.168.0.2',
 '192.168.0.3'
],
 'added': [
 '192.168.0.1',
 '172.17.17.1'
]
 }
 },
 'result': None
 }
 }
}
```

## 21.19.203 salt.states.netsnmp

### Network SNMP

Manage the SNMP configuration on network devices.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**depends** napalm

**platform** unix

### Dependencies

- *napalm snmp management module (salt.modules.napalm\_snmp)*

**salt.states.netsnmp.managed**(*name, config=None, defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
 netsnmp.managed:
 - config:
 location: Honolulu, HI, US
 - defaults:
 contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:

 ID: snmp_example
 Function: snmp.managed
 Result: None
 Comment: Testing mode: configuration was not changed!
 Started: 13:29:06.872363
 Duration: 920.466 ms
 Changes:

 added:

 chassis_id:
 None
 contact:
 noc@cloudflare.com
 location:
 Honolulu, HI, US

Summary for edge01.hnl01

Succeeded: 1 (unchanged=1, changed=1)
Failed: 0

```

(continues on next page)

(continued from previous page)

## 21.19.204 salt.states.netusers

### Network Users

Manage the users configuration on network devices via the NAPALM proxy.

```
codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix
```

### Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

**salt.states.netusers.managed**(*name*, *users=None*, *defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be removed whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
 netusers.managed:
 - users:
 admin:
 level: 15
 password: 1knmhgPPv$g8745biu4rb.Zf.IT.F/U1

### 21.19.205 salt.states.network

#### Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

**Note:** RedHat-based systems (RHEL, CentOS, Scientific, etc.) have been supported since version 2014.1.0.

Debian-based systems (Debian, Ubuntu, etc.) have been supported since version 2017.7.0. The following options are not supported: `ipaddr_start`, and `ipaddr_end`.

Other platforms are not yet supported.

**Note:** On Debian-based systems, networking configuration can be specified in `/etc/network/interfaces` or via included

files such as (by default) `/etc/network/interfaces.d/*`. This can be problematic for configuration management. It is recommended to use either `file.managed` or `network.managed`.

If using `network.managed`, it can be useful to ensure `interfaces.d/` is empty. This can be done using:

`/etc/network/interfaces.d:`

`file.directory:`

- `clean: True`
- 

```
system:
 network.system:
 - enabled: True
 - hostname: server1.example.com
 - gateway: 192.168.0.1

lo:
 network.managed:
 - name: lo
 - type: eth
 - proto: loopback
 - onboot: yes
 - userctl: no
 - ipv6_autoconf: no
 - enable_ipv6: true

.. note::
 Apply changes to hostname immediately.
```

(continues on next page)

(continued from previous page)

```

.. versionadded:: 2015.5.0

system:
 network.system:
 - hostname: server2.example.com
 - apply_hostname: True
 - retain_settings: True

.. note::
 Use `retain_settings` to retain current network settings that are not
 otherwise specified in the state. Particularly useful if only setting
 the hostname. Default behavior is to delete unspecified network
 settings.

.. versionadded:: 2016.11.0

```

---

**Note:** When managing bridged interfaces on a Debian or Ubuntu based system, the `ports` argument is required. Red Hat systems will ignore the argument.

---

`salt.states.network.managed`(*name*, *type*, *enabled=True*, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**name** The name of the interface to manage

**type** Type of interface and configuration.

**enabled** Designates the state of this interface.

**kwargs** The IP parameters for this interface.

`salt.states.network.routes`(*name*, *\*\*kwargs*)

Manage network interface static routes.

**name** Interface name to apply the route to.

**kwargs** Named routes

`salt.states.network.system`(*name*, *\*\*kwargs*)

Ensure that global network settings are configured properly.

**name** Custom name to represent this configuration change.

**kwargs** The global parameters for the system.

## 21.19.206 salt.states.neutron\_network

### Management of OpenStack Neutron Networks

New in version 2018.3.0.

**depends** `shade`

**configuration** see `salt.modules.neutronng` for setup instructions

Example States

```

create network:
 neutron_network.present:
 - name: network1

delete network:

```

(continues on next page)

(continued from previous page)

```

neutron_network.absent:
 - name: network1

create network with optional params:
neutron_network.present:
 - name: network1
 - vlan: 200
 - shared: False
 - external: False
 - project: project1

```

`salt.states.neutron_network.absent(name, auth=None, **kwargs)`

Ensure a network does not exists

**name** Name of the network

`salt.states.neutron_network.present(name, auth=None, **kwargs)`

Ensure a network exists and is up-to-date

**name** Name of the network

**provider** A dict of network provider options.

**shared** Set the network as shared.

**external** Whether this network is externally accessible.

**admin\_state\_up** Set the network administrative state to up.

**vlan** Vlan ID. Alias for provider

- **physical\_network:** provider
- **network\_type:** vlan
- **segmentation\_id:** (vlan id)

### 21.19.207 salt.states.neutron\_secgroup

#### Management of OpenStack Neutron Security Groups

New in version 2018.3.0.

**depends** shade

**configuration** see `salt.modules.neutronng` for setup instructions

Example States

```

create security group;
neutron_secgroup.present:
 - name: security_group1
 - description: "Very Secure Security Group"

delete security group:
neutron_secgroup.absent:
 - name_or_id: security_group1
 - project_name: Project1

create security group with optional params:
neutron_secgroup.present:
 - name: security_group1
 - description: "Very Secure Security Group"
 - project_id: 1dcac318a83b4610b7a7f7ba01465548

```

(continues on next page)

(continued from previous page)

```

create security group with optional params:
neutron_secgroup.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_name: Project1

```

`salt.states.neutron_secgroup.absent(name, auth=None, **kwargs)`

Ensure a security group does not exist

**name** Name of the security group

`salt.states.neutron_secgroup.present(name, auth=None, **kwargs)`

Ensure a security group exists.

You can supply either `project_name` or `project_id`.

Creating a default security group will not show up as a change; it gets created through the lookup process.

**name** Name of the security group

**description** Description of the security group

**project\_name** Name of Project

**project\_id** ID of Project

## 21.19.208 salt.states.neutron\_secgroup\_rule

### Management of OpenStack Neutron Security Group Rules

New in version 2018.3.0.

**depends** shade

**configuration** see `salt.modules.neutronng` for setup instructions

Example States

```

create security group rule:
neutron_secgroup_rule.present:
- name: security_group1
- project_name: Project1
- protocol: icmp

delete security group:
neutron_secgroup_rule.absent:
- name_or_id: security_group1

create security group with optional params:
neutron_secgroup_rule.present:
- name: security_group1
- description: "Very Secure Security Group"
- project_id: 1dcac318a83b4610b7a7f7ba01465548

```

`salt.states.neutron_secgroup_rule.absent(name, auth=None, **kwargs)`

Ensure a security group rule does not exist

**name** name or id of the security group rule to delete

**rule\_id** uuid of the rule to delete

**project\_id** id of project to delete rule from

`salt.states.neutron_secgroup_rule.present(name, auth=None, **kwargs)`

Ensure a security group rule exists

defaults: port\_range\_min=None, port\_range\_max=None, protocol=None, remote\_ip\_prefix=None, remote\_group\_id=None, direction='ingress', ethertype='IPv4', project\_id=None  
**name** Name of the security group to associate with this rule  
**project\_name** Name of the project associated with the security group  
**protocol** The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

### 21.19.209 salt.states.neutron\_subnet

#### Management of OpenStack Neutron Subnets

New in version 2018.3.0.

**depends** shade

**configuration** see *salt.modules.neutronng* for setup instructions

Example States

```
create_subnet:
 neutron_subnet.present:
 - name: subnet1
 - network_name_or_id: network1
 - cidr: 192.168.199.0/24

delete_subnet:
 neutron_subnet.absent:
 - name: subnet2

create_subnet_with_optional_params:
 neutron_subnet.present:
 - name: subnet1
 - network_name_or_id: network1
 - enable_dhcp: True
 - cidr: 192.168.199.0/24
 - allocation_pools:
 - start: 192.168.199.5
 - end: 192.168.199.250
 - host_routes:
 - destination: 192.168..0.0/24
 - nexthop: 192.168.0.1
 - gateway_ip: 192.168.199.1
 - dns_nameservers:
 - 8.8.8.8
 - 8.8.8.7

create_ipv6_subnet:
 neutron_subnet.present:
 - name: v6subnet1
 - network_name_or_id: network1
 - ip_version: 6
```

**salt.states.neutron\_subnet.absent**(*name*, *auth*=None)

Ensure a subnet does not exist

**name** Name of the subnet

**salt.states.neutron\_subnet.present**(*name*, *auth*=None, *\*\*kwargs*)

Ensure a subnet exists and is up-to-date

**name** Name of the subnet

**network\_name\_or\_id** The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.

**allocation\_pools** A list of dictionaries of the start and end addresses for the allocation pools

**gateway\_ip** The gateway IP address.

**dns\_nameservers** A list of DNS name servers for the subnet.

**host\_routes** A list of host route dictionaries for the subnet.

**ipv6\_ra\_mode** IPv6 Router Advertisement mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.

**ipv6\_address\_mode** IPv6 address mode. Valid values are: 'dhcpv6-stateful', 'dhcpv6-stateless', or 'slaac'.

### 21.19.210 salt.states.nexus module

This state downloads artifacts from Nexus 3.x.

New in version 2018.3.0.

**salt.states.nexus.downloaded**(*name, artifact, target\_dir='/tmp', target\_file=None*)

Ensures that the artifact from nexus exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in nexus. If it is different then the step will fail.

**artifact** Details of the artifact to be downloaded from nexus. Various options are:

- **nexus\_url**: URL of the nexus instance
- **repository**: Repository in nexus
- **artifact\_id**: Artifact ID
- **group\_id**: Group ID
- **packaging**: Packaging
- **classifier**: Classifier
- **version**: **Version** One of the following: - **Version** to download - **latest** - Download the latest release of this artifact - **latest\_snapshot** - Download the latest snapshot for this artifact
- **username**: nexus username
- **password**: nexus password

**target\_dir** Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

**target\_file** Target file to download artifact to. By default file name is resolved by nexus.

An example to download an artifact to a specific file:

```
jboss_module_downloaded:
 nexus.downloaded:
 - artifact:
 nexus_url: http://nexus.intranet.example.com/repository
 repository: 'libs-release-local'
 artifact_id: 'module'
 group_id: 'com.company.module'
 packaging: 'jar'
 classifier: 'sources'
 version: '1.0'
 - target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
maven_artifact_downloaded:
 nexus.downloaded:
 - artifact:
 nexus_url: http://nexus.intranet.example.com/repository
 repository: 'maven-releases'
```

(continues on next page)

(continued from previous page)

```

artifact_id: 'module'
group_id: 'com.company.module'
packaging: 'zip'
classifier: 'dist'
version: '1.0'
- target_dir: /opt/maven/modules/com/company/release

```

### 21.19.211 salt.states.nfs\_export

#### Management of NFS exports

New in version 2018.3.0.

To ensure an NFS export exists:

```

add_simple_export:
 nfs_export.present:
 - name: '/srv/nfs'
 - hosts: '10.0.2.0/24'
 - options:
 - 'rw'

```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw)
```

For more complex exports with multiple groups of hosts, use 'clients':

```

add_complex_export:
 nfs_export.present:
 - name: '/srv/nfs'
 - clients:
 # First export, same as simple one above
 - hosts: '10.0.2.0/24'
 options:
 - 'rw'
 # Second export
 - hosts: '*.example.com'
 options:
 - 'ro'
 - 'subtree_check'

```

This creates the following in /etc/exports:

```
/srv/nfs 10.0.2.0/24(rw) 192.168.0.0/24,172.19.0.0/16(ro,subtree_check)
```

Any export of the given path will be modified to match the one specified.

To ensure an NFS export is absent:

```

delete_export:
 nfs_export.absent:
 - name: '/srv/nfs'

```

**salt.states.nfs\_export.absent**(*name*, *exports*='/etc/exports')

Ensure that the named path is not exported

**name** The export path to remove

`salt.states.nfs_export.present(name, clients=None, hosts=None, options=None, ex-  
ports='/etc/exports')`

Ensure that the named export is present with the given options

**name** The export path to configure

**clients** A list of hosts and the options applied to them. This option may not be used in combination with the 'hosts' or 'options' shortcuts.

```
- clients:
 # First export
 - hosts: '10.0.2.0/24'
 options:
 - 'rw'
 # Second export
 - hosts: '*.example.com'
 options:
 - 'ro'
 - 'subtree_check'
```

**hosts** A string matching a number of hosts, for example:

```
hosts: '10.0.2.123'

hosts: '10.0.2.0/24'

hosts: 'minion1.example.com'

hosts: '*.example.com'

hosts: '*'
```

**options** A list of NFS options, for example:

```
options:
 - 'rw'
 - 'subtree_check'
```

## 21.19.212 salt.states.nftables

### Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```
httpd:
 nftables.append:
 - table: filter
 - chain: input
 - jump: accept
 - match: state
 - connstate: new
 - dport: 80
 - proto: tcp
 - sport: 1025:65535
 - save: True
```

(continues on next page)

(continued from previous page)

```
httpd:
 nftables.append:
 - table: filter
 - family: ipv6
 - chain: INPUT
 - jump: ACCEPT
 - match: state
 - connstate: NEW
 - dport: 80
 - proto: tcp
 - sport: 1025:65535
 - save: True
```

```
httpd:
 nftables.insert:
 - position: 1
 - table: filter
 - chain: INPUT
 - jump: ACCEPT
 - match: state
 - connstate: NEW
 - dport: 80
 - proto: tcp
 - sport: 1025:65535
 - save: True
```

```
httpd:
 nftables.insert:
 - position: 1
 - table: filter
 - family: ipv6
 - chain: INPUT
 - jump: ACCEPT
 - match: state
 - connstate: NEW
 - dport: 80
 - proto: tcp
 - sport: 1025:65535
 - save: True
```

```
httpd:
 nftables.delete:
 - table: filter
 - chain: INPUT
 - jump: ACCEPT
 - match: state
 - connstate: NEW
 - dport: 80
 - proto: tcp
 - sport: 1025:65535
 - save: True
```

```
httpd:
 nftables.delete:
 - position: 1
```

(continues on next page)

(continued from previous page)

```

- table: filter
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

**httpd:**

```

nftables.delete:
- table: filter
- family: ipv6
- chain: INPUT
- jump: ACCEPT
- match: state
- connstate: NEW
- dport: 80
- proto: tcp
- sport: 1025:65535
- save: True

```

**output:**

```

nftables.chain_present:
- family: ip
- table: filter

```

**output:**

```

nftables.chain_absent:
- family: ip
- table: filter

```

**salt.states.nftables.append**(*name*, *family*='ipv4', *\*\*kwargs*)

New in version 0.17.0.

Append a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

**salt.states.nftables.chain\_absent**(*name*, *table*='filter', *family*='ipv4')

New in version 2014.7.0.

Verify the chain is absent.

**family** Networking family, either ipv4 or ipv6

**salt.states.nftables.chain\_present**(*name*, *table*='filter', *table\_type*=None, *hook*=None, *priority*=None, *family*='ipv4')

New in version 2014.7.0.

Verify the chain is exist.

**name** A user-defined chain name.

**table** The table to own the chain.

**family** Networking family, either ipv4 or ipv6

`salt.states.nftables.delete(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Delete a rule to a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

`salt.states.nftables.flush(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Flush current nftables state

**family** Networking family, either ipv4 or ipv6

`salt.states.nftables.insert(name, family='ipv4', **kwargs)`

New in version 2014.7.0.

Insert a rule into a chain

**name** A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

**family** Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: `--state` is specified as `connstate` instead of `state` (not to be confused with `ctstate`).

## 21.19.213 salt.states.npm

### Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a `pkg.installed` state for the package which provides npm (simply `npm` in most cases). Example:

```
npm:
 pkg.installed

yaml:
 npm.installed:
 - require:
 - pkg: npm
```

`salt.states.npm.bootstrap(name, user=None, silent=True)`

Bootstraps a node.js application.

Will execute 'npm install --json' on the specified directory.

**user** The user to run NPM with

New in version 0.17.0.

`salt.states.npm.cache_cleaned(name=None, user=None, force=False)`

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

**name** The name of the package to remove from the cache, or `None` for all packages

**user** The user to run NPM with

**force** Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

`salt.states.npm.installed(name, pkgs=None, dir=None, user=None, force_reinstall=False, registry=None, env=None)`

Verify that the given package is installed and is at the correct version (if specified).

```
coffee-script:
 npm.installed:
 - user: someuser

coffee-script@1.0.1:
 npm.installed: []
```

**name** The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

**pkgs** A list of packages to install with a single npm invocation; specifying this argument will ignore the name argument

New in version 2014.7.0.

**dir** The target directory in which to install the package, or None for global installation

**user** The user to run NPM with

New in version 0.17.0.

**registry** The NPM registry from which to install the package

New in version 2014.7.0.

**env** A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

New in version 2014.7.0.

**force\_reinstall** Install the package even if it is already installed

`salt.states.npm.removed(name, dir=None, user=None)`

Verify that the given package is not installed.

**dir** The target directory in which to install the package, or None for global installation

**user** The user to run NPM with

New in version 0.17.0.

## 21.19.214 salt.states.ntp

### Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
 ntp.managed:
 - servers:
 - pool.ntp.org
 - us.pool.ntp.org
```

`salt.states.ntp.managed(name, servers=None)`

Manage NTP servers

**servers** A list of NTP servers

### 21.19.215 salt.states.nxos module

State module for Cisco NX-OS Switch Proxy and Native minions

For documentation on setting up the nxos proxy minion look in the documentation for [salt.proxy.nxos](#).

**salt.states.nxos.config\_absent**(*name*)

Ensure a specific configuration line does not exist in the running config

**name** config line to remove

Examples:

```
add snmp group:
 nxos.config_absent:
 - names:
 - snmp-server community randoSNMPstringHERE group network-operator
 - snmp-server community AnotherRandomSNMPString group network-admin
```

---

**Note:** For certain cases extra lines could be removed based on dependencies. In this example, included after the example for `config_present`, the ACLs would be removed because they depend on the existence of the group.

---

**salt.states.nxos.config\_present**(*name*)

Ensure a specific configuration line exists in the running config

**name** config line to set

Examples:

```
add snmp group:
 nxos.config_present:
 - names:
 - snmp-server community randoSNMPstringHERE group network-operator
 - snmp-server community AnotherRandomSNMPString group network-admin

add snmp acl:
 nxos.config_present:
 - names:
 - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
 - snmp-server community AnotherRandomSNMPString use-acl snmp-acl-rw
```

**salt.states.nxos.replace**(*name*, *repl*, *full\_match=False*)

Replace all instances of a string or full line in the running config

**name** String to replace

**repl** The replacement text

**full\_match** Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, `*` is added around *name* for matching in the `show run` config.

Examples:

```
replace snmp string:
 nxos.replace:
 - name: randoSNMPstringHERE
 - repl: NEWrandoSNMPstringHERE

replace full snmp string:
 nxos.replace:
 - name: ^snmp-server community randoSNMPstringHERE group network-operator$
 - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
 - full_match: True
```

---

**Note:** The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readdded, because it was not matched.

---

```
salt.states.nxos.user_absent(name)
```

Ensure a user is not present

**name** username to remove if it exists

Examples:

```
delete:
 nxos.user_absent:
 - name: daniel
```

```
salt.states.nxos.user_present(name, password=None, roles=None, encrypted=False,
 crypt_salt=None, algorithm='sha256')
```

Ensure a user is present with the specified groups

**name** Name of user

**password** Encrypted or Plain Text password for user

**roles** List of roles the user should be assigned. Any roles not in this list will be removed

**encrypted** Whether the password is encrypted already or not. Defaults to False

**crypt\_salt** Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

**algorithm** Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```
create:
 nxos.user_present:
 - name: daniel
 - roles:
 - vdc-admin

set_password:
 nxos.user_present:
 - name: daniel
 - password: admin
 - roles:
 - network-admin

update:
 nxos.user_present:
 - name: daniel
 - password: AiN9jaoP
 - roles:
 - network-admin
 - vdc-admin
```

### 21.19.216 salt.states.nxos\_upgrade module

Manage NX-OS System Image Upgrades.

**maturity** new

**platform** nxos

**codeauthor** Michael G Wiebe

For documentation on setting up the nxos proxy minion look in the documentation for [salt.proxy.nxos](#).

**salt.states.nxos\_upgrade.image\_running**(*name*, *system\_image*, *kickstart\_image*=None, *issu*=True, *\*\*kwargs*)

Ensure the NX-OS system image is running on the device.

**name** Name of the salt state task

**system\_image** Name of the system image file on bootflash:

**kickstart\_image** Name of the kickstart image file on bootflash: This is not needed if the system\_image is a combined system and kickstart image Default: None

**issu** Ensure the correct system is running on the device using an in service software upgrade, or force a disruptive upgrade by setting the option to False. Default: False

**timeout** Timeout in seconds for long running 'install all' upgrade command. Default: 900

Examples:

```
upgrade_software_image_n9k:
 nxos.image_running:
 - name: Ensure nxos.7.0.3.I7.5a.bin is running
 - system_image: nxos.7.0.3.I7.5a.bin
 - issu: True

upgrade_software_image_n7k:
 nxos.image_running:
 - name: Ensure n7000-s2-kickstart.8.0.1.bin is running
 - kickstart_image: n7000-s2-kickstart.8.0.1.bin
 - system_image: n7000-s2-dk9.8.0.1.bin
 - issu: False
```

### 21.19.217 salt.states.openstack\_config

Manage OpenStack configuration file settings.

**maintainer** Jeffrey C. Ollie <jeff@ocjtech.us>

**maturity** new

**depends**

**platform** linux

**salt.states.openstack\_config.absent**(*name*, *filename*, *section*, *parameter*=None)

Ensure a value is not set in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set

**parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

**salt.states.openstack\_config.present**(*name*, *filename*, *section*, *value*, *parameter*=None)

Ensure a value is set in an OpenStack configuration file.

**filename** The full path to the configuration file

**section** The section in which the parameter will be set  
**parameter (optional)** The parameter to change. If the parameter is not supplied, the name will be used as the parameter.  
**value** The value to set

### 21.19.218 salt.states.openvswitch\_bridge module

Management of Open vSwitch bridges.

**salt.states.openvswitch\_bridge.absent**(*name*)  
 Ensures that the named bridge does not exist, eventually deletes it.  
**Parameters** **name** -- The name of the bridge.

**salt.states.openvswitch\_bridge.present**(*name*)  
 Ensures that the named bridge exists, eventually creates it.  
**Parameters** **name** -- The name of the bridge.

### 21.19.219 salt.states.openvswitch\_port module

Management of Open vSwitch ports.

**salt.states.openvswitch\_port.absent**(*name*, *bridge=None*)  
 Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

**Parameters**

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

**salt.states.openvswitch\_port.present**(*name*, *bridge*, *tunnel\_type=None*, *id=None*, *remote=None*, *dst\_port=None*, *internal=False*)  
 Ensures that the named port exists on bridge, eventually creates it.

**Parameters**

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **tunnel\_type** -- Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst\_port** -- Port to use when creating tunnelport in the switch.
- **internal** -- Create an internal port if one does not exist

### 21.19.220 salt.states.opsgenie

#### Create/Close an alert in OpsGenie

New in version 2018.3.0.

This state is useful for creating or closing alerts in OpsGenie during state runs.

```
used_space:
 disk.status:
 - name: /
 - maximum: 79%
 - minimum: 20%
```

(continues on next page)

(continued from previous page)

```

opsgenie_create_action_sender:
 opsgenie.create_alert:
 - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
 - reason: 'Disk capacity is out of designated range.'
 - name: disk.status
 - onfail:
 - disk: used_space

opsgenie_close_action_sender:
 opsgenie.close_alert:
 - api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
 - name: disk.status
 - require:
 - disk: used_space

```

**salt.states.opsgenie.close\_alert**(*name=None, api\_key=None, reason='Conditions are met.', action\_type='Close'*)

Close an alert in OpsGenie. It's a wrapper function for create\_alert. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

**name** It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

Optional Parameters:

**api\_key** It's the API Key you've copied while adding integration in OpsGenie.

**reason** It will be used as alert's default message in OpsGenie.

**action\_type** OpsGenie supports the default values Create/Close for action\_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

**salt.states.opsgenie.create\_alert**(*name=None, api\_key=None, reason=None, action\_type='Create'*)

Create an alert in OpsGenie. Example usage with Salt's requisites and other global state arguments could be found above.

Required Parameters:

**api\_key** It's the API Key you've copied while adding integration in OpsGenie.

**reason** It will be used as alert's default message in OpsGenie.

Optional Parameters:

**name** It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in above case.

**action\_type** OpsGenie supports the default values Create/Close for action\_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

## 21.19.221 salt.states.pagerduty

### Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```

server-warning-message:
 pagerduty.create_event:
 - name: 'This is a server warning message'

```

(continues on next page)

(continued from previous page)

```
- details: 'This is a much more detailed message'
- service_key: 9abcd123456789efabcde362783cdbaf
- profile: my-pagerduty-account
```

`salt.states.pagerduty.create_event(name, details, service_key, profile)`

Create an event on the PagerDuty service

```
server-warning-message:
 pagerduty.create_event:
 - name: 'This is a server warning message'
 - details: 'This is a much more detailed message'
 - service_key: 9abcd123456789efabcde362783cdbaf
 - profile: my-pagerduty-account
```

The following parameters are required:

**name** This is a short description of the event.

**details** This can be a more detailed description of the event.

**service\_key** This key can be found by using `pagerduty.list_services`.

**profile** This refers to the configuration profile to use to connect to the PagerDuty service.

## 21.19.222 salt.states.pagerduty\_escalation\_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
 pagerduty_escalation_policy.present:
 - name: bruce test escalation policy
 - escalation_rules:
 - targets:
 - type: schedule
 id: 'bruce test schedule level1'
 - type: user
 id: 'Bruce Sherrod'
 escalation_delay_in_minutes: 15
 - targets:
 - type: schedule
 id: 'bruce test schedule level2'
 escalation_delay_in_minutes: 15
 - targets:
 - type: user
 id: 'Bruce TestUser1'
 - type: user
 id: 'Bruce TestUser2'
 - type: user
 id: 'Bruce TestUser3'
 - type: user
 id: 'bruce+test4@lyft.com'
 escalation_delay_in_minutes: 15
```

`salt.states.pagerduty_escalation_policy.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)`

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that pager-duty\_escalation\_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

`salt.states.pagerduty_escalation_policy.present` (*profile='pagerduty', subdomain=None, api\_key=None, \*\*kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in [https://developer.pagerduty.com/documentation/rest/escalation\\_policies/create](https://developer.pagerduty.com/documentation/rest/escalation_policies/create). In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

`pagerduty_escalation_policy.present`:

- name: bruce test escalation policy
- escalation\_rules:
  - targets:
    - \* type: schedule id: 'bruce test schedule level1'
    - \* type: user id: 'Bruce Sherrod'

In this example, 'Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

### 21.19.223 salt.states.pagerduty\_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
 pagerduty_schedule.present:
 - name: 'bruce test schedule level1'
 - schedule:
 name: 'bruce test schedule level1'
 time_zone: 'Pacific Time (US & Canada)'
 schedule_layers:
 - name: 'Schedule Layer 1'
 start: '2015-01-01T00:00:00'
 users:
 - user:
 'id': 'Bruce TestUser1'
 member_order: 1
 - user:
 'id': 'Bruce TestUser2'
 member_order: 2
 - user:
 'id': 'bruce+test3@lyft.com'
 member_order: 3
 - user:
 'id': 'bruce+test4@lyft.com'
 member_order: 4
 rotation_virtual_start: '2015-01-01T00:00:00'
 priority: 1
 rotation_turn_length_seconds: 604800
```

`salt.states.pagerduty_schedule.absent`(*profile='pagerduty', subdomain=None, api\_key=None,*  
*\*\*kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

`salt.states.pagerduty_schedule.present`(*profile='pagerduty', subdomain=None, api\_key=None,*  
*\*\*kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in <https://developer.pagerduty.com/documentation/rest/schedules/create>. This means that most arguments are in a dict called "schedule."

User id's can be pagerduty id, or name, or email address.

## 21.19.224 salt.states.pagerduty\_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```
ensure test service
 pagerduty_service.present:
 - name: 'my service'
 - escalation_policy_id: 'my escalation policy'
 - type: nagios
```

`salt.states.pagerduty_service.absent`(*profile='pagerduty', subdomain=None, api\_key=None,*  
*\*\*kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

`salt.states.pagerduty_service.present`(*profile='pagerduty', subdomain=None, api\_key=None,*  
*\*\*kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in <https://developer.pagerduty.com/documentation/rest/services/create>

Note that many arguments are mutually exclusive, depending on the "type" argument.

Examples:

```
create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
 pagerduty_service.present:
 - name: my email service
 - service:
 description: "email service controlled by salt"
 escalation_policy_id: "my escalation policy"
 type: "generic_email"
 service_key: "test-email"
```

```
create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
 pagerduty_service.present:
 - name: my cloudwatch service
 - service:
 escalation_policy_id: "my escalation policy"
 type: aws_cloudwatch
 description: "my cloudwatch service controlled by salt"
```

### 21.19.225 salt.states.pagerduty\_user

Manage PagerDuty users.

#### Example

ensure bruce test user 1:

pagerduty.user\_present:

- name: 'Bruce TestUser1'
- email: `bruce+test1@lyft.com`
- requester\_id: P1GV5NT

`salt.states.pagerduty_user.absent(profile='pagerduty', subdomain=None, api_key=None, **kwargs)`

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

`salt.states.pagerduty_user.present(profile='pagerduty', subdomain=None, api_key=None, **kwargs)`

Ensure pagerduty user exists. Arguments match those supported by <https://developer.pagerduty.com/documentation/rest/users/create>.

### 21.19.226 salt.states.panos

A state module to manage Palo Alto network devices.

`codeauthor` Spencer Ervin <spencer\_ervin@hotmail.com>

`maturity` new

`depends` none

`platform` unix

#### About

This state module was designed to handle connections to a Palo Alto based firewall. This module relies on the Palo Alto proxy module to interface with the devices.

This state module is designed to give extreme flexibility in the control over XPATH values on the PANOS device. It exposes the core XML API commands and allows state modules to chain complex XPATH commands.

Below is an example of how to construct a security rule and move to the top of the policy. This will take a config lock to prevent execution during the operation, then remove the lock. After the XPATH has been deployed, it will commit to the device.

```
panos/takelock:
 panos.add_config_lock
panos/service_tcp_22:
 panos.set_config:
 - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
 → entry[@name='vsys1']/service
 - value: <entry name='tcp-22'><protocol><tcp><port>22</port></tcp></protocol>
 → </entry>
```

(continues on next page)

(continued from previous page)

```

- commit: False
panos/create_rule1:
 panos.set_config:
 - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
 ↪entry[@name='vsys1']/rulebase/security/rules
 - value: '
 <entry name="rule1">
 <from><member>trust</member></from>
 <to><member>untrust</member></to>
 <source><member>10.0.0.1</member></source>
 <destination><member>10.0.1.1</member></destination>
 <service><member>tcp-22</member></service>
 <application><member>any</member></application>
 <action>allow</action>
 <disabled>no</disabled>
 </entry>'
 - commit: False
panos/moveruletop:
 panos.move_config:
 - xpath: /config/devices/entry[@name='localhost.localdomain']/vsys/
 ↪entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
 - where: top
 - commit: False
panos/remove_lock:
 panos.remove_config_lock
panos/commit:
 panos.commit_config

```

## Version Specific Configurations

Palo Alto devices running different versions will have different supported features and different command structures. In order to account for this, the proxy module can be leveraged to check if the panos device is at a specific revision level.

The proxy['panos.is\_required\_version'] method will check if a panos device is currently running a version equal or greater than the passed version. For example, proxy['panos.is\_required\_version']('7.0.0') would match both 7.1.0 and 8.0.0.

```

{% if proxy['panos.is_required_version']('8.0.0') %}
panos/deviceconfig/system/motd-and-banner:
 panos.set_config:
 - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/system/
 ↪motd-and-banner
 - value: |
 <banner-header>BANNER TEXT</banner-header>
 <banner-header-color>color2</banner-header-color>
 <banner-header-text-color>color18</banner-header-text-color>
 <banner-header-footer-match>yes</banner-header-footer-match>
 - commit: False
{% endif %}

```

See also:

*Palo Alto Proxy Module*

`salt.states.panos.add_config_lock(name)`

Prevent other users from changing configuration until the lock is released.

name: The name of the module function to execute.

SLS Example:

```
panos/takeLock:
 panos.add_config_lock
```

```
salt.states.panos.address_exists(name, addressname=None, vsys=1, ipnetmask=None,
 iprange=None, fqdn=None, description=None, commit=False)
```

Ensures that an address object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will only process a single address type (ip-netmask, ip-range, or fqdn). It will process the specified value if the following order: ip-netmask, ip-range, fqdn. For proper execution, only specify a single address type.

name: The name of the module function to execute.

addressname(str): The name of the address object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

ipnetmask(str): The IPv4 or IPv6 address or IP address range using the format ip\_address/mask or ip\_address where the mask is the number of significant binary digits used for the network portion of the address. Ideally, for IPv6, you specify only the network portion, not the host portion.

iprange(str): A range of addresses using the format ip\_address-ip\_address where both addresses can be IPv4 or both can be IPv6.

fqdn(str): A fully qualified domain name format. The FQDN initially resolves at commit time. Entries are subsequently refreshed when the firewall performs a check every 30 minutes; all changes in the IP address for the entries are picked up at the refresh cycle.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/address/h-10.10.10.10:
 panos.address_exists:
 - addressname: h-10.10.10.10
 - vsys: 1
 - ipnetmask: 10.10.10.10
 - commit: False

panos/address/10.0.0.1-10.0.0.50:
 panos.address_exists:
 - addressname: r-10.0.0.1-10.0.0.50
 - vsys: 1
 - iprange: 10.0.0.1-10.0.0.50
 - commit: False

panos/address/foo.bar.com:
 panos.address_exists:
 - addressname: foo.bar.com
 - vsys: 1
```

(continues on next page)

(continued from previous page)

```
- fqdn: foo.bar.com
- description: My fqdn object
- commit: False
```

`salt.states.panos.address_group_exists(name, groupname=None, vsys=1, members=None, description=None, commit=False)`

Ensures that an address group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

`name`: The name of the module function to execute.

`groupname(str)`: The name of the address group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

`vsys(str)`: The string representation of the VSYS ID. Defaults to VSYS 1.

`members(str, list)`: The members of the address group. These must be valid address objects or address groups on the system that already exist prior to the execution of this state.

`description(str)`: A description for the policy (up to 255 characters).

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/address-group/my-group:
 panos.address_group_exists:
 - groupname: my-group
 - vsys: 1
 - members:
 - my-address-object
 - my-other-address-group
 - description: A group that needs to exist
 - commit: False
```

`salt.states.panos.clone_config(name, xpath=None, newname=None, commit=False)`

Clone a specific XPATH and set it to a new name.

`name`: The name of the module function to execute.

`xpath(str)`: The XPATH of the configuration API tree to clone.

`newname(str)`: The new name of the XPATH clone.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/clonerule:
 panos.clone_config:
 - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
 ↪ rules&from=/config/devices/
 entry/vsys/entry[@name='vsys1']/rulebase/security/rules/entry[@name='rule1']
 - value: rule2
 - commit: True
```

`salt.states.panos.commit_config(name)`

Commits the candidate configuration to the running configuration.

name: The name of the module function to execute.

SLS Example:

```
panos/commit:
 panos.commit_config
```

`salt.states.panos.delete_config(name, xpath=None, commit=False)`

Deletes a Palo Alto XPATH to a specific value.

Use the xpath parameter to specify the location of the object to be deleted.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/deletetgroup:
 panos.delete_config:
 - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
 ↪entry[@name='test']
 - commit: True
```

`salt.states.panos.download_software(name, version=None, synch=False, check=False)`

Ensures that a software version is downloaded.

name: The name of the module function to execute.

version(str): The software version to check. If this version is not already downloaded, it will attempt to download the file from Palo Alto.

synch(bool): If true, after downloading the file it will be synched to its peer.

check(bool): If true, the PANOS device will first attempt to pull the most recent software inventory list from Palo Alto.

SLS Example:

```
panos/version8.0.0:
 panos.download_software:
 - version: 8.0.0
 - synch: False
 - check: True
```

`salt.states.panos.edit_config(name, xpath=None, value=None, commit=False)`

Edits a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can replace an existing object hierarchy at a specified location in the configuration with a new value. Use the xpath parameter to specify the location of the object, including the node to be replaced.

This is the recommended state to enforce configurations on a xpath.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to edit. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/addressgroup:
 panos.edit_config:
 - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address-group/
 ↪entry[@name='test']
 - value: <static><entry name='test'><member>abc</member><member>xyz</member>
 ↪</entry></static>
 - commit: True
```

**salt.states.panos.move\_config**(name, xpath=None, where=None, dst=None, commit=False)

Moves a XPATH value to a new location.

Use the xpath parameter to specify the location of the object to be moved, the where parameter to specify type of move, and dst parameter to specify the destination path.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to move.

where(str): The type of move to execute. Valid options are after, before, top, bottom. The after and before options will require the dst option to specify the destination of the action. The top action will move the XPATH to the top of its structure. The bottom action will move the XPATH to the bottom of its structure.

dst(str): Optional. Specifies the destination to utilize for a move action. This is ignored for the top or bottom action.

commit(bool): If true the firewall will commit the changes, if false do not commit changes. If the operation is not successful, it will not commit.

SLS Example:

```
panos/moveruletop:
 panos.move_config:
 - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
 ↪rules/entry[@name='rule1']
 - where: top
 - commit: True

panos/moveruleafter:
 panos.move_config:
 - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/rulebase/security/
 ↪rules/entry[@name='rule1']
 - where: after
 - dst: rule2
 - commit: True
```

**salt.states.panos.remove\_config\_lock**(name)

Release config lock previously held.

name: The name of the module function to execute.

SLS Example:

```
panos/takelock:
 panos.remove_config_lock
```

**salt.states.panos.rename\_config**(name, xpath=None, newname=None, commit=False)

Rename a Palo Alto XPATH to a specific value. This will always rename the value even if a change is not needed.

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

newname(str): The new name of the XPATH value.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/renamegroup:
 panos.rename_config:
 - xpath: /config/devices/entry/vsys/entry[@name='vsys1']/address/
 ↪entry[@name='old_address']
 - value: new_address
 - commit: True
```

```
salt.states.panos.security_rule_exists(name, rulename=None, vsys='1', action=None,
 disabled=None, sourcezone=None, destination-
 zone=None, source=None, destination=None, ap-
 plication=None, service=None, description=None,
 logsetting=None, logstart=None, logend=None,
 negatesource=None, negatedestination=None, pro-
 filegroup=None, datafilter=None, fileblock=None,
 spyware=None, urlfilter=None, virus=None, vul-
 nerability=None, wildfire=None, move=None,
 movetarget=None, commit=False)
```

Ensures that a security rule exists on the device. Also, ensure that all configurations are set appropriately.

This method will create the rule if it does not exist. If the rule does exist, it will ensure that the configurations are set appropriately.

If the rule does not exist and is created, any value that is not provided will be provided as the default. The action, to, from, source, destination, application, and service fields are mandatory and must be provided.

This will enforce the exact match of the rule. For example, if the rule is currently configured with the log-end option, but this option is not specified in the state method, it will be removed and reset to the system default.

It is strongly recommended to specify all options to ensure proper operation.

When defining the profile group settings, the device can only support either a profile group or individual settings. If both are specified, the profile group will be preferred and the individual settings are ignored. If neither are specified, the value will be set to system default of none.

name: The name of the module function to execute.

rulename(str): The name of the security rule. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

action(str): The action that the security rule will enforce. Valid options are: allow, deny, drop, reset-client, reset-server, reset-both.

disabled(bool): Controls if the rule is disabled. Set 'True' to disable and 'False' to enable.

sourcezone(str, list): The source zone(s). The value 'any' will match all zones.

destinationzone(str, list): The destination zone(s). The value 'any' will match all zones.

source(str, list): The source address(es). The value 'any' will match all addresses.

destination(str, list): The destination address(es). The value 'any' will match all addresses.

`application(str, list)`: The application(s) matched. The value 'any' will match all applications.

`service(str, list)`: The service(s) matched. The value 'any' will match all services. The value 'application-default' will match based upon the application defined ports.

`description(str)`: A description for the policy (up to 255 characters).

`logsetting(str)`: The name of a valid log forwarding profile.

`logstart(bool)`: Generates a traffic log entry for the start of a session (disabled by default).

`logend(bool)`: Generates a traffic log entry for the end of a session (enabled by default).

`negatesource(bool)`: Match all but the specified source addresses.

`negatedestination(bool)`: Match all but the specified destination addresses.

`profilegroup(str)`: A valid profile group name.

`datafilter(str)`: A valid data filter profile name. Ignored with the profilegroup option set.

`fileblock(str)`: A valid file blocking profile name. Ignored with the profilegroup option set.

`spyware(str)`: A valid spyware profile name. Ignored with the profilegroup option set.

`urlfilter(str)`: A valid URL filtering profile name. Ignored with the profilegroup option set.

`virus(str)`: A valid virus profile name. Ignored with the profilegroup option set.

`vulnerability(str)`: A valid vulnerability profile name. Ignored with the profilegroup option set.

`wildfire(str)`: A valid vulnerability profile name. Ignored with the profilegroup option set.

`move(str)`: An optional argument that ensure the rule is moved to a specific location. Valid options are 'top', 'bottom', 'before', or 'after'. The 'before' and 'after' options require the use of the 'movetarget' argument to define the location of the move request.

`movetarget(str)`: An optional argument that defines the target of the move operation if the move argument is set to 'before' or 'after'.

`commit(bool)`: If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/rulebase/security/rule01:
 panos.security_rule_exists:
 - rulename: rule01
 - vsys: 1
 - action: allow
 - disabled: False
 - sourcezone: untrust
 - destinationzone: trust
 - source:
 - 10.10.10.0/24
 - 1.1.1.1
 - destination:
 - 2.2.2.2-2.2.2.4
 - application:
 - any
 - service:
 - tcp-25
 - description: My test security rule
 - logsetting: logprofile
 - logstart: False
```

(continues on next page)

(continued from previous page)

```

- legend: True
- negatesource: False
- negatedestination: False
- profilegroup: myprofilegroup
- move: top
- commit: False

panos/rulebase/security/rule01:
panos.security_rule_exists:
- rulename: rule01
- vsys: 1
- action: allow
- disabled: False
- sourcezone: untrust
- destinationzone: trust
- source:
- 10.10.10.0/24
- 1.1.1.1
- destination:
- 2.2.2.2-2.2.2.4

- vulnerability: foobar
- wildfire: foobar
- move: after
- movetarget: rule02
- commit: False

```

**salt.states.panos.service\_exists**(*name*, *servicename=None*, *vsys=1*, *protocol=None*, *port=None*, *description=None*, *commit=False*)

Ensures that a service object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

**name:** The name of the module function to execute.

**servicename(str):** The name of the security object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

**vsys(str):** The string representation of the VSYS ID. Defaults to VSYS 1.

**protocol(str):** The protocol that is used by the service object. The only valid options are tcp and udp.

**port(str):** The port number that is used by the service object. This can be specified as a single integer or a valid range of ports.

**description(str):** A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service/tcp-80:
 panos.service_exists:
 - servicename: tcp-80
 - vsys: 1
 - protocol: tcp
 - port: 80
 - description: Hypertext Transfer Protocol
 - commit: False

panos/service/udp-500-550:
 panos.service_exists:
 - servicename: udp-500-550
 - vsys: 3
 - protocol: udp
 - port: 500-550
 - commit: False
```

`salt.states.panos.service_group_exists`(name, groupname=None, vsys=1, members=None, description=None, commit=False)

Ensures that a service group object exists in the configured state. If it does not exist or is not configured with the specified attributes, it will be adjusted to match the specified values.

This module will enforce group membership. If a group exists and contains members this state does not include, those members will be removed and replaced with the specified members in the state.

name: The name of the module function to execute.

groupname(str): The name of the service group object. The name is case-sensitive and can have up to 31 characters, which can be letters, numbers, spaces, hyphens, and underscores. The name must be unique on a firewall and, on Panorama, unique within its device group and any ancestor or descendant device groups.

vsys(str): The string representation of the VSYS ID. Defaults to VSYS 1.

members(str, list): The members of the service group. These must be valid service objects or service groups on the system that already exist prior to the execution of this state.

description(str): A description for the policy (up to 255 characters).

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/service-group/my-group:
 panos.service_group_exists:
 - groupname: my-group
 - vsys: 1
 - members:
 - tcp-80
 - custom-port-group
 - description: A group that needs to exist
 - commit: False
```

`salt.states.panos.set_config`(name, xpath=None, value=None, commit=False)

Sets a Palo Alto XPATH to a specific value. This will always overwrite the existing value, even if it is not changed.

You can add or create a new object at a specified location in the configuration hierarchy. Use the xpath parameter to specify the location of the object in the configuration

name: The name of the module function to execute.

xpath(str): The XPATH of the configuration API tree to control.

value(str): The XML value to set. This must be a child to the XPATH.

commit(bool): If true the firewall will commit the changes, if false do not commit changes.

SLS Example:

```
panos/hostname:
 panos.set_config:
 - xpath: /config/devices/entry[@name='localhost.localdomain']/deviceconfig/
 ↪ system
 - value: <hostname>foobar</hostname>
 - commit: True
```

### 21.19.227 salt.states.pbm module

Manages VMware storage policies (called pbm because the vCenter endpoint is /pbm)

#### Examples

##### Storage policy

```
{
 "name": "salt_storage_policy"
 "description": "Managed by Salt. Random capability values.",
 "resource_type": "STORAGE",
 "subprofiles": [
 {
 "capabilities": [
 {

},
],
}

```

## Dependencies

- pyVmomi Python Module

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See *Issue #29537* <<https://github.com/saltstack/salt/issues/29537>> for more information.

**salt.states.pbm.default\_storage\_policy\_assigned**(*name, policy, datastore*)

Assigns a default storage policy to a datastore

**policy** Name of storage policy

**datastore** Name of datastore

**salt.states.pbm.default\_vsan\_policy\_configured**(*name, policy*)

Configures the default VSAN policy on a vCenter. The state assumes there is only one default VSAN policy on a vCenter.

**policy** Dict representation of a policy

**salt.states.pbm.storage\_policies\_configured**(*name, policies*)

Configures storage policies on a vCenter.

**policies** List of dict representation of the required storage policies

## 21.19.228 salt.states.pcs module

### Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.110.

**depends** pcs

Walkthrough of a complete PCS cluster setup: [http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters\\_from\\_Scratch/](http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters_from_Scratch/)

**Requirements:** PCS is installed, pcs service is started and the password for the hacluster user is set and known.

**Remark on the cibname variable used in the examples:** The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
 pcs.cib_present:
 - cibname: cib_for_galera
 - scope: None
 - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
 pcs.resource_present:
 - resource_id: galera
 - resource_type: "ocf:heartbeat:galera"
 - resource_options:
 - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
 - '--master'
 - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
 pcs.cib_pushed:
 - cibname: cib_for_galera
 - scope: None
 - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

```
pcs_auth__auth:
 pcs.auth:
 - nodes:
 - node1.example.com
 - node2.example.com
 - pcsuser: hacluster
 - pcspasswd: hoonetorg
 - extra_args: []
```

2. Do the initial cluster setup:

```
pcs_setup__setup:
 pcs.cluster_setup:
 - nodes:
 - node1.example.com
 - node2.example.com
 - pcsclustername: pcscluster
 - extra_args:
 - '--start'
 - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:
 pcs.prop_has_value:
 - prop: no-quorum-policy
 - value: ignore
 - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:
 pcs.resource_defaults_to:
 - default: resource-stickiness
 - value: 100
 - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
 pcs.resource_op_defaults_to:
 - op_default: monitor-interval
 - value: 60s
 - cibname: cib_for_cluster_settings
```

6. Configure Fencing (!is often not optional on production ready cluster!):

```
pcs_stonith__created_eps_fence:
 pcs.stonith_present:
 - stonith_id: eps_fence
 - stonith_device_type: fence_eps
 - stonith_device_options:
 - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
 - 'ipaddr=myepsdevice.example.org'
 - 'power_wait=5'
 - 'verbose=1'
 - 'debug=/var/log/pcsd/eps_fence.log'
 - 'login=hidden'
 - 'passwd=hoonetorg'
 - cibname: cib_for_stonith
```

7. Add resources to your cluster:

```
mysql_pcs__resource_present_galera:
 pcs.resource_present:
 - resource_id: galera
 - resource_type: "ocf:heartbeat:galera"
```

(continues on next page)

(continued from previous page)

```

- resource_options:
 - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
 ↪node3.example.org'
 - '--master'
- cibname: cib_for_galera

```

8. Optional: Add constraints (locations, colocations, orders):

```

haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
pcs.constraint_present:
- constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
- constraint_type: colocation
- constraint_options:
 - 'add'
 - 'vip_galera'
 - 'with'
 - 'haproxy-clone'
- cibname: cib_for_haproxy

```

New in version 2016.3.0.

**salt.states.pcs.auth**(*name, nodes, pcsuser='hacluster', pcspasswd='hacluster', extra\_args=None*)

Ensure all nodes are authorized to the cluster

**name** Irrelevant, not used (recommended: `pcs_auth__auth`)

**nodes** a list of nodes which should be authorized to the cluster

**pcsuser** user for communication with pcs (default: `hacluster`)

**pcspasswd** password for pcsuser (default: `hacluster`)

**extra\_args** list of extra args for the 'pcs cluster auth' command

Example:

```

pcs_auth__auth:
pcs.auth:
- nodes:
 - node1.example.com
 - node2.example.com
- pcsuser: hacluster
- pcspasswd: hoonetorg
- extra_args: []

```

**salt.states.pcs.cib\_present**(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `{{formulaname}}__cib_present_{{cibname}}`)

**cibname** name/path of the file containing the CIB

**scope** specific section of the CIB (default:

**extra\_args** additional options for creating the CIB-file

Example:

```

mysql_pcs__cib_present_cib_for_galera:
pcs.cib_present:
- cibname: cib_for_galera
- scope: None
- extra_args: None

```

**salt.states.pcs.cib\_pushed**(*name, cibname, scope=None, extra\_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with `pcs.cib_present`

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `{{formulaname}}__cib_pushed_{{cibname}}`)

**cibname** name/path of the file containing the CIB

**scope** specific section of the CIB

**extra\_args** additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
 pcs.cib_pushed:
 - cibname: cib_for_galera
 - scope: None
 - extra_args: None
```

`salt.states.pcs.cluster_node_present(name, node, extra_args=None)`

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

**name** Irrelevant, not used (recommended: `pcs_setup__node_add_{{node}}`)

**node** node that should be added

**extra\_args** list of extra args for the 'pcs cluster node add' command

Example:

```
pcs_setup__node_add_node1.example.com:
 pcs.cluster_node_present:
 - node: node1.example.com
 - extra_args:
 - '--start'
 - '--enable'
```

`salt.states.pcs.cluster_setup(name, nodes, pcsclustername='pcscluster', extra_args=None)`

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `pcs_setup__setup`)

**nodes** a list of nodes which should be set up

**pcsclustername** Name of the Pacemaker cluster

**extra\_args** list of extra args for the 'pcs cluster setup' command

Example:

```
pcs_setup__setup:
 pcs.cluster_setup:
 - nodes:
 - node1.example.com
 - node2.example.com
 - pcsclustername: pcscluster
 - extra_args:
 - '--start'
 - '--enable'
```

`salt.states.pcs.constraint_present(name, constraint_id, constraint_type, constraint_options=None, cibname=None)`

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `{{formulaname}}__constraint_present_{{constraint_id}}`)

**constraint\_id** name for the constraint (try first to create manually to find out the autogenerated name)

**constraint\_type** constraint type (location, colocation, order)

**constraint\_options** options for creating the constraint

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
 pcs.constraint_present:
 - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
 - constraint_type: colocation
 - constraint_options:
 - 'add'
 - 'vip_galera'
 - 'with'
 - 'haproxy-clone'
 - cibname: cib_for_haproxy
```

`salt.states.pcs.prop_has_value(name, prop, value, extra_args=None, cibname=None)`

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)

**name** Irrelevant, not used (recommended: `pcs_properties__prop_has_value_{{prop}}`)

**prop** name of the property

**value** value of the property

**extra\_args** additional options for the pcs property command

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__prop_has_value_no-quorum-policy:
 pcs.prop_has_value:
 - prop: no-quorum-policy
 - value: ignore
 - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_defaults_to(name, default, value, extra_args=None, cibname=None)`

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_properties__resource_defaults_to_{{default}}`)

**default** name of the default resource property

**value** value of the default resource property

**extra\_args** additional options for the pcs command

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
 pcs.resource_defaults_to:
 - default: resource-stickiness
 - value: 100
 - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_op_defaults_to(name, op_default, value, extra_args=None, cibname=None)`

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: `pcs_properties__resource_op_defaults_to_{{op_default}}`)

**op\_default** name of the operation default resource property

**value** value of the operation default resource property

**extra\_args** additional options for the pcs command

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
 pcs.resource_op_defaults_to:
 - op_default: monitor-interval
 - value: 60s
 - cibname: cib_for_cluster_settings
```

`salt.states.pcs.resource_present`(*name*, *resource\_id*, *resource\_type*, *resource\_options*=None, *cibname*=None)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: {{formulaname}}\_\_resource\_present\_{{resource\_id}})

**resource\_id** name for the resource

**resource\_type** resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

**resource\_options** additional options for creating the resource

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
mysql_pcs__resource_present_galera:
 pcs.resource_present:
 - resource_id: galera
 - resource_type: "ocf:heartbeat:galera"
 - resource_options:
 - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,
↪node3.example.org'
 - '--master'
 - cibname: cib_for_galera
```

`salt.states.pcs.stonith_present`(*name*, *stonith\_id*, *stonith\_device\_type*, *stonith\_device\_options*=None, *cibname*=None)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

**name** Irrelevant, not used (recommended: pcs\_stonith\_\_created\_{{stonith\_id}})

**stonith\_id** name for the stonith resource

**stonith\_device\_type** name of the stonith agent fence\_eps, fence\_xvm f.e.

**stonith\_device\_options** additional options for creating the stonith resource

**cibname** use a cached CIB-file named like cibname instead of the live CIB

Example:

```
pcs_stonith__created_eps_fence:
 pcs.stonith_present:
 - stonith_id: eps_fence
 - stonith_device_type: fence_eps
 - stonith_device_options:
 - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
 - 'ipaddr=myepsdevice.example.org'
 - 'power_wait=5'
 - 'verbose=1'
 - 'debug=/var/log/pcsd/eps_fence.log'
 - 'login=hidden'
 - 'passwd=hoonetorg'
 - cibname: cib_for_stonith
```

### 21.19.229 salt.states.pdbedit

Manage accounts in Samba's passdb using pdbedit

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** pdbedit

**platform** posix

New in version 2017.7.0.

```
wash:
 pdbedit.absent

keylee:
 pdbedit.managed:
 - password: A70C708517B5DD0EDB67714FE25336EB
 - password_hashed: True
 - drive: 'X:'
 - homedir: '\\serenity\mechanic\profile'
```

**salt.states.pdbedit.absent**(*name*)

Ensure user account is absent

**name** [string] username

**salt.states.pdbedit.managed**(*name*, *\*\*kwargs*)

Manage user account

**login** [string] login name

**password** [string] password

**password\_hashed** [boolean] set if password is a nt hash instead of plain text

**domain** [string] users domain

**profile** [string] profile path

**script** [string] logon script

**drive** [string] home drive

**homedir** [string] home directory

**fullname** [string] full name

**account\_desc** [string] account description

**machine\_sid** [string] specify the machines new primary group SID or rid

**user\_sid** [string] specify the users new primary group SID or rid

**account\_control** [string] specify user account control properties

---

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

---

**reset\_login\_hours** [boolean] reset the users allowed logon hours

**reset\_bad\_password\_count** [boolean] reset the stored bad login counter

**salt.states.pdbedit.present**(*name*, *\*\*kwargs*)

Alias for pdbedit.managed

### 21.19.230 salt.states.pecl

#### Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (php-pear in most cases). Example:

```
php-pear:
 pkg.installed

mongo:
 pecl.installed:
 - require:
 - pkg: php-pear
```

`salt.states.pecl.installed(name, version=None, defaults=False, force=False, preferred_state='stable')`

New in version 0.17.0.

Make sure that a pecl extension is installed.

**name** The pecl extension name to install

**version** The pecl extension version to install. This option may be ignored to install the latest stable version.

**defaults** Use default answers for extensions such as pecl\_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force** Whether to force the installed version or not

**preferred\_state** The pecl extension state to install

`salt.states.pecl.removed(name)`

Make sure that a pecl extension is not installed.

**name** The pecl extension name to uninstall

### 21.19.231 salt.states.pip\_state

#### Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (python-pip in most cases). Example:

```
python-pip:
 pkg.installed

virtualenvwrapper:
 pip.installed:
 - require:
 - pkg: python-pip
```

```
salt.states.pip_state.installed(name, pkgs=None, pip_bin=None, requirements=None,
 bin_env=None, use_wheel=False, no_use_wheel=False,
 log=None, proxy=None, timeout=None, repo=None, ed-
 itable=None, find_links=None, index_url=None, ex-
 tra_index_url=None, no_index=False, mirrors=None,
 build=None, target=None, download=None, down-
 load_cache=None, source=None, upgrade=False,
 force_reinstall=False, ignore_installed=False, ex-
 ists_action=None, no_deps=False, no_install=False,
 no_download=False, install_options=None,
 global_options=None, user=None, cwd=None, pre_releases=False,
 cert=None, allow_all_external=False, allow_external=None,
 allow_unverified=None, process_dependency_links=False,
 env_vars=None, use_vt=False, trusted_host=None,
 no_cache_dir=False, cache_dir=None, no_binary=None, ex-
 tra_args=None, **kwargs)
```

Make sure the package is installed

**name** The name of the python package to install. You can also specify version numbers here using the standard operators ==, >=, <=. If **requirements** is given, this parameter will be ignored.

