**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"
CLI Example:
```
salt 'system.shutdown
salt 'now + 1 hour'
```

```python
salt.modules.mac_system.sleep(at_time=None)
```
Sleep the system. If a user is active on the system it will likely fail to sleep.

**Parameters**

- **at_time** *(str)* -- Any valid *at* expression. For example, some valid at expressions could be:
  - noon
  - midnight
  - fri
  - 9:00 AM
  - 2:30 PM tomorrow
  - now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:
```
salt 'system.sleep
salt '10:00 PM'
```

### 21.9.253 salt.modules.mac_timezone module

Module for editing date/time settings on macOS

New in version 2016.3.0.

`salt.modules.mac_timezone.get_date()`
Displays the current date

**Returns** the system date

**Return type** *str*

CLI Example:
```
salt 'timezone.get_date
```

`salt.modules.mac_timezone.get_hwclock()`
Get current hardware clock setting (UTC or localtime)

CLI Example:
```
salt 'timezone.get_hwclock
```

`salt.modules.mac_timezone.get_offset()`
Displays the current time zone offset

**Returns** The current time zone offset

**Return type** *str*

CLI Example:
salt '*' timezone.get_offset

salt.modules.mac_timezone.get_time()
Get the current system time.

Returns The current time in 24 hour format
Return type str

CLI Example:
salt '*' timezone.get_time

salt.modules.mac_timezone.get_time_server()
Display the currently set network time server.

Returns the network time server
Return type str

CLI Example:
salt '*' timezone.get_time_server

salt.modules.mac_timezone.get_using_network_time()
Display whether network time is on or off

Returns True if network time is on, False if off
Return type bool

CLI Example:
salt '*' timezone.get_using_network_time

salt.modules.mac_timezone.get_zone()
Displays the current time zone

Returns The current time zone
Return type str

CLI Example:
salt '*' timezone.get_zone

salt.modules.mac_timezone.get_zonecode()
Displays the current time zone abbreviated code

Returns The current time zone code
Return type str

CLI Example:
salt '*' timezone.get_zonecode

salt.modules.mac_timezone.list_zones()
Displays a list of available time zones. Use this list when setting a time zone using timezone.set_zone

Returns a list of time zones
Return type list

CLI Example:
salt '*' timezone.list_zones

salt.modules.mac_timezone.set_date(date)
Set the current month, day, and year

Parameters date (str) -- The date to set. Valid date formats are:

- %m:%d:%y
- `%m:%d:%Y`
- `%m/%d/%y`
- `%m/%d/%Y`

**Returns** True if successful, False if not

**Return type** bool

**Raises** SaltInvocationError on Invalid Date format

**Raises** CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

salt.modules.mac_timezone.set_hwclock(clock)

Sets the hardware clock to be either UTC or localtime.

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.mac_timezone.set_time(time)

Sets the current time. Must be in 24 hour format.

**Parameters**

- **time** (str) -- The time to set in 24 hour format. The value must be double quoted. ie: "17:46"

**Returns** True if successful, False if not

**Return type** bool

**Raises** SaltInvocationError on Invalid Time format

**Raises** CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time "17:34"
```

salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')

Designates a network time server. Enter the IP address or DNS name for the network time server.

**Parameters**

- **time_server** -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of 'time.apple.com'

  **Type** str

**Returns** True if successful, False if not

**Return type** bool

**Raises** CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

salt.modules.mac_timezone.set_using_network_time(enable)

Set whether network time is on or off.

**Parameters**

- **enable** -- True to enable, False to disable. Can also use 'on' or 'off'

  **Type** str bool

**Returns** True if successful, False if not

**Return type** bool

**Raises** CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

salt.modules.mac_timezone.set_zone(time_zone)

Set the local time zone. Use timezone.list_zones to list valid time_zone arguments

21.9. execution modules
Parameters **time_zone** *(str)* -- The time zone to apply  
**Returns** True if successful, False if not  
**Return type** bool  
**Raises** SaltInvocationError on Invalid Timezone  
**Raises** CommandExecutionError on failure  

CLI Example:
```
salt '*' timezone.set_zone America/Denver
```

**salt.modules.mac_timezone.zone_compare** *(time_zone)*  
Compares the given timezone name with the system timezone name.  
**Returns** True if they are the same, False if not  
**Return type** bool  

CLI Example:
```
salt '*' timezone.zone_compare America/Boise
```

**21.9.254  salt.modules.mac_user**

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ‘user.info’ is not available), see here.

**salt.modules.mac_user.add** *(name, uid=None, gid=None, groups=None, home=None, shell=None, full_name=None, createhome=True, **kwargs)*  
Add a user to the minion  

CLI Example:
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

**salt.modules.mac_user.chfullname** *(name, fullname)*  
Change the user’s Full Name  

CLI Example:
```
salt '*' user.chfullname foo 'Foo Bar'
```

**salt.modules.mac_user.chgid** *(name, gid)*  
Change the default group of the user  

CLI Example:
```
salt '*' user.chgid foo 4376
```

**salt.modules.mac_user.chgroups** *(name, groups, append=False)*  
Change the groups to which the user belongs. Note that the user’s primary group does not have to be one of the groups passed, membership in the user’s primary group is automatically assumed.  
**groups** Groups to which the user should belong, can be passed either as a python list or a comma-separated string  
**append** Instead of removing user from groups not included in the groups parameter, just add user to any groups for which they are not members  

CLI Example:
salt '*' user.chgroups foo wheel,root

```
salt.modules.mac_user.chhome(name, home, **kwargs)
```
Change the home directory of the user

CLI Example:
```
salt '*' user.chhome foo /Users/foo
```

```
salt.modules.mac_user.chshell(name, shell)
```
Change the default shell of the user

CLI Example:
```
salt '*' user.chshell foo /bin/zsh
```

```
salt.modules.mac_user.chuid(name, uid)
```
Change the uid for a named user

CLI Example:
```
salt '*' user.chuid foo 4376
```

```
salt.modules.mac_user.delete(name, remove=False, force=False)
```
Remove a user from the minion

CLI Example:
```
salt '*' user.delete name remove=True force=True
```

```
salt.modules.mac_user.disable_auto_login()
```
New in version 2016.3.0.
Disables auto login on the machine

Returns True if successful, otherwise False

```
Return type bool
```

CLI Example:
```
salt '*' user.disable_auto_login
```

```
salt.modules.mac_user.enable_auto_login(name, password)
```
New in version 2016.3.0.
Configures the machine to auto login with the specified user

Parameters
- name (str) -- The user account use for auto login
- password (str) -- The password to user for auto login

New in version 2017.7.3.

Returns True if successful, otherwise False

```
Return type bool
```

CLI Example:
```
salt '*' user.enable_auto_login stevej
```

```
salt.modules.mac_user.get_auto_login()
```
New in version 2016.3.0.

---

21.9. execution modules
Gets the current setting for Auto Login
Returns If enabled, returns the user name, otherwise returns False
Return type str, bool
CLI Example:
```
salt '*' user.get_auto_login
```

```
salt.modules.mac_user.getent(refresh=False)
```
Return the list of all info for all users
CLI Example:
```
salt '*' user.getent
```

```
salt.modules.mac_user.info(name)
```
Return user information
CLI Example:
```
salt '*' user.info root
```

```
salt.modules.mac_user.list_groups(name)
```
Return a list of groups the named user belongs to.
name
The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user,
including groups beginning with an underscore will be listed.
Changed in version 2016.11.0.
CLI Example:
```
salt '*' user.list_groups foo
```

```
salt.modules.mac_user.list_users()
```
Return a list of all users
CLI Example:
```
salt '*' user.list_users
```

```
salt.modules.mac_user.primary_group(name)
```
Return the primary group of the named user
New in version 2016.3.0.
CLI Example:
```
salt '*' user.primary_group saltadmin
```

```
salt.modules.mac_user.rename(name, new_name)
```
Change the username for a named user
CLI Example:
```
salt '*' user.rename name new_name
```
21.9.255  salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

```
salt.modules.mac_xattr.clear(path)
```
Causes the all attributes on the file/directory to be removed

**Parameters**
- path *(str)* -- The file(s) to get attributes from

**Returns**
True if successful, otherwise False

**Raises**
CommandExecutionError on file not found or any other unknown error

**CLI Example:**
```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

```
salt.modules.mac_xattr.delete(path, attribute)
```
Removes the given attribute from the file

**Parameters**
- path *(str)* -- The file(s) to get attributes from
- attribute *(str)* -- The attribute name to be deleted from the file/directory

**Returns**
True if successful, otherwise False

**Return type**
bool

** Raises**
CommandExecutionError on file not found, attribute not found, and any other unknown error

**CLI Example:**
```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

```
salt.modules.mac_xattr.list_(path, **kwargs)
```
List all of the extended attributes on the given file/directory

**Parameters**
- path *(str)* -- The file(s) to get attributes from
- hex *(bool)* -- Return the values with forced hexadecimal values

**Returns**
A dictionary containing extended attributes and values for the given file

**Return type**
dict

** Raises**
CommandExecutionError on file not found or any other unknown error

**CLI Example:**
```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

```
salt.modules.mac_xattr.read(path, attribute, **kwargs)
```
Read the given attributes on the given file/directory

**Parameters**
- path *(str)* -- The file to get attributes from
- attribute *(str)* -- The attribute to read
- hex *(bool)* -- Return the values with forced hexadecimal values

**Returns**
A string containing the value of the named attribute

**Return type**
str

** Raises**
CommandExecutionError on file not found, attribute not found, and any other unknown error

**CLI Example:**
salt 'x' xattr.read /path/to/file com.test.attr
salt 'x' xattr.read /path/to/file com.test.attr hex=True

salt.modules.mac_xattr.write(path, attribute, value, **kwargs)
Causes the given attribute name to be assigned the given value

Parameters
- path (str) -- The file(s) to get attributes from
- attribute (str) -- The attribute name to be written to the file/directory
- value (str) -- The value to assign to the given attribute
- hex (bool) -- Set the values with forced hexadecimal values

Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError on file not found or any other unknown error

CLI Example:
salt 'x' xattr.write /path/to/file "com.test.attr" "value"

21.9.256 salt.modules.macdefaults
Set defaults on Mac OS

salt.modules.macdefaults.delete(domain, key, user=None)
Delete a default from the system

CLI Example:
salt 'x' macdefaults.delete com.apple.CrashReporter DialogType
salt 'x' macdefaults.delete NSGlobalDomain ApplePersistence

domain The name of the domain to delete from
key The key of the given domain to delete
user The user to delete the defaults with

salt.modules.macdefaults.read(domain, key, user=None)
Write a default to the system

CLI Example:
salt 'x' macdefaults.read com.apple.CrashReporter DialogType
salt 'x' macdefaults.read NSGlobalDomain ApplePersistence

domain The name of the domain to read from
key The key of the given domain to read from
user The user to write the defaults to

salt.modules.macdefaults.write(domain, key, value, type='string', user=None)
Write a default to the system

CLI Example:
salt 'salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt 'salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool

domain  The name of the domain to write to
key   The key of the given domain to write to
value  The value to write to the given key
type   The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add
user   The user to write the defaults to

21.9.257 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.
salt.modules.macpackage.get_mpkg_ids (mpkg)
Attempt to get the package IDs from a mounted .mpkg file
Parameters  mpkg (str) -- The location of the mounted mpkg file
Returns  List of package IDs
Return type  list
CLI Example:
salt 'salt '*' macpackage.get_mpkg_ids /dev/disk2

salt.modules.macpackage.get_pkg_id (pkg)
Attempt to get the package ID from a .pkg file
Parameters  pkg (str) -- The location of the pkg file
Returns  List of all of the package IDs
Return type  list
CLI Example:
salt 'salt '*' macpackage.get_pkg_id /tmp/test.pkg

salt.modules.macpackage.install (pkg, target='LocalSystem', store=False, allow_untrusted=False)
Install a pkg file
Parameters
  • pkg (str) -- The package to install
  • target (str) -- The target in which to install the package to
  • store (bool) -- Should the package be installed as if it was from the store?
  • allow_untrusted (bool) -- Allow the installation of untrusted packages?
Returns  A dictionary containing the results of the installation
Return type  dict
CLI Example:
salt 'salt '*' macpackage.install test.pkg

salt.modules.macpackage.install_app (app, target='/Applications/)
Install an app file by moving it into the specified Applications directory
Parameters
  • app (str) -- The location of the .app file

21.9. execution modules
• **target** *(str)* -- The target in which to install the package to Default is "/Applications/"

  Returns The results of the rsync command

  Return type  str

  CLI Example:

```bash
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

**salt.modules.macpackage.installed_pkgs()**

Return the list of installed packages on the machine

  Returns  List of installed packages

  Return type  list

  CLI Example:

```bash
salt '*' macpackage.installed_pkgs
```

**salt.modules.macpackage.mount**(dmg)

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

  Parameters  *dmg* *(str)* -- The location of the dmg file to mount

  Returns  Tuple containing the results of the command along with the mount point

  Return type  tuple

  CLI Example:

```bash
salt '*' macpackage.mount /tmp/software.dmg
```

**salt.modules.macpackage.uninstall_app**(app)

Uninstall an app file by removing it from the Applications directory

  Parameters  *app* *(str)* -- The location of the .app file

  Returns  True if successful, otherwise False

  Return type  bool

  CLI Example:

```bash
salt '*' macpackage.uninstall_app /Applications/app.app
```

**salt.modules.macpackage.unmount**(mountpoint)

Attempt to unmount a dmg file from a temporary location

  Parameters  *mountpoint* *(str)* -- The location of the mount point

  Returns  The results of the hdutil detach command

  Return type  str

  CLI Example:

```bash
salt '*' macpackage.unmount /dev/disk2
```

**21.9.258  salt.modules.makeconf**

Support for modifying make.conf under Gentoo

**salt.modules.makeconf.append_cflags**(value)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
              'new': '<new-value>'}}
```
CLI Example:
```bash
salt '*' makeconf.append_cflags '-pipe'
```

**salt.modules.makeconf.append_cxxflags(value)**

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:
```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
```bash
salt '*' makeconf.append_cxxflags '-pipe'
```

**salt.modules.makeconf.append_emerge_default_opts(value)**

Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf

Return a dict containing the new value for variable:
```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
```bash
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

**salt.modules.makeconf.append_features(value)**

Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:
```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
```bash
salt '*' makeconf.append_features 'webrsync-gpg'
```

**salt.modules.makeconf.append_gentoo_mirrors(value)**

Add to or create a new GENTOO_MIRRORS in the make.conf

Return a dict containing the new value for variable:
```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```

CLI Example:
```bash
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

**salt.modules.makeconf.append_makeopts(value)**

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:
```json
{ '<variable>': { 'old': '<old-value>', 'new': '<new-value>' } }
```
CLI Example:
```
salt '*' makeconf.append_makeopts '-j3'
```

**salt.modules.makeconf.append_var(var, value)**
Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:
```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

**salt.modules.makeconf.cflags_contains(value)**
Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```
salt '*' makeconf.cflags_contains '-pipe'
```

**salt.modules.makeconf.chost_contains(value)**
Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

**salt.modules.makeconf.cxxflags_contains(value)**
Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```
salt '*' makeconf.cxxflags_contains '-pipe'
```

**salt.modules.makeconf.emerge_default_opts_contains(value)**
Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

**salt.modules.makeconf.features_contains(value)**
Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```
salt '*' makeconf.features_contains 'webrsync-gpg'
```
salt.modules.makeconf.gentoo_mirrors_contains(value)
Verify if GENTOO_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.get_cflags()
Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

salt.modules.makeconf.get_chost()
Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

salt.modules.makeconf.get_cxxflags()
Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

salt.modules.makeconf.get_emerge_default_opts()
Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

salt.modules.makeconf.get_features()
Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

salt.modules.makeconf.get_gentoo_mirrors()
Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```
salt.modules.makeconf.get_makeopts()
Get the value of MAKEOPTS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt '*' makeconf.get_makeopts

salt.modules.makeconf.get_sync()
Get the value of SYNC variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt '*' makeconf.get_sync

salt.modules.makeconf.get_var(var)
Get the value of a variable in make.conf
Return the value of the variable or None if the variable is not in make.conf
CLI Example:
salt '*' makeconf.get_var 'LINGUAS'

salt.modules.makeconf.makeopts_contains(value)
Verify if MAKEOPTS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
salt '*' makeconf.makeopts_contains '-j3'

salt.modules.makeconf.remove_var(var)
Remove a variable from the make.conf
Return a dict containing the new value for the variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.remove_var 'LINGUAS'

salt.modules.makeconf.set_cflags(value)
Set the CFLAGS variable
Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
salt.modules.makeconf.set_chost(value)
Set the CHOST variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:

`salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'`

salt.modules.makeconf.set_cxxflags(value)
Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:

`salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'`

salt.modules.makeconf.set_emerge_default_opts(value)
Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:

`salt '*' makeconf.set_emerge_default_opts '--jobs'`

salt.modules.makeconf.set_gentoo_mirrors(value)
Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:

`salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'`

salt.modules.makeconf.set_makeopts(value)
Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```python
{'<variable>': {'old': '<old-value>',
    'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.set_makeopts '-j3'

salt.modules.makeconf.set_sync(value)
Set the SYNC variable
Return a dict containing the new value for variable:

```json
{
'variable': {
'old': '<old-value>',
'new': '<new-value>'
}
}
```

CLI Example:
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.set_var(var, value)
Set a variable in the make.conf
Return a dict containing the new value for variable:

```json
{
'variable': {
'old': '<old-value>',
'new': '<new-value>'
}
}
```

CLI Example:
salt '*' makeconf.set_var 'LINGUAS' 'en'

salt.modules.makeconf.sync_contains(value)
Verify if SYNC variable contains a value in make.conf
Return True if value is set for var

CLI Example:
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'

salt.modules.makeconf.trim_cflags(value)
Remove a value from CFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```json
{
'variable': {
'old': '<old-value>',
'new': '<new-value>'
}
}
```

CLI Example:
salt '*' makeconf.trim_cflags '-pipe'

salt.modules.makeconf.trim_cxxflags(value)
Remove a value from CXXFLAGS variable in the make.conf
Return a dict containing the new value for variable:

```json
{
'variable': {
'old': '<old-value>',
'new': '<new-value>'
}
}
```

CLI Example:
salt '*' makeconf.trim_cxxflags '-pipe'
salt.modules.makeconf.trim_emerge_default_opts(value)
Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}```

CLI Example:
```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

salt.modules.makeconf.trim_features(value)
Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}```

CLI Example:
```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

salt.modules.makeconf.trim_gentoo_mirrors(value)
Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}```

CLI Example:
```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.trim_makeopts(value)
Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}```

CLI Example:
```
salt '*' makeconf.trim_makeopts '-j3'
```

salt.modules.makeconf.trim_var(var, value)
Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```{"<variable>": {"old": "<old-value>",
    "new": "<new-value>"}}```

CLI Example:
salt '*' makeconf.trim_var 'LINGUAS' 'en'

salt.modules.makeconf.var_contains(var, value)
Verify if variable contains a value in make.conf
Return True if value is set for var

CLI Example:
salt '*' makeconf.var_contains 'LINGUAS' 'en'

21.9.259 salt.modules.mandrill

Mandrill
Send out emails using the Mandrill API.
In the minion configuration file, the following block is required:

```yaml
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.
salt.modules.mandrill.send(message, asynchronous=False, ip_pool=None, send_at=None, api_url=None, api_version=None, api_key=None)
Send out the email using the details from the message argument.
message The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

asynchronous: False Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.
ip_pool The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.
send_at When this message should be sent as a UTC timestamp in YYYY-MM-DD HH:MM:SS format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

Note: For further details please consult the API documentation.

CLI Example:

```
$ salt '*' mandrill.send message="{\'subject\': \'Hi\', \'from_email\': \'test@example.com\', \'to\': [[\'email\': \'recv@example.com\', \'type\': \'to\']]}"
```

message structure example (as YAML for readability):

```yaml
message:
  text:
    This is the body of the email.
    This is the second line.
```

(continues on next page)
subject: Email subject
from_name: Test At Example Dot Com
from_email: test@example.com
to:
  - email: recv@example.com
type: to
name: Recv At Example Dot Com
  - email: cc@example.com
type: cc
name: CC At Example Dot Com
important: true
track_clicks: true
track_opens: true
attachments:
  - type: text/x-yaml
name: yaml_file.yml
content: aV9hbV9zdXBlcl9jdXJpb3VzOiB0cnVl

Output example:

```
minion: ----------
comment: 
out: |
  ----------
  _id: c4353540a3c123eca112bbdd704ab6
  email: recv@example.com
  reject_reason: None
  status: sent
result: True
```

21.9.260 `salt.modules.marathon` module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

**salt.modules.marathon.app(id)**

Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

**salt.modules.marathon.apps()**

Return a list of the currently installed app ids.

CLI Example:
salt.modules.marathon.has_app(id)
Return whether the given app id is currently configured.
CLI Example:
```
salt marathon-minion-id marathon.has_app my-app
```

salt.modules.marathon.info()
Return configuration and status information about the marathon instance.
CLI Example:
```
salt marathon-minion-id marathon.info
```

salt.modules.marathon.restart_app(id, restart=False, force=True)
Restart the current server configuration for the specified app.
Parameters
- restart -- Restart the app
- force -- Override the current deployment
CLI Example:
```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.
```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.
The force option tells marathon to ignore the current app deployment if there is one.

salt.modules.marathon.rm_app(id)
Remove the specified app from the server.
CLI Example:
```
salt marathon-minion-id marathon.rm_app my-app
```

salt.modules.marathon.update_app(id, config)
Update the specified app with the given configuration.
CLI Example:
```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```
21.9.261  `salt.modules.match`

The match module allows for match routines to be run and determine target specs

```
salt.modules.match.compound(tgt, minion_id=None)
```

Return True if the minion ID matches the given compound target

- `minion_id` Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'user:cheese,foo and *'
```

```
salt.modules.match.data(tgt)
```

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

```
salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, merge=None, merge_lists=False, default='default')
```

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, default='web*') %}
# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

```
salt.modules.match.glob(tgt, minion_id=None)
```

Return True if the minion ID matches the given glob target

- `minion_id` Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

```
salt.modules.match.grain(tgt, delimiter=':')
```

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```
```
 delimiter Specify an alternate delimiter to use when traversing a nested dict
    New in version 2014.7.0.
 delim Specify an alternate delimiter to use when traversing a nested dict
    New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.grain_pcre(tgt, delimiter=':)
    Return True if the minion matches the given grain_pcre target. The delimiter argument can be used to specify a different delimiter.
    New in version 2014.7.0.
    New in version 0.16.4.
    Deprecated since version 2015.8.0.