Example:

```
django:
 pip.installed:
 - name: django >= 1.6, <= 1.7
 - require:
 - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

**requirements** Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

**user** The user under which to run pip

**use\_wheel** [False] Prefer wheel archives (requires pip>=1.4)

**no\_use\_wheel** [False] Force to not use wheel archives (requires pip>=1.4)

**no\_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```
django:
 pip.installed:
 - no_binary: ':all:'

flask:
 pip.installed:
 - no_binary:
 - itsdangerous
 - click
```

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**timeout** Set the socket timeout (default 15 seconds)

**editable** install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

**find\_links** URL to look for packages at

**index\_url** Base URL of Python Package Index

**extra\_index\_url** Extra URLs of package indexes to use in addition to **index\_url**

**no\_index** Ignore package index  
**mirrors** Specific mirror URL(s) to query (automatically adds --use-mirrors)  
**build** Unpack packages into `build` dir  
**target** Install packages into `target` dir  
**download** Download packages into `download` instead of installing them  
**download\_cache** Cache downloaded packages in `download_cache` dir  
**source** Check out `editable` packages into `source` dir  
**upgrade** Upgrade all packages to the newest available version  
**force\_reinstall** When upgrading, reinstall all packages even if they are already up-to-date.  
**ignore\_installed** Ignore the installed packages (reinstalling instead)  
**exists\_action** Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup  
**no\_deps** Ignore package dependencies  
**no\_install** Download and unpack all packages, but don't actually install them  
**no\_cache\_dir**: Disable the cache.  
**cwd** Current working directory to run pip from  
**pre\_releases** Include pre-releases in the available versions  
**cert** Provide a path to an alternate CA bundle  
**allow\_all\_external** Allow the installation of all externally hosted files  
**allow\_external** Allow the installation of externally hosted files (comma separated list)  
**allow\_unverified** Allow the installation of insecure and unverifiable files (comma separated list)  
**process\_dependency\_links** Enable the processing of dependency links  
**bin\_env** [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.  
**env\_vars** Add or modify environment variables. Useful for tweaking build steps, such as specifying `INCLUDE` or `LIBRARY` paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```

django:
 pip.installed:
 - name: django_app
 - env_vars:
 CUSTOM_PATH: /opt/django_app
 VERBOSE: True

```

**use\_vt** Use VT terminal emulation (see output while installing)  
**trusted\_host** Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```

django:
 pip.installed:
 - name: django >= 1.6, <= 1.7
 - bin_env: /foo/.virtualenvs/bar
 - require:
 - pkg: python-pip

```

Or

Example:

```

django:
 pip.installed:
 - name: django >= 1.6, <= 1.7
 - bin_env: /foo/.virtualenvs/bar/bin/pip
 - require:
 - pkg: python-pip

```

---

**Attention**

The following arguments are deprecated, do not use.

---

**pip\_bin** [None] Deprecated, use **bin\_env**

Changed in version 0.17.0: **use\_wheel** option added.

**install\_options**

Extra arguments to be supplied to the `setup.py` install command. If you are using an option with a directory path, be sure to use absolute path.

Example:

```
django:
 pip.installed:
 - name: django
 - install_options:
 - --prefix=/blah
 - require:
 - pkg: python-pip
```

**global\_options** Extra global options to be supplied to the `setup.py` call before the install command.

New in version 2014.1.3.

---

**Attention**

As of Salt 0.17.0 the `pip` state **needs** an importable `pip` module. This usually means having the system's `pip` package installed or running Salt from an active `virtualenv`.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

---

---

**Attention**

Please set `reload_modules: True` to have the salt minion import this module after installation.

---

Example:

```
pyopenssl:
 pip.installed:
 - name: pyOpenSSL
 - reload_modules: True
 - exists_action: i
```

**extra\_args** `pip` keyword and positional arguments not yet implemented in salt

```
pandas:
 pip.installed:
 - name: pandas
 - extra_args:
 - --latest-pip-kwarg: param
 - --latest-pip-arg
```

**Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

```

salt.states.pip_state.pip_has_exceptions_mod(ver)
 True when the pip version has the pip.exceptions module

salt.states.pip_state.pip_has_internal_exceptions_mod(ver)
 True when the pip version has the pip._internal.exceptions module

salt.states.pip_state.purge_pip()
 Purge pip and its sub-modules

salt.states.pip_state.removed(name, requirements=None, bin_env=None, log=None, proxy=None,
 timeout=None, user=None, cwd=None, use_vt=False)
 Make sure that a package is not installed.
 name The name of the package to uninstall
 user The user under which to run pip
 bin_env [None] the pip executable or virtualenv to use
 use_vt Use VT terminal emulation (see output while installing)

salt.states.pip_state.uptodate(name, bin_env=None, user=None, cwd=None, use_vt=False)
 New in version 2015.5.0.

 Verify that the system is completely up to date.
 name The name has no functional value and is only used as a tracking reference
 user The user under which to run pip
 bin_env the pip executable or virtualenv to use
 use_vt Use VT terminal emulation (see output while installing)

```

### 21.19.232 salt.states.pkg

#### Installation of packages using OS package managers such as yum or apt-get

**Note:** On minions running systemd<=205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```

vim:
 pkg.installed

```

A more involved example involves pulling from a custom repository.

```

base:
 pkgrepo.managed:
 - name: ppa:wolfnet/logstash
 - dist: precise
 - file: /etc/apt/sources.list.d/logstash.list
 - keyid: 28B04E4A

```

(continues on next page)

(continued from previous page)

```
- keyserver: keyserver.ubuntu.com
```

```
logstash:
```

```
 pkg.installed:
```

```
 - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the pkgs state module

```
dotdeb.repo:
```

```
 pkgrepo.managed:
```

```
 - name: deb http://packages.dotdeb.org wheezy-php55 all
 - dist: wheezy-php55
 - file: /etc/apt/sources.list.d/dotbeb.list
 - keyid: 89DF5277
 - keyserver: keys.gnupg.net
 - refresh_db: true
```

```
php.packages:
```

```
 pkg.installed:
```

```
 - fromrepo: wheezy-php55
 - pkgs:
 - php5-fpm
 - php5-cli
 - php5-curl
```

**Warning:** Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

`salt.states.pkg.downloaded(name, version=None, pkgs=None, fromrepo=None, ignore_epoch=None, **kwargs)`

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to download the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
```

```
 pkg.downloaded:
```

```
 - disablerepo: base,updates
```

To see what is supported, check [this page](#) to find the documentation for your platform's pkg module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

Currently supported for the following pkg providers: *yumpkg*, *zypper* and *zypper*

#### Parameters

- **name** (*str*) -- The name of the package to be downloaded. This parameter is ignored if either "pkgs" is used. Additionally, please note that this option can only be used to

download packages from a software repository.

- **version** (*str*) -- Download a specific version of a package.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
 pkg.downloaded:
 - version: 2:7.4.160-1.el7
```

An **ignore\_epoch** argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

You can install a specific version when using the **pkgs** argument by including the version after the package:

```
common_packages:
 pkg.downloaded:
 - pkgs:
 - unzip
 - dos2unix
 - salt-minion: 2015.8.5-1.el6
```

- **resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

CLI Example:

```
zsh:
 pkg.downloaded:
 - version: 5.0.5-4.63
 - fromrepo: "myrepository"
```

**salt.states.pkg.group\_installed** (*name*, *skip=None*, *include=None*, *\*\*kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in pacman

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and *pacman* package managers.

**skip** Packages that would normally be installed by the package group ("default" packages), which should not be installed.

```
Load Balancer:
 pkg.group_installed:
 - skip:
 - piranha
```

**include** Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
 pkg.group_installed:
```

(continues on next page)

(continued from previous page)

- **include:**
- haproxy

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

**Note:** Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed on to the call to `pkg.install`.

```
salt.states.pkg.installed(name, version=None, refresh=None, fromrepo=None, skip_verify=False,
 skip_suggestions=False, pkgs=None, sources=None, allow_updates=False,
 pkg_verify=False, normalize=True, ignore_epoch=None, reinstall=False,
 update_holds=False, **kwargs)
```

Ensure that the package is installed, and that it is the correct version (if specified).

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
 pkg.installed:
 - disablerepo: base,updates
```

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

#### Parameters

- **name** (*str*) -- The name of the package to be installed. This parameter is ignored if either "pkgs" or "sources" is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option detailed below.
- **version** (*str*) -- Install a specific version of a package. This option is ignored if "sources" is used. Currently, this option is supported for the following pkg providers: `apt`, `ebuild`, `pacman`, `pkgin`, `win_pkg`, `yumpkg`, and `zypper`. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
salt myminion pkg.latest_version vim-enhanced
myminion:
 2:7.4.160-1.el7
```

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
 pkg.installed:
 - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, `pkg.list_repo_pkgs` will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
salt myminion pkg.list_repo_pkgs bash
myminion:

 bash:
 - 4.2.46-21.el7_3
 - 4.2.46-20.el7_2
```

This function was first added for `pkg.list_repo_pkgs` in 2014.1.0, and was expanded to `Debian/Ubuntu` and `Arch Linux`-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
 pkg.installed:
 - pkgs:
 - unzip
 - dos2unix
 - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

## WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```
mypkg:
 pkg.installed:
 - version: '1.2.34*'
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

- **refresh** (*bool*) -- This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

- **cache\_valid\_time** (*str*) -- New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
 pkg.installed:
 - fromrepo: mycustomrepo
 - skip_verify: True
 - skip_suggestions: True
 - version: 2.0.6~ubuntu3
 - refresh: True
 - cache_valid_time: 300
 - allow_updates: True
 - hold: False
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get` update was executed on the system.

---

**Note:** This parameter is available only on Debian based distributions and has no effect on the rest.

---

- **fromrepo** (*str*) -- Specify a repository from which to install

---

**Note:** Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```

root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy
↳ffmpeg'
ubuntu01:
 ffmpeg:
 Installed: (none)
 Candidate: 7:0.10.11-1~precise1
 Version table:
 7:0.10.11-1~precise1 0
 500 http://ppa.launchpad.net/jon-severinsson/
↳ffmpeg/ubuntu/ precise/main amd64 Packages
 4:0.8.10-0ubuntu0.12.04.1 0
 500 http://us.archive.ubuntu.com/ubuntu/ precise-
↳updates/main amd64 Packages
 500 http://security.ubuntu.com/ubuntu/ precise-
↳security/main amd64 Packages
 4:0.8.1-0ubuntu1 0
 500 http://us.archive.ubuntu.com/ubuntu/ precise/
↳main amd64 Packages

```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version 4:0.8.10-0ubuntu0.12.04.1 either precise-updates or precise-security could be used for the fromrepo value.

- **skip\_verify** (*bool*) -- Skip the GPG verification check for the package to be installed
- **skip\_suggestions** (*bool*) -- Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

- **resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

- **allow\_updates** (*bool*) -- Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```

httpd:
 pkg.installed:
 - fromrepo: mycustomrepo
 - skip_verify: True
 - skip_suggestions: True
 - version: 2.0.6~ubuntu3
 - refresh: True
 - allow_updates: True
 - hold: False

```

- **pkg\_verify** (*bool*) -- New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for upgrade or downgrade, use pkg.verify to determine if any of the files installed by the package have been altered. If files have been altered, the reinstall option of pkg.install is used to force a reinstall. Types to ignore can be passed to pkg.verify. Additionally,

`verify_options` can be used to modify further the behavior of `pkg.verify`. See examples below. Currently, this option is supported for the following `pkg` providers: *yumpkg*.

Examples:

```
httpd:
 pkg.installed:
 - version: 2.2.15-30.el6.centos
 - pkg_verify: True
```

```
mypkgs:
 pkg.installed:
 - pkgs:
 - foo
 - bar: 1.2.3-4
 - baz
 - pkg_verify:
 - ignore_types:
 - config
 - doc
```

```
mypkgs:
 pkg.installed:
 - pkgs:
 - foo
 - bar: 1.2.3-4
 - baz
 - pkg_verify:
 - ignore_types:
 - config
 - doc
 - verify_options:
 - nodeps
 - nofiledigest
```

- **ignore\_types** (*list*) -- List of types to ignore when verifying the package

New in version 2014.7.0.

- **verify\_options** (*list*) -- List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

- **normalize** (*bool*) -- Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
 pkg.installed:
 - normalize: False
```

- **ignore\_epoch** (*bool*) -- If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

#### MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

##### Parameters

- **pkgs** (*list*) -- A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
 pkg.installed:
 - pkgs:
 - foo
 - bar
 - baz
 - hold: True
```

NOTE: For *apt*, *ebuild*, *pacman*, *winrepo*, *yumpkg*, and *zypper*, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
 pkg.installed:
 - pkgs:
 - foo
 - bar: 1.2.3-4
 - baz
```

Additionally, *ebuild*, *pacman*, *zypper*, *yum/dnf*, and *apt* support the `<`, `<=`, `>=`, and `>` operators for more control over what versions will be installed. For example:

```
mypkgs:
 pkg.installed:
 - pkgs:
 - foo
 - bar: '>=1.2.3-4'
 - baz
```

NOTE: When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With *ebuild* is also possible to specify a use flag list and/or if the given packages should be in `package.accept_keywords` file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
 pkg.installed:
 - pkgs:
```

(continues on next page)

(continued from previous page)

```
- foo: '~'
- bar: '~>=1.2:slot::overlay[use,-otheruse]'
- baz
```

- **sources** (*list*) -- A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
 pkg.installed:
 - sources:
 - foo: salt://rpms/foo.rpm
 - bar: http://somesite.org/bar.rpm
 - baz: ftp://someothersite.org/baz.rpm
 - qux: /minion/path/to/qux.rpm
```

## PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

### Parameters

- **hold** (*bool*) -- Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

- **update\_holds** (*bool*) -- If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

Currently works with YUM/DNF & APT based systems.

New in version 2016.11.0.

- **names** (*list*) -- A list of packages to install from a software repository. Each package will be installed individually by the package manager.

**Warning:** Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

- **install\_recommends** (*bool*) -- Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
 pkg.installed:
 - install_recommends: False
```

- **only\_upgrade** (*bool*) -- Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
 pkg.installed:
 - only_upgrade: True
```

**Note:** If this parameter is set to True and the package is not already installed, the state will fail.

- **report\_reboot\_exit\_codes** (*bool*) -- If the installer exits with a recognized exit code indicating that a reboot is required, the module function *win\_system.set\_reboot\_required\_witnessed* will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to True. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
 pkg.installed:
 - name: ms-vcpp
 - version: 10.0.40219
 - report_reboot_exit_codes: False
```

**Returns** A dictionary containing the state of the software installation  
Rtype dict

**Note:** The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the [Reloading Modules](#) documentation for more information.

See also:

`unless` and `onlyif`

If running `pkg` commands together with `aggregate` isn't an option, you can use the `creates`, `unless`, or `onlyif` syntax to skip a full package run. This can be helpful in large environments with multiple states that include requisites for packages to be installed.

```
Using creates for a simple single-factor check
install_nginx:
 pkg.installed:
 - name: nginx
 - creates:
 - /etc/nginx/nginx.conf
```

```
Using file.file_exists for a single-factor check
install_nginx:
 pkg.installed:
 - name: nginx
```

(continues on next page)

(continued from previous page)

```

- unless:
- fun: file.file_exists
 args:
 - /etc/nginx/nginx.conf

Using unless with a shell test
install_nginx:
 pkg.installed:
 - name: nginx
 - unless: test -f /etc/nginx/nginx.conf

```

```

Using file.search for a two-factor check
install_nginx:
 pkg.installed:
 - name: nginx
 - unless:
 - fun: file.search
 args:
 - /etc/nginx/nginx.conf
 - 'user www-data;'

```

The above examples use different methods to reasonably ensure that a package has already been installed. First, with checking for a file that would be created with the package. Second, by checking for specific text within a file that would be created or managed by salt. With these requisists satisfied, `creates/unless` will return `True` and the `pkg.installed` state will be skipped.

```

Example of state run without unless used
salt 'saltdev' state.apply nginx
saltdev:

 ID: install_nginx
 Function: pkg.installed
 Name: nginx
 Result: True
 Comment: All specified packages are already installed
 Started: 20:11:56.388331
 Duration: 4290.0 ms
 Changes:

Example of state run using unless requisite
salt 'saltdev' state.apply nginx
saltdev:

 ID: install_nginx
 Function: pkg.installed
 Name: nginx
 Result: True
 Comment: unless condition is true
 Started: 20:10:50.659215
 Duration: 1530.0 ms
 Changes:

```

The result is a reduction of almost 3 seconds. In larger environments, small reductions in waiting time can add up.

*Unless Requisite*

`salt.states.pkg.latest(name, refresh=None, fromrepo=None, skip_verify=False, pkgs=None, watch_flags=True, **kwargs)`

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the `installed` function to be used, as `latest` will update the package whenever a new package is available.

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the package(s). For example, you can include a `disablerepo` argument on platforms that use yum/dnf to disable that repo:

```
mypkg:
 pkg.latest:
 - disablerepo: base,updates
```

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

**name** The name of the package to maintain at the latest available version. This parameter is ignored if "pkgs" is used.

**fromrepo** Specify a repository from which to install

**skip\_verify** Skip the GPG verification check for the package to be installed

**refresh** This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

**param str cache\_valid\_time** New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
 pkg.latest:
 - refresh: True
 - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

**Note:** This parameter is available only on Debian based distributions and has

no effect on the rest.

**param bool resolve\_capabilities** Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

**pkgs** A list of packages to maintain at the latest available version.

```
mypkgs:
 pkg.latest:
 - pkgs:
 - foo
 - bar
 - baz
```

**install\_recommends** Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
 pkg.latest:
 - install_recommends: False
```

**only\_upgrade** Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
 pkg.latest:
 - only_upgrade: True
```

---

**Note:** If this parameter is set to `True` and the package is not already installed, the state will fail.

---

**report\_reboot\_exit\_codes** If the installer exits with a recognized exit code indicating that a reboot is required, the module function

*win\_system.set\_reboot\_required\_witnessed*

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
 pkg.latest:
 - name: ms-vcpp
 - report_reboot_exit_codes: False
```

`salt.states.pkg.mod_aggregate` (*low, chunks, running*)

The `mod_aggregate` function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

`salt.states.pkg.mod_watch(name, **kwargs)`  
 Install/reinstall a package based on a watch requisite

---

**Note:** This state exists to support special handling of the watch [requisite](#). It should not be called directly. Parameters for this function should be set by the state being triggered.

---

`salt.states.pkg.patch_downloaded(name, advisory_ids=None, **kwargs)`  
 New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: [yumpkg](#) and [zypper](#)

CLI Example:

```
preparing-to-fix-issues:
 pkg.patch_downloaded:
 - advisory_ids:
 - SUSE-SLE-SERVER-12-SP2-2017-185
 - SUSE-SLE-SERVER-12-SP2-2017-150
 - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.patch_installed(name, advisory_ids=None, downloadonly=None, **kwargs)`  
 New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

---

**Note:** Any argument which is either a) not explicitly defined for this state, or b) not a global state argument like `saltenv`, or `reload_modules`, will be passed through to the call to `pkg.install` to install the patch(es).

To see what is supported, check [this page](#) to find the documentation for your platform's `pkg` module, then look at the documentation for the `install` function.

Any argument that is passed through to the `install` function, which is not defined for that function, will be silently ignored.

---

Currently supported for the following pkg providers: [yumpkg](#) and [zypper](#)

CLI Example:

```
issue-foo-fixed:
 pkg.patch_installed:
 - advisory_ids:
 - SUSE-SLE-SERVER-12-SP2-2017-185
 - SUSE-SLE-SERVER-12-SP2-2017-150
 - SUSE-SLE-SERVER-12-SP2-2017-120
```

`salt.states.pkg.purged(name, version=None, pkgs=None, normalize=True, ignore_epoch=None, **kwargs)`

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

**name** The name of the package to be purged.

**version** The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
pkg.purged:
- version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore\_epoch** [None] If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

Multiple Package Options:

**pkgs** A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.removed(name, version=None, pkgs=None, normalize=True, ignore_epoch=None, **kwargs)`

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

**name** The name of the package to be removed.

**version** The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

**Important:** As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
pkg.removed:
- version: 2:7.4.160-1.el7
```

In version 2015.8.9, an `ignore_epoch` argument has been added to `pkg.installed`, `pkg.removed`, and `pkg.purged` states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If `ignore_epoch` was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

**ignore\_epoch** [None] If this option is not explicitly set, and there is no epoch in the desired package version, the epoch will be implicitly ignored. Set this argument to `True` to explicitly ignore the epoch, and `False` to strictly enforce it.

New in version 2015.8.9.

Changed in version 3001: In prior releases, the default behavior was to strictly enforce epochs unless this argument was set to `True`.

Multiple Package Options:

**pkgs** A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.uptodate` (*name*, *refresh=False*, *pkgs=None*, *\*\*kwargs*)

New in version 2014.7.0.

Changed in version 2018.3.0: Added support for the `pkgin` provider.

Verify that the system is completely up to date.

**name** The name has no functional value and is only used as a tracking reference

**refresh** refresh the package database before checking for new upgrades

**pkgs** list of packages to upgrade

Parameters

- **cache\_valid\_time** (*str*) -- This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

In this case `cache_valid_time` is set, `refresh` will not take place for amount in seconds since last `apt-get update` executed on the system.

---

**Note:** This parameter available only on Debian based distributions, and have no effect on the rest.

---

- **resolve\_capabilities** (*bool*) -- Turn on resolving capabilities. This allow one to name "provides" or alias names for packages.

New in version 2018.3.0.

**kwargs** Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

### 21.19.233 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
 pkgbuild.built:
 - runas: thatch
 - results:
 - salt-2015.5.2-2.el7.centos.noarch.rpm
 - salt-api-2015.5.2-2.el7.centos.noarch.rpm
 - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
 - salt-master-2015.5.2-2.el7.centos.noarch.rpm
 - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
 - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
 - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
 - dest_dir: /tmp/pkg
 - spec: salt://pkg/salt/spec/salt.spec
 - template: jinja
 - deps:
 - salt://pkg/salt/sources/required_dependency.rpm
 - tgt: epel-7-x86_64
 - sources:
 - salt://pkg/salt/sources/logrotate.salt
 - salt://pkg/salt/sources/README.fedora
 - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
 - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
 - salt://pkg/salt/sources/salt-api
 - salt://pkg/salt/sources/salt-api.service
 - salt://pkg/salt/sources/salt-master
 - salt://pkg/salt/sources/salt-master.service
 - salt://pkg/salt/sources/salt-minion
 - salt://pkg/salt/sources/salt-minion.service
 - salt://pkg/salt/sources/saltpkg.sls
 - salt://pkg/salt/sources/salt-syndic
 - salt://pkg/salt/sources/salt-syndic.service
 - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
 pkgbuild.repo
```

```
salt.states.pkgbuild.built(name, runas, dest_dir, spec, sources, tgt, template=None,
 deps=None, env=None, results=None, force=False, saltenv='base',
 log_dir='/var/log/salt/pkgbuild')
```

Ensure that the named package is built and exists in the named directory

**name** The name to track the build, the name value is otherwise unused

**runas** The user to run the build process as

**dest\_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**tgt** The target platform to run the build on

**template** Run the spec file through a templating engine

Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

**deps** Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading

directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

**env** A dictionary of environment variables to be set prior to execution. Example:

```
- env:
 DEB_BUILD_OPTIONS: 'nocheck'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

**results** The names of the expected rpms that will be built

**force** [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

New in version 2015.8.2.

**saltenv** The saltenv to use for files downloaded from the salt fileserver

**log\_dir** [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

New in version 2015.8.2.

**salt.states.pkgbuild.repo** (*name*, *keyid*=None, *env*=None, *use\_passphrase*=False, *gnupghome*='/etc/salt/gpgkeys', *runas*='builder', *timeout*=15.0)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

**name** The directory to find packages that will be in the repository

**keyid** Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
 -----BEGIN PGP PRIVATE KEY BLOCK-----
 Version: GnuPG v1

 lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
 w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
 .
 .
 Ebe+8JCQTWqSXPRtZxmy/b5WXDeM79CkLWvuGpXFor76D+ECMRpv/rawukEcNptn
 R50mgHqvYdEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZIopzalvX
 =JvW8
 -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
 -----BEGIN PGP PUBLIC KEY BLOCK-----
 Version: GnuPG v1

 mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
 w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
 .
```

(continues on next page)

(continued from previous page)

```
.
bYP7t5iwJmQzRMMyFInYRt77wkJBPCpJc9FPNebL9vLZcN4zv0KQta+4alcWivvoP
4QIXE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----
```

**gpg\_pkg\_pub\_keyname:** gpg\_pkg\_key.pub

**env** Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
 OPTIONS: 'ask-passphrase'
```

**Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

---

**Note:** This parameter is not used for making yum repositories.

---

**use\_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with 'keyid'

**runas** [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

---

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

---

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

### 21.19.234 salt.states.pkgng

#### Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
 pkgng.update_packaging_site:
 - name: "http://192.168.0.2"
```

```
salt.states.pkgng.update_packaging_site(name)
```

### 21.19.235 salt.states.pkgrepo

#### Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```
base:
 pkgrepo.managed:
 - humanname: CentOS-$releasever - Base
 - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&
 ↪repo=os
 - comments:
 - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
 - gpgcheck: 1
 - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6
```

```
base:
 pkgrepo.managed:
 - humanname: Logstash PPA
 - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
 - dist: precise
 - file: /etc/apt/sources.list.d/logstash.list
 - keyid: 28B04E4A
 - keyserver: keyserver.ubuntu.com
 - require_in:
 - pkg: logstash

 pkg.latest:
 - name: logstash
 - refresh: True
```

```
base:
 pkgrepo.managed:
 - humanname: deb-multimedia
 - name: deb http://www.deb-multimedia.org stable main
 - file: /etc/apt/sources.list.d/deb-multimedia.list
 - key_url: salt://deb-multimedia/files/marillat.pub
```

```
base:
 pkgrepo.managed:
```

(continues on next page)

(continued from previous page)

```
- humannname: Google Chrome
- name: deb http://dl.google.com/linux/chrome/deb/ stable main
- dist: stable
- file: /etc/apt/sources.list.d/chrome-browser.list
- require_in:
 - pkg: google-chrome-stable
- gpgcheck: 1
- key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
```

```
base:
 pkgrepo.managed:
 - ppa: wolfnet/logstash
 pkg.latest:
 - name: logstash
 - refresh: True
```

**Note:** On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a [bug](#) in their `python-software-properties` package, a missing dependency on `pycurl`, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `python-apt` package is required to be installed. To check if this package is installed, run `dpkg -l python-apt`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.absent(name, **kwargs)`

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around `pkg.del_repo`.

**name** The name of the package repo, as it would be referred to when running the regular package manager commands.

#### UBUNTU-SPECIFIC OPTIONS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
 pkgrepo.absent:
 - ppa: wolfnet/logstash
```

**ppa\_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
 pkgrepo.absent:
 - ppa: wolfnet/logstash
 - ppa_auth: username:password
```

**keyid** If passed, then the GPG key corresponding to the passed KeyID will also be removed.

**keyid\_ppa** [False] If set to True, the GPG key's ID will be looked up from `ppa.launchpad.net` and removed, and the `keyid` argument will be ignored.

**Note:** This option will be disregarded unless the `ppa` argument is present.

`salt.states.pkgrepo.managed(name, ppa=None, **kwargs)`

This state manages software package repositories. Currently, `yum`, `apt`, and `zypper` repositories are supported.

#### YUM/DNF/ZYPPER-BASED SYSTEMS

**Note:** One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

**name** This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in `/etc/yum.repos.d` (e.g. `/etc/yum.repos.d/foo.conf`).

**enabled** `[True]` Whether or not the repo is enabled. Can be specified as `True/False` or `1/0`.

**disabled** `[False]` Included to reduce confusion due to APT's use of the `disabled` argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.

**humanname** This is used as the "name" value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

**baseurl** The URL to a yum repository

**mirrorlist** A URL which points to a file containing a collection of baseurls

**comments** Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (`#`) in front.

**gpgautoimport** Only valid for Zypper package manager. If set to `True`, automatically trust and import public GPG key for the repository. The key should be specified with `gpgkey` parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
 pkgrepo.managed:
 - humanname: Personal repo for foo
 - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
 - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
 - gpgcheck: 1
```

#### APT-BASED SYSTEMS

**ppa** On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally. For example:

```
logstash-ppa:
 pkgrepo.managed:
 - ppa: wolfneth/logstash
```

**ppa\_auth** For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
 pkgrepo.managed:
 - ppa: wolfneth/logstash
 - ppa_auth: username:password
```

**name** On apt-based systems this must be the complete entry as it would be seen in the `sources.list` file. This can have a limited subset of components (i.e. 'main') which can be added/modified with the `comps` option.

```
precise-repo:
 pkgrepo.managed:
 - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

---

**Note:** The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
 pkgrepo.managed
```

---

**disabled** [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

**enabled** [True] Included to reduce confusion due to YUM/DNF/Zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.

**architectures** On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list.

**comps** On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

**file** The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

**dist** This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

**keyid** The KeyID or a list of KeyIDs of the GPG key to install. This option also requires the `keyserver` option to be set.

**keyserver** This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.

**key\_url** URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

---

**Note:** Use either `keyid/keyserver` or `key_url`, but not both.

---

**key\_text**

The string representation of the GPG key to install.

New in version 2018.3.0.

---

**Note:** Use either `keyid/keyserver`, `key_url`, or `key_text` but not more than one method.

---

**consolidate** [False] If set to `True`, this will consolidate all sources definitions to the `sources.list` file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the `sources.list` file. The `consolidate` will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

**clean\_file** [False] If set to `True`, empty the file before config repo

---

**Note:** Use with care. This can be dangerous if multiple sources are configured in the same file.

---

New in version 2015.8.0.

**refresh** [True] If set to `False` this will skip refreshing the apt package database on debian based systems.

**refresh\_db** [True] Deprecated since version 2018.3.0: Use `refresh` instead.

**require\_in** Set this to a list of `pkg.installed` or `pkg.latest` to trigger the running of `apt-get update` prior to attempting to install these packages. Setting a `require in` the `pkg` state will not work for this.

### 21.19.236 salt.states.portage\_config

#### Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
 portage_config.flags:
 - use:
 - openssl
```

**salt.states.portage\_config.flags**(*name*, *use=None*, *accept\_keywords=None*, *env=None*, *license=None*, *properties=None*, *unmask=False*, *mask=False*)  
Enforce the given flags on the given package or DEPEND atom.

**Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

**name** The name of the package or its DEPEND atom  
**use** A list of USE flags  
**accept\_keywords** A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords  
**env** A list of environment files  
**license** A list of accepted licenses  
**properties** A list of additional properties  
**unmask** A boolean to unmask the package  
**mask** A boolean to mask the package

### 21.19.237 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

**Note:** It may be helpful to use a higher timeout when running a *ports.installed* state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

**salt.states.ports.installed**(*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.

**options** Make sure that the desired non-default options are set

**Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
 ports.installed:
 - options:
 - IPV6: off
```

### 21.19.238 salt.states.postgres\_cluster module

#### Management of PostgreSQL clusters

The postgres\_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
 postgres_cluster.present:
 - name: 'main'
 - version: '9.3'
```

**salt.states.postgres\_cluster.absent**(*version, name*)

Ensure that the named cluster is absent

**version** Version of the postgresql server of the cluster to remove

**name** The name of the cluster to remove

New in version 2015.XX.

**salt.states.postgres\_cluster.present**(*version, name, port=None, encoding=None, locale=None, datadir=None, allow\_group\_access=None, data\_checksums=None, wal\_segsize=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see `man pg_createcluster(1)`

**version** Version of the postgresql cluster

**name** The name of the cluster

**port** Cluster port

**encoding** The character encoding scheme to be used in this database

**locale** Locale with which to create cluster

**datadir** Where the cluster is stored

**allow\_group\_access** Allows users in the same group as the cluster owner to read all cluster files created by initdb

**data\_checksums** Use checksums on data pages

**wal\_segsize** Set the WAL segment size, in megabytes

New in version 2015.XX.

### 21.19.239 salt.states.postgres\_database

#### Management of PostgreSQL databases

The postgres\_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
 postgres_database.present
```

**salt.states.postgres\_database.absent**(*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named database is absent

**name** The name of the database to remove

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

```
salt.states.postgres_database.present(name, tablespace=None, encoding=None,
 lc_collate=None, lc_ctype=None, owner=None,
 owner_recurse=False, template=None, user=None,
 maintenance_db=None, db_password=None,
 db_host=None, db_port=None, db_user=None)
```

Ensure that the named database is present with the specified properties. For more information about all of these options see `man createdb(1)`

**name** The name of the database to manage

**tablespace** Default tablespace for the database

**encoding** The character encoding scheme to be used in this database

**lc\_collate** The LC\_COLLATE setting to be used in this database

**lc\_ctype** The LC\_CTYPE setting to be used in this database

**owner** The username of the database owner

**owner\_recurse** Recurse owner change to all relations in the database

**template** The template database from which to build this database

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

New in version 0.17.0.

## 21.19.240 salt.states.postgres\_extension

### Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

#### adminpack:

```
postgres_extension.present
```

New in version 2014.7.0.

```
salt.states.postgres_extension.absent(name, if_exists=None, restrict=None, cascade=None,
 user=None, maintenance_db=None, db_user=None,
 db_password=None, db_host=None, db_port=None)
```

Ensure that the named extension is absent.

**name** Extension name of the extension to remove

**if\_exists** Add if exist slug

**restrict** Add restrict slug

**cascade** Drop on cascade

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

```
salt.states.postgres_extension.present(name, if_not_exists=None, schema=None,
 ext_version=None, from_version=None,
 user=None, maintenance_db=None, db_user=None,
 db_password=None, db_host=None, db_port=None)
```

Ensure that the named extension is present.

---

**Note:** Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

---

For more information about all of these options see CREATE EXTENSION SQL command reference in the PostgreSQL documentation.

**name** The name of the extension to be installed  
**if\_not\_exists** Add an IF NOT EXISTS parameter to the DDL statement  
**schema** Schema to install the extension into  
**ext\_version** Version to install  
**from\_version** Old extension version if already installed  
**user** System user all operations should be performed on behalf of  
**maintenance\_db** Database to act on  
**db\_user** Database username if different from config or default  
**db\_password** User password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

### 21.19.241 salt.states.postgres\_group

#### Management of PostgreSQL groups (roles)

The postgres\_group module is used to create and manage Postgres groups.

**frank:**  
postgres\_group.present

```
salt.states.postgres_group.absent(name, user=None, maintenance_db=None,
 db_password=None, db_host=None, db_port=None,
 db_user=None)
```

Ensure that the named group is absent

**name** The groupname of the group to remove

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

```
salt.states.postgres_group.present(name, createdb=None, createroles=None, encrypted=None,
 superuser=None, inherit=None, login=None, replica-
 tion=None, password=None, refresh_password=None,
 groups=None, user=None, maintenance_db=None,
 db_password=None, db_host=None, db_port=None,
 db_user=None)
```

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name** The name of the group to manage  
**createdb** Is the group allowed to create databases?  
**createroles** Is the group allowed to create other roles/users  
**encrypted** Should the password be encrypted in the system catalog?  
**login** Should the group have login perm  
**inherit** Should the group inherit permissions  
**superuser** Should the new group be a "superuser"  
**replication** Should the new group be allowed to initiate streaming replication  
**password** The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD50F({password}{role}}'
```

If encrypted is `None` or `True`, the password will be automatically encrypted to the previous format if it is not already done.

**refresh\_password** Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**groups** A string of comma separated groups the group should be in

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

## 21.19.242 salt.states.postgres\_initdb

### Initialization of PostgreSQL data directory

The `postgres_initdb` module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
postgres_initdb.present:
- name: /var/lib/pgsql/data
- auth: password
- user: postgres
- password: strong_password
- encoding: UTF8
- locale: C
- runas: postgres
- allow_group_access: True
- data_checkums: True
- wal_segsize: 32
```

`salt.states.postgres_initdb.present`(*name*, *user*=*None*, *password*=*None*, *auth*='password', *encoding*='UTF8', *locale*=*None*, *runas*=*None*, *waldir*=*None*, *checkums*=*False*)

Initialize the PostgreSQL data directory

**name** The name of the directory to initialize  
**user** The database superuser name  
**password** The password to set for the postgres user  
**auth** The default authentication method for local connections  
**encoding** The default encoding for new databases  
**locale** The default locale for new databases  
**waldir** The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

**checksums** If True, the cluster will be created with data page checksums.

---

**Note:** Data page checksums are supported since PostgreSQL 9.3.

---

New in version 2019.2.0.

**runas** The system user the operation should be performed on behalf of

## 21.19.243 salt.states.postgres\_language

### Management of PostgreSQL languages

The postgres\_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
postgres_language.present:
- maintenance_db: testdb
```

```
plpgsql:
postgres_language.absent:
- maintenance_db: testdb
```

**salt.states.postgres\_language.absent**(*name*, *maintenance\_db*, *user=None*, *db\_password=None*,  
*db\_host=None*, *db\_port=None*, *db\_user=None*)

Ensure that a named language is absent in the specified database.

**name** The name of the language to remove  
**maintenance\_db** The name of the database in which the language is to be installed  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default  
**db\_port** Database port if different from config or default

**salt.states.postgres\_language.present**(*name*, *maintenance\_db*, *user=None*,  
*db\_password=None*, *db\_host=None*, *db\_port=None*,  
*db\_user=None*)

Ensure that a named language is present in the specified database.

**name** The name of the language to install  
**maintenance\_db** The name of the database in which the language is to be installed  
**user** System user all operations should be performed on behalf of  
**db\_user** database username if different from config or default  
**db\_password** user password if any password for a specified user  
**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 21.19.244 salt.states.postgres\_privileges

#### Management of PostgreSQL Privileges

The `postgres_privileges` module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the `grant_option` is supported as well.

New in version 2016.3.0.

```
baruwa:
 postgres_privileges.present:
 - object_name: awl
 - object_type: table
 - privileges:
 - SELECT
 - INSERT
 - DELETE
 - grant_option: False
 - prepend: public
 - maintenance_db: testdb
```

```
andrew:
 postgres_privileges.present:
 - object_name: admins
 - object_type: group
 - grant_option: False
 - maintenance_db: testdb
```

```
baruwa:
 postgres_privileges.absent:
 - object_name: awl
 - object_type: table
 - privileges:
 - SELECT
 - INSERT
 - DELETE
 - prepend: public
 - maintenance_db: testdb
```

```
andrew:
postgres_privileges.absent:
- object_name: admins
- object_type: group
- maintenance_db: testdb
```

```
salt.states.postgres_privileges.absent(name, object_name, object_type, privileges=None,
 prepend='public', maintenance_db=None, user=None,
 db_password=None, db_host=None, db_port=None,
 db_user=None)
```

Revoke the requested privilege(s) on the specified object(s)

**name** Name of the role whose privileges should be revoked

**object\_name** Name of the object on which the revoke is to be performed

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object\_type: table*.

**privileges** Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when revoking group membership

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

```
salt.states.postgres_privileges.present(name, object_name, object_type, privileges=None,
 grant_option=None, prepend='public', maintenance_db=None, user=None,
 db_password=None, db_host=None, db_port=None, db_user=None)
```

Grant the requested privilege(s) on the specified object to a role

**name** Name of the role to which privileges should be granted

**object\_name** Name of the object on which the grant is to be performed. 'ALL' may be used for objects of type

'table' or 'sequence'.

**object\_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

View permissions should specify *object\_type*: *table*.

**privileges** List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**note** privileges should not be set when granting group membership

**grant\_option** If grant\_option is set to True, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance\_db** The name of the database in which the language is to be installed

**user** System user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

## 21.19.245 salt.states.postgres\_schema

### Management of PostgreSQL schemas

The postgres\_schemas module is used to create and manage Postgres schemas.

**public:**

```
postgres_schema.present 'dbname' 'name'
```

```
salt.states.postgres_schema.absent(dbname, name, user=None, db_user=None,
 db_password=None, db_host=None, db_port=None)
```

Ensure that the named schema is absent.

**dbname** The database's name will work on

**name** The name of the schema to remove

**user** system user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

```
salt.states.postgres_schema.present(dbname, name, owner=None, user=None, db_user=None,
 db_password=None, db_host=None, db_port=None)
```

Ensure that the named schema is present in the database.

**dbname** The database's name will work on

**name** The name of the schema to manage

**user** system user all operations should be performed on behalf of

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

## 21.19.246 salt.states.postgres\_tablespace

### Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```
ssd-tablespace:
 postgres_tablespace.present:
 - name: indexes
 - directory: /mnt/ssd-data
```

New in version 2015.8.0.

```
salt.states.postgres_tablespace.absent(name, user=None, maintenance_db=None,
 db_user=None, db_password=None, db_host=None,
 db_port=None)
```

Ensure that the named tablespace is absent.

**name** The name of the tablespace to remove

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

```
salt.states.postgres_tablespace.present(name, directory, options=None, owner=None,
 user=None, maintenance_db=None,
 db_password=None, db_host=None, db_port=None,
 db_user=None)
```

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.

**name** The name of the tablespace to create/manage.

**directory** The directory where the tablespace will be located, must already exist

**options** A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```
my_space:
 postgres_tablespace.present:
 - directory: /srv/my_tablespace
 - options:
 seq_page_cost: 1.0
 random_page_cost: 4.0
```

**owner** The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)

**user** System user all operations should be performed on behalf of

**maintenance\_db** Database to act on

**db\_user** Database username if different from config or default

**db\_password** User password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

### 21.19.247 salt.states.postgres\_user

#### Management of PostgreSQL users (roles)

The postgres\_users module is used to create and manage Postgres users.

```
frank:
 postgres_user.present
```

**salt.states.postgres\_user.absent** (*name, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named user is absent

**name** The username of the user to remove

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** database username if different from config or default

**db\_password** user password if any password for a specified user

**db\_host** Database host if different from config or default

**db\_port** Database port if different from config or default

**salt.states.postgres\_user.present** (*name, createdb=None, createroles=None, encrypted=None, superuser=None, replication=None, inherit=None, login=None, password=None, default\_password=None, refresh\_password=None, valid\_until=None, groups=None, user=None, maintenance\_db=None, db\_password=None, db\_host=None, db\_port=None, db\_user=None*)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

**name** The name of the system user to manage.

**createdb** Is the user allowed to create databases?

**createroles** Is the user allowed to create other users?

**encrypted** Should the password be encrypted in the system catalog?

**login** Should the group have login perm

**inherit** Should the group inherit permissions

**superuser** Should the new user be a "superuser"

**replication** Should the new user be allowed to initiate streaming replication

**password** The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

**default\_password** The password used only when creating the user, unless password is set.

New in version 2016.3.0.

**refresh\_password** Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If `refresh_password` is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

**valid\_until** A date and time after which the role's password is no longer valid.

**groups** A string of comma separated groups the user should be in

**user** System user all operations should be performed on behalf of

New in version 0.17.0.

**db\_user** Postgres database username, if different from config or default.

**db\_password** Postgres user's password, if any password, for a specified `db_user`.

**db\_host** Postgres database host, if different from config or default.

**db\_port** Postgres database port, if different from config or default.

## 21.19.248 salt.states.powerpath

### Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

<b>key:</b> <b>powerpath.license_present:</b> []
-----------------------------------------------------

**salt.states.powerpath.license\_absent**(*name*)

Ensures that the specified PowerPath license key is absent on the host.

**name** The license key to ensure is absent

**salt.states.powerpath.license\_present**(*name*)

Ensures that the specified PowerPath license key is present on the host.

**name** The license key to ensure is present

## 21.19.249 salt.states.probes

### Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

## Dependencies

- *napalm probes management module*

`salt.states.probes.managed(name, probes, defaults=None)`

Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not configured as expected will trigger config updates.

### Parameters

- **probes** -- Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics.
- **defaults** -- Specifies common parameters for the probes.

SLS Example:

```
rpmprobes:
 probes.managed:
 - probes:
 probe_name1:
 probe1_test1:
 source: 192.168.0.2
 target: 192.168.0.1
 probe1_test2:
 target: 172.17.17.1
 probe1_test3:
 target: 8.8.8.8
 probe_type: http-ping
 probe_name2:
 probe2_test1:
 test_interval: 100
 - defaults:
 target: 10.10.10.10
 probe_count: 15
 test_interval: 3
 probe_type: icmp-ping
```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- **source** - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- **target** - Destination IP Address.
- **probe\_count** - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- **probe\_interval** - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- **probe\_type** - Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```
probe_name1:
 probe1_test1:
 source: 192.168.0.2
 target: 192.168.0.1
 probe_count: 15
 test_interval: 3
```

(continues on next page)

(continued from previous page)

```
 probe_type: icmp-ping
 probe1_test2:
 target: 172.17.17.1
 probe_count: 15
 test_interval: 3
 probe_type: icmp-ping
 probe1_test3:
 target: 8.8.8.8
 probe_count: 15
 test_interval: 3
 probe_type: http-ping
 probe_name2:
 probe2_test1:
 target: 10.10.10.10
 probe_count: 15
 test_interval: 3
 probe_type: icmp-ping
```

### 21.19.250 salt.states.process

#### Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
 process.absent:
 - name: apache2
```

`salt.states.process.absent` (*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

**name** The pattern to match.

**user** The user to which the process belongs

**signal** Signal to send to the process(es).

### 21.19.251 salt.states.proxy module

#### Allows you to manage proxy settings on minions

Setup proxy settings on minions

```
192.168.1.4:
 proxy.managed:
 - port: 3128
 - bypass_domains:
 - localhost
 - 127.0.0.1
```

`salt.states.proxy.managed` (*name*, *port*, *services=None*, *user=None*, *password=None*, *by-pass\_domains=None*, *network\_service='Ethernet'*)

Manages proxy settings for this minion

**name** The proxy server to use

**port** The port used by the proxy server

**services** A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

**user** The username to use for the proxy server if required

**password** The password to use for the proxy server if required

**bypass\_domains** An array of the domains that should bypass the proxy

**network\_service** The network service to apply the changes to, this only necessary on macOS

## 21.19.252 salt.states.pushover

### Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
 pushover.post_message:
 - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
 - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
 - title: Salt Returner
 - device: phone
 - priority: -1
 - expire: 3600
 - retry: 5
 - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

```
pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

```
salt.states.pushover.post_message(name, user=None, device=None, message=None, title=None,
 priority=None, expire=None, retry=None, sound=None,
 api_version=1, token=None)
```

Send a message to a PushOver channel.

```
pushover-message:
 pushover.post_message:
 - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
 - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
 - title: Salt Returner
 - device: phone
 - priority: -1
 - expire: 3600
 - retry: 5
```

The following parameters are required:

**name** The unique name for this event.

**user** The user or group of users to send the message to. Must be ID of user, not name or email address.

**message** The message that is to be sent to the PushOver channel.

The following parameters are optional:

**title** The title to use for the message.

**device** The device for the user to send the message to.

**priority** The priority for the message.

**expire** The message should expire after specified amount of seconds.

**retry** The message should be resent this many times.

**token** The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

## 21.19.253 salt.states.pyenv

### Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv\_ROOT to their environment.

This is how a state configuration could look like:

```
pyenv-deps:
 pkg.installed:
 - pkgs:
 - make
 - build-essential
 - libssl-dev
 - zlib1g-dev
 - libbz2-dev
 - libreadline-dev
 - libsqlite3-dev
 - wget
 - curl
 - llvm
python-2.6:
 pyenv.absent:
 - require:
 - pkg: pyenv-deps
python-2.7.6:
 pyenv.installed:
 - default: True
 - require:
 - pkg: pyenv-deps
```

---

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

---

**salt.states.pyenv.absent**(name, user=None)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

**name** The version of python to uninstall

**user: None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

**salt.states.pyenv.install\_pyenv**(name, user=None)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

**user: None** The user to run pyenv as.

`salt.states.pyenv.installed(name, default=False, user=None)`

Verify that the specified python is installed with pyenv. pyenv is installed if necessary.

**name** The version of python to install

**default** [False] Whether to make this python the default.

**user: None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

## 21.19.254 salt.states.pyrax\_queues

### Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses pyrax, which can be installed via package, or pip. This module is greatly inspired by boto\_\* modules from SaltStack code source.

```
myqueue:
 pyrax_queues.present:
 - provider: my-pyrax

myqueue:
 pyrax_queues.absent:
 - provider: my-pyrax
```

`salt.states.pyrax_queues.absent(name, provider)`

Ensure the named Rackspace queue is deleted.

**name** Name of the Rackspace queue.

**provider** Salt Cloud provider

`salt.states.pyrax_queues.present(name, provider)`

Ensure the RackSpace queue exists.

**name** Name of the Rackspace queue.

**provider** Salt Cloud Provider

## 21.19.255 salt.states.quota

### Management of POSIX Quotas

The quota can be managed for the system:

```
/:
 quota.mode:
 mode: off
 quotatype: user
```

`salt.states.quota.mode(name, mode, quotatype)`

Set the quota for the system

**name** The filesystem to set the quota mode on

**mode** Whether the quota system is on or off

**quotatype** Must be user or group

## 21.19.256 salt.states.rabbitmq\_cluster

### Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
rabbitmq_cluster.join:
- user: rabbit
- host: rabbit.example.com
```

**salt.states.rabbitmq\_cluster.join**(*name, host, user='rabbit', ram\_node=None, runas='root'*)

This function is an alias of **joined**.

Ensure the current node joined to a cluster with node **user@host**

**name** Irrelevant, not used (recommended: **user@host**)

**user** The user of node to join to (default: rabbit)

**host** The host of node to join to

**ram\_node** Join node as a RAM node

**runas** The user to run the rabbitmq command as

**salt.states.rabbitmq\_cluster.joined**(*name, host, user='rabbit', ram\_node=None, runas='root'*)

Ensure the current node joined to a cluster with node **user@host**

**name** Irrelevant, not used (recommended: **user@host**)

**user** The user of node to join to (default: rabbit)

**host** The host of node to join to

**ram\_node** Join node as a RAM node

**runas** The user to run the rabbitmq command as

## 21.19.257 salt.states.rabbitmq\_plugin

### Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
rabbitmq_plugin.enabled: []
```

**salt.states.rabbitmq\_plugin.disabled**(*name, runas=None*)

Ensure the RabbitMQ plugin is disabled.

**name** The name of the plugin

**runas** The user to run the rabbitmq-plugin command as

**salt.states.rabbitmq\_plugin.enabled**(*name, runas=None*)

Ensure the RabbitMQ plugin is enabled.

**name** The name of the plugin

**runas** The user to run the rabbitmq-plugin command as

## 21.19.258 salt.states.rabbitmq\_policy

### Manage RabbitMQ Policies

**maintainer** Benn Eichhorn <benn@getlocalmeasure.com>

**maturity** new

**platform** all

Example:

```
rabbit_policy:
 rabbitmq_policy.present:
 - name: HA
 - pattern: '.*'
 - definition: '{"ha-mode": "all"}'
```

**salt.states.rabbitmq\_policy.absent**(*name*, *vhost*='/', *runas*=None)

Ensure the named policy is absent

Reference: <http://www.rabbitmq.com/ha.html>

**name** The name of the policy to remove

**runas** Name of the user to run the command as

**salt.states.rabbitmq\_policy.present**(*name*, *pattern*, *definition*, *priority*=0, *vhost*='/', *runas*=None, *apply\_to*=None)

Ensure the RabbitMQ policy exists.

Reference: <http://www.rabbitmq.com/ha.html>

**name** Policy name

**pattern** A regex of queues to apply the policy to

**definition** A json dict describing the policy

**priority** Priority (defaults to 0)

**vhost** Virtual host to apply to (defaults to '/')

**runas** Name of the user to run the command as

**apply\_to** Apply policy to 'queues', 'exchanges' or 'all' (default to 'all')

## 21.19.259 salt.states.rabbitmq\_upstream

### Manage RabbitMQ Upstreams

Example:

```
rabbit_upstream:
 rabbitmq_upstream.present:
 - name: upstream_1
 - uri: amqp://my_user:my_password@rabbitmq_host
 - trust_user_id: True
 - ack_mode: on-confirm
 - max_hops: 1
```

New in version 3000.

**salt.states.rabbitmq\_upstream.absent**(*name*, *runas*=None)

Ensure the named upstream is absent.

**Parameters**

- **name** (*str*) -- The name of the upstream to remove

- **runas** (*str*) -- User to run the command

New in version 3000.

```
salt.states.rabbitmq_upstream.present(name, uri, prefetch_count=None, re-
 connect_delay=None, ack_mode=None,
 trust_user_id=None, exchange=None, max_hops=None,
 expires=None, message_ttl=None, ha_policy=None,
 queue=None, runas=None)
```

Ensure the RabbitMQ upstream exists.

#### Parameters

- **name** (*str*) -- The name of the upstream connection
- **uri** (*str*) -- The URI to connect to. If upstream is a cluster and can have several URIs, you can enter them here separated by spaces. Examples: - amqp://user:password@server\_name - amqp://user:password@server\_name/vhost When connecting with SSL, several URI-parameters need also be specified: - cacertfile = /path/to/cacert.pem - certfile = /path/to/cert.pem - keyfile = /path/to/key.pem - verify = verify\_peer - fail\_if\_no\_peer\_cert = true | false - auth\_mechanism = external Example: - amqp://user:password@server\_name?cacertfile=/path/to/cacert.pem&certfile=/path/to/cert.pem&keyfile=/path/to/key.pem&verify=verify\_peer - amqp://server-name?cacertfile=/path/to/cacert.pem&certfile=/path/to/cert.pem&keyfile=/path/to/key.pem&verify=verify\_peer&fail\_if\_no\_peer\_cert=true&auth\_mechanism=external
- **prefetch\_count** (*int*) -- Maximum number of unacknowledged messages that may be in flight over a federation link at one time. Default: 1000
- **reconnect\_delay** (*int*) -- Time in seconds to wait after a network link goes down before attempting reconnection. Default: 5
- **ack\_mode** (*str*) -- The following values are allowed: on-confirm: Messages are acknowledged to the upstream broker after they have been confirmed downstream. Handles network errors and broker failures without losing messages. The slowest option, and the default. on-publish: Messages are acknowledged to the upstream broker after they have been published downstream. Handles network errors without losing messages, but may lose messages in the event of broker failures. no-ack: Message acknowledgements are not used. The fastest option, but you may lose messages in the event of network or broker failures.
- **trust\_user\_id** (*bool*) -- Set True to preserve the "user-id" field across a federation link, even if the user-id does not match that used to republish the message. Set to False to clear the "user-id" field when messages are federated. Only set this to True if you trust the upstream broker not to forge user-ids.
- **exchange** (*str*) -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max\_hops** (*int*) -- Maximum number of federation links that messages can traverse before being dropped. Defaults to 1 if not set.
- **expires** (*int*) -- Time in milliseconds that the upstream should remember about this node for. After this time all upstream state will be removed. Set to None (Default) to mean "forever".
- **message\_ttl** (*int*) -- Time in milliseconds that undelivered messages should be held upstream when there is a network outage or backlog. Set to None (default) to mean "forever".
- **ha\_policy** (*str*) -- Determines the "x-ha-policy"-argument for the upstream queue for a federated exchange. Default is "none" meaning the queue is not HA.
- **queue** (*str*) -- The name of the upstream queue. Default is to use the same name as the federated queue.

New in version 3000.

## 21.19.260 salt.states.rabbitmq\_user

### Manage RabbitMQ Users

Example:

```
rabbit_user:
 rabbitmq_user.present:
 - password: password
 - force: True
 - tags:
 - monitoring
 - user
 - perms:
 - ['/']:
 - ['.*']
 - ['.*']
 - ['.*']
 - runas: rabbitmq
```

**salt.states.rabbitmq\_user.absent**(*name*, *runas=None*)

Ensure the named user is absent

**name** The name of the user to remove

**runas** User to run the command

**salt.states.rabbitmq\_user.present**(*name*, *password=None*, *force=False*, *tags=None*, *perms=()*, *runas=None*)

Ensure the RabbitMQ user exists.

**name** User name

**password** User's password, if one needs to be set

**force** If user exists, forcibly change the password

**tags** Optional list of tags for the user

**perms** A list of dicts with vhost keys and 3-tuple values

**runas** Name of the user to run the command

## 21.19.261 salt.states.rabbitmq\_vhost

### Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
 rabbitmq_vhost.present:
 - user: rabbit_user
 - conf: .*
 - write: .*
 - read: .*
```

**salt.states.rabbitmq\_vhost.absent**(*name*)

Ensure the RabbitMQ Virtual Host is absent

**name** Name of the Virtual Host to remove

**runas** User to run the command

Deprecated since version 2015.8.0.

`salt.states.rabbitmq_vhost.present(name)`  
Ensure the RabbitMQ VHost exists.  
**name** VHost name  
**user** Initial user permission to set on the VHost, if present  
    Deprecated since version 2015.8.0.  
**owner** Initial owner permission to set on the VHost, if present  
    Deprecated since version 2015.8.0.  
**conf** Initial conf string to apply to the VHost and user. Defaults to `*`  
    Deprecated since version 2015.8.0.  
**write** Initial write permissions to apply to the VHost and user. Defaults to `*`  
    Deprecated since version 2015.8.0.  
**read** Initial read permissions to apply to the VHost and user. Defaults to `*`  
    Deprecated since version 2015.8.0.  
**runas** Name of the user to run the command  
    Deprecated since version 2015.8.0.

### 21.19.262 salt.states.rbac\_solaris

Management of Solaris RBAC

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>  
**maturity** new  
**depends** rbac\_solaris,solaris\_user  
**platform** solaris,illumos

New in version 2016.11.0.

```
sjorge:
 rbac.managed:
 - roles:
 - netcfg
 - profiles:
 - System Power
 - authorizations:
 - solaris.audit.*
```

`salt.states.rbac_solaris.managed(name, roles=None, profiles=None, authorizations=None)`  
Manage RBAC properties for user  
**name** [string] username  
**roles** [list] list of roles for user  
**profiles** [list] list of profiles for user  
**authorizations** [list] list of authorizations for user

**Warning:** All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.

Set the property to *None* to not manage it.

### 21.19.263 salt.states.rbenv

#### Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: <https://github.com/rbenv/ruby-build/wiki>

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV\_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
 pkg.installed:
 - names:
 - bash
 - git
 - openssl
 - libssl-dev
 - make
 - curl
 - autoconf
 - bison
 - build-essential
 - libffi-dev
 - libyaml-dev
 - libreadline6-dev
 - zlib1g-dev
 - libncurses5-dev

ruby-1.9.3-p429:
 rbenv.absent:
 - require:
 - pkg: rbenv-deps

ruby-2.0.0-p598:
 rbenv.installed:
 - default: True
 - require:
 - pkg: rbenv-deps
```

`salt.states.rbenv.absent(name, user=None)`

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

**name** The version of ruby to uninstall

**user: None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

`salt.states.rbenv.install_rbenv(name, user=None)`

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the `rbenv.root` configuration option to set the path for `rbenv` if you want a system wide install that is not in a user home dir.

**user:** `None` The user to run `rbenv` as.

`salt.states.rbenv.installed(name, default=False, user=None)`

Verify that the specified ruby is installed with `rbenv`. `Rbenv` is installed if necessary.

**name** The version of ruby to install

**default** `[False]` Whether to make this ruby the default.

**user:** `None` The user to run `rbenv` as.

New in version 0.17.0.

New in version 0.16.0.

## 21.19.264 salt.states.rdp

Manage RDP Service on Windows servers

`salt.states.rdp.disabled(name)`

Disable the RDP service

`salt.states.rdp.enabled(name)`

Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

## 21.19.265 salt.states.redismod

### Management of Redis server

New in version 2014.7.0.

**depends**

- `redis` Python module

**configuration** See `salt.modules.redis` for setup instructions.

```
key_in_redis:
 redis.string:
 - value: string data
```

The `redis` server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
 redis.string:
 - value: string data
 - host: localhost
 - port: 6379
 - db: 0
 - password: somuchkittycat
```

`salt.states.redismod.absent(name, keys=None, **connection_args)`

Ensure key absent from `redis`

**name** Key to ensure absent from `redis`

**keys** list of keys to ensure absent, name will be ignored if this is used

`salt.states.redismod.slaveof(name, sentinel_host=None, sentinel_port=None, sentinel_password=None, **connection_args)`

Set this `redis` instance as a slave.

**name** Master to make this a slave of  
**sentinel\_host** Ip of the sentinel to check for the master  
**sentinel\_port** Port of the sentinel to check for the master

`salt.states.redismod.string(name, value, expire=None, expireat=None, **connection_args)`

Ensure that the key exists in redis with the value specified

**name** Redis key to manage

**value** Data to persist in key

**expire** Sets time to live for key in seconds

**expireat** Sets expiration time for key via UNIX timestamp, overrides *expire*

## 21.19.266 salt.states.reg

### Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

#### Hives

This is the top level of the registry. They all begin with HKEY.

- HKEY\_CLASSES\_ROOT (HKCR)
- HKEY\_CURRENT\_USER (HKCU)
- HKEY\_LOCAL\_MACHINE (HKLM)
- HKEY\_USER (HKU)
- HKEY\_CURRENT\_CONFIG

#### Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

When passing the hivekey values they must be quoted correctly depending on the backslashes being used (`\` vs `\\`). The way backslashes are handled in the state file is different from the way they are handled when working on the CLI. The following are valid methods of passing the hivekey:

Using **single backslashes**: `HKLM\SOFTWARE\Python`

Using **double backslashes**: `"HKLM\\SOFTWARE\\Python"`

#### Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (`Default`) with a displayed value of (`value not set`). The actual value is Null.

## Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\C:\Program Files\Realtek\Audio\HDA\RtkNGUI64.exe" -s"
"NvBackend"="\C:\Program Files (x86)\NVIDIA Corporation\Update Core\NvBackend.
↪exe\"
"BTMTrayAgent"="rundll32.exe \"C:\Program Files (x86)\Intel\Bluetooth\btmsllex.
↪dll\",TrayApp"
```

In this example these are the values for each:

Hive: HKEY\_LOCAL\_MACHINE

Key and subkeys: SOFTWARE\Microsoft\Windows\CurrentVersion\Run

Value:

- There are 3 value names: RTHDVCPL, NvBackend, and BTMTrayAgent
- Each value name has a corresponding value

`salt.states.reg.absent(name, vname=None, use_32bit_registry=False)`

Ensure a registry value is removed. To remove a key use `key_absent`.

### Parameters

- **name** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

HKEY\_LOCAL\_MACHINE\SOFTWARE\Salt

Valid hive values include:

- HKEY\_CURRENT\_USER or HKCU
- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_USERS or HKU
- **vname** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- **use\_32bit\_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** A dictionary showing the results of the registry operation.

**Return type** `dict`

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
 reg.absent
 - vname: version
```

In the above example the value named `version` will be removed from the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive. If `vname` was not passed, the (Default) value would be deleted.

`salt.states.reg.key_absent(name, use_32bit_registry=False)`

New in version 2015.5.4.

Ensure a registry key is removed. This will remove the key, subkeys, and all value entries.

### Parameters

- **name** (*str*) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:
  - HKEY\_LOCAL\_MACHINE or HKLM
  - HKEY\_CURRENT\_USER or HKCU

- HKEY\_USER or HKU
- **use\_32bit\_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

**Returns** A dictionary showing the results of the registry operation.

**Return type** `dict`

CLI Example:

The following example will delete the SOFTWARE\DeleteMe key in the HKEY\_LOCAL\_MACHINE hive including all its subkeys and value pairs.

```
remove_key_demo:
 reg.key_absent:
 - name: HKEY_CURRENT_USER\SOFTWARE\DeleteMe
```

In the above example the path is interpreted as follows:

- HKEY\_CURRENT\_USER is the hive
- SOFTWARE\DeleteMe is the key

```
salt.states.reg.present(name, vname=None, vdata=None, vtype='REG_SZ',
 use_32bit_registry=False, win_owner=None, win_perms=None,
 win_deny_perms=None, win_inheritance=True, win_perms_reset=False)
```

Ensure a registry key or value is present.

**Parameters**

- **name** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:

```
HKEY_LOCAL_MACHINE\SOFTWARE\Salt
```

Valid hive values include:

- HKEY\_CURRENT\_USER or HKCU
- HKEY\_LOCAL\_MACHINE or HKLM
- HKEY\_USERS or HKU
- **vname** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- **vdata** (*str, int, list, bytes*) -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in **vtype**. The correspondence is as follows:

- REG\_BINARY: Binary data (str in Py2, bytes in Py3)
- REG\_DWORD: int
- REG\_EXPAND\_SZ: str
- REG\_MULTI\_SZ: list of str
- REG\_QWORD: int
- REG\_SZ: str

---

**Note:** When setting REG\_BINARY, string data will be converted to binary automatically. To pass binary data, use the built-in yaml tag `!!binary` to denote the actual binary characters. For example, the following lines will both set the same data in the registry:

- `vdata: Salty Test`
- `vdata: !!binary U2FsdHkgVGZzdA==\n`

For more information about the `!!binary` tag see [here](#)

---

---

**Note:** The type for the (Default) value is always REG\_SZ and cannot be changed.

This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

- 
- **vtype** (*str*) -- The value type for the data you wish to store in the registry. Valid values are:
    - REG\_BINARY
    - REG\_DWORD
    - REG\_EXPAND\_SZ
    - REG\_MULTI\_SZ
    - REG\_QWORD
    - REG\_SZ (Default)
  - **use\_32bit\_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.
  - **win\_owner** (*str*) -- The owner of the registry key. If this is not passed, the account under which Salt is running will be used.

---

**Note:** Owner is set for the key that contains the value/data pair. You cannot set ownership on value/data pairs themselves.

---

New in version 2019.2.0.

- **win\_perms** (*dict*) -- A dictionary containing permissions to grant and their propagation. If not passed the 'Grant' permissions will not be modified.

---

**Note:** Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

---

For each user specify the account name, with a sub dict for the permissions to grant and the 'Applies to' setting. For example: {'Administrators': {'perms': 'full\_control', 'applies\_to': 'this\_key\_subkeys'}}. perms must be specified.

Registry permissions are specified using the perms key. You can specify a single basic permission or a list of advanced perms. The following are valid perms:

Basic (passed as a string):

- full\_control
- read
- write

Advanced (passed as a list):

- delete
- query\_value
- set\_value
- create\_subkey
- enum\_subkeys
- notify
- create\_link
- read\_control
- write\_dac
- write\_owner

The 'Applies to' setting is optional. It is specified using the `applies_to` key. If not specified `this_key_subkeys` is used. Valid options are:

Applies to settings:

- this\_key\_only

- `this_key_subkeys`
- `subkeys_only`

New in version 2019.2.0.

- **`win_deny_perms`** (*dict*) -- A dictionary containing permissions to deny and their propagation. If not passed the *Deny* permissions will not be modified.

---

**Note:** Permissions are set for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

---

Valid options are the same as those specified in `win_perms`

---

**Note:**

'Deny' permissions always take precedence over 'grant' permissions.

---

New in version 2019.2.0.

- **`win_inheritance`** (*bool*) -- True to inherit permissions from the parent key. False to disable inheritance. Default is True.

---

**Note:** Inheritance is set for the key that contains the value/data pair. You cannot set inheritance on value/data pairs themselves.

---

New in version 2019.2.0.

- **`win_perms_reset`** (*bool*) -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False

---

**Note:** Perms are reset for the key that contains the value/data pair. You cannot set permissions on value/data pairs themselves.

---

New in version 2019.2.0.

**Returns** A dictionary showing the results of the registry operation.

**Return type** *dict*

Example:

The following example will set the (Default) value for the `SOFTWARE\\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`:

```
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
reg.present:
- vdata: 2016.3.1
```

Example:

The following example will set the value for the `version` entry under the `SOFTWARE\\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`. The value will be reflected in `Wow6432Node`:

```
HKEY_CURRENT_USER\\SOFTWARE\\Salt:
reg.present:
- vname: version
- vdata: 2016.3.1
```

In the above example the path is interpreted as follows:

- HKEY\_CURRENT\_USER is the hive
- SOFTWARE\\Salt is the key
- vname is the value name ('version') that will be created under the key
- vdata is the data that will be assigned to 'version'

Example:

Binary data can be set in two ways. The following two examples will set a binary value of Salty Test

```
no_conversion:
 reg.present:
 - name: HKLM\SOFTWARE\SaltTesting
 - vname: test_reg_binary_state
 - vdata: Salty Test
 - vtype: REG_BINARY

conversion:
 reg.present:
 - name: HKLM\SOFTWARE\SaltTesting
 - vname: test_reg_binary_state_with_tag
 - vdata: !!binary U2FsdHkgVGZzdA==\n
 - vtype: REG_BINARY
```

Example:

To set a REG\_MULTI\_SZ value:

```
reg_multi_sz:
 reg.present:
 - name: HKLM\SOFTWARE\Salt
 - vname: reg_multi_sz
 - vdata:
 - list item 1
 - list item 2
```

Example:

To ensure a key is present and has permissions:

```
set_key_permissions:
 reg.present:
 - name: HKLM\SOFTWARE\Salt
 - vname: version
 - vdata: 2016.3.1
 - win_owner: Administrators
 - win_perms:
 jsnuffy:
 perms: full_control
 sjones:
 perms:
 - read_control
 - enum_subkeys
 - query_value
 applies_to:
 - this_key_only
 - win_deny_perms:
 bsimpson:
 perms: full_control
 applies_to: this_key_subkeys
```

(continues on next page)

(continued from previous page)

- **win\_inheritance**: True
- **win\_perms\_reset**: True

### 21.19.267 salt.states.rsync

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```
/opt/user-backups:
 rsync.synchronized:
 - source: /home
 - force: True
```

**salt.states.rsync.synchronized**(*name*, *source*, *delete*=False, *force*=False, *update*=False, *passwordfile*=None, *exclude*=None, *excludefrom*=None, *prepare*=False, *dryrun*=False, *additional\_opts*=None)

Guarantees that the source directory is always copied to the target.

**name** Name of the target directory.

**source** Source directory.

**prepare** Create destination directory if it does not exists.

**delete** Delete extraneous files from the destination dirs (True or False)

**force** Force deletion of dirs even if not empty

**update** Skip files that are newer on the receiver (True or False)

**passwordfile** Read daemon-access password from the file (path)

**exclude** Exclude files, that matches pattern.

**excludefrom** Read exclude patterns from the file (path)

**dryrun** Perform a trial run with no changes made. Is the same as doing test=True

New in version 2016.3.1.

**additional\_opts** Pass additional options to rsync, should be included as a list.

New in version 2018.3.0.

### 21.19.268 salt.states.rvm

#### Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```
rvm:
 group.present: []
 user.present:
 - gid: rvm
 - home: /home/rvm
 - require:
 - group: rvm

rvm-deps:
```

(continues on next page)

(continued from previous page)

```
pkg.installed:
- pkgs:
 - bash
 - coreutils
 - gzip
 - bzip2
 - gawk
 - sed
 - curl
 - git-core
 - subversion

mri-deps:
pkg.installed:
- pkgs:
 - build-essential
 - openssl
 - libreadline6
 - libreadline6-dev
 - curl
 - git-core
 - zlib1g
 - zlib1g-dev
 - libssl-dev
 - libyaml-dev
 - libsqlite3-0
 - libsqlite3-dev
 - sqlite3
 - libxml2-dev
 - libxslt1-dev
 - autoconf
 - libc6-dev
 - libncurses5-dev
 - automake
 - libtool
 - bison
 - subversion
 - ruby

jruby-deps:
pkg.installed:
- pkgs:
 - curl
 - g++
 - openjdk-6-jre-headless

ruby-1.9.2:
rvm.installed:
- default: True
- user: rvm
- require:
 - pkg: rvm-deps
 - pkg: mri-deps
 - user: rvm

jruby:
```

(continues on next page)

(continued from previous page)

```

rvm.installed:
- user: rvm
- require:
 - pkg: rvm-deps
 - pkg: jruby-deps
 - user: rvm

jgemset:
 rvm.gemset_present:
 - ruby: jruby
 - user: rvm
 - require:
 - rvm: jruby

mygemset:
 rvm.gemset_present:
 - ruby: ruby-1.9.2
 - user: rvm
 - require:
 - rvm: ruby-1.9.2

```

`salt.states.rvm.gemset_present(name, ruby='default', user=None)`

Verify that the gemset is present.

**name** The name of the gemset.

**ruby: default** The ruby version this gemset belongs to.

**user: None** The user to run rvm as.

New in version 0.17.0.

`salt.states.rvm.installed(name, default=False, user=None, opts=None, env=None)`

Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

**name** The version of ruby to install

**default** [False] Whether to make this ruby the default.

**user: None** The user to run rvm as.

**env: None** A list of environment variables to set (ie, RUBY\_CONFIGURE\_OPTS)

**opts: None** A list of option flags to pass to RVM (ie -C, --patch)

New in version 0.17.0.

## 21.19.269 salt.states.salt\_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

```

salt-proxy-configure:

```

```

 salt_proxy.configure_proxy:

```

- proxyname: p8000

- **start**: True

This state will configure the salt proxy settings within `/etc/salt/proxy` (if `/etc/salt/proxy` doesn't exist) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.config_proxy(name, proxyname='p8000', start=True)`

Create the salt proxy file and start the proxy process if required

**Parameters**

- **name** -- The name of this state
- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started

Example:

```
..code-block:: yaml
 salt-proxy-configure:
 salt_proxy.config_proxy:
 - proxyname: p8000
 - start: True
```

## 21.19.270 salt.states.saltmod

### Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's [Python API](#).

Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [The Orchestrate runner](#)

`salt.states.saltmod.function(name, tgt, ssh=False, tgt_type='glob', ret="", ret_config=None, ret_kwargs=None, expect_minions=False, fail_minions=None, fail_function=None, arg=None, kwarg=None, timeout=None, batch=None, subset=None, failhard=None, **kwargs)`

Execute a single module function on a remote minion via salt or salt-ssh

**name** The name of the function to run, aka `cmd.run` or `pkg.install`

**tgt** The target specification, aka `"*"` for all minions

**tgt\_type** The target type, defaults to `glob`

**arg** The list of arguments to pass into the function

**kwarg** The dict (not a list) of keyword arguments to pass into the function

**ret** Optionally set a single or a list of returners to use

**ret\_config** Use an alternative returner configuration

**ret\_kwargs** Override individual returner configuration items

**expect\_minions** An optional boolean for failing if some minions do not respond

**fail\_minions** An optional list of targeted minions where failure is an option

**fail\_function** An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions

**ssh** Set to `True` to use the ssh client instead of the standard salt client

**batch** Execute the command *in batches*. E.g.: 10%.  
**subset** Number of minions from the targeted set to randomly use

New in version 2017.7.0.

**failhard** pass failhard down to the executing state

New in version 2019.2.2.

`salt.states.saltmod.parallel_runners(name, runners, **kwargs)`

Executes multiple runner modules on the master in parallel.

New in version 2017.x.0: (Nitrogen)

A separate thread is spawned for each runner. This state is intended to be used with the orchestrate runner in place of the `saltmod.runner` state when different tasks should be run in parallel. In general, Salt states are not safe when used concurrently, so ensure that they are used in a safe way (e.g. by only targeting separate minions in parallel tasks).

**name:** name identifying this state. The name is provided as part of the output, but not used for anything else.

**runners:** list of runners that should be run in parallel. Each element of the list has to be a dictionary. This dictionary's name entry stores the name of the runner function that shall be invoked. The optional kwarg entry stores a dictionary of named arguments that are passed to the runner function.

```
parallel-state:
 salt.parallel_runners:
 - runners:
 my_runner_1:
 - name: state.orchestrate
 - kwarg:
 mods: orchestrate_state_1
 my_runner_2:
 - name: state.orchestrate
 - kwarg:
 mods: orchestrate_state_2
```

`salt.states.saltmod.runner(name, **kwargs)`

Execute a runner module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the runner function

```
run-manage-up:
 salt.runner:
 - name: manage.up
```

`salt.states.saltmod.state(name, tgt, ssh=False, tgt_type='glob', ret="", ret_config=None, ret_kwargs=None, highstate=None, sls=None, top=None, saltenv=None, test=None, pillar=None, pillarenv=None, expect_minions=True, fail_minions=None, allow_fail=0, concurrent=False, timeout=None, batch=None, queue=False, subset=None, orchestration_jid=None, failhard=None, **kwargs)`

Invoke a state run on a given target

**name** An arbitrary name used to track the state execution

**tgt** The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

**tgt\_type** The target type to resolve, defaults to `glob`

**ret** Optionally set a single or a list of returners to use

**ret\_config** Use an alternative returner configuration  
**ret\_kwargs** Override individual returner configuration items  
**highstate** Defaults to `None`, if set to `True` the target systems will ignore any `sls` references specified in the `sls` option and call `state.highstate` on the targeted minions  
**top** Should be the name of a top file. If set `state.top` is called with this top file instead of `state.sls`.  
**sls** A group of `sls` files to execute. This can be defined as a single string containing a single `sls` file, or a list of `sls` files  
**test** Pass `test=true` or `test=false` through to the state function. This can be used to override a test mode set in the minion's config file. If left as the default of `None` and the 'test' mode is supplied on the command line, that value is passed instead.  
**pillar** Pass the `pillar` kwarg through to the state function  
**pillarenv** The pillar environment to grab pillars from

New in version 2017.7.0.

**saltenv** The default salt environment to pull `sls` files from  
**ssh** Set to `True` to use the `ssh` client instead of the standard salt client  
**roster** In the event of using `salt-ssh`, a roster system can be set  
**expect\_minions** An optional boolean for failing if some minions do not respond  
**fail\_minions** An optional list of targeted minions where failure is an option  
**allow\_fail** Pass in the number of minions to allow for failure before setting the result of the execution to `False`  
**concurrent** Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

**queue** Pass `queue=true` through to the state function  
**batch** Execute the command *in batches*. E.g.: 10%.

New in version 2016.3.0.

**subset** Number of minions from the targeted set to randomly use

New in version 2017.7.0.

**failhard** pass `failhard` down to the executing state

New in version 2019.2.2.

Examples:

Run a list of `sls` files via `state.sls` on target minions:

```
webservers:
 salt.state:
 - tgt: 'web*'
 - sls:
 - apache
 - django
 - core
 - saltenv: prod
```

Run a full `state.highstate` on target minions.

```
databases:
 salt.state:
 - tgt: role:database
 - tgt_type: grain
 - highstate: True
```

`salt.states.saltmod.wait_for_event(name, id_list, event_id='id', timeout=300, node='master')`  
Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

**name** An event tag to watch for; supports Reactor-style globbing.

**id\_list** A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

**event\_id** [id] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

**timeout** [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
 salt.function:
 - name: system.reboot
 - tgt: '*'

wait_for_reboots:
 salt.wait_for_event:
 - name: salt/minion/*/start
 - id_list:
 - jerry
 - stuart
 - dave
 - phil
 - kevin
 - mike
 - require:
 - salt: reboot_all_minions
```

`salt.states.saltmod.wheel(name, **kwargs)`

Execute a wheel module on the master

New in version 2014.7.0.

**name** The name of the function to run

**kwargs** Any keyword arguments to pass to the wheel function

```
accept_minion_key:
 salt.wheel:
 - name: key.accept
 - match: frank
```

## 21.19.271 salt.states.saltutil

### Saltutil State

This state wraps the saltutil execution modules to make them easier to run from a states. Rather than needing to use `module.run` this state allows for improved change detection.

`salt.states.saltutil.sync_all(name, **kwargs)`

Performs the same task as `saltutil.sync_all` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_all:
 - refresh: True
```

`salt.states.saltutil.sync_beacons(name, **kwargs)`

Performs the same task as `saltutil.sync_beacons` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_beacons:
 - refresh: True
```

`salt.states.saltutil.sync_clouds(name, **kwargs)`

Performs the same task as `saltutil.sync_clouds` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_clouds:
 - refresh: True
```

`salt.states.saltutil.sync_engines(name, **kwargs)`

Performs the same task as `saltutil.sync_engines` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_engines:
 - refresh: True
```

`salt.states.saltutil.sync_executors(name, **kwargs)`

Performs the same task as `saltutil.sync_executors` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_executors:
 - refresh: True
```

`salt.states.saltutil.sync_grains(name, **kwargs)`

Performs the same task as `saltutil.sync_grains` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_grains:
 - refresh: True
```

`salt.states.saltutil.sync_log_handlers(name, **kwargs)`

Performs the same task as `saltutil.sync_log_handlers` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_log_handlers:
 - refresh: True
```

`salt.states.saltutil.sync_matchers(name, **kwargs)`

Performs the same task as `saltutil.sync_matchers` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_matchers:
 - refresh: True
```

`salt.states.saltutil.sync_modules(name, **kwargs)`

Performs the same task as `saltutil.sync_modules` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_modules:
 - refresh: True
```

`salt.states.saltutil.sync_output(name, **kwargs)`

Performs the same task as `saltutil.sync_output` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_output:
 - refresh: True
```

`salt.states.saltutil.sync_outputters(name, **kwargs)`

Performs the same task as `saltutil.sync_outputters` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_outputters:
 - refresh: True
```

`salt.states.saltutil.sync_pillar(name, **kwargs)`

Performs the same task as `saltutil.sync_pillar` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_pillar:
 - refresh: True
```

`salt.states.saltutil.sync_proxymodules(name, **kwargs)`

Performs the same task as `saltutil.sync_proxymodules` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_proxymodules:
 - refresh: True
```

`salt.states.saltutil.sync_renderers(name, **kwargs)`

Performs the same task as `saltutil.sync_renderers` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_renderers:
 - refresh: True
```

`salt.states.saltutil.sync_returners(name, **kwargs)`

Performs the same task as `saltutil.sync_returners` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_returners:
 - refresh: True
```

`salt.states.saltutil.sync_sdb(name, **kwargs)`

Performs the same task as `saltutil.sync_sdb` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_sdb:
 - refresh: True
```

`salt.states.saltutil.sync_serializers(name, **kwargs)`

Performs the same task as `saltutil.sync_serializers` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_serializers:
 - refresh: True
```

`salt.states.saltutil.sync_states(name, **kwargs)`

Performs the same task as `saltutil.sync_states` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_states:
 - refresh: True
```

`salt.states.saltutil.sync_thorium(name, **kwargs)`

Performs the same task as `saltutil.sync_thorium` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_thorium:
 - refresh: True
```

`salt.states.saltutil.sync_utils(name, **kwargs)`

Performs the same task as `saltutil.sync_utils` module See *saltutil module for full list of options*

```
sync_everything:
 saltutil.sync_utils:
 - refresh: True
```

## 21.19.272 salt.states.schedule

### Management of the Salt scheduler

```
job3:
 schedule.present:
 - function: test.ping
 - seconds: 3600
 - splay: 10
```

**This will schedule the command:** `test.ping` every 3600 seconds (every hour) splaying the time between 0 and 10 seconds

```
job2:
```

(continues on next page)

(continued from previous page)

```

schedule.present:
- function: test.ping
- seconds: 15
- splay:
 start: 10
 end: 20

```

**This will schedule the command:** test.ping every 15 seconds splaying the time between 10 and 20 seconds

```

job1:
 schedule.present:
 - function: state.sls
 - job_args:
 - httpd
 - job_kwargs:
 test: True
 - when:
 - Monday 5:00pm
 - Tuesday 3:00pm
 - Wednesday 5:00pm
 - Thursday 3:00pm
 - Friday 5:00pm

```

**This will schedule the command:** state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

```

job1:
 schedule.present:
 - function: state.sls
 - job_args:
 - httpd
 - job_kwargs:
 test: True
 - cron: '* /5 * * * *'

```

Scheduled jobs can also be specified using the format used by cron. This will **schedule the command:** state.sls httpd test=True to run every 5 minutes. Requires that python-croniter is installed on the minion.

```

job1:
 schedule.present:
 - function: state.sls
 - job_args:
 - httpd
 - job_kwargs:
 test: True
 - when:
 - Monday 5:00pm
 - Tuesday 3:00pm
 - Wednesday 5:00pm
 - Thursday 3:00pm
 - Friday 5:00pm
 - returner: xmpp
 - return_config: xmpp_state_run

```

(continues on next page)

(continued from previous page)

```
- return_kwargs:
 recipient: user@domain.com
```

**This will schedule the command:** state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Using the xmpp returner to return the results of the scheduled job, with the alternative configuration options found in the xmpp\_state\_run section.

```
job1:
 schedule.present:
 - function: state.sls
 - job_args:
 - httpd
 - job_kwargs:
 test: True
 - hours: 1
 - skip_during_range:
 - start: 2pm
 - end: 3pm
 - run_after_skip_range: True
```

**This will schedule the command:** state.sls httpd test=True at 5pm on Monday, Wednesday and Friday, and 3pm on Tuesday and Thursday. Requires that python-dateutil is installed on the minion.

**salt.states.schedule.absent**(name, \*\*kwargs)

Ensure a job is absent from the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

**salt.states.schedule.disabled**(name, \*\*kwargs)

Ensure a job is disabled in the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

**salt.states.schedule.enabled**(name, \*\*kwargs)

Ensure a job is enabled in the schedule

**name** The unique name that is given to the scheduled job.

**persist** Whether the job should persist between minion restarts, defaults to True.

**salt.states.schedule.present**(name, \*\*kwargs)

Ensure a job is present in the schedule

**name** The unique name that is given to the scheduled job.

**seconds** The scheduled job will be executed after the specified number of seconds have passed.

**minutes** The scheduled job will be executed after the specified number of minutes have passed.

**hours** The scheduled job will be executed after the specified number of hours have passed.

**days** The scheduled job will be executed after the specified number of days have passed.

**when** This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.

**cron** This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.

**run\_on\_start** Whether the job will run when Salt minion starts, or the job will be skipped **once** and run at the next scheduled run. Value should be a boolean.

**function** The function that should be executed by the scheduled job.

**job\_args** The arguments that will be used by the scheduled job.

**job\_kwargs** The keyword arguments that will be used by the scheduled job.

**maxrunning** Ensure that there are no more than N copies of a particular job running.

**jid\_include** Include the job into the job cache.

**splay** The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with 'start' and 'end' values.

**range** This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

**once** This will schedule a job to run once on the specified date.

**once\_fmt** The default date format is ISO 8601 but can be overridden by also specifying the `once_fmt` option.

**enabled** Whether the job should be enabled or disabled. Value should be a boolean.

**return\_job** Whether to return information to the Salt master upon job completion.

**metadata** Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the `return_job` parameter. The metadata parameter must be specified as a dictionary, otherwise it will be ignored.

**returner** The returner to use to return the results of the scheduled job.

**return\_config** The alternative configuration to use for returner configuration options.

**return\_kwargs** Any individual returner configuration items to override. Should be passed as a dictionary.

**persist** Whether the job should persist between minion restarts, defaults to True.

**skip\_during\_range** This will ensure that the scheduled command does not run within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.

**run\_after\_skip\_range** Whether the job should run immediately after the `skip_during_range` time period ends.

### 21.19.273 salt.states.selinux

#### Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
 selinux.mode

samba_create_home_dirs:
 selinux.boolean:
 - value: True
 - persist: True

nginx:
 selinux.module:
 - enabled: False
```

**Note:** Use of these states require that the `selinux` execution module is available.

`salt.states.selinux.boolean(name, value, persist=False)`

Set up an SELinux boolean

**name** The name of the boolean to set

**value** The value to set on the boolean

**persist** Defaults to False, set persist to true to make the boolean apply on a reboot

`salt.states.selinux.fcontext_policy_absent(name, filetype='a', sel_type=None, sel_user=None, sel_level=None)`

New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.

**name** filespec of the file or directory. Regex syntax is allowed.  
**filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).  
**sel\_type** The SELinux context type. There are many.  
**sel\_user** The SELinux user.  
**sel\_level** The SELinux MLS range.

`salt.states.selinux.fcontext_policy_applied(name, recursive=False)`

New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

`salt.states.selinux.fcontext_policy_present(name, sel_type, filetype='a', sel_user=None, sel_level=None)`

New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.

**name** filespec of the file or directory. Regex syntax is allowed.  
**sel\_type** SELinux context type. There are many.  
**filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).  
**sel\_user** The SELinux user.  
**sel\_level** The SELinux MLS range.

`salt.states.selinux.mode(name)`

Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

---

**Note:** A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

---

**name** The mode to run SELinux in, permissive, enforcing, or disabled.

`salt.states.selinux.module(name, module_state='Enabled', version='any', **opts)`

Enable/Disable and optionally force a specific version for an SELinux module

**name** The name of the module to control

**module\_state** Should the module be enabled or disabled?

**version** Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.

**install** Setting to True installs module

**source** Points to module source file, used only when install is True

**remove** Setting to True removes module

New in version 2016.3.0.

`salt.states.selinux.module_install(name)`

Installs custom SELinux module from given file

**name** Path to file with module to install

New in version 2016.11.6.

`salt.states.selinux.module_remove(name)`

Removes SELinux module

**name** The name of the module to remove

New in version 2016.11.6.

`salt.states.selinux.port_policy_absent(name, sel_type=None, protocol=None, port=None)`

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is absent.

**name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).

**sel\_type** The SELinux Type. Optional; can be used in determining if policy is present, ignored by `semanage port --delete`.

**protocol** The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

```
salt.states.selinux.port_policy_present(name, sel_type, protocol=None, port=None,
 sel_range=None)
```

New in version 2019.2.0.

Makes sure an SELinux port policy for a given port, protocol and SELinux context type is present.

**name** The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

**sel\_type** The SELinux Type.

**protocol** The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

**port** The port or port range. Required if name is not formatted.

**sel\_range** The SELinux MLS/MCS Security Range.

## 21.19.274 salt.states.serverdensity\_device

### Monitor Server with Server Density

New in version 2014.7.0.

[Server Density](#) Is a hosted monitoring service.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
 api_token: "b97da80a41c4f61bff05975ee51eb1aa"
 account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
 api_token: "b97da80a41c4f61bff05975ee51eb1aa"
 account_name: "your-account"
```

**Note:** Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
 serverdensity_device.monitored
```

```
salt.states.serverdensity_device.monitored(name, group=None, salt_name=True,
 salt_params=True, agent_version=1,
 **params)
```

Device is monitored with Server Density.

**name** Device name in Server Density.

**salt\_name** If `True` (default), takes the name from the `id` grain. If `False`, the provided name is used.

**group** Group name under which device will appear in Server Density dashboard. Default - *None*.

**agent\_version** The agent version you want to use. Valid values are 1 or 2. Default - 1.

**salt\_params** If `True` (default), needed config parameters will be sourced from grains and from *status.all\_status*.

**params** Add parameters that you want to appear in the Server Density dashboard. Will overwrite the *salt\_params* parameters. For more info, see the [API docs](#).

Usage example:

```
'server_name':
 serverdensity_device.monitored
```

```
'server_name':
 serverdensity_device.monitored:
 - group: web-servers
```

```
'my_special_server':
 serverdensity_device.monitored:
 - salt_name: False
 - group: web-servers
 - cpuCores: 2
 - os: '{"code": "linux", "name": "Linux"}'
```

## 21.19.275 salt.states.service

### Starting or restarting of services and daemons

Services are defined as system daemons and are typically launched using system init or rc scripts. This service state uses whichever service module is loaded on the minion with the virtualname of `service`. Services can be defined as either running or dead.

If you need to know if your init system is supported, see the list of supported `service` modules for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the *Overriding Virtual Module Providers* section of Salt's module documentation to work around possible errors.

---

**Note:** The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

---

```
httpd:
 service.running: []
```

The service can also be set to start at runtime via the `enable` option:

```
openvpn:
 service.running:
 - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is restarted. If the desired behavior is to reload the service, then set the `reload` value to `True`:

```
redis:
 service.running:
 - enable: True
 - reload: True
 - watch:
 - pkg: redis
```

---

**Note:** More details regarding `watch` can be found in the [Requisites](#) documentation.

---

`salt.states.service.dead(name, enable=None, sig=None, init_delay=None, **kwargs)`

Ensure that the named service is dead by stopping the service if it is running

**name** The name of the init or rc script used to manage the service

**enable** Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

**sig** The string to search for when looking for the service process with `ps`

**init\_delay** Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

**no\_block** [False] **For systemd minions only.** Stops the service using `--no-block`.

New in version 2017.7.0.

`salt.states.service.disabled(name, **kwargs)`

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the `enable: False` option for the running or dead function.

**name** The name of the init or rc script used to manage the service

`salt.states.service.enabled(name, **kwargs)`

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the `enable: True` option for the running or dead function.

**name** The name of the init or rc script used to manage the service

`salt.states.service.masked(name, runtime=False)`

New in version 2017.7.0.

---

**Note:** This state is only available on minions which use [systemd](#).

---

Ensures that the named service is masked (i.e. prevented from being started).

**name** Name of the service to mask

**runtime** [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to runtime mask the service.

---

**Note:** It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with `runtime` set to `True` will `_not_` remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a [service.unmasked](#) state, like so:

```
mask_runtime_foo:
 service.masked:
 - name: foo
 - runtime: True
```

(continues on next page)

(continued from previous page)

```
unmask_indefinite_foo:
 service.unmasked:
 - name: foo
 - runtime: False
```

```
salt.states.service.mod_watch(name, sfun=None, sig=None, reload=False, full_restart=False,
 init_delay=None, force=False, **kwargs)
```

The service watcher, called to invoke the watch command. When called, it will restart or reload the named service.

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the watching service. (i.e. `service.running`)

**name** The name of the init or rc script used to manage the service

**sfun** The original function which triggered the `mod_watch` call (*service.running*, for example).

**sig** The string to search for when looking for the service process with `ps`

**reload** When set, reload the service instead of restarting it. (i.e. `service nginx reload`)

**full\_restart** Perform a full stop/start of a service by passing `--full-restart`. This option is ignored if `reload` is set and is supported by only a few *service modules*.

**force** Use `service.force_reload` instead of `reload` (needs `reload` to be set to `True`)

**init\_delay** Add a sleep command (in seconds) before the service is restarted/reloaded

```
salt.states.service.running(name, enable=None, sig=None, init_delay=None, **kwargs)
```

Ensure that the service is running

**name** The name of the init or rc script used to manage the service

**enable** Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

**sig** The string to search for when looking for the service process with `ps`

**init\_delay** Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an 'init\_delay' to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

**no\_block** [False] **For systemd minions only.** Starts the service using `--no-block`.

New in version 2017.7.0.

**unmask** [False] **For systemd minions only.** Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

**unmask\_runtime** [False] **For systemd minions only.** Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

**wait** [3] **For systemd minions only.** Passed through when using *service.status* to determine whether the service is running or not.

New in version 2019.2.3.

**Note:**

**watch** can be used with `service.running` to restart a service when another state changes ( example: a `file.managed` state that creates the service's config file ). More details regarding `watch` can be found in

the [Requisites](#) documentation.

`salt.states.service.unmasked(name, runtime=False)`

New in version 2017.7.0.

**Note:** This state is only available on minions which use `systemd`.

Ensures that the named service is unmasked

**name** Name of the service to unmask

**runtime** [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to ensure that the service is runtime masked.

**Note:** It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with `runtime` set to `True` will *not* remove the indefinite mask.

## 21.19.276 salt.states.slack

### Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
 slack.post_message:
 - channel: '#general'
 - from_name: SuperAdmin
 - message: 'This state was executed successfully.'
 - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
 api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.slack.post_message(name, **kwargs)`

Send a message to a Slack channel.

```
slack-message:
 slack.post_message:
 - channel: '#general'
 - from_name: SuperAdmin
 - message: 'This state was executed successfully.'
 - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

**api\_key** parameters:

**name** The unique name for this event.

**channel** The channel to send the message to. Can either be the ID or the name.

**from\_name** The name of that is to be shown in the "from" field.

**message** The message that is to be sent to the Slack channel.

The following parameters are optional:

**api\_key** The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

**icon** URL to an image to use as the icon for this message

**webhook parameters:**

**name** The unique name for this event.

**message** The message that is to be sent to the Slack channel.

**color** The color of border of left side

**short** An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.

**webhook** The identifier of WebHook (URL or token).

**channel** The channel to use instead of the WebHook default.

**username** Username to use instead of WebHook default.

**icon\_emoji** Icon to use instead of WebHook default.

## 21.19.277 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** vmadm, imgadm

**platform** smartos

New in version 2016.3.0.

```
vmtest.example.org:
smartos.vm_present:
- config:
 reprovision: true
- vmconfig:
 image_uuid: c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
 brand: joyent
 alias: vmtest
 quota: 5
 max_physical_memory: 512
 tags:
 label: 'test vm'
 owner: 'sjorge'
 nics:
 "82:1b:8e:49:e9:12":

(continues on next page)

(continued from previous page)

```
source: "/vmdata/emby_config"
type: lofs
options:
 - nodevices
```

```
cleanup_images:
 smartos.image_vacuum
```

---

**Note:** Keep in mind that when removing properties from `vmconfig` they will not get removed from the vm's current configuration, except for `nics`, `disk`, `tags`, ... they get removed via `add_*`, `set_*`, `update_*`, and `remove_*`. Properties must be manually reset to their default value. The same behavior as when using `'vmadm update'`.

---

**Warning:** For HVM (bhyve and KVM) brands the `image_uuid` field should go on the boot disks, this disk should NOT have a size specified. (See `man vmadm`)

`salt.states.smartos.config_absent(name)`  
Ensure configuration property is absent in `/usbkey/config`  
**name** [string] name of property

`salt.states.smartos.config_present(name, value)`  
Ensure configuration property is set to value in `/usbkey/config`  
**name** [string] name of property  
**value** [string] value of property

`salt.states.smartos.image_absent(name)`  
Ensure image is absent on the computenode  
**name** [string] uuid of image

---

**Note:** `computenode.image_absent` will only remove the image if it is not used by a vm.

---

`salt.states.smartos.image_present(name)`  
Ensure image is present on the computenode  
**name** [string] uuid of image

`salt.states.smartos.image_vacuum(name)`  
Delete images not in use or installed via `image_present`

**Warning:** Only `image_present` states that are included via the top file will be detected.

`salt.states.smartos.source_absent(name)`  
Ensure an image source is absent on the computenode  
**name** [string] source url

`salt.states.smartos.source_present(name, source_type='imgapi')`  
Ensure an image source is present on the computenode  
**name** [string] source url  
**source\_type** [string] source type (imgapi or docker)

`salt.states.smartos.vm_absent(name, archive=False)`  
Ensure vm is absent on the computenode

**name** [string] hostname of vm  
**archive** [boolean] toggle archiving of vm on removal

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

**salt.states.smartos.vm\_present**(*name*, *vmconfig*, *config=None*)

Ensure vm is present on the computenode

**name** [string] hostname of vm  
**vmconfig** [dict] options to set for the vm  
**config** [dict] fine grain control over vm\_present

---

**Note:**

The following configuration properties can be toggled in the config parameter.

- **kvm\_reboot** (true) - reboots of kvm zones if needed for a config update
  - **auto\_import** (false) - automatic importing of missing images
  - **auto\_lx\_vars** (true) - copy kernel\_version and docker:\* variables from image
  - **reprovision** (false) - reprovision on image\_uuid changes
  - **enforce\_tags** (true) - false = add tags only, true = add, update, and remove tags
  - **enforce\_routes** (true) - false = add tags only, true = add, update, and remove routes
  - **enforce\_internal\_metadata** (true) - false = add metadata only, true = add, update, and remove metadata
  - **enforce\_customer\_metadata** (true) - false = add metadata only, true = add, update, and remove metadata
- 

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

---

**Note:** If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

---

---

**Note:**

The following instances should have a unique ID.

- **nic** : mac
- **filesystem**: target
- **disk** : path or diskN for zvols

e.g. disk0 will be the first disk added, disk1 the 2nd,...

---

Changed in version 2019.2.0: Added support for docker image uuids, added auto\_lx\_vars configuration, documented some missing configuration options.

**salt.states.smartos.vm\_running**(*name*)

Ensure vm is in the running state on the computenode

**name** [string] hostname of vm

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

**salt.states.smartos.vm\_stopped**(*name*)

Ensure vm is in the stopped state on the computenode

**name** [string] hostname of vm

---

**Note:** State ID is used as hostname. Hostnames must be unique.

---

## 21.19.278 salt.states.smtp

### Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
 smtp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-smtp-account
 - recipient: admins@example.com
```

`salt.states.smtp.send_msg(name, recipient, subject, sender=None, profile=None, use_ssl='True', attachments=None)`

Send a message via SMTP

```
server-warning-message:
 smtp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-smtp-account
 - subject: 'Message from Salt'
 - recipient: admin@example.com
 - sender: admin@example.com
 - use_ssl: True
 - attachments:
 - /var/log/syslog
 - /var/log/messages
```

**name** The message to send via SMTP

## 21.19.279 salt.states.snapper module

### Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```
/etc/config_file:
 file.managed:
 - source: salt://configs/myconfig
```

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```
my_baseline:
 snapper.baseline_snapshot:
 - number: 20
 - include_diff: False
 - ignore:
 - /var/log
 - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

```
my_baseline_external_storage:
 snapper.baseline_snapshot:
 • tag: my_custom_baseline_tag
 • config: external
 • ignore: - /mnt/tmp_files/
```

If you have this state, and you haven't done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
my_baseline:
 snapper.baseline_snapshot:
 - number: 20
 - ignore:
 - /var/log
 - /var/cache

hosts_entry:
 file.blockreplace:
 - name: /etc/hosts
 - content: 'First line of content'
 - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the `snapper.baseline_snapshot` as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

**Warning:** Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

**Warning:** Do not specify more than one baseline rule as only the last one will affect the result.

**codeauthor** Duncan Mac-Vicar P. <dmacvicar@suse.de>

**codeauthor** Pablo Suárez Hernández <psuarezhernandez@suse.de>

**maturity** new

**platform** Linux

**salt.states.snapper.baseline\_snapshot**(*name*, *number=None*, *tag=None*, *include\_diff=True*,  
*config='root'*, *ignore=None*)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

**number** Number of selected baseline snapshot.

**tag** Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (*tag* and *number* cannot be used at the same time)

**include\_diff** Include a diff in the response (Default: True)

**config** Snapper config name (Default: root)

**ignore** List of files to ignore. (Default: None)

## 21.19.280 salt.states.solrcloud module

States for solrcloud alias and collection configuration

New in version 2017.7.0.

**salt.states.solrcloud.alias**(*name*, *collections*, *\*\*kwargs*)

Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to http.query

**name** The collection name

**collections** list of collections to include in the alias

**salt.states.solrcloud.collection**(*name*, *options=None*, *\*\*kwargs*)

Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to http.query

**name** The collection name

**options** [{}] options to ensure

## 21.19.281 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
ensure example test user 1:
 splunk.present:
 - name: 'Example TestUser1'
 - email: example@domain.com
```

`salt.states.splunk.absent(email, profile='splunk', **kwargs)`  
 Ensure a splunk user is absent

```
ensure example test user 1:
 splunk.absent:
 - email: 'example@domain.com'
 - name: 'exampleuser'
```

The following parameters are required:

**email** This is the email of the user in splunk

**name** This is the splunk username used to identify the user.

`salt.states.splunk.present(email, profile='splunk', **kwargs)`  
 Ensure a user is present

```
ensure example test user 1:
 splunk.user_present:
 - realname: 'Example TestUser1'
 - name: 'exampleuser'
 - email: 'example@domain.com'
 - roles: ['user']
```

The following parameters are required:

**email** This is the email of the user in splunk

## 21.19.282 salt.states.splunk\_search

Splunk Search State Module

New in version 2015.5.0.

This state is used to ensure presence of splunk searches.

```
server-warning-message:
 splunk_search.present:
 - name: This is the splunk search name
 - search: index=main sourcetype=
```

`salt.states.splunk_search.absent(name, profile='splunk')`  
 Ensure a search is absent

```
API Error Search:
 splunk_search.absent
```

The following parameters are required:

**name** This is the name of the search in splunk

`salt.states.splunk_search.present(name, profile='splunk', **kwargs)`  
 Ensure a search is present

```
API Error Search:
 splunk_search.present:
 search: index=main sourcetype=blah
 template: alert_5min
```

The following parameters are required:

**name** This is the name of the search in splunk

### 21.19.283 salt.states.sqlite3

#### Management of SQLite3 databases

New in version 2016.3.0.

##### depends

- SQLite3 Python Module

**configuration** See [salt.modules.sqlite3](#) for setup instructions

The sqlite3 module is used to create and manage sqlite3 databases and execute queries

Here is an example of creating a table using sql statements:

```
users:
 sqlite3.table_present:
 - db: /var/www/data/app.sqlite
 - schema: CREATE TABLE `users` (`username` TEXT COLLATE NOCASE UNIQUE NOT NULL,
 ↪ `password` BLOB NOT NULL, `salt` BLOB NOT NULL, `last_login` INT)
```

Here is an example of creating a table using yaml/jinja instead of sql:

```
users:
 sqlite3.table_present:
 - db: /var/www/app.sqlite
 - schema:
 - email TEXT COLLATE NOCASE UNIQUE NOT NULL
 - firstname TEXT NOT NULL
 - lastname TEXT NOT NULL
 - company TEXT NOT NULL
 - password BLOB NOT NULL
 - salt BLOB NOT NULL
```

Here is an example of making sure a table is absent:

```
badservers:
 sqlite3.table_absent:
 - db: /var/www/data/users.sqlite
```

Sometimes you would to have specific data in tables to be used by other services Here is an example of making sure rows with specific data exist:

```
user_john_doe_xyz:
 sqlite3.row_present:
 - db: /var/www/app.sqlite
 - table: users
 - where_sql: email='john.doe@companyxyz.com'
 - data:
 email: john.doe@companyxyz.com
 lastname: doe
 firstname: john
 company: companyxyz.com
 password: abcdef012934125
 salt: abcdef012934125
 - require:
 - sqlite3: users
```

Here is an example of removing a row from a table:

```

user_john_doe_abc:
 sqlite3.row_absent:
 - db: /var/www/app.sqlite
 - table: users
 - where_sql: email="john.doe@companyabc.com"
 - require:
 - sqlite3: users

```

Note that there is no explicit state to perform random queries, however, this can be approximated with sqlite3's module functions and module.run:

```

zone-delete:
 module.run:
 - name: sqlite3.modify
 - db: {{ db }}
 - sql: "DELETE FROM records WHERE id > {{ count[0] }} AND domain_id = {{ domain_
 ↪ id }}"
 - watch:
 - sqlite3: zone-insert-12

```

**salt.states.sqlite3.row\_absent**(*name*, *db*, *table*, *where\_sql*, *where\_args=None*)

Makes sure the specified row is absent in db. If multiple rows match where\_sql, then the state will fail.

**name** Only used as the unique ID

**db** The database file name

**table** The table name to check

**where\_sql** The sql to select the row to check

**where\_args** The list parameters to substitute in where\_sql

**salt.states.sqlite3.row\_present**(*name*, *db*, *table*, *data*, *where\_sql*, *where\_args=None*, *update=False*)

Checks to make sure the given row exists. If row exists and update is True then row will be updated with data. Otherwise it will leave existing row unmodified and check it against data. If the existing data doesn't match data\_check the state will fail. If the row doesn't exist then it will insert data into the table. If more than one row matches, then the state will fail.

**name** Only used as the unique ID

**db** The database file name

**table** The table name to check the data

**data** The dictionary of key/value pairs to check against if row exists, insert into the table if it doesn't

**where\_sql** The sql to select the row to check

**where\_args** The list parameters to substitute in where\_sql

**update** True will replace the existing row with data When False and the row exists and data does not equal the row data then the state will fail

**salt.states.sqlite3.table\_absent**(*name*, *db*)

Make sure the specified table does not exist

**name** The name of the table

**db** The name of the database file

**salt.states.sqlite3.table\_present**(*name*, *db*, *schema*, *force=False*)

Make sure the specified table exists with the specified schema

**name** The name of the table

**db** The name of the database file

**schema** The dictionary containing the schema information

**force** If the name of the table exists and force is set to False, the state will fail. If force is set to True, the existing table will be replaced with the new table

## 21.19.284 salt.states.ssh\_auth

### Control of entries in SSH authorized\_key files

The information stored in a user's SSH authorized key file can be easily controlled via the `ssh_auth` state. Defaults can be set by the `enc`, `options`, and `comment` keys. These defaults can be overridden by including them in the name.

Since the YAML specification limits the length of simple keys to 1024 characters, and since SSH keys are often longer than that, you may have to use a YAML 'explicit key', as demonstrated in the second example below.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==:
 ssh_auth.present:
 - user: root
 - enc: ssh-dss

? AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==...
:
 ssh_auth.present:
 - user: root
 - enc: ssh-dss

thatch:
 ssh_auth.present:
 - user: root
 - source: salt://ssh_keys/thatch.id_rsa.pub
 - config: '%h/.ssh/authorized_keys'

sshkeys:
 ssh_auth.present:
 - user: root
 - enc: ssh-rsa
 - options:
 - option1="value1"
 - option2="value2 flag2"
 - comment: myuser
 - names:
 - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
 - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
 - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
 - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment

sshkeys:
 ssh_auth.manage:
 - user: root
 - enc: ssh-rsa
 - options:
 - option1="value1"
 - option2="value2 flag2"
 - comment: myuser
 - ssh_keys:
 - AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyY==
 - ssh-dss AAAAB3NzaCL0sQ9fJ5bYTEyY== user@domain
 - option3="value3" ssh-dss AAAAB3NzaC1kcQ9J5bYTEyY== other@testdomain
 - AAAAB3NzaC1kcQ9fJFF435bYTEyY== newcomment
```

`salt.states.ssh_auth.absent` (*name*, *user*, *enc*='ssh-rsa', *comment*="", *source*="", *options*=None, *config*='ssh/authorized\_keys', *fingerprint\_hash\_type*=None)

Verifies that the specified SSH key is absent

**name** The SSH key to manage  
**user** The user who owns the SSH authorized keys file to modify  
**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss  
**comment** The comment to be placed with the SSH public key  
**options** The options passed to the key, pass a list object  
**source** The source file for the key(s). Can contain any number of public keys, in standard "authorized\_keys" format. If this is set, comment, enc and options will be ignored.

New in version 2015.8.0.

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized\_keys". Token expansion %u and %h for username and home path supported.  
**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.7.

```
salt.states.ssh_auth.manage(name, ssh_keys, user, enc='ssh-rsa', comment="", source="",
 options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)
```

New in version 3000.

Ensures that only the specified ssh\_keys are present for the specified user

**ssh\_keys** The SSH key to manage  
**user** The user who owns the SSH authorized keys file to modify  
**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss  
**comment** The comment to be placed with the SSH public key  
**source** The source file for the key(s). Can contain any number of public keys, in standard "authorized\_keys" format. If this is set, comment and enc will be ignored.

---

**Note:** The source file must contain keys in the format <enc> <key> <comment>. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the *private* key file (not the public key), and click Open.
  2. Copy the public key from the box labeled Public key for pasting into OpenSSH authorized\_keys file.
  3. Paste it into a new file.
- 

**options** The options passed to the keys, pass a list object  
**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/authorized\_keys". Token expansion %u and %h for username and home path supported.  
**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

```
salt.states.ssh_auth.present(name, user, enc='ssh-rsa', comment="", source="", options=None, config='.ssh/authorized_keys', fingerprint_hash_type=None, **kwargs)
```

Verifies that the specified SSH key is present for the specified user

**name** The SSH key to manage  
**user** The user who owns the SSH authorized keys file to modify  
**enc** Defines what type of key is being used; can be ed25519, ecdsa, ssh-rsa or ssh-dss  
**comment** The comment to be placed with the SSH public key  
**source** The source file for the key(s). Can contain any number of public keys, in standard "authorized\_keys" format. If this is set, comment and enc will be ignored.

---

**Note:** The source file must contain keys in the format <enc> <key> <comment>. If you have generated a keypair using PuTTYgen, then you will need to do the following to retrieve an OpenSSH-compatible public key.

1. In PuTTYgen, click Load, and select the *private* key file (not the public key), and click Open.
  2. Copy the public key from the box labeled Public key for pasting into OpenSSH `authorized_keys` file.
  3. Paste it into a new file.
- 

**options** The options passed to the key, pass a list object

**config** The location of the authorized keys file relative to the user's home directory, defaults to `".ssh/authorized_keys"`. Token expansion `%u` and `%h` for username and home path supported.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

## 21.19.285 salt.states.ssh\_known\_hosts

### Control of SSH `known_hosts` entries

Manage the information stored in the `known_hosts` files.

```
github.com:
ssh_known_hosts:
- present
- user: root
- fingerprint: 16:27:ac:a5:76:28:2d:36:63:1b:56:4d:eb:df:a6:48
- fingerprint_hash_type: md5

example.com:
ssh_known_hosts:
- absent
- user: root
```

`salt.states.ssh_known_hosts.absent` (*name*, *user=None*, *config=None*)

Verifies that the specified host is not known by the given user

**name** The host name Note that only single host names are supported. If `foo.example.com` and `bar.example.com` are the same machine and you need to exclude both, you will need one Salt state for each.

**user** The user who owns the ssh authorized keys file to modify

**config** The location of the authorized keys file relative to the user's home directory, defaults to `".ssh/known_hosts"`. If no user is specified, defaults to `"/etc/ssh/ssh_known_hosts"`. If present, must be an absolute path when a user is not specified.

`salt.states.ssh_known_hosts.present` (*name*, *user=None*, *fingerprint=None*,  
*key=None*, *port=None*, *enc=None*, *config=None*,  
*hash\_known\_hosts=True*, *timeout=5*, *fingerprint\_hash\_type=None*)

Verifies that the specified host is known by the specified user

On many systems, specifically those running with openssh 4 or older, the `enc` option must be set, only openssh 5 and above can detect the key type.

**name** The name of the remote host (e.g. `"github.com"`) Note that only a single hostname is supported, if `foo.example.com` and `bar.example.com` have the same host you will need two separate Salt States to represent them.

**user** The user who owns the ssh authorized keys file to modify

**fingerprint** The fingerprint of the key which must be present in the `known_hosts` file (optional if key specified)

**key** The public key which must be present in the `known_hosts` file (optional if fingerprint specified)

**port** optional parameter, port which will be used to when requesting the public key from the remote host, defaults to port 22.

**enc** Defines what type of key is being used, can be `ed25519`, `ecdsa` `ssh-rsa` or `ssh-dss`

**config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known\_hosts". If no user is specified, defaults to "/etc/ssh/ssh\_known\_hosts". If present, must be an absolute path when a user is not specified.

**hash\_known\_hosts** [True] Hash all hostnames and addresses in the known hosts file.

**timeout** [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

**fingerprint\_hash\_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

## 21.19.286 salt.states.stateconf

### Stateconf System

The stateconf system is intended for use only with the stateconf renderer. This State module presents the `set` function. This function does not execute any functionality, but is used to interact with the stateconf renderer.