CLI Example:

    salt '*' match.grain_pcre 'os:Fedo.*'
    salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'

salt.modules.match.ipcidr(tgt)
    Return True if the minion matches the given ipcidr target
    CLI Example:

    salt '*' match.ipcidr '192.168.44.0/24'

delimiter Pillar Example:

    '172.16.0.0/12':
        - match: ipcidr
        - nodeclass: internal

salt.modules.match.list_(tgt, minion_id=None)
    Return True if the minion ID matches the given list target
    minion_id Specify the minion ID to match against the target expression
    New in version 2014.7.0.
    CLI Example:

    salt '*' match.list 'server1,server2'

salt.modules.match.pcre(tgt, minion_id=None)
    Return True if the minion ID matches the given pcre target
    minion_id Specify the minion ID to match against the target expression
    New in version 2014.7.0.
    CLI Example:

    salt '*' match.pcre '.*'

salt.modules.match.pillar(tgt, delimiter=':)
    Return True if the minion matches the given pillar target. The delimiter argument can be used to specify a different delimiter.
```
CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter='|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

```
salt.modules.match.pillar_pcre(tgt, delimiter=':')
```

Return True if the minion matches the given pillar_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git' delimiter='|'
```

**delimiter** Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

**delim** Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

```
salt.modules.match.search_by(lookup, tgt_type='compound', minion_id=None)
```

Search a dictionary of target strings for matching targets

This is the inverse of `match.filter_by` and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by(
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2, node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
)) %}
```

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
21.9.262 salt.modules.mattermost module

Module for sending messages to Mattermost

New in version 2017.7.0.

**configuration** This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

salt.modules.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)

Send a message to a Mattermost channel.

**Parameters**

- **channel** -- The channel name, either will work.
- **username** -- The username of the poster.
- **message** -- The message to send to the Mattermost channel.
- **api_url** -- The Mattermost api url, if not specified in the configuration.
- **hook** -- The Mattermost hook, if not specified in the configuration.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' mattermost.post_message message='Build is done'
```

21.9.263 salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

salt.modules.mdadm_raid.add(name, device)

Add new device to RAID array.

CLI Example:

```
salt '*' raid.add /dev/md0 /dev/sda1
```

salt.modules.mdadm_raid.assemble(name, devices, test_mode=False, **kwargs)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

**Note:** Adding test_mode=True as an argument will print out the mdadm command that would have been run.

- **name** The name of the array to assemble.
- **devices** The list of devices comprising the array to assemble.
- **kwargs** Optional arguments to be passed to mdadm.

**returns**
test_mode=True: Prints out the full command.

**Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:
```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde']" test_mode=True
```

Note: Adding test_mode=True as an argument will print out the mdadm command that would have been run.

name The name of the array to create.
level The RAID level to use when creating the raid.
devices A list of devices used to build the array.
metadata Version of metadata to use when creating the array.
kwarys Optional arguments to be passed to mdadm.

returns
- **test_mode=True:** Prints out the full command.
- **test_mode=False (Default):** Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:
```
salt '*' raid.detail /dev/md0
```

For more info, read the mdadm(8) manpage

salt.modules.mdadm_raid.destroy(device)
Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array.

CLI Example:
```
salt '*' raid.destroy /dev/md0
```

salt.modules.mdadm_raid.detail(device="/dev/md0")
Show detail for a specified RAID device

CLI Example:
```
salt '*' raid.detail '/dev/md0'
```

salt.modules.mdadm_raid.examine(device, quiet=False)
Show detail for a specified RAID component device
device  Device to examine, that is part of the RAID
quiet   If the device is not part of the RAID, do not show any error

CLI Example:

```
salt '*' raid.examine '/dev/sda1'
```

salt.modules.mdadm_raid.list_()
List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

salt.modules.mdadm_raid.save_config()
Save RAID configuration to config file.

Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF:  http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```
salt '*' raid.save_config
```

salt.modules.mdadm_raid.stop()
Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

**21.9.264 salt.modules.mdata**

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

Maintainer  Jorge Schrauwen <sjorge@blackdot.be>

Maturity  new

Platform  smartos

salt.modules.mdata.delete_(*keyname*)
Delete metadata

```
prop [string] name of property
```

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.get_(*keyname*)
Get metadata

```
keyname [string] name of key
```

Note: If no keynames are specified, we get all (public) properties

CLI Example:
```python
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.list()  
List available metadata  

CLI Example:
```
salt '*' mdata.list
```

salt.modules.mdata.put_(keyname, val)  
Put metadata  

**prop** [string] name of property  

**val** [string] value to set  

CLI Example:
```
salt '*' mdata.list
```

### 21.9.265 salt.modules.memcached

Module for Management of Memcached Keys  
New in version 2014.1.0.

salt.modules.memcached.add(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)  
Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.  

CLI Example:
```
salt '*' memcached.add <key> <value>
```

salt.modules.memcached.decrement(key, delta=1, host='127.0.0.1', port=11211)  
Decrement the value of a key  

CLI Example:
```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

salt.modules.memcached.delete(key, host='127.0.0.1', port=11211, time=0)  
Delete a key from memcache server  

CLI Example:
```
salt '*' memcached.delete <key>
```

salt.modules.memcached.get(key, host='127.0.0.1', port=11211)  
Retrieve value for a key  

CLI Example:
```
salt '*' memcached.get <key>
```

salt.modules.memcached.increment(key, delta=1, host='127.0.0.1', port=11211)  
Increment the value of a key  

CLI Example:
salt '.*' memcached.increment <key>
salt '.*' memcached.increment <key> 2

salt.modules.memcached.replace(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of memcached.add

CLI Example:
salt '.*' memcached.replace <key> <value>

salt.modules.memcached.set_(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Set a key on the memcached server, overwriting the value if it exists.

CLI Example:
salt '.*' memcached.set <key> <value>

salt.modules.memcached.status(host='127.0.0.1', port=11211)
Get memcached status

CLI Example:
salt '.*' memcached.status

21.9.266 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

salt.modules.mine.delete(fun)
Remove specific function contents of minion.

Parameters
fun (str) -- The name of the function.

Return type bool
Returns True on success.

CLI Example:
salt '.*' mine.delete 'network.interfaces'

salt.modules.mine.flush()
Remove all mine contents of minion.

Return type bool
Returns True on success

CLI Example:
salt '.*' mine.flush

salt.modules.mine.get(tgt, fun, tgt_type='glob', exclude_minion=False)
Get data from the mine.

Parameters
- tgt (str) -- Target whose mine data to get.
- fun (str or list) -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
• **tgt_type** (*str*) -- Default glob. Target type to use with `tgt`. See *Targeting Minions* for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.

• **exclude_minion** (*bool*) -- Excludes the current minion from the result set.

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ip_addrs compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *Mine Runner module* instead; it can be invoked from a Pillar SLS file using the `saltutil.runner` module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

salt.modules.mine.get_docker(*interfaces=None, cidrs=None, with_container_id=False*)

Changed in version 2017.7.8, 2018.3.3: When `docker.update_mine` is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: `docker.update_mine` now defaults to `False`

Get all mine data for `docker.ps` and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

`with_container_id` Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces=['eth0', 'eth1']
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs=['107.170.147.0/24', '172.17.42.0/24']
salt '*' mine.get_docker interfaces=['eth0', 'eth1'] cidrs=['107.170.147.0/24',
    '172.17.42.0/24']
```

salt.modules.mine.send(*name, *args, **kwargs*)

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

**Parameters**

- **name** (*str*) -- Name of the function to add to the mine.

The following parameters are extracted from `kwargs` if present:

**Parameters**

- **mine_function** (*str*) -- The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to `name`.

- **allow_tgt** (*str*) -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.
- **allow_tgt_type**(str) -- Type of the targeting specification. This value will be ignored if allow_tgt is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

    Return type bool

    Returns Whether executing the function and storing the information was successful.

Changed in version 3000: Added allow_tgt- and allow_tgt_type-parameters to specify which minions are allowed to access this function. See Targeting Minions for more information about targeting.

CLI Example:

```bash
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0 allow_tgt='G@grain:value' allow_tgt_type=compound
```

**salt.modules.mine.update**(clear=False, mine_functions=None)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option mine_functions:

```python
mine_functions:
    network.ip_addrs:
        - eth0
    disk.usage: []
```

This function accepts the following arguments:

    Parameters

- **clear**(bool) -- Default: False Specifies whether updating will clear the existing values (True), or whether it will update them (False).

- **mine_functions**(dict) -- Update (or clear, see clear) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltstack.com/en/latest/topics/mine/index.html#mine-functions

This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under mine_functions in the minion/master config or pillar. A potential use would be together with the scheduler, for example:

```python
schedule:
    lldp_mine_update:
        function: mine.update
        kwargs:
            mine_functions:
                net.lldp: []
        hours: 12
```

In the example above, the mine for net.lldp would be refreshed every 12 hours, while network.ip_addrs would continue to be updated as specified in mine_interval.

The function cache will be populated with information from executing these functions

CLI Example:

```bash
salt '*' mine.update
```

**salt.modules.mine.valid()**

List valid entries in mine configuration.
CLI Example:

```
salt '*' mine.valid
```

21.9.267 salt.modules.minion module

Module to provide information about minions

salt.modules.minion.kill(timeout=15)

Kill the salt minion.

- **timeout** int seconds to wait for the minion to die.
- If you have a monitor that restarts salt-minion when it dies then this is a great way to restart after a minion upgrade.

CLI example:

```
$ salt minion[12] minion.kill
minion1: ------------
    killed: 7874
    retcode: 0
minion2: ------------
    killed: 29071
    retcode: 0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the **retcode** value: 0 is success, anything else is a failure.

salt.modules.minion.list()

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as salt-key -L

CLI Example:

```
salt 'master' minion.list
```

salt.modules.minion.restart()

Kill and restart the salt minion.

The configuration key **minion_restart_command** is an argv list for the command to restart the minion. If **minion_restart_command** is not specified or empty then the argv of the current process will be used.

if the configuration value **minion_restart_command** is not set and the -d (daemonize) argument is missing from argv then the minion will be killed but will not be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
$ salt minion[12] minion.restart
minion1: ------------
    comment: - Restart using process argv:
    comment: - /home/omniture/install/bin/salt-minion
```

(continues on next page)
The result of the command shows the process ID of minion1 that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero retcode and possibly output in the stderr and/or stdout values along with addition information in the comment field as is demonstrated with minion2.

21.9.268 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

cryptokit.mod_random.get_str(length=20)

Returns a random string of the specified length.

length [20] Any valid number of bytes.

CLI Example:

```
salt '*' random.get_str 128
```

cryptokit.mod_random.hash(value, algorithm='sha512')

New in version 2014.7.0.
Encodes a value with the specified encoder.

**value**  The value to be hashed.

**algorithm**  [sha512]  The algorithm to use. May be any valid algorithm supported by hashlib.

**CLI Example:**

```
salt '*' random.hash 'I am a string' md5
```

salt.modules.mod_random.rand_int(start=1, end=10, seed=None)

Returns a random integer number between the start and end number.

**start**  [1]  Any valid integer number

**end**  [10]  Any valid integer number

**seed**  Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

**CLI Example:**

```
salt '*' random.rand_int 1 10
```

salt.modules.mod_random.seed(range=10, hash=None)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

**hash**  None  Any hashable object.

**range**  10  Any valid integer number

**CLI Example:**

```
salt '*' random.seed 10 hash=None
```

salt.modules.mod_random.shadow_hash(crypt_salt=None, password=None, algorithm='sha512')

Generates a salted hash suitable for /etc/shadow.

**crypt_salt**  [None]  Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

**password**  [None]  Value to be salted and hashed. If one is not provided, a random password will be generated.

**algorithm**  [sha512]  Hash algorithm to use.

**CLI Example:**

```
salt '*' random.shadow_hash 'My5alT' 'MyP@sswd' md5
```

salt.modules.mod_random.str_encode(value, encoder='base64')

New in version 2014.7.0.

**value**  The value to be encoded.

**encoder**  [base64]  The encoder to use on the subsequent string.

**CLI Example:**

```
salt '*' random.str_encode 'I am a new string' base64
```

21.9.269  salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.
If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```yaml
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

```python
salt.modules.modjk.bulk_activate(workers, lbn, profile='default')
```

Activate all the given workers in the specific load balancer

CLI Examples:

```bash
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile
```

```python
salt.modules.modjk.bulk_disable(workers, lbn, profile='default')
```

Disable all the given workers in the specific load balancer

CLI Examples:

```bash
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile
```

```python
salt.modules.modjk.bulk_recover(workers, lbn, profile='default')
```

Recover all the given workers in the specific load balancer

CLI Examples:

```bash
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile
```

```python
salt.modules.modjk.bulk_stop(workers, lbn, profile='default')
```

Stop all the given workers in the specific load balancer

CLI Examples:

```bash
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
```
salt modules.modjk.dump_config(profile='default')
Dump the original configuration that was loaded from disk

    CLI Examples:

    salt '*' modjk.dump_config
    salt '*' modjk.dump_config other-profile

salt modules.modjk.get_running(profile='default')
Get the current running config (not from disk)

    CLI Examples:

    salt '*' modjk.get_running
    salt '*' modjk.get_running other-profile

salt modules.modjk.lb_edit(lbn, settings, profile='default')
Edit the loadbalancer settings

    Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

    CLI Examples:

    salt '*' modjk.lb_edit loadbalancer1 '{'vlr': 1, 'vlt': 60}'
    salt '*' modjk.lb_edit loadbalancer1 '{'vlr': 1, 'vlt': 60}' other-profile

salt modules.modjk.list_configured_members(lbn, profile='default')
Return a list of member workers from the configuration files

    CLI Examples:

    salt '*' modjk.list_configured_members loadbalancer1
    salt '*' modjk.list_configured_members loadbalancer1 other-profile

salt modules.modjk.recover_all(lbn, profile='default')
Set the all the workers in lbn to recover and activate them if they are not

    CLI Examples:

    salt '*' modjk.recover_all loadbalancer1
    salt '*' modjk.recover_all loadbalancer1 other-profile

salt modules.modjk.reset_stats(lbn, profile='default')
Reset all runtime statistics for the load balancer

    CLI Examples:

    salt '*' modjk.reset_stats loadbalancer1
    salt '*' modjk.reset_stats loadbalancer1 other-profile

salt modules.modjk.version(profile='default')
Return the modjk version

    CLI Examples:
salt '*' modjk.version
salt '*' modjk.version other-profile

salt.modules.modjk.worker_activate(worker, lbn, profile='default')
Set the worker to activate state in the lbn load balancer

CLI Examples:
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile

salt.modules.modjk.worker_disable(worker, lbn, profile='default')
Set the worker to disable state in the lbn load balancer

CLI Examples:
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile

salt.modules.modjk.worker_edit(worker, lbn, settings, profile='default')
Edit the worker settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}" other-profile

salt.modules.modjk.worker_recover(worker, lbn, profile='default')
Set the worker to recover this module will fail if it is in OK state

CLI Examples:
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile

salt.modules.modjk.worker_status(worker, profile='default')
Return the state of the worker

CLI Examples:
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile

salt.modules.modjk.worker_stop(worker, lbn, profile='default')
Set the worker to stopped state in the lbn load balancer

CLI Examples:
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile

salt.modules.modjk.workers(profile='default')
Return a list of member workers and their status

CLI Examples:
21.9.270 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

**configuration** This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.db_exists(name, user=None, password=None, host=None, port=None, authdb=None)

Checks if a database exists in MongoDB

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

salt.modules.mongodb.db_list(user=None, password=None, host=None, port=None, authdb=None)

List all MongoDB databases

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

salt.modules.mongodb.db_remove(name, user=None, password=None, host=None, port=None, authdb=None)

Remove a MongoDB database

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

salt.modules.mongodb.find(collection, query=None, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Find an object or list of objects in a collection

CLI Example:

```
salt '*' mongodb.find mycollection '[["foo": "FOO", "bar": "BAR"]]' <user> <password> <host> <port> <database>
```

salt.modules.mongodb.insert(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Insert an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.insert '[["foo": "FOO", "bar": "BAR"], {{"foo": "BAZ", "bar": "BAM"}}]' mycollection <user> <password> <host> <port> <database>
```
salt.modules.mongodb.remove(collection, query=None, user=None, password=None, host=None, port=None, database='admin', w=1, authdb=None)

Remove an object or list of objects into a collection

CLI Example:
```
salt '*' mongodb.remove mycollection [{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM"}] <user> <password> <host> <port> <database>
```

salt.modules.mongodb.update_one(objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Update an object into a collection

New in version 2016.11.0.

CLI Example:
```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_create(name, passwd, user=None, password=None, host=None, port=None, database='admin', authdb=None, roles=None)

Create a MongoDB user

CLI Example:
```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_exists(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Checks if a user exists in MongoDB

CLI Example:
```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_find(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get single user from MongoDB

CLI Example:
```
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_grant_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Grant one or many roles to a MongoDB user

CLI Examples:
```
salt '*' mongodb.user_grant_roles johndoe ['"readWrite"] dbname admin adminpwd localhost 27017
```
```
salt '*' mongodb.user_grant_roles janedoe ['{"role": "readWrite", "db": "dbname" }', '{"role": "read", "db": "otherdb"}'] dbname admin adminpwd localhost 27017
```
salt.modules.mongodb.user_list(user=None, password=None, host=None, port=None, database='admin', authdb=None)

List users of a MongoDB database

CLI Example:
```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_remove(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Remove a MongoDB user

CLI Example:
```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_revoke_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Revoke one or many roles to a MongoDB user

CLI Examples:
```
salt '*' mongodb.user_revoke_roles johndoe 
["readWrite"]
dbname admin adminpwd
localhost 27017
```
```
salt '*' mongodb.user_revoke_roles janedoe 
["readWrite", "dbname"]
["read", "otherdb"]
dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.user_roles_exists(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Checks if a user of a MongoDB database has specified roles

CLI Examples:
```
salt '*' mongodb.user_roles_exists johndoe 
["readWrite"]
dbname admin adminpwd
localhost 27017
```
```
salt '*' mongodb.user_roles_exists johndoe 
["readWrite", "dbname"]
["read", "otherdb"]
dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.version(user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get MongoDB instance version

CLI Example:
```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

21.9.271 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.configtest()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:
salt '*' monit.configtest

salt.modules.monit.id_(reset=False)
    New in version 2016.3.0.
    Return monit unique id.
    reset [False] Reset current id and generate a new id when it's True.
    CLI Example:
    
    salt '*' monit.id [reset=True]

salt.modules.monit.monitor(name)
    monitor service via monit
    CLI Example:
    
    salt '*' monit.monitor <service name>

salt.modules.monit.reload_()
    New in version 2016.3.0.
    Reload monit configuration
    CLI Example:
    
    salt '*' monit.reload

salt.modules.monit.restart(name)
    Restart service via monit
    CLI Example:
    
    salt '*' monit.restart <service name>

salt.modules.monit.start(name)
    CLI Example:
    
    salt '*' monit.start <service name>

salt.modules.monit.status(svc_name="")
    Display a process status from monit
    CLI Example:
    
    salt '*' monit.status
    salt '*' monit.status <service name>

salt.modules.monit.stop(name)
    Stops service via monit
    CLI Example:
    
    salt '*' monit.stop <service name>

salt.modules.monit.summary(svc_name="")
    Display a summary from monit
    CLI Example:
salt 'salt '*' monit.summary
salt 'salt '*' monit.summary <service name>

salt.modules.monit.unmonitor(name)
    Unmonitor service via monit
    CLI Example:
    salt 'salt '*' monit.unmonitor <service name>

salt.modules.monit.validate()
    New in version 2016.3.0.
    Check all services
    CLI Example:
    salt 'salt '*' monit.validate

salt.modules.monit.version()
    New in version 2016.3.0.
    Return version from monit -V
    CLI Example:
    salt 'salt '*' monit.version

21.9.272 salt.modules.moosefs

Module for gathering and managing information about MooseFS

salt.modules.moosefs.dirinfo(path, opts=None)
    Return information on a directory located on the Moose
    CLI Example:
    salt 'salt '*' moosefs.dirinfo /path/to/dir/ [-n h H]

salt.modules.moosefs.fileinfo(path)
    Return information on a file located on the Moose
    CLI Example:
    salt 'salt '*' moosefs.fileinfo /path/to/dir/

salt.modules.moosefs.getgoal(path, opts=None)
    Return goal(s) for a file or directory
    CLI Example:
    salt 'salt '*' moosefs.getgoal /path/to/file [-n h H]
salt 'salt '*' moosefs.getgoal /path/to/dir/ [-n h H][r]

salt.modules.moosefs.mounts()
    Return a list of current MooseFS mounts
    CLI Example:
salt '*' moosefs.mounts

21.9.273 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

salt.modules.mount.**active**(extended=False)
List the active mounts.