**salt.states.stateconf.context**(*name*, *\*\*kwargs*)

No-op state to support state config via the stateconf renderer.

**salt.states.stateconf.set**(*name*, *\*\*kwargs*)

No-op state to support state config via the stateconf renderer.

## 21.19.287 salt.states.status

Minion status monitoring

Maps to the `status` execution module.

**salt.states.status.loadavg**(*name*, *maximum=None*, *minimum=None*)

Return the current load average for the specified minion. Available values for *name* are *1-min*, *5-min* and *15-min*. *minimum* and *maximum* values should be passed in as strings.

**salt.states.status.process**(*name*)

Return whether the specified signature is found in the process tree. This differs slightly from the `services` states, in that it may refer to a process that is not managed via the `init` system.

## 21.19.288 salt.states.statuspage

### StatusPage

Manage the `StatusPage` configuration.

In the minion configuration file, the following block is required:

```
statuspage:
 api_key: <API_KEY>
 page_id: <PAGE_ID>
```

New in version 2017.7.0.

```
salt.states.statuspage.create(name, endpoint='incidents', api_url=None, page_id=None,
 api_key=None, api_version=None, **kwargs)
```

Insert a new entry under a specific endpoint.

**endpoint:** **incidents** Insert under this specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version:** **1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

**kwargs** Other params.

SLS Example:

```
create-my-component:
 statuspage.create:
 - endpoint: components
 - name: my component
 - group_id: 993vgplshj12
```

```
salt.states.statuspage.delete(name, endpoint='incidents', id=None, api_url=None, page_id=None,
 api_key=None, api_version=None)
```

Remove an entry from an endpoint.

**endpoint:** **incidents** Request a specific endpoint.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version:** **1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```
delete-my-component:
 statuspage.delete:
 - endpoint: components
 - id: ftgks51sfs2d
```

```
salt.states.statuspage.managed(name, config, api_url=None, page_id=None, api_key=None,
 api_version=None, pace=1, allow_empty=False)
```

Manage the StatusPage configuration.

**config** Dictionary with the expected configuration of the StatusPage. The main level keys of this dictionary represent the endpoint name. If a certain endpoint does not exist in this structure, it will be ignored / not configured.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version:** **1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

**pace:** **1** Max requests per second allowed by the API.

**allow\_empty:** **False** Allow empty config.

SLS example:

```
my-statuspage-config:
 statuspage.managed:
 - config:
 components:
 - name: component1
 group_id: uy4g37rf
 - name: component2
 group_id: 3n4uyu4gf
 incidents:
 - name: incident1
```

(continues on next page)

(continued from previous page)

```

 status: resolved
 impact: major
 backfilled: false
- name: incident2
 status: investigating
 impact: minor

```

`salt.states.statuspage.update` (*name*, *endpoint*='incidents', *id*=None, *api\_url*=None, *page\_id*=None, *api\_key*=None, *api\_version*=None, *\*\*kwargs*)

Update attribute(s) of a specific endpoint.

**id** The unique ID of the endpoint entry.

**endpoint: incidents** Endpoint name.

**page\_id** Page ID. Can also be specified in the config file.

**api\_key** API key. Can also be specified in the config file.

**api\_version: 1** API version. Can also be specified in the config file.

**api\_url** Custom API URL in case the user has a StatusPage service running in a custom environment.

SLS Example:

```

update-my-incident:
 statuspage.update:
 - id: dz959yz2nd4l
 - status: resolved

```

## 21.19.289 salt.states.supervisord

### Interaction with the Supervisor daemon

```

wsgi_server:
 supervisord.running:
 - require:
 - pkg: supervisor
 - watch:
 - file: /etc/nginx/sites-enabled/wsgi_server.conf

```

`salt.states.supervisord.dead` (*name*, *user*=None, *conf\_file*=None, *bin\_env*=None, *\*\*kwargs*)

Ensure the named service is dead (not running).

**name** Service name as defined in the supervisor configuration file

**user** Name of the user to run the supervisorctl command

New in version 0.17.0.

**conf\_file** path to supervisorctl config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

`salt.states.supervisord.mod_watch` (*name*, *restart*=True, *update*=False, *user*=None, *conf\_file*=None, *bin\_env*=None, *\*\*kwargs*)

The supervisord watcher, called to invoke the watch command. Always restart on watch

---

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

**salt.states.supervisord.running**(*name*, *restart=False*, *update=False*, *user=None*, *conf\_file=None*, *bin\_env=None*, *\*\*kwargs*)

Ensure the named service is running.

**name** Service name as defined in the supervisor configuration file

**restart** Whether to force a restart

**update** Whether to update the supervisor configuration.

**user** Name of the user to run the supervisorctl command

New in version 0.17.0.

**conf\_file** path to supervisorctl config file

**bin\_env** path to supervisorctl bin or path to virtualenv with supervisor installed

## 21.19.290 salt.states.svn

### Manage SVN repositories

Manage repository checkouts via the svn vcs system. Note that subversion must be installed for these states to be available, so svn states should include a requisite to a pkg.installed state for the package which provides subversion (subversion in most cases). Example:

```
subversion:
 pkg.installed

http://unladen-swallow.googlecode.com/svn/trunk/:
 svn.latest:
 - target: /tmp/swallow
```

**salt.states.svn.dirty**(*name*, *target*, *user=None*, *username=None*, *password=None*, *ignore\_unversioned=False*)

Determine if the working directory has been changed.

**salt.states.svn.export**(*name*, *target=None*, *rev=None*, *user=None*, *username=None*, *password=None*, *force=False*, *overwrite=False*, *externals=True*, *trust=False*, *trust\_failures=None*)

Export a file or directory from an SVN repository

**name** Address and path to the file or directory to be exported.

**target** Name of the target directory where the checkout will put the working directory

**rev** [None] The name revision number to checkout. Enable "force" if the directory already exists.

**user** [None] Name of the user performing repository management operations

**username** [None] The user to access the name repository with. The svn default is the current user

**password** Connect to the Subversion server with this password

New in version 0.17.0.

**force** [False] Continue if conflicts are encountered

**overwrite** [False] Overwrite existing target

**externals** [True] Change to False to not checkout or update externals

**trust** [False] Automatically trust the remote server. SVN's --trust-server-cert

**trust\_failures** [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if trust=True is not sufficient. The specified string is passed to SVN's --trust-server-cert-failures option as-is.

New in version 2019.2.0.

**salt.states.svn.latest**(*name*, *target=None*, *rev=None*, *user=None*, *username=None*, *password=None*, *force=False*, *externals=True*, *trust=False*, *trust\_failures=None*)

Checkout or update the working directory to the latest revision from the remote repository.

**name** Address of the name repository as passed to "svn checkout"

**target** Name of the target directory where the checkout will put the working directory  
**rev** [None] The name revision number to checkout. Enable "force" if the directory already exists.  
**user** [None] Name of the user performing repository management operations  
**username** [None] The user to access the name repository with. The svn default is the current user  
**password** Connect to the Subversion server with this password

New in version 0.17.0.

**force** [False] Continue if conflicts are encountered  
**externals** [True] Change to False to not checkout or update externals  
**trust** [False] Automatically trust the remote server. SVN's --trust-server-cert  
**trust\_failures** [None] Comma-separated list of certificate trust failures, that shall be ignored. This can be used if trust=True is not sufficient. The specified string is passed to SVN's --trust-server-cert-failures option as-is.

New in version 2019.2.0.

## 21.19.291 salt.states.sysctl

### Configuration of the kernel using sysctl

Control the kernel sysctl system.

```
vm.swappiness:
 sysctl.present:
 - value: 20
```

**salt.states.sysctl.present** (*name*, *value*, *config=None*, *ignore=False*)

Ensure that the named sysctl value is set in memory and persisted to the named configuration file. The default sysctl configuration file is /etc/sysctl.conf

**name** The name of the sysctl value to edit

**value** The sysctl value to apply

**config** The location of the sysctl configuration file. If not specified, the proper location will be detected based on platform.

**ignore** New in version 3001.

Adds --ignore to sysctl commands. This suppresses errors in environments where sysctl settings may have been disabled in kernel boot configuration. Defaults to False

## 21.19.292 salt.states.syslog\_ng

### State module for syslog\_ng

**maintainer** Tibor Benke <[btibi@sch.bme.hu](mailto:btibi@sch.bme.hu)>

**maturity** new

**depends** cmd, ps, syslog\_ng

**platform** all

Users can generate syslog-ng configuration files from YAML format or use plain ones and reload, start, or stop their syslog-ng by using this module.

## Details

The service module is not available on all system, so this module includes *syslog-ng.reloaded*, *syslog-ng.stopped*, and *syslog-ng.started* functions. If the service module is available on the computers, users should use that.

Users can generate syslog-ng configuration with *syslog-ng.config* function. For more information see *syslog-ng state usage*.

## Syslog-ng configuration file format

The syntax of a configuration snippet in syslog-ng.conf:

```
object_type object_id {<options>;
```

These constructions are also called statements. There are options inside of them:

```
option(parameter1, parameter2); option2(parameter1, parameter2);
```

You can find more information about syslog-ng's configuration syntax in the Syslog-ng Admin guide: <http://www.balabit.com/sites/default/files/documents/syslog-ng-ose-3.5-guides/en/syslog-ng-ose-v3.5-guide-admin/html-single/index.html#syslog-ng.conf.5>

**salt.states.syslog-ng.config**(*name*, *config*, *write=True*)

Builds syslog-ng configuration.

*name* : the id of the Salt document *config* : the parsed YAML code *write* : if True, it writes the config into the configuration file, otherwise just returns it

**salt.states.syslog-ng.reloaded**(*name*)

Reloads syslog-ng.

**salt.states.syslog-ng.started**(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no\_caps=False*, *pidfile=None*, *enable\_core=False*, *fd\_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist\_file=None*, *control=None*, *worker\_threads=None*, *\*args*, *\*\*kwargs*)

Ensures, that syslog-ng is started via the given parameters.

Users shouldn't use this function, if the service module is available on their system.

**salt.states.syslog-ng.stopped**(*name=None*)

Kills syslog-ng.

## 21.19.293 salt.states.sysrc

State to work with sysrc

**salt.states.sysrc.absent**(*name*, *\*\*kwargs*)

Ensure a sysrc variable is absent.

**name** The variable name to set

**file** (optional) The rc file to add the variable to.

**jail** (option) the name or JID of the jail to set the value in.

**salt.states.sysrc.managed**(*name*, *value*, *\*\*kwargs*)

Ensure a sysrc variable is set to a specific value.

**name** The variable name to set

**value** Value to set the variable to

**file** (optional) The rc file to add the variable to.  
**jail** (option) the name or JID of the jail to set the value in.  
 Example:

```
syslogd:
 sysrc.managed:
 - name: syslogd_flags
 - value: -ss
```

## 21.19.294 salt.states.telemetry\_alert

### Manage Telemetry alert configurations

New in version 2016.3.0.

Create, Update and destroy Mongo Telemetry alert configurations.

This module uses requests, which can be installed via package, or pip.

This module accepts explicit credential (telemetry api key) or can also read api key credentials from a pillar. Example:

```
ensure telemetry alert X is defined on deployment Y:
 telemetry_alert.present:
 - deployment_id: "rs-XXXXXX"
 - metric_name: "testMetric"
 - alert_config:
 max: 1
 filter: SERVER_ROLE_MONGOD_PRIMARY
 escalate_to: "example@pagerduty.com"
 - name: "**MANAGED BY ORCA DO NOT EDIT BY HAND** manages alarm on testMetric"
```

**salt.states.telemetry\_alert.absent**(*name, deployment\_id, metric\_name, api\_key=None, profile='telemetry'*)

Ensure the telemetry alert config is deleted

**name** An optional description of the alarms (not currently supported by telemetry API)

**deployment\_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

**metric\_name** Specifies the unique ID of the metric to whose values these thresholds will be applied

**api\_key** Telemetry api key for the user

**profile** A dict with telemetry config data. If present, will be used instead of **api\_key**.

**salt.states.telemetry\_alert.present**(*name, deployment\_id, metric\_name, alert\_config, api\_key=None, profile='telemetry'*)

Ensure the telemetry alert exists.

**name** An optional description of the alarm (not currently supported by telemetry API)

**deployment\_id** Specifies the ID of the root deployment resource (replica set cluster or sharded cluster) to which this alert definition is attached

**metric\_name** Specifies the unique ID of the metric to whose values these thresholds will be applied

**alert\_config:** Is a list of dictionaries where each dict contains the following fields:

**filter** By default the alert will apply to the deployment and all its constituent resources. If the alert only applies to a subset of those resources, a filter may be specified to narrow this scope.

**min** the smallest "ok" value the metric may take on; if missing or null, no minimum is enforced.

**max** the largest "ok" value the metric may take on; if missing or null, no maximum is enforced.

**notify\_all** Used to indicate if you want to alert both onCallEngineer and apiNotifications

**api\_key** Telemetry api key for the user

**profile** A dict of telemetry config information. If present, will be used instead of **api\_key**.

## 21.19.295 salt.states.test

### Test States

Provide test case states that enable easy testing of things to do with state calls, e.g. running, calling, logging, output filtering etc.

```
always-passes-with-any-kwarg:
 test.nop:
 - name: foo
 - something: else
 - foo: bar

always-passes:
 test.succeed_without_changes:
 - name: foo

always-fails:
 test.fail_without_changes:
 - name: foo

always-changes-and-succeeds:
 test.succeed_with_changes:
 - name: foo

always-changes-and-fails:
 test.fail_with_changes:
 - name: foo

my-custom-combo:
 test.configurable_test_state:
 - name: foo
 - changes: True
 - result: False
 - comment: bar.baz
 - warnings: A warning

is-pillar-foo-present-and-bar-is-int:
 test.check_pillar:
 - present:
 - foo
 - integer:
 - bar
```

You may also use these states for controlled failure in state definitions, for example if certain conditions in pillar or grains do not apply. The following state definition will fail with a message "OS not supported!" when `grains['os']` is neither Ubuntu nor CentOS:

```
{% if grains['os'] in ['Ubuntu', 'CentOS'] %}

Your state definitions go here

{% else %}
failure:
 test.fail_without_changes:
 - name: "OS not supported!"
 - failhard: True
```

(continues on next page)

(continued from previous page)

```
{% endif %}
```

```
salt.states.test.check_pillar(name, present=None, boolean=None, integer=None, string=None,
 listing=None, dictionary=None, verbose=False)
```

Checks the presence and, optionally, the type of given keys in Pillar

Supported kwargs for types are: - boolean (bool) - integer (int) - string (str) - listing (list) - dictionary (dict)

Checking for None type pillars is not implemented yet.

```
is-pillar-foo-present-and-bar-is-int:
 test.check_pillar:
 - present:
 - foo
 - integer:
 - bar
```

```
salt.states.test.configurable_test_state(name, changes=True, result=True, comment="",
 warnings=None)
```

New in version 2014.7.0.

A configurable test state which allows for more control over the return data

**name** A unique string to serve as the state's ID

**changes** [True] Controls whether or not the state reports that there were changes. There are three supported values for this argument:

- If `True`, the state will report changes
- If `False`, the state will report no changes
- If `"Random"`, the state will randomly report either changes or no changes.

**result** [True] Controls the result for for the state. Like `changes`, there are three supported values for this argument:

- If `True`, the state will report a `True` result
- If `False`, the state will report a `False` result
- If `"Random"`, the state will randomly report either `True`

**Note:** The result will be reported as `None` if *all* of the following are true:

1. The state is being run in test mode (i.e. `test=True` on the CLI)
2. `result` is `True` (either explicitly, or via being set to `"Random"`)
3. `changes` is `True` (either explicitly, or via being set to `"Random"`)

**comment** ["" ] Comment field for the state. By default, this is an empty string.

**warnings** A string (or a list of strings) to fill the warnings field with. Default is `None`

New in version 3000.

```
salt.states.test.fail_with_changes(name, **kwargs)
```

New in version 2014.7.0.

Returns `False` with an non-empty changes dictionary. Useful for testing requisites.

**name** A unique string to serve as the state's ID

```
salt.states.test.fail_without_changes(name, **kwargs)
```

New in version 2014.7.0.

Returns failure

**name** A unique string to serve as the state's ID

```
salt.states.test.mod_watch(name, sfun=None, **kwargs)
```

Call this function via a watch statement

New in version 2014.7.0.

Any parameters in the state return dictionary can be customized by adding the keywords `result`, `comment`, and `changes`.

```
this_state_will_return_changes:
 test.succeed_with_changes

this_state_will_NOT_return_changes:
 test.succeed_without_changes

this_state_is_watching_another_state:
 test.succeed_without_changes:
 - comment: 'This is a custom comment'
 - watch:
 - test: this_state_will_return_changes
 - test: this_state_will_NOT_return_changes

this_state_is_also_watching_another_state:
 test.succeed_without_changes:
 - watch:
 - test: this_state_will_NOT_return_changes
```

`salt.states.test.nop(name, **kwargs)`

New in version 2015.8.1.

A no-op state that does nothing. Useful in conjunction with the `use` requisite, or in templates which could otherwise be empty due to jinja rendering.

**name** A unique string to serve as the state's ID

`salt.states.test.show_notification(name, text=None, **kwargs)`

New in version 2015.8.0.

Simple notification using text argument.

**name** A unique string to serve as the state's ID

**text** Text to return in the comment field

`salt.states.test.succeed_with_changes(name, **kwargs)`

New in version 2014.7.0.

Returns True with an non-empty changes dictionary. Useful for testing requisites.

**name** A unique string to serve as the state's ID

`salt.states.test.succeed_without_changes(name, **kwargs)`

New in version 2014.7.0.

Returns successful

**name** A unique string to serve as the state's ID

## 21.19.296 salt.states.testinframod module

## 21.19.297 salt.states.timezone

### Management of timezones

The timezone can be managed for the system:

```
America/Denver:
 timezone.system
```

The system and the hardware clock are not necessarily set to the same time. By default, the hardware clock is set to localtime, meaning it is set to the same time as the system clock. If *utc* is set to True, then the hardware clock will be set to UTC, and the system clock will be an offset of that.

```
America/Denver:
 timezone.system:
 - utc: True
```

The Ubuntu community documentation contains an explanation of this setting, as it applies to systems that dual-boot with Windows. This is explained in greater detail [here](#).

**salt.states.timezone.system**(*name*, *utc*=True)

Set the timezone for the system.

**name** The name of the timezone to use (e.g.: America/Denver)

**utc** Whether or not to set the hardware clock to UTC (default is True)

## 21.19.298 salt.states.tls

### Enforce state for SSL/TLS

**salt.states.tls.valid\_certificate**(*name*, *weeks*=0, *days*=0, *hours*=0, *minutes*=0, *seconds*=0)

Verify that a TLS certificate is valid now and (optionally) will be valid for the time specified through weeks, days, hours, minutes, and seconds.

## 21.19.299 salt.states.tomcat

### Manage Apache Tomcat web applications

---

**Note:** This state requires the Tomcat Manager webapp to be installed and running.

---

The following grains/pillars must be set for communication with Tomcat Manager to work:

```
tomcat-manager:
 user: 'tomcat-manager'
 passwd: 'Passw0rd'
```

## Configuring Tomcat Manager

To manage webapps via the Tomcat Manager, you'll need to configure a valid user in the file `conf/tomcat-users.xml`.

Listing 1: `conf/tomcat-users.xml`

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
 <role rolename="manager-script"/>
 <user username="tomcat-manager" password="Passw0rd" roles="manager-script"/>
</tomcat-users>
```

### Notes

- Using multiple versions (aka. parallel deployments) on the same context path is not supported.
- More information about the Tomcat Manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- If you use only this module for deployments you might want to restrict access to the manager so it's only accessible via localhost. For more info: [http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring\\_Manager\\_Application\\_Access](http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access)
- Last tested on:

Tomcat Version: Apache Tomcat/7.0.54

JVM Vendor: Oracle Corporation

JVM Version: 1.8.0\_101-b13

OS Architecture: amd64

OS Name: Linux

OS Version: 3.10.0-327.22.2.el7.x86\_64

`salt.states.tomcat.mod_watch(name, url='http://localhost:8080/manager', timeout=180)`

The tomcat watcher, called to invoke the watch command. When called, it will reload the webapp in question

---

**Note:** This state exists to support special handling of the watch *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

`salt.states.tomcat.undeployed(name, url='http://localhost:8080/manager', timeout=180)`

Enforce that the WAR will be undeployed from the server

**name** The context path to undeploy.

**url** [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
jenkins:
 tomcat.undeployed:
 - name: /ran
 - require:
 - service: application-service
```

`salt.states.tomcat.wait(name, url='http://localhost:8080/manager', timeout=180)`

Wait for the Tomcat Manager to load.

Notice that if tomcat is not running we won't wait for it start and the state will fail. This state can be required in the `tomcat.war_deployed` state to make sure tomcat is running and that the manager is running as well and ready for deployment.

**url** [<http://localhost:8080/manager>] The URL of the server with the Tomcat Manager webapp.

**timeout** [180] Timeout for HTTP request to the Tomcat Manager.

Example:

```
tomcat-service:
 service.running:
 - name: tomcat
 - enable: True

wait-for-tomcatmanager:
 tomcat.wait:
 - timeout: 300
 - require:
 - service: tomcat-service

jenkins:
 tomcat.war_deployed:
 - name: /ran
 - war: salt://jenkins-1.2.4.war
 - require:
 - tomcat: wait-for-tomcatmanager
```

`salt.states.tomcat.war_deployed(name, war, force=False, url='http://localhost:8080/manager',  
 timeout=180, temp_war_location=None, version=True)`

Enforce that the WAR will be deployed and started in the context path, while making use of WAR versions in the filename.

---

**Note:** For more info about Tomcats file paths and context naming, please see <http://tomcat.apache.org/tomcat-7.0-doc/config/context.html#Naming>

---

**name** The context path to deploy (incl. forward slash) the WAR to.

**war** Absolute path to WAR file (should be accessible by the user running Tomcat) or a path supported by the `salt.modules.cp.get_url` function.

**force** [False] Force deployment even if the version strings are the same. Disabled by default.

**url** [<http://localhost:8080/manager>] The URL of the Tomcat Web Application Manager.

**timeout** [180] Timeout for HTTP requests to the Tomcat Manager.

**temp\_war\_location** [None] Use another location to temporarily copy the WAR file to. By default the system's temp directory is used.

**version** [""] Specify the WAR version. If this argument is provided, it overrides the version encoded in the WAR file name, if one is present.

New in version 2015.8.6.

Use `False` or blank value to prevent guessing the version and keeping it blank.

New in version 2016.11.0.

Example:

```
jenkins:
 tomcat.war_deployed:
```

(continues on next page)

(continued from previous page)

```
- name: /salt-powered-jenkins
- war: salt://jenkins-1.2.4.war
- require:
 - service: application-service
```

**Note:** Be aware that in the above example the WAR `jenkins-1.2.4.war` will be deployed to the context path `salt-powered-jenkins##1.2.4`. To avoid this either specify a version yourself, or set version to `False`.

## 21.19.300 salt.states.trafficserver

### Control Apache Traffic Server

New in version 2015.8.0.

`salt.states.trafficserver.bounce_cluster(name)`

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
bounce_ats_cluster:
 trafficserver.bounce_cluster
```

`salt.states.trafficserver.bounce_local(name, drain=False)`

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

This option modifies the behavior of `traffic_line -b` and `traffic_line -L` such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
bounce_ats_local:
 trafficserver.bounce_local

bounce_ats_local:
 trafficserver.bounce_local
 - drain: True
```

`salt.states.trafficserver.clear_cluster(name)`

Clears accumulated statistics on all nodes in the cluster.

```
clear_ats_cluster:
 trafficserver.clear_cluster
```

`salt.states.trafficserver.clear_node(name)`

Clears accumulated statistics on the local node.

```
clear_ats_node:
 trafficserver.clear_node
```

`salt.states.trafficserver.config(name, value)`

Set Traffic Server configuration variable values.

```
proxy.config.proxy_name:
trafficserver.config:
 - value: cdn.site.domain.tld
```

OR

```
traffic_server_setting:
trafficserver.config:
 - name: proxy.config.proxy_name
 - value: cdn.site.domain.tld
```

**salt.states.trafficserver.offline**(*name*, *path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic\_server process.

```
offline_ats_path:
trafficserver.offline:
 - path: /path/to/cache
```

**salt.states.trafficserver.refresh**(*name*)

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure\_time metric.

```
refresh_ats:
trafficserver.refresh
```

**salt.states.trafficserver.restart\_cluster**(*name*)

Restart the traffic\_manager process and the traffic\_server process on all the nodes in a cluster.

```
restart_ats_cluster:
trafficserver.restart_cluster
```

**salt.states.trafficserver.restart\_local**(*name*, *drain=False*)

Restart the traffic\_manager and traffic\_server processes on the local node.

This option modifies the behavior of traffic\_line -b and traffic\_line -L such that traffic\_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active\_client\_threshold configuration variable.

```
restart_ats_local:
trafficserver.restart_local

restart_ats_local_drain:
trafficserver.restart_local
 - drain: True
```

**salt.states.trafficserver.shutdown**(*name*)

Shut down Traffic Server on the local node.

```
shutdown_ats:
trafficserver.shutdown
```

`salt.states.trafficserver.startup(name)`

Start Traffic Server on the local node.

```
startup_ats:
 trafficserver.startup
```

`salt.states.trafficserver.zero_cluster(name)`

Reset performance statistics to zero across the cluster.

```
zero_ats_cluster:
 trafficserver.zero_cluster
```

`salt.states.trafficserver.zero_node(name)`

Reset performance statistics to zero on the local node.

```
zero_ats_node:
 trafficserver.zero_node
```

### 21.19.301 salt.states.tuned

Interface to Red Hat tuned-adm module

**maintainer** Syed Ali <[alicsyed@gmail.com](mailto:alicsyed@gmail.com)>

**maturity** new

**depends** cmd.run

**platform** Linux

`salt.states.tuned.off(name=None)`

Turns 'tuned' off. Example tuned.sls file for turning tuned off:

**tuned:** tuned.off: []

To see a valid list of states call execution module: `tuned.list`

`salt.states.tuned.profile(name)`

This state module allows you to modify system tuned parameters

Example tuned.sls file to set profile to virtual-guest

**tuned:**

**tuned:**

- profile
- name: virtual-guest

**name** tuned profile name to set the system to

To see a valid list of states call execution module: `tuned.list`

### 21.19.302 salt.states.uptime

#### Monitor Web Server with Uptime

[Uptime](#) is an open source remote monitoring application using Node.js, MongoDB, and Twitter Bootstrap.

**Warning:** This state module is beta. It might be changed later to include more or less automation.

**Note:** This state module requires a pillar to specify the location of your uptime install

```
uptime:
 application_url: "http://uptime-url.example.org"
```

Example:

```
url:
 uptime.monitored
url/sitemap.xml:
 uptime.monitored:
 - polling: 600 # every hour
```

`salt.states.uptime.monitored(name, **params)`

Makes sure an URL is monitored by uptime. Checks if URL is already monitored, and if not, adds it.

### 21.19.303 salt.states.user

#### Management of user accounts

The user module is used to create and manage user settings, users can be set as either absent or present

```
fred:
 user.present:
 - fullname: Fred Jones
 - shell: /bin/zsh
 - home: /home/fred
 - uid: 4000
 - gid: 4000
 - groups:
 - wheel
 - storage
 - games

testuser:
 user.absent
```

`salt.states.user.absent(name, purge=False, force=False)`

Ensure that the named user is absent

**name** The name of the user to remove

**purge** Set purge to True to delete all of the user's files as well as the user, Default is False.

**force** If the user is logged in, the absent state will fail. Set the force option to True to remove the user even if they are logged in. Not supported in FreeBSD and Solaris, Default is False.

`salt.states.user.present(name, uid=None, gid=None, usergroup=None, groups=None, optional_groups=None, remove_groups=True, home=None, createhome=True, password=None, hash_password=False, enforce_password=True, empty_password=False, shell=None, unique=True, system=False, full_name=None, roomnumber=None, workphone=None, homephone=None, other=None, loginclass=None, date=None, mindays=None, maxdays=None, inactdays=None, warndays=None, expire=None, win_homedrive=None, win_profile=None, win_logonscript=None, win_description=None, nologinit=False, allow_uid_change=False, allow_gid_change=False, **kwargs)`

Ensure that the named user is present with the specified properties

**name** The name of the user to manage

**uid** The user id to assign. If not specified, and the user does not exist, then the next available uid will be assigned.

**gid** The id of the default group to assign to the user. Either a group name or gid can be used. If not specified, and the user does not exist, then the next available gid will be assigned.

**allow\_uid\_change** [False] Set to `True` to allow the state to update the uid.

New in version 2018.3.1.

**allow\_gid\_change** [False] Set to `True` to allow the state to update the gid.

New in version 2018.3.1.

**usergroup** If `True`, a group with the same name as the user will be created. If `False`, a group with the same name as the user will not be created. The default is distribution-specific. See the `USERGROUPS_ENAB` section of the `login.defs(5)` man page.

---

**Note:** Only supported on GNU/Linux distributions

---

New in version 3001.

**groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will fail. If set to the empty list, the user will be removed from all groups except the default group. If unset, salt will assume current groups are still wanted, and will make no changes to them.

**optional\_groups** A list of groups to assign the user to, pass a list object. If a group specified here does not exist on the minion, the state will silently ignore it.

NOTE: If the same group is specified in both "groups" and "optional\_groups", then it will be assumed to be required and not optional.

**remove\_groups** Remove groups that the user is a member of that weren't specified in the state, Default is `True`.

**home** The custom login directory of user. Uses default value of underlying system if not set. Notice that this directory does not have to exist. This also the location of the home directory to create if `createhome` is set to `True`.

**createhome** [True] If set to `False`, the home directory will not be created if it doesn't already exist.

**Warning:** Not supported on Windows or Mac OS.

Additionally, parent directories will *not* be created. The parent directory for home must already exist.

**nologinit** [False] If set to `True`, it will not add the user to lastlog and faillog databases.

---

**Note:** Not supported on Windows.

---

**password** A password hash to set for the user. This field is only supported on Linux, FreeBSD, NetBSD, OpenBSD, and Solaris. If the `empty_password` argument is set to `True` then `password` is ignored. For Windows this is the plain text password. For Linux, the hash can be generated with `mkpasswd -m sha-256`.

Changed in version 0.16.0: BSD support added.

**hash\_password** Set to `True` to hash the clear text password. Default is `False`.

**enforce\_password** Set to `False` to keep the password from being changed if it has already been set and the password hash differs from what is specified in the "password" field. This option will be ignored if "password" is not specified, Default is `True`.

**empty\_password** Set to `True` to enable password-less login for user, Default is `False`.

**shell** The login shell, defaults to the system default shell  
**unique** Require a unique UID, Default is `True`.  
**system** Choose UID in the range of `FIRST_SYSTEM_UID` and `LAST_SYSTEM_UID`, Default is `False`.  
**loginclass** The login class, defaults to empty (BSD only)  
 User comment field (GECOS) support (currently Linux, BSD, and MacOS only):

The below values should be specified as strings to avoid ambiguities when the values are loaded. (Especially the phone and room number fields which are likely to contain numeric data)

**fullname** The user's full name  
**roomnumber** The user's room number (not supported in MacOS)  
**workphone** The user's work phone number (not supported in MacOS)  
**homephone** The user's home phone number (not supported in MacOS)  
**other** The user's other attribute (not supported in MacOS) If GECOS field contains more than 4 commas, this field will have the rest of 'em

Changed in version 2014.7.0: Shadow attribute support added.

Shadow attributes support (currently Linux only):

The below values should be specified as integers.

**date** Date of last change of password, represented in days since epoch (January 1, 1970).  
**mindays** The minimum number of days between password changes.  
**maxdays** The maximum number of days between password changes.  
**inactdays** The number of days after a password expires before an account is locked.  
**warndays** Number of days prior to maxdays to warn users.  
**expire** Date that account expires, represented in days since epoch (January 1, 1970).

The below parameters apply to windows only:

**win\_homedrive (Windows Only)** The drive letter to use for the home directory. If not specified the home directory will be a unc path. Otherwise the home directory will be mapped to the specified drive. Must be a letter followed by a colon. Because of the colon, the value must be surrounded by single quotes. ie:  
 - win\_homedrive: 'U:'

Changed in version 2015.8.0.

**win\_profile (Windows Only)** The custom profile directory of the user. Uses default value of underlying system if not set.

Changed in version 2015.8.0.

**win\_logonscript (Windows Only)** The full path to the logon script to run when the user logs in.

Changed in version 2015.8.0.

**win\_description (Windows Only)** A brief description of the purpose of the users account.

Changed in version 2015.8.0.

## 21.19.304 salt.states.vagrant

### Manage Vagrant VMs

Manange execution of Vagrant virtual machines on Salt minions.

**Vagrant** is a tool for building and managing virtual machine environments. It can use various providers, such as **VirtualBox**, **Docker**, or **VMware**, to run its VMs. Vagrant provides some of the functionality of a light-weight hypervisor. The combination of Salt modules, Vagrant running on the host, and a virtual machine provider, gives hypervisor-like functionality for developers who use Vagrant to quickly define their virtual environments.

New in version 2018.3.0.

The configuration of each virtual machine is defined in a file named `Vagrantfile` which must exist on the VM host machine. The essential parameters which must be defined to start a Vagrant VM are the directory where the

Vagrantfile is located (argument `cwd:`), and the username which will own the Vagrant box created for the VM (argument `vagrant_runas:`).

A single Vagrantfile may define one or more virtual machines. Use the `machine` argument to chose among them. The default (blank) value will select the primary (or only) machine in the Vagrantfile.

[NOTE:] Each virtual machine host must have the following:

- a working salt-minion
- a Salt sdb database configured for `vagrant_sdb_data`.
- Vagrant installed and the `vagrant` command working
- a suitable VM provider

```
EXAMPLE:
file /etc/salt/minion.d/vagrant_sdb.conf on the host computer
-- this sdb database is required by the Vagrant module --
vagrant_sdb_data: # The sdb database must have this name.
 driver: sqlite3 # Let's use SQLite to store the data ...
 database: /var/cache/salt/vagrant.sqlite # ... in this file ...
 table: sdb # ... using this table name.
 create_table: True # if not present
```

`salt.states.vagrant.destroyed(name)`

Stops a VM (or VMs) and removes all references to it (them). (Runs `vagrant destroy`.)

Subsequent re-use of the same machine will require another operation of `vagrant.running` or a call to the `vagrant.init` execution module.

Parameters **name** -- May be a Salt\_id node or a POSIX-style wildcard string.

```
node_name:
 vagrant.destroyed
```

`salt.states.vagrant.initialized(name, **kwargs)`

Defines a new VM with specified arguments, but does not start it.

Parameters **name** -- the Salt\_id node name you wish your VM to have.

Each machine must be initialized individually using this function or the "vagrant.running" function, or the `vagrant.init` execution module call.

This command will not change the state of a running or paused machine.

Possible keyword arguments:

- `cwd`: The directory (path) containing the Vagrantfile
- `machine`: (") the name of the machine (in the Vagrantfile) if not default
- `vagrant_runas`: ('root') the username who owns the vagrantbox file
- `vagrant_provider`: the provider to run the VM (usually 'virtualbox')
- `vm`: ({} ) a dictionary containing these or other keyword arguments

```
node_name1:
 vagrant.initialized
 - cwd: /projects/my_project
 - vagrant_runas: my_username
 - machine: machine1

node_name2:
 vagrant.initialized
 - cwd: /projects/my_project
 - vagrant_runas: my_username
```

(continues on next page)

(continued from previous page)

```

- machine: machine2

start_nodes:
 vagrant.start:
 - name: node_name?

```

**salt.states.vagrant.paused(name)**Stores the state of a VM (or VMs) for fast restart. (Runs `vagrant suspend`.)**Parameters name** -- May be a Salt\_id node or a POSIX-style wildcard string.

```

node_name:
 vagrant.paused

```

**salt.states.vagrant.powered\_off(name)**Stops a VM (or VMs) by power off. (Runs `vagrant halt`.)

This method is provided for compatibility with other VM-control state modules. For Vagrant, the action is identical with `stopped`.

**Parameters name** -- May be a Salt\_id node or a POSIX-style wildcard string.

```

node_name:
 vagrant.unpowered

```

**salt.states.vagrant.rebooted(name)**Reboots a running, paused, or stopped VM (or VMs). (Runs `vagrant reload`.)

The will re-run the provisioning

**Parameters name** -- May be a Salt\_id node or a POSIX-style wildcard string.

```

node_name:
 vagrant.reloaded

```

**salt.states.vagrant.running(name, \*\*kwargs)**Defines and starts a new VM with specified arguments, or restart a VM (or group of VMs). (Runs `vagrant up`.)**Parameters name** -- the Salt\_id node name you wish your VM to have.If `name` contains a `"?"` or `"**"` then it will re-start a group of VMs which have been paused or stopped.

Each machine must be initially started individually using this function or the `vagrant.init` execution module call.

[NOTE:] Keyword arguments are silently ignored when re-starting an existing VM.

Possible keyword arguments:

- `cwd`: The directory (path) containing the Vagrantfile
- `machine`: (") the name of the machine (in the Vagrantfile) if not default
- `vagrant_runas`: ('root') the username who owns the vagrantbox file
- `vagrant_provider`: the provider to run the VM (usually 'virtualbox')
- `vm`: ({} ) a dictionary containing these or other keyword arguments

```

node_name:
 vagrant.running

```

```

node_name:
 vagrant.running:
 - cwd: /projects/my_project

```

(continues on next page)

(continued from previous page)

```
- vagrant_runas: my_username
- machine: machine1
```

**salt.states.vagrant.stopped**(*name*)Stops a VM (or VMs) by shutting it (them) down nicely. (Runs `vagrant halt`)**Parameters** **name** -- May be a Salt\_id node, or a POSIX-style wildcard string.

```
node_name:
 vagrant.stopped
```

### 21.19.305 salt.states.vault module

States for managing Hashicorp Vault. Currently handles policies. Configuration instructions are documented in the execution module docs.

**maintainer** SaltStack**maturity** new**platform** all

New in version 2017.7.0.

**salt.states.vault.policy\_present**(*name, rules*)

Ensure a Vault policy with the given name and rules is present.

**name** The name of the policy**rules** Rules formatted as in-line HCL

```
demo-policy:
vault.policy_present:
 - name: foo/bar
 - rules: |
 path "secret/top-secret/*" {
 policy = "deny"
 }
 path "secret/not-very-secret/*" {
 policy = "write"
 }
```

### 21.19.306 salt.states.vbox\_guest

VirtualBox Guest Additions installer state

**salt.states.vbox\_guest.additions\_installed**(*name, reboot=False, upgrade\_os=False*)

Ensure that the VirtualBox Guest Additions are installed. Uses the CD, connected by VirtualBox.

**name** The name has no functional value and is only used as a tracking reference.**reboot** [False] Restart OS to complete installation.**upgrade\_os** [False] Upgrade OS (to ensure the latests version of kernel and developer tools installed).**salt.states.vbox\_guest.additions\_removed**(*name, force=False*)

Ensure that the VirtualBox Guest Additions are removed. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

**name** The name has no functional value and is only used as a tracking reference.

**force** Force VirtualBox Guest Additions removing.

`salt.states.vbox_guest.grant_access_to_shared_folders_to(name, users=None)`

Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument *users*.

**name** Name of the user to grant access to auto-mounted shared folders to.

**users** List of names of users to grant access to auto-mounted shared folders to. If specified, *name* will not be taken into account.

### 21.19.307 salt.states.victorops

#### Create an Event in VictorOps

New in version 2015.8.0.

This state is useful for creating events on the VictorOps service during state runs.

```
webserver-warning-message:
 victorops.create_event:
 - message_type: 'CRITICAL'
 - entity_id: 'webserver/diskspace'
 - state_message: 'Webserver diskspace is low.'
```

`salt.states.victorops.create_event(name, message_type, routing_key='everyone', **kwargs)`

Create an event on the VictorOps service

```
webserver-warning-message:
 victorops.create_event:
 - message_type: 'CRITICAL'
 - entity_id: 'webserver/diskspace'
 - state_message: 'Webserver diskspace is low.'

database-server-warning-message:
 victorops.create_event:
 - message_type: 'WARNING'
 - entity_id: 'db_server/load'
 - state_message: 'Database Server load is high.'
 - entity_is_host: True
 - entity_display_name: 'dbdserver.example.com'
```

The following parameters are required:

**name** This is a short description of the event.

**message\_type** One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

**routing\_key** The key for where messages should be routed. By default, sent to 'everyone' route.

**entity\_id** The name of alerting entity. If not provided, a random name will be assigned.

**timestamp** Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

**timestamp\_fmt** The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.

**state\_start\_time** The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.

**state\_start\_time\_fmt** The date format for the timestamp parameter. Defaults to '%Y-%m-%dT%H:%M:%S'.

**state\_message** Any additional status information from the alert item.  
**entity\_is\_host** Used within VictorOps to select the appropriate display format for the incident.  
**entity\_display\_name** Used within VictorOps to display a human-readable name for the entity.  
**ack\_message** A user entered comment for the acknowledgment.  
**ack\_author** The user that acknowledged the incident.

## 21.19.308 salt.states.virt module

### Manage virt

For the key certificate this state uses the external pillar in the master to call for the generation and signing of certificates for systems running libvirt:

**libvirt\_keys:**  
virt.keys

```
salt.states.virt.defined(name, cpu=None, mem=None, vm_type=None, disk_profile=None,
 disks=None, nic_profile=None, interfaces=None, graphics=None, seed=True,
 install=True, pub_key=None, priv_key=None, connection=None, user-
 name=None, password=None, os_type=None, arch=None, boot=None,
 update=True)
```

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 3001.

#### Parameters

- **name** -- name of the virtual machine to run
- **cpu** -- number of CPUs for the virtual machine to create
- **mem** -- amount of memory in MiB for the new virtual machine
- **vm\_type** -- force virtual machine type for the new VM. The default value is taken from the host capabilities. This could be useful for example to use 'qemu' type instead of the 'kvm' one.
- **disk\_profile** -- Name of the disk profile to use for the new virtual machine
- **disks** -- List of disk to create for the new virtual machine. See [Disks Definitions](#) for more details on the items on this list.
- **nic\_profile** -- Name of the network interfaces profile to use for the new virtual machine
- **interfaces** -- List of network interfaces to create for the new virtual machine. See [Network Interfaces Definitions](#) for more details on the items on this list.
- **graphics** -- Graphics device to create for the new virtual machine. See [Graphics Definition](#) for more details on this dictionary
- **saltenv** -- Fileserver environment (Default: 'base'). See [cp module for more details](#)
- **seed** -- True to seed the disk image. Only used when the image parameter is provided. (Default: True)
- **install** -- install salt minion if absent (Default: True)
- **pub\_key** -- public key to seed with (Default: None)
- **priv\_key** -- public key to seed with (Default: None)
- **seed\_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
- **os\_type** -- type of virtualization as found in the //os/type element of the libvirt definition. The default value is taken from the host capabilities, with a preference for

hvm. Only used when creating a new virtual machine.

- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but x86\_64 is preferred over i686. Only used when creating a new virtual machine.
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to [Boot parameters definition](#) for the complete boot parameters description.

To update any boot parameters, specify the new path for each. To remove any boot parameters, pass a None object, for instance: 'kernel': None.

New in version 3000.

- **update** -- set to False to prevent updating a defined domain. (Default: True)

Deprecated since version 3001.

### Example States

Make sure a virtual machine called `domain_name` is defined:

```
domain_name:
 virt.defined:
 - cpu: 2
 - mem: 2048
 - disk_profile: prod
 - disks:
 - name: system
 size: 8192
 overlay_image: True
 pool: default
 image: /path/to/image.qcow2
 - name: data
 size: 16834
 - nic_profile: prod
 - interfaces:
 - name: eth0
 mac: 01:23:45:67:89:AB
 - name: eth1
 type: network
 source: admin
 - graphics:
 type: spice
 listen:
 type: address
 address: 192.168.0.125
```

`salt.states.virt.keys(name, basepath='/etc/pki', **kwargs)`

Manage libvirt keys.

**name** The name variable used to track the execution

**basepath** Defaults to `/etc/pki`, this is the root location used for libvirt keys on the hypervisor

The following parameters are optional:

**country** The country that the certificate should use. Defaults to US.

New in version 2018.3.0.

**state** The state that the certificate should use. Defaults to Utah.

New in version 2018.3.0.

**locality** The locality that the certificate should use. Defaults to Salt Lake City.

New in version 2018.3.0.

**organization** The organization that the certificate should use. Defaults to Salted.

New in version 2018.3.0.

**expiration\_days** The number of days that the certificate should be valid for. Defaults to 365 days (1 year)

New in version 2018.3.0.

```
salt.states.virt.network_defined(name, bridge, forward, vport=None, tag=None,
 ipv4_config=None, ipv6_config=None, autostart=True, connection=None, username=None, password=None)
```

Defines a new network with specified arguments.

**Parameters**

- **bridge** -- Bridge name
- **forward** -- Forward mode(bridge, router, nat)
- **vport** -- Virtualport type (Default: 'None')
- **tag** -- Vlan tag (Default: 'None')
- **ipv4\_config** -- IPv4 network configuration. See the :py:func`virt.network\_define` <salt.modules.virt.network\_define>` function corresponding parameter documentation for more details on this dictionary. (Default: None).
- **ipv6\_config** -- IPv6 network configuration. See the :py:func`virt.network\_define` <salt.modules.virt.network\_define>` function corresponding parameter documentation for more details on this dictionary. (Default: None).
- **autostart** -- Network autostart (default 'True')
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3001.

```
network_name:
 virt.network_defined
```

```
network_name:
 virt.network_defined:
 - bridge: main
 - forward: bridge
 - vport: openvswitch
 - tag: 180
 - autostart: True
```

```
network_name:
 virt.network_defined:
 - bridge: natted
 - forward: nat
 - ipv4_config:
 cidr: 192.168.42.0/24
 dhcp_ranges:
 - start: 192.168.42.10
 end: 192.168.42.25
 - start: 192.168.42.100
 end: 192.168.42.150
 - autostart: True
```

```
salt.states.virt.network_running(name, bridge, forward, vport=None, tag=None,
 ipv4_config=None, ipv6_config=None, autostart=True, connection=None, username=None, password=None)
```

Defines and starts a new network with specified arguments.

#### Parameters

- **bridge** -- Bridge name
- **forward** -- Forward mode(bridge, router, nat)
- **vport** -- Virtualport type (Default: 'None')
- **tag** -- Vlan tag (Default: 'None')
- **ipv4\_config** -- IPv4 network configuration. See the :py:func`virt.network\_define` <salt.modules.virt.network\_define>` function corresponding parameter documentation for more details on this dictionary. (Default: None).

New in version 3000.

- **ipv6\_config** -- IPv6 network configuration. See the :py:func`virt.network\_define` <salt.modules.virt.network\_define>` function corresponding parameter documentation for more details on this dictionary. (Default: None).

New in version 3000.

- **autostart** -- Network autostart (default 'True')
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
network_name:
 virt.network_running
```

```
network_name:
 virt.network_running:
 - bridge: main
 - forward: bridge
 - vport: openvswitch
 - tag: 180
 - autostart: True
```

```
network_name:
 virt.network_running:
 - bridge: natted
 - forward: nat
 - ipv4_config:
 cidr: 192.168.42.0/24
 dhcp_ranges:
 - start: 192.168.42.10
 end: 192.168.42.25
 - start: 192.168.42.100
 end: 192.168.42.150
 - autostart: True
```

`salt.states.virt.pool_defined`(*name*, *p*type=None, *target*=None, *permissions*=None, *source*=None, *transient*=False, *autostart*=True, *connection*=None, *username*=None, *password*=None)

Defines a new pool with specified arguments.

New in version 3001.

#### Parameters

- **ptype** -- libvirt pool type
- **target** -- full path to the target device or folder. (Default: None)
- **permissions** -- target permissions. See [Permissions definition](#) for more details on this structure.
- **source** -- dictionary containing keys matching the `source_*` parameters in function `salt.modules.virt.pool_define()`.
- **transient** -- when set to True, the pool will be automatically undefined after being stopped. (Default: False)
- **autostart** -- Whether to start the pool when booting the host. (Default: True)
- **start** -- When True, define and start the pool, otherwise the pool will be left stopped.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

```
pool_name:
 virt.pool_defined:
 - ptype: netfs
 - target: /mnt/cifs
 - permissions:
 - mode: 0770
 - owner: 1000
 - group: 100
 - source:
 dir: samba_share
 hosts:
 - one.example.com
 - two.example.com
 format: cifs
 - autostart: True
```

`salt.states.virt.pool_deleted(name, purge=False, connection=None, username=None, password=None)`

Deletes a virtual storage pool.

#### Parameters

- **name** -- the name of the pool to delete.
- **purge** -- if True, the volumes contained in the pool will be deleted as well as the pool itself. Note that these will be lost for ever. If False the pool will simply be undefined. (Default: False)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

In order to be purged a storage pool needs to be running to get the list of volumes to delete.

Some libvirt storage drivers may not implement deleting, those actions are implemented on a best effort idea. In any case check the result's comment property to see if any of the action was unsupported.

New in version 3000.

`salt.states.virt.pool_running(name, ptype=None, target=None, permissions=None, source=None, transient=False, autostart=True, connection=None, username=None, password=None)`

Defines and starts a new pool with specified arguments.

New in version 2019.2.0.

#### Parameters

- **ptype** -- libvirt pool type
- **target** -- full path to the target device or folder. (Default: None)

- **permissions** -- target permissions. See [Permissions definition](#) for more details on this structure.
- **source** -- dictionary containing keys matching the `source_*` parameters in function `salt.modules.virt.pool_define()`.
- **transient** -- when set to `True`, the pool will be automatically undefined after being stopped. (Default: `False`)
- **autostart** -- Whether to start the pool when booting the host. (Default: `True`)
- **start** -- When `True`, define and start the pool, otherwise the pool will be left stopped.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

```
pool_name:
 virt.pool_running
```

```
pool_name:
 virt.pool_running:
 - ptype: netfs
 - target: /mnt/cifs
 - permissions:
 - mode: 0770
 - owner: 1000
 - group: 100
 - source:
 dir: samba_share
 hosts:
 - one.example.com
 - two.example.com
 format: cifs
 - autostart: True
```

`salt.states.virt.powered_off(name, connection=None, username=None, password=None)`

Stops a VM by power off.

New in version 2016.3.0.

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults  
New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults  
New in version 2019.2.0.

```
domain_name:
 virt.stopped
```

`salt.states.virt.rebooted(name, connection=None, username=None, password=None)`

Reboots VMs

New in version 2016.3.0.

#### Parameters

- **name** --
- **connection** -- libvirt connection URI, overriding defaults  
New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

`salt.states.virt.reverted(name, snapshot=None, cleanup=False)`

Deprecated since version 2016.3.0.

Reverts to the particular snapshot.

New in version 2016.3.0.

```
domain_name:
 virt.reverted:
 - cleanup: True

domain_name_1:
 virt.reverted:
 - snapshot: snapshot_name
 - cleanup: False
```

`salt.states.virt.running(name, cpu=None, mem=None, vm_type=None, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, seed=True, install=True, pub_key=None, priv_key=None, update=False, connection=None, username=None, password=None, os_type=None, arch=None, boot=None)`

Starts an existing guest, or defines and starts a new VM with specified arguments.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the virtual machine to run
- **cpu** -- number of CPUs for the virtual machine to create
- **mem** -- amount of memory in MiB for the new virtual machine
- **vm\_type** -- force virtual machine type for the new VM. The default value is taken from the host capabilities. This could be useful for example to use 'qemu' type instead of the 'kvm' one.

New in version 2019.2.0.

- **disk\_profile** -- Name of the disk profile to use for the new virtual machine

New in version 2019.2.0.

- **disks** -- List of disk to create for the new virtual machine. See [Disks Definitions](#) for more details on the items on this list.

New in version 2019.2.0.

- **nic\_profile** -- Name of the network interfaces profile to use for the new virtual machine

New in version 2019.2.0.

- **interfaces** -- List of network interfaces to create for the new virtual machine. See [Network Interfaces Definitions](#) for more details on the items on this list.

New in version 2019.2.0.

- **graphics** -- Graphics device to create for the new virtual machine. See [Graphics Definition](#) for more details on this dictionary

New in version 2019.2.0.

- **saltenv** -- Fileserver environment (Default: 'base'). See [cp module for more details](#)

New in version 2019.2.0.

- **seed** --  
**True** to seed the disk image. Only used when the **image** parameter is provided.  
(Default: True)

New in version 2019.2.0.

- **install** -- install salt minion if absent (Default: True)

New in version 2019.2.0.

- **pub\_key** -- public key to seed with (Default: None)

New in version 2019.2.0.

- **priv\_key** -- public key to seed with (Default: None)

New in version 2019.2.0.

- **seed\_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')

New in version 2019.2.0.

- **update** -- set to True to update a defined domain. (Default: False)

New in version 2019.2.0.

Deprecated since version 3001.

- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

- **os\_type** -- type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm. Only used when creating a new virtual machine.

New in version 3000.

- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but x86\_64 is preferred over i686. Only used when creating a new virtual machine.

New in version 3000.

- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to [Boot parameters definition](#) for the complete boot parameters description.

To update any boot parameters, specify the new path for each. To remove any boot parameters, pass a None object, for instance: 'kernel': None.

New in version 3000.

### Example States

Make sure an already-defined virtual machine called `domain_name` is running:

```
domain_name:
 virt.running
```

Do the same, but define the virtual machine if needed:

```
domain_name:
 virt.running:
 - cpu: 2
 - mem: 2048
 - disk_profile: prod
 - disks:
 - name: system
 size: 8192
 overlay_image: True
 pool: default
 image: /path/to/image.qcow2
 - name: data
 size: 16834
 - nic_profile: prod
 - interfaces:
 - name: eth0
 mac: 01:23:45:67:89:AB
 - name: eth1
 type: network
 source: admin
 - graphics:
 type: spice
 listen:
 type: address
 address: 192.168.0.125
```

`salt.states.virt.saved(name, suffix=None)`

Deprecated since version 2016.3.0: Use `snapshot()` instead.

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

```
domain_name:
 virt.saved:
 - suffix: periodic

domain*:
 virt.saved:
 - suffix: periodic
```

`salt.states.virt.snapshot(name, suffix=None, connection=None, username=None, password=None)`

Takes a snapshot of a particular VM or by a UNIX-style wildcard.

New in version 2016.3.0.

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
domain_name:
 virt.snapshot:
 - suffix: periodic

domain*:
 virt.snapshot:
 - suffix: periodic
```

`salt.states.virt.stopped(name, connection=None, username=None, password=None)`

Stops a VM by shutting it down nicely.

New in version 2016.3.0.

#### Parameters

- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

```
domain_name:
 virt.stopped
```

`salt.states.virt.unpowered(name)`

Deprecated since version 2016.3.0: Use `powered_off()` instead.

Stops a VM by power off.

New in version 2016.3.0.

```
domain_name:
 virt.stopped
```

`salt.states.virt.volume_defined(pool, name, size, allocation=0, format=None, type=None, permissions=None, backing_store=None, nocow=False, connection=None, username=None, password=None)`

Ensure a disk volume is existing.

#### Parameters

- **pool** -- name of the pool containing the volume
- **name** -- name of the volume
- **size** -- capacity of the volume to define in MiB
- **allocation** -- allocated size of the volume in MiB. Defaults to 0.
- **format** -- volume format. The allowed values are depending on the pool type. Check the `virt.pool_capabilities` output for the possible values and the default.
- **type** -- type of the volume. One of file, block, dir, network, netdir, ploop or None. By default, the type is guessed by libvirt from the pool type.
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See [Permissions definition](#) for more details on this structure.
- **backing\_store** -- dictionary describing a backing file for the volume. It must contain a `path` property pointing to the base volume and a `format` property defining

the format of the base volume.

The base volume format will not be guessed for security reasons and is thus mandatory.

- **nocow** -- disable COW for the volume.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

#### CLI Example:

Volume on ESX:

```
esx_volume:
 virt.volume_defined:
 - pool: "[local-storage]"
 - name: myvm/myvm.vmdk
 - size: 8192
```

QCow2 volume with backing file:

```
myvolume:
 virt.volume_defined:
 - pool: default
 - name: myvm.qcow2
 - format: qcow2
 - size: 8192
 - permissions:
 mode: '0775'
 owner: '123'
 group: '345'
 - backing_store:
 path: /path/to/base.img
 format: raw
 - nocow: True
```

New in version 3001.

### 21.19.309 salt.states.virtualenv

Setup of Python virtualenv sandboxes.

New in version 0.17.0.