CLI Example:

```
salt '*' mount.active
```

salt.modules.mount.**automaster**(config='/etc/auto_salt')
List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

salt.modules.mount.**delete_mount_cache**(real_name)
New in version 2018.3.0.
Provide information if the path is mounted

CLI Example:

```
salt '*' mount.delete_mount_cache /mnt/share
```

salt.modules.mount.**filesystems**(config='/etc/filesystems')
New in version 2018.3.3.
List the contents of the filesystems

CLI Example:

```
salt '*' mount.filesystems
```

salt.modules.mount.**fstab**(config='/etc/fstab')
Changed in version 2016.3.2.
List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

salt.modules.mount.**is_fuse_exec**(cmd)
Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

salt.modules.mount.**is_mounted**(name)
New in version 2014.7.0.
Provide information if the path is mounted

CLI Example:
salt 'salt '*' mount.is_mounted /mnt/share'

**salt.modules.mount**

(name, device=False, mkmnt=False, fstype='', opts='defaults', user=None, util='mount')

Mount a device

CLI Example:
salt 'salt '*' mount.mount /mnt/foo /dev/sdz1 True'

**salt.modules.mount.read_mount_cache**

(name)

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:
salt 'salt '*' mount.read_mount_cache /mnt/share'

**salt.modules.mount.remount**

(name, device, mkmnt=False, fstype='', opts='defaults', user=None)

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:
salt 'salt '*' mount.remount /mnt/foo /dev/sdz1 True'

**salt.modules.mount.rm_automaster**

(name, device, config='/etc/auto_salt')

Remove the mount point from the auto_master

CLI Example:
salt 'salt '*' mount.rm_automaster /mnt/foo /dev/sdg'

**salt.modules.mount.rm_filesystems**

(name, device, config='/etc/filesystems')

New in version 2018.3.3.

Remove the mount point from the filesystems

CLI Example:
salt 'salt '*' mount.rm_filesystems /mnt/foo /dev/sdg'

**salt.modules.mount.rm_fstab**

(name, device, config='/etc/fstab')

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:
salt 'salt '*' mount.rm_fstab /mnt/foo /dev/sdg'

**salt.modules.mount.rm_vfstab**

(name, device, config='/etc/vfstab')

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:
salt 'salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0'
salt.modules.mount.set_automaster(name, device, fstype, opts='', config='/etc/auto_salt', test=False, not_change=False, **kwargs)

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:
```bash
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.set_filesystems(name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs)

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via match_on and not_change is True, the current line will be preserved.

Provide information if the path is mounted

Parameters

- **name** -- The name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:
```bash
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

salt.modules.mount.set_fstab(name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', not_change=False, **kwargs)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.

CLI Example:
```bash
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.set_vfstab(name, device, fstype, opts='-', device_fsck='-', pass_fsck='-', mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto', not_change=False, **kwargs)

.. versionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.

CLI Example:
salt 'salt' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs

salt.modules.mount.swapoff(name)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.swapon(name, priority=None)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.swaps()

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

salt.modules.mount.umount(name, device=None, user=None, util='mount')

Attempt to unmount a device by specifying the directory it is mounted on

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

salt.modules.mount.vfstab(config='/etc/vfstab')

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

salt.modules.mount.write_mount_cache(real_name, device, mkmnt, fstype, mount_opts)

New in version 2018.3.0.

Provide information if the path is mounted

Parameters

- real_name -- The real name of the mount point where the device is mounted.
- device -- The device that is being mounted.
- mkmnt -- Whether or not the mount point should be created.
- fstype -- The file system that is used.
• **mount_opts** -- Additional options used when mounting the device.

Returns Boolean if message was sent successfully.

CLI Example:
```
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,nosuid
```

### 21.9.274 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

**depends**
- FreeTDS
- pymssql Python module

**configuration** In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```python
mssql.server: 'localhost'
mssql.port: 1433
mssql.user: 'sysdba'
mssql.password: 'Some preferable complex password'
mssql.database: ''
```

The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

**salt.modules.mssql.db_create**(database, containment='NONE', new_database_options=None, **kwargs)

Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings.

CLI Example:
```
salt minion mssql.db_create DB_NAME
```

**salt.modules.mssql.db_exists**(database_name, **kwargs)

Find if a specific database exists on the MS SQL server.

CLI Example:
```
salt minion mssql.db_exists database_name='DBNAME'
```

**salt.modules.mssql.db_list**( **kwargs)

Return the database list created on a MS SQL server.

CLI Example:
```
salt minion mssql.db_list
```

**salt.modules.mssql.db_remove**(database_name, **kwargs)

Drops a specific database from the MS SQL server. It will not drop any of ‘master’, ‘model’, ‘msdb’ or ‘tempdb’.

CLI Example:
```
salt minion mssql.db_remove database_name='DBNAME'
```
salt.modules.mssql.login_create(login, new_login_password=None, new_login_domain='',
                           new_login_roles=None, new_login_options=None, **kwargs)

Creates a new login. Does not update password of existing logins. For Windows authentication, provide
new_login_domain. For SQL Server authentication, provide new_login_password. Since hashed pass-
words are varbinary values, if the new_login_password is ‘int / long’, it will be considered to be HASHED.

- new_login_roles: a list of SERVER roles
- new_login_options: a list of strings

CLI Example:

```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_
--password=PASSWORD]
```

salt.modules.mssql.login_exists(login, domain='', **kwargs)

Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.login_remove(login, **kwargs)

Removes an login.

CLI Example:

```
salt minion mssql.login_remove LOGINNAME
```

salt.modules.mssql.role_create(role, owner=None, grants=None, **kwargs)

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE
ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba grants='['SELECT",
 ->"INSERT", "UPDATE", "DELETE", "EXECUTE"]'
```

salt.modules.mssql.role_exists(role, **kwargs)

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

salt.modules.mssql.role_list(**kwargs)

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

salt.modules.mssql.role_remove(role, **kwargs)

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

salt.modules.mssql.tsql_query(query, **kwargs)

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an
empty list if no data is available.
CLI Example:
```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

```python
salt.modules.mssql.user_create(username, login=None, domain='', database=None, roles=None, options=None, **kwargs)
```
Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings.

CLI Example:
```
salt minion mssql.user_create USERNAME database=DBNAME
```

```python
salt.modules.mssql.user_exists(username, domain='', database=None, **kwargs)
```
Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username.

CLI Example:
```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

```python
salt.modules.mssql.user_list(**kwargs)
```
Get the user list for a specific database on the MS SQL server.

CLI Example:
```
salt minion mssql.user_list [database='DBNAME']
```

```python
salt.modules.mssql.user_remove(username, **kwargs)
```
Removes an user.

CLI Example:
```
salt minion mssql.user_remove USERNAME database=DBNAME
```

```python
salt.modules.mssql.version(**kwargs)
```
Return the version of a MS SQL server.

CLI Example:
```
salt minion mssql.version
```

### 21.9.275 `salt.modules.msteams module`

Module for sending messages to MS Teams

New in version 2017.7.0.

**configuration** This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```toml
msteams:
    hook_url: https://outlook.office.com/webhook/837
```

```python
salt.modules.mssql.msteams.post_card(message, hook_url=None, title=None, theme_color=None)
```
Send a message to an MS Teams channel. :param message: The message to send to the MS Teams channel. :param hook_url: The Teams webhook URL, if not specified in the configuration. :param title: Optional title
for the posted card:

:param theme_color: Optional hex color highlight for the posted card
:returns: Boolean if message was sent successfully.

CLI Example:
salt '*' msteams.post_card message="Build is done"

### 21.9.276 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

**salt.modules.munin.list_plugins()**
List all the munin plugins

CLI Example:
salt '*' munin.list_plugins

**salt.modules.munin.run(plugins)**
Run one or more named munin plugins

CLI Example:
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory

**salt.modules.munin.run_all()**
Run all the munin plugins

CLI Example:
salt '*' munin.run_all

### 21.9.277 salt.modules.mysql

Module to provide MySQL compatibility to salt.

**depends**
- MySQLdb Python module

**Note:** On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

**configuration**
In order to connect to MySQL, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```python
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:
Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined here. Additionally, it is now possible to setup a user with no password.

```
salt.modules.mysql.alter_db(name, character_set=None, collate=None, **connection_args)
```
Modify database using ALTER DATABASE %dbname% CHARACTER SET %charset% COLLATE %collation%; query.

CLI Example:
```
salt '*' mysql.alter_db testdb charset='latin1'
```

```
salt.modules.mysql.db_check(name, table=None, **connection_args)
```
Repairs the full database or just a given table

CLI Example:
```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

```
salt.modules.mysql.db_create(name, character_set=None, collate=None, **connection_args)
```
Adds a databases to the MySQL server.
name The name of the database to manage
character_set The character set, if left empty the MySQL default will be used
collate The collation, if left empty the MySQL default will be used

CLI Example:
```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

```
salt.modules.mysql.db_exists(name, **connection_args)
```
Checks if a database exists on the MySQL server.

CLI Example:
```
salt '*' mysql.db_exists 'dbname'
```

```
salt.modules.mysql.db_get(name, **connection_args)
```
Return a list of databases of a MySQL server using the output from the SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname'; query.

CLI Example:
```
salt '*' mysql.db_get test
```

```
salt.modules.mysql.db_list(**connection_args)
```
Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:
```
salt '*' mysql.db_list
```

```
salt.modules.mysql.db_optimize(name, table=None, **connection_args)
```
Optimizes the full database or just a given table

CLI Example:
salt '*' mysql.db_optimize dbname

salt.modules.mysql.db_remove(name, **connection_args)
Removes a databases from the MySQL server.
CLI Example:

    salt '*' mysql.db_remove 'dbname'

salt.modules.mysql.db_repair(name, table=None, **connection_args)
Repairs the full database or just a given table
CLI Example:

    salt '*' mysql.db_repair dbname

salt.modules.mysql.db_tables(name, **connection_args)
Shows the tables in the given MySQL database (if exists)
CLI Example:

    salt '*' mysql.db_tables 'database'

salt.modules.mysql.file_query(database, file_name, **connection_args)
Run an arbitrary SQL query from the specified file and return the the number of affected rows.
New in version 2017.7.0.

database
database to run script inside
file_name
File name of the script. This can be on the minion, or a file that is reachable by the fileserver
CLI Example:

    salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
    salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql

Return data:

    {'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}

salt.modules.mysql.free_slave(**connection_args)
Frees a slave from its master. This is a WIP, do not use.
CLI Example:

    salt '*' mysql.free_slave

salt.modules.mysql.get_master_status(**connection_args)
Retrieves the master status from the minion.
Returns:

    {'host.domain.com': {'Binlog_Do_DB': '',
                        'Binlog_Ignore_DB': '',
                        'File': 'mysql-bin.000021',
                        'Position': 107}}

CLI Example:
Salt Documentation, Release 3002.6

salt '_salt '*' mysql.get_master_status

salt.modules.mysql.get_slave_status(**connection_args)
Retrieves the slave status from the minion.

Returns:

```python
{'host.domain.com': {'Connect_Retry': 60,
'Exec_Master_Log_Pos': 107,
'Last_Errno': 0,
'Last_Error': '',
'Last_IO_Errno': 0,
'Last_IO_Error': '',
'Last_SQL_Errno': 0,
'Last_SQL_Error': '',
'Master_Host': 'comet.scion-eng.com',
'Master_Log_File': 'mysql-bin.000021',
'Master_Port': 3306,
'Master_SSL_Allowed': 'No',
'Master_SSL_CA_File': '',
'Master_SSL_CA_Path': '',
'Master_SSL_Cert': '',
'Master_SSL_Cipher': '',
'Master_SSL_Cert': '',
'Master_SSL_Verify_Server_Cert': 'No',
'Master_Server_Id': 1,
'Master_User': 'replu',
'Read_Master_Log_Pos': 107,
'Relay_Log_File': 'klo-relay-bin.000071',
'Relay_Log_Pos': 253,
'Relay_Log_Space': 553,
'Relay_Master_Log_File': 'mysql-bin.000021',
'Replicate_Do_DB': '',
'Replicate_Do_Table': '',
'Replicate_Ignore_DB': '',
'Replicate_Ignore_Table': '',
'Replicate_Wild_Do_Table': '',
'Replicate_Wild_Ignore_Table': '',
'Seconds_Behind_Master': 0,
'Skip_Counter': 0,
'Slave_IO_Running': 'Yes',
'Slave_IO_State': 'Waiting for master to send event',
'Slave_SQL_Running': 'Yes',
'Until_Condition': 'None',
'Until_Log_File': '',
'Until_Log_Pos': 0}}
```

CLI Example:

salt '_salt '*' mysql.get_slave_status

salt.modules.mysql.grant_add(grant, database, user, host='localhost', grant_option=False, escape=True, ssl_option=False, **connection_args)
Adds a grant to the MySQL server.
For database, make sure you specify database.table or database.*

CLI Example:
salt.modules.mysql.grant_add('SELECT,INSERT,UPDATE,...' 'database.*' → 'frank' 'localhost')

salt.modules.mysql.grant_add(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)

Checks to see if a grant exists in the database

CLI Example:

salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*' → 'frank' 'localhost'

salt.modules.mysql.grant_revoke(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)

Removes a grant from the MySQL server.

CLI Example:

salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*' 'frank' → 'localhost'

salt.modules.mysql.plugin_add(name, soname=None, **connection_args)

Add a plugin.

CLI Example:

salt '*' mysql.plugin_add auth_socket

salt.modules.mysql.plugin_remove(name, **connection_args)

Remove a plugin.

CLI Example:

salt '*' mysql.plugin_remove auth_socket

salt.modules.mysql.plugin_status(name, **connection_args)

Return the status of a plugin.

CLI Example:

salt '*' mysql.plugin_status auth_socket

salt.modules.mysql.plugins_list(**connection_args)

Return a list of plugins and their status from the SHOW PLUGINS query.

CLI Example:

salt '*' mysql.plugins_list

salt.modules.mysql.processlist(**connection_args)

Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```python
{'Command': 'Query', 'Host': 'localhost', 'Id': 39, 'Info': 'SHOW FULL PROCESSLIST', 'Rows_examined': 0,}
```

(continues on next page)
CLI Example:

```
salt '*' mysql.processlist
```

salt.modules.mysql.query(database, query, **connection_args)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{
    'query time': {'human': '39.0ms', 'raw': '0.03899'},
    'rows affected': 1L
}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{
    'query time': {'human': '1.0ms', 'raw': '0.001'},
    'results': [(1L, 'User 1', Decimal('110.000000')), (2L, 'User 2', Decimal('215.636756')), (3L, 'User 3', Decimal('0.040000'))],
    'rows returned': 3L
}
```

CLI Example:

```
salt '*' mysql.query mydb "INSERT into users values (null,"user 4", 5)"
```

Return data:

```
{
    'query time': {'human': '25.6ms', 'raw': '0.02563'},
    'rows affected': 1L
}
```

CLI Example:

```
salt '*' mysql.query mydb "DELETE from users where id = 4 limit 1"
```

Return data:

```
{
    'query time': {'human': '39.0ms', 'raw': '0.03899'},
    'rows affected': 1L
}
```

Jinja Example: Run a query on mydb and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[0][0] }}
```
salt.modules.mysql.quote_identifier(identifier, for_grants=False)

Return an identifier name (column, table, database, etc) escaped for MySQL.

This means surrounded by "'" character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

Parameters

- **identifier** -- the table, column or database identifier
- **for_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape "_" and "%" characters as requested by MySQL. Note that theses characters should only be escaped when requesting grants on the database level (my_%db.*) but not for table level grants (my_%db.foo)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar'
```

salt.modules.mysql.showglobal(**connection_args)

Retrieves the show global variables from the minion.

Returns: show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

salt.modules.mysql.showvariables(**connection_args)

Retrieves the show variables from the minion.

Returns: show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

salt.modules.mysql.slave_lag(**connection_args)

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

salt.modules.mysql.status(**connection_args)

Return the status of a MySQL server using the output from the `SHOW STATUS` query.

CLI Example:

```
salt '*' mysql.status
```

salt.modules.mysql.tokenize_grant(grant)

External wrapper function

- **param grant:**
- **return:** dict

CLI Example:

```
salt '*' mysql.tokenize_grant "GRANT SELECT, INSERT ON testdb.* TO →'testuser'@'localhost'"
```

salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args)

Change password for a MySQL user
**host**  Host for which this user/password combo applies

**password**  The password to set for the new user. Will take precedence over the password_hash option if both are specified.

**password_hash**  The password in hashed form. Be sure to quote the password because YAML doesn’t like the `*`. A password hash can be obtained from the mysql command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+---------------------------------------------------------------------------+
| PASSWORD('mypass')                                                        |
+---------------------------------------------------------------------------+
| *6C8989366EAF75B8670AD8EA7A7FC1176A95CEF4                                 |
+---------------------------------------------------------------------------+
1 row in set (0.00 sec)
```

**allow_passwordless**  If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```sh
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
```

salt.modules.mysql.user_create(**connection_args**, **connection_args**)

Creates a MySQL user

**host**  Host for which this user/password combo applies

**password**  The password to use for the new user. Will take precedence over the password_hash option if both are specified.

**password_hash**  The password in hashed form. Be sure to quote the password because YAML doesn’t like the `*`. A password hash can be obtained from the mysql command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+---------------------------------------------------------------------------+
| PASSWORD('mypass')                                                        |
+---------------------------------------------------------------------------+
| *6C8989366EAF75B8670AD8EA7A7FC1176A95CEF4                                 |
+---------------------------------------------------------------------------+
1 row in set (0.00 sec)
```

**allow_passwordless**  If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

**unix_socket**  If True and allow_passwordless is True then will be used unix_socket auth plugin.

**password_column**  The password column to use in the user table.

**auth_plugin**  The authentication plugin to use, default is to use the mysql_native_password plugin.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```sh
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

salt.modules.mysql.user_exists(**connection_args**, **connection_args**)

**host**  Host for which this user/password combo applies

**password**  The password to set for the new user. Will take precedence over the password_hash option if both are specified.

**password_hash**  The password in hashed form. Be sure to quote the password because YAML doesn’t like the `*`. A password hash can be obtained from the mysql command-line client like so:
Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

```bash
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_string'
```

**salt.modules.mysql.user_grants** *(user, host='localhost', **connection_args)*

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```bash
salt '*' mysql.user_grants 'frank' 'localhost'
```

**salt.modules.mysql.user_info** *(user, host='localhost', **connection_args)*

Get full info on a MySQL user

CLI Example:

```bash
salt '*' mysql.user_info root localhost
```

**salt.modules.mysql.user_list** *(**connection_args)*

Return a list of users on a MySQL server

CLI Example:

```bash
salt '*' mysql.user_list
```

**salt.modules.mysql.user_remove** *(user, host='localhost', **connection_args)*

Delete MySQL user

CLI Example:

```bash
salt '*' mysql.user_remove frank localhost
```

**salt.modules.mysql.verify_login** *(user, password=None, **connection_args)*

Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:

```bash
salt '*' mysql.verify_login root password
```

**salt.modules.mysql.version** *(**connection_args)*

Return the version of a MySQL server using the output from the SELECT VERSION() query.

CLI Example:

```bash
salt '*' mysql.version
```
21.9.278 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don’t advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have pillar_opts=True:

```bash
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
    # also `box_type` default changed from secretbox to sealedbox.
    box_type: sealedbox (default)
    sk_file: /etc/salt/pki/master/nacl (default)
    pk_file: /etc/salt/pki/master/nacl.pub (default)
    sk: None
    pk: None
```

Usage can override the config defaults:

```bash
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your sk_file and pk_file use:

```bash
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.keygen local:
    -------
    pk:
        /kfGX7PbWeu099782PbbKWLPg/9p06IK QswkdwHCDk0=
    sk:
        SVWut5SnPupb99782PbbKWLPg/9p06IK QswkdwHCDk0=
```

Now with your keypair, you can encrypt data:

You have two option, sealedbox or secretbox.

SecretBox is data encrypted using private key pk. Sealedbox is encrypted using public key pk.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```bash
salt-call --local nacl.enc asecretpass pk=/kfGX7PbWeu099782PbbKWLPg/9p06IK QswkdwHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdk1MbGPGj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/+cYsk6mWhGdk58=
```

To decrypt the data:

```bash
salt-call --local nacl.dec data=
    tqXzeIJnTAM9Xf0mdLcpEdk1MbGPGj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/+cYsk6mWhGdk58=
    sk=SVWut5SnPupb99782PbbKWLPg/9p06IK QswkdwHCDk0=
```
When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```bash
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnUIiDiu1g4Kx8ecET/NoeKEzd4nLeYcCF/9k=

salt-run nacl.enc 'asecretpass'
salt-run nacl.dec 'tqXzeI/JnTAM9Xf0mdLcpEdk1MbfGDPj2oTKmlgrm3S1TVH/hNh9h8mU1Gk1lGq/+cYsk6m5WhGdk58='
```

The developer can then use a less-secure system to encrypt data.

```
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
  user: root
  password1: {salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hWj0llUA+uaVvou3vJ4=')}
  cert_key: {salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')}
  cert_key2: {salt.nacl.dec_file('salt:///certs/example.com/key.nacl')}
```

Larger files like certificates can be encrypted with:

```
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

```
# or more advanced
cert=$(cat /tmp/cert.crt)
salt-call --out=newline_values_only nacl.enc_pub data="$cert" /tmp/cert.nacl
```

In pillars rendered with jinja be sure to include `json` so line breaks are encoded:

```
cert: {{salt.nacl.dec('S2uogToXkgENz9...085KYt') | json}}
```

In states rendered with jinja it is also good practice to include `json`:

```
{{sls}} private key:
  file.managed:
    - name: /etc/ssl/private/cert.key
    - mode: 700
    - contents: "{{pillar['pillarexample']['cert_key'] | json}}"
```

Optional small program to encrypt data without needing salt modules.

```
#!/bin/python3
import sys, base64, libnacl.sealed
pk = base64.b64decode('YOURPUBKEY')
b = libnacl.sealed.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```
echo 'apassword' | nacl_enc.py
```

21.9. execution modules
salt.modules.nacl.dec(data, **kwargs)
Alias to `box_type_decrypt`
box_type: secretbox, sealedbox(default)
salt.modules.nacl.dec_file(name, out=None, **kwargs)
This is a helper function to decrypt a file and return its contents.
You can provide an optional output file using `out`
name can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
```
salt.modules.nacl.enc(data, **kwargs)
Alias to `box_type_encrypt`
box_type: secretbox, sealedbox(default)
salt.modules.nacl.enc_file(name, out=None, **kwargs)
This is a helper function to encrypt a file and return its contents.
You can provide an optional output file using `out`
name can be a local file or when not using `salt-run` can be a url like `salt://`, `https://` etc.
CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert.nacl out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa.nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
```
salt.modules.nacl.keygen(sk_file=None, pk_file=None, **kwargs)
Use libnacl to generate a keypair.
If no `sk_file` is defined return a keypair.
If only the `sk_file` is defined `pk_file` will use the same name with a postfix `.pub`.
When the `sk_file` is already existing, but `pk_file` is not. The `pk_file` will be generated using the `sk_file`.
CLI Examples:

```
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/
   --master/nacl.pub
salt-call --local nacl.keygen
```
salt.modules.nacl.sealedbox_decrypt(data, **kwargs)
Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.
CLI Examples:
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/
→pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='

salt.modules.nacl.sealedbox_encrypt(data, **kwargs)
Encrypt data using a public key generated from nacl.keygen. The encryptd data can be decrypted using
nacl.sealedbox_decrypt only with the secret key.

CLI Examples:
salt-call nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/master/
→nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
→'vrwQF7cNiNAVQVA1S3bvcbJUnF0cN6fU9YTZD9mBfzQ='

salt.modules.nacl.secretbox_decrypt(data, **kwargs)
Decrypt data that was encrypted using nacl.secretbox_encrypt using the secret key that was generated from
nacl.keygen.

CLI Examples:
salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/
→pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='

salt.modules.nacl.secretbox_encrypt(data, **kwargs)
Encrypt data using a secret key generated from nacl.keygen. The same secret key can be used to decrypt the
data using nacl.secretbox_decrypt.

CLI Examples:
salt-run nacl.secretbox_encrypt datatoenc	salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/
→nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo,'

21.9.279 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.
salt.modules.nagios.list_plugins()  
List all the nagios plugins

CLI Example:
salt '*' nagios.list_plugins

salt.modules.nagios.retcode(plugin, args='', key_name=None)
Run one nagios plugin and return retcode of the execution

salt.modules.nagios.retcode_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this
format:
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks (one or more) and always it will return the highest value of all the checks

CLI Example:

```bash
salt '*' nagios.retcode webserver
```

`salt.modules.nagios.run(plugin, args='')`
Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```bash
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

`salt.modules.nagios.run_all(plugin, args='')`
Run nagios plugin and return all the data execution with cmd.run_all

`salt.modules.nagios.run_all_pillar(pillar_name)`
Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```bash
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```bash
salt '*' nagios.run webserver
```

`salt.modules.nagios.run_pillar(pillar_name)`
Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:
webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```shell
salt '*' nagios.run webserver
```

### 21.9.280 `salt.modules.nagios_rpc`

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

**salt.modules.nagios_rpc.host_status** (*hostname=None, **kwargs*)

Check status of a particular host. By default statuses are returned in a numeric format.

- **hostname** The hostname to check the status of the service in Nagios.
- **numeric** Turn to false in order to return status in text format (‘OK’ instead of 0, ‘Warning’ instead of 1 etc)

**Returns** status: ‘OK’, ‘Warning’, ‘Critical’ or ‘Unknown’

CLI Example:

```shell
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

**salt.modules.nagios_rpc.service_status** (*hostname=None, service=None, **kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

- **hostname** The hostname to check the status of the service in Nagios.
- **service** The service to check the status of in Nagios.
- **numeric** Turn to false in order to return status in text format (‘OK’ instead of 0, ‘Warning’ instead of 1 etc)

**Returns** status: ‘OK’, ‘Warning’, ‘Critical’ or ‘Unknown’

CLI Example:

```shell
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP' numeric=False
```
21.9.281 salt.modules.namecheap_domains module

Namecheap Domain Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.name</td>

<tr>
<td>namecheap.url</td>
<td><a href="https://api.sandbox.namecheap.xml.response">https://api.sandbox.namecheap.xml.response</a></td>
</tr>
</tbody>
</table>

salt.modules.namecheap_domains.check(domain_to_check)

Checks the availability of domains

- **domains_to_check**: array of strings List of domains to check
- Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

```
salt 'my-minion' namecheap_domains.check domain-to-check
```

salt.modules.namecheap_domains.create(domain_name, years, **kwargs)

Try to register the specified domain name

- **domain_name**: The domain name to be registered
- **years**: Number of years to register
- Returns the following information:
  - Whether or not the domain was renewed successfully
  - Whether or not WhoisGuard is enabled
  - Whether or not registration is instant
  - The amount charged for registration
  - The domain ID
  - The order ID
  - The transaction ID

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

salt.modules.namecheap_domains.get_info(domain_name)

Returns information about the requested domain

- returns a dictionary of information about the domain named

```
salt 'my-minion' namecheap_domains.get_info domain-name
```
Salt Documentation, Release 3002.6

```python
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

```python
salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)
```

Returns a list of domains for the particular user as a list of objects offset by page length of page_size

- **list_type** [ALL] One of ALL, EXPIRING, EXPIRED
- **search_term** Keyword to look for on the domain list
- **page** [1] Number of result page to return
- **page_size** [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
- **sort_by** One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATEDATE_DESC

CLI Example:

```python
salt 'my-minion' namecheap_domains.get_list
```

```python
salt.modules.namecheap_domains.get_tld_list()
```

Returns a list of TLDs as objects

CLI Example:

```python
salt 'my-minion' namecheap_domains.get_tld_list
```

```python
salt.modules.namecheap_domains.reactivate(domain_name)
```

Try to reactivate the expired domain name

Returns the following information:
- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID

CLI Example:

```python
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

```python
salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)
```

Try to renew the specified expiring domain name for a specified number of years

- **domain_name** The domain name to be renewed
- **years** Number of years to renew

Returns the following information:
- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

CLI Example:

```python
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```
Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67890c0d1e2f3
namecheap.client_ip: 162.155.30.172
namecheap.url: https://api.namecheap.com/xml.response
```

```
namecheap.url: https://api.sandbox.namecheap.com/xml.response
```

```
salt.modules.namecheap_domains_dns.get_hosts(sld, tld)
```

Retrieves DNS host record settings for the requested domain.

- `returns` a dictionary of information about the requested domain
- `sld` SLD of the domain name
- `tld` TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

```
salt.modules.namecheap_domains_dns.get_list(sld, tld)
```

Gets a list of DNS servers associated with the requested domain.

- `returns` a dictionary of information about requested domain
- `sld` SLD of the domain name
- `tld` TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

```
salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)
```

Sets domain to use custom DNS servers.

- `returns` True if the custom nameservers were set successfully
- `sld` SLD of the domain name
- `tld` TLD of the domain name
- `nameservers` array of strings List of nameservers to be associated with this domain

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

```
salt.modules.namecheap_domains_dns.set_default(sld, tld)
```

Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.
salt Documentation, Release 3002.6

**set_default**

sld SLD of the domain name
tld TLD of the domain name
Returns True if the domain was successfully pointed at the default DNS servers.

CLI Example:
```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)

Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully
sld SLD of the domain name
tld TLD of the domain name
hosts Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:
• hostname
• recordtype - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
• address - URL or IP address
• ttl - An integer between 60 and 60000 (default: 1800)

Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.

CLI Example:
```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

---

21.9.283 **namecheap_domains_dns**

Namecheap Nameserver Management

New in version 2017.7.0.

**Prerequisites**

This module uses the requests Python module to communicate to the namecheap API.

**Configuration**

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172

# Real url
namecheap.url: https://api.namecheap.com/xml.response
# Sandbox url
# namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains.ns.create(sld, tld, nameserver, ip)

Creates a new nameserver. Returns True if the nameserver was created successfully.

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
ip Nameserver IP address

CLI Example:
salt '*' namecheap_domains_ns.create sld tld nameserver ip

salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)
    Deletes a nameserver. Returns True if the nameserver was deleted successfully
    sld  SLD of the domain name
    tld  TLD of the domain name
    nameserver  Nameserver to delete
    CLI Example:
    salt '*' namecheap_domains_ns.delete sld tld nameserver

salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)
    Retrieves information about a registered nameserver. Returns the following information:
    •  IP Address set for the nameserver
    •  Domain name which was queried
    •  A list of nameservers and their statuses
    sld  SLD of the domain name
    tld  TLD of the domain name
    nameserver  Nameserver to retrieve
    CLI Example:
    salt '*' namecheap_domains_ns.get_info sld tld nameserver

salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)
    Deletes a nameserver. Returns True if the nameserver was updated successfully.
    sld  SLD of the domain name
    tld  TLD of the domain name
    nameserver  Nameserver to create
    old_ip  Current ip address
    new_ip  New ip address
    CLI Example:
    salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip

21.9.284  salt.modules.namecheap_ssl module

Namecheap SSL Certificate Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.
Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

```
salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file

certificate_id Unique ID of the SSL certificate you wish to activate

web_server_type The type of certificate format to return. Possible values include:
- apache2
- apachepachessl
- apacheopenssl
- apacheraven
- apachesssl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

approver_email The email ID which is on the approver email list.

---

**Note:** `http_dc_validation` must be set to `False` if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.
Note: For other parameters which may be required, see here.

CLI Example:
```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```
salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None, sans_to_add=None)

Creates a new SSL certificate. Returns the following information:

- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

years  [1] Number of years to register
certificate_type  Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

g promotional_code  An optional promo code to use when creating the certificate
sans_to_add [0] This parameter defines the number of add-on domains to be purchased in addition to the
default number of domains included with a multi-domain certificate. Each certificate that supports SANs
has the default number of domains included. You may check the default number of domains included
and the maximum number of domains that can be added to it in the table below.

<table>
<thead>
<tr>
<th>Provider</th>
<th>Product name</th>
<th>Default number of domains (domain from CSR is counted here)</th>
<th>Maximum number of total domains</th>
<th>Maximum number of domains that can be passed in sans_to_add parameter</th>

</tbody>
</table>

CLI Example:

```shell
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

salt.modules.namecheap_ssl.get_info(certificate_id, returncertificate=False, returntype=None)

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL
certificate with two keys:
- **ssl** - Contains the metadata information
- **certificate** - Contains the details for the certificate such as the CSR, Approver, and certificate data

**certificate_id** Unique ID of the SSL certificate

**returncertificate** [False] Set to True to ask for the certificate in response

**returntype** Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

**Note:** Required if returncertificate is True

CLI Example:
```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

```python
salt.modules.namecheap_ssl.get_list(**kwargs)
Returns a list of SSL certificates for a particular user
```

**ListType** [All] Possible values:
- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

**SearchTerm** Keyword to look for on the SSL list

**Page** [1] Page number to return

**PageSize** [20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

**sortBy** One of `PURCHASEDATE`, `PURCHASEDATE_DESC`, `SSLTYPE`, `SSLTYPE_DESC`, `EXPIREDATETIME`, `EXPIREDATETIME_DESC`, `Host_Name`, or `Host_Name_DESC`

CLI Example:
```
salt 'my-minion' namecheap_ssl.get_list Processing
```

```python
salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, httpdc_validation=False)
Parses the CSR. Returns a dictionary of result values.
```

**csr_file** Path to Certificate Signing Request file

**certificate_type** Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV

2268 Chapter 21. Salt Module Reference
• True BusinessID
• True BusinessID Multi Domain
• True BusinessID Wildcard
• True BusinessID with EV
• True BusinessID with EV Multi Domain
• Unified Communications

**http_dc_validation** [False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

```python
salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file
certificate_id Unique ID of the SSL certificate you wish to activate
web_server_type The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessley

**approver_email** The email ID which is on the approver email list.

**Note:** http_dc_validation must be set to False if this option is used.

**http_dc_validation** [False] Whether or not to activate using HTTP-based validation.

**Note:** For other parameters which may be required, see here.
CLI Example:

```
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

```python
salt.modules.namecheap_ssl.renew(years, certificate_id, certificate_type, promotion_code=None)
```

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

**years** [1] Number of years to register

**certificate_id** Unique ID of the SSL certificate you wish to renew

**certificate_type** Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotion_code** An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```
21.9.285 salt.modules.namecheap_users module

Namecheap User Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>namecheap.name: companyname</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3</td>
</tr>
<tr>
<td>namecheap.client_ip: 162.155.30.172</td>
</tr>
</tbody>
</table>
# Real url
| namecheap.url: https://api.namecheap.com/xml.response |
# Sandbox url
| #namecheap.url: https://api.sandbox.namecheap.xml.response |

salt.modules.namecheap_users.check_balances(minimum=100)
Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns False if the user's account balance is less than the provided minimum or True if greater than the minimum.

minimum [100] The value to check

CLI Example:
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150

salt.modules.namecheap_users.get_balances()
Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

Note: If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:
salt 'my-minion' namecheap_users.get_balances
21.9.286  salt.modules.napalm_bgp module

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

**codeauthor**  Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

**maturity** new

**depends** napalm

**platform** unix

Dependencies

- **napalm proxy minion**

New in version 2016.11.0.

salt.modules.napalm_bgp.config(group=None, neighbor=None, **kwargs)

Provides the BGP configuration on the device.

**Parameters**

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

**Returns**  A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)
- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:
salt '*' bgp.config  # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME  # provides detail only about BGP group PEERS-
  → GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1  # provides details only about BGP
  → neighbor 172.17.17.1, # configured in the group PEERS-GROUP-NAME

Output Example:

```
{
  'PEERS-GROUP-NAME':{
    'type': 'external',
    'description': 'Here we should have a nice description',
    'apply_groups': ['BGP-PREFIX-LIMIT'],
    'import_policy': 'PUBLIC-PEER-IN',
    'export_policy': 'PUBLIC-PEER-OUT',
    'remove_private': True,
    'multipath': True,
    'multihop_ttl': 30,
    'neighbors': {
      '192.168.0.1': {
        'description': 'Facebook [CDN]',
        'prefix_limit': {
          'inet': {
            'unicast': {
              'limit': 100,
              'teardown': {
                'threshold': 95,
                'timeout': 5
              }
            }
          }
        },
        'peer-as': 32934,
        'route_reflector': False,
        'nhs': True
      },
      '172.17.17.1': {
        'description': 'Twitter [CDN]',
        'prefix_limit': {
          'inet': {
            'unicast': {
              'limit': 500,
              'no-validate': 'IMPORT-FLOW ROUTES'
            }
          }
        },
        'peer-as': 13414,
        'route_reflector': False,
        'nhs': False
      }
    }
  }
}
```

```
salt.modules.napalm_bgp.neighbors(neighbor=None, **kwargs)
```

Provides details regarding the BGP sessions configured on the network device.

**Parameters**

- **neighbor** -- IP Address of a specific neighbor.
Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messagesqueued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- `flap_count (int)`

**CLI Example:**

```
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s) 172.17.17.
```

**Output Example:**

```json
{
  'default': {
    8121: [
      {
        'up': True,
        'local_as': 13335,
        'remote_as': 8121,
        'local_address': '172.101.76.1',
        'local_address_configured': True,
        'local_port': 179,
        'remote_address': '192.247.78.0',
        'router_id': '192.168.0.1',
        'remote_port': 58380,
        'multihop': False,
        'import_policy': '4-NTT-TRANSIT-IN',
        'export_policy': '4-NTT-TRANSIT-OUT',
        'input_messages': 123,
        'output_messages': 13,
        'input_updates': 123,
        'output_updates': 5,
        'messages_queued_out': 23,
        'connection_state': 'Established',
        'previous_connection_state': 'EstabSync',
        'last_event': 'RecvKeepAlive',
        'suppress_4byte_as': False,
        'local_as_prepend': False,
        'holdtime': 90,
        'configured_holdtime': 90,
        'keepalive': 30,
        'configured_keepalive': 30,
        'active_prefix_count': 132808,
        'received_prefix_count': 566739,
        'accepted_prefix_count': 566479,
        'suppressed_prefix_count': 0,
        'advertise_prefix_count': 0,
        'flap_count': 27
      }
    ]
  }
}
```
21.9.287  salt.modules.napalm_formula module

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

`salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=':')`

Return the list of all the possible paths in a container, down to the `config` container. This function can be used to verify that the `model` is a Python object correctly structured and respecting the OpenConfig hierarchy.

- `model` The OpenConfig-structured object to inspect.
- `delim:` The key delimiter. In particular cases, it is indicated to use `//` as `:` might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path "{'interfaces': {'interface': {'Ethernet1 →': {'config': {'name': 'Ethernet1'}}}}}
```

The example above would return a list with the following element: `interfaces:interface:Ethernet1:config` which is the only possible path in that hierarchy.

Other output examples:

- `interfaces:interface:Ethernet1:config`
- `interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config`
- `interfaces:interface:Ethernet2:config`

`salt.modules.napalm_formula.defaults(model, defaults_, delim='//', flipped_merge=False)`

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

- `model` The OpenConfig model to apply the defaults to.
- `defaults_` The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don't have to provide the defaults for each entity but only for the entity type. See an example below.

- `delim:` The key delimiter to use. Generally, `//` should cover all the possible cases, and you don't need to override this value.
- `flipped_merge: False` Whether should merge the model into the defaults, or the defaults into the model. Default: False (merge the model into the defaults, i.e., any defaults would be overridden by the values from the `model`).

CLI Example:

```
salt '*' napalm_formula.defaults "{'interfaces': {'interface': {'Ethernet1: { →'config': {'name': 'Ethernet1'}}}}}" "{'interfaces': {'interface': {'*: { →'config': {'enabled': True}}}}}"
```

As one can notice in the example above, the `*` corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

`salt.modules.napalm_formula.dictupdate(dest, upd, recursive_update=True, merge_lists=False)`

Recursive version of the default `dict.update`

Merges `upd` recursively into `dest`

If `recursive_update=False`, will use the classic `dict.update`, or fall back on a manual merge (helpful for non-dict types like `FunctionWrapper`).
If merge_lists=True, will aggregate list object types instead of replace. The list in upd is added to the list in dest, so the resulting list is dest[key] + upd[key]. This behaviour is only activated when recursive_update=True. By default merge_lists=False.

```python
salt.modules.napalm_formula.render_field(dictionary, field, prepend=None, append=None, quotes=False, **opts)
```

Render a field found under the field level of the hierarchy in the dictionary object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: {{ interfaces.interface.Ethernet5.config.description }} for the following object: {'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}} it would error, as the Ethernet5 key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

dictionary The dictionary to traverse.
field The key name or part to traverse in the dictionary.
prepend: None The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.
append: None Text to append at the end.
quotes: False Whether should wrap the text around quotes.

CLI Example:

```shell
clicksalt '*' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the 'enabled' leaf key
clicksalt '*' napalm_formula.render_field "{'enabled': True}" description
# This would not error
```

Jinja usage example:

```jinja
{% set config = {'enabled': True, 'description': 'Interface description'} %}

{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won’t be accepted by Junos):

```
description "Interface description;"
```

```python
salt.modules.napalm_formula.render_fields(dictionary, *fields, **opts)
```

This function works similarly to render_field but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

dictionary The dictionary to traverse.
fields A list of field names or paths in the dictionary.
indent: 0 The indentation to use, prepended to the rendered field.
separator: \n The separator to use between fields.

CLI Example:

```shell
clicksalt '*' napalm_formula.render_fields "{'mtu': 68, 'description': 'Interface description'}" mtu description
```

Jinja usage example:

```jinja
{% set config={'mtu': 68, 'description': 'Interface description'} %}

{{ salt.napalm_formula.render_fields(config, 'mtu', 'description', quotes=True) }}
```

The Jinja example above would generate the following configuration:
Salt Documentation, Release 3002.6

```
mtu "68"
description "Interface description"
```

```
salt.modules.napalm_formula.setval(key, val, dict_=None, delim=': ')
Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}}.