```
salt.states.virtualenv_mod.managed(name, venv_bin=None, requirements=None,
system_site_packages=False, distribute=False,
use_wheel=False, clear=False, python=None, extra_search_dir=None,
never_download=None, prompt=None, user=None, cwd=None, index_url=None,
extra_index_url=None, pre_releases=False, no_deps=False,
pip_download=None, pip_download_cache=None,
pip_exists_action=None, pip_ignore_installed=False,
proxy=None, use_vt=False, env_vars=None, no_use_wheel=False,
pip_upgrade=False, pip_pkgs=None, pip_no_cache_dir=False,
pip_cache_dir=None, process_dependency_links=False, no_binary=None, **kwargs)
```

Create a virtualenv and optionally manage it with pip

**name** Path to the virtualenv.

**venv\_bin: virtualenv** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`.

**requirements: None** Path to a pip requirements file. If the path begins with `salt://` the file will be transferred from the master file server.

**use\_wheel: False** Prefer wheel archives (requires pip >= 1.4).

**python: None** Python executable used to build the virtualenv

**user: None** The user under which to run virtualenv and pip.

**cwd: None** Path to the working directory where *pip install* is executed.

**no\_deps: False** Pass `--no-deps` to *pip install*.

**pip\_exists\_action: None** Default action of pip when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup.

**proxy: None** Proxy address which is passed to *pip install*.

**env\_vars: None** Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling.

**no\_use\_wheel: False** Force to not use wheel archives (requires pip >= 1.4)

**no\_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either `:all:` to disable all binary packages, `:none:` to empty the set, or a list of one or more packages

**pip\_upgrade: False** Pass `--upgrade` to *pip install*.

**pip\_pkgs: None** As an alternative to *requirements*, pass a list of pip packages that should be installed.

**process\_dependency\_links: False** Run pip install with the `--process-dependency-links` flag.

New in version 2017.7.0.

Also accepts any kwargs that the virtualenv module will. However, some kwargs, such as the `pip` option, require `distributed: True`.

```
/var/www/myvirtualenv.com:
 virtualenv.managed:
 - system_site_packages: False
 - requirements: salt://REQUIREMENTS.txt
 - env_vars:
 PATH_VAR: '/usr/local/bin/'
```

### 21.19.310 salt.states.webutil

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
 webutil.user_exists:
 - password: secr3t
 - htpasswd_file: /etc/nginx/htpasswd
 - options: d
 - force: true
```

**salt.states.webutil.user\_absent**(*name*, *htpasswd\_file*=None, *runas*=None)

Make sure the user is not in the specified htpasswd file

**name** User name

**htpasswd\_file** Path to the htpasswd file

**runas** The system user to run htpasswd command with

**salt.states.webutil.user\_exists**(*name*, *password*=None, *htpasswd\_file*=None, *options*="", *force*=False, *runas*=None, *update*=False)

Make sure the user is inside the specified htpasswd file

**name** User name

**password** User password  
**htpasswd\_file** Path to the htpasswd file  
**options** See `salt.modules.htpasswd.useradd`  
**force** Touch the file even if user already created  
**runas** The system user to run htpasswd command with  
**update** Update an existing user's password if it's different from what's in the htpasswd file (unlike force, which updates regardless)

### 21.19.311 salt.states.win\_certutil module

#### Installing of certificates to the Windows Certificate Manager

Install certificates to the Windows Certificate Manager

```
salt://certs/cert.cer:
certutil.add_store:
- store: TrustedPublisher
```

**salt.states.win\_certutil.add\_store**(*name, store, saltenv='base'*)  
Store a certificate to the given store  
**name** The certificate to store, this can use local paths or salt:// paths  
**store** The store to add the certificate to  
**saltenv** The salt environment to use, this is ignored if a local path is specified

**salt.states.win\_certutil.del\_store**(*name, store, saltenv='base'*)  
Remove a certificate in the given store  
**name** The certificate to remove, this can use local paths or salt:// paths  
**store** The store to remove the certificate from  
**saltenv** The salt environment to use, this is ignored if a local path is specified

### 21.19.312 salt.states.win\_dacl

Windows Object Access Control Lists

Ensure an ACL is present

**parameters:** **name** - the path of the object **objectType** - Registry/File/Directory **user** - user account or SID for the ace **permission** - permission for the ace (see module win\_acl for available permissions for each objectType) **acetype** - Allow/Deny **propagation** - how the ACL should apply to child objects (see module win\_acl for available propagation types)

```
addAcl:
win_dacl.present:
- name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
- objectType: Registry
- user: FakeUser
- permission: FullControl
- acetype: ALLOW
- propagation: KEY&SUBKEYS
```

Ensure an ACL does not exist

**parameters:** **name** - the path of the object **objectType** - Registry/File/Directory **user** - user account or SID for the ace **permission** - permission for the ace (see module win\_acl for available permissions for each objectType) **acetype** - Allow/Deny **propagation** - how the ACL should apply to child objects (see module win\_acl for available propagation types)

```

removeAcl:
win_dacl.absent:
- name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
- objectType: Registry
- user: FakeUser
- permission: FullControl
- acetype: ALLOW
- propagation: KEY&SUBKEYS

```

#### Ensure an object is inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory clear\_existing\_acl - True/False  
- when inheritance is enabled, should the existing ACL be kept or cleared out

```

eInherit:
win_dacl.enableinheritance:
- name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
- objectType: Registry
- clear_existing_acl: True

```

#### Ensure an object is not inheriting permissions

parameters: name - the path of the object objectType - Registry/File/Directory copy\_inherited\_acl - True/False - if inheritance is enabled, should the inherited permissions be copied to the ACL when inheritance is disabled

```

dInherit:
win_dacl.disableinheritance:
- name: HKEY_LOCAL_MACHINE\SOFTWARE\mykey
- objectType: Registry
- copy_inherited_acl: False

```

`salt.states.win_dacl.absent(name, objectType, user, permission, acetype, propagation)`

Ensure an ACL does not exist

`salt.states.win_dacl.disinherit(name, objectType, copy_inherited_acl=True)`

Ensure an object is not inheriting ACLs from its parent

`salt.states.win_dacl.inherit(name, objectType, clear_existing_acl=False)`

Ensure an object is inheriting ACLs from its parent

`salt.states.win_dacl.present(name, objectType, user, permission, acetype, propagation)`

Ensure an ACE is present

### 21.19.313 salt.states.win\_dism module

#### Installing of Windows features using DISM

Install windows features/capabilities with DISM

```

Language.Basic~en-US~0.0.1.0:
dism.capability_installed

NetFx3:
dism.feature_installed

```

```
salt.states.win_dism.capability_installed(name, source=None, limit_access=False, im-
 age=None, restart=False)
```

Install a DISM capability

Parameters

- **name** (*str*) -- The capability to install
- **source** (*str*) -- The optional source of the capability
- **limit\_access** (*bool*) -- Prevent DISM from contacting Windows Update for on-line images
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.available_capabilities` to get a list of available capabilities. This will help you get the proper name to use.

```
install_dotnet35:
 dism.capability_installed:
 - name: NetFX3~~~~
```

```
salt.states.win_dism.capability_removed(name, image=None, restart=False)
```

Uninstall a DISM capability

Parameters

- **name** (*str*) -- The capability to uninstall
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.installed_capabilities` to get a list of installed capabilities. This will help you get the proper name to use.

```
remove_dotnet35:
 dism.capability_removed:
 - name: NetFX3~~~~
```

```
salt.states.win_dism.feature_installed(name, package=None, source=None,
 limit_access=False, enable_parent=False, im-
 age=None, restart=False)
```

Install a DISM feature

Parameters

- **name** (*str*) -- The feature in which to install
- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*str*) -- The optional source of the feature
- **limit\_access** (*bool*) -- Prevent DISM from contacting Windows Update for on-line images
- **enable\_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.available_features` to get a list of available features. This will help you get the proper name to use.

```
install_telnet_client:
 dism.feature_installed:
 - name: TelnetClient
```

```
salt.states.win_dism.feature_removed(name, remove_payload=False, image=None,
 restart=False)
```

Disables a feature.

#### Parameters

- **name** (*str*) -- The feature to disable
- **remove\_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

### Example

Run `dism.installed_features` to get a list of installed features. This will help you get the proper name to use.

```
remove_telnet_client:
 dism.feature_removed:
 - name: TelnetClient
 - remove_payload: True
```

```
salt.states.win_dism.package_installed(name, ignore_check=False, prevent_pending=False,
 image=None, restart=False)
```

Install a package.

#### Parameters

- **name** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder
- **ignore\_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent\_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

## Example

```
install_KB123123123:
 dism.package_installed:
 - name: C:\Packages\KB123123123.cab
```

`salt.states.win_dism.package_removed(name, image=None, restart=False)`

Uninstall a package

## Parameters

- **name** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

## Example

```
Example using source
remove_KB1231231:
 dism.package_installed:
 - name: C:\Packages\KB1231231.cab

Example using name from ``dism.installed_packages``
remove_KB1231231:
 dism.package_installed:
 - name: Package_for_KB1231231~31bf3856ad364e35~amd64~~10.0.1.3
```

## 21.19.314 salt.states.win\_dns\_client

Module for configuring DNS Client on Windows systems

`salt.states.win_dns_client.dns_dhcp(name, interface='Local Area Connection')`

Configure the DNS server list from DHCP Server

`salt.states.win_dns_client.dns_exists(name, servers=None, interface='Local Area Connection', replace=False)`

Configure the DNS server list in the specified interface

Example:

```
config_dns_servers:
 win_dns_client.dns_exists:
 - replace: True #remove any servers not in the "servers" list, default is 
 ↪ False
 - servers:
 - 8.8.8.8
 - 8.8.8.9
```

`salt.states.win_dns_client.primary_suffix(name, suffix=None, updates=False)`

New in version 2014.7.0.

Configure the global primary DNS suffix of a DHCP client.

**suffix** [None] The suffix which is advertised for this client when acquiring a DHCP lease When none is set, the explicitly configured DNS suffix will be removed.

**updates** [False] Allow syncing the DNS suffix with the AD domain when the client's AD domain membership changes

```
primary_dns_suffix:
 win_dns_client.primary_suffix:
 - suffix: sub.domain.tld
 - updates: True
```

### 21.19.315 salt.states.win\_firewall

State for configuring Windows Firewall

**salt.states.win\_firewall.add\_rule**(*name*, *localport*, *protocol*='tcp', *action*='allow', *dir*='in', *remoteip*='any')

Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) -- The direction. Can be in or out.
- **remoteip** (*Optional [str]*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

New in version 2016.11.6.

Example:

```
open_smb_port:
 win_firewall.add_rule:
 - name: SMB (445)
 - localport: 445
 - protocol: tcp
 - action: allow
```

`salt.states.win_firewall.disabled(name='allprofiles')`

Disable all the firewall profiles (Windows only)

Parameters **profile** (*Optional[`str`]*) -- The name of the profile to disable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

Example:

```
To disable the domain profile
disable_domain:
 win_firewall.disabled:
 - name: domainprofile

To disable all profiles
disable_all:
 win_firewall.disabled:
 - name: allprofiles
```

`salt.states.win_firewall.enabled(name='allprofiles')`

Enable all the firewall profiles (Windows only)

Parameters **profile** (*Optional[`str`]*) -- The name of the profile to enable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

Example:

```
To enable the domain profile
enable_domain:
 win_firewall.enabled:
 - name: domainprofile

To enable all profiles
enable_all:
 win_firewall.enabled:
 - name: allprofiles
```

### 21.19.316 salt.states.win\_iis module

Microsoft IIS site management

This module provides the ability to add/remove websites and application pools from Microsoft IIS.

New in version 2016.3.0.

`salt.states.win_iis.container_setting(name, container, settings=None)`

Set the value of the setting for an IIS container.

Parameters

- **name** (*`str`*) -- The name of the IIS container.
- **container** (*`str`*) -- The type of IIS container. The container types are: `AppPools`, `Sites`, `SslBindings`
- **settings** (*`str`*) -- A dictionary of the setting names and their values. Example of usage for the `AppPools` container:

```

site0-apppool-setting:
 win_iis.container_setting:
 - name: site0
 - container: AppPools
 - settings:
 managedPipelineMode: Integrated
 processModel.maxProcesses: 1
 processModel.userName: TestUser
 processModel.password: TestPassword
 processModel.identityType: SpecificUser

```

Example of usage for the Sites container:

```

site0-site-setting:
 win_iis.container_setting:
 - name: site0
 - container: Sites
 - settings:
 logFile.logFormat: W3C
 logFile.period: Daily
 limits.maxUrlSegments: 32

```

`salt.states.win_iis.create_app(name, site, sourcepath, apppool=None)`

Create an IIS application.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Example of usage with only the required arguments:

```

site0-v1-app:
 win_iis.create_app:
 - name: v1
 - site: site0
 - sourcepath: C:\inetpub\site0\v1

```

Example of usage specifying all available arguments:

```

site0-v1-app:
 win_iis.create_app:
 - name: v1
 - site: site0
 - sourcepath: C:\inetpub\site0\v1
 - apppool: site0

```

`salt.states.win_iis.create_apppool(name)`

Create an IIS application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Usage:

```

site0-apppool:
 win_iis.create_apppool:
 - name: site0

```

`salt.states.win_iis.create_binding(name, site, hostheader="", ipaddress="", port=80, protocol='http', sslflags=0)`

Create an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Example of usage with only the required arguments:

```
site0-https-binding:
 win_iis.create_binding:
 - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding:
 win_iis.create_binding:
 - site: site0
 - hostheader: site0.local
 - ipaddress: '*'
 - port: 443
 - protocol: https
 - sslflags: 0
```

```
salt.states.win_iis.create_cert_binding(name, site, hostheader="", ipaddress="", port=443,
 sslflags=0)
```

Assign a certificate to an IIS binding.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **sslflags** (*str*) -- Flags representing certificate type and certificate storage of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding:
 win_iis.create_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
```

Example of usage specifying all available arguments:

```
site0-cert-binding:
 win_iis.create_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
 - hostheader: site0.local
 - ipaddress: 192.168.1.199
 - port: 443
 - sslflags: 1
```

New in version 2016.11.0.

```
salt.states.win_iis.create_vdir(name, site, sourcepath, app='/')
```

Create an IIS virtual directory.

**Parameters**

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```
site0-foo-vdir:
 win_iis.create_vdir:
 - name: foo
 - site: site0
 - sourcepath: C:\inetpub\vdirs\foo
```

Example of usage specifying all available arguments:

```
site0-foo-vdir:
 win_iis.create_vdir:
 - name: foo
 - site: site0
 - sourcepath: C:\inetpub\vdirs\foo
 - app: v1
```

```
salt.states.win_iis.deployed(name, sourcepath, apppool="", hostheader="", ipaddress='*', port=80,
 protocol='http')
```

Ensure the website has been deployed.

**Parameters**

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.

Example of usage with only the required arguments. This will default to using the default application pool assigned by IIS:

```
site0-deployed:
 win_iis.deployed:
 - name: site0
 - sourcepath: C:\inetpub\site0
```

Example of usage specifying all available arguments:

```
site0-deployed:
 win_iis.deployed:
 - name: site0
 - sourcepath: C:\inetpub\site0
 - apppool: site0
 - hostheader: site0.local
 - ipaddress: '*'
 - port: 443
 - protocol: https
```

```
salt.states.win_iis.remove_app(name, site)
```

Remove an IIS application.

**Parameters**

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Usage:

```
site0-v1-app-remove:
 win_iis.remove_app:
 - name: v1
 - site: site0
```

`salt.states.win_iis.remove_apppool(name)`

Remove an IIS application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Usage:

```
defaultapppool-remove:
 win_iis.remove_apppool:
 - name: DefaultAppPool
```

`salt.states.win_iis.remove_binding(name, site, hostheader="", ipaddress="*", port=80)`

Remove an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-https-binding-remove:
 win_iis.remove_binding:
 - site: site0
```

Example of usage specifying all available arguments:

```
site0-https-binding-remove:
 win_iis.remove_binding:
 - site: site0
 - hostheader: site0.local
 - ipaddress: '*'
 - port: 443
```

`salt.states.win_iis.remove_cert_binding(name, site, hostheader="", ipaddress="*", port=443)`

Remove a certificate from an IIS binding.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*str*) -- The TCP port of the binding.

Example of usage with only the required arguments:

```
site0-cert-binding-remove:
 win_iis.remove_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
```

Example of usage specifying all available arguments:

```

site0-cert-binding-remove:
 win_iis.remove_cert_binding:
 - name: 9988776655443322111000AAABBBCCDDDEEEFFF
 - site: site0
 - hostheader: site0.local
 - ipaddress: 192.168.1.199
 - port: 443

```

New in version 2016.11.0.

`salt.states.win_iis.remove_site(name)`

Delete a website from IIS.

Parameters **name** (*str*) -- The IIS site name.

Usage:

```

defaultwebsite-remove:
 win_iis.remove_site:
 - name: Default Web Site

```

`salt.states.win_iis.remove_vdir(name, site, app='')`

Remove an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Example of usage with only the required arguments:

```

site0-foo-vdir-remove:
 win_iis.remove_vdir:
 - name: foo
 - site: site0

```

Example of usage specifying all available arguments:

```

site0-foo-vdir-remove:
 win_iis.remove_vdir:
 - name: foo
 - site: site0
 - app: v1

```

`salt.states.win_iis.set_app(name, site, settings=None)`

New in version 2017.7.0.

Set the value of the setting for an IIS web application.

---

**Note:** This function only configures existing app. Params are case sensitive.

---

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values.

Available settings:

- `physicalPath` - The physical path of the webapp
- `applicationPool` - The application pool for the webapp
- `userName` "connectAs" user

- password "connectAs" password for user

Return type `bool`

Example of usage:

```
site0-webapp-setting:
 win_iis.set_app:
 - name: app0
 - site: Default Web Site
 - settings:
 userName: domain\\user
 password: pass
 physicalPath: c:\inetpub\wwwroot
 applicationPool: appPool0
```

`salt.states.win_iis.webconfiguration_settings(name, settings=None)`

Set the value of webconfiguration settings.

Parameters

- **name** (*str*) -- The name of the IIS PSPath containing the settings. Possible PSPaths are : MACHINE, MACHINE/WEBROOT, IIS:, IIS:Sitessitename, ...
- **settings** (*dict*) -- Dictionaries of dictionaries. You can match a specific item in a collection with this syntax inside a key: 'Collection[{name: site0}].logFile.directory'

Example of usage for the MACHINE/WEBROOT PSPath:

```
MACHINE-WEBROOT-level-security:
 win_iis.webconfiguration_settings:
 - name: 'MACHINE/WEBROOT'
 - settings:
 system.web/authentication/forms:
 requireSSL: True
 protection: "All"
 credentials.passwordFormat: "SHA1"
 system.web/httpCookies:
 httpOnlyCookies: True
```

Example of usage for the IIS:\Sites\site0 PSPath:

```
site0-IIS-Sites-level-security:
 win_iis.webconfiguration_settings:
 - name: 'IIS:\Sites\site0'
 - settings:
 system.webServer/httpErrors:
 errorMode: "DetailedLocalOnly"
 system.webServer/security/requestFiltering:
 allowDoubleEscaping: False
 verbs.Collection:
 - verb: TRACE
 allowed: False
 fileExtensions.allowUnlisted: False
```

Example of usage for the IIS:\ PSPath with a collection matching:

```
site0-IIS-level-security:
 win_iis.webconfiguration_settings:
 - name: 'IIS:\'
 - settings:
```

(continues on next page)

(continued from previous page)

```

system.applicationHost/sites:
 'Collection[{name: site0}].logFile.directory': 'C:\logs\iis\site0'

```

### 21.19.317 salt.states.win\_lgpo module

#### Manage Windows Local Group Policy

New in version 2016.11.0.

This state allows configuring local Windows Group Policy

The state can be used to ensure the setting of a single policy or multiple policies in one pass.

Single policies must specify the policy name, the setting, and the policy class (Machine/User/Both)

Example single policy configuration

```

Ensure Account Lockout Duration:
 lgpo.set:
 - name: Account lockout duration
 - setting: 90
 - policy_class: Machine

```

```

Account lockout duration:
 lgpo.set:
 - setting: 120
 - policy_class: Machine

```

Multiple policy configuration

```

Company Local Group Policy:
 lgpo.set:
 - computer_policy:
 Deny log on locally:
 - Guest
 Account lockout duration: 120
 Account lockout threshold: 10
 Reset account lockout counter after: 120
 Enforce password history: 24
 Maximum password age: 60
 Minimum password age: 1
 Minimum password length: 14
 Password must meet complexity requirements: Enabled
 Store passwords using reversible encryption: Disabled
 Configure Automatic Updates:
 Configure automatic updating: 4 - Auto download and schedule the
→intsall
 Scheduled install day: 7 - Every Saturday
 Scheduled install time: 17:00
 Specify intranet Microsoft update service location:
 Set the intranet update service for detecting updates: http://mywsus
 Set the intranet statistics server: http://mywsus
 - user_policy:
 Do not process the legacy run list: Enabled

```

```

server_policy:
 lgpo.set:
 - computer_policy:
 Maximum password age: 60
 Minimum password age: 1
 Minimum password length: 14
 Account lockout duration: 120
 Account lockout threshold: 10
 Reset account lockout counter after: 120
 Manage auditing and security log:
 - "BUILTIN\Administrators"
 Replace a process level token:
 - "NT AUTHORITY\NETWORK SERVICE"
 - "NT AUTHORITY\LOCAL SERVICE"
 "Accounts: Guest account status": Disabled
 "Accounts: Rename guest account": Not_4_U
 "Audit: Audit the use of Backup and Restore privilege": Enabled
 "Interactive logon: Do not display last user name": Enabled
 "Network\DNS Client\Dynamic update": Disabled
 "System\Logon\Do not display the Getting Started welcome screen at logon":
 ↪ Enabled
 "Windows Components\Remote Desktop Services\Remote Desktop Session Host\
 ↪ Connections\Select RDP transport protocols":
 "Select Transport Type": "Use both UDP and TCP"
 "Windows Components\Windows Update\Allow Automatic Updates immediate
 ↪ installation": Enabled
 "Windows Components\Windows Update\Allow non-administrators to receive update
 ↪ notifications": Disabled
 "Windows Components\Windows Update\Always automatically restart at the
 ↪ scheduled time":
 "The restart timer will give users this much time to save their work
 ↪ (minutes)": 15
 "Windows Components\Windows Update\Automatic Updates detection frequency":
 "Check for updates at the following interval (hours)": 1
 "Windows Components\Windows Update\Configure Automatic Updates":
 "Configure automatic updating": 4 - Auto download and schedule the install
 "Install during automatic maintenance": False
 "Scheduled install day": 7 - Every Saturday
 "Scheduled install time": "17:00"
 "Windows Components\Windows Update\Delay Restart for scheduled installations":
 "Wait the following period before proceeding with a scheduled restart
 ↪ (minutes)": 1
 "Windows Components\Windows Update\No auto-restart with logged on users for
 ↪ scheduled automatic updates installations": Disabled
 "Windows Components\Windows Update\Re-prompt for restart with scheduled
 ↪ installations":
 "Wait the following period before prompting again with a scheduled
 ↪ restart (minutes)": 30
 "Windows Components\Windows Update\Reschedule Automatic Updates scheduled
 ↪ installations": Disabled
 "Windows Components\Windows Update\Specify intranet Microsoft update service
 ↪ location":
 "Set the intranet update service for detecting updates": http://mywsus
 "Set the intranet statistics server": http://mywsus
 - cumulative_rights_assignments: True

```

```
salt.states.win_lgpo.set_(name, setting=None, policy_class=None, computer_policy=None,
 user_policy=None, cumulative_rights_assignments=True,
 adml_language='en-US')
```

Ensure the specified policy is set.

**Warning:** The `setting` argument cannot be used in conjunction with the `computer_policy` or `user_policy` arguments

#### Parameters

- **name** (*str*) -- The name of a single policy to configure
- **setting** (*str*, *dict*, *list*) -- The configuration setting for the single named policy. If this argument is used the `computer_policy` / `user_policy` arguments will be ignored
- **policy\_class** (*str*) -- The policy class of the single named policy to configure. This can machine, user, or both
- **computer\_policy** (*dict*) -- A dictionary of containing the policy name and key/value pairs of a set of computer policies to configure. If this argument is used, the name / `policy_class` arguments will be ignored
- **user\_policy** (*dict*) -- A dictionary of containing the policy name and key/value pairs of a set of user policies to configure. If this argument is used, the name / `policy_class` arguments will be ignored
- **cumulative\_rights\_assignments** (*bool*) -- If user rights assignments are being configured, determines if any user right assignment policies specified will be cumulative or explicit
- **adml\_language** (*str*) -- The adml language to use for AMDX policy data/display conversions. Default is en-US

### 21.19.318 salt.states.win\_license module

#### Installation and activation of windows licenses

Install and activate windows licenses

```
XXXXXX-XXXXXX-XXXXXX-XXXXXX-XXXXX:
license.activate
```

```
salt.states.win_license.activate(name)
 Install and activate the given product key
 name The 5x5 product key given to you by Microsoft
```

### 21.19.319 salt.states.win\_network

#### Configuration of network interfaces on Windows hosts

New in version 2014.1.0.

This module provides the `network` state(s) on Windows hosts. DNS servers, IP addresses and default gateways can currently be managed.

Below is an example of the configuration for an interface that uses DHCP for both DNS servers and IP addresses:

**Local Area Connection #2:**

```
network.managed:
- dns_proto: dhcp
- ip_proto: dhcp
```

---

**Note:** Both the `dns_proto` and `ip_proto` arguments are required.

---

Static DNS and IP addresses can be configured like so:

**Local Area Connection #2:**

```
network.managed:
- dns_proto: static
- dns_servers:
- 8.8.8.8
- 8.8.4.4
- ip_proto: static
- ip_addrs:
- 10.2.3.4/24
```

---

**Note:** IP addresses are specified using the format `<ip-address>/<subnet-length>`. Salt provides a convenience function called `ip.get_subnet_length` to calculate the subnet length from a netmask.

---

Optionally, if you are setting a static IP address, you can also specify the default gateway using the `gateway` parameter:

**Local Area Connection #2:**

```
network.managed:
- dns_proto: static
- dns_servers:
- 8.8.8.8
- 8.8.4.4
- ip_proto: static
- ip_addrs:
- 10.2.3.4/24
- gateway: 10.2.3.1
```

`salt.states.win_network.managed`(*name*, *dns\_proto*=None, *dns\_servers*=None, *ip\_proto*=None, *ip\_addrs*=None, *gateway*=None, *enabled*=True, *\*\*kwargs*)

Ensure that the named interface is configured properly.

**Parameters**

- **name** (*str*) -- The name of the interface to manage
- **dns\_proto** (*str*) -- None Set to `static` and use the `dns_servers` parameter to provide a list of DNS nameservers. set to `dhcp` to use DHCP to get the DNS servers.
- **dns\_servers** (*list*) -- None A list of static DNS servers. To clear the list of DNS servers pass an empty list (`[]`). None will make no changes.
- **ip\_proto** (*str*) -- None Set to `static` and use the `ip_addrs` and (optionally) `gateway` parameters to provide a list of static IP addresses and the default gateway. Set to `dhcp` to use DHCP.
- **ip\_addrs** (*list*) -- None A list of static IP addresses with netmask flag, ie: `192.168.0.11/24`
- **gateway** (*str*) -- None The gateway to set for the interface
- **enabled** (*bool*) -- True Set to `False` to ensure that this interface is disabled.

**Returns** A dictionary of old and new settings

Return type `dict`

Example:

```
Ethernet1:
 network.managed:
 - dns_proto: static
 - dns_servers:
 - 8.8.8.8
 - 8.8.8.4
 - ip_proto: static
 - ip_addrs:
 - 192.168.0.100/24
```

Clear DNS entries example:

```
Ethernet1:
 network.managed:
 - dns_proto: static
 - dns_servers: []
 - ip_proto: dhcp
```

### 21.19.320 salt.states.win\_path

Manage the Windows System PATH

`salt.states.win_path.absent(name)`

Remove the directory from the SYSTEM path

Example:

```
'C:\sysinternals':
 win_path.absent
```

`salt.states.win_path.exists(name, index=None)`

Add the directory to the system PATH at index location

**index** Position where the directory should be placed in the PATH. This is 0-indexed, so 0 means to prepend at the very start of the PATH.

---

**Note:** If the index is not specified, and the directory needs to be added to the PATH, then the directory will be appended to the PATH, and this state will not enforce its location within the PATH.

---

Examples:

```
'C:\python27':
 win_path.exists

'C:\sysinternals':
 win_path.exists:
 - index: 0

'C:\mystuff':
 win_path.exists:
 - index: -1
```

### 21.19.321 salt.states.win\_pki module

Microsoft certificate management via the Pki PowerShell module.

**platform** Windows

New in version 2016.11.0.

```
salt.states.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', ex-
 portable=True, password="", saltenv='base')
```

Import the certificate file into the given certificate store.

**Parameters**

- **name** (*str*) -- The path of the certificate file to import.
- **cert\_format** (*str*) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format.
- **saltenv** (*str*) -- The environment the file resides in.

Example of usage with only the required arguments:

```
site0-cert-imported:
 win_pki.import_cert:
 - name: salt://win/webserver/certs/site0.cer
```

Example of usage specifying all available arguments:

```
site0-cert-imported:
 win_pki.import_cert:
 - name: salt://win/webserver/certs/site0.pfx
 - cert_format: pfx
 - context: LocalMachine
 - store: My
 - exportable: True
 - password: TestPassword
 - saltenv: base
```

```
salt.states.win_pki.remove_cert(name, thumbprint, context='LocalMachine', store='My')
```

Remove the certificate from the given certificate store.

**Parameters**

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Example of usage with only the required arguments:

```
site0-cert-removed:
 win_pki.remove_cert:
 - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
```

Example of usage specifying all available arguments:

```
site0-cert-removed:
 win_pki.remove_cert:
 - thumbprint: 9988776655443322111000AAABBBCCDDDEEEFFF
 - context: LocalMachine
 - store: My
```

### 21.19.322 salt.states.win\_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
Set timeout to 30 minutes on battery power
monitor:
 powercfg.set_timeout:
 - value: 30
 - power: dc
```

`salt.states.win_powercfg.set_timeout(name, value, power='ac', scheme=None)`

Set the sleep timeouts of specific items such as disk, monitor, etc.

#### Parameters

- **name** (*str*) -- The setting to change, can be one of the following:
  - monitor
  - disk
  - standby
  - hibernate
- **value** (*int*) -- The amount of time in minutes before the item will timeout
- **power** (*str*) -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- **scheme** (*str*) -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

CLI Example:

```
Set monitor timeout to 30 minutes on Battery
monitor:
 powercfg.set_timeout:
 - value: 30
 - power: dc

Set disk timeout to 10 minutes on AC Power
disk:
 powercfg.set_timeout:
 - value: 10
 - power: ac
```

### 21.19.323 salt.states.win\_servermanager

Manage Windows features via the ServerManager powershell module. Can install and remove roles/features.

**maintainer** Shane Lee <slee@saltstack.com>

**platform** Windows Server 2008R2 or greater

**depends** win\_servermanager.install

**depends** win\_servermanager.remove

`salt.states.win_servermanager.installed(name, features=None, recurse=False, restart=False, source=None, exclude=None, **kwargs)`

Install the windows feature. To install a single feature, use the `name` parameter. To install multiple features, use the `features` parameter.

---

**Note:** Some features require reboot after un/installation. If so, until the server is restarted other features can not be installed!

---

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`). This can be a single feature or a string of features in a comma delimited list (no spaces)

---

**Note:** A list is not allowed in the name parameter of any state. Use the `features` parameter if you want to pass the features as a list

---

- **features** (*Optional[list]*) -- A list of features to install. If this is passed it will be used instead of the `name` parameter.

New in version 2018.3.0.

- **recurse** (*Optional[bool]*) -- Install all sub-features as well. If the feature is installed but one of its sub-features are not installed set this will install additional sub-features. This argument was previously renamed from `force`. To ensure backwards compatibility `force` will continue to work but please update your states to use the preferred `recurse` arg.
- **source** (*Optional[str]*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*Optional[bool]*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*Optional[str]*) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

**Warning:** As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. If the feature named in `exclude` is not a sub-feature of one of the installed items it will still be removed.

#### Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```
Installs the IIS Web Server Role (Web-Server)
IIS-WebServerRole:
 win_servermanager.installed:
 - recurse: True
```

(continues on next page)

(continued from previous page)

```

- name: Web-Server

Install multiple features, exclude the Web-Service
install_multiple_features:
 win_servermanager.installed:
 - recurse: True
 - features:
 - RemoteAccess
 - XPS-Viewer
 - SNMP-Service
 - exclude:
 - Web-Server

```

`salt.states.win_servermanager.removed(name, features=None, remove_payload=False, restart=False)`

Remove the windows feature To remove a single feature, use the `name` parameter. To remove multiple features, use the `features` parameter.

#### Parameters

- **name** (*str*) -- Short name of the feature (the right column in `win_servermanager.list_available`). This can be a single feature or a string of features in a comma-delimited list (no spaces)

---

**Note:** A list is not allowed in the `name` parameter of any state. Use the `features` parameter if you want to pass the features as a list

---

- **features** (*Optional[list]*) -- A list of features to remove. If this is passed it will be used instead of the `name` parameter.

New in version 2018.3.0.

- **remove\_payload** (*Optional[bool]*) -- True will cause the feature to be removed from the side-by-side store. To install the feature in the future you will need to specify the source
- **restart** (*Optional[bool]*) -- Restarts the computer when uninstall is complete if required by the role/feature uninstall. Default is False

---

**Note:** Some features require a reboot after uninstall. If so the feature will not be completely uninstalled until the server is restarted.

---

#### Example

Do not use the role or feature names mentioned in the PKGMGR documentation. To get a list of available roles and features run the following command:

```
salt <minion_name> win_servermanager.list_available
```

Use the name in the right column of the results.

```

Uninstall the IIS Web Server Rol (Web-Server)
IIS-WebserverRole:
 win_servermanager.removed:
 - name: Web-Server

```

(continues on next page)

(continued from previous page)

```
Uninstall multiple features, reboot if required
uninstall_multiple_features:
 win_servermanager.removed:
 - features:
 - RemoteAccess
 - XPX-Viewer
 - SNMP-Service
 - restart: True
```

### 21.19.324 salt.states.win\_smtp\_server module

Module for managing IIS SMTP server configuration on Windows servers.

`salt.states.win_smtp_server.active_log_format(name, log_format, server='SmtpSvc/1')`

Manage the active log format for the SMTP server.

Parameters

- **log\_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-log-format:
 win_smtp_server.active_log_format:
 - log_format: Microsoft IIS Log File Format
```

`salt.states.win_smtp_server.connection_ip_list(name, addresses=None, grant_by_default=False, server='SmtpSvc/1')`

Manage IP list for SMTP connections.

Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant\_by\_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Example of usage for creating a whitelist:

```
smtp-connection-whitelist:
 win_smtp_server.connection_ip_list:
 - addresses:
 127.0.0.1: 255.255.255.255
 172.16.1.98: 255.255.255.255
 172.16.1.99: 255.255.255.255
 - grant_by_default: False
```

Example of usage for creating a blacklist:

```
smtp-connection-blacklist:
 win_smtp_server.connection_ip_list:
 - addresses:
 172.16.1.100: 255.255.255.255
 172.16.1.101: 255.255.255.255
 - grant_by_default: True
```

Example of usage for allowing any source to connect:

```
smtp-connection-blacklist:
 win_smtp_server.connection_ip_list:
 - addresses: {}
 - grant_by_default: True
```

`salt.states.win_smtp_server.relay_ip_list(name, addresses=None, server='SmtSvc/1')`

Manage IP list for SMTP relay connections.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

**Note:** Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

#### Parameters

- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses:
 - 24.0.0.128
 - 32.0.0.128
 - 60.0.0.128
 - 1.0.0.0
 - 76.0.0.0
 - 0.0.0.0
 - 0.0.0.0
 - 1.0.0.0
 - 1.0.0.0
 - 2.0.0.0
 - 2.0.0.0
 - 4.0.0.0
 - 0.0.0.0
 - 76.0.0.128
 - 0.0.0.0
 - 0.0.0.0
 - 0.0.0.0
 - 0.0.0.0
 - 255.255.255.255
 - 127.0.0.1
```

Example of usage for disabling relaying:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses: None
```

Example of usage for allowing relaying from any source:

```
smtp-relay-list:
 win_smtp_server.relay_ip_list:
 - addresses: []
```

`salt.states.win_smtp_server.server_setting(name, settings=None, server='SmtSvc/1')`  
Ensure the value is set for the specified setting.

---

**Note:** The setting names are case-sensitive.

---

#### Parameters

- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Example of usage:

```
smtp-settings:
 win_smtp_server.server_setting:
 - settings:
 LogType: 1
 LogFilePeriod: 1
 MaxMessageSize: 16777216
 MaxRecipients: 10000
 MaxSessionSize: 16777216
```

## 21.19.325 salt.states.win\_snmp module

Module for managing SNMP service settings on Windows servers.

`salt.states.win_snmp.agent_settings(name, contact, location, services=None)`  
Manage the SNMP sysContact, sysLocation, and sysServices settings.

#### Parameters

- **contact** (*str*) -- The SNMP contact.
- **location** (*str*) -- The SNMP location.
- **services** (*str*) -- A list of selected services.

Example of usage:

```
snmp-agent-settings:
 win_snmp.agent_settings:
 - contact: Test Contact
 - location: Test Location
 - services:
 - Physical
 - Internet
```

`salt.states.win_snmp.auth_traps_enabled(name, status=True)`  
Manage the sending of authentication traps.

Parameters **status** (*bool*) -- The enabled status.

Example of usage:

```

snmp-auth-traps:
 win_snmp.auth_traps_enabled:
 - status: True

```

`salt.states.win_snmp.community_names(name, communities=None)`

Manage the SNMP accepted community names and their permissions.

Parameters **communities** (*str*) -- A dictionary of SNMP communities and permissions.

Example of usage:

```

snmp-community-names:
 win_snmp.community_names:
 - communities:
 TestCommunity: Read Only
 OtherCommunity: Read Write

```

### 21.19.326 salt.states.win\_system

#### Management of Windows system information

New in version 2014.1.0.

This state is used to manage system information such as the computer name and description.

```

ERIK-WORKSTATION:
 system.computer_name: []

This is Erik's computer, don't touch!:
 system.computer_desc: []

```

`salt.states.win_system.computer_desc(name)`

Manage the computer's description field

**name** The desired computer description

`salt.states.win_system.computer_name(name)`

Manage the computer's name

**name** The desired computer name

`salt.states.win_system.hostname(name)`

New in version 2016.3.0.

Manage the hostname of the computer

**name** The hostname to set

`salt.states.win_system.join_domain(name, username=None, password=None, account_ou=None, account_exists=False, restart=False)`

Checks if a computer is joined to the Domain. If the computer is not in the Domain, it will be joined.

Parameters

- **name** (*str*) -- The name of the Domain.
- **username** (*str*) -- Username of an account which is authorized to join computers to the specified domain. Need to be either fully qualified like `user@domain.tld` or simply user.
- **password** (*str*) -- Password of the account to add the computer to the Domain.
- **account\_ou** (*str*) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`.

- **account\_exists** (*bool*) -- Needs to be set to `True` to allow re-using an existing computer account.
- **restart** (*bool*) -- Needs to be set to `True` to restart the computer after a successful join.

Example:

```
join_to_domain:
 system.join_domain:
 - name: mydomain.local.com
 - username: myaccount@mydomain.local.com
 - password: mysecretpassword
 - restart: True
```

```
salt.states.win_system.reboot(name, message=None, timeout=5, force_close=True,
 in_seconds=False, only_on_pending_reboot=True)
```

Reboot the computer

#### Parameters

- **message** (*str*) -- An optional message to display to users. It will also be used as a comment in the event log entry.

The default value is `None`.

- **timeout** (*int*) -- The number of minutes or seconds before a reboot will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

The default value is `5`.

- **in\_seconds** (*bool*) -- If this is `True`, the value of `timeout` will be treated as a number of seconds. If this is `False`, the value of `timeout` will be treated as a number of minutes.

The default value is `False`.

- **force\_close** (*bool*) -- If this is `True`, running applications will be forced to close without warning. If this is `False`, running applications will not get the opportunity to prompt users about unsaved data.

The default value is `True`.

- **only\_on\_pending\_reboot** (*bool*) -- If this is `True`, the reboot will only occur if the system reports a pending reboot. If this is `False`, the reboot will always occur.

The default value is `True`.

```
salt.states.win_system.shutdown(name, message=None, timeout=5, force_close=True,
 boot=False, in_seconds=False, only_on_pending_reboot=False)
```

Shutdown the computer

#### Parameters

- **message** (*str*) -- An optional message to display to users. It will also be used as a comment in the event log entry.

The default value is `None`.

- **timeout** (*int*) -- The number of minutes or seconds before a shutdown will occur. Whether this number represents minutes or seconds depends on the value of `in_seconds`.

The default value is `5`.

- **in\_seconds** (*bool*) -- If this is `True`, the value of `timeout` will be treated as a number of seconds. If this is `False`, the value of `timeout` will be treated as a number of minutes.

The default value is `False`.

- **force\_close** (*bool*) -- If this is True, running applications will be forced to close without warning. If this is False, running applications will not get the opportunity to prompt users about unsaved data.

The default value is True.

- **reboot** (*bool*) -- If this is True, the computer will restart immediately after shutting down. If False the system flushes all caches to disk and safely powers down the system.

The default value is False.

- **only\_on\_pending\_reboot** (*bool*) -- If this is True, the shutdown will only occur if the system reports a pending reboot. If this is False, the shutdown will always occur.

The default value is False.

`salt.states.win_system.workgroup` (*name*)

New in version 3001.

Manage the workgroup of the computer

Parameters **name** (*str*) -- The workgroup to set

Example:

```
set workgroup:
 system.workgroup:
 - name: local
```

### 21.19.327 salt.states.win\_wua module

Installation of Windows Updates using the Windows Update Agent

New in version 2017.7.0.

Salt can manage Windows updates via the "wua" state module. Updates can be installed and removed. Update management declarations are as follows:

For installation:

```
Install a single update using the KB
KB3194343:
 wua.installed

Install a single update using the name parameter
install_update:
 wua.installed:
 - name: KB3194343

Install multiple updates using the updates parameter and a combination of
KB number and GUID
install_updates:
 wua.installed:
 - updates:
 - KB3194343
 - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

For removal:

```
Remove a single update using the KB
KB3194343:
 wua.removed

Remove a single update using the name parameter
remove_update:
 wua.removed:
 - name: KB3194343

Remove multiple updates using the updates parameter and a combination of
KB number and GUID
remove_updates:
 wua.removed:
 - updates:
 - KB3194343
 - bb1dbb26-3fb6-45fd-bb05-e3c8e379195c
```

`salt.states.win_wua.installed(name, updates=None)`

Ensure Microsoft Updates are installed. Updates will be downloaded if needed.

**Parameters**

- **name** (*str*) -- The identifier of a single update to install.
- **updates** (*list*) -- A list of identifiers for updates to be installed. Overrides **name**. Default is None.

---

**Note:** Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're installing the correct update.

---

**Warning:** Using a partial KB number or a partial Title could result in more than one update being installed.

**Returns** A dictionary containing the results of the update

**Return type** `dict`

CLI Example:

```
using a GUID
install_update:
 wua.installed:
 - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

using a KB
install_update:
 wua.installed:
 - name: KB3194343

using the full Title
install_update:
 wua.installed:
 - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
 ↪ (for x64-based Systems) (KB3194343)

Install multiple updates
install_updates:
 wua.installed:
 - updates:
```

(continues on next page)

(continued from previous page)

- KB3194343
- 28cf1b09-2b1a-458c-9bd1-971d1b26b211

`salt.states.win_wua.removed(name, updates=None)`

Ensure Microsoft Updates are uninstalled.

#### Parameters

- **name** (*str*) -- The identifier of a single update to uninstall.
- **updates** (*list*) -- A list of identifiers for updates to be removed. Overrides **name**. Default is `None`.

**Note:** Identifiers can be the GUID, the KB number, or any part of the Title of the Microsoft update. GUIDs and KBs are the preferred method to ensure you're uninstalling the correct update.

**Warning:** Using a partial KB number or a partial Title could result in more than one update being removed.

**Returns** A dictionary containing the results of the removal

**Return type** `dict`

CLI Example:

```
using a GUID
uninstall_update:
 wua.removed:
 - name: 28cf1b09-2b1a-458c-9bd1-971d1b26b211

using a KB
uninstall_update:
 wua.removed:
 - name: KB3194343

using the full Title
uninstall_update:
 wua.removed:
 - name: Security Update for Adobe Flash Player for Windows 10 Version 1607
 ↪ (for x64-based Systems) (KB3194343)

Install multiple updates
uninstall_updates:
 wua.removed:
 - updates:
 - KB3194343
 - 28cf1b09-2b1a-458c-9bd1-971d1b26b211
```

`salt.states.win_wua.uptodate(name, software=True, drivers=False, skip_hidden=False, skip_mandatory=False, skip_reboot=True, categories=None, severities=None)`

Ensure Microsoft Updates that match the passed criteria are installed. Updates will be downloaded if needed.

This state allows you to update a system without specifying a specific update to apply. All matching updates will be installed.

#### Parameters

- **name** (*str*) -- The name has no functional value and is only used as a tracking reference
- **software** (*bool*) -- Include software updates in the results (default is `True`)

- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **skip\_hidden** (*bool*) -- Skip updates that have been hidden. Default is False.
- **skip\_mandatory** (*bool*) -- Skip mandatory updates. Default is False.
- **skip\_reboot** (*bool*) -- Skip updates that require a reboot. Default is True.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

**Returns** A dictionary containing the results of the update

**Return type** *dict*

CLI Example:

```
Update the system using the state defaults
update_system:
 wua.uptodate

Update the drivers
update_drivers:
 wua.uptodate:
 - software: False
 - drivers: True
 - skip_reboot: False

Apply all critical updates
update_critical:
 wua.uptodate:
 - severities:
 - Critical
```

### 21.19.328 salt.states.win\_wusa module

Microsoft Updates (KB) Management

This module provides the ability to enforce KB installations from files (.msu), without WSUS or Windows Update New in version 2018.3.4.

**salt.states.win\_wusa.installed**(*name*, *source*)

Ensure an update is installed on the minion

Parameters

- **name** (*str*) -- Name of the Windows KB ("KB123456")
- **source** (*str*) -- Source of .msu file corresponding to the KB

Example:

```
KB123456:
wusa.installed:
- source: salt://kb123456.msu
```

**salt.states.win\_wusa.uninstalled**(*name*)

Ensure an update is uninstalled from the minion

Parameters **name** (*str*) -- Name of the Windows KB ("KB123456")

Example:

```
KB123456:
wusa.uninstalled
```

### 21.19.329 salt.states.winrepo

Manage Windows Package Repository

**salt.states.winrepo.genrepo**(*name*, *force=False*, *allow\_empty=False*)

Refresh the winrepo.p file of the repository (salt-run winrepo.genrepo)

If *force* is True no checks will be made and the repository will be generated if *allow\_empty* is True then the state will not return an error if there are 0 packages,

---

**Note:** This state only loads on minions that have the `roles: salt-master` grain set.

---

Example:

```
winrepo:
winrepo.genrepo
```

### 21.19.330 salt.states.wordpress module

This state module is used to manage Wordpress installations

**depends** wp binary from <http://wp-cli.org/>

**salt.states.wordpress.activated**(*name*, *path*, *user*)

Activate wordpress plugins

**name** name of plugin to activate

**path** path to wordpress installation

**user** user who should own the files in the wordpress installation

```
HyperDB:
wordpress.activated:
 - path: /var/www/html
 - user: apache
```

`salt.states.wordpress.deactivated`(*name, path, user*)

Deactivate wordpress plugins

**name** name of plugin to deactivate

**path** path to wordpress installation

**user** user who should own the files in the wordpress installation

```
HyperDB:
wordpress.deactivated:
 - path: /var/www/html
 - user: apache
```

`salt.states.wordpress.installed`(*name, user, admin\_user, admin\_password, admin\_email, title, url*)

Run the initial setup of wordpress

**name** path to the wordpress installation

**user** user that owns the files for the wordpress installation

**admin\_user** username for wordpress website administrator user

**admin\_password** password for wordpress website administrator user

**admin\_email** email for wordpress website administrator user

**title** title for the wordpress website

**url** url for the wordpress website

```
/var/www/html:
wordpress.installed:
 - title: Daniel's Awesome Blog
 - user: apache
 - admin_user: dwallace
 - admin_email: dwallace@example.com
 - admin_password: password123
 - url: https://blog.dwallace.com
```

### 21.19.331 salt.states.x509

Manage X509 Certificates

New in version 2015.8.0.

**depends** M2Crypto

This module can enable managing a complete PKI infrastructure including creating private keys, CAs, certificates and CRLs. It includes the ability to generate a private key on a server, and have the corresponding public key sent to a remote CA to create a CA signed certificate. This can be done in a secure manner, where private keys are always generated locally and never moved across the network.

Here is a simple example scenario. In this example `ca` is the ca server, and `www` is a web server that needs a certificate signed by `ca`.

For remote signing, peers must be permitted to remotely call the `sign_remote_certificate` function.

`/etc/salt/master.d/peer.conf`

```
peer:
 .*:
 - sign_remote_certificate
```

/srv/salt/top.sls

```
base:
 '*':
 - cert
 'ca':
 - ca
 'www':
 - www
```

This state creates the CA key, certificate and signing policy. It also publishes the certificate to the mine where it can be easily retrieved by other minions.

/srv/salt/ca.sls

```
salt-minion:
 service.running:
 - enable: True
 - watch:
 - file: /etc/salt/minion.d/x509.conf

/etc/salt/minion.d/x509.conf:
 file.managed:
 - source: salt://x509.conf

/etc/pki:
 file.directory

/etc/pki/issued_certs:
 file.directory

/etc/pki/ca.crt:
 x509.private_key_managed:
 - name: /etc/pki/ca.key
 - bits: 4096
 - backup: True

/etc/pki/ca.crt:
 x509.certificate_managed:
 - signing_private_key: /etc/pki/ca.key
 - CN: ca.example.com
 - C: US
 - ST: Utah
 - L: Salt Lake City
 - basicConstraints: "critical CA:true"
 - keyUsage: "critical cRLSign, keyCertSign"
 - subjectKeyIdentifier: hash
 - authorityKeyIdentifier: keyid,issuer:always
 - days_valid: 3650
 - days_remaining: 0
 - backup: True
 - require:
 - file: /etc/pki
```

The signing policy defines properties that override any property requested or included in a CRL. It also can define a restricted list of minions which are allowed to remotely invoke this signing policy.

/srv/salt/x509.conf

```
mine_functions:
 x509.get_pem_entries: [/etc/pki/ca.crt]

x509_signing_policies:
 www:
 - minions: 'www'
 - signing_private_key: /etc/pki/ca.key
 - signing_cert: /etc/pki/ca.crt
 - C: US
 - ST: Utah
 - L: Salt Lake City
 - basicConstraints: "critical CA:false"
 - keyUsage: "critical keyEncipherment"
 - subjectKeyIdentifier: hash
 - authorityKeyIdentifier: keyid,issuer:always
 - days_valid: 90
 - copypath: /etc/pki/issued_certs/
```

This state will instruct all minions to trust certificates signed by our new CA. Using Jinja to strip newlines from the text avoids dealing with newlines in the rendered YAML, and the `sign_remote_certificate` state will handle properly formatting the text before writing the output.

/srv/salt/cert.sls

```
/usr/local/share/ca-certificates:
 file.directory

/usr/local/share/ca-certificates/intca.crt:
 x509.pem_managed:
 - text: {{ salt['mine.get']('ca', 'x509.get_pem_entries')['ca']['/etc/pki/ca.crt
↪']|replace('\n', '') }}
```

This state creates a private key then requests a certificate signed by ca according to the `www` policy.

/srv/salt/www.sls

```
/etc/pki/www.crt:
 x509.private_key_managed:
 - name: /etc/pki/www.key
 - bits: 4096
 - backup: True

/etc/pki/www.crt:
 x509.certificate_managed:
 - ca_server: ca
 - signing_policy: www
 - public_key: /etc/pki/www.key
 - CN: www.example.com
 - days_remaining: 30
 - backup: True
```

This other state creates a private key then requests a certificate signed by ca according to the `www` policy but adds a strict date range for the certificate to be considered valid.

/srv/salt/www-time-limited.sls

```
/etc/pki/www-time-limited.crt:
x509.certificate_managed:
- ca_server: ca
- signing_policy: www
- public_key: /etc/pki/www-time-limited.key
- CN: www.example.com
- not_before: 2019-05-05 00:00:00
- not_after: 2020-05-05 14:30:00
- backup: True
```

`salt.states.x509.certificate_managed(name, days_remaining=90, append_certs=None, managed_private_key=None, **kwargs)`

Manage a Certificate

**name** Path to the certificate

**days\_remaining** [90] Recreate the certificate if the number of days remaining on it are less than this number. The value should be less than `days_valid`, otherwise the certificate will be recreated every time the state is run. A value of 0 disables automatic renewal.

**append\_certs**: A list of certificates to be appended to the managed file. They must be valid PEM files, otherwise an error will be thrown.

**managed\_private\_key**: Has no effect since v2016.11 and will be removed in Salt Aluminium. Use a separate `x509.private_key_managed` call instead.

**kwargs**: Any arguments supported by `x509.create_certificate` or `file.managed` are supported.

**not\_before**: Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

**not\_after**: Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

Examples:

```
/etc/pki/ca.crt:
x509.certificate_managed:
- signing_private_key: /etc/pki/ca.key
- CN: ca.example.com
- C: US
- ST: Utah
- L: Salt Lake City
- basicConstraints: "critical CA:true"
- keyUsage: "critical cRLSign, keyCertSign"
- subjectKeyIdentifier: hash
- authorityKeyIdentifier: keyid,issuer:always
- days_valid: 3650
- days_remaining: 0
- backup: True
```

```
/etc/ssl/www.crt:
x509.certificate_managed:
- ca_server: pki
- signing_policy: www
- public_key: /etc/ssl/www.key
- CN: www.example.com
- days_valid: 90
- days_remaining: 30
- backup: True
```

```
salt.states.x509.crl_managed(name, signing_private_key, signing_private_key_passphrase=None,
 signing_cert=None, revoked=None, days_valid=100, digest="",
 days_remaining=30, include_expired=False, **kwargs)
```

Manage a Certificate Revocation List

**name** Path to the certificate

**signing\_private\_key** The private key that will be used to sign the CRL. This is usually your CA's private key.

**signing\_private\_key\_passphrase** Passphrase to decrypt the private key.

**signing\_cert** The certificate of the authority that will be used to sign the CRL. This is usually your CA's certificate.

**revoked** A list of certificates to revoke. Must include either a serial number or a the certificate itself. Can optionally include the revocation date and notAfter date from the certificate. See example below for details.

**days\_valid** [100] The number of days the certificate should be valid for.

**digest** The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14.

**days\_remaining** [30] The CRL should be automatically recreated if there are less than **days\_remaining** days until the CRL expires. Set to 0 to disable automatic renewal.

**include\_expired** [False] If True, include expired certificates in the CRL.

**kwargs** Any arguments supported by *file.managed* are supported.

Example:

```
/etc/pki/ca.crl:
x509.crl_managed:
- signing_private_key: /etc/pki/myca.key
- signing_cert: /etc/pki/myca.crt
- revoked:
 - compromised_web_key:
 - certificate: /etc/pki/certs/badweb.crt
 - revocation_date: 2015-03-01 00:00:00
 - reason: keyCompromise
 - terminated_vpn_user:
 - serial_number: D6:D2:DC:D8:4D:5C:C0:F4
 - not_after: 2016-01-01 00:00:00
 - revocation_date: 2015-02-25 00:00:00
 - reason: cessationOfOperation
```

```
salt.states.x509.csr_managed(name, **kwargs)
```

Manage a Certificate Signing Request

**name**: Path to the CSR

**properties**: The properties to be added to the certificate request, including items like subject, extensions and public key. See above for valid properties.

**kwargs**: Any arguments supported by *file.managed* are supported.

Example:

```
/etc/pki/mycert.csr:
x509.csr_managed:
- private_key: /etc/pki/mycert.key
- CN: www.example.com
- C: US
- ST: Utah
- L: Salt Lake City
- keyUsage: 'critical dataEncipherment'
```

```
salt.states.x509.pem_managed(name, text, backup=False, **kwargs)
```

Manage the contents of a PEM file directly with the content in text, ensuring correct formatting.

**name**: The path to the file to manage

**text**: The PEM formatted text to write.

**kwargs:** Any arguments supported by *file.managed* are supported.

```
salt.states.x509.private_key_managed(name, bits=2048, passphrase=None, cipher='aes_128_cbc', new=False, overwrite=False, verbose=True, **kwargs)
```

Manage a private key's existence.

**name:** Path to the private key

**bits:** Key length in bits. Default 2048.

**passphrase:** Passphrase for encrypting the private key.

**cipher:** Cipher for encrypting the private key.

**new:** Always create a new key. Defaults to `False`. Combining `new` with `prereq` can allow key rotation whenever a new certificate is generated.

**overwrite:** Overwrite an existing private key if the provided passphrase cannot decrypt it.

**verbose:** Provide visual feedback on stdout, dots while key is generated. Default is `True`.

New in version 2016.11.0.

**kwargs:** Any kwargs supported by *file.managed* are supported.

Example:

The JINJA templating in this example ensures a private key is generated if the file doesn't exist and that a new private key is generated whenever the certificate that uses it is to be renewed.