Note: Currently this doesn't work with integers, i.e. cannot build lists dynamically.
```

CLI Example:
```
salt '*' formula.setval foo:baz:bar True
```

```
salt.modules.napalm_formula.traverse(data, key, default=None, delimiter=': ')
Traverse a dict or list using a colon-delimited (or otherwise delimited, using the delimiter param) target string. The target foo:bar:0 will return data['foo'][bar][0] if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target foo:bar:0 will return data['foo'][bar][0] if data like {'foo':{'bar':[\'baz\']}}, if data like {'foo':{'bar':{'0':'baz'}}} then return data['foo'][bar]['0']
```

CLI Example:
```
salt '*' napalm_formula.traverse '{\'foo\': {\'bar\': {\'baz\': True}}}'' foo:baz:bar
```

21.9.288 salt.modules.napalm_mod module

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

```
salt.modules.napalm_mod.alive(**kwargs)
Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.
```

CLI Example:
```
salt '*' napalm.alive
```

Output Example:
```
result: True
t: False
```

```
salt.modules.napalm_mod.call(method, *args, **kwargs)
Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

Note: This feature is not recommended to be used in production. It should be used for testing only!
```

CLI Example:
salt ' '*' napalm.call get_lldp_neighbors
salt ' '*' napalm.call get_firewall_policies
salt ' '*' napalm.call get_bgp_config group='my-group'

salt.modules.napalm_mod.compliance_report(filepath=None, string=None, renderer='jinja|yaml', **kwargs)

Return the compliance report.

filepath  The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename 2019.2.0, this function has been enhanced, to be able to leverage
the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote
systems, the URL schemes supported being:

- salt://
- ftp://
- s3://
- swift://

Or on the local file system (on the Minion).

Note: The rendering result does not necessarily need to be YAML, instead it can be any format inter-
preted by Salt's rendering pipeline (including pure Python).

string  New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system.
Note, not all render modules can work with strings; the `py` renderer requires a file, for example.

renderer: jinja|yaml  New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

kwargs  Changed in version 2019.2.0.

Keyword args to pass to Salt's compile_template() function.

CLI Example:

```
salt ' '*' napalm.compliance_report ~/validate.yml
salt ' '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```yaml
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
        _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
  os_version: {{ grains.version }}
- get_interfaces_ip:
  Loopback0:
```

(continues on next page)
ipv4:
  {{ grains.lo0.ipv4 }}:
    prefix_length: 24
    _mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}

Output Example:

device1:
  ---------
comment:
  out:
  ---------
complies:
    False
get_facts:
  ---------
complies:
    False
extra:
  missing:
  present:
  ---------
  os_version:
  ---------
actual_value:
    15.1F6-S1.4
complies:
    False
nested:
    False
get_interfaces_ip:
  ---------
complies:
    False
extra:
  missing:
    - Management1
  present:
  ---------
skipped:
result:
    True

salt.modules.napalm_mod.config_diff_text(source1='candidate', candidate_path=None,
source2='running', running_path=None)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified
using the source1 and source2 arguments when retrieving from the managed network device.
source1: candidate The source from where to retrieve the configuration to be compared with. Available
candidate_path Absolute or remote path from where to load the candidate configuration text. This argument
allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.
source2: running The source from where to retrieve the configuration to compare with. Available options:
candidate, running, startup. Default: running.
running_path Absolute or remote path from where to load the running configuration text. This argument
allows any URI supported by \texttt{cp.get_url}, e.g., \texttt{salt://}, \texttt{https://}, \texttt{s3://}, \texttt{ftp://}, etc.

\textbf{saltenv: base} Salt fileserver environment from which to retrieve the file. Ignored if \texttt{candidate_path} or \texttt{running_path} is not a \texttt{salt://} URL.

CLI Example:

```bash
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

\texttt{salt.modules.napalm_mod.config_diff_tree}(source1='candidate', candidate_path=None, source2='running', running_path=None)

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the \texttt{source1} and \texttt{source2} arguments when retrieving from the managed network device.

\textbf{source1: candidate} The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.

\textbf{candidate_path} Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by \texttt{cp.get_url}, e.g., \texttt{salt://}, \texttt{https://}, \texttt{s3://}, \texttt{ftp://}, etc.

\textbf{source2: running} The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.

\textbf{running_path} Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by \texttt{cp.get_url}, e.g., \texttt{salt://}, \texttt{https://}, \texttt{s3://}, \texttt{ftp://}, etc.

\textbf{saltenv: base} Salt fileserver environment from which to retrieve the file. Ignored if \texttt{candidate_path} or \texttt{running_path} is not a \texttt{salt://} URL.

CLI Example:

```bash
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

```
CLI Example:

salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

\texttt{salt.modules.napalm_mod.config_filter_lines}(parent_regex, child_regex, source='running')

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the \texttt{parent_regex} argument, and the child matches the \texttt{child_regex} regular expression. The result is a list of dictionaries with the following keys:

- \textbf{match}: a boolean value that tells whether \texttt{child_regex} matched any children lines.
- \textbf{parent}: the parent line (as text).
- \textbf{child}: the child line (as text). If no child line matched, this field will be \texttt{None}.

\textbf{Note:} This function is only available only when the underlying library \texttt{ciscoconfparse} is installed. See \texttt{ciscoconfparse module} for more details.

\textbf{parent_regex} The regular expression to match the parent configuration lines against.

\textbf{child_regex} The regular expression to match the child configuration lines against.

CLI Example:
salt.modules.napalm_mod.config_filter_lines(regex, source='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the regex argument. The configuration is read from the network device interrogated.

regex The regular expression to match the configuration lines against.

CLI Example:

```
salt '*' napalm.config_filter_lines '^
```
salt.modules.napalm_mod.config_merge_diff
(source='running', merge_config=None, merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.
saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.
CLI Example:

```
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_merge_text
(source='running', merge_config=None, merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge result of the configuration from source with the merge configuration, as plain text (without loading the config on the device).

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.
saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.
CLI Example:

```
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_merge_tree
(source='running', merge_config=None, merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge tree of the initial_config with the merge_config, as a Python dictionary.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url), e.g., salt://, https://, s3://, ftp://, etc.
saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.
CLI Example:

```
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.config_tree
(source='running', with_tags=False)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the
with_tags argument, this function may provide different views, valuable in different situations.

source: **running** The configuration type to retrieve from the network device. Default: **running**. Available options: **running**, **startup**, **candidate**.

with_tags: **False** Whether this function should return a detailed view, with tags.

**CLI Example:**
```
salt '*' napalm.config_tree
```

```
salt.modules.napalm_mod.junos_call(fun, *args, **kwargs)
```

New in version 2019.2.0.

Execute an arbitrary function from the **junos** execution module. To check what **args** and **kwargs** you must send to the function, please consult the appropriate documentation.

fun The name of the function. E.g., **setHostname**.

args List of arguments to send to the **junos** function invoked.

kwargs Dictionary of key-value arguments to send to the **junos** function invoked.

**CLI Example:**
```
salt '*' napalm.junos_fun cli 'show system commit'
```

```
salt.modules.napalm_mod.junos_cli(command, format=None, dev_timeout=None, dest=None, **kwargs)
```

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.

command The command to execute on the Junos CLI.

format: **text** Format in which to get the CLI output (either **text** or **xml**).

dev_timeout: 30 The NETCONF RPC timeout (in seconds).

dest Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.

To push the files to the Master, use **cp.push**.

**CLI Example:**
```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

```
salt.modules.napalm_mod.junos_commit(**kwargs)
```

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

dev_timeout: 30 The NETCONF RPC timeout (in seconds).

comment Provide a comment for the commit.

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync: **False** When **True**, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync: **False** When **True**, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full When **True**, requires all the daemons to check and evaluate the new configuration.

detail When **True**, return commit detail.

**CLI Examples:**
```
salt '*' napalm.junos_commit comment='Committing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

```
salt.modules.napalm_mod.junos_copy_file(src, dst, **kwargs)
```

New in version 2019.2.0.
Copies the file on the remote Junos device.

**src** The source file path. This argument accepts the usual Salt URIs (e.g., `salt://`, `http://`, `https://`, `s3://`, `ftp://`, etc.).

**dst** The destination path on the device where to copy the file.

CLI Example:

```bash
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/myjunos.cfg
```

```python
salt.modules.napalm_mod.junos_copy_file(src, dst)
```

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```bash
salt '*' napalm.junos_facts
```

```python
salt.modules.napalm_mod.junos_facts(**kwargs)
```

New in version 2019.2.0.

Installs the given image on the device.

**path** The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- `salt://` to fetch from the Salt fileserver.
- `ftp://`
- `swift://`
- `s3://`

**dev_timeout** The NETCONF RPC timeout (in seconds)

**reboot** Whether to reboot the device after the installation is complete.

**no_copy** If True the software package will not be copied to the remote device.

CLI Example:

```bash
salt '*' napalm.junos_install_os path=salt://images/junos_16_1.tgz reboot=True
```

```python
salt.modules.napalm_mod.junos_install_os(path=None, **kwargs)
```

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

**cmd** The RPC request to the executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.

**dest** Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.

To push the files to the Master, use `cp.push` Execution function.

**format** The format in which the RPC reply is received from the device.

**dev_timeout** The NETCONF RPC timeout.

**filter** Used with the `get-config` RPC request to filter out the config tree.

**terse** Whether to return terse output.

**Note:** Some RPC requests may not support this argument.

**interface_name** Name of the interface to query.

CLI Example:

```bash
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></system></configuration>
```

(continues on next page)
salt.modules.napalm_mod.netmiko_args(**kwargs)

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., panos, f5, mos - either from https://github.com/napalm-automation-community or defined in user’s own environment, one can specify the Netmiko device type (the device_type argument) via the netmiko_device_type_map configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
  f5: f5_ltm
  dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM os Grain and the Netmiko device_type, e.g., when the NAPALM Grain is f5, it would use the f5_ltm SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

salt.modules.napalm_mod.netmiko_call(method, *args, **kwargs)

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

- **method** The name of the Netmiko method to execute.
- **args** List of arguments to send to the Netmiko method specified in method.
- **kwargs** Key-value arguments to send to the execution function specified in method.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

salt.modules.napalm_mod.netmiko_commands(*commands, **kwargs)

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

- **commands** A list of commands to be executed.
- **expect_string** Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.
- **delay_factor:** 1 Multiplying factor used to adjust delays (default: 1).
- **max_loops:** 500 Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
- **auto_find_prompt:** True Whether it should try to auto-detect the prompt (default: True).
- **strip_prompt:** True Remove the trailing router prompt from the output (default: True).
- **strip_command:** True Remove the echo of the command from the output (default: True).
- **normalize:** True Ensure the proper enter is sent at end of command (default: True).
- **use_textfsm:** False Process command output through TextFSM template (default: False).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```
salt.modules.napalm_mod.netmiko_config(*config_commands, **kwargs)

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

**Warning:** Please remember that netmiko does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the commit argument to True to transfer the changes from the candidate into the running config before exiting.

**config_commands** A list of configuration commands to be loaded on the remote device.

**config_file** Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see template_engine).

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- salt://, to fetch the file from the Salt fileserver.
- http:// or https://
- ftp://
- s3://
- swift://

**exit_config_mode:** True Determines whether or not to exit config mode after complete.

**delay_factor:** 1 Factor to adjust delays.

**max_loops:** 150 Controls wait time in conjunction with delay_factor (default: 150).

**strip_prompt:** False Determines whether or not to strip the prompt (default: False).

**strip_command:** False Determines whether or not to strip the command (default: False).

**config_mode_command** The command to enter into config mode.

**commit:** False Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don’t have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
```

salt.modules.napalm_mod.netmiko_conn(**kwargs)

New in version 2019.2.0.

Return the connection object with the network device, over Netmiko, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules.

**USAGE Example:**

```
conn = __salt__['napalm.netmiko_conn']()
res = conn.send_command('show interfaces')
conn.disconnect()
```

salt.modules.napalm_mod.netmiko_fun(fun, *args, **kwargs)

New in version 2019.2.0.
Call an arbitrary function from the Netmiko module, passing the authentication details from the existing NAPALM connection.

**fun**  The name of the function from the Netmiko to invoke.

**args**  List of arguments to send to the execution function specified in fun.

**kwargs**  Key-value arguments to send to the execution function specified in fun.

**CLI Example:**

```python
salt '*' napalm.netmiko_fun send_command 'show version'
```

### salt.modules.napalm_mod.netmiko_multi_call(*methods, **kwargs)

**New in version 2019.2.0.**

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

**methods**  List of dictionaries with the following keys:

- **name**: the name of the Netmiko function to invoke.
- **args**: list of arguments to send to the name method.
- **kwargs**: key-value arguments to send to the name method.

**CLI Example:**

```python
salt '*' napalm.netmiko_multi_call "{'name': 'send_command', 'args': ['show version']}", "{'name': 'send_command', 'args': ['show interfaces']}"
```

### salt.modules.napalm_mod.nxos_api_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

**New in version 2019.2.0.**

Configures the Nexus switch with the specified commands, via the NX-API.

**commands**  The list of configuration commands to load on the Nexus switch.

**Note:** This argument is ignored when config_file is specified.

**config_file**  The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp:
- s3://
- swift://

**template_engine**: **jinja**  The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context**: None  Variables to add to the template context.

**defaults**: None  Default values of the context dict.

**saltenv**: base  Salt fileserver environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.

**CLI Example:**

```python
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy context="{"_servers": ["1.2.3.4"]}"
```

### salt.modules.napalm_mod.nxos_api_rpc(commands, method='cli', **kwargs)

**New in version 2019.2.0.**
Execute an arbitrary RPC request via the Nexus API.

**commands**  The RPC commands to be executed.

**method:**  `cli`  The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

**CLI Example:**

```
salt '*' napalm.nxos_api_rpc 'show version'
```

```
salt.modules.napalm_mod.nxos_api_show(commands, raw_text=True, **kwargs)
```

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

**commands**  The commands to be executed.

**raw_text:**  `True`  Whether to return raw text or structured data.

**CLI Example:**

```
salt '*' napalm.nxos_api_show 'show version'
```

```
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

```
salt.modules.napalm_mod.pyeapi_call(method, *args, **kwargs)
```

New in version 2019.2.0.

Invoke an arbitrary method from the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**method**  The name of the `pyeapi` method to invoke.

**kwargs**  Key-value arguments to send to the `pyeapi` method.

**CLI Example:**

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
```

```
salt '*' napalm.pyeapi_call get_config as_string=True
```

```
salt.modules.napalm_mod.pyeapi_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

**commands**  The list of configuration commands to load on the Arista switch.

---

**Note:**  This argument is ignored when `config_file` is specified.

**config_file**  The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp://`
- `s3://`
- `swift://`

**template_engine:**  `jinja`  The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context:**  `None`  Variables to add to the template context.

**defaults:**  `None`  Default values of the `context` dict.

**saltenv:**  `base`  Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.
CLI Example:

```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

salt.modules.napalm_mod.pyeapi_conn(**kwargs)
New in version 2019.2.0.

Return the connection object with the Arista switch, over pyeapi, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules, to reusing the established connection, as in opposite to opening a new connection for each task.

Usage example:

```
conn = __salt__['napalm.pyeapi_conn']()
res1 = conn.run_commands('show version')
res2 = conn.get_config(as_string=True)
```

salt.modules.napalm_mod.pyeapi_nxos_api_args(**prev_kwargs)
New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the pyeapi execution module.

CLI Example:

```
salt '*' napalm.pyeapi_nxos_api_args
```

salt.modules.napalm_mod.pyeapi_run_commands(*commands, **kwargs)
Execute a list of commands on the Arista switch, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

- **commands**: A list of commands to execute.
- **encoding**: `json` The requested encoding of the command output. Valid values for encoding are `json` (default) or `text`.

CLI Example:

```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

salt.modules.napalm_mod.reconnect(force=False, **kwargs)
Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

**Note:** This function can be used only when running proxy minions.

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

salt.modules.napalm_mod.rpc(command, **kwargs)
New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:
- `napalm.junos_rpc` for `junos`
- `napalm.pyeapi_run_commands` for `eos`
- `napalm.nxos_api_rpc` for `nxos`
- `napalm.netmiko_commands` for `ios`, `iosxr`, and `nxos_ssh`

**command** The RPC command to execute. This depends on the nature of the operating system.

**kwargs** Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```

The mapping above reads: when the NAPALM os Grain is `f5`, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

CLI Example:

```
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

`salt.modules.napalm_mod.scp_get(remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)`

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

- **remote_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
- **recursive:** `False` Transfer files and directories recursively.
- **preserve_times:** `False` Preserve mtime and atime of transferred files and directories.
- **passphrase** Used for decrypting private keys.
- **pkey** An optional private key to use for authentication.
- **key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- **timeout** An optional timeout (in seconds) for the TCP connect.
- **socket_timeout:** `10` The channel socket timeout in seconds.
- **buff_size:** `16384` The size of the SCP send buffer.
- **allow_agent:** `True` Set to `False` to disable connecting to the SSH agent.
- **look_for_keys:** `True` Set to `False` to disable searching for discoverable private key files in `~/.ssh/`
- **banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.
- **auth_timeout** An optional timeout (in seconds) to wait for an authentication response.
- **auto_add_policy:** `False` Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```
salt.modules.napalm_mod.scp_put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)

New in version 2019.2.0.

Transfer files and directories to remote network device.

Note: This function is only available only when the underlying library scp is installed. See scp module for more details.

files A single path or a list of paths to be transferred.
remote_path The path on the remote device where to store the files.
recursive: True Transfer files and directories recursively.
preserve_times: False Preserve mtime and atime of transferred files and directories.
saltenv: base The name of the Salt environment. Ignored when files is not a salt:// URL.
hostname The hostname of the remote device.
port: 22 The port of the remote device.
username The username required for SSH authentication on the device.
password Used for password authentication. It is also used for private key decryption if passphrase is not given.
passphrase Used for decrypting private keys.
pkey An optional private key to use for authentication.
key_filename The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10 The channel socket timeout in seconds.
buf_size: 16384 The size of the SCP send buffer.
allow_agent: True Set to False to disable connecting to the SSH agent.
look_for_keys: True Set to False to disable searching for discoverable private key files in ~/.ssh/ banner_timeout An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

21.9.289 salt.modules.napalm_netacl

NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends capirca, napalm
platform unix
Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

salt.modules.napalm_netacl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

- **filter_name** The name of the filter.
- **pillar_key** The root key of the whole policy config.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.napalm_netacl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

- **filter_name** The name of the filter.
- **term_name** The name of the term.
- **pillar_key** ac The root key of the whole policy config. Default: acl.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

salt.modules.napalm_netacl.load_filter_config(filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)

Generate and load the configuration of a policy filter.

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the terms and/or inside the pillar.

When merging the terms with the pillar data, consider the prepend argument to make sure the order is correct!

- **filter_name** The name of the policy filter.
- **filter_options** Additional filter options. These options are platform-specific. See the complete list of options.
- **terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
- **prepend**: True When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.
- **pillar_key**: acl The key in the pillar containing the default attributes values. Default: acl.
pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True  Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.
only_lower_merge: False  Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.
revision_id  Add a comment in the filter config having the description for the changes applied.
revision_no  The revision count.
revision_date: True  Boolean flag: display the date when the filter configuration was generated. Default: True.
revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

CLI Example:
```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl --debug=True
```

Output Example:
```
edge01.bjm01:
    ---------
    already_configured: False
comment: diff:
    [edit firewall]
    + family inet {
    +     /*
    +         ** $Date: 2017/03/22 $ 
    +         **
    +         */
    +     filter my-filter {
    +         interface-specific;
    +         term my-term {
    +             from {
    +                 source-port [ 1234 1235 ];
    +             }
    +             then {
    +                 reject;
    +             }
    +         }
    +     term my-other-term {
    +         from {
    +             protocol tcp;
    +                 source-port 5678-5680;
    +             }
    +             then accept;
    +         }
```
(continues on next page)
The filter configuration has been loaded from the pillar, having the following structure:

```yaml
netacl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        action: reject
      - my-other-term:
        source_port:
          - - 5678
          - 5680
        protocol: tcp
        action: accept
```

result: True
Generate and load the configuration of the whole policy.

**Note:** The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the filters and/or inside the pillar.

When merging the filters with the pillar data, consider the **prepend** argument to make sure the order is correct!

**filters** List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless **merge_pillar** is set as **False**.

**prepend:** **True** When **merge_pillar** is set as **True**, the final list of filters generated by merging the filters from **filters** with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to **False**.

**pillar_key:** **acl** The key in the pillar containing the default attributes values. Default: **acl**.

**pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv** Included only for compatibility with **pillarenv_from_saltenv**, and is otherwise ignored.

**merge_pillar**: **True** Merge the CLI variables with the pillar. Default: **True**.

The merge logic depends on the **prepend** argument and the CLI has higher priority than the pillar.

**only_lower_merge:** **False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: **False**. This option requires **merge_pillar**, otherwise it is ignored.

**revision_id** Add a comment in the policy config having the description for the changes applied.

**revision_no** The revision count.

**revision_date:** **True** Boolean flag: display the date when the policy configuration was generated. Default: **True**.

**revision_date_format:** **%Y/%m/%d** The date format to be used when generating the perforce data. Default: **%Y/%m/%d** (<year>/<month>/<day>).

**test:** **False** Dry run? If set as **True**, will apply the config, discard and return the changes. Default: **False** and will commit the changes on the device.

**commit:** **True** Commit? Default: **True**.

**debug:** **False** Debug mode. Will insert a new key under the output dictionary, as **loaded_config** containing the raw configuration loaded on the device.

The output is a dictionary having the same form as **net.load_config**.

**CLI Example:**

```bash
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

**Output Example:**

```
edge01.flw01:
    -------
    already_configured:
```

(continues on next page)
The policy configuration has been loaded from the pillar, having the following structure:

```yaml
acl:
  - my-filter:
      terms:
        - my-term:
            source_port:
              - 1234
              - 1235
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
```

(continues on next page)
source_port:  
  - [5678, 5680]  
protocol: tcp  
action: accept  

- block-icmp:  
terms:  
  - first-term:  
protocol:  
  - icmp  
action: reject

```
salt.modules.napalm_netacl.load_term_config(filter_name, term_name, filter_options=None, pillar_key='acl',  
pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True,  
revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False,  
source_service=None, destination_service=None, **term_fields)
```

Generate and load the configuration of a policy term.

- **filter_name** The name of the policy filter.
- **term_name** The name of the term.
- **filter_options** Additional filter options. These options are platform-specific. See the complete list of options.
- **pillar_key**: *acl* The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:

```
firewall:  
  - my-filter:  
    terms:  
      - my-term:  
        source_port: 1234  
        source_address:  
          - 1.2.3.4/32  
          - 5.6.7.8/32
```

The pillar_key field would be specified as firewall.

- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
- **merge_pillar**: *True* Merge the CLI variables with the pillar. Default: True.

The properties specified through the CLI have higher priority than the pillar.

- **revision_id** Add a comment in the term config having the description for the changes applied.
- **revision_no** The revision count.
- **revision_date**: *True* Boolean flag: display the date when the term configuration was generated. Default: True.
- **revision_date_format**: *%Y/%m/%d* The date format to be used when generating the perforce data. Default: %Y/%m/%d (year/month/day).
- **test**: *False* Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
- **commit**: *True* Commit? Default: True.
- **debug**: *False* Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.
- **source_service** A special service to choose from. This is a helper so the user is able to select a source just
using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the `file state`.

**destination_service** A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

**term_fields** Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

**Note:** The following fields are accepted (some being platform-specific):
- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:
- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: destination_address can be either defined as:
**destination_address:** 172.17.17.1/24

or as a list of destination IP addresses:

```
**destination_address:**
- 172.17.17.1/24
- 172.17.19.1/24
```

or a list of services to be matched:

```
**source_service:**
- ntp
- snmp
- ldap
- bgpd
```

**Note:** The port fields **source_port** and **destination_port** can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
**source_port:**
- - 1000
- 2000
- - 3000
- 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as `net.load_config`.

**CLI Example:**

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

**Output Example:**

```
edge01.bjm01:
    ----------
    already_configured: False
    comment: Configuration discarded.
    diff:
    [edit firewall]
    + family inet {
      + /*
      + ** $Date: 2017/03/22 $
      + **
      + */
      + filter filter-name {
        + interface-specific;
        + term term-name {
          + from {
            + source-address {
```
21.9.290  salt.modules.napalm_network module

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

   codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
   maturity new
   depends napalm
   platform unix
Dependencies

- **napalm proxy minion**

New in version 2016.11.0.

Changed in version 2017.7.0.

```python
salt.modules.napalm_network.arp(interface='', ipaddr='', macaddr='', **kwargs)
```

NAPALM returns a list of dictionaries with details of the ARP entries.

**Parameters**

- **interface** -- interface name to filter on
- **ipaddr** -- IP address to filter on
- **macaddr** -- MAC address to filter on

**Returns** List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac': '5c:5e:ab:da:3c:f0',
        'ip': '172.17.17.1',
        'age': 1454496274.84
    },
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac': '66:0e:94:96:e0:ff',
        'ip': '172.17.17.2',
        'age': 1435641582.49
    }
]
```

```python
salt.modules.napalm_network.blockreplace(marker_start, marker_end, content='', append_if_not_found=False, prepend_if_not_found=False, show_changes=True, append_newline=False, source='running', path=None, test=False, commit=True, debug=False, replace=True)
```

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

- **marker_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.
- **marker_end** The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.
- **content** The content to be used between the two lines identified by `marker_start` and `marker_stop`. 
append_if_not_found: False  If markers are not found and set to True then, the markers and content will be appended to the file.
prepend_if_not_found: False  If markers are not found and set to True then, the markers and content will be prepended to the file.
append_newline: False  Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.
show_changes: True  Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).
path: None  Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefer a particular location of the temporary file.
test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
commit: True  Commit the configuration changes? Default: True.
debug: False  Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: True  Load and replace the configuration. Default: True.

CLI Example:
salt '*' net.blockreplace 'ntp' 'interface' ''
salt.modules.napalm_network.cancel_commit(jid)
New in version 2019.2.0.
Cancel a commit scheduled to be executed via the commit_in and commit_at arguments from the net.
load_template or net.load_config execution functions. The commit ID is displayed when the com-
mmit is scheduled via the functions named above.

CLI Example:
salt '*' net.cancel_commit 20180726083540640360

salt.modules.napalm_network.cli(*commands, **kwargs)
Returns a dictionary with the raw output of all commands passed as arguments.
commands  List of commands to be executed on the device.
textfsm_parse: False  Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

Note:  This option can be also specified in the minion configuration file or pillar as
napalm_cli_textfsm_parse.
textfsm_path  The path where the TextFSM templates can be found. This option implies the usage of the
TextFSM index file. textfsm_path can be either absolute path on the server, either specified using the
following URL mschemes: file://, salt://, http://, https://, ftp://, s3://, swift://. 

New in version 2018.3.0.

Note:  This needs to be a directory with a flat structure, having an index file (whose name can be
specified using the index_file option) and a number of TextFSM templates.
Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

textfsm_template The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:
  - salt://, to fetch the template from the Salt fileserver.
  - http:// or https://
  - ftp://
  - s3://
  - swift://
New in version 2018.3.0.

textfsm_template_dict A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.
New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_template_dict`.

platform_grain_name: os The name of the grain used to identify the platform name in the TextFSM index file. Default: os.
New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

platform_column_name: Platform The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: Platform.
New in version 2018.3.0.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

index_file: index The name of the TextFSM index file, under the `textfsm_path`. Default: index.
New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a salt:// URL.
New in version 2018.3.0.

include_empty: False Include empty files under the `textfsm_path`.
New in version 2018.3.0.
**include_pat** Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**exclude_pat** Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```
{
    'show version and haiku': 'Hostname: re0.edge01.arn01
     Model: mx480
     Junos: 13.3R6.5
     Help me, Obi-Wan
     I just saw Episode Two
     You're my only hope

    'show chassis fan': 'Item', Status, RPM, Measurement
    Top Rear Fan   OK 3840 Spinning
    Bottom Rear Fan OK 3840 Spinning
    Top Middle Fan  OK 3900 Spinning
    Bottom Middle Fan OK 3840 Spinning
    Top Front Fan   OK 3810 Spinning
    Bottom Front Fan OK 3840 Spinning
}
```

Example output with TextFSM parsing:

```
{
    "comment": "",
    "result": true,
    "out": {
        "sh ver": [
            {
                "kernel": "9.1S3.5",
                "documentation": "9.1S3.5",
                "boot": "9.1S3.5",
```
salt.modules.napalm_network.commit(inherit_napalm_device=None, **kwargs)
Commits the configuration changes made on the network device.

CLI Example:
salt '*' net.commit

salt.modules.napalm_network.compare_config(inherit_napalm_device=None, **kwargs)
Returns the difference between the running config and the candidate config.

CLI Example:
salt '*' net.compare_config

salt.modules.napalm_network.config(source=None, **kwargs)
New in version 2017.7.0.
Return the whole configuration of the network device. By default, it will return all possible configuration
sources supported by the network device. At most, there will be:
• running config
• startup config
• candidate config
To return only one of the configurations, you can use the source argument.
source Which configuration type you want to display, default is all of them.

Options:
• running
• candidate
• startup

Returns
The object returned is a dictionary with the following keys:
• running (string): Representation of the native running configuration.
• candidate (string): Representation of the native candidate configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.
• startup (string): Representation of the native startup configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:
salt '*' net.config
salt '*' net.config source=candidate
salt.modules.napalm_network.config_changed(* inherit_napalm_device= None,**kwargs)
Will prompt if the configuration has been changed.

Returns A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:
salt '*' net.config_changed

salt.modules.napalm_network.config_control(* inherit_napalm_device= None,**kwargs)
Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:
salt '*' net.config_control

salt.modules.napalm_network.confirm_commit(jid)
New in version 2019.2.0.
Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:
salt '*' net.confirm_commit 20180726083540640360

salt.modules.napalm_network.connected(**kwargs)
Specifies if the connection to the device succeeded.

CLI Example:
salt '*' net.connected

salt.modules.napalm_network.discard_config(* inherit_napalm_device= None,**kwargs)
Discards the changes applied.

CLI Example:
salt '*' net.discard_config

salt.modules.napalm_network.environment(**kwargs)
Returns the environment of the device.

CLI Example:
salt '*' net.environment

Example output:
```
{
  'fans': {
    'Bottom Rear Fan': {
      'status': True
    },
    'Bottom Middle Fan': {
(continues on next page)
```
{'status': True},
'Top Middle Fan': {
'status': True
},
'Bottom Front Fan': {
'status': True
},
'Top Front Fan': {
'status': True
},
'Top Rear Fan': {
'status': True
}
},
'memory': {
'available_ram': 16349,
'used_ram': 4934
},
'temperature': {
'FPC 0 Exhaust A': {
'is_alert': False,
'temperature': 35.0,
'is_critical': False
}
},
'cpu': {
'1': {
'usage': 19.0
},
'0': {
'usage': 35.0
}
}
}

salt.modules.napalm_network.facts(**kwargs)

Returns characteristics of the network device. :return: a dictionary with the following keys:
- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os_version - String with the OS version running on the device.
- serial_number - Serial number of the device
- interface_list - List of the interfaces of the device

CLI Example:

salt '*' net.facts

Example output:

```python
{
'os_version': '13.3R6.5',
'uptime': 10117140,
'interface_list': [
```
salt.modules.napalm_network.interfaces(**kwargs)

Returns details of the interfaces on the device.

Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```json
{
    'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': '',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': 'dead:beef:dead',
    },
    'Ethernet1': {
        'is_up': True,
        'is_enabled': True,
        'description': 'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': 'beef:dead:beef',
    }
}
```

salt.modules.napalm_network.ipaddrs(**kwargs)

Returns IP addresses configured on the device.

Returns a dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:
salt 

Example output:
```json
{
    'FastEthernet8': {
        'ipv4': {
            '10.66.43.169': {
                'prefix_length': 22
            }
        },
        'Loopback555': {
            'ipv4': {
                '192.168.1.1': {
                    'prefix_length': 24
                }
            },
            'ipv6': {
                '1::1': {
                    'prefix_length': 64
                },
                '2001:DB8:1:1': {
                    'prefix_length': 64
                },
                'FE80::3': {
                    'prefix_length': 'N/A'
                }
            }
        }
    },
    'Loopback555': {
        'ipv4': {
            '192.168.1.1': {
                'prefix_length': 24
            }
        },
        'ipv6': {
            '1::1': {
                'prefix_length': 64
            },
            '2001:DB8:1:1': {
                'prefix_length': 64
            },
            'FE80::3': {
                'prefix_length': 'N/A'
            }
        }
    }
}
```

salt.modules.napalm_network.lldp(interface='', **kwargs)
Returns a detailed view of the LLDP neighbors.

Parameters

- **interface** -- interface name to filter on

Returns

A dictionary with the LLDPL neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:
```bash
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'
```

Example output:
```json
{
    'TenGigE0/0/0/8': [
        {
            'parent_interface': 'Bundle-Ether8',
            'interface_description': 'TenGigE0/0/0/8',
            'remote_chassis_id': '8c60.4f69.e96c',
            'remote_system_name': 'switch',
            'remote_port': 'Eth2/2/1',
            'remote_port_description': 'Ethernet2/2/1',
            'remote_system_description': 'Cisco Nexus Operating System (NX-OS)®
→Software 7.1(0)N1(1a)
TAC support: http://www.cisco.com/tac
Copyright (c) 2002-2015, Cisco Systems, Inc. All rights®
→reserved.
```
```
Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

**filename** Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

*Changed in version 2018.3.0.*

**text** String containing the desired configuration. This argument is ignored when `filename` is specified.

**test** `False` Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit** `True` Commit? Default: `True`.

**debug** `False` Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

*New in version 2016.11.2.*

**replace** `False` Load and replace the configuration. Default: `False`.

*New in version 2016.11.2.*

**commit_in** `None` Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

*Note:* This feature works on any platforms, as it does not rely on the native features of the network operating system.

*Note:* After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.
Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit_at:** None

Commit the changes at a specific time. Example of accepted formats: 1 am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20 am, etc.

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note:** After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert_in:** None

Commit and revert the changes in a specific number of minutes/hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert_at:** None

Commit and revert the changes at a specific time. Example of accepted formats: 1 am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20 am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.
The `confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

```bash
saltenv: base
```

Specifies the Salt environment name.

New in version 2018.3.0.

**Returns** a dictionary having the following keys:

- `result` (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- `comment` (str): a message for the user
- `already_configured` (bool): flag to check if there were no changes applied
- `loaded_config` (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- `diff` (str): returns the config changes applied

**CLI Example:**

```bash
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file' commit=False
```

Example output:

```plaintext
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[edit interfaces xe-0/0/5]+ description "Adding a description";
}
```

**salt.modules.napalm_network.load_template**

```bash
salt.modules.napalm_network.load_template(template_name=None, template_source=None, context=None, defaults=None, template_engine='jinja', saltenv='base', template_hash=None, template_hash_name=None, skip_verify=False, test=False, commit=True, debug=False, replace=False, commit_in=None, commit_at=None, revert_in=None, revert_at=None, inherit_napalm_device=None, **template_vars)
```

Renders a configuration template (default: Jinja) and loads the result on the device.
By default this function will commit the changes. If there are no changes, it does not commit, discards he config and the flag `already_configured` will be set as True to point this out.

To avoid committing the configuration, set the argument `test` to True and will discard (dry run).

To preserve the changes, set `commit` to False. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to True.

`template_name` Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```yaml
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via http, https or ftp.

Examples:
- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

`template_source`: None Inline config template to be rendered and loaded on the device.

`context`: None Overrides default context variables passed to the template. New in version 2019.2.0.

`template_hash_name`: None When `template_hash` refers to a remote file, this specifies the filename to look for in that file. New in version 2016.11.2.

`saltenv`: `base` Specifies the template environment. This will influence the relative imports inside the templates. New in version 2016.11.2.

`template_engine`: `jinja` The following templates engines are supported:
- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

New in version 2016.11.2.

`skip_verify`: True If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the `source_hash` argument will be ignored. New in version 2016.11.2.
test: False  Dry run? If set to True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True  Commit? (default: True)

debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw result after the template was rendered.

New in version 2016.11.2.

replace: False  Load and replace the configuration.

New in version 2016.11.2.

commit_in: None  Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: None  Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: None  Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).
**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert_at:** *None* Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**defaults:** *None* Default variables/context passed to the template.

New in version 2016.11.2.

**template_vars** Dictionary with the arguments/context to be used when the template is rendered.

**Note:** Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

**Note:** It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.
**Returns** a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires *debug* to be set as *True*
- diff (str): returns the config changes applied

The template can use variables from the *grains*, *pillar* or *opts*, for example:

```jinja
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
    system {
        host-name {{hostname}};
    }
{% elif router_vendor|lower == 'cisco' %}
    hostname {{hostname}}
{% endif %}
```

**CLI Examples:**

```bash
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1] # uses NAPALM
-> default templates

# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {{host_}
-> name}}; ' host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template template_source='system { host-name {
-> {grains.model}.lab; }' # if the device is a MX480, the command above will set the hostname as: MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {
-> pillar.proxy.host}}; ' # if the device is a MX480, the command above will set the hostname as: MX480.lab

salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example # will commit
salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example test=True #
-> dry run

salt '*' net.load_template salt://templates/example.jinja debug=True # Using the
-> salt:// URI

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_engine=mako
-> debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True
-> peers=['192.168.0.1']
-> peers=['192.168.0.1']
```

(continues on next page)
# render multiple templates at once

Example output:

```json
{
    'comment' : '',
    'already_configured' : False,
    'result' : True,
    'diff' : '[edit system] host-name edge01.bjm01',
    'loaded_config' : 'system { host-name edge01.bjm01; }
}
```

salt.modules.napalm_network.mac(address='', interface='', vlan=0, **kwargs)
Retrieves the MAC Address Table on the device.

**Parameters**

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

**Returns**
A list of dictionaries representing the entries in the MAC Address Table

**CLI Example:**

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
    {
        'mac' : '00:1c:58:29:4a:71',
        'interface' : 'xe-3/0/2',
        'static' : False,
        'active' : True,
        'moves' : 1,
        'vlan' : 10,
        'last_move' : 1454417742.58
    },
    {
        'mac' : '8c:60:4f:58:e1:c1',
        'interface' : 'xe-1/0/1',
        'static' : False,
        'active' : True,
        'moves' : 2,
        'vlan' : 42,
        'last_move' : 1453191948.11
    }
]
```

salt.modules.napalm_network.optics(**kwargs)

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.
Returns

Returns a dictionary where the keys are as listed below:

- **intf_name** (unicode)
  - **physical_channels**
    - **channels** (list of dicts)
      - **index** (int)
      - **state**
        - **input_power**
          - **instant** (float)
          - **avg** (float)
          - **min** (float)
          - **max** (float)
        - **output_power**
          - **instant** (float)
          - **avg** (float)
          - **min** (float)
          - **max** (float)
    - **laser_bias_current**
      - **instant** (float)
      - **avg** (float)
      - **min** (float)
      - **max** (float)

CLI Example:

```
salt '*' net.optics
```

```
salt.modules.napalm_network.patch(patchfile, options='', saltenv='base', source_hash=None, show_changes=True, source='running', path=None, test=False, commit=True, debug=False, replace=True)
```

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

- **patchfile** A patch file to apply to the configuration source.
- **options** Options to pass to patch.
- **source_hash** If the patch file (specified via the patchfile argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.
- **show_changes**: **True** Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).
- **source**: **running** The configuration source. Choose from: running, candidate, or startup. Default: running.
- **path**: **None** Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.
test: **False**  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: **True**  Commit the configuration changes? Default: True.

download: **False**  Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: **True**  Load and replace the configuration. Default: True.

CLI Example:

```
salt '*' net.patch https://example.com/running_config.patch
```

salt.modules.napalm_network.ping(destination, source=None, ttl=None, timeout=None, size=None, count=None, vrf=None, **kwargs)

Executes a ping on the network device and returns a dictionary as a result.

destination  Hostname or IP address of remote host

source  Source address of echo request

ttl  IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

timeout  Maximum wait time after sending final packet (seconds)

size  Size of request packets (0..65468 bytes)

count  Number of ping requests to send (1..2000000000 packets)

vrf  VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

salt.modules.napalm_network.replace_pattern(pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, search_only=False, show_changes=True, backslash_literal=False, source=None, path=None, test=False, replace=True, debug=False, commit=True)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If show_changes is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made. This is a pure Python implementation that wraps Python’s sub().

pattern  A regular expression, to be matched using Python’s search().

repl  The replacement text.

count: 8  Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int): 8  A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR (|) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str): 1  How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value file may be specified which will read the entire file into memory before processing.

append_if_not_found: False  If set to True, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: False  If set to True and pattern is not found, then the content will be prepended to the file.

not_found_content  Content to use for append/prepend if not found. If None (default), uses repl. Useful
when repl uses references to group in pattern.

search_only: **False** If set to True, this no changes will be performed on the file, and this function will simply return **True** if the pattern was matched, and **False** if not.

show_changes: **True** If True, return a diff of changes made. Otherwise, return **True** if changes were made, and **False** if not.

backslash_literal: **False** Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

path: Save the temporary configuration to a specific path, then read from there.

test: **False** Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: **True** Commit the configuration changes? Default: True.

debug: **False** Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: **True** Load and replace the configuration. Default: True. If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' net.replace_pattern "bind-address\s*=\"bind-address:\"
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

salt.modules.napalm_network.rollback(inherit_napalm_device=None, **kwargs)
Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

salt.modules.napalm_network.save_config(source=None, path=None)
New in version 2019.2.0.
Save the configuration to a file on the local file system.

path Absolute path to file where to save the configuration. To push the files to the Master, use cp.push

Execution function.

CLI Example:

```
salt '*' net.save_config source=running
```

salt.modules.napalm_network.traceroute(destination, source=None, ttl=None, timeout=None, vrf=None, **kwargs)
Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

destination Hostname or address of remote host

source Source address to use in outgoing traceroute packets

ttl IP maximum time-to-live value (or IPv6 maximum hop-limit value)

timeout Number of seconds to wait for response (seconds)

vrf VRF (routing instance) for traceroute attempt
New in version 2016.11.4.

CLI Example:

```bash
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

## 21.9.291 salt.modules.napalm_ntp module

### NAPALM NTP

Manages NTP on network devices.

- **codeauthor**: Mircea Ulinic & Jerome Fleury
- **maturity**: new
- **depends**: napalm
- **platform**: unix

### Dependencies

- **NAPALM proxy minion**
- **NET basic features**

### See also:

- **NTP peers management state**

### New in version 2016.11.0.

salt.modules.napalm_ntp.delete_peers(*peers, **options)*

Removes NTP peers configured on the device.

**Parameters**

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool)(commit)** -- discard loaded config. By default `test` is False (will not discard the changes)
- **(bool)** -- commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For a dry run, use the `test` argument.