```
/etc/pki/www.key:
x509.private_key_managed:
- bits: 4096
- new: True
{% if salt['file.file_exists']('/etc/pki/www.key') -%}
- prereq:
- x509: /etc/pki/www.crt
{%- endif %}
```

## 21.19.332 salt.states.xml

### XML Manager

State management of XML files

```
salt.states.xml.value_present(name, xpath, value, **kwargs)
```

New in version 3000.

Manages a given XML file

**name** [string] The location of the XML file to manage, as an absolute path.

**xpath** [string] xpath location to manage

**value** [string] value to ensure present

```
ensure_value_true:
xml.value_present:
- name: /tmp/test.xml
- xpath: .//playwright[@id='1']
- value: William Shakespeare
```

### 21.19.333 salt.states.xmpp

#### Sending Messages over XMPP

New in version 2014.1.0.

This state is useful for firing messages during state runs, using the XMPP protocol

```
server-warning-message:
 xmpp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-xmpp-account
 - recipient: admins@xmpp.example.com/salt
```

`salt.states.xmpp.send_msg(name, recipient, profile)`  
Send a message to an XMPP user

```
server-warning-message:
 xmpp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-xmpp-account
 - recipient: admins@xmpp.example.com/salt
```

**name** The message to send to the XMPP user

`salt.states.xmpp.send_msg_multi(name, profile, recipients=None, rooms=None)`  
Send a message to an list of recipients or rooms

```
server-warning-message:
 xmpp.send_msg:
 - name: 'This is a server warning message'
 - profile: my-xmpp-account
 - recipients:
 - admins@xmpp.example.com/salt
 - rooms:
 - qa@conference.xmpp.example.com
```

**name** The message to send to the XMPP user

### 21.19.334 salt.states.zabbix\_action

New in version 2017.7.

Management of Zabbix Action object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

`salt.states.zabbix_action.absent(name, **kwargs)`  
Makes the Zabbix Action to be absent (either does not exist or delete it).

#### Parameters

- **name** -- Zabbix Action name
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

zabbix-action-absent:
 zabbix_action.absent:
 - name: Action name

```

`salt.states.zabbix_action.present(name, params, **kwargs)`

Creates Zabbix Action object or if differs update it according defined parameters

#### Parameters

- **name** -- Zabbix Action name
- **params** -- Definition of the Zabbix Action
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

If there is a need to get a value from current zabbix online (e.g. id of a hostgroup you want to put a discovered system into), put a dictionary with two keys "query\_object" and "query\_name" instead of the value. In this example we want to get object id of hostgroup named "Virtual machines" and "Databases".

```

zabbix-action-present:
 zabbix_action.present:
 - name: VMs
 - params:
 eventsources: 2
 status: 0
 filter:
 evaltype: 2
 conditions:
 - conditiontype: 24
 operator: 2
 value: 'virtual'
 - conditiontype: 24
 operator: 2
 value: 'kvm'
 operations:
 - operationtype: 2
 - operationtype: 4
 opgroup:
 - groupid:
 query_object: hostgroup
 query_name: Virtual machines
 - groupid:
 query_object: hostgroup
 query_name: Databases

```

### 21.19.335 salt.states.zabbix\_host module

Management of Zabbix hosts.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_host.absent(name, **kwargs)`

Ensures that the host does not exists, eventually deletes host.

New in version 2016.3.0.

**Param** name: technical name of the host

**Parameters**

- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**TestHostWithInterfaces:**

zabbix\_host.absent

`salt.states.zabbix_host.assign_templates(host, templates, **kwargs)`

Ensures that templates are assigned to the host.

New in version 2017.7.0.

**Parameters**

- **host** -- technical name of the host
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**add\_zabbix\_templates\_to\_host:**

**zabbix\_host.assign\_templates:**

- **host:** TestHost
- **templates:**
  - "Template OS Linux"
  - "Template App MySQL"

`salt.states.zabbix_host.present(host, groups, interfaces, **kwargs)`

Ensures that the host exists, eventually creates new host. NOTE: please use argument `visible_name` instead of `name` to not mess with name from salt sls. This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see: <https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host>

New in version 2016.3.0.

**Parameters**

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **proxy\_host** -- Optional proxy name or proxyid to monitor host
- **inventory** -- Optional list of inventory names and values
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible\_name** -- Optional - string with visible name of the host, use 'visible\_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```
create_test_host:
 zabbix_host.present:
 - host: TestHostWithInterfaces
 - proxy_host: 12345
 - groups:
 - 5
 - 6
 - 7
 - interfaces:
 - test1.example.com:
 - ip: '192.168.1.8'
 - type: 'Agent'
 - port: 92
 - testing2_create:
 - ip: '192.168.1.9'
 - dns: 'test2.example.com'
 - type: 'agent'
 - main: false
 - testovacil_ipmi:
 - ip: '192.168.100.111'
 - type: 'ipmi'
 - inventory:
 - alias: some alias
 - asset_tag: jlm3937
```

### 21.19.336 salt.states.zabbix\_hostgroup module

Management of Zabbix host groups.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.states.zabbix\_hostgroup.absent**(name, \*\*kwargs)

Ensures that the host group does not exist, eventually delete host group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_testing_host_group:
 zabbix_hostgroup.absent:
 - name: 'My hostgroup name'
```

**salt.states.zabbix\_hostgroup.present**(name, \*\*kwargs)

Ensures that the host group exists, eventually creates new host group.

New in version 2016.3.0.

#### Parameters

- **name** -- name of the host group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
create_testing_host_group:
 zabbix_hostgroup.present:
 - name: 'My hostgroup name'
```

## 21.19.337 salt.states.zabbix\_mediatype module

Management of Zabbix mediatypes.

**codeauthor** Raymond Kuiper <qix@the-wired.net>

`salt.states.zabbix_mediatype.absent(name, **kwargs)`

Ensures that the mediatype does not exist, eventually deletes the mediatype.

#### Parameters

- **name** -- name of the mediatype
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_mediatype:
 zabbix_mediatype.absent:
 - name: 'Email'
```

`salt.states.zabbix_mediatype.present(name, mediatype, **kwargs)`

Creates new mediatype. NOTE: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host\\_inventory](https://www.zabbix.com/documentation/3.0/manual/api/reference/host/object#host_inventory)

#### Parameters

- **name** -- name of the mediatype
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_mediatype:
 zabbix_mediatype.present:
 - name: 'Email'
 - mediatype: 0
 - smtp_server: smtp.example.com
 - smtp_hello: zabbix.example.com
 - smtp_email: zabbix@example.com
```

### 21.19.338 salt.states.zabbix\_template

New in version 2017.7.

Management of Zabbix Template object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

**salt.states.zabbix\_template.absent**(*name*, *\*\*kwargs*)

Makes the Zabbix Template to be absent (either does not exist or delete it).

#### Parameters

- **name** -- Zabbix Template name
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
zabbix-template-absent:
 zabbix_template.absent:
 - name: Ceph OSD
```

**salt.states.zabbix\_template.is\_present**(*name*, *\*\*kwargs*)

Check if Zabbix Template already exists.

#### Parameters

- **name** -- Zabbix Template name
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
does_zabbix-template-exist:
 zabbix_template.is_present:
 - name: Template OS Linux
```

**salt.states.zabbix\_template.present**(*name*, *params*, *static\_host\_list=True*, *\*\*kwargs*)

Creates Zabbix Template object or if differs update it according defined parameters. See Zabbix API documentation.

Zabbix API version: >3.0

#### Parameters

- **name** -- Zabbix Template name
- **params** -- Additional parameters according to Zabbix API documentation
- **static\_host\_list** -- If hosts assigned to the template are controlled only by this state or can be also assigned externally
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Note:** If there is a need to get a value from current zabbix online (e.g. ids of host groups you want the template to be associated with), put a dictionary with two keys "query\_object" and "query\_name" instead of the value.

In this example we want to create template named "Testing Template", assign it to hostgroup Templates, link it to two ceph nodes and create a macro.

---

**Note:** IMPORTANT NOTE: Objects (except for template name) are identified by name (or by other key in some exceptional cases) so changing name of object means deleting old one and creating new one with new ID !!!

---

**Note:**

**NOT SUPPORTED FEATURES:**

- linked templates
  - trigger dependencies
  - groups and group prototypes for host prototypes
- 

SLS Example:

```
zabbix-template-present:
 zabbix_template.present:
 - name: Testing Template
 # Do not touch existing assigned hosts
 # True will detach all other hosts than defined here
 - static_host_list: False
 - params:
 description: Template for Ceph nodes
 groups:
 # groups must already exist
 # template must be at least in one hostgroup
 - groupid:
 query_object: hostgroup
 query_name: Templates
 macros:
 - macro: "{$CEPH_CLUSTER_NAME}"
 value: ceph
 hosts:
 # hosts must already exist
 - hostid:
 query_object: host
 query_name: ceph-osd-01
 - hostid:
 query_object: host
 query_name: ceph-osd-02
 # templates:
 # Linked templates - not supported by state module but can be linked
 ↪ manually (will not be touched)

 applications:
 - name: Ceph OSD
 items:
 - name: Ceph OSD avg fill item
 key_: ceph.osd_avg_fill
 type: 2
 value_type: 0
 delay: 60
 units: '%'
```

(continues on next page)

(continued from previous page)

```

```

### 21.19.339 salt.states.zabbix\_user module

Management of Zabbix users.

**codeauthor** Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_user.absent(name, **kwargs)`

Ensures that the user does not exist, eventually delete user.

New in version 2016.3.0.

#### Parameters

- **name** -- user alias
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**George:**

```
zabbix_user.absent
```

`salt.states.zabbix_user.admin_password_present(name, password=None, **kwargs)`

Initial change of Zabbix Admin password to password taken from one of the sources (only the most prioritized one):

1. 'password' parameter
  2. '\_connection\_password' parameter
  3. pillar 'zabbix.password' setting
- 1) Tries to log in as Admin with password found in state password parameter or \_connection\_password or pillar or default zabbix password in this precise order, if any of them is present.
  - 2) If one of above passwords matches, it tries to change the password to the most prioritized one.
  - 3) If not able to connect with any password then it fails.

#### Parameters

- **name** -- Just a name of state
- **password** -- Optional - desired password for Admin to be set
- **\_connection\_user** -- Optional - Ignored in this state (always assumed 'Admin')
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
password taken from pillar or _connection_password
```

```
zabbix-admin-password:
```

```
 zabbix_user.admin_password_present
```

```
directly set password
```

```
zabbix-admin-password:
```

```
 zabbix_user.admin_password_present:
```

```
 - password: SECRET_PASS
```

`salt.states.zabbix_user.present(alias, passwd, usrgtps, medias=None, password_reset=False, **kwargs)`

Ensures that the user exists, eventually creates new user. NOTE: use argument firstname instead of name to not mess values with name from salt sls.

New in version 2016.3.0.

## Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **medias** -- Optional - user's medias to create
- **password\_reset** -- whether or not to reset password at update
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

```
make_user:
 zabbix_user.present:
 - alias: George
 - passwd: donottellanyonE@456x
 - password_reset: True
 - usrgrps:
 - 13
 - 7
 - medias:
 - me@example.com:
 - mediatype: mail
 - period: '1-7,00:00-24:00'
 - severity: NIWAHD
 - make_jabber:
 - active: true
 - mediatype: jabber
 - period: '1-5,08:00-19:00'
 - sendto: jabbera@example.com
 - text_me_morning_disabled:
 - active: false
 - mediatype: sms
 - period: '1-5,09:30-10:00'
 - severity: D
 - sendto: '+42032132588568'
```

### 21.19.340 salt.states.zabbix\_usergroup module

Management of Zabbix user groups.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.states.zabbix_usergroup.absent(name, **kwargs)`

Ensures that the user group does not exist, eventually delete user group.

New in version 2016.3.0.

## Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_thai_monks_usrgrp:
 zabbix_usergroup.absent:
 - name: 'Thai monks'
```

`salt.states.zabbix_usergroup.present(name, **kwargs)`

Creates new user group. NOTE: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see: [https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user\\_group](https://www.zabbix.com/documentation/2.0/manual/appendix/api/usergroup/definitions#user_group)

New in version 2016.3.0.

#### Parameters

- **name** -- name of the user group
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
make_new_thai_monks_usergroup:
 zabbix_usergroup.present:
 - name: 'Thai monks'
 - gui_access: 1
 - debug_mode: 0
 - users_status: 0
```

## 21.19.341 salt.states.zabbix\_usermacro module

Management of Zabbix usermacros. :codeauthor: Raymond Kuiper <[qix@the-wired.net](mailto:qix@the-wired.net)>

`salt.states.zabbix_usermacro.absent(name, hostid=None, **kwargs)`

Ensures that the mediatype does not exist, eventually deletes the mediatype.

#### Parameters

- **name** -- name of the usermacro
- **hostid** -- id's of the hosts to apply the usermacro on, if missing a global usermacro is assumed.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
delete_usermacro:
 zabbix_usermacro.absent:
 - name: '{$SNMP_COMMUNITY}'
```

`salt.states.zabbix_usermacro.present(name, value, hostid=None, **kwargs)`

Creates a new usermacro.

#### Parameters

- **name** -- name of the usermacro
- **value** -- value of the usermacro

- **hostid** -- id's of the hosts to apply the usermacro on, if missing a global usermacro is assumed.
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

override host usermacro:
 zabbix_usermacro.present:
 - name: '{$SNMP_COMMUNITY}'
 - value: 'public'
 - hostid: 21

```

### 21.19.342 salt.states.zabbix\_valuemap

New in version 2017.7.

Management of Zabbix Valuemap object over Zabbix API.

**codeauthor** Jakub Sliva <jakub.sliva@ultimum.io>

**salt.states.zabbix\_valuemap.absent**(*name*, *\*\*kwargs*)

Makes the Zabbix Value map to be absent (either does not exist or delete it).

**Parameters**

- **name** -- Zabbix Value map name
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

zabbix-valuemap-absent:
 zabbix_valuemap.absent:
 - name: Value map name

```

**salt.states.zabbix\_valuemap.present**(*name*, *params*, *\*\*kwargs*)

Creates Zabbix Value map object or if differs update it according defined parameters

**Parameters**

- **name** -- Zabbix Value map name
- **params** -- Definition of the Zabbix Value map
- **\_connection\_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **\_connection\_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **\_connection\_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```

zabbix-valuemap-present:
 zabbix_valuemap.present:
 - name: Number mapping
 - params:
 mappings:

```

(continues on next page)

(continued from previous page)

```
- value: 1
 newvalue: one
- value: 2
 newvalue: two
```

## 21.19.343 salt.states.zcbuildout

### Management of zc.buildout

This module is inspired from minitage's buildout maker (<https://github.com/minitage/minitage/blob/master/src/minitage/core/makers/buildout.py>)

New in version 2016.3.0.

---

**Note:** This state module is beta; the API is subject to change and no promise as to performance or functionality is yet present

---

### Available Functions

- built

```
installed1
 buildout.installed:
 - name: /path/to/buildout

installed2
 buildout.installed:
 - name: /path/to/buildout
 - parts:
 - a
 - b
 - python: /path/to/pythonpath/bin/python
 - unless: /bin/test_something_installed
 - onlyif: /bin/test_else_installed
```

```
salt.states.zcbuildout.installed(name, config='buildout.cfg', quiet=False, parts=None,
 user=None, env=(), buildout_ver=None, test_release=False,
 distribute=None, new_st=None, offline=False, newest=False,
 python='/builds/saltstack/open/docs/builddocs/venv/bin/python3',
 debug=False, verbose=False, unless=None, onlyif=None,
 use_vt=False, loglevel='debug', **kwargs)
```

Install buildout in a specific directory

It is a thin wrapper to modules.buildout.buildout

**name** directory to execute in

**quiet**

do not output console & logs

**config** buildout config to use (default: buildout.cfg)

**parts** specific buildout parts to run

**user** user used to run buildout as

New in version 2014.1.4.

**env** environment variables to set when running  
**buildout\_ver** force a specific buildout version (1 | 2)  
**test\_release** buildout accept test release  
**new\_st** Forcing use of setuptools >= 0.7  
**distribute** use distribute over setuptools if possible  
**offline** does buildout run offline  
**python** python to use  
**debug** run buildout with -D debug flag  
**onlyif** Only execute cmd if statement on the host return 0  
**unless** Do not execute cmd if statement on the host return 0  
**newest** run buildout in newest mode  
**verbose** run buildout in verbose mode (-vvvvv)  
**use\_vt** Use the new salt VT to stream output [experimental]  
**loglevel** loglevel for buildout commands

### 21.19.344 salt.states.zenoss

State to manage monitoring in Zenoss.

New in version 2016.3.0.

This state module depends on the 'zenoss' Salt execution module.

Allows for setting a state of minions in Zenoss using the Zenoss API. Currently Zenoss 4.x and 5.x are supported.

```
enable_monitoring:
 zenoss.monitored:
 - name: web01.example.com
 - device_class: /Servers/Linux
 - collector: localhost
 - prod_state: 1000
```

`salt.states.zenoss.monitored(name, device_class=None, collector='localhost', prod_state=None)`

Ensure a device is monitored. The 'name' given will be used for Zenoss device name and should be resolvable.

```
enable_monitoring:
 zenoss.monitored:
 - name: web01.example.com
 - device_class: /Servers/Linux
 - collector: localhost
 - prod_state: 1000
```

### 21.19.345 salt.states.zfs

States for managing zfs datasets

**maintainer** Jorge Schrauwen <[sjorge@blackdot.be](mailto:sjorge@blackdot.be)>

**maturity** new

**depends** salt.utils.zfs, salt.modules.zfs

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```
test/shares/yuki:
 zfs.filesystem_present:
 - create_parent: true
 - properties:
 quota: 16G

test/iscsi/haruhi:
 zfs.volume_present:
 - create_parent: true
 - volume_size: 16M
 - sparse: true
 - properties:
 readOnly: on

test/shares/yuki@frozen:
 zfs.snapshot_present

moka_origin:
 zfs.hold_present:
 - snapshot: test/shares/yuki@frozen

test/shares/moka:
 zfs.filesystem_present:
 - cloned_from: test/shares/yuki@frozen

test/shares/moka@tsukune:
 zfs.snapshot_absent
```

**salt.states.zfs.bookmark\_absent**(*name*, *force=False*, *recursive=False*)  
ensure bookmark is absent on the system  
**name** [string] name of snapshot  
**force** [boolean] try harder to destroy the dataset (zfs destroy -f)  
**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**salt.states.zfs.bookmark\_present**(*name*, *snapshot*)  
ensure bookmark exists  
**name** [string] name of bookmark  
**snapshot** [string] name of snapshot

**salt.states.zfs.filesystem\_absent**(*name*, *force=False*, *recursive=False*)  
ensure filesystem is absent on the system  
**name** [string] name of filesystem  
**force** [boolean] try harder to destroy the dataset (zfs destroy -f)  
**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**Warning:** If a volume with name exists, this state will succeed without destroying the volume specified by name. This module is dataset type sensitive.

**salt.states.zfs.filesystem\_present**(*name*, *create\_parent=False*, *properties=None*, *cloned\_from=None*)  
ensure filesystem exists and has properties set  
**name** [string] name of filesystem  
**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**cloned\_from** [string] name of snapshot to clone  
**properties** [dict] additional zfs properties (-o)

---

**Note:** `cloned_from` is only use if the filesystem does not exist yet, when `cloned_from` is set after the filesystem exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

---

**salt.states.zfs.hold\_absent**(*name, snapshot, recursive=False*)  
 ensure hold is absent on the system  
**name** [string] name of hold  
**snapshot** [string] name of snapshot  
**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

**salt.states.zfs.hold\_present**(*name, snapshot, recursive=False*)  
 ensure hold is present on the system  
**name** [string] name of hold  
**snapshot** [string] name of snapshot  
**recursive** [boolean] recursively add hold with the given tag on the snapshots of all descendent file systems.

**salt.states.zfs.promoted**(*name*)  
 ensure a dataset is not a clone  
**name** [string] name of fileset or volume

**Warning:** only one dataset can be the origin, if you promote a clone the original will now point to the promoted dataset

**salt.states.zfs.scheduled\_snapshot**(*name, prefix, recursive=True, schedule=None*)  
 maintain a set of snapshots based on a schedule  
**name** [string] name of filesystem or volume  
**prefix** [string] prefix for the snapshots e.g. 'test' will result in snapshots being named 'test-yyyymmdd\_hhmm'  
**recursive** [boolean] create snapshots for all children also  
**schedule** [dict] dict holding the schedule, the following keys are available (minute, hour, day, month, and year) by default all are set to 0 the value indicated the number of snapshots of that type to keep around.

**Warning:** snapshots will only be created and pruned every time the state runs. a schedule must be setup to automatically run the state. this means that if you run the state daily the hourly snapshot will only be made once per day!

Changed in version 2018.3.0: switched to localtime from gmtime so times now take into account timezones.

**salt.states.zfs.snapshot\_absent**(*name, force=False, recursive=False*)  
 ensure snapshot is absent on the system  
**name** [string] name of snapshot  
**force** [boolean] try harder to destroy the dataset (zfs destroy -f)  
**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**salt.states.zfs.snapshot\_present**(*name, recursive=False, properties=None*)  
 ensure snapshot exists and has properties set  
**name** [string] name of snapshot

**recursive** [boolean] recursively create snapshots of all descendent datasets  
**properties** [dict] additional zfs properties (-o)

**salt.states.zfs.volume\_absent**(*name, force=False, recursive=False*)  
ensure volume is absent on the system  
**name** [string] name of volume  
**force** [boolean] try harder to destroy the dataset (zfs destroy -f)  
**recursive** [boolean] also destroy all the child datasets (zfs destroy -r)

**Warning:** If a filesystem with **name** exists, this state will succeed without destroying the filesystem specified by **name**. This module is dataset type sensitive.

**salt.states.zfs.volume\_present**(*name, volume\_size, sparse=False, create\_parent=False, properties=None, cloned\_from=None*)  
ensure volume exists and has properties set  
**name** [string] name of volume  
**volume\_size** [string] size of volume  
**sparse** [boolean] create sparse volume  
**create\_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.  
**cloned\_from** [string] name of snapshot to clone  
**properties** [dict] additional zfs properties (-o)

---

**Note:** **cloned\_from** is only use if the volume does not exist yet, when **cloned\_from** is set after the volume exists it will be ignored.

---

---

**Note:** Properties do not get cloned, if you specify the properties in the state file they will be applied on a subsequent run.

---

**volume\_size** is considered a property, so the volume's size will be corrected when the properties get updated if it differs from the original volume.

The **sparse** parameter is ignored when using **cloned\_from**.

---

### 21.19.346 salt.states.zk\_concurrency

#### Control concurrency of steps within state execution using zookeeper

**depends** kazoo

**configuration** See *salt.modules.zookeeper* for setup instructions.

This module allows you to "wrap" a state's execution with concurrency control. This is useful to protect against all hosts executing highstate simultaneously if your services don't all HUP restart. The common way of protecting against this is to run in batch mode, but that doesn't protect from another person running the same batch command (and thereby having 2x the number of nodes deploying at once).

This module will block while acquiring a slot, meaning that however the command gets called it will coordinate with zookeeper to ensure that no more than **max\_concurrency** steps are executing with a single path.

**acquire\_lock:**  
**zk\_concurrency.lock:**

(continues on next page)

(continued from previous page)

```

- name: /trafficeserver
- zk_hosts: 'zookeeper:2181'
- max_concurrency: 4
- prereq:
 - service: trafficserver

trafficserver:
 service.running:
 - watch:
 - file: /etc/trafficserver/records.config

/etc/trafficserver/records.config:
 file.managed:
 - source: salt://records.config

release_lock:
 zk_concurrency.unlock:
 - name: /trafficserver
 - require:
 - service: trafficserver

```

This example would allow the file state to change, but would limit the concurrency of the trafficserver service restart to 4.

```

salt.states.zk_concurrency.lock(name, zk_hosts=None, identifier=None, max_concurrency=1,
 timeout=None, ephemeral_lease=False, profile=None,
 scheme=None, username=None, password=None, de-
 fault_acl=None)

```

Block state execution until you are able to get the lock (or hit the timeout)

```

salt.states.zk_concurrency.min_party(name, zk_hosts, min_nodes, blocking=False, pro-
 file=None, scheme=None, username=None, pass-
 word=None, default_acl=None)

```

Ensure that there are *min\_nodes* in the party at *name*, optionally blocking if not available.

```

salt.states.zk_concurrency.unlock(name, zk_hosts=None, identifier=None, max_concurrency=1,
 ephemeral_lease=False, profile=None, scheme=None, user-
 name=None, password=None, default_acl=None)

```

Remove lease from semaphore.

### 21.19.347 salt.states.zone

Management of Solaris Zones

```

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
depends salt.modules.zoneadm, salt.modules.zonecfg
platform solaris

```

New in version 2017.7.0.

Below are some examples of how to use this state. Lets start with creating a zone and installing it.

```

omipkg1_configuration:
 zone.present:

```

(continues on next page)

(continued from previous page)

```

- name: omipkg1
- brand: ipkg
- zonepath: /zones/omipkg1
- properties:
 - autoboot: true
 - ip-type: exclusive
 - cpu-shares: 50
- resources:
 - attr:
 - name: owner
 - value: Jorge Schrauwen
 - type: string
 - attr:
 - name: description
 - value: OmniOS ipkg zone for testing
 - type: string
 - capped-memory:
 - physical: 64M
omipkg1_installation:
 zone.installed:
 - name: omipkg1
 - require:
 - zone: omipkg1_configuration
omipkg1_running:
 zone.booted:
 - name: omipkg1
 - require:
 - zone: omipkg1_installation

```

A zone without network access is not very useful. We could update the `zone.present` state in the example above to add a network interface or we could use a separate state for this.

```

omipkg1_network:
 zone.resource_present:
 - name: omipkg1
 - resource_type: net
 - resource_selector_property: mac-addr
 - resource_selector_value: "02:08:20:a2:a3:10"
 - physical: znic1
 - require:
 - zone: omipkg1_configuration

```

Since this is a single tenant system having the owner attribute is pointless. Let's remove that attribute.

**Note:** The following state run the `omipkg1_configuration` state will add it again! If the entire configuration is managed it would be better to add `resource_prune` and optionally the `resource_selector_property` properties to the resource.

```

omipkg1_strip_owner:
 zone.resource_present:
 - name: omipkg1
 - resource_type: attr
 - resource_selector_property: name
 - resource_selector_value: owner

```

(continues on next page)

(continued from previous page)

```
- require:
 - zone: omipkg1_configuration
```

Let's bump the zone's CPU shares a bit.

**Note:** The following state run the omipkg1\_configuration state will set it to 50 again. Update the entire zone configuration is managed you should update it there instead.

```
omipkg1_more_cpu:
 zone.property_present:
 - name: omipkg1
 - property: cpu-shares
 - value: 100
```

Or we can remove the limit altogether!

**Note:** The following state run the omipkg1\_configuration state will set it to 50 again. Update the entire zone configuration is managed you should set the property to None (nothing after the :) instead.

```
omipkg1_no_cpu:
 zone.property_absent:
 - name: omipkg1
 - property: cpu-shares
```

```
salt.states.zone.absent(name, uninstall=False)
 Ensure a zone is absent
 name [string] name of the zone
 uninstall [boolean] when true, uninstall instead of detaching the zone first.
```

```
salt.states.zone.attached(name, force=False)
 Ensure zone is attached
 name [string] name of the zone
 force [boolean] force attach the zone
```

```
salt.states.zone.booted(name, single=False)
 Ensure zone is booted
 name [string] name of the zone
 single [boolean] boot in single usermode
```

```
salt.states.zone.detached(name)
 Ensure zone is detached
 name [string] name of the zone
```

```
salt.states.zone.export(name, path, replace=False)
 Export a zones configuration
 name [string] name of the zone
 path [string] path of file to export too.
 replace [boolean] replace the file if it exists
```

```
salt.states.zone.halted(name, graceful=True)
 Ensure zone is halted
 name [string] name of the zone
 graceful [boolean] use shutdown instead of halt if true
```

`salt.states.zone.import_(name, path, mode='import', nodataset=False, brand_opts=None)`

Import a zones configuration

**name** [string] name of the zone

**path** [string] path of the configuration file to import

**mode** [string] either import, install, or attach

**nodataset** [boolean] do not create a ZFS file system

**brand\_opts** [boolean] brand specific options to pass

---

**Note:** The mode argument can be set to `import`, `install`, or `attach`. `import`: will only import the configuration `install`: will import and then try to install the zone `attach`: will import and then try to attach of the zone

---

**omipkg1:**

**zone.import:**

- **path:** /foo/bar/baz

`salt.states.zone.installed(name, nodataset=False, brand_opts=None)`

Ensure zone is installed

**name** [string] name of the zone

**nodataset** [boolean] do not create a ZFS file system

**brand\_opts** [boolean] brand specific options to pass

`salt.states.zone.present(name, brand, zonepath, properties=None, resources=None)`

Ensure a zone with certain properties and resources

**name** [string] name of the zone

**brand** [string] brand of the zone

**zonepath** [string] path of the zone

**properties** [list of key-value pairs] dict of properties

**resources** [list of key-value pairs] dict of resources

---

**Note:** If the zone does not exist it will not be installed. You can use the ``zone.installed`` state for this.

---

**Note:**

**Default resource selectors:**

- fs: dir
  - net: mac-addr
  - device: match
  - rctl: name
  - attr: name
  - dataset: name
  - admin: user
- 

**Warning:** Properties and resource will not be removed when they are absent from the state!

For properties, simple set them to ``None``.

For resources, add the ``resource_prune`` property and set it to ``True``. Also specify the ``resource_selector_property`` if the default is not the one you want.

`salt.states.zone.property_absent(name, property)`

Ensure property is absent

**name** [string] name of the zone  
**property** [string] name of property

---

**Note:** This does a zonecfg clear call. So the property may be reset to a default value! Does has the side effect of always having to be called.

---

**salt.states.zone.property\_present**(*name, property, value*)

Ensure property has a certain value

**name** [string] name of the zone  
**property** [string] name of property  
**value** [string] value of property

**salt.states.zone.resource\_absent**(*name, resource\_type, resource\_selector\_property, resource\_selector\_value*)

Ensure resource is absent

**name** [string] name of the zone  
**resource\_type** [string] type of resource  
**resource\_selector\_property** [string] unique resource identifier  
**resource\_selector\_value** [string] value for resource selection

**Warning:** Both `resource_selector_property` and `resource_selector_value` must be provided, some properties like ``name`` are already reserved by salt in there states.

---

**Note:** You can set both `resource_selector_property` and `resource_selector_value` to `None` for resources that do not require them.

---

**salt.states.zone.resource\_present**(*name, resource\_type, resource\_selector\_property, resource\_selector\_value, \*\*kwargs*)

Ensure resource exists with provided properties

**name** [string] name of the zone  
**resource\_type** [string] type of resource  
**resource\_selector\_property** [string] unique resource identifier  
**resource\_selector\_value** [string] value for resource selection  
**kwargs** [string|int|...] resource properties

**Warning:** Both `resource_selector_property` and `resource_selector_value` must be provided, some properties like `name` are already reserved by salt in states.

---

**Note:** You can set both `resource_selector_property` and `resource_selector_value` to `None` for resources that do not require them.

---

**salt.states.zone.uninstalled**(*name*)

Ensure zone is uninstalled

**name** [string] name of the zone

## 21.19.348 salt.states.zookeeper

**depends** kazoo

**configuration** See *salt.modules.zookeeper* for setup instructions.

### ACLS

For more information about acls, please checkout the kazoo documentation.

[http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make\\_digest\\_acl](http://kazoo.readthedocs.io/en/latest/api/security.html#kazoo.security.make_digest_acl)

The following options can be included in the acl dictionary:

**param username** Username to use for the ACL.

**param password** A plain-text password to hash.

**param write** Write permission.

**type write** bool

**param create** Create permission.

**type create** bool

**param delete** Delete permission.

**type delete** bool

**param admin** Admin permission.

**type admin** bool

**param all** All permissions.

**type all** bool

**salt.states.zookeeper.absent**(*name, version=- 1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Make sure znode is absent

**name** path to znode

**version** Specify the version which should be deleted Default: -1 (always match)

**recursive** Boolean to indicate if children should be recursively deleted Default: False

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

**delete znode:**

**zookeeper.absent:**

```
- name: /test
- recursive: True
```

**salt.states.zookeeper.acls**(*name, acls, version=- 1, profile=None, hosts=None, scheme=None, username=None, password=None, default\_acl=None*)

Update acls on a znode

**name** path to znode

**acls** list of acl dictionaries to set on znode

**version** Specify the version which should be deleted Default: -1 (always match)

**profile** Configured Zookeeper profile to authenticate with (Default: None)  
**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')  
**scheme** Scheme to authenticate with (Default: 'digest')  
**username** Username to authenticate (Default: None)  
**password** Password to authenticate (Default: None)  
**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

```
update acls:
 zookeeper.acls:
 - name: /test/name
 - acls:
 - username: daniel
 password: test
 all: True
 - username: gtmanfred
 password: test
 all: True
```

`salt.states.zookeeper.present(name, value, acls=None, ephemeral=False, sequence=False, makepath=False, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)`

Make sure znode is present in the correct state with the correct acls

**name** path to znode

**value** value znode should be set to

**acls** list of acl dictionaries to set on znode (make sure the ones salt is connected with are included) Default: None

**ephemeral** Boolean to indicate if ephemeral znode should be created Default: False

**sequence** Boolean to indicate if znode path is suffixed with a unique index Default: False

**makepath** Boolean to indicate if the parent paths should be created Default: False

**version** For updating, specify the version which should be updated Default: -1 (always match)

**profile** Configured Zookeeper profile to authenticate with (Default: None)

**hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

**scheme** Scheme to authenticate with (Default: 'digest')

**username** Username to authenticate (Default: None)

**password** Password to authenticate (Default: None)

**default\_acl** Default acls to assign if a node is created in this connection (Default: None)

```
add znode:
 zookeeper.present:
 - name: /test/name
 - value: gtmanfred
 - makepath: True

update znode:
 zookeeper.present:
 - name: /test/name
 - value: daniel
 - acls:
 - username: daniel
 password: test
 read: true
 - username: gtmanfred
 password: test
 read: true
 write: true
```

(continues on next page)

(continued from previous page)

```

 create: true
 delete: true
 admin: true
 - makepath: True

```

### 21.19.349 salt.states.zpool

States for managing zpools

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**depends** salt.utils.zfs, salt.modules.zpool

**platform** smartos, illumos, solaris, freebsd, linux

New in version 2016.3.0.

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```

oldpool:
 zpool.absent:
 - export: true

newpool:
 zpool.present:
 - config:
 import: false
 force: true
 - properties:
 comment: salty storage pool
 - layout:
 - mirror:
 - /dev/disk0
 - /dev/disk1
 - mirror:
 - /dev/disk2
 - /dev/disk3

partitionpool:
 zpool.present:
 - config:
 import: false
 force: true
 - properties:
 comment: disk partition salty storage pool
 ashift: '12'
 feature@lz4_compress: enabled
 - filesystem_properties:
 compression: lz4
 atime: on
 relatime: on
 - layout:
 - /dev/disk/by-uuid/3e43ce94-77af-4f52-a91b-6cdbb0b0f41b

```

(continues on next page)

(continued from previous page)

```

simplepool:
 zpool.present:
 - config:
 import: false
 force: true
 - properties:
 comment: another salty storage pool
 - layout:
 - /dev/disk0
 - /dev/disk1

```

**Warning:** The layout will never be updated, it will only be used at time of creation. It's a whole lot of work to figure out if a devices needs to be detached, removed, etc. This is best done by the sysadmin on a case per case basis.

Filesystem properties are also not updated, this should be managed by the zfs state module.

**salt.states.zpool.absent**(*name*, *export=False*, *force=False*)

ensure storage pool is absent on the system

**name** [string] name of storage pool

**export** [boolean] export instead of destroy the zpool if present

**force** [boolean] force destroy or export

**salt.states.zpool.present**(*name*, *properties=None*, *filesystem\_properties=None*, *layout=None*, *config=None*)

ensure storage pool is present on the system

**name** [string] name of storage pool

**properties** [dict] optional set of properties to set for the storage pool

**filesystem\_properties** [dict] optional set of filesystem properties to set for the storage pool (creation only)

**layout: dict** disk layout to use if the pool does not exist (creation only)

**config** [dict] fine grain control over this state

**Note:**

The following configuration properties can be toggled in the config parameter.

- **import** (true) - try to import the pool before creating it if absent
- **import\_dirs** (None) - specify additional locations to scan for devices on import (comma-separated)
- **device\_dir** (None, SunOS=/dev/dsk, Linux=/dev) - specify device directory to prepend for none absolute device paths
- **force** (false) - try to force the import or creation

**Note:** It is no longer needed to give a unique name to each top-level vdev, the old layout format is still supported but no longer recommended.

```

- mirror:
 - /tmp/vdisk3
 - /tmp/vdisk2
- mirror:
 - /tmp/vdisk0
 - /tmp/vdisk1

```

The above yaml will always result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk3 /tmp/vdisk2 mirror /tmp/vdisk0 /tmp/vdisk1
```

**Warning:** The legacy format is also still supported but not recommended, because ID's inside the layout dict must be unique they need to have a suffix.

```
mirror-0:
 /tmp/vdisk3
 /tmp/vdisk2
mirror-1:
 /tmp/vdisk0
 /tmp/vdisk1
```

**Warning:** Pay attention to the order of your dict!

```
- mirror:
 - /tmp/vdisk0
 - /tmp/vdisk1
- /tmp/vdisk2
```

The above will result in the following zpool create:

```
zpool create mypool mirror /tmp/vdisk0 /tmp/vdisk1 /tmp/vdisk2
```

Creating a 3-way mirror! While you probably expect it to be mirror root vdev with 2 devices + a root vdev of 1 device!

## 21.20 thorium modules

<i>calc</i>	Used to manage the thorium register.
<i>check</i>	The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.
<i>file</i>	Writes matches to disk to verify activity, helpful when testing
<i>key</i>	The key Thorium State is used to apply changes to the accepted/rejected/pending keys
<i>local</i>	Run remote execution commands via the local client
<i>reg</i>	Used to manage the thorium register.
<i>runner</i>	React by calling asynchronous runners
<i>status</i>	This thorium state is used to track the status beacon events and keep track of the active status of minions
<i>timer</i>	Allow for flow based timers.
<i>wheel</i>	React by calling asynchronous runners

### 21.20.1 salt.thorium.calc module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

New in version 2016.11.0.

**depends** statistics PyPi module

**salt.thorium.calc.add**(*name, num, minimum=0, maximum=0, ref=None*)

Adds together the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.add:
 - name: myregistry
 - num: 5
```

**salt.thorium.calc.calc**(*name, num, oper, minimum=0, maximum=0, ref=None*)

Perform a calculation on the num most recent values. Requires a list. Valid values for *oper* are:

- *add*: Add last num values together
- *mul*: Multiple last num values together
- *mean*: Calculate mean of last num values
- *median*: Calculate median of last num values
- *median\_low*: Calculate low median of last num values
- *median\_high*: Calculate high median of last num values
- *median\_grouped*: Calculate grouped median of last num values
- *mode*: Calculate mode of last num values

USAGE:

```
foo:
 calc.calc:
 - name: myregistry
 - num: 5
 - oper: mean
```

**salt.thorium.calc.mean**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.mean:
 - name: myregistry
 - num: 5
```

**salt.thorium.calc.median**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median:
 - name: myregistry
 - num: 5
```

**salt.thorium.calc.median\_grouped**(*name, num, minimum=0, maximum=0, ref=None*)

Calculates the grouped mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median_grouped:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.median_high(name, num, minimum=0, maximum=0, ref=None)`

Calculates the high mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median_high:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.median_low(name, num, minimum=0, maximum=0, ref=None)`

Calculates the low mean of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.median_low:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.mode(name, num, minimum=0, maximum=0, ref=None)`

Calculates the mode of the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.mode:
 - name: myregistry
 - num: 5
```

`salt.thorium.calc.mul(name, num, minimum=0, maximum=0, ref=None)`

Multiplies together the num most recent values. Requires a list.

USAGE:

```
foo:
 calc.mul:
 - name: myregistry
 - num: 5
```

## 21.20.2 salt.thorium.check module

The check Thorium state is used to create gateways to commands, the checks make it easy to make states that watch registers for changes and then just succeed or fail based on the state of the register, this creates the pattern of having a command execution get gated by a check state via a requisite.

`salt.thorium.check.contains(name, value, count_lt=None, count_lte=None, count_eq=None, count_gte=None, count_gt=None, count_ne=None)`

Only succeed if the value in the given register location contains the given value

USAGE:

```
foo:
 check.contains:
 - value: itni

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.eq(name, value)`

Only succeed if the value in the given register location is equal to the given value

USAGE:

```
foo:
 check.eq:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.event(name)`

Checks for a specific event match and returns result True if the match happens

USAGE:

```
salt/foo/*/bar:
 check.event

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: salt/foo/*/bar
```

`salt.thorium.check.gt(name, value)`

Only succeed if the value in the given register location is greater than the given value

USAGE:

```
foo:
 check.gt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.gte(name, value)`

Only succeed if the value in the given register location is greater or equal than the given value

USAGE:

```
foo:
 check.gte:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_eq(name, value)`

Only succeed if the length of the given register location is equal to the given value.

USAGE:

```
foo:
 check.len_eq:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_gt(name, value)`

Only succeed if length of the given register location is greater than the given value.

USAGE:

```
foo:
 check.len_gt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_gte(name, value)`

Only succeed if the length of the given register location is greater or equal than the given value

USAGE:

```
foo:
 check.len_gte:
 - value: 42

run_remote_ex:
 local.cmd:
```

(continues on next page)

(continued from previous page)

```
- tgt: '*'
- func: test.ping
- require:
 - check: foo
```

`salt.thorium.check.len_lt(name, value)`

Only succeed if the length of the given register location is less than the given value.

USAGE:

```
foo:
 check.len_lt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_lte(name, value)`

Only succeed if the length of the given register location is less than or equal the given value

USAGE:

```
foo:
 check.len_lte:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.len_ne(name, value)`

Only succeed if the length of the given register location is not equal to the given value.

USAGE:

```
foo:
 check.len_ne:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.lt(name, value)`

Only succeed if the value in the given register location is less than the given value

USAGE:

```
foo:
 check.lt:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.lte`(*name*, *value*)

Only succeed if the value in the given register location is less than or equal the given value

USAGE:

```
foo:
 check.lte:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

`salt.thorium.check.ne`(*name*, *value*)

Only succeed if the value in the given register location is not equal to the given value

USAGE:

```
foo:
 check.ne:
 - value: 42

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping
 - require:
 - check: foo
```

### 21.20.3 salt.thorium.file module

Writes matches to disk to verify activity, helpful when testing

Normally this is used by giving the name of the file (without a path) that the data will be saved to. If for instance you use `foo` as the name:

```
foo:
 file.save
```

Then the file will be saved to:

```
<salt cachedir>/thorium/saves/foo
```

You may also provide an absolute path for the file to be saved to:

```
/tmp/foo.save:
file.save
```

Files will be saved in JSON format. However, JSON does not support `set()`'s. If you are saving a register entry that contains a `set()`, then it will fail to save to JSON format. However, you may pass data through a filter which makes it JSON compliant:

```
foo:
 file.save:
 filter: True
```

Be warned that if you do this, then the file will be saved, but not in a format that can be re-imported into Python.

`salt.thorium.file.save(name, filter=False)`

Save the register to <salt cachedir>/thorium/saves/<name>, or to an absolute path.

If an absolute path is specified, then the directory will be created non-recursively if it doesn't exist.

USAGE:

```
foo:
file.save

/tmp/foo:
file.save
```

#### 21.20.4 salt.thorium.key module

The key Thorium State is used to apply changes to the accepted/rejected/pending keys

New in version 2016.11.0.

`salt.thorium.key.timeout(name, delete=0, reject=0)`

If any minion's status is older than the timeout value then apply the given action to the timed out key. This example will remove keys to minions that have not checked in for 300 seconds (5 minutes)

USAGE:

```
statreg:
status.reg

clean_keys:
 key.timeout:
 - require:
 - status: statreg
 - delete: 300
```

### 21.20.5 salt.thorium.local module

Run remote execution commands via the local client

`salt.thorium.local.cmd(name, tgt, func, arg=(), tgt_type='glob', ret='', kwarg=None, **kwargs)`

Execute a remote execution command

USAGE:

```
run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.ping

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.sleep
 - arg:
 - 30

run_remote_ex:
 local.cmd:
 - tgt: '*'
 - func: test.sleep
 - kwarg:
 length: 30
```

### 21.20.6 salt.thorium.reg module

Used to manage the thorium register. The thorium register is where compound values are stored and computed, such as averages etc.

`salt.thorium.reg.clear(name)`

Clear the namespace from the register

USAGE:

```
clearns:
 reg.clear:
 - name: myregister
```

`salt.thorium.reg.delete(name)`

Delete the namespace from the register

USAGE:

```
deletens:
 reg.delete:
 - name: myregister
```

`salt.thorium.reg.list_(name, add, match, stamp=False, prune=0)`

Add the specified values to the named list

If `stamp` is True, then the timestamp from the event will also be added if `prune` is set to an integer higher than 0, then only the last `prune` values will be kept in the list.

USAGE:

```
foo:
 reg.list:
 - add: bar
 - match: my/custom/event
 - stamp: True
```

`salt.thorium.reg.mean(name, add, match)`

Accept a numeric value from the matched events and store a running average of the values in the given register. If the specified value is not numeric it will be skipped

USAGE:

```
foo:
 reg.mean:
 - add: data_field
 - match: my/custom/event
```

`salt.thorium.reg.set_(name, add, match)`

Add a value to the named set

USAGE:

```
foo:
 reg.set:
 - add: bar
 - match: my/custom/event
```

## 21.20.7 salt.thorium.runner module

React by calling asynchronous runners

`salt.thorium.runner.cmd(name, func=None, arg=(), **kwargs)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
 runner.cmd:
 - func: cloud.create
 - arg:
 - my-ec2-config
 - myinstance

run_cloud:
 runner.cmd:
 - func: cloud.create
 - kwargs:
 provider: my-ec2-config
 instances: myinstance
```

### 21.20.8 salt.thorium.status module

This thorium state is used to track the status beacon events and keep track of the active status of minions

New in version 2016.11.0.

`salt.thorium.status.reg(name)`

Activate this register to turn on a minion status tracking register, this register keeps the current status beacon data and the time that each beacon was last checked in.

### 21.20.9 salt.thorium.timer module

Allow for flow based timers. These timers allow for a sleep to exist across multiple runs of the flow

`salt.thorium.timer.hold(name, seconds)`

Wait for a given period of time, then fire a result of True, requiring this state allows for an action to be blocked for evaluation based on time

USAGE:

```
hold_on_a_moment:
 timer.hold:
 - seconds: 30
```

### 21.20.10 salt.thorium.wheel module

React by calling asynchronous runners

`salt.thorium.wheel.cmd(name, fun=None, arg=(), **kwargs)`

Execute a runner asynchronous:

USAGE:

```
run_cloud:
 wheel.cmd:
 - fun: key.delete
 - match: minion_id
```

## 21.21 token modules

---

<i>localfs</i>	Stores eauth tokens in the filesystem of the master.
<i>rediscluster</i>	Provide token storage in Redis cluster.

---

### 21.21.1 salt.tokens.localfs

Stores eauth tokens in the filesystem of the master. Location is configured by the master config option 'token\_dir'

**salt.tokens.localfs.get\_token**(*opts*, *tok*)

Fetch the token data from the store.

**Parameters**

- **opts** -- Salt master config options
- **tok** -- Token value to get

**Returns** Token data if successful. Empty dict if failed.

**salt.tokens.localfs.list\_tokens**(*opts*)

List all tokens in the store.

**Parameters** **opts** -- Salt master config options

**Returns** List of dicts (tokens)

**salt.tokens.localfs.mk\_token**(*opts*, *tdata*)

Mint a new token using the config option hash\_type and store tdata with 'token' attribute set to the token. This module uses the hash of random 512 bytes as a token.

**Parameters**

- **opts** -- Salt master config options
- **tdata** -- Token data to be stored with 'token' attribute of this dict set to the token.

**Returns** tdata with token if successful. Empty dict if failed.

**salt.tokens.localfs.rm\_token**(*opts*, *tok*)

Remove token from the store.

**Parameters**

- **opts** -- Salt master config options
- **tok** -- Token to remove

**Returns** Empty dict if successful. None if failed.

### 21.21.2 salt.tokens.rediscluster

Provide token storage in Redis cluster.

To get started simply start a redis cluster and assign all hashslots to the connected nodes. Add the redis hostname and port to master configs as eauth\_redis\_host and eauth\_redis\_port. Default values for these configs are as follow:

```
eauth_redis_host: localhost
eauth_redis_port: 6379
```

**depends**

- redis-py-cluster Python package

**salt.tokens.rediscluster.get\_token**(*opts*, *tok*)

Fetch the token data from the store.

**Parameters**

- **opts** -- Salt master config options
- **tok** -- Token value to get

**Returns** Token data if successful. Empty dict if failed.

**salt.tokens.rediscluster.list\_tokens**(*opts*)

List all tokens in the store.

**Parameters** **opts** -- Salt master config options

**Returns** List of dicts (token\_data)

`salt.tokens.rediscluster.mk_token(opts, tdata)`

Mint a new token using the config option `hash_type` and store `tdata` with 'token' attribute set to the token. This module uses the hash of random 512 bytes as a token.

Parameters

- **opts** -- Salt master config options
- **tdata** -- Token data to be stored with 'token' attribute of this dict set to the token.

Returns `tdata` with token if successful. Empty dict if failed.

`salt.tokens.rediscluster.rm_token(opts, tok)`

Remove token from the store.

Parameters

- **opts** -- Salt master config options
- **tok** -- Token to remove

Returns Empty dict if successful. None if failed.

## 21.22 master tops modules

<code>cobbler</code>	Cobbler Tops
<code>ext_nodes</code>	External Nodes Classifier
<code>mongo</code>	Read tops data from a mongodb collection
<code>reclass_adapter</code>	Read tops data from a reclass database
<code>saltclass</code>	Saltclass Configuration
<code>varstack_top</code>	Use <a href="#">Varstack</a> to provide tops data

### 21.22.1 salt.tops.cobbler

#### Cobbler Tops

Cobbler Tops is a master tops subsystem used to look up mapping information from Cobbler via its API. The same `cobbler.*` parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
master_tops:
 cobbler: {}
cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

## Module Documentation

`salt.tops.cobbler.top(**kwargs)`  
Look up top data in Cobbler for a minion.

### 21.22.2 salt.tops.ext\_nodes

#### External Nodes Classifier

The External Nodes Classifier is a master tops subsystem that retrieves mapping information from major configuration management systems. One of the most common external nodes classifiers system is provided by Cobbler and is called `cobbler-ext-nodes`.

The `cobbler-ext-nodes` command can be used with this configuration:

```
master_tops:
 ext_nodes: cobbler-ext-nodes
```

It is noteworthy that the Salt system does not directly ingest the data sent from the `cobbler-ext-nodes` command, but converts the data into information that is used by a Salt top file.

Any command can replace the call to 'cobbler-ext-nodes' above, but currently the data must be formatted in the same way that the standard 'cobbler-ext-nodes' does.

See (admittedly degenerate and probably not complete) example:

```
classes:
 - basepackages
 - database
```

The above essentially is the same as a `top.sls` containing the following:

```
base:
 '*':
 - basepackages
 - database

base:
 '*':
 - basepackages
 - database
```

`salt.tops.ext_nodes.top(**kwargs)`  
Run the command configured

### 21.22.3 salt.tops.mongo

Read tops data from a mongodb collection

This module will load tops data from a mongo collection. It uses the node's id for lookups.

## Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

## Configuring the Mongo Tops Subsystem

```
master_tops:
 mongo:
 collection: tops
 id_field: _id
 re_replace: ""
 re_pattern: \.example\.com
 states_field: states
 environment_field: environment
```

## Module Documentation

`salt.tops.mongo.top(**kwargs)`

Connect to a mongo database and read per-node tops data.

### Parameters

- **collection**(\*) -- The mongodb collection to read data from. Defaults to 'tops'.
- **id\_field**(\*) -- The field in the collection that represents an individual minion id. Defaults to '\_id'.
- **re\_pattern**(\*) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re\_pattern* will be used to match the name, and *re\_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If None, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to None.
- **re\_replace**(\*) -- Use as the replacement value in node ids matched with *re\_pattern*. Defaults to ". Feel free to use backreferences here.
- **states\_field**(\*) -- The name of the field providing a list of states.
- **environment\_field**(\*) -- The name of the field providing the environment. Defaults to `environment`.

### 21.22.4 salt.tops.reclass\_adapter

Read tops data from a reclass database

This *master\_tops* plugin provides access to the **reclass** database, such that state information (top data) are retrieved from **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the `master_tops` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
master_tops:
 reclass:
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `ext_pillar` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
 storage_type: yaml_fs
 inventory_base_uri: /srv/salt
 reclass_source_path: ~/code/reclass

ext_pillar:
 - reclass: *reclass

master_tops:
 reclass: *reclass
```

If you want to run **reclass** from source, rather than installing it, you can either let the master know via the `PYTHONPATH` environment variable, or by setting the configuration option, like in the example above.

`salt.tops.reclass_adapter.top(**kwargs)`  
Query **reclass** for the top data (states of the minions).

### 21.22.5 salt.tops.saltclass

#### Saltclass Configuration

```
master_tops:
 saltclass:
 path: /srv/saltclass
```

## Description

This module clones the behaviour of reclass (<http://reclass.pantsfullofunix.net/>), without the need of an external app, and add several features to improve flexibility. Saltclass lets you define your nodes from simple yaml files (.yaml) through hierarchical class inheritance with the possibility to override pillars down the tree.

## Features

- Define your nodes through hierarchical class inheritance
- Reuse your reclass datas with minimal modifications
  - applications => states
  - parameters => pillars
- Use Jinja templating in your yaml definitions
- Access to the following Salt objects in Jinja
  - `__opts__`
  - `__salt__`
  - `__grains__`
  - `__pillars__`
  - `minion_id`
- Chose how to merge or override your lists using ^ character (see examples)
- Expand variables `${}` with possibility to escape them if needed `$\{}` (see examples)
- Ignores missing node/class and will simply return empty without breaking the pillar module completely - will be logged

An example subset of datas is available here: <http://git.mauras.ch/salt/saltclass/src/master/examples>

Terms usable in yaml files	Description
classes	A list of classes that will be processed in order
states	A list of states that will be returned by <code>master_tops</code> function
pillars	A yaml dictionary that will be returned by the <code>ext_pillar</code> function
environment	Node saltenv that will be used by <code>master_tops</code>

A class consists of:

- zero or more parent classes
- zero or more states
- any number of pillars

A child class can override pillars from a parent class. A node definition is a class in itself with an added `environment` parameter for `saltenv` definition.

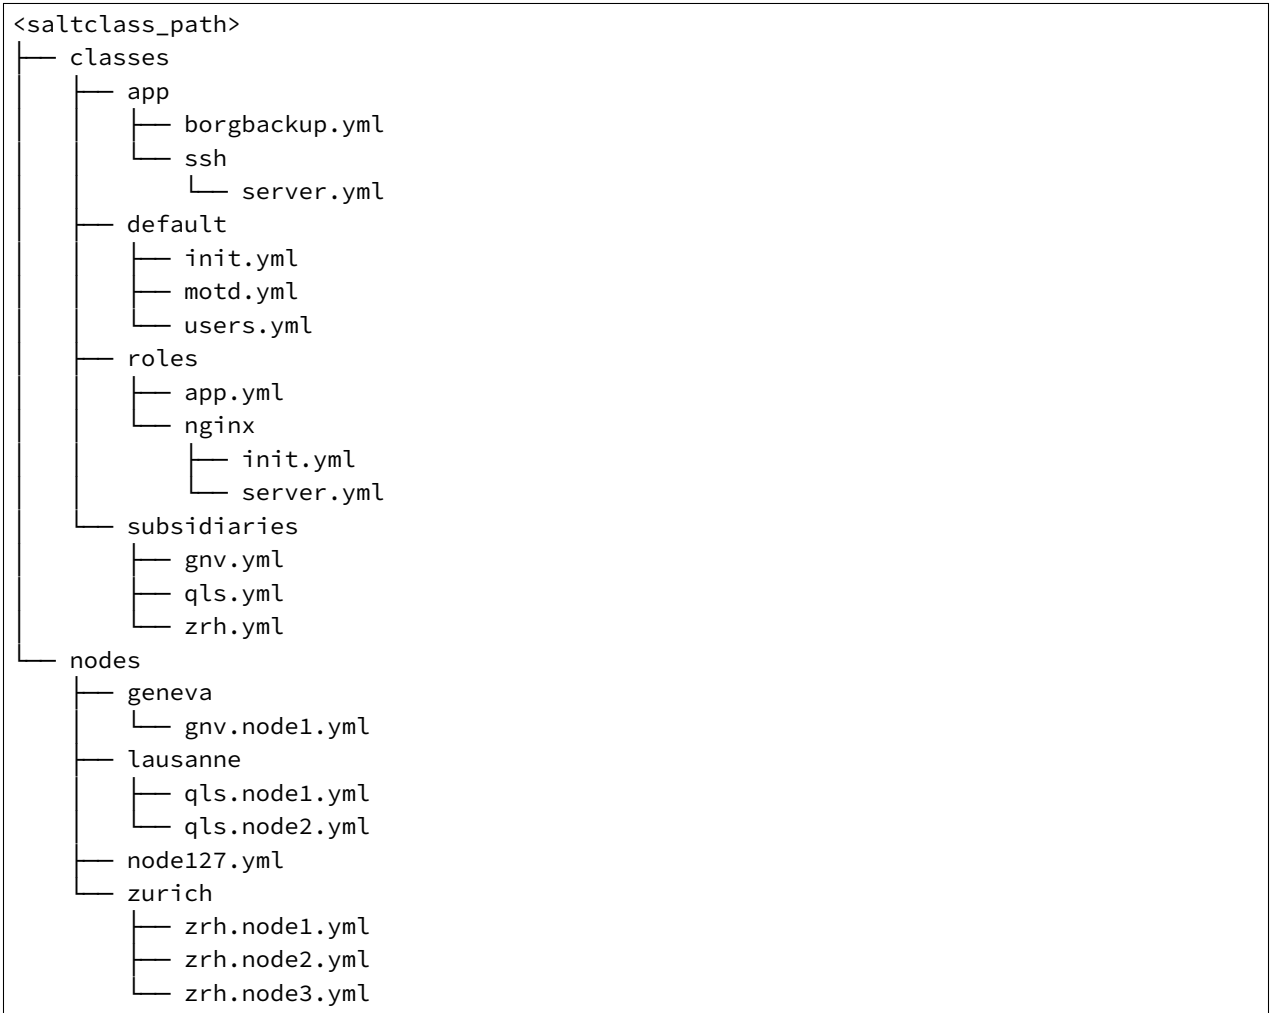

## Class names

Class names mimic salt way of defining states and pillar files. This means that `default.users` class name will correspond to one of these:

- `<saltclass_path>/classes/default/users.yml`
- `<saltclass_path>/classes/default/users/init.yml`

## Saltclass file hierarchy

A saltclass tree would look like this:

## Saltclass Examples

<saltclass\_path>/nodes/lausanne/qls.node1.yml

```
environment: base

classes:
{% for class in ['default'] %}
- {{ class }}
{% endfor %}
- subsidiaries.{{ __grains__['id'].split('.')[0] }}
```

<saltclass\_path>/classes/default/init.yml

```
classes:
- default.users
- default.motd

states:
- openssh

pillars:
default:
 network:
 dns:
 srv1: 192.168.0.1
 srv2: 192.168.0.2
 domain: example.com
 ntp:
 srv1: 192.168.10.10
 srv2: 192.168.10.20
```

<saltclass\_path>/classes/subsidiaries/gnv.yml

```
pillars:
default:
 network:
 sub: Geneva
 dns:
 srv1: 10.20.0.1
 srv2: 10.20.0.2
 srv3: 192.168.1.1
 domain: gnv.example.com
 users:
 adm1:
 uid: 1210
 gid: 1210
 gecos: 'Super user admin1'
 homedir: /srv/app/adm1
 adm3:
 uid: 1203
 gid: 1203
 gecos: 'Super user adm'
```

## Variable expansions

Escaped variables are rendered as is: `${test}`

Missing variables are rendered as is: `${net:dns:srv2}`

```
pillars:
 app:
 config:
 dns:
 srv1: ${default:network:dns:srv1}
 srv2: ${net:dns:srv2}
 uri: https://application.domain/call?\${test}
 prod_parameters:
 - p1
 - p2
 - p3
 pkg:
 - app-core
 - app-backend
```

## List override

Not using `^` as the first entry will simply merge the lists

```
pillars:
 app:
 pkg:
 - ^
 - app-frontend
```

### Note: Known limitation

Currently you can't have both a variable and an escaped variable in the same string as the escaped one will not be correctly rendered - `'${xx}'` will stay as is instead of being rendered as `'${xx}'`

```
salt.tops.saltclass.top(**kwargs)
 Compile tops
```

## 21.22.6 salt.tops.varstack\_top

Use [Varstack](#) to provide tops data

This [master\\_tops](#) plugin provides access to the **varstack** hierarchical yaml files, so you can use **varstack** as a full *external node classifier* and store state information (top data) in it.

## Configuring Varstack

To use varstack as a master top external node classifier, install varstack as documented. Then, add to your master's configuration:

```
master_tops:
 varstack: /path/to/the/config/file/varstack.yaml
```

Varstack will then use /path/to/the/config/file/varstack.yaml (usually /etc/varstack.yaml) to determine which configuration data to return as adapter information. From there you can take a look at the [README](#) of varstack to learn how this file is evaluated. The ENC part will just return the 'states' dictionary for the node.

Ie, if my.fqdn.yaml file contains:

```

states:
 - sudo
 - openssh
 - apache
 - salt.minion
```

these will be returned as {'base': ['sudo', 'openssh', 'apache', 'salt.minion']} and managed by salt as if given from a top.sls file.

```
salt.tops.varstack_top.top(**kwargs)
 Query varstack for the top data (states of the minions).
```

## 21.23 wheel modules

<i>config</i>	Manage the master configuration file
<i>error</i>	Error generator to enable integration testing of salt wheel error handling
<i>file_roots</i>	Read in files from the file_root and save files to the file root
<i>key</i>	Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.
<i>minions</i>	Wheel system wrapper for connected minions
<i>pillar_roots</i>	The <i>pillar_roots</i> wheel module is used to manage files under the pillar roots directories on the master server.

### 21.23.1 salt.wheel.config

Manage the master configuration file

```
salt.wheel.config.apply(key, value)
 Set a single key
```

---

**Note:** This will strip comments from your config file

---

```
salt.wheel.config.update_config(file_name, yaml_contents)
 Update master config with yaml_contents.
```

Writes `yaml_contents` to a file named `file_name.conf` under the folder specified by `default_include`. This folder is named `master.d` by default. Please look at `include-configuration` for more information.

Example low data:

```
data = {
 'username': 'salt',
 'password': 'salt',
 'fun': 'config.update_config',
 'file_name': 'gui',
 'yaml_contents': {'id': 1},
 'client': 'wheel',
 'eauth': 'pam',
}
```

`salt.wheel.config.values()`

Return the raw values of the config file

### 21.23.2 salt.wheel.error

Error generator to enable integration testing of salt wheel error handling

`salt.wheel.error.error(name=None, message="")`

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-wheel error
salt-wheel error.error name="Exception" message="This is an error."
```

### 21.23.3 salt.wheel.file\_roots

Read in files from the `file_root` and save files to the file root

`salt.wheel.file_roots.find(path, saltenv='base')`

Return a dict of the files located with the given path and environment

`salt.wheel.file_roots.list_env(saltenv='base')`

Return all of the file paths found in an environment

`salt.wheel.file_roots.list_roots()`

Return all of the files names in all available environments

`salt.wheel.file_roots.read(path, saltenv='base')`

Read the contents of a text file, if the file is binary then

`salt.wheel.file_roots.write(data, path, saltenv='base', index=0)`

Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

### 21.23.4 salt.wheel.key

Wheel system wrapper for the Salt key system to be used in interactions with the Salt Master programmatically.

The key module for the wheel system is meant to provide an internal interface for other Salt systems to interact with the Salt Master. The following usage examples assume that a `WheelClient` is available:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

Note that importing and using the `WheelClient` must be performed on the same machine as the Salt Master and as the same user that runs the Salt Master, unless `external_auth` is configured and the user is authorized to execute wheel functions.

The function documentation starts with the `wheel` reference from the code sample above and use the `WheelClient` functions to show how they can be called from a Python interpreter.

The wheel key functions can also be called via a `salt` command at the CLI using the *saltutil execution module*.

`salt.wheel.key.accept(match, include_rejected=False, include_denied=False)`

Accept keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to accept.

**include\_rejected** To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd('key.accept', ['minion1'])
{'minions': ['minion1']}
```

`salt.wheel.key.accept_dict(match, include_rejected=False, include_denied=False)`

Accept keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to accept.

**include\_rejected** To include rejected keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

Example to move a list of keys from the `minions_pre` (pending) directory to the `minions` (accepted) directory:

```
>>> wheel.cmd('key.accept_dict',
{
 'minions_pre': [
 'jerry',
 'stuart',
 'bob',
],
})
{'minions': ['jerry', 'stuart', 'bob']}
```

`salt.wheel.key.delete(match)`

Delete keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

**salt.wheel.key.delete\_dict(match)**

Delete keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to delete.

```
>>> wheel.cmd_async({'fun': 'key.delete_dict',
'match': {
 'minions': [
 'jerry',
 'stuart',
 'bob',
],
}})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

**salt.wheel.key.finger(match, hash\_type=None)**

Return the matching key fingerprints. Returns a dictionary.

**match** The key for with to retrieve the fingerprint.

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger', ['minion1'])
{'minions': {'minion1': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**salt.wheel.key.finger\_master(hash\_type=None)**

Return the fingerprint of the master's public key

**hash\_type** The hash algorithm used to calculate the fingerprint

```
>>> wheel.cmd('key.finger_master')
{'local': {'master.pub': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**salt.wheel.key.gen(id\_=None, keysize=2048)**

Generate a key pair. No keys are stored on the master. A key pair is returned as a dict containing pub and priv keys. Returns a dictionary containing the pub and priv keys with their generated values.

**id\_** Set a name to generate a key pair for use with salt. If not specified, a random name will be specified.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

```
>>> wheel.cmd('key.gen')
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmG8OrcUl10WHw09SDWL0lnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTBlx4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

**salt.wheel.key.gen\_accept(id\_, keysize=2048, force=False)**

Generate a key pair then accept the public key. This function returns the key pair in a dict, only the public key is preserved on the master. Returns a dictionary.

**id\_** The name of the minion for which to generate a key pair.

**keysize** The size of the key pair to generate. The size must be 2048, which is the default, or greater. If set to a value less than 2048, the key size will be rounded up to 2048.

**force** If a public key has already been accepted for the given minion on the master, then the `gen_accept` function will return an empty dictionary and not create a new key. This is the default behavior. If `force` is set to `True`, then the minion's previously accepted key will be overwritten.

```
>>> wheel.cmd('key.gen_accept', ['foo'])
{'pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBC
...
BBPfamX9gGPQTpN9e8HwcZjXQnmg80rcUl10WHw09SDWL0lnW+ueTWugEQpPt\niQIDAQAB\n
-----END PUBLIC KEY-----',
'priv': '-----BEGIN RSA PRIVATE KEY-----\nMIIEpAIBAAKCAQEA42Kf+w9XeZWgguzv
...
QH3/W74X1+WTB1x4R2KGLYBiH+bCCFEQ/Zvcu4Xp4bIOPtRKozEQ==\n
-----END RSA PRIVATE KEY-----'}
```

We can now see that the `foo` minion's key has been accepted by the master:

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['foo', 'minion1', 'minion2', 'minion3']}
```

**salt.wheel.key.gen\_keys**(*keydir=None, keyname=None, keysize=None, user=None*)

Generate minion RSA public keypair

**salt.wheel.key.gen\_signature**(*priv, pub, signature\_path, auto\_create=False, keysize=None*)

Generate master public-key-signature

**salt.wheel.key.key\_str**(*match*)

Return information about the key. Returns a dictionary.

**match** The key to return information about.

```
>>> wheel.cmd('key.key_str', ['minion1'])
{'minions': {'minion1': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0B
...
TWugEQpPt\niQIDAQAB\n-----END PUBLIC KEY-----'}}
```

**salt.wheel.key.list\_**(*match*)

List all the keys under a named status. Returns a dictionary.

**match** The type of keys to list. The `pre`, `un`, and `unaccepted` options will list unaccepted/unsigned keys. `acc` or `accepted` will list accepted/signed keys. `rej` or `rejected` will list rejected keys. Finally, `all` will list all keys.

```
>>> wheel.cmd('key.list', ['accepted'])
{'minions': ['minion1', 'minion2', 'minion3']}
```

**salt.wheel.key.list\_all**()

List all the keys. Returns a dictionary containing lists of the minions in each salt-key category, including `minions`, `minions_rejected`, `minions_denied`, etc. Returns a dictionary.

```
>>> wheel.cmd('key.list_all')
{'local': ['master.pem', 'master.pub'], 'minions_rejected': [],
'minions_denied': [], 'minions_pre': [],
'minions': ['minion1', 'minion2', 'minion3']}
```

**salt.wheel.key.master\_key\_str**()

Returns master's public key. Returns a dictionary

```
>>> wheel.cmd('key.master_key_str')
{'local': {'master.pub': '-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0B
```

(continues on next page)

(continued from previous page)

```
...
TWugEQpPt\niQIDAQAB\n-----END PUBLIC KEY-----'}}
```

**salt.wheel.key.name\_match**(*match*)

List all the keys based on a glob match

**salt.wheel.key.reject**(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a glob match. Returns a dictionary.

**match** The glob match of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

```
>>> wheel.cmd_async({'fun': 'key.reject', 'match': 'minion1'})
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

**salt.wheel.key.reject\_dict**(*match*, *include\_accepted=False*, *include\_denied=False*)

Reject keys based on a dict of keys. Returns a dictionary.

**match** The dictionary of keys to reject.

**include\_accepted** To include accepted keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

**include\_denied** To include denied keys in the match along with pending keys, set this to `True`. Defaults to `False`.

New in version 2016.3.4.

```
>>> wheel.cmd_async({'fun': 'key.reject_dict',
'match': {
 'minions': [
 'jerry',
 'stuart',
 'bob',
],
}},
{'jid': '20160826201244808521', 'tag': 'salt/wheel/20160826201244808521'}
```

### 21.23.5 salt.wheel.minions

Wheel system wrapper for connected minions

`salt.wheel.minions.connected()`  
List all connected minions on a salt-master

### 21.23.6 salt.wheel.pillar\_roots

The *pillar\_roots* wheel module is used to manage files under the pillar roots directories on the master server.

`salt.wheel.pillar_roots.find(path, saltenv='base')`  
Return a dict of the files located with the given path and environment

`salt.wheel.pillar_roots.list_env(saltenv='base')`  
Return all of the file paths found in an environment

`salt.wheel.pillar_roots.list_roots()`  
Return all of the files names in all available environments

`salt.wheel.pillar_roots.read(path, saltenv='base')`  
Read the contents of a text file, if the file is binary then

`salt.wheel.pillar_roots.write(data, path, saltenv='base', index=0)`  
Write the named file, by default the first file found is written, but the index of the file can be specified to write to a lower priority file root

## 22.1 Python client API

Salt provides several entry points for interfacing with Python applications. These entry points are often referred to as `*Client()` APIs. Each client accesses different parts of Salt, either from the master or from a minion. Each client is detailed below.

See also:

There are many ways to access Salt programmatically.

Salt can be used from CLI scripts as well as via a REST interface.

See Salt's [outputter system](#) to retrieve structured data from Salt as JSON, or as shell-friendly text, or many other formats.

See the [state.event](#) runner to utilize Salt's event bus from shell scripts.

Salt's [netapi module](#) provides access to Salt externally via a REST interface. Review the [netapi module](#) documentation for more information.

### 22.1.1 Salt's `opts` dictionary

Some clients require access to Salt's `opts` dictionary. (The dictionary representation of the [master](#) or [minion](#) config files.)

A common pattern for fetching the `opts` dictionary is to defer to environment variables if they exist or otherwise fetch the config from the default location.

```
salt.config.client_config(path, env_var='SALT_CLIENT_CONFIG', defaults=None)
```

Load Master configuration data

Usage:

```
import salt.config
master_opts = salt.config.client_config('/etc/salt/master')
```

Returns a dictionary of the Salt Master configuration file with necessary options needed to communicate with a locally-running Salt Master daemon. This function searches for client specific configurations and adds them to the data from the master configuration.

This is useful for master-side operations like [LocalClient](#).

```
salt.config.minion_config(path, env_var='SALT_MINION_CONFIG', defaults=None,
 cache_minion_id=False, ignore_config_errors=True, minion_id=None,
 role='minion')
```

Reads in the minion configuration file and sets up special options

This is useful for Minion-side operations, such as the [Caller](#) class, and manually running the loader interface.

```
import salt.config
minion_opts = salt.config.minion_config('/etc/salt/minion')
```

## 22.1.2 Salt's Loader Interface

Modules in the Salt ecosystem are loaded into memory using a custom loader system. This allows modules to have conditional requirements (OS, OS version, installed libraries, etc) and allows Salt to inject special variables (`__salt__`, `__opts__`, etc).

Most modules can be manually loaded. This is often useful in third-party Python apps or when writing tests. However some modules require and expect a full, running Salt system underneath. Notably modules that facilitate master-to-minion communication such as the [mine](#), [publish](#), and [peer](#) execution modules. The error `KeyError: 'master_uri'` is a likely indicator for this situation. In those instances use the [Caller](#) class to execute those modules instead.

Each module type has a corresponding loader function.

```
salt.loader.minion_mods(opts, context=None, utils=None, whitelist=None, initial_load=False,
 loaded_base_name=None, notify=False, static_modules=None, proxy=None)
```

Load execution modules

Returns a dictionary of execution modules appropriate for the current system by evaluating the `__virtual__()` function in each module.

### Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **context** (*dict*) -- A Salt context that should be made present inside generated modules in `__context__`
- **utils** (*dict*) -- Utility functions which should be made available to Salt modules in `__utils__`. See `utils_dirs` in `salt.config` for additional information about configuration.
- **whitelist** (*list*) -- A list of modules which should be whitelisted.
- **initial\_load** (*bool*) -- Deprecated flag! Unused.
- **loaded\_base\_name** (*str*) -- A string marker for the loaded base name.
- **notify** (*bool*) -- Flag indicating that an event should be fired upon completion of module loading.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
__opts__['grains'] = __grains__
__utils__ = salt.loader.utils(__opts__)
__salt__ = salt.loader.minion_mods(__opts__, utils=__utils__)
__salt__['test.ping']()
```

```
salt.loader.raw_mod(opts, name, functions, mod='modules')
```

Returns a single module loaded raw and bypassing the `__virtual__` function

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
testmod = salt.loader.raw_mod(__opts__, 'test', None)
testmod['test.ping']()
```

`salt.loader.states`(*opts*, *functions*, *utils*, *serializers*, *whitelist=None*, *proxy=None*, *context=None*)

Returns the state modules

Parameters

- **opts** (*dict*) -- The Salt options dictionary
- **functions** (*dict*) -- A dictionary of minion modules, with module names as keys and funcs as values.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
statemods = salt.loader.states(__opts__, None, None)
```

`salt.loader.grains`(*opts*, *force\_refresh=False*, *proxy=None*)

Return the functions for the dynamic grains and the values for the static grains.

Since grains are computed early in the startup process, grains functions do not have `__salt__` or `__proxy__` available. At proxy-minion startup, this function is called with the proxymodule LazyLoader object so grains functions can communicate with their controlled device.

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
__grains__ = salt.loader.grains(__opts__)
print __grains__['id']
```

`salt.loader.grain_funcs`(*opts*, *proxy=None*)

Returns the grain functions

```
import salt.config
import salt.loader

__opts__ = salt.config.minion_config('/etc/salt/minion')
grainfuncs = salt.loader.grain_funcs(__opts__)
```

### 22.1.3 Salt's Client Interfaces

#### LocalClient

**class** `salt.client.LocalClient`(*c\_path='/etc/salt/master'*, *mopts=None*, *skip\_perm\_errors=False*, *io\_loop=None*, *keep\_loop=False*, *auto\_reconnect=False*)

The interface used by the **salt** CLI tool on the Salt Master

`LocalClient` is used to send a command to Salt minions to execute *execution modules* and return the results to the Salt Master.

Importing and using `LocalClient` must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. (Unless *external\_auth* is configured and

authentication credentials are included in the execution).

---

**Note:** The LocalClient uses a Tornado IOloop, this can create issues when using the LocalClient inside an existing IOloop. If creating the LocalClient in partnership with another IOloop either create the IOloop before creating the LocalClient, or when creating the IOloop use `ioloop.current()` which will return the ioloop created by LocalClient.

---

```
import salt.client

local = salt.client.LocalClient()
local.cmd('*', 'test.fib', [10])
```

**cmd**(tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", jid="", full\_return=False, kwarg=None, \*\*kwargs)

Synchronously execute a command on targeted minions

The cmd method will execute and wait for the timeout period for all minions to reply, then it will return all minion data at once.

```
>>> import salt.client
>>> local = salt.client.LocalClient()
>>> local.cmd('*', 'cmd.run', ['whoami'])
{'jerry': 'root'}
```

With extra keyword arguments for the command function to be run:

```
local.cmd('*', 'test.arg', [arg1, arg2], kwarg={'foo': 'bar'})
```

Compound commands can be used for multiple executions in a single publish. Function names and function arguments are provided in separate lists but the index values must correlate and an empty list must be used if no arguments are required.

```
>>> local.cmd('*', [
 'grains.items',
 'sys.doc',
 'cmd.run',
],
[
 [],
 [],
 ['uptime'],
])
```

#### Parameters

- **tgt** (*string or list*) -- Which minions to target for the execution. Default is shell glob. Modified by the `tgt_type` option.
- **fun** (*string or list of strings*) -- The module and function to call on the specified minions of the form `module.function`. For example `test.ping` or `grains.items`.

**Compound commands** Multiple functions may be called in a single publish by passing a list of commands. This can dramatically lower overhead and speed up the application communicating with Salt.

This requires that the `arg` param is a list of lists. The `fun` list and the `arg` list must correlate by index meaning a function that does not take

arguments must still have a corresponding empty list at the expected index.

- **arg** (*list* or *list-of-lists*) -- A list of arguments to pass to the remote function. If the function takes no arguments **arg** may be omitted except when executing a compound command.
- **timeout** -- Seconds to wait after the last minion returns but before all minions return.
- **tgt\_type** -- The type of **tgt**. Allowed values:
  - **glob** - Bash glob completion - Default
  - **pcr** - Perl style regular expression
  - **list** - Python list of hosts
  - **grain** - Match based on a grain comparison
  - **grain\_pcr** - Grain comparison with a regex
  - **pillar** - Pillar data comparison
  - **pillar\_pcr** - Pillar data comparison with a regex
  - **nodegroup** - Match on nodegroup
  - **range** - Use a Range server for matching
  - **compound** - Pass a compound match string
  - **ipcidr** - Match based on Subnet (CIDR notation) or IPv4 address.

Changed in version 2017.7.0: Renamed from `expr_form` to `tgt_type`

- **ret** -- The returner to use. The value passed can be single returner, or a comma delimited list of returners to call in order on the minions
- **kwarg** -- A dictionary with keyword arguments for the function.
- **full\_return** -- Output the job return only (default) or the full return including exit code and other job metadata.
- **kwargs** -- Optional keyword arguments. Authentication credentials may be passed when using [external\\_auth](#).

For example: `local.cmd('*', 'test.ping', username='saltdev', password='saltdev', eauth='pam')`. Or: `local.cmd('*', 'test.ping', token='5871821ea51754fdcea8153c1c745433')`

**Returns** A dictionary with the result of the execution, keyed by minion ID. A compound command will return a sub-dictionary keyed by function name.

**cmd\_async** (*tgt, fun, arg=()*, *tgt\_type='glob'*, *ret=""*, *jid=""*, *kwarg=None*, *\*\*kwargs*)  
Asynchronously send a command to connected minions

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A job ID or 0 on failure.

```
>>> local.cmd_async('*', 'test.sleep', [300])
'20131219215921857715'
```

**cmd\_batch** (*tgt, fun, arg=()*, *tgt\_type='glob'*, *ret=""*, *kwarg=None*, *batch='10%'*, *\*\*kwargs*)  
Iteratively execute a command on subsets of minions at a time

The function signature is the same as `cmd()` with the following exceptions.

**Parameters batch** -- The batch identifier of systems to execute on

**Returns** A generator of minion returns

```
>>> returns = local.cmd_batch('*', 'state.highstate', batch='10%')
>>> for ret in returns:
... print(ret)
{'jerry': {...}}
{'dave': {...}}
{'stewart': {...}}
```

**cmd\_iter**(tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", kwarg=None, \*\*kwargs)

Yields the individual minion returns as they come in

The function signature is the same as `cmd()` with the following exceptions.

Normally `cmd_iter()` does not yield results for minions that are not connected. If you want it to return results for disconnected minions set `expect_minions=True` in `kwargs`.

**Returns** A generator yielding the individual minion returns

```
>>> ret = local.cmd_iter('*', 'test.ping')
>>> for i in ret:
... print(i)
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
{'stewart': {'ret': True}}
```

**cmd\_iter\_no\_block**(tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", kwarg=None, show\_jid=False, verbose=False, \*\*kwargs)

Yields the individual minion returns as they come in, or `None` when no returns are available.

The function signature is the same as `cmd()` with the following exceptions.

**Returns** A generator yielding the individual minion returns, or `None` when no returns are available. This allows for actions to be injected in between minion returns.

```
>>> ret = local.cmd_iter_no_block('*', 'test.ping')
>>> for i in ret:
... print(i)
None
{'jerry': {'ret': True}}
{'dave': {'ret': True}}
None
{'stewart': {'ret': True}}
```

**cmd\_subset**(tgt, fun, arg=(), tgt\_type='glob', ret="", kwarg=None, subset=3, cli=False, progress=False, full\_return=False, \*\*kwargs)

Execute a command on a random subset of the targeted systems

The function signature is the same as `cmd()` with the following exceptions.

**Parameters**

- **subset** -- The number of systems to execute on
- **cli** -- When this is set to `True`, a generator is returned, otherwise a dictionary of the minion returns is returned

```
>>> SLC.cmd_subset('*', 'test.ping', subset=1)
{'jerry': True}
```

**get\_cli\_returns**(jid, minions, timeout=None, tgt='\*', tgt\_type='glob', verbose=False, show\_jid=False, \*\*kwargs)

Starts a watcher looking at the return data for a specified JID

**Returns** all of the information for the JID

**get\_event\_iter\_returns**(jid, minions, timeout=None)

Gather the return data from the event system, break hard when timeout is reached.

**run\_job**(tgt, fun, arg=(), tgt\_type='glob', ret="", timeout=None, jid="", kwarg=None, listen=False, \*\*kwargs)

Asynchronously send a command to connected minions

Prep the job directory and publish a command to any targeted minions.

**Returns** A dictionary of (validated) `pub_data` or an empty dictionary on failure. The `pub_data` contains the job ID and a list of all minions that are expected to return data.

```
>>> local.run_job('*', 'test.sleep', [300])
{'jid': '20131219215650131543', 'minions': ['jerry']}
```

## Salt Caller

**class** `salt.client.Caller`(*c\_path='/etc/salt/minion', mopts=None*)

Caller is the same interface used by the **salt-call** command-line tool on the Salt Minion.

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

Importing and using `Caller` must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to `'local'`. The same can be achieved at the Python level by including that setting in a minion config file.

New in version 2014.7.0: Pass the minion config as the `mopts` dictionary.

```
import salt.client
import salt.config
__opts__ = salt.config.minion_config('/etc/salt/minion')
__opts__['file_client'] = 'local'
caller = salt.client.Caller(mopts=__opts__)
```

**cmd**(*fun, \*args, \*\*kwargs*)

Call an execution module with the given arguments and keyword arguments

Changed in version 2015.8.0: Added the `cmd` method for consistency with the other Salt clients. The existing `function` and `sminion.functions` interfaces still exist but have been removed from the docs.

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
 data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

## Salt Proxy Caller

**class** salt.client.ProxyCaller(*c\_path='/etc/salt/proxy', mopts=None*)

ProxyCaller is the same interface used by the **salt-call** with the args `--proxyid <proxyid>` command-line tool on the Salt Proxy Minion.

Importing and using ProxyCaller must be done on the same machine as a Salt Minion and it must be done using the same user that the Salt Minion is running as.

Usage:

```
import salt.client
caller = salt.client.Caller()
caller.cmd('test.ping')
```

Note, a running master or minion daemon is not required to use this class. Running `salt-call --local` simply sets `file_client` to 'local'. The same can be achieved at the Python level by including that setting in a minion config file.

```
import salt.client
import salt.config
__opts__ = salt.config.proxy_config('/etc/salt/proxy', minion_id='quirky_edison')
__opts__['file_client'] = 'local'
caller = salt.client.ProxyCaller(mopts=__opts__)
```

---

**Note:** To use this for calling proxies, the `is_proxy` functions requires that `--proxyid` be an argument on the commandline for the script this is used in, or that the string `proxy` is in the name of the script.

---

**cmd**(*fun, \*args, \*\*kwargs*)

Call an execution module with the given arguments and keyword arguments

```
caller.cmd('test.arg', 'Foo', 'Bar', baz='Baz')

caller.cmd('event.send', 'myco/myevent/something',
 data={'foo': 'Foo'}, with_env=['GIT_COMMIT'], with_grains=True)
```

## RunnerClient

**class** salt.runner.RunnerClient(*opts, context=None*)

The interface used by the **salt-run** CLI tool on the Salt Master

It executes *runner modules* which run on the Salt Master.

Importing and using RunnerClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as.

Salt's *external\_auth* can be used to authenticate calls. The eauth user must be authorized to execute runner modules: (@runner). Only the `master_call()` below supports eauth.

**asynchronous** (*fun, low, user='UNKNOWN', pub=None, local=True*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** (*fun, arg=None, pub\_data=None, kwarg=None, print\_event=True, full\_return=False*)

Execute a function

**cmd\_async** (*low*)

Execute a runner function asynchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_async({
 'fun': 'jobs.list_jobs',
 'username': 'saltdev',
 'password': 'saltdev',
 'eauth': 'pam',
})
```

**cmd\_sync** (*low*, *timeout=None*, *full\_return=False*)

Execute a runner function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@runner).

```
runner.eauth_sync({
 'fun': 'jobs.list_jobs',
 'username': 'saltdev',
 'password': 'saltdev',
 'eauth': 'pam',
})
```

## WheelClient

**class** salt.wheel.WheelClient(*opts=None*)

An interface to Salt's wheel modules

*Wheel modules* interact with various parts of the Salt Master.

Importing and using WheelClient must be done on the same machine as the Salt Master and it must be done using the same user that the Salt Master is running as. Unless *external\_auth* is configured and the user is authorized to execute wheel functions: (@wheel).

Usage:

```
import salt.config
import salt.wheel
opts = salt.config.master_config('/etc/salt/master')
wheel = salt.wheel.WheelClient(opts)
```

**asynchronous** (*fun*, *low*, *user='UNKNOWN'*, *pub=None*, *local=True*)

Execute the function in a multiprocess and return the event tag to use to watch for the return

**cmd** (*fun*, *arg=None*, *pub\_data=None*, *kwarg=None*, *print\_event=True*, *full\_return=False*)

Execute a function

```
>>> wheel.cmd('key.finger', ['jerry'])
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

**cmd\_async** (*low*)

Execute a function asynchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized

```
>>> wheel.cmd_async({
 'fun': 'key.finger',
 'match': 'jerry',
```

(continues on next page)

(continued from previous page)

```
'eauth': 'auto',
'username': 'saltdev',
'password': 'saltdev',
})
{'jid': '20131219224744416681', 'tag': 'salt/wheel/20131219224744416681'}
```

**cmd\_sync** (*low*, *timeout=None*, *full\_return=False*)

Execute a wheel function synchronously; eauth is respected

This function requires that *external\_auth* is configured and the user is authorized to execute runner functions: (@wheel).

```
>>> wheel.cmd_sync({
'fun': 'key.finger',
'match': 'jerry',
'eauth': 'auto',
'username': 'saltdev',
'password': 'saltdev',
})
{'minions': {'jerry': '5d:f6:79:43:5e:d4:42:3f:57:b8:45:a8:7e:a4:6e:ca'}}
```

## CloudClient

**class** salt.cloud.**CloudClient** (*path=None*, *opts=None*, *config\_dir=None*, *pillars=None*)

The client class to wrap cloud interactions

**action** (*fun=None*, *cloudmap=None*, *names=None*, *provider=None*, *instance=None*, *kwargs=None*)

Execute a single action via the cloud plugin backend

Examples:

```
client.action(fun='show_instance', names=['myinstance'])
client.action(fun='show_image', provider='my-ec2-config',
 kwargs={'image': 'ami-10314d79'})
)
```

**create** (*provider*, *names*, *\*\*kwargs*)

Create the named VMs, without using a profile

Example:

```
client.create(provider='my-ec2-config', names=['myinstance'],
 image='ami-1624987f', size='t1.micro', ssh_username='ec2-user',
 securitygroup='default', delvol_on_destroy=True)
```

**destroy** (*names*)

Destroy the named VMs

**extra\_action** (*names*, *provider*, *action*, *\*\*kwargs*)

Perform actions with block storage devices

Example:

```
client.extra_action(names=['myblock'], action='volume_create',
 provider='my-nova', kwargs={'voltype': 'SSD', 'size': 1000})
)
```

(continues on next page)

(continued from previous page)

```
client.extra_action(names=['salt-net'], action='network_create',
 provider='my-nova', kwargs={'cidr': '192.168.100.0/24'})
)
```

**full\_query** (*query\_type='list\_nodes\_full'*)

Query all instance information

**list\_images** (*provider=None*)

List all available images in configured cloud systems

**list\_locations** (*provider=None*)

List all available locations in configured cloud systems

**list\_sizes** (*provider=None*)

List all available sizes in configured cloud systems

**low** (*fun, low*)

Pass the cloud function and low data structure to run

**map\_run** (*path=None, \*\*kwargs*)

To execute a map

**min\_query** (*query\_type='list\_nodes\_min'*)

Query select instance information

**profile** (*profile, names, vm\_overrides=None, \*\*kwargs*)

Pass in a profile to create, names is a list of vm names to allocate

vm\_overrides is a special dict that will be per node options overrides

Example:

```
>>> client= salt.cloud.CloudClient(path='/etc/salt/cloud')
>>> client.profile('do_512_git', names=['minion01',])
{'minion01': {'backups_active': 'False',
 'created_at': '2014-09-04T18:10:15Z',
 'droplet': {'event_id': 31000502,
 'id': 2530006,
 'image_id': 5140006,
 'name': 'minion01',
 'size_id': 66},
 'id': '2530006',
 'image_id': '5140006',
 'ip_address': '107.XXX.XXX.XXX',
 'locked': 'True',
 'name': 'minion01',
 'private_ip_address': None,
 'region_id': '4',
 'size_id': '66',
 'status': 'new'}}
```

**query** (*query\_type='list\_nodes'*)

Query basic instance information

**select\_query** (*query\_type='list\_nodes\_select'*)

Query select instance information

## SSHClient

**class** salt.client.ssh.client.**SSHClient**(*c\_path='/etc/salt/master', mopts=None, disable\_custom\_roster=False*)

Create a client object for executing routines via the salt-ssh backend

New in version 2015.5.0.

**cmd**(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', kwarg=None, \*\*kwargs*)

Execute a single command via the salt-ssh subsystem and return all routines at once

New in version 2015.5.0.

**cmd\_iter**(*tgt, fun, arg=(), timeout=None, tgt\_type='glob', ret="", kwarg=None, \*\*kwargs*)

Execute a single command via the salt-ssh subsystem and return a generator

New in version 2015.5.0.

## 22.2 netapi modules

### 22.2.1 Introduction to netapi modules

netapi modules provide API-centric access to Salt. Usually externally-facing services such as REST or WebSockets, XMPP, XMLRPC, etc.

In general netapi modules bind to a port and start a service. They are purposefully open-ended. A single module can be configured to run as well as multiple modules simultaneously.

netapi modules are enabled by adding configuration to your Salt Master config file and then starting the **salt-api** daemon. Check the docs for each module to see external requirements and configuration settings.

Communication with Salt and Salt satellite projects is done using Salt's own *Python API*. A list of available client interfaces is below.

---

#### salt-api

Prior to Salt's 2014.7.0 release, netapi modules lived in the separate sister projected **salt-api**. That project has been merged into the main Salt project.

---

See also:

*The full list of netapi modules*

### 22.2.2 Client interfaces

Salt's client interfaces expose executing functions by crafting a dictionary of values that are mapped to function arguments. This allows calling functions simply by creating a data structure. (And this is exactly how much of Salt's own internals work!)

**class** salt.netapi.**NetapiClient**(*opts*)

Provide a uniform method of accessing the various client interfaces in Salt in the form of low-data data structures. For example:

```
>>> client = NetapiClient(__opts__)
>>> lowstate = {'client': 'local', 'tgt': '*', 'fun': 'test.ping', 'arg': ''}
>>> client.run(lowstate)
```

**local**(*\*args, \*\*kwargs*)

Run *execution modules* synchronously

See `salt.client.LocalClient.cmd()` for all available parameters.

Sends a command from the master to the targeted minions. This is the same interface that Salt's own CLI uses. Note the `arg` and `kwarg` parameters are sent down to the minion(s) and the given function, `fun`, is called with those parameters.

**Returns** Returns the result from the execution module

**local\_async**(*\*args, \*\*kwargs*)

Run *execution modules* asynchronously

Wraps `salt.client.LocalClient.run_job()`.

**Returns** job ID

**local\_subset**(*\*args, \*\*kwargs*)

Run *execution modules* against subsets of minions

New in version 2016.3.0.

Wraps `salt.client.LocalClient.cmd_subset()`

**runner**(*fun, timeout=None, full\_return=False, \*\*kwargs*)

Run *runner modules* <all-salt.runners> synchronously

Wraps `salt.runner.RunnerClient.cmd_sync()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the runner module

**runner\_async**(*fun, \*\*kwargs*)

Run *runner modules* <all-salt.runners> asynchronously

Wraps `salt.runner.RunnerClient.cmd_async()`.

Note that runner functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** event data and a job ID for the executed function.

**ssh**(*\*args, \*\*kwargs*)

Run salt-ssh commands synchronously

Wraps `salt.client.ssh.client.SSHClient.cmd_sync()`.

**Returns** Returns the result from the salt-ssh command

**wheel**(*fun, \*\*kwargs*)

Run *wheel modules* synchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

**wheel\_async**(*fun, \*\*kwargs*)

Run *wheel modules* asynchronously

Wraps `salt.wheel.WheelClient.master_call()`.

Note that wheel functions must be called using keyword arguments. Positional arguments are not supported.

**Returns** Returns the result from the wheel module

## Writing netapi modules

netapi modules, put simply, bind a port and start a service. They are purposefully open-ended and can be used to present a variety of external interfaces to Salt, and even present multiple interfaces at once.

See also:

*The full list of netapi modules*

## Configuration

All netapi configuration is done in the *Salt master config* and takes a form similar to the following:

```
rest_cherrypy:
 port: 8000
 debug: True
 ssl_cert: /etc/pki/tls/certs/localhost.crt
 ssl_key: /etc/pki/tls/certs/localhost.key
```

## The \_\_virtual\_\_ function

Like all module types in Salt, netapi modules go through Salt's loader interface to determine if they should be loaded into memory and then executed.

The `__virtual__` function in the module makes this determination and should return `False` or a string that will serve as the name of the module. If the module raises an `ImportError` or any other errors, it will not be loaded.

## The start function

The `start()` function will be called for each netapi module that is loaded. This function should contain the server loop that actually starts the service. This is started in a multiprocessing.

## Multiple instances

New in version 2016.11.0.

*rest\_cherrypy* and *rest\_tornado* support running multiple instances by copying and renaming entire directory of those. To start the copied multiple netapi modules, add configuration blocks for the copied netapi modules in the Salt Master config. The name of each added configuration block must match with the name of each directory of the copied netapi module.

## Inline documentation

As with the rest of Salt, it is a best-practice to include liberal inline documentation in the form of a module docstring and docstrings on any classes, methods, and functions in your netapi module.

### Loader “magic” methods

The loader makes the `__opts__` data structure available to any function in a `netapi` module.

## ARCHITECTURE

If you are used to configuration management tools that require you to plan down to the last detail before you install anything, you are probably wondering why this section doesn't appear before the installation instructions. With Salt, you can switch to a high availability architecture at any time, and add additional components to scale your deployment as you go.

Since a single Salt master can manage thousands of systems, we usually recommend that you start by deploying a single Salt master, and then modifying your deployment as needed for redundancy, geographical distribution, and scale.

### 23.1 High Availability Features in Salt

Salt supports several features for high availability and fault tolerance. Brief documentation for these features is listed alongside their configuration parameters in *Configuration file examples*.

#### 23.1.1 Multimaster

Salt minions can connect to multiple masters at one time by configuring the *master* configuration parameter as a YAML list of all the available masters. By default, all masters are "hot", meaning that any master can direct commands to the Salt infrastructure.

In a multimaster configuration, each master must have the same cryptographic keys, and minion keys must be accepted on all masters separately. The contents of *file\_roots* and *pillar\_roots* need to be kept in sync with processes external to Salt as well.

A tutorial on setting up multimaster with "hot" masters is here:

*Multimaster Tutorial*

#### 23.1.2 Multimaster with Failover

Changing the *master\_type* parameter from *str* to *failover* will cause minions to connect to the first responding master in the list of masters. Every *master\_alive\_interval* seconds the minions will check to make sure the current master is still responding. If the master does not respond, the minion will attempt to connect to the next master in the list. If the minion runs out of masters, the list will be recycled in case dead masters have been restored. Note that *master\_alive\_interval* must be present in the minion configuration, or else the recurring job to check master status will not get scheduled.

Failover can be combined with PKI-style encrypted keys, but PKI is NOT REQUIRED to use failover.

Multimaster with PKI and Failover is discussed in *this tutorial*

`master_type: failover` can be combined with `master_shuffle: True` to spread minion connections across all masters (one master per minion, not each minion connecting to all masters). Adding Salt Syndics into the mix makes it possible to create a load-balanced Salt infrastructure. If a master fails, minions will notice and select another master from the available list.

### 23.1.3 Syndic

Salt's Syndic feature is a way to create differing infrastructure topologies. It is not strictly an HA feature, but can be treated as such.

With the syndic, a Salt infrastructure can be partitioned in such a way that certain masters control certain segments of the infrastructure, and "Master of Masters" nodes can control multiple segments underneath them.

Syndics are covered in depth in [Salt Syndic](#).

### 23.1.4 Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Syndics are covered in depth in [Salt Syndic](#).

## 23.2 Salt Syndic

The most basic or typical Salt topology consists of a single Master node controlling a group of Minion nodes. An intermediate node type, called Syndic, when used offers greater structural flexibility and scalability in the construction of Salt topologies than topologies constructed only out of Master and Minion node types.

A Syndic node can be thought of as a special passthrough Minion node. A Syndic node consists of a `salt-syndic` daemon and a `salt-master` daemon running on the same system. The `salt-master` daemon running on the Syndic node controls a group of lower level Minion nodes and the `salt-syndic` daemon connects higher level Master node, sometimes called a Master of Masters.

The `salt-syndic` daemon relays publications and events between the Master node and the local `salt-master` daemon. This gives the Master node control over the Minion nodes attached to the `salt-master` daemon running on the Syndic node.

### 23.2.1 Configuring the Syndic

To setup a Salt Syndic you need to tell the Syndic node and its Master node about each other. If your Master node is located at `10.10.0.1`, then your configurations would be:

On the Syndic node:

```
/etc/salt/master
syndic_master: 10.10.0.1 # may be either an IP address or a hostname
```

```
/etc/salt/minion
id is shared by the salt-syndic daemon and a possible salt-minion daemon
```

(continues on next page)

(continued from previous page)

```
on the Syndic node
id: my_syndic
```

On the Master node:

```
/etc/salt/master
order_masters: True
```

The `syndic_master` option tells the Syndic node where to find the Master node in the same way that the `master` option tells a Minion node where to find a Master node.

The `id` option is used by the `salt-syndic` daemon to identify with the Master node and if unset will default to the hostname or IP address of the Syndic just as with a Minion.

The `order_masters` option configures the Master node to send extra information with its publications that is needed by Syndic nodes connected directly to it.

---

**Note:** Each Syndic must provide its own `file_roots` directory. Files will not be automatically transferred from the Master node.

---

### 23.2.2 Configuring the Syndic with Multimaster

New in version 2015.5.0.

Syndic with Multimaster lets you connect a syndic to multiple masters to provide an additional layer of redundancy in a syndic configuration.

Higher level masters should first be configured in a multimaster configuration. See [Multimaster Tutorial](#).

On the syndic, the `syndic_master` option is populated with a list of the higher level masters.

Since each syndic is connected to each master, jobs sent from any master are forwarded to minions that are connected to each syndic. If the `master_id` value is set in the master config on the higher level masters, job results are returned to the master that originated the request in a best effort fashion. Events/jobs without a `master_id` are returned to any available master.

### 23.2.3 Running the Syndic

The `salt-syndic` daemon is a separate process that needs to be started in addition to the `salt-master` daemon running on the Syndic node. Starting the `salt-syndic` daemon is the same as starting the other Salt daemons.

The Master node in many ways sees the Syndic as an ordinary Minion node. In particular, the Master will need to accept the Syndic's Minion key as it would for any other Minion.

On the Syndic node:

```
salt-syndic
or
service salt-syndic start
```

On the Master node:

```
salt-key -a my_syndic
```

The Master node will now be able to control the Minion nodes connected to the Syndic. Only the Syndic key will be listed in the Master node's key registry but this also means that key activity between the Syndic's Minions and the Syndic does not encumber the Master node. In this way, the Syndic's key on the Master node can be thought of as a placeholder for the keys of all the Minion and Syndic nodes beneath it, giving the Master node a clear, high level structural view on the Salt cluster.

On the Master node:

```
salt-key -L
Accepted Keys:
my_syndic
Denied Keys:
Unaccepted Keys:
Rejected Keys:

salt '*' test.version
minion_1:
 2018.3.4
minion_2:
 2018.3.4
minion_4:
 2018.3.4
minion_3:
 2018.3.4
```

### 23.2.4 Topology

A Master node (a node which is itself not a Syndic to another higher level Master node) must run a `salt-master` daemon and optionally a `salt-minion` daemon.

A Syndic node must run `salt-syndic` and `salt-master` daemons and optionally a `salt-minion` daemon.

A Minion node must run a `salt-minion` daemon.

When a `salt-master` daemon issues a command, it will be received by the Syndic and Minion nodes directly connected to it. A Minion node will process the command in the way it ordinarily would. On a Syndic node, the `salt-syndic` daemon will relay the command to the `salt-master` daemon running on the Syndic node, which then propagates the command to the Minions and Syndics connected to it.

When events and job return data are generated by `salt-minion` daemons, they are aggregated by the `salt-master` daemon they are connected to, which `salt-master` daemon then relays the data back through its `salt-syndic` daemon until the data reaches the Master or Syndic node that issued the command.

### 23.2.5 Syndic wait

`syndic_wait` is a master configuration file setting that specifies the number of seconds the Salt client should wait for additional syndics to check in with their lists of expected minions before giving up. This value defaults to 5 seconds.

The `syndic_wait` setting is necessary because the higher-level master does not have a way of knowing which minions are below the syndics. The higher-level master has its own list of expected minions and the masters below them have their own lists as well, so the Salt client does not how long to wait for all returns. The `syndic_wait` option allows time for all minions to return to the Salt client.

---

**Note:** To reduce the amount of time the CLI waits for Minions to respond, install a Minion on the Syndic or tune the value of the `syndic_wait` configuration.

---

While it is possible to run a Syndic without a Minion installed on the same system, it is recommended, for a faster CLI response time, to do so. Without a Minion installed on the Syndic node, the timeout value of `syndic_wait` increases significantly - about three-fold. With a Minion installed on the Syndic, the CLI timeout resides at the value defined in `syndic_wait`.

---

**Note:** If you have a very large infrastructure or many layers of Syndics, you may find that the CLI doesn't wait long enough for the Syndics to return their events. If you think this is the case, you can set the `syndic_wait` value in the Master configs on the Master or Syndic nodes from which commands are executed. The default value is 5, and should work for the majority of deployments.

---

In order for a Master or Syndic node to return information from Minions that are below their Syndics, the CLI requires a short wait time in order to allow the Syndics to gather responses from their Minions. This value is defined in the `syndic_wait` config option and has a default of five seconds.

### 23.2.6 Syndic config options

These are the options that can be used to configure a Syndic node. Note that other than `id`, Syndic config options are placed in the Master config on the Syndic node.

- `id`: Syndic id (shared by the `salt-syndic` daemon with a potential `salt-minion` daemon on the same system)
- `syndic_master`: Master node IP address or hostname
- `syndic_master_port`: Master node `ret_port`
- `syndic_log_file`: path to the logfile (absolute or not)
- `syndic_pidfile`: path to the pidfile (absolute or not)
- `syndic_wait`: time in seconds to wait on returns from this syndic

### 23.2.7 Minion Data Cache

Beginning with Salt 2016.11.0, the *Pluggable Minion Data Cache* was introduced. The minion data cache contains the Salt Mine data, minion grains, and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module, but other external data stores can be used instead.

Using a pluggable minion cache modules allows for the data stored on a Salt Master about Salt Minions to be replicated on other Salt Masters the Minion is connected to. Please see the *Minion Data Cache* documentation for more information and configuration examples.

## MINION DATA CACHE

New in version 2016.11.0.

The Minion data cache contains the Salt Mine data, minion grains and minion pillar information cached on the Salt Master. By default, Salt uses the `localfs` cache module to save the data in a `msgpack` file on the Salt Master.

### 24.1 Pluggable Data Cache

While the default Minion data cache is the `localfs` cache, other external data stores can also be used to store this data such as the `consul` module. To configure a Salt Master to use a different data store, the `cache` setting needs to be established:

```
cache: consul
```

The pluggable data cache streamlines using various Salt topologies such as a *Multi-Master* or *Salt Syndics* configuration by allowing the data stored on the Salt Master about a Salt Minion to be available to other Salt Syndics or Salt Masters that a Salt Minion is connected to.

Additional minion data cache modules can be easily created by modeling the custom data store after one of the existing cache modules.

See *cache modules* for a current list.

### 24.2 Configuring the Minion Data Cache

The default `localfs` Minion data cache module doesn't require any configuration. External data cache modules with external data stores such as Consul require a configuration setting in the master config.

Here's an example config for Consul:

```
consul.host: 127.0.0.1
consul.port: 8500
consul.token: None
consul.scheme: http
consul.consistency: default
consul.dc: dc1
consul.verify: True

cache: consul
```

## SLOTS

New in version 2018.3.0.

Changed in version 3000.

---

**Note:** This functionality is under development and could be changed in the future releases

---

Many times it is useful to store the results of a command during the course of an execution. Salt Slots are designed to allow you to store this information and use it later during the *highstate* or other job execution.

Slots extend the state syntax and allows you to do things right before the state function is executed. So you can make a decision in the last moment right before a state is executed.

### 25.1 Execution functions

---

**Note:** Using execution modules return data as a state values is a first step of Slots development. Other functionality is under development.

---

Slots allow you to use the return from a remote-execution function as an argument value in states.

Slot syntax looks close to the simple python function call.

```
__slot__:salt:<module>.<function>(<args>, ..., <kwargs...>, ...)
```

For the 3000 release, this syntax has been updated to support parsing functions which return dictionaries and for appending text to the slot result.

```
__slot__:salt:<module>.<function>(<args>..., <kwargs...>, ...).dictionary ~ append
```

There are some specifics in the syntax coming from the execution functions nature and a desire to simplify the user experience. First one is that you don't need to quote the strings passed to the slots functions. The second one is that all arguments handled as strings.

Here is a simple example:

```
copy-some-file:
 file.copy:
 - name: __slot__:salt:test.echo(text=/tmp/some_file)
 - source: __slot__:salt:test.echo(/etc/hosts)
```

This will execute the `test.echo` execution functions right before calling the state. The functions in the example will return `/tmp/some_file` and `/etc/hosts` strings that will be used as a target and source arguments in the state function `file.copy`.

Here is an example of result parsing and appending:

```
file-in-user-home:
 file.copy:

 - source: salt://somefile
```

## WINDOWS

This section contains details on the Windows Package Manager, and specific information you need to use Salt on Windows.

### 26.1 Windows Package Manager

#### 26.1.1 Introduction

The Windows Package Manager provides a software repository and a package manager similar to what is provided by `yum` and `apt` on Linux. This tool enables the installation of software on remote Windows systems.

The repository contains a collection of software definition files. A software definition file is a YAML/JINJA file with an `.sls` file extension. It contains all the information Salt needs to install a software package on a Windows system, including the download location of the installer, required command-line switches for silent install, etc.

Software definition files can be hosted in one or more Git repositories. The default repository is hosted on GitHub by SaltStack. It is maintained by SaltStack and the Salt community and contains software definition files for many common Windows packages. Anyone is welcome to submit a pull request to this repo to add new software definitions. The default github repository is:

- [salt-winrepo-ng](#)

The Windows Package Manager is used the same way as other package managers Salt is aware of. For example:

- the `pkg.installed` and similar states work on Windows.
- the `pkg.install` and similar module functions work on Windows.

High level differences to `yum` and `apt` are:

- The repository metadata (SLS files) can be managed through either Salt or git
- Packages can be downloaded from within the Salt repository, a git repository or from HTTP(S) or FTP URLs
- No dependencies are managed. Dependencies between packages need to be managed manually

## Requirements

If using the a software definition files hosted on a Git repo, the following libraries are required:

- GitPython 0.3 or later
- or
- pygit2 0.20.3 with libgit 0.20.0 or later

### 26.1.2 Quick Start

You can get up and running with winrepo pretty quickly just using the defaults. Assuming no changes to the default configuration (ie, `file_roots`) run the following commands on the master:

```
salt-run winrepo.update_git_repos
salt * pkg.refresh_db
salt * pkg.install firefox_x64
```

On a masterless minion run the following:

```
salt-call --local winrepo.update_git_repos
salt-call --local pkg.refresh_db
salt-call --local pkg.install firefox_x64
```

These commands clone the default winrepo from github, update the winrepo database on the minion, and install the latest version of Firefox.

### 26.1.3 Configuration

The Github repository (winrepo) is synced to the `file_roots` in a location specified by the `winrepo_dir_ng` setting in the config. The default value of `winrepo_dir_ng` is as follows:

- Linux master: `/srv/salt/win/repo-ng` (`salt://win/repo-ng`)
- Masterless minion: `C:\salt\srv\salt\win\repo-ng` (`salt://win/repo-ng`)

## Master Configuration

The following are settings are available for configuring the winrepo on the master:

- `winrepo_dir`
- `winrepo_dir_ng`
- `winrepo_remotes`
- `winrepo_remotes_ng`
- `winrepo_branch`
- `winrepo_provider`
- `winrepo_ssl_verify`

See [here](#) for detailed information on all master config options for winrepo.

## winrepo\_dir

*winrepo\_dir* (str)

This setting is maintained for backwards compatibility with legacy minions. It points to the location in the `file_roots` where the winrepo files are kept. The default is: `/srv/salt/win/repo`

## winrepo\_dir\_ng

*winrepo\_dir\_ng* (str)

The location in the `file_roots` where the winrepo files are kept. The default is `/srv/salt/win/repo-ng`.

**Warning:** You can change the location of the winrepo directory. However, it must always be set to a path that is inside the `file_roots`. Otherwise the software definition files will be unreachable by the minion.

---

**Important:** A common mistake is to change the `file_roots` setting and fail to update the `winrepo_dir_ng` and `winrepo_dir` settings so that they are inside the `file_roots`

---

## winrepo\_remotes

*winrepo\_remotes* (list)

This setting is maintained for backwards compatibility with legacy minions. It points to the legacy git repo. The default is a list containing a single URL:

<https://github.com/saltstack/salt-winrepo>

The legacy repo can be disabled by setting it to an empty list in the master config.

```
winrepo_remotes: []
```

## winrepo\_remotes\_ng

*winrepo\_remotes\_ng* (list)

This setting tells the `winrepo.upgrade_git_repos` command where the next generation winrepo is hosted. This is a list of URLs to multiple git repos. The default is a list containing a single URL:

<https://github.com/saltstack/salt-winrepo-ng>

## **winrepo\_refsspecs**

*winrepo\_refsspecs* (list)

Specify what references to fetch from remote repositories. The default is `['+refs/heads/*:refs/remotes/origin/*', '+refs/tags/*:refs/tags/*']`

## **winrepo\_branch**

*winrepo\_branch* (str)

The branch of the git repo to checkout. The default is master

## **winrepo\_provider**

*winrepo\_provider* (str)

The provider to be used for winrepo. Default is `pygit2`. Falls back to `gitpython` when `pygit2` is not available

## **winrepo\_ssl\_verify**

*winrepo\_ssl\_verify* (bool)

Ignore SSL certificate errors when contacting remote repository. Default is `False`

## **Master Configuration (pygit2)**

The following configuration options only apply when the *winrepo\_provider* option is set to `pygit2`.

- *winrepo\_insecure\_auth*
- *winrepo\_passphrase*
- *winrepo\_password*
- *winrepo\_privkey*
- *winrepo\_pubkey*
- *winrepo\_user*

## **winrepo\_insecure\_auth**

*winrepo\_insecure\_auth* (bool)

Used only with `pygit2` provider. Whether or not to allow insecure auth. Default is `False`

**winrepo\_passphrase**

*winrepo\_passphrase* (str)

Used only with `pygit2` provider. Used when the SSH key being used to authenticate is protected by a passphrase. Default is `''`

**winrepo\_privkey**

*winrepo\_privkey* (str)

Used only with `pygit2` provider. Used with *winrepo\_pubkey* to authenticate to SSH remotes. Default is `''`

**winrepo\_pubkey**

*winrepo\_pubkey* (str)

Used only with `pygit2` provider. Used with *winrepo\_privkey* to authenticate to SSH remotes. Default is `''`

**winrepo\_user**

*winrepo\_user* (str)

Used only with `pygit2` provider. Used with *winrepo\_password* to authenticate to HTTPS remotes. Default is `''`

**winrepo\_password**

*winrepo\_password* (str)

Used only with `pygit2` provider. Used with *winrepo\_user* to authenticate to HTTPS remotes. Default is `''`

**Minion Configuration**

Refreshing the package definitions can take some time, these options were introduced to allow more control of when it occurs. These settings apply to all minions whether in masterless mode or not.

- *winrepo\_cache\_expire\_max*
- *winrepo\_cache\_expire\_min*
- *winrepo\_cache\_file*
- *winrepo\_source\_dir*

### winrepo\_cache\_expire\_max

*winrepo\_cache\_expire\_max* (int)

Sets the maximum age in seconds of the winrepo metadata file to avoid it becoming stale. If the metadata file is older than this setting it will trigger a `pkg.refresh_db` on the next run of any `pkg` module function that requires the metadata file. Default is 604800 (1 week).

Software package definitions are automatically refreshed if stale after *winrepo\_cache\_expire\_max*. Running a highstate normal forces the refresh of the package definition and generation of the metadata, unless the metadata is younger than *winrepo\_cache\_expire\_max*.

### winrepo\_cache\_expire\_min

*winrepo\_cache\_expire\_min* (int)

Sets the minimum age in seconds of the winrepo metadata file to avoid refreshing too often. If the metadata file is older than this setting the metadata will be refreshed unless you pass `refresh: False` in the state. Default is 1800 (30 min).

### winrepo\_cache\_file

*winrepo\_cache\_file* (str)

The file name of the winrepo cache file. The file is placed at the root of `winrepo_dir_ng`. Default is `winrepo.p`.

### winrepo\_source\_dir

*winrepo\_source\_dir* (str)

The location of the `.sls` files on the Salt file server. This allows for using different environments. Default is `salt:/win/repo-ng/`.

**Warning:** If the default for `winrepo_dir_ng` is changed, this setting may need to be changed on each minion. The default setting for `winrepo_dir_ng` is `/srv/salt/win/repo-ng`. If that were changed to `/srv/salt/new/repo-ng` then the `winrepo_source_dir` would need to be changed to `salt://new/repo-ng`.

## Masterless Minion Configuration

The following settings are available for configuring the winrepo on a masterless minion:

- *winrepo\_dir*
- *winrepo\_dir\_ng*
- *winrepo\_remotes*
- *winrepo\_remotes\_ng*

See [here](#) for detailed information on all minion config options for winrepo.

## winrepo\_dir

*winrepo\_dir* (str)

This setting is maintained for backwards compatibility with legacy minions. It points to the location in the `file_roots` where the winrepo files are kept. The default is: `C:\salt\srv\salt\win\repo`

## winrepo\_dir\_ng

*winrepo\_dir\_ng* (str)

The location in the `file_roots` where the winrepo files are kept. The default is ```C:\salt\srv\salt\win\repo-ng`.

**Warning:** You can change the location of the winrepo directory. However, it must always be set to a path that is inside the `file_roots`. Otherwise the software definition files will be unreachable by the minion.

---

**Important:** A common mistake is to change the `file_roots` setting and fail to update the `winrepo_dir_ng` and `winrepo_dir` settings so that they are inside the `file_roots`. You might also want to verify `winrepo_source_dir` on the minion as well.

---

## winrepo\_remotes

*winrepo\_remotes* (list)

This setting is maintained for backwards compatibility with legacy minions. It points to the legacy git repo. The default is a list containing a single URL:

<https://github.com/saltstack/salt-winrepo>

The legacy repo can be disabled by setting it to an empty list in the minion config.