**CLI Example:**

```bash
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.delete_servers(*servers, **options)*

Removes NTP servers configured on the device.

**Parameters**

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool)(commit)** -- discard loaded config. By default `test` is False (will not discard the changes)
**Salt Documentation, Release 3002.6**

- **(bool)** -- commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

  By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

  CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.peers(**kwargs)**

Returns a list the NTP peers configured on the network device.

**Returns** configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
['192.168.0.1',
 '172.17.17.1',
 '172.17.17.2',
 '2400:cb00:6:1024::c71b:840a']
```

salt.modules.napalm_ntp.servers(**kwargs)**

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```
['192.168.0.1',
 '172.17.17.1',
 '172.17.17.2',
 '2400:cb00:6:1024::c71b:840a']
```

salt.modules.napalm_ntp.set_peers(*peers, **options)**

Configures a list of NTP peers on the device.

**Parameters**

- **peers** -- list of IP Addresses/Domain Names
- **(bool)** (test) -- discard loaded config. By default test is False (will not discard the changes)

  **Commit commit (bool)** commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

  By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

  CLI Example:
salt.modules.napalm_ntp.set_servers(*servers, **options)
Configures a list of NTP servers on the device.

Parameters
- servers -- list of IP Addresses/Domain Names

Commit commit (bool) commit loaded config. By default commit is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For dry run use the test argument.

CLI Example:

salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False # preserves the changes, but does not commit

salt.modules.napalm_ntp.stats(peer=None, **kwargs)
Returns a dictionary containing synchronization details of the NTP peers.

Parameters peer -- Returns only the details of a specific NTP peer.

Returns
a list of dictionaries, with the following keys:
- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

salt '*' ntp.stats

Example output:

```python
[
{
    'remote' : '188.114.101.4',
    'referenceid' : '188.114.100.1',
    'synchronized' : True,
    'stratum' : 4,
    'type' : '-'
}]
```
‘reachability’ : 377,
‘delay’ : 164.228,
‘offset’ : -13.866,
‘jitter’ : 2.695
}
]

21.9.292 salt.modules.napalm_probes module

NAPALM Probes

Manages RPM/SLA probes on the network device.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- napalm proxy minion
- NET basic features

See also:
Probes configuration management state
New in version 2016.11.0.
salt.modules.napalm_probes.config(**kwargs)

Returns the configuration of the RPM probes.

Returns A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:
salt '*' probes.config

Output Example:

{
    'probe1':{
        'test1': {
            'probe_type' : 'icmp-ping',
            'target' : '192.168.0.1',
            'source' : '192.168.0.2',
            'probe_count' : 13,
            'test_interval': 3
        },
        'test2': {
            'probe_type' : 'http-ping',
            'target' : '172.17.17.1',
            'source' : '192.17.17.2',
            'probe_count' : 5,
        },
    }
}
salt.modules.napalm_probes.delete_probes(
    probes, test=False, commit=True, **kwargs)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```python
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.results(**kwargs)

Provides the results of the measurements of the RPM/SLA probes.

:returns a dictionary with the results of the probes.

CLI Example:

```bash
salt '*' probes.results
```

Output example:

```python
{
    'probel': {
        'test1': {
            'last_test_min_delay' : 63.120,
            'global_test_min_delay' : 62.912,
            'current_test_avg_delay' : 63.190,
            'global_test_max_delay' : 177.349,
        }
    }
}
```
salt.modules.napalm_probes.schedule_probes(probes, test=False, commit=True, **kwargs)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template schedule_probes from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

**Parameters**

- **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** `MergeConfigException` -- If there is an error on the configuration sent.

**Returns** a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

Input example:

```python
probes = {
    'new_probe':{
        'new_test1': {},
        'new_test2': {}
    }
}
```

```
salt.modules.napalm_probes.set_probes(probes, test=False, commit=True, **kwargs)
```

Configures RPM/SLA probes on the device. Calls the configuration template `set_probes` from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the **already_configured** flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

Input example - via state/script:

```python
probes = {
    'new_probe':{
        'new_test1': {
            'probe_type' : 'icmp-ping',
            'target' : '192.168.0.1',
            'source' : '192.168.0.2',
            'probe_count' : 13,
            'test_interval' : 3
        },
        'new_test2': {
            'probe_type' : 'http-ping',
            'target' : '172.17.17.1',
            'source' : '192.17.17.2',
            'probe_count' : 5,
            'test_interval' : 60
        }
    }
}
```

CLI Example - to push changes on the fly (not recommended):
salt 'junos_minion' probes.set_probes "{'new_probe':{'new_test1':{'probe_type': "icmp-ping", 'target':'192.168.0.1','source':'192.168.0.2','probe_count':13,'test_interval':3}}}" test=True

Output example - for the CLI example above:

```
junos_minion:
   ------------
   already_configured:
      False
   comment:
      Configuration discarded.
   diff:
      [edit services rpm]
      probe transit { ... }
      + probe new_probe {
      +   test new_test1 {
      +     probe-type icmp-ping;
      +     target address 192.168.0.1;
      +     probe-count 13;
      +     test-interval 3;
      +     source-address 192.168.0.2;
      +   }
      + }
   result:
      True
```

21.9.293 salt.modules.napalm_route module

NAPALM Route

Retrieves route details from network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

- **NAPALM proxy minion**

New in version 2016.11.0.

salt.modules.napalm_route.show(destination, protocol=None, **kwargs)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

**Note:** This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.
destination  destination prefix.

protocol (optional)  protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```bash
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```json
{
  '172.16.0.0/25': [
    {
      'protocol': 'BGP',
      'last_active': True,
      'current_active': True,
      'age': 1178693,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.11',
      'outgoing_interface': 'xe-1/1/1.100',
      'preference': 170,
      'selected_next_hop': False,
      'protocol_attributes': {
        'remote_as': 65001,
        'metric': 5,
        'local_as': 13335,
        'as_path': '',
        'remote_address': '192.168.0.11',
        'metric2': 0,
        'local_preference': 0,
        'communities': [
          '0:2',
          'no-export'
        ],
        'preference2': -1
      },
      'inactive_reason': ''
    },
    {
      'protocol': 'BGP',
      'last_active': False,
      'current_active': False,
      'age': 2359429,
      'routing_table': 'inet.0',
      'next_hop': '192.168.0.17',
      'outgoing_interface': 'xe-1/1/1.100',
      'preference': 170,
      'selected_next_hop': True,
      'protocol_attributes': {
        'remote_as': 65001,
        'metric': 5,
        'local_as': 13335,
        'as_path': '',
        'remote_address': '192.168.0.17',
        'metric2': 0,
        'local_preference': 0,
        'communities': [
```

(continues on next page)
21.9.294 salt.modules.napalm_snmp module

NAPALM SNMP

Manages SNMP on network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion
- NET basic features

See also:
SNMP configuration management state

New in version 2016.11.0.

```
salt.modules.napalm_snmp.config(**kwargs)
```
Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

```
salt.modules.napalm_snmp.remove_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)
```
Removes a configuration element from the SNMP configuration.

Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
• **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
• **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises MergeConfigException** -- If there is an error on the configuration sent.

**Returns** A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

**CLI Example:**

```bash
salt '*' snmp.remove_config community='abcd'
```

```python
salt.modules.napalm_snmp.update_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)
```

Updates the SNMP configuration.

**Parameters**

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

**Parameters**

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises MergeConfigException** -- If there is an error on the configuration sent.

**Returns** A dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

**CLI Example:**

```bash
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):
edge01.lon01:
----------
already_configured: False
comment: Configuration discarded.
diff:
[edit snmp]
- location "London, UK";
+ location "Greenwich, UK";
result: True

21.9.295 salt.modules.napalm_users module

NAPALM Users

Manages the configuration of the users on network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

• NAPALM proxy minion

See also:
Users management state

New in version 2016.11.0.

salt.modules.napalm_users.config(**kwargs)
Returns the configuration of the users on the device

CLI Example:
salt '*' users.config

Output example:

{ 'mircea': { 'level': 15, 'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/', 'sshkeys': [ 'ssh-rsa' AAAAB3NzaC1yc2EAAAADAQABAAABAQC4pFn+shPwTb2yEL04L7NTqRk0jXNeCl1je l9STXVaRAnuc2PXL35vnWmcmUq6YbUecgUTRzzXfme1JKuVJDTI3lMxii7h2xkbQp0YZlEs4P 8ipwnRBAxFKf/2cDsN3mjeP4/yjN56ejk345jk345jk345jk341p3A/ 9LIL76YewLBCw3j6 D+fWSJ0/ YW+7oH17Fk2HH+tw0L5pcWlHkwA4t60iXn16qDbIk/ze6jv2hDgdCdz7oYQeCE55C CH0HM7WVF3jrc4s0ry8/lu6Ka1EvkV7iMmro7ChTboV/5snT4ljf2wKkgHH7FNaCfnUW4yHA nTs8zh0rGScSrtb mircea@master-roshi' (continues on next page) }

(continues on next page)
salt.modules.napalm_users.delete_users(users, test=False, commit=True, **kwargs)

Removes users from the configuration of network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add/remove/update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure.
  In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users "{'mircea': {}}"
```

salt.modules.napalm_users.set_users(users, test=False, commit=True, **kwargs)

Configures users on network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add/remove/update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- **result** (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users "{'mircea': {}}"
```
21.9.296  salt.modules.napalm_yang_mod module

NAPALM YANG

NAPALM YANG basic operations.
New in version 2017.7.0.

salt.modules.napalm_yang_mod.compliance_report(data, "models", "**kwargs")
Return the compliance report using YANG objects.
  data  Dictionary structured with respect to the models referenced.
  models  A list of models to be used when generating the config.
  filepath  The absolute path to the validation file.

CLI Example:

```bash
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=~/.validate.yml
```

Output Example:

```json
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    },
    "extra": []
  }
}
```

salt.modules.napalm_yang_mod.diff(candidate, running, "models")
Returns the difference between two configuration entities structured according to the YANG model.

**Note:** This function is recommended to be used mostly as a state helper.

candidate  First model to compare.
running  Second model to compare.
models  A list of models to be used when comparing.

CLI Example:

```bash
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```json
{
  "interfaces": {
    "interface": {
      "both": {
        "Port-Channel1": {
```
"config": {
  "mtu": {
    "first": "0",
    "second": "9000"
  }
},
"first_only": [
  "Loopback0"
],
"second_only": [
  "Loopback1"
]
}

salt.modules.napalm_yang_mod.get_config(data, *models, **kwargs)

Return the native config.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default pro-

file(s).

CLI Example:
salt '*' napalm_yang.get_config {} models.openconfig_interfaces

Output Example:

interface et1
  ip address 192.168.1.1/24
description Uplink1
  mtu 9000
interface et2
  ip address 192.168.2.1/24
description Uplink2
  mtu 9000

salt.modules.napalm_yang_mod.load_config(data, *models, **kwargs)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default pro-

file(s).

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: False Should replace the config with the new generate one?

CLI Example:
salt '*' napalm_yang.load_config {} models.openconfig_interfaces test=True&
--debug=True

21.9. execution modules
Output Example:

device1:
---
already_configured:
False

salt.modules.napalm_yang_mod.parse(*models, **kwargs)
Parse configuration from the device.
models A list of models to be used when parsing.
config: False Parse config.
state: False Parse state.
profiles: None Use certain profiles to parse. If not specified, will use the device default profile(s).
CLI Example:
salt '*' napalm_yang.parse models.openconfig_interfaces

Output Example:

```json
{
  "interfaces": {
    "interface": {
      ".local.: {
        "name": ".local.
```
"state": {

        }
    }
}
21.9.297 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends netaddr

salt.modules.netaddress.cidr_broadcast(cidr)
Get the broadcast address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.cidr_netmask(cidr)
Get the netmask address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.list_cidr_ips(cidr)
Get a list of IP addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

salt.modules.netaddress.list_cidr_ips_ipv6(cidr)
Get a list of IPv6 addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```
21.9.298  salt.modules.netbox module

NetBox

Module to query NetBox

   codeauthor  Zach Moody <zmoody@do.co>
   maturity new
   depends  pynetbox

The following config should be in the minion config file. In order to work with secrets you should provide a token and path to your private key file:

```
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.

salt.modules.netbox.create_circuit(name, provider_id, circuit_type, description=None)

   New in version 2019.2.0.
   Create a new Netbox circuit
   name  Name of the circuit
   provider_id  The netbox id of the circuit provider
   circuit_type  The name of the circuit type
   asn  The ASN of the circuit provider
   description  The description of the circuit

   CLI Example:
   ```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299 "New Telia→circuit"
   ```

salt.modules.netbox.create_circuit_provider(name, asn=None)

   New in version 2019.2.0.
   Create a new Netbox circuit provider
   name  The name of the circuit provider
   asn  The ASN of the circuit provider

   CLI Example:
   ```
salt myminion netbox.create_circuit_provider Telia 1299
   ```

salt.modules.netbox.create_circuit_termination(circuit, interface, device, speed, xconnect_id=None, term_side='A')

   New in version 2019.2.0.
   Terminate a circuit on an interface
   circuit  The name of the circuit
   interface  The name of the interface to terminate on
   device  The name of the device the interface belongs to
   speed  The speed of the circuit, in Kbps
   xconnect_id  The cross-connect identifier
   term_side  The side of the circuit termination

   CLI Example:
salt.modules.netbox.create_circuit_type(name)
New in version 2019.2.0.
Create a new Netbox circuit type.
name The name of the circuit type
CLI Example:
salt myminion netbox.create_circuit_type Transit

salt.modules.netbox.create_device(name, role, model, manufacturer, site)
New in version 2019.2.0.
Create a new device with a name, role, model, manufacturer and site. All these components need to be already in Netbox.
name The name of the device, e.g., edge_router
role String of device role, e.g., router
model String of device model, e.g., MX480
manufacturer String of device manufacturer, e.g., Juniper
site String of device site, e.g., BRU
CLI Example:
salt myminion netbox.create_device edge_router router MX480 Juniper BRU

salt.modules.netbox.create_device_role(role, color)
New in version 2019.2.0.
Create a device role
role String of device role, e.g., router
CLI Example:
salt myminion netbox.create_device_role router

salt.modules.netbox.create_device_type(model, manufacturer)
New in version 2019.2.0.
Create a device type. If the manufacturer doesn’t exist, create a new manufacturer.
model String of device model, e.g., MX480
manufacturer String of device manufacturer, e.g., Juniper
CLI Example:
salt myminion netbox.create_device_type MX480 Juniper

salt.modules.netbox.create_interface(device_name, interface_name, mac_address=None, description=None, enabled=None, lag=None, lag_parent=None, form_factor=None)
New in version 2019.2.0.
Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.
device_name The name of the device, e.g., edge_router
interface_name The name of the interface, e.g., TenGigE0/0/0
mac_address String of mac address, e.g., 50:87:89:73:92:C8
description String of interface description, e.g., NTT
enabled String of boolean interface status, e.g., True
lag Boolean of interface lag status, e.g., True
lag_parent String of interface lag parent name, e.g., ae13
form_factor Integer of form factor id, obtained through _choices API endpoint, e.g., 200

CLI Example:
salt myminion netbox.create_interface edge_router ae13 description="Core uplink"

salt.modules.netbox.create_interface_connection(interface_a, interface_b)
New in version 2019.2.0.
Create an interface connection between 2 interfaces
interface_a Interface id for Side A
interface_b Interface id for Side B

CLI Example:
salt myminion netbox.create_interface_connection 123 456

salt.modules.netbox.create_inventory_item(device_name, item_name, manufacturer_name=None, serial='', part_id='', description='')
New in version 2019.2.0.
Add an inventory item to an existing device.
device_name The name of the device, e.g., edge_router.
item_name String of inventory item name, e.g., Transceiver.
manufacturer_name String of inventory item manufacturer, e.g., Fiberstore.
serial String of inventory item serial, e.g., FS1238931.
part_id String of inventory item part id, e.g., 740-01234.
description String of inventory item description, e.g., SFP+-10G-LR.

CLI Example:
salt myminion netbox.create_inventory_item edge_router Transceiver part_id=740-01234

salt.modules.netbox.create_ipaddress(ip_address, family, device=None, interface=None)
New in version 2019.2.0.
Add an IP address, and optionally attach it to an interface.
ip_address The IP address and CIDR, e.g., 192.168.1.1/24
family Integer of IP family, e.g., 4
device The name of the device to attach IP to, e.g., edge_router
interface The name of the interface to attach IP to, e.g., ae13

CLI Example:
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router
interface=ae13

salt.modules.netbox.create_manufacturer(name)
New in version 2019.2.0.
Create a device manufacturer.
name The name of the manufacturer, e.g., Juniper

CLI Example:
salt myminion netbox.create_manufacturer Juniper

salt.modules.netbox.create_platform(platform)
New in version 2019.2.0.
Create a new device platform

**platform**  String of device platform, e.g., junos

CLI Example:

```
salt myminion netbox.create_platform junos
```

salt.modules.netbox.create_site(site)

New in version 2019.2.0.

Create a new device site

**site**  String of device site, e.g., BRU

CLI Example:

```
salt myminion netbox.create_site BRU
```

salt.modules.netbox.delete_interface(device_name, interface_name)

New in version 2019.2.0.

Delete an interface from a device.

**device_name**  The name of the device, e.g., edge_router.

**interface_name**  The name of the interface, e.g., ae13

CLI Example:

```
salt myminion netbox.delete_interface edge_router ae13
```

salt.modules.netbox.delete_inventory_item(item_id)

New in version 2019.2.0.

Remove an item from a devices inventory. Identified by the netbox id

**item_id**  Integer of item to be deleted

CLI Example:

```
salt myminion netbox.delete_inventory_item 1354
```

salt.modules.netbox.delete_ipaddress(ipaddr_id)

New in version 2019.2.0.

Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.

**id**  The Netbox id for the IP address.

CLI Example:

```
salt myminion netbox.delete_ipaddress 9002
```

salt.modules.netbox.filter_(app, endpoint, **kwargs)

Get a list of items from NetBox.

**app**  String of netbox app, e.g., dcim, circuits, ipam

**endpoint**  String of app endpoint, e.g., sites, regions, devices

**kwargs**  Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., role=router

Returns a list of dictionaries

```
salt myminion netbox.filter dcim devices status=1 role=router
```

salt.modules.netbox.get_(app, endpoint, id=None, **kwargs)

Get a single item from NetBox.

**app**  String of netbox app, e.g., dcim, circuits, ipam

**endpoint**  String of app endpoint, e.g., sites, regions, devices

```
```
Returns a single dictionary
To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

```
salt.modules.netbox.get_circuit_provider(name, asn=None)
```
New in version 2019.2.0.
Get a circuit provider with a given name and optional ASN.

- **name** The name of the circuit provider
- **asn** The ASN of the circuit provider

CLI Example:
```
salt myminion netbox.get_circuit_provider Telia 1299
```

```
salt.modules.netbox.get_interfaces(device_name=None, **kwargs)
```
New in version 2019.2.0.
Returns interfaces for a specific device using arbitrary netbox filters

- **device_name** The name of the device, e.g., edge_router
- **kwargs** Optional arguments to be used for filtering

CLI Example:
```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

```
salt.modules.netbox.get_ipaddresses(device_name=None, **kwargs)
```
New in version 2019.2.0.
Filters for an IP address using specified filters

- **device_name** The name of the device to check for the IP address
- **kwargs** Optional arguments that can be used to filter, e.g., family=4

CLI Example:
```
salt myminion netbox.get_ipaddresses device_name family=4
```

```
salt.modules.netbox.make_interface_child(device_name, interface_name, parent_name)
```
New in version 2019.2.0.
Set an interface as part of a LAG.

- **device_name** The name of the device, e.g., edge_router.
- **interface_name** The name of the interface to be attached to LAG, e.g., xe-1/0/2.
- **parent_name** The name of the LAG interface, e.g., ae13.

CLI Example:
```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

```
salt.modules.netbox.make_interface_lag(device_name, interface_name)
```
New in version 2019.2.0.
Update an interface to be a LAG.

- **device_name** The name of the device, e.g., edge_router.
- **interface_name** The name of the interface, e.g., ae13.

CLI Example:
salt.modules.netbox.openconfig_interfaces(device_name=None)

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-interfaces YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

**device_name: None** The name of the device to query the interface data for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon
```

salt.modules.netbox.openconfig_lacp(device_name=None)

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-lacp YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

**Note:** The *interval* and *lacp_mode* keys have the values set as SLOW and ACTIVE respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See *interval* and *lacp-mode* for further details.

**device_name: None** The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon
```

salt.modules.netbox.slugify(value)

'Slugify given value. Credit to Djangoproject https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify

salt.modules.netbox.update_device(name, **kwargs)

New in version 2019.2.0.

Add attributes to an existing device, identified by name.

**name** The name of the device, e.g., *edge_router*

**kwargs** Arguments to change in device, e.g., *serial=JN2932930*

CLI Example:

```
salt myminion netbox.update_device edge_router serial=JN2932920
```

salt.modules.netbox.update_interface(device_name, interface_name, **kwargs)

New in version 2019.2.0.

Update an existing interface with new attributes.