```
winrepo_remotes: []
```

## winrepo\_remotes\_ng

*winrepo\_remotes\_ng* (list)

This setting tells the `winrepo.upgrade_git_repos` command where the next generation winrepo is hosted. This is a list of URLs to multiple git repos. The default is a list containing a single URL:

<https://github.com/saltstack/salt-winrepo-ng>

## 26.1.4 Initialization

### Populate the Local Repository

The SLS files used to install Windows packages are not distributed by default with Salt. Use the *winrepo.update\_git\_repos* runner initialize the repository in the location specified by *winrepo\_dir\_ng* in the master config. This will pull the software definition files down from the git repository.

```
salt-run winrepo.update_git_repos
```

If running a minion in masterless mode, the same command can be run using *salt-call*. The repository will be initialized in the location specified by *winrepo\_dir\_ng* in the minion config.

```
salt-call --local winrepo.update_git_repos
```

These commands will also sync down the legacy repo to maintain backwards compatibility with legacy minions. See *Legacy Minions*

The legacy repo can be disabled by setting it to an empty list in the master or minion config.

```
winrepo_remotes: []
```

### Generate the Metadata File (Legacy)

This step is only required if you are supporting legacy minions. In current usage the metadata file is generated on the minion in the next step, Update the Minion Database. For legacy minions the metadata file is generated on the master using the *winrepo.genrepo* runner.

```
salt-run winrepo.genrepo
```

### Update the Minion Database

Run *pkg.refresh\_db* on each of your Windows minions to synchronize the package repository to the minion and build the package database.

```
From the master
salt -G 'os:windows' pkg.refresh_db

From the minion in masterless mode
salt-call --local pkg.refresh_db
```

The above command returns the following summary denoting the number of packages that succeeded or failed to compile:

```
local:

failed:
 0
success:
 301
total:
 301
```

---

**Note:** This command can take a few minutes to complete as the software definition files are copied to the minion and the database is generated.

---

---

**Note:** Use `pkg.refresh_db` when developing new Windows package definitions to check for errors in the definitions against one or more Windows minions.

---

### 26.1.5 Usage

After completing the configuration and initialization steps, you are ready to manage software on your Windows minions.

---

**Note:** The following example commands can be run from the master using `salt` or on a masterless minion using `salt-call`

---

#### List Installed Packages

You can get a list of packages installed on the system using `pkg.list_pkgs`.

```
From the master
salt -G 'os:windows' pkg.list_pkgs

From the minion in masterless mode
salt-call --local pkg.list_pkgs
```

This will return all software installed on the system whether it is managed by Salt or not as shown below:

```
local:

Frhed 1.6.0:
 1.6.0
GNU Privacy Guard:
 2.2.16
Gpg4win (3.1.9):
 3.1.9
git:
 2.17.1.2
nsis:
 3.03
python3_x64:
 3.7.4150.0
salt-minion-py3:
 2019.2.3
```

You can tell by how the software name is displayed which software is managed by Salt and which software is not. When Salt finds a match in the winrepo database it displays the short name as defined in the software definition file. It is usually a single-word, lower-case name. All other software names will be displayed with the full name as they are shown in Add/Remove Programs. So, in the return above, you can see that Git (git), Nullsoft Installer (nsis), Python 3.7 (python3\_x64) and Salt (salt-minion-py3) all have a corresponding software definition file. The others do not.

## List Available Versions

You can query the available version of a package using `pkg.list_available` and passing the name of the software:

```
From the master
salt winminion pkg.list_available firefox_x64

From the minion in masterless mode
salt-call --local pkg.list_available firefox_x64
```

The above command will return the following:

```
winminion:
 - 69.0
 - 69.0.1
 - 69.0.2
 - 69.0.3
 - 70.0
 - 70.0.1
 - 71.0
 - 72.0
 - 72.0.1
 - 72.0.2
 - 73.0
 - 73.0.1
 - 74.0
```

As you can see, there are many versions of Firefox available for installation. You can refer to a software package by its name or its `full_name` surrounded by quotes.

---

**Note:** From a Linux master it is OK to use single-quotes. However, the cmd shell on Windows requires you to use double-quotes when wrapping strings that may contain spaces. Powershell seems to accept either one.

---

## Install a Package

You can install a package using `pkg.install`:

```
From the master
salt winminion pkg.install 'firefox_x64'

From the minion in masterless mode
salt-call --local pkg.install "firefox_x64"
```

The above will install the latest version of Firefox.

```
From the master
salt winminion pkg.install 'firefox_x64' version=74.0

From the minion in masterless mode
salt-call --local pkg.install "firefox_x64" version=74.0
```

The above will install version 74.0 of Firefox.

If a different version of the package is already installed it will be replaced with the version in the winrepo (only if the package itself supports live updating).

You can also specify the full name:

```
From the master
salt winminion pkg.install 'Mozilla Firefox 17.0.1 (x86 en-US)'

From the minion in masterless mode
salt-call --local pkg.install "Mozilla Firefox 17.0.1 (x86 en-US)"
```

## Remove a Package

You can uninstall a package using `pkg.remove`:

```
From the master
salt winminion pkg.remove firefox_x64

From the minion in masterless mode
salt-call --local pkg.remove firefox_x64
```

### 26.1.6 Software Definition Files

A software definition file is a YAML/JINJA2 file that contains all the information needed to install a piece of software using Salt. It defines information about the package to include version, full name, flags required for the installer and uninstaller, whether or not to use the Windows task scheduler to install the package, where to download the installation package, etc.

#### Directory Structure and Naming

The files are stored in the location designated by the `winrepo_dir_ng` setting. All files in this directory that have a `.sls` file extension are considered software definition files. The files are evaluated to create the metadata file on the minion.

You can maintain standalone software definition files that point to software on other servers or on the internet. In this case the file name would be the short name of the software with the `.sls` extension, ie `firefox.sls`.

You can also store the binaries for your software together with their software definition files in their own directory. In this scenario, the directory name would be the short name for the software and the software definition file would be inside that directory and named `init.sls`.

Look at the following example directory structure on a Linux master assuming default config settings:

```
srv/
|--salt/
| |--win/
| |--repo-ng/
| |--custom_defs/
| |--ms_office_2013_x64/
| |--access.en-us/
| |--excel.en-us/
| |--outlook.en-us/
| |--powerpoint.en-us/
| |--word.en-us/
| |--init.sls
| |--setup.dll
| |--setup.exe
```

(continues on next page)

(continued from previous page)

```
| | | | |---openssl.sls
| | | | |---zoom.sls
| | | |---salt-winrepo-ng/
| | | | |---auditbeat/
| | | | | |---init.sls
| | | | | |---install.cmd
| | | | | |---install.ps1
| | | | | |---remove.cmd
| | | |---gpg4win/
| | | | |---init.sls
| | | | |---silent.ini
| | | |---7zip.sls
| | | |---adobereader.sls
| | | |---audacity.sls
| | | |---ccleaner.sls
| | | |---chrome.sls
| | | |---firefox.sls
```

In the above directory structure, the user has created the `custom_defs` directory in which to store their custom software definition files. In that directory you see a folder for MS Office 2013 that contains all the installer files along with a software definition file named `init.sls`. The user has also created two more standalone software definition files; `openssl.sls` and `zoom.sls`.

The `salt-winrepo-ng` directory is created by the `winrepo.update_git_repos` command. This folder contains the clone of the git repo designated by the `winrepo_remotes_ng` config setting.

**Warning:** It is recommended that the user not modify the files in the `salt-winrepo-ng` directory as it will break future runs of `winrepo.update_git_repos`.

**Warning:** It is recommended that the user not place any custom software definition files in the `salt-winrepo-ng` directory. The `winrepo.update_git_repos` command wipes out the contents of the `salt-winrepo-ng` directory each time it is run. Any extra files stored there will be lost.

## Writing Software Definition Files

A basic software definition file is really easy to write if you already know some basic things about your software:

- The full name as shown in Add/Remove Programs
- The exact version number as shown in Add/Remove Programs
- How to install your software silently from the command line

The software definition file itself is just a data structure written in YAML. The top level item is a short name that Salt will use to reference the software. There can be only one short name in the file and it must be unique across all software definition files in the repo. This is the name that will be used to install/remove the software. It is also the name that will appear when Salt finds a match in the repo when running `pkg.list_pkgs`.

The next indentation level is the version number. There can be many of these, but they must be unique within the file. This is also displayed in `pkg.list_pkgs`.

The last indentation level contains the information Salt needs to actually install the software. Available parameters are:

- `full_name` : The full name as displayed in Add/Remove Programs
- `installer` : The location of the installer binary
- `install_flags` : The flags required to install silently
- `uninstaller` : The location of the uninstaller binary
- `uninstall_flags` : The flags required to uninstall silently
- `msiexec` : Use msiexec to install this package
- `allusers` : If this is an MSI, install to all users
- `cache_dir` : Cache the entire directory in the installer URL (`salt://`)
- `cache_file` : Cache a single file in the installer URL (`salt://`)
- `use_scheduler` : Launch the installer using the task scheduler
- `source_hash` : The hash sum for the installer

Usage of these parameters is demonstrated in the following examples and discussed in more detail below. To understand these examples you'll need a basic understanding of Jinja. The following links have some basic tips and best practices for working with Jinja in Salt:

[Understanding Jinja](#)

[Jinja](#)

### Example: Basic

Take a look at this basic, pure YAML example for a software definition file for Firefox:

```
firefox_x64:
 '74.0':
 full_name: Mozilla Firefox 74.0 (x64 en-US)
 installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/releases/74.0/
 ↪win64/en-US/Firefox%20Setup%2074.0.exe'
 install_flags: '/S'
 uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
 uninstall_flags: '/S'
 '73.0.1':
 full_name: Mozilla Firefox 73.0.1 (x64 en-US)
 installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/releases/73.0.
 ↪1/win64/en-US/Firefox%20Setup%2073.0.1.exe'
 install_flags: '/S'
 uninstaller: '%ProgramFiles(x86)%/Mozilla Firefox/uninstall/helper.exe'
 uninstall_flags: '/S'
```

You can see the first item is the short name for the software, in this case `firefox_x64`. It is the first line in the definition. The next line is indented two spaces and contains the software version. The lines following the version are indented two more spaces and contain all the information needed to install the Firefox package.

---

**Important:** The package name must be unique to all other packages in the software repository. The `full_name` combined with the version must also be unique. They must also match exactly what is shown in Add/Remove Programs (`appwiz.cpl`).

---

---

**Important:** The version number must be enclosed in quotes, otherwise the YAML parser will remove trailing zeros. For example, `74.0` will just become `74`.

---

As you can see in the example above, a software definition file can define multiple versions for the same piece of software. These are denoted by putting the next version number at the same indentation level as the first with its software definition information indented below it.

### Example: Jinja

When there are tens or hundreds of versions available for a piece of software definition file can become quite large. This is a scenario where Jinja can be helpful. Consider the following software definition file for Firefox using Jinja:

```
{%- set lang = salt['config.get']('firefox:pkg:lang', 'en-US') %}

firefox_x64:
 {% for version in ['74.0',
 '73.0.1', '73.0',
 '72.0.2', '72.0.1', '72.0',
 '71.0', '70.0.1', '70.0',
 '69.0.3', '69.0.2', '69.0.1'] %}
 '{{ version }}':
 full_name: 'Mozilla Firefox {{ version }} (x64 {{ lang }})'
 installer: 'https://download-installer.cdn.mozilla.net/pub/firefox/releases/{{
↪version }}/win64/{{ lang }}/Firefox%20Setup%20{{ version }}.exe'
 install_flags: '/S'
 uninstaller: '%ProgramFiles%\Mozilla Firefox\uninstall\helper.exe'
 uninstall_flags: '/S'
 {% endfor %}
```

In this example we are able to generate a software definition file that defines how to install 12 versions of Firefox. We use Jinja to create a list of available versions. That list is in a `for` loop where each version is placed in the `version` variable. The version is inserted everywhere there is a `{{ version }}` marker inside the `for` loop.

You'll notice that there is a single variable (`lang`) defined at the top of the software definition. Because these files are going through the Salt renderer many Salt modules are exposed via the `salt` keyword. In this case it is calling the `config.get` function to get a language setting that can be placed in the minion config. If it is not there, it defaults to `en-US`.

### Example: Latest

There are some software vendors that do not provide access to all versions of their software. Instead they provide a single URL to what is always the latest version. In some cases the software keeps itself up to date. One example of this is the Google Chrome web browser.

#### Chrome

To handle situations such as these, set the version to *latest*. Here's an example:

```
chrome:
 latest:
 full_name: 'Google Chrome'
 installer: 'https://dl.google.com/edgedl/chrome/install/
↪GoogleChromeStandaloneEnterprise.msi'
 install_flags: '/qn /norestart'
```

(continues on next page)

(continued from previous page)

```

uninstaller: 'https://dl.google.com/edgedl/chrome/install/
↳GoogleChromeStandaloneEnterprise.msi'
uninstall_flags: '/qn /norestart'
msiexec: True

```

The above example shows us two things. First it demonstrates the usage of `latest` as the version. In this case Salt will install the version of Chrome at the URL and report that version.

The second thing to note is that this is installing software using an MSI. You can see that `msiexec` is set to `True`.

### Example: MSI Patch

When the `msiexec` parameter is set to `True` it uses the `/i` option for installs and the `/x` option for uninstalls. This is problematic when trying to install an MSI patch which requires the `/p` option. You can't combine the `/i` and `/p` options. So how do you apply a patch to installed software in winrepo using an `.msp` file?

One wily contributor came up with the following solution to this problem by using the `%cd%` environment variable. Consider the following software definition file:

```

MyApp:
 '1.0':
 full_name: MyApp
 installer: 'salt://win/repo-ng/MyApp/MyApp.1.0.msi'
 install_flags: '/qn /norestart'
 uninstaller: '{B5B5868F-23BA-297A-917D-0DF345TF5764}'
 uninstall_flags: '/qn /norestart'
 msiexec: True
 '1.1':
 full_name: MyApp
 installer: 'salt://win/repo-ng/MyApp/MyApp.1.0.msi'
 install_flags: '/qn /norestart /update "%cd%\MyApp.1.1.msp" '
 uninstaller: '{B5B5868F-23BA-297A-917D-0DF345TF5764}'
 uninstall_flags: '/qn /norestart'
 msiexec: True
 cache_file: salt://win/repo/MyApp/MyApp.1.1.msp

```

There are a few things to note about this software definition file. First, is the solution we are trying to solve, that of applying a patch. Version `1.0` just installs the application using the `1.0` MSI defined in the `installer` parameter. There is nothing special in the `install_flags` and nothing is cached.

Version `1.1` uses the same installer, but uses the `cache_file` option to specify a single file to cache. In order for this to work the MSP file needs to be in the same directory as the MSI file on the `file_roots`.

The final step to getting this to work is to add the additional `/update` flag to the `install_flags` parameter. Add the path to the MSP file using the `%cd%` environment variable. `%cd%` resolves to the current working directory which is the location in the minion cache where the installer file is cached.

See issue [#32780](#) for more details.

This same approach could be used for applying MST files for MSIs and answer files for other types of `.exe` based installers.

## Parameters

These are the parameters that can be used to generate a software definition file. These parameters are all placed under the `version` in the software definition file:

Example usage can be found on the [github repo](#)

### `full_name (str)`

This is the full name for the software as shown in "Programs and Features" in the control panel. You can also get this information by installing the package manually and then running `pkg.list_pkgs`. Here's an example of the output from `pkg.list_pkgs`:

```
salt 'test-2008' pkg.list_pkgs
test-2008

 7-Zip 9.20 (x64 edition):
 9.20.00.0
 Mozilla Firefox 74.0 (x64 en-US)
 74.0
 Mozilla Maintenance Service:
 74.0
 salt-minion-py3:
 3001
```

Notice the Full Name for Firefox: `Mozilla Firefox 74.0 (x64 en-US)`. That's exactly what should be in the `full_name` parameter in the software definition file.

If any of the software installed on the machine matches the full name defined in one of the software definition files in the repository the package name will be returned. The example below shows the `pkg.list_pkgs` for a machine that has Mozilla Firefox 74.0 installed and a software definition for that version of Firefox.

```
test-2008:

 7zip:
 9.20.00.0
 Mozilla Maintenance Service:
 74.0
 firefox_x64:
 74.0
 salt-minion-py3:
 3001
```

---

**Important:** The version number and `full_name` need to match the output from `pkg.list_pkgs` exactly so that the installation status can be verified by the state system.

---

---

**Note:** It is still possible to successfully install packages using `pkg.install`, even if the `full_name` or the version number don't match exactly. The module will complete successfully, but continue to display the full name in `pkg.list_pkgs`. If this is happening, verify that the `full_name` and the `version` match exactly what is displayed in Add/Remove Programs.

---

---

**Tip:** To force Salt to display the full name when there's already an existing package definition file on the system, you

---

can pass a bogus `saltenv` parameter to the command like so: `pkg.list_pkgs saltenv=NotARealEnv`

**Tip:** It's important use `pkg.refresh_db` to check for errors and ensure the latest package definition is on any minion you're testing new definitions on.

### installer (str)

This is the path to the binary (`.exe`, `.msi`) that will install the package. This can be a local path or a URL. If it is a URL or a Salt path (`salt://`), the package will be cached locally and then executed. If it is a path to a file on disk or a file share, it will be executed directly.

**Note:** When storing software in the same location as the winrepo it is usually best practice to place each installer in its own directory rather than in the root of winrepo.

Best practice is to create a sub folder named after the package. That folder will contain the software definition file named `init.sls`. The binary installer should be stored in that directory as well if you're hosting those files on the `file_roots`.

`pkg.refresh_db` will process all `.sls` files in all sub directories in the `winrepo_dir_ng` directory.

### install\_flags (str)

This setting contains any flags that need to be passed to the installer to make it perform a silent install. These can often be found by adding `/?` or `/h` when running the installer from the command-line. A great resource for finding these silent install flags is the WPKG project [wiki](#):

**Warning:** Salt will appear to hang if the installer is expecting user input. So it is imperative that the software have the ability to install silently.

### uninstaller (str)

This is the path to the program used to uninstall this software. This can be the path to the same `exe` or `msi` used to install the software. Exe uninstallers are pretty straight forward. MSIs, on the other hand, can be handled a couple different ways. You can use the GUID for the software to uninstall or you can use the same MSI used to install the software.

You can usually find uninstall information in the registry:

- `Software\Microsoft\Windows\CurrentVersion\Uninstall`
- `Software\WOW6432Node\Microsoft\Windows\CurrentVersion\Uninstall`

Here's an example using the GUID to uninstall software.

```
7zip:
 '9.20.00.0':
 full_name: 7-Zip 9.20 (x64 edition)
 installer: salt://win/repo-ng/7zip/7z920-x64.msi
```

(continues on next page)

(continued from previous page)

```
install_flags: '/qn /norestart'
uninstaller: '{23170F69-40C1-2702-0920-0000001000000}'
uninstall_flags: '/qn /norestart'
msiexec: True
```

Here's an example using the same MSI used to install the software:

```
7zip:
 '9.20.00.0':
 full_name: 7-Zip 9.20 (x64 edition)
 installer: salt://win/repo-ng/7zip/7z920-x64.msi
 install_flags: '/qn /norestart'
 uninstaller: salt://win/repo-ng/7zip/7z920-x64.msi
 uninstall_flags: '/qn /norestart'
 msiexec: True
```

### uninstall\_flags (str)

This setting contains any flags that need to be passed to the uninstaller to make it perform a silent uninstall. These can often be found by adding `/?` or `/h` when running the uninstaller from the command-line. A great resource for finding these silent install flags the WPKG project [wiki](#):

**Warning:** Salt will appear to hang if the uninstaller is expecting user input. So it is imperative that the software have the ability to uninstall silently.

### msiexec (bool, str)

This tells Salt to use `msiexec /i` to install the package and `msiexec /x` to uninstall. This is for `.msi` installations only.

Possible options are:

- True
- False (default)
- the path to `msiexec.exe` on your system

```
7zip:
 '9.20.00.0':
 full_name: 7-Zip 9.20 (x64 edition)
 installer: salt://win/repo/7zip/7z920-x64.msi
 install_flags: '/qn /norestart'
 uninstaller: salt://win/repo/7zip/7z920-x64.msi
 uninstall_flags: '/qn /norestart'
 msiexec: 'C:\Windows\System32\msiexec.exe'
```

**allusers (bool)**

This parameter is specific to `.msi` installations. It tells `msiexec` to install the software for all users. The default is `True`.

**cache\_dir (bool)**

This setting requires the software to be stored on the `file_roots` and only applies to URLs that begin with `salt://`. If `True` the entire directory where the installer resides will be recursively cached. This is useful for installers that depend on other files in the same directory for installation.

**Warning:** Be aware that all files and directories in the same location as the installer file will be copied down to the minion. If you place your software definition file in the root of winrepo (`/srv/salt/win/repo-ng`) and it contains `cache_dir: True` the entire contents of winrepo will be cached to the minion. Therefore, it is best practice to place your installer files in a subdirectory if they are to be stored in winrepo.

Here's an example using `cache_dir`:

```
sqlxpress:
 '12.0.2000.8':
 full_name: Microsoft SQL Server 2014 Setup (English)
 installer: 'salt://win/repo/sqlxpress/setup.exe'
 install_flags: '/ACTION=install /IACCEPTSQLSERVERLICENSETERMS /Q'
 cache_dir: True
```

**cache\_file (str)**

This setting requires the file to be stored on the `file_roots` and only applies to URLs that begin with `salt://`. It indicates a single file to copy down for use with the installer. It is copied to the same location as the installer. Use this over `cache_dir` if there are many files in the directory and you only need a specific file and don't want to cache additional files that may reside in the installer directory.

**use\_scheduler (bool)**

If set to `True`, Windows will use the task scheduler to run the installation. A one-time task will be created in the task scheduler and launched. The return to the minion will be that the task was launched successfully, not that the software was installed successfully.

---

**Note:** This is used by the software definition for Salt itself. The first thing the Salt installer does is kill the Salt service, which then kills all child processes. If the Salt installer is launched via Salt, then the installer itself is killed leaving Salt on the machine but not running. Use of the task scheduler allows an external process to launch the Salt installation so its processes aren't killed when the Salt service is stopped.

---

### source\_hash (str)

This tells Salt to compare a hash sum of the installer to the provided hash sum before execution. The value can be formatted as `<hash_algorithm>=<hash_sum>`, or it can be a URI to a file containing the hash sum.

For a list of supported algorithms, see the [hashlib documentation](#).

Here's an example using `source_hash`:

```
messageanalyzer:
 '4.0.7551.0':
 full_name: 'Microsoft Message Analyzer'
 installer: 'salt://win/repo/messageanalyzer/MessageAnalyzer64.msi'
 install_flags: '/quiet /norestart'
 uninstaller: '{1CC02C23-8FCD-487E-860C-311EC0A0C933}'
 uninstall_flags: '/quiet /norestart'
 msixexec: True
 source_hash: 'sha1=62875ff451f13b10a8ff988f2943e76a4735d3d4'
```

### Not Implemented

The following parameters are often seen in the software definition files hosted on the Git repo. However, they are not implemented and have no effect on the installation process.

`param bool reboot` Not implemented

`param str locale` Not implemented

## 26.1.7 Managing Windows Software on a Standalone Windows Minion

The Windows Software Repository functions similarly in a standalone environment, with a few differences in the configuration.

To replace the `winrepo` runner that is used on the Salt master, an `execution` module exists to provide the same functionality to standalone minions. The functions are named the same as the ones in the runner, and are used in the same way; the only difference is that `salt-call` is used instead of `salt-run`:

```
salt-call winrepo.update_git_repos
salt-call pkg.refresh_db
```

After executing the previous commands the repository on the standalone system is ready for use.

## 26.1.8 Troubleshooting

### My software installs correctly but `pkg.installed` says it failed

If you have a package that seems to install properly, but Salt reports a failure then it is likely you have a `version` or `full_name` mismatch.

Check the exact `full_name` and `version` as shown in Add/Remove Programs (`appwiz.cpl`). Use `pkg.list_pkgs` to check that the `full_name` and `version` exactly match what is installed. Make sure the software definition file has the exact value for `full_name` and that the version matches exactly.

Also, make sure the version is wrapped in single quotes in the software definition file.

### Changes to sls files not being picked up

You may have recently updated some of the software definition files on the repo. Ensure you have refreshed the database on the minion.

```
salt winminion pkg.refresh_db
```

### How Success and Failure are Reported by pkg.installed

The install state/module function of the Windows package manager works roughly as follows:

1. Execute `pkg.list_pkgs` to get a list of software currently on the machine
2. Compare the requested version with the installed version
3. If versions are the same, report no changes needed
4. Install the software as described in the software definition file
5. Execute `pkg.list_pkgs` to get a new list of software currently on the machine
6. Compare the requested version with the new installed version
7. If versions are the same, report success
8. If versions are different, report failure

### Winrepo Upgrade Issues

To minimize potential issues, it is a good idea to remove any winrepo git repositories that were checked out by the legacy (pre-2015.8.0) winrepo code when upgrading the master to 2015.8.0 or later. Run `winrepo.update_git_repos` to clone them anew after the master is started.

## 26.1.9 pygit2/GitPython Support for Maintaining Git Repos

The `winrepo.update_git_repos` runner now makes use of the same underlying code used by the *Git Fileserver Backend* and *Git External Pillar* to maintain and update its local clones of git repositories. If a compatible version of either `pygit2` (0.20.3 and later) or `GitPython` (0.3.0 or later) is installed, Salt will use it instead of the old method (which invokes the `git.latest` state).

**Note:** If compatible versions of both `pygit2` and `GitPython` are installed, then Salt will prefer `pygit2`. To override this behavior use the `winrepo_provider` configuration parameter:

```
winrepo_provider: gitpython
```

The winrepo execution module (discussed above in the *Managing Windows Software on a Standalone Windows Minion* section) does not yet officially support the new `pygit2/GitPython` functionality, but if either `pygit2` or `GitPython` is installed into Salt's bundled Python then it *should* work. However, it should be considered experimental at this time.

### 26.1.10 Accessing Authenticated Git Repos (pygit2)

Support for pygit2 added the ability to access authenticated git repositories and to set per-remote config settings. An example of this would be the following:

```
winrepo_remotes:
- https://github.com/saltstack/salt-winrepo.git
- git@github.com:myuser/myrepo.git:
 - pubkey: /path/to/key.pub
 - privkey: /path/to/key
 - passphrase: myaw3s0m3pa$$phr4$3
- https://github.com/myuser/privaterepo.git:
 - user: mygithubuser
 - password: CorrectHorseBatteryStaple
```

---

**Note:** Per-remote configuration settings work in the same fashion as they do in gitfs, with global parameters being overridden by their per-remote counterparts. For instance, setting `winrepo_passphrase` would set a global passphrase for winrepo that would apply to all SSH-based remotes, unless overridden by a `passphrase` per-remote parameter.

See [here](#) for more a more in-depth explanation of how per-remote configuration works in gitfs. The same principles apply to winrepo.

---

### 26.1.11 Maintaining Git Repos

A `clean` argument has been added to the `winrepo.update_git_repos` runner. When `clean` is `True` it will tell the runner to dispose of directories under the `winrepo_dir_ng/winrepo_dir_ng` which are not explicitly configured. This prevents the need to manually remove these directories when a repo is removed from the config file. To clean these old directories, just pass `clean=True`:

```
salt-run winrepo.update_git_repos clean=True
```

If a mix of git and non-git Windows Repo definition files are being used, then this should *not* be used, as it will remove the directories containing non-git definitions.

### 26.1.12 Name Collisions Between Repos

Collisions between repo names are now detected. The `winrepo.update_git_repos` runner will not proceed if any are detected. Consider the following configuration:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git
- https://github.com/foobar/baz
```

The `winrepo.update_git_repos` runner will refuse to update repos here, as all three of these repos would be checked out to the same directory. To work around this, a per-remote parameter called `name` can be used to resolve these conflicts:

```
winrepo_remotes:
- https://foo.com/bar/baz.git
- https://mydomain.tld/baz.git:
```

(continues on next page)

(continued from previous page)

```
- name: baz_junior
- https://github.com/foobar/baz:
- name: baz_the_third
```

### 26.1.13 Legacy Minions

The Windows Package Manager was upgraded with breaking changes starting with Salt 2015.8.0. To maintain backwards compatibility Salt continues to support older minions.

The breaking change was to generate the winrepo database on the minion instead of the master. This allowed for the use of Jinja in the software definition files. It enabled the use of pillar, grains, execution modules, etc. during compile time. To support this new functionality, a next-generation (ng) repo was created.

See the *Changes in Version 2015.8.0* for details.

On prior versions of Salt, or legacy minions, the winrepo database was generated on the master and pushed down to the minions. Any grains exposed at compile time would have been those of the master and not the minion.

The repository for legacy minions is named `salt-winrepo` and is located at:

- <https://github.com/saltstack/salt-winrepo>

### Legacy Configuration

Winrepo settings were changed with the introduction of the Next Generation (ng) of winrepo.

### Legacy Master Config Options

There were three options available for a legacy master to configure winrepo. Unless you're running a legacy master as well, you shouldn't need to configure any of these.

- `win_gitrepos`
- `win_repo`
- `win_repo_mastercachefile`

`win_gitrepos`: (list)

A list of URLs to github repos. Default is a list with a single URL:

- `'https://github.com/saltstack/salt-winrepo.git'`

`win_repo`: (str)

The location on the master to store the winrepo. The default is `/srv/salt/win/repo`.

`win_repo_mastercachefile`: (str) The location on the master to generate the winrepo database file. The default is `/srv/salt/win/repo/winrep.p`

## Legacy Minion Config Options

There is only one option available to configure a legacy minion for winrepo.

- `win_repo_cache_file`

`win_repo_cache_file`: (str)

The location on the Salt file server to obtain the winrepo database file. The default is `salt://win/repo/winrepo.p`

---

**Note:** If the location of the `winrepo.p` file is not in the default location on the master, the `win_repo_cache_file` setting will need to be updated to reflect the proper location on each minion.

---

## Legacy Quick Start

You can get up and running with winrepo pretty quickly just using the defaults. Assuming no changes to the default configuration (ie, `file_roots`) run the following commands on the master:

```
salt-run winrepo.update_git_repos
salt-run winrepo.genrepo
salt * pkg.refresh_db
salt * pkg.install firefox
```

These commands clone the default winrepo from github, generate the metadata file, push the metadata file down to the legacy minion, and install the latest version of Firefox.

## Legacy Initialization

Initializing the winrepo for a legacy minion is similar to that for a newer minion. There is an added step in that the metadata file needs to be generated on the master prior to refreshing the database on the minion.

## Populate the Local Repository

The SLS files used to install Windows packages are not distributed by default with Salt. So, the first step is to clone the repo to the master. Use the `winrepo.update_git_repos` runner initialize the repository in the location specified by `winrepo_dir` in the master config. This will pull the software definition files down from the git repository.

```
salt-run winrepo.update_git_repos
```

## Generate the Metadata File

The next step is to create the metadata file for the repo (`winrepo.p`). The metadata file is generated on the master using the `winrepo.genrepo` runner.

```
salt-run winrepo.genrepo
```

---

**Note:** You only need to do this if you need to support legacy minions.

---

## Update the Minion Database

Run `pkg.refresh_db` on each of your Windows minions to copy the metadata file down to the minion.

```
From the master
salt -G 'os:windows' pkg.refresh_db
```

## Changes in Version 2015.8.0+

Git repository management for the Windows Software Repository changed in version 2015.8.0, and several master/minion config parameters were renamed for consistency.

For a complete list of the new winrepo config options, see [here](#) for master config options, and [here](#) for configuration options for masterless Windows minions.

## pygit2/GitPython Support

On the master, the `winrepo.update_git_repos` runner was updated to use either `pygit2` or `GitPython` to checkout the git repositories containing repo data. If `pygit2` or `GitPython` is installed, existing winrepo git checkouts should be removed after upgrading to 2015.8.0. Then they should be cloned again by running `winrepo.update_git_repos`.

If neither `GitPython` nor `pygit2` are installed, Salt will fall back to pre-existing behavior for `winrepo.update_git_repos`, and a warning will be logged in the master log.

---

**Note:** Standalone Windows minions do not support the new `GitPython/pygit2` functionality, and will instead use the `git.latest` state to keep repositories up-to-date. More information on how to use the Windows Software Repo on a standalone minion can be found [here](#).

---

## Config Parameters Renamed

Many of the legacy winrepo configuration parameters changed in version 2015.8.0 to make them more consistent. Below are the parameters which changed for version 2015.8.0:

Master Config

Old Name	New Name
<code>win_repo</code>	<code>winrepo_dir</code>
<code>win_repo_mastercachefile</code>	No longer used on master
<code>win_gitrepos</code>	<code>winrepo_remotes</code>

---

**Note:** The `winrepo_dir_ng` and `winrepo_remotes_ng` settings were introduced in 2015.8.0 for working with the next generation repo.

---

See [here](#) for detailed information on all master config options for the Windows Repo.

Minion Config

Old Name	New Name
win_repo	<i>winrepo_dir</i>
win_repo_cache	<i>winrepo_cache</i>
win_gitrepos	<i>winrepo_remotes</i>

---

**Note:** The `winrepo_dir_ng` and `winrepo_remotes_ng` settings were introduced in 2015.8.0 for working with the next generation repo.

---

See [here](#) for detailed information on all minion config options for the Windows Repo.

## 26.2 Windows-specific Behaviour

Salt is capable of managing Windows systems, however due to various differences between the operating systems, there are some things you need to keep in mind.

This document will contain any quirks that apply across Salt or generally across multiple module functions. Any Windows-specific behavior for particular module functions will be documented in the module function documentation. Therefore this document should be read in conjunction with the module function documentation.

### 26.2.1 Group parameter for files

Salt was originally written for managing Unix-based systems, and therefore the file module functions were designed around that security model. Rather than trying to shoehorn that model on to Windows, Salt ignores these parameters and makes non-applicable module functions unavailable instead.

One of the commonly ignored parameters is the `group` parameter for managing files. Under Windows, while files do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Because of this, any file module functions that typically require a group, do not under Windows. Attempts to directly use file module functions that operate on the group (e.g. `file.chgrp`) will return a pseudo-value and cause a log message to appear. No group parameters will be acted on.

If you do want to access and change the 'primary group' property and understand the implications, use the `file.get_pgid` or `file.get_pgroup` functions or the `pgroup` parameter on the `file.chown` module function.

### 26.2.2 Dealing with case-insensitive but case-preserving names

Windows is case-insensitive, but however preserves the case of names and it is this preserved form that is returned from system functions. This causes some issues with Salt because it assumes case-sensitive names. These issues generally occur in the state functions and can cause bizarre looking errors.

To avoid such issues, always pretend Windows is case-sensitive and use the right case for names, e.g. specify `user=Administrator` instead of `user=administrator`.

Follow [issue #11801](#) for any changes to this behavior.

### 26.2.3 Dealing with various username forms

Salt does not understand the various forms that Windows usernames can come in, e.g. `username`, `mydomain\username`, `username@mydomain.tld` can all refer to the same user. In fact, Salt generally only considers the raw username value, i.e. the username without the domain or host information.

Using these alternative forms will likely confuse Salt and cause odd errors to happen. Use only the raw username value in the correct case to avoid problems.

Follow [issue #11801](#) for any changes to this behavior.

### 26.2.4 Specifying the None group

Each Windows system has built-in `_None_` group. This is the default 'primary group' for files for users not on a domain environment.

Unfortunately, the word `_None_` has special meaning in Python - it is a special value indicating 'nothing', similar to `null` or `nil` in other languages.

To specify the None group, it must be specified in quotes, e.g. `./salt '*' file.chgrp C:\path\to\file "None"`.

### 26.2.5 Symbolic link loops

Under Windows, if any symbolic link loops are detected or if there are too many levels of symlinks (defaults to 64), an error is always raised.

For some functions, this behavior is different to the behavior on Unix platforms. In general, avoid symlink loops on either platform.

## DEVELOPING SALT

### 27.1 Overview

In its most typical use, Salt is a software application in which clients, called "minions" can be commanded and controlled from a central command server called a "master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, 'salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

### 27.2 Salt Client

#### 27.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called 'LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master\_event\_pub.ipc).

### 27.3 Salt Master

#### 27.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the 'salt' CLI.

### 27.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called 'salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 27.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish\_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 27.3.4 EventPublisher

The EventPublisher publishes master events out to any event listeners. It is bound to the following:

- IPC: master\_event\_pull.ipc
- IPC: master\_event\_pub.ipc

### 27.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of 'worker\_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 27.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

The ReqServer is bound to the following:

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 27.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

- 1) A command is issued on the CLI. For example, 'salt my\_minion test.version'.
- 2) The 'salt' command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on [TCP:4506](#) and issuing the job.
- 3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
- 4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in `ClearFuncs.publish()`.
- 5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (`master_event_pull.ipc`) where the EventPublisher picks it up and distributes it to all connected event listeners on `master_event_pub.ipc`.
- 6) The message to the minions is encrypted and sent to the Publisher via IPC on `publish_pull.ipc`.
- 7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over `publish_pull`, it sends the jobs across the wire to the minions for processing.
- 8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
- 9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across `workers.ipc` to an available worker.)
- 10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (`master_event_pull.ipc`). (Again for the curious, this happens in `AESFuncs._return()`).
- 11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on `master_event_pub.ipc`). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
- 12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

## 27.4 Salt Minion

### 27.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via 'salt-call' or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect *back* to a master defined in the minion config file. They connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

### 27.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at `minion_event_<unique_id>_pub.ipc` and `minion_event_<unique_id>_pull.ipc`.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondly, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

### 27.4.3 Minion Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the 'salt-call' script run by a local user on the salt minion or they can come directly from a master.

The job flow on a minion, coming from the master via a 'salt' command is as follows:

- 1) A master publishes a job that is received by a minion as outlined by the master's job flow above.
- 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.
- 3) A new minion process or thread is created and provided with the contents of the decrypted message. The `_thread_return()` method is provided with the contents of the received message.
- 4) The new minion thread is created. The `_thread_return()` function starts up and actually calls out to the requested function contained in the job.
- 5) The requested function runs and returns a result. [Still in thread.]
- 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.]
- 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

## 27.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

- 1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.
- 2) AESFuncs is used everywhere else.

## 27.6 Changelog

With the addition of [SEP 01](#) the `keepachangelog` format was introduced into our `CHANGELOG.md` file. The Salt project is using the `towncrier` tool to manage the `CHANGELOG.md` file. The reason this tool was added to manage the changelog was because we were previously managing the file manually and it would cause many merge conflicts. This tool allows us to add changelog entries into separate files and before a release we simply need to run `towncrier --version=<version>` for it to compile the changelog correctly.

### 27.6.1 How do I add a changelog entry

To add a changelog entry you will need to add a file in the `changelog` directory. The file name should follow the syntax `<issue #>.<type>`. If it is a security fix then the following syntax will need to be used `cve-<cve-number>.security`.

The types are in alignment with `keepachangelog`:

- removed:** any features that have been removed
- deprecated:** any features that will soon be removed
- changed:** any changes in current existing features
- fixed:** any bug fixes
- added:** any new features added
- security:** any fixes for a cve

For example if you are fixing a bug for issue number #1234 your filename would look like this: `changelog/1234.fixed`. The contents of the file should contain a summary of what you are fixing. If there is a legitimate reason to not include an issue number with a given contribution you can add the PR number as the file name (`<PR #>.<type>`).

For a security fix your filename would look like this: `changelog/cve-2021-25283.security`.

If your PR does not align with any of the types, then you do not need to add a changelog entry.

### 27.6.2 How to generate the changelog

This step is only used when we need to generate the changelog right before releasing. You should NOT run `towncrier` on your PR, unless you are preparing the final PR to update the changelog before a release.

You can run the `towncrier` tool directly or you can use `nox` to help run the command and ensure `towncrier` is installed in a virtual environment. The instructions below will detail both approaches.

If you want to see what output `towncrier` will produce before generating the change log you can run `towncrier` in draft mode:

```
towncrier --draft --version=3001
```

```
nox -e 'changelog(draft=True)' -- 3000.1
```

Version will need to be set to whichever version we are about to release. Once you are confident the draft output looks correct you can now generate the changelog by running:

```
towncrier --version=3001
```

```
nox -e 'changelog(draft=False)' -- 3000.1
```

After this is run towncrier will automatically remove all the files in the changelog directory.

## 27.7 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development, including (but not limited to):

- filing well-written bug reports
- enhancing the documentation
- providing workarounds, patches, and other code without tests
- engaging in constructive discussion
- helping out in [#salt on Freenode](#), the [Community Slack](#), the [salt-users mailing list](#), a [SaltStack meetup](#), or [Server Fault](#).
- telling others about problems you solved with Salt

If this or other Salt documentation is unclear, please review [Writing Salt Documentation](#). PRs are welcome!

### 27.7.1 Quickstart

If you just want to get started before reading the rest of this guide, you can get the process started by running the following:

```
python3 -m pip install --user pre-commit
git clone --origin upstream https://github.com/saltstack/salt.git
cd salt
pre-commit install
```

While those commands are running, finish reading the rest of this guide.

### 27.7.2 Pre-commit

To reduce friction during the development process, SaltStack uses [pre-commit](#). This tool adds pre-commit hooks to git to automate several processes that used to be manual. Rather than having to remember to run several different tools before you commit, you only have to run `git commit`, and you will be notified about style and lint issues before you ever open a PR.

**Warning:** Currently there is an issue with the `pip-tools-compile` pre-commit hook on windows. The details around this issue are included here: <https://github.com/saltstack/salt/issues/56642>. Please ensure you export `SKIP=pip-tools-compile` to skip `pip-tools-compile`.

### 27.7.3 Salt Coding Style

After the 3000 release, SaltStack is [joining the ranks](#) of projects in adopting the [Black code formatter](#) in order to ease the adoption of a unified code formatting style.

Where Black is silent, SaltStack has its own coding style guide that informs contributors on various style points. Please review the [Salt Coding Style](#) documentation for information about Salt's particular coding patterns.

Within the [Salt Coding Style](#) documentation, there is a section about running Salt's `.testing.pylintrc` file. SaltStack recommends running the `.testing.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt's repository.

If you've installed `pre-commit`, this will automatically happen before each commit. Otherwise, see the [Linting](#) documentation for more information.

### 27.7.4 Copyright Headers

Copyright headers are not needed for files in the Salt project. Files that have existing copyright headers should be considered legacy and not an example to follow.

### 27.7.5 New Features

Feature requests through Salt go through a multi-stage process.

All features are added to major releases only. Salt does not accept feature additions in bug-fix branches. Therefore, all feature work is done exclusively in the develop branch.

To formally propose a new feature, the proposal must take the form of an RFC. To create an RFC, copy the template file found in the `rfcs/` directory of the Salt codebase and fill the outline with the reasoning for the new feature and with implementation details.

Upon submitting the written RFC via a pull-request, it will be reviewed by the core development team as well as the community. Once discussed and agreed upon, the RFC may be merged.

A merged RFC indicates that a feature has been accepted and will be added to an upcoming release of Salt.

### 27.7.6 Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors [GitHub's own guide](#) and is well worth reading.

1. [Fork saltstack/salt](#) on GitHub.
2. Make a local clone of your fork. (Skip this step if you followed the [Quickstart](#))

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add [saltstack/salt](#) as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

If you followed the [Quickstart](#), you'll add your own remote instead

```
git remote add my-account git@github.com:my-account/salt.git
```

4. Create a new branch in your clone.

---

**Note:** A branch should have one purpose. For example, "Fix bug X," or "Add feature Y". Multiple unrelated fixes and/or features should be isolated into separate branches.

---

```
git fetch upstream
git checkout -b fix-broken-thing upstream/master
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2 tests/test_file1.py tests/test_file2.py
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary. Use an imperative style for the title.

GOOD

```
Fix broken things in file1 and file2

Fixes #31337

We needed to make this change because the underlying dependency
changed. Now this uses the up-to-date API.

Please enter the commit message for your changes. Lines starting
with '#' will be ignored, and an empty message aborts the commit.
On branch fix-broken-thing
Changes to be committed:
modified: path/to/file1
modified: path/to/file2
```

BAD

```
Fixes broken things

Please enter the commit message for your changes. Lines starting
with '#' will be ignored, and an empty message aborts the commit.
On branch fix-broken-thing
Changes to be committed:
modified: path/to/file1
modified: path/to/file2
```

Taking a few moments to explain *why* you made a change will save time and effort in the future when others come to investigate a change. A clear explanation of why something changed can help future developers avoid introducing bugs, or breaking an edge case.

---

**Note:** If your change fixes a bug or implements a feature already filed in the [issue tracker](#), be sure to [reference the issue](#) number in the commit message body.

---

If you get stuck, there are many introductory Git resources on <https://help.github.com/en>.

6. Push your locally-committed changes to your GitHub fork.

```
git push -u origin fix-broken-thing
```

or

```
git push -u origin add-cool-feature
```

---

**Note:** You may want to rebase before pushing to work out any potential conflicts:

```
git fetch upstream
git rebase upstream/master fix-broken-thing
git push -u origin fix-broken-thing
```

If you do rebase, and the push is rejected with a (non-fast-forward) comment, then run `git status`. You will likely see a message about the branches diverging:

```
On branch fix-broken-thing
Your branch and 'origin/fix-broken-thing' have diverged,
and have 1 and 2 different commits each, respectively.
(use "git pull" to merge the remote branch into yours)
nothing to commit, working tree clean
```

Do **NOT** perform a `git pull` or `git merge` here. Instead, add `--force-with-lease` to the end of the `git push` command to get the changes pushed to your fork. Pulling or merging, while they will resolve the non-fast-forward issue, will likely add extra commits to the pull request which were not part of your changes.

---

- Find the branch on your GitHub salt fork.

<https://github.com/my-account/salt/branches/fix-broken-thing>

- Open a new pull request.

Click on **Pull Request** on the right near the top of the page,

<https://github.com/my-account/salt/pull/new/fix-broken-thing>

- Choose `master` as the base Salt branch.
- Review that the proposed changes are what you expect.
- Write a descriptive comment. If you added good information to your git commit message, they will already be present here. Include links to related issues (e.g. 'Fixes #31337.') in the comment field.
- Click **Create pull request**.

- Salt project members will review your pull request and automated tests will run on it.

If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

- Make the new changes in your local clone on the same local branch.
- Push the branch to GitHub again using the same commands as before.
- New and updated commits will be added to the pull request automatically.
- Feel free to add a comment to the discussion.

---

**Note:** Jenkins

Pull request against `saltstack/salt` are automatically tested on a variety of operating systems and configurations. On average these tests take a couple of hours. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at <https://jenkinsci.saltstack.com/>.

---

### 27.7.7 Salt's Branch Topology

Salt will only have one active branch - `master`. This will include bug fixes, features and CVE “Common Vulnerabilities and Exposures”.

The release will be cut from the master when the time comes for a new release, which should be every 3 to 4 months.

To be able to merge code:

1. The code must have a well-written test. Note that you are only expected to write tests for what you did, not the whole modules or function.
2. All tests must pass.

The SaltStack employee that reviews your pull request might request changes or deny the pull request for various reasons.

Salt uses a typical branch strategy - `master` is the next expected release. Code should only make it to `master` once it's production ready. This means that typical changes (fixes, features) should have accompanying tests.

#### Closing GitHub issues from commits

SaltStack encourages using the magic keywords to close a GitHub issue. These should appear in the commit message text directly.

### 27.7.8 Release Naming Convention

A new convention will start when Salt releases Salt 3000. Every new release name will increment by one ‘Salt last\_release\_number + 1’.

This naming convention is very different from past releases, which was ‘YYYY.MM.PATCH’.

### 27.7.9 Handling CVE

If a CVE is discovered, Salt will create a new release that **only** contains the tests and patch for the CVE. This method should improve the upgrade process by reducing the chances of breaking something.

### 27.7.10 Backporting Pull Requests

On rare occasions, a serious bug will be found in the middle of a release cycle. These bugs will require a point release. Contributors should still submit fixes directly to `master`, but they should also call attention to the fact that it addresses a critical issue and will need to be back-ported.

### 27.7.11 Keeping Salt Forks in Sync

Salt advances quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

[GitHub Fork a Repo Guide](#)

The following assumes `origin` is the name of your fork and `upstream` is the name of the main [saltstack/salt](#) repository.

1. View existing remotes.

```
git remote -v
```

2. Add the upstream remote.

```
For ssh github
git remote add upstream git@github.com:saltstack/salt.git

For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the master branch.

```
git checkout master
git merge --ff-only upstream/master
```

If Git complains that a fast-forward merge is not possible, you have local commits.

- Run `git pull --rebase origin master` to rebase your changes on top of the upstream changes.
- Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your master branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

```
git push origin master
```

6. Repeat the previous two steps for any other branches you work with, such as the current release branch.

### 27.7.12 Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the `salt-users` mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

### 27.7.13 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

### 27.7.14 Mentionbot

SaltStack runs a mention-bot which notifies contributors who might be able to help review incoming pull-requests based on their past contribution to files which are being changed.

If you do not wish to receive these notifications, please add your GitHub handle to the blacklist line in the `.mention-bot` file located in the root of the Salt repository.

### 27.7.15 Bootstrap Script Changes

Salt's Bootstrap Script, known as `bootstrap-salt.sh` in the Salt repo, has its own repository, contributing guidelines, and release cadence.

All changes to the Bootstrap Script should be made to `salt-bootstrap` repo. Any pull requests made to the `bootstrap-salt.sh` file in the Salt repository will be automatically overwritten upon the next stable release of the Bootstrap Script.

For more information on the release process or how to contribute to the Bootstrap Script, see the Bootstrap Script's [Contributing Guidelines](#).

## 27.8 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they were using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is 3001, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides `salt.utils.versions.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.versions.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
 if foo is not None:
 salt.utils.versions.warn_until(
 "Aluminum",
 "The 'foo' argument has been deprecated and its "
 "functionality removed, as such, its usage is no longer "
 "required.",
)
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

## 27.9 Python 2 Deprecation FAQ

### FAQ

- *Python 2 Deprecation FAQ*
  - *Why are we deprecating Python 2?*
  - *Was this announced/decided before making the change?*
  - *Can I contribute Python 2 code?*
  - *What if my OS does not include Python 3 packages? Or, how do I upgrade from Salt on Python 2 to Salt on Python 3?*
    - \* *On Modern Platforms*
    - \* *On Other Platforms*
      - *Build Your Own*
      - *pop-build distributions*
  - *Will you support a Python 3 master with an older Python 2 minion?*
  - *Will you support Python 2 master with a new Python 3 minion?*
  - *How does this impact Salt-SSH support?*
  - *What is your plan for removing Python 2 code?*
  - *Will Salt continue to package for Python 2?*

### 27.9.1 Why are we deprecating Python 2?

Python 2.7.18 was the final release of Python2, released in April 2020. At this point, Python 2 will no longer receive any unpaid support. The Python core developers are focusing their efforts on improving and enhancing Python 3. Additionally, many libraries that Salt depends on have also dropped Python 2 support.

To take advantage of continued support and improvements, Salt is joining the ranks of projects that are dropping legacy Python support in favor of Python 3.

### 27.9.2 Was this announced/decided before making the change?

SEP 5 was approved in April, 2019.

### 27.9.3 Can I contribute Python 2 code?

For several years, Salt has been a Python 2/3 codebase, requiring Python 3 support for all contributions. The only changes contributors can expect to this process is that we will now accept Python 3-only code changes.

While there is a significant subset of Python that is compatible with both Python 3 and legacy Python, changes requiring `six` or otherwise removing Python 3-only code will not be accepted.

### 27.9.4 What if my OS does not include Python 3 packages? Or, how do I upgrade from Salt on Python 2 to Salt on Python 3?

There are several options to upgrade to Python 3.

#### On Modern Platforms

At this point, most modern Linux distributions have Python 3 packages. Ubuntu 20.04 LTS has moved to Python 3.8 as it's default system Python.

#### On Other Platforms

##### Build Your Own

If your current distribution does not have Python 3 it's [pretty simple to use Salt](#) to build and distribute Python 3 on your own. Installing Python 3 and pip installing Salt gives you the most control over your distribution.

##### pop-build distributions

Another approach is to use the `pop-build` distribution of Salt. With the Sodium release we will begin releasing packages for Salt using `pop-build`, in tandem with our normal build process. The `pop-build` distribution will contain Salt, Python, and any necessary dependencies, which will make it trivial to have a completely supported version of Salt.

### 27.9.5 Will you support a Python 3 master with an older Python 2 minion?

Yes! Our policy of keeping newer masters backwards compatible with *at least* the most recent minion version is not changing. You should be able to run modern Salt Masters on Python 3 with slightly older minions running on legacy Python. Of course, if you want your minions to be able to take advantage of the newest features in Salt, upgrading to Python 3 will be necessary.

### 27.9.6 Will you support Python 2 master with a new Python 3 minion?

In keeping with our existing policy, we make no guarantees about older masters with newer minions. It *may* work, but breakages are common and should be expected.

### 27.9.7 How does this impact Salt-SSH support?

Salt-SSH will need Python 3 on the target minions. We will be upgrading Salt-SSH to provide instructions or recommendations on adding Python3 if it is not detected.

### 27.9.8 What is your plan for removing Python 2 code?

Legacy Python code will be gradually removed from the Salt codebase.

While we could remove most of it at once, that introduces a high level of risk. Instead, beginning with the Sodium (v3001) release, Salt will simply drop support for Python 2. PRs will no longer be required to support Python 2 before merging.

Over time, as modules are changed, `six` and other legacy Python syntax will be removed. It may be at some point in the future it becomes necessary to remove the last vestiges of legacy Python from Salt, but currently the plan is to take a more measured approach.

### 27.9.9 Will Salt continue to package for Python 2?

No. Beginning with Sodium (v3001), Salt will no longer release packages for, or support Python 2.

## 27.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

---

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git 'fetch' utility:

```
git fetch --tags upstream
```

---

Create a new `virtualenv`:

```
virtualenv /path/to/your/virtualenv
```

---

Avoid making your *virtualenv path too long*.

On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

On Gentoo you must use `--system-site-packages` to enable pkg and portage\_config functionality

---

**Note:** Using system Python modules in the virtualenv

To use already-installed python modules in virtualenv (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system PYTHONPATH at the time of virtualenv creation.

---

**Note:** Python development package

Be sure to install python devel package in order to install required Python modules. In Debian/Ubuntu run `sudo apt-get install -y python-dev`. In RedHat based system install `python-devel`

---

Activate the virtualenv:

```
source /path/to/your/virtualenv/bin/activate
```

---

Install Salt (and dependencies) into the virtualenv:

```
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil futures tornado
pip install -e ./salt # the path to the salt git clone from above
```

---

**Note:** Installing psutil

Python header files are required to build this module, otherwise the pip install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

---

**Note:** Installing dependencies on macOS.

You can install needed dependencies on macOS using homebrew or macports. See [macOS Installation](#)

---

**Warning:** Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

### 27.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

The `/path/to/your/virtualenv` referenced multiple times below is also available in the variable `$VIRTUAL_ENV` once the virtual environment is activated.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt/pki/{master,minion}
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