**device_name** The name of the device, e.g., *edge_router*

**interface_name** The name of the interface, e.g., *ae13*

**kwargs** Arguments to change in interface, e.g., *mac_address=50:87:69:53:32:D0*

CLI Example:

```
salt myminion netbox.update_interface edge_router ae13 mac_address=50:87:69:53:32:D0
```
21.9.299 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.netbsd_sysctl.assign(name, value)
    Assign a single sysctl parameter for this minion
    CLI Example:
    ```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
    ```

salt.modules.netbsd_sysctl.get(name)
    Return a single sysctl parameter for this minion
    CLI Example:
    ```
salt '*' sysctl.get hw.physmem
    ```

salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
    Assign and persist a simple sysctl parameter for this minion
    CLI Example:
    ```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
    ```

salt.modules.netbsd_sysctl.show(config_file=False)
    Return a list of sysctl parameters for this minion
    CLI Example:
    ```
salt '*' sysctl.show
    ```

21.9.300 salt.modules.netbsdservice

The service module for NetBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *service.start* is not available), see here.

salt.modules.netbsdservice.available(name)
    Returns True if the specified service is available, otherwise returns False.
    CLI Example:
    ```
salt '*' service.available ssd
    ```

salt.modules.netbsdservice.disable(name, **kwargs)
    Disable the named service to start at boot
    CLI Example:
salt '!' service.disable <service name>

salt.modules.netbsdservice.disabled(name)
Return True if the named service is enabled, false otherwise

   CLI Example:
   
   salt '!' service.disabled <service name>

salt.modules.netbsdservice.enable(name, **kwargs)
Enable the named service to start at boot

   CLI Example:
   
   salt '!' service.enable <service name>

salt.modules.netbsdservice.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

   CLI Example:
   
   salt '!' service.enabled <service name>

salt.modules.netbsdservice.force_reload(name)
Force-reload the named service

   CLI Example:
   
   salt '!' service.force_reload <service name>

salt.modules.netbsdservice.get_all()
Return all available boot services

   CLI Example:
   
   salt '!' service.get_all

salt.modules.netbsdservice.get_disabled()
Return a set of services that are installed but disabled

   CLI Example:
   
   salt '!' service.get_disabled

salt.modules.netbsdservice.get_enabled()
Return a list of service that are enabled on boot

   CLI Example:
   
   salt '!' service.get_enabled

salt.modules.netbsdservice.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

   CLI Example:
   
   salt '!' service.missing sshd
salt.modules.netbsdservice.reload(name)
    Reload the named service
    CLI Example:
    ```
salt '*' service.reload <service name>
    ```

salt.modules.netbsdservice.restart(name)
    Restart the named service
    CLI Example:
    ```
salt '*' service.restart <service name>
    ```

salt.modules.netbsdservice.start(name)
    Start the specified service
    CLI Example:
    ```
salt '*' service.start <service name>
    ```

salt.modules.netbsdservice.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    • name (str) -- The name of the service to check
    • sig (str) -- Signature to use to find the service via ps
    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
    Return type bool
    CLI Example:
    ```
salt '*' service.status <service name> [service signature]
    ```

salt.modules.netbsdservice.stop(name)
    Stop the specified service
    CLI Example:
    ```
salt '*' service.stop <service name>
    ```

21.9.301 salt.modules.netmiko_mod

Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., device_type, ip, username, password etc.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>
maturity new
depends netmiko
platform  unix

Dependencies

The netmiko proxy modules requires Netmiko to be installed: pip install netmiko.

Usage

This module can equally be used via the netmiko Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the netmiko library installed.

When running outside of the netmiko Proxy (i.e., from another Proxy Minion type, or regular Minion), the netmiko connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the netmiko key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the netmiko Proxy Module:

- device_type - Class selection based on device type. Supported options:
  - a10: A10 Networks
  - accedian: Accedian Networks
  - alcatel_aos: Alcatel AOS
  - alcatel_sros: Alcatel SROS
  - apresia_aeos: Apresia AEOS
  - arista_eos: Arista EOS
  - aruba_os: Aruba
  - avaya_ers: Avaya ERS
  - avaya_vsp: Avaya VSP
  - brocade_fastiron: Brocade Fastiron
  - brocade_netiron: Brocade Netiron
  - brocade_nos: Brocade NOS
  - brocade_vdx: Brocade NOS
  - brocade_vyos: VyOS
  - checkpoint_gaia: Check Point GAIa
  - calix_b6: Calix B6
  - ciena_saos: Ciena SAOS
  - cisco_asa: Cisco SA
  - cisco_ios: Cisco IOS
  - cisco_nxos: Cisco NX-oS
  - cisco_s300: Cisco S300
  - cisco_tp: Cisco TpTcCe
  - cisco_wlc: Cisco WLC
- cisco_xe: Cisco IOS
- cisco_xr: Cisco XR
- coriant: Coriant
- dell_force10: Dell Force10
- dell_os10: Dell OS10
- dell_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme_wing: Extreme Wing
- f5_ltm: F5 LTM
- fortinet: Fortinet
- generic_termserver: TerminalServer
- hp_comware: HP Comware
- hp_procurve: HP Procurve
- huawei: Huawei
- huawei_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv_optiswitch: MrvOptiswitch
- netapp_cdot: NetAppcDot
- netscaler: Netscaler
- ovs_linux: OvsLinux
- paloalto_panos: PaloAlto Panos
- pluribus: Pluribus
- quanta_mesh: Quanta Mesh
- ruckus_fastiron: Ruckus Fastiron
- ubiquiti_edge: Ubiquiti Edge
- ubiquiti_edgeswitch: Ubiquiti Edge
- vyatta_vyos: VyOS
- vyos: VyOS
- brocade_fastiron_telnet: Brocade Fastiron over Telnet
- brocade_netiron_telnet: Brocade Netiron over Telnet
- cisco_ios_telnet: Cisco IOS over Telnet
- apresia_aeos_telnet: Apresia AEOS over Telnet
- arista_eos_telnet: Arista EOS over Telnet
- hp_procurve_telnet: HP Procurve over Telnet
- hp_comware_telnet: HP Comware over Telnet
- juniper_junos_telnet: Juniper Junos over Telnet
- calix_b6_telnet: Calix B6 over Telnet
- dell_powerconnect_telnet: Dell PowerConnect over Telnet
- generic_termserver_telnet: TerminalServer over Telnet
- extreme_telnet: Extreme Networks over Telnet
- ruckus_fastiron_telnet: Ruckus Fastiron over Telnet
- cisco_ios_serial: Cisco IOS over serial port

- **ip** - IP address of target device (not required if **host** is provided)
- **host** - Hostname of target device (not required if **ip** is provided)
- **username** - Username to authenticate against target device, if required
- **password** - Password to authenticate against target device, if required
- **secret** - The enable password if target device requires one
- **port** - The destination port used to connect to the target device
- **global_delay_factor** - Multiplication factor affecting Netmiko delays (default: 1)
- **use_keys** - Connect to target device using SSH keys (default: False)
- **key_file** - Filename path of the SSH key file to use
- **allow_agent** - Enable use of SSH key-agent
- **ssh_strict** - Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
- **system_host_keys** - Load host keys from the user's "known_hosts" file (default: False)
- **alt_host_keys** - If True, host keys will be loaded from the file specified in **alt_key_file** (default: False)
- **alt_key_file** - SSH host key file to use (if **alt_host_keys**=True)
- **ssh_config_file** - File name of OpenSSH configuration file
- **timeout** - Connection timeout, in seconds (default: 90)
- **session_timeout** - Set a timeout for parallel requests, in seconds (default: 60)
- **keepalive** - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- **default_enter** - Character(s) to send to correspond to enter key (default: \n)
- **response_return** - Character(s) to use in normalized return data to represent enter key (default: \n)

Example (when not running in a netmiko Proxy Minion):
netmiko:
  username: test
  password: test

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `netmiko` Proxy, e.g:

```
salt '* netmiko.send_command 'show version' host=router1.example.com device_type=juniper
salt '* netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com device_type=cisco_ios
```

**Note:** Remember that the above applies only when not running in a `netmiko` Proxy Minion. If you want to use the `<salt.proxy.netmiko_px>`, please follow the documentation notes for a proper setup.

```
salt.modules.netmiko_mod.call(method, *args, **kwargs)
   Invoke an arbitrary Netmiko method.

method   The name of the Netmiko method to invoke.
args      A list of arguments to send to the method invoked.
kwargs    Key-value dictionary to send to the method invoked.
```

```
salt.modules.netmiko_mod.commit(**kwargs)
   Commit the configuration changes.

Warning: This function is supported only on the platforms that support the commit operation.
```

```
salt.modules.netmiko_mod.enter_config_mode(**kwargs)
   Enter into config mode.

config_command Configuration command to send to the device.
pattern  Pattern to terminate reading of channel.
```

```
salt.modules.netmiko_mod.exit_config_mode(**kwargs)
   Exit from configuration mode.

exit_config Command to exit configuration mode.
pattern  Pattern to terminate reading of channel.
```

```
salt.modules.netmiko_mod.get_connection(**kwargs)
   Return the Netmiko connection object.
```
**Warning**: This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs**  Key-value dictionary with the authentication details.

**USAGE Example:**

```python
conn = __salt__['netmiko.get_connection'](host='router1.example.com',
                                        username='example',
                                        password='example')

show_if = conn.send_command('show interfaces')
conn.disconnect()
```

**salt.modules.netmiko_mod.multi_call(methods, **kwargs)**

Invoke multiple Netmiko methods at once, and return their output, as list.

**methods**  A list of dictionaries with the following keys:

- **name**: the name of the Netmiko method to be executed.
- **args**: list of arguments to be sent to the Netmiko method.
- **kwargs**: dictionary of arguments to be sent to the Netmiko method.

**kwargs**  Key-value dictionary with the connection details (when not running under a Proxy Minion).

**salt.modules.netmiko_mod.send_command(command_string, **kwargs)**

Execute command_string on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

**command_string**  The command to be executed on the remote device.

**expect_string**  Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay_factor**: 1  Multiplying factor used to adjust delays (default: 1).

**max_loops**: 500  Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

**auto_find_prompt**: True  Whether it should try to auto-detect the prompt (default: True).

**strip_prompt**: True  Remove the trailing router prompt from the output (default: True).

**strip_command**: True  Remove the echo of the command from the output (default: True).

**normalize**: True  Ensure the proper enter is sent at end of command (default: True).

**use_textfsm**: False  Process command output through TextFSM template (default: False).

**CLI Example:**

```shell
$ salt '*' netmiko.send_command 'show version'
$ salt '*' netmiko.send_command 'show_version' host='router1.example.com' username='example' device_type='cisco_ios'
```

**salt.modules.netmiko_mod.send_command_timing(command_string, **kwargs)**

Execute command_string on the SSH channel using a delay-based mechanism. Generally used for show commands.

**command_string**  The command to be executed on the remote device.

**delay_factor**: 1  Multiplying factor used to adjust delays (default: 1).

**max_loops**: 500  Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

**strip_prompt**: True  Remove the trailing router prompt from the output (default: True).

**strip_command**: True  Remove the echo of the command from the output (default: True).

**normalize**: True  Ensure the proper enter is sent at end of command (default: True).

**use_textfsm**: False  Process command output through TextFSM template (default: False).

**CLI Example:**
salt '*' netmiko.send_command_timing 'show version'
salt '*' netmiko.send_command_timing 'show version' host='router1.example.com'
    → username='example' device_type='arista_eos'

salt.modules.netmiko_mod.send_config(config_file=None, config_commands=None,
    template_engine='jinja', commit=False, context=None,
    defaults=None, saltenv='base', **kwargs)

Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.

config_file The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

config_commands Multiple configuration commands to be sent to the device.

Note: This argument is ignored when config_file is specified.

template_engine: `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

commit: `False` Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

context Variables to add to the template context.

defaults Default values of the context_dict.

exit_config_mode: `True` Determines whether or not to exit config mode after complete.

delay_factor: `1` Factor to adjust delays.

max_loops: `150` Controls wait time in conjunction with delay_factor (default: `150`).

strip_prompt: `False` Determines whether or not to strip the prompt (default: `False`).

strip_command: `False` Determines whether or not to strip the command (default: `False`).

config_mode_command The command to enter into config mode.

CLI Example:

salt '*' netmiko.send_config config_commands="[['interface GigabitEthernet3', 'no ip address']]"
salt '*' netmiko.send_config config_commands="[['snmp-server location {{ grains. location }}']]"
salt '*' netmiko.send_config config_file=salt://config.txt
salt '*' netmiko.send_config config_file=https://bit.ly/2sgljCB device_type='cisco_ios' ip='1.2.3.4' username='example'
21.9.302 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

depends

• nsnitro Python module

Note: You can install nsnitro using:

```
pip install nsnitro
```

configuration

This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
| netscaler.host: 1.2.3.4 |
| netscaler.user: user |
| netscaler.pass: password |
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples

Calls relying on configuration passed using /etc/salt/minion, grains, or pillars: .. code-block:: bash

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts .. code-block:: bash

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4 netscaler_user=username netscaler_pass=password
```

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState' netscaler_host=1.2.3.6 netscaler_useSSL=False
```

```
salt.modules.netscaler.server_add(s_name, s_ip, s_state=None, **connection_args)
```

Add a server Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

```
salt.modules.netscaler.server_delete(s_name, **connection_args)
```

Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

```
salt.modules.netscaler.server_disable(s_name, **connection_args)
```

Disable a server globally

CLI Example:
salt '*' netscaler.server_disable 'serverName'

```
salt.modules.netscaler.server_enable(s_name, **connection_args)
    Enables a server globally
    CLI Example:
    salt '*' netscaler.server_enable 'serverName'
```

```
salt.modules.netscaler.server_enabled(s_name, **connection_args)
    Check if a server is enabled globally
    CLI Example:
    salt '*' netscaler.server_enabled 'serverName'
```

```
salt.modules.netscaler.server_exists(s_name, ip=None, s_state=None, **connection_args)
    Checks if a server exists
    CLI Example:
    salt '*' netscaler.server_exists 'serverName'
```

```
salt.modules.netscaler.server_update(s_name, s_ip, **connection_args)
    Update a server's attributes
    CLI Example:
    salt '*' netscaler.server_update 'serverName' 'serverIP'
```

```
salt.modules.netscaler.service_disable(s_name, s_delay=None, **connection_args)
    Disable a service
    CLI Example:
    salt '*' netscaler.service_disable 'serviceName'
    salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'
```

```
salt.modules.netscaler.service_enable(s_name, **connection_args)
    Enable a service
    CLI Example:
    salt '*' netscaler.service_enable 'serviceName'
```

```
salt.modules.netscaler.service_exists(s_name, **connection_args)
    Checks if a service exists
    CLI Example:
    salt '*' netscaler.service_exists 'serviceName'
```

```
salt.modules.netscaler.service_up(s_name, **connection_args)
    Checks if a service is UP
    CLI Example:
    salt '*' netscaler.service_up 'serviceName'
```
salt.modules.netscaler.servicegroup_add(sg_name, sg_type='HTTP', **connection_args)
Add a new service group. If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:
```
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

salt.modules.netscaler.servicegroup_delete(sg_name, **connection_args)
Delete a new service group

CLI Example:
```
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

salt.modules.netscaler.servicegroup_exists(sg_name, sg_type=None, **connection_args)
Checks if a service group exists

CLI Example:
```
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

salt.modules.netscaler.servicegroup_server_add(sg_name, s_name, s_port, **connection_args)
Add a server:port member to a servicegroup

CLI Example:
```
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName'
← 'serverPort'
```

salt.modules.netscaler.servicegroup_server_delete(sg_name, s_name, s_port, **connection_args)
Remove a server:port member from a servicegroup

CLI Example:
```
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName'
← 'serverPort'
```

salt.modules.netscaler.servicegroup_server_disable(sg_name, s_name, s_port, **connection_args)
Disable a server:port member of a servicegroup

CLI Example:
```
salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName'
← 'serverPort'
```

salt.modules.netscaler.servicegroup_server_enable(sg_name, s_name, s_port, **connection_args)
Enable a server:port member of a servicegroup

CLI Example:
```
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName'
← 'serverPort'
```
salt.modules.netscaler.servicegroup_server_exists(\texttt{s}\textunderscore name, \texttt{s}\textunderscore name, \texttt{s}\textunderscore port=None, **\texttt{connection\_args})

Check if a server:port combination is a member of a servicegroup

CLI Example:
```
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName' \n   \n   \n   → 'serverPort'
```

salt.modules.netscaler.servicegroup_server_up(\texttt{s}\textunderscore name, \texttt{s}\textunderscore name, \texttt{s}\textunderscore port, **\texttt{connection\_args})

Check if a server:port combination is in state UP in a servicegroup

CLI Example:
```
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName' \n   \n   \n   → 'serverPort'
```

salt.modules.netscaler.vserver_add(\texttt{v}\textunderscore name, \texttt{v}\textunderscore ip, \texttt{v}\textunderscore port, \texttt{v}\textunderscore type, **\texttt{connection\_args})

Add a new lb vserver

CLI Example:
```
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort' \n   \n   \n   → 'vserverType'

salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

salt.modules.netscaler.vserver_delete(\texttt{v}\textunderscore name, **\texttt{connection\_args})

Delete a lb vserver

CLI Example:
```
salt '*' netscaler.vserver_delete 'vserverName'
```

salt.modules.netscaler.vserver_exists(\texttt{v}\textunderscore name, \texttt{v}\textunderscore ip=None, \texttt{v}\textunderscore port=None, \texttt{v}\textunderscore type=None, **\texttt{connection\_args})

Checks if a vserver exists

CLI Example:
```
salt '*' netscaler.vserver_exists 'vserverName'
```

salt.modules.netscaler.vserver_servicegroup_add(\texttt{v}\textunderscore name, \texttt{sg}\textunderscore name, **\texttt{connection\_args})

Bind a servicegroup to a vserver

CLI Example:
```
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_delete(\texttt{v}\textunderscore name, \texttt{sg}\textunderscore name, **\texttt{connection\_args})

Unbind a servicegroup from a vserver

CLI Example:
```
salt '*' netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_exists(\texttt{v}\textunderscore name, \texttt{sg}\textunderscore name, **\texttt{connection\_args})

Checks if a servicegroup is tied to a vserver
CLI Example:
```
salt '* netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.**vserver_sslcert_add**(v_name, sc_name, **connection_args)
Binds a SSL certificate to a vserver

CLI Example:
```
salt '* netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.**vserver_sslcert_delete**(v_name, sc_name, **connection_args)
Unbinds a SSL certificate from a vserver

CLI Example:
```
salt '* netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.**vserver_sslcert_exists**(v_name, sc_name, **connection_args)
Checks if a SSL certificate is tied to a vserver

CLI Example:
```
salt '* netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

21.9.303  salt.modules.network

Module for gathering and managing network information

salt.modules.network.**active_tcp**( )
Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:
```
salt '* network.active_tcp
```

salt.modules.network.**arp**( )
Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:
```
salt '* network.arp
```

salt.modules.network.**calc_net**(ip_addr, netmask=None)
Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:
```
salt '* network.calc_net 172.17.0.5 255.255.255.240
salt '* network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

salt.modules.network.**connect**(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.
New in version 2014.7.0.

CLI Example:

```shell
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
  timeout=3
```

**salt.modules.network.convert_cidr(cidr)**
returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```shell
salt '*' network.convert_cidr 172.31.0.0/16
```

**salt.modules.network.default_route(family=None)**
Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```shell
salt '*' network.default_route
```

**salt.modules.network.dig(host)**
Performs a DNS lookup with dig

CLI Example:

```shell
salt '*' network.dig archlinux.org
```

**salt.modules.network.fqdns()**
Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

**salt.modules.network.get_bufsize(iface)**
Return network buffer sizes as a dict (currently linux only)

CLI Example:

```shell
salt '*' network.get_bufsize eth0
```

**salt.modules.network.get_fqdn()**
Get fully qualified domain name

CLI Example:

```shell
salt '*' network.get_fqdn
```

**salt.modules.network.get_hostname()**
Get hostname

CLI Example:
salt 'salt '*' network.get_hostname

salt.modules.network.get_route(ip)
    Return routing information for given destination ip
    New in version 2015.5.3.
    Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD
    Changed in version 2016.11.4: Added support for AIX
    CLI Example:
    
    
salt '*' network.get_route 10.10.10.10

salt.modules.network.hw_addr(iface)
    Return the hardware address (a.k.a. MAC address) for a given interface
    CLI Example:

    
salt '*' network.hw_addr eth0

salt.modules.network.hwaddr(iface)
    This function is an alias of hw_addr.
    Return the hardware address (a.k.a. MAC address) for a given interface
    CLI Example:

    
salt '*' network.hw_addr eth0

salt.modules.network.ifacestartswith(cidr)
    Retrieve the interface name from a specific CIDR
    New in version 2016.11.0.
    CLI Example:

    
salt '*' network.ifacestartswith 10.0

salt.modules.network.in_subnet(cidr)
    Returns True if host is within specified subnet, otherwise False.
    CLI Example:

    
salt '*' network.in_subnet 10.0.0.0/16

salt.modules.network.interface(iface)
    Return the inet address for a given interface
    New in version 2014.7.0.
    CLI Example:

    
salt '*' network.interface eth0

salt.modules.network.interface_ip(iface)
    Return the inet address for a given interface
    New in version 2014.7.0.
    CLI Example:
salt 'salt '*' network.interface_ip eth0

salt.modules.network.interfaces()
    Return a dictionary of information about all the interfaces on the minion
    
    CLI Example:
    
salt 'salt '*' network.interfaces

salt.modules.network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
    Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type='private'.
    
    Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.
    
    CLI Example:
    
salt 'salt '*' network.ip_addrs

salt.modules.network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
    Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.
    
    Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.
    
    CLI Example:
    
salt 'salt '*' network.ip_addrs6

salt.modules.network.ip_in_subnet(ip_addr, cidr)
    Returns True if given IP is within specified subnet, otherwise False.
    
    CLI Example:
    
salt 'salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12

salt.modules.network.ip_networks(interface=None, include_loopback=False, verbose=False)
    New in version 3001.
    
    Returns a list of IPv4 networks to which the minion belongs.
    
    interface Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.
    
    CLI Example:
    
salt 'salt '*' network.list_networks
    salt 'salt '*' network.list_networks interface=docker0
    salt 'salt '*' network.list_networks interface=docker0,enp*
    salt 'salt '*' network.list_networks interface=eth*

salt.modules.network.ip_networks6(interface=None, include_loopback=False, verbose=False)
    New in version 3001.
    
    Returns a list of IPv6 networks to which the minion belongs.
interface  Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.list_networks6
salt '*' network.list_networks6 interface=.docker0
salt '*' network.list_networks6 interface=docker0,enp*
salt '*' network.list_networks6 interface=eth*
```

**salt.modules.network.ipaddrs** *(interface=None, include_loopback=False, cidr=None, type=None)*

This function is an alias of ip_addrs.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

**salt.modules.network.ipaddrs6** *(interface=None, include_loopback=False, cidr=None)*

This function is an alias of ip_addrs6.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

**salt.modules.network.iphexval** *(ip)*

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

**salt.modules.network.is_loopback** *(ip_addr)*

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

**salt.modules.network.is_private** *(ip_addr)*

Check if the given IP address is a private address

New in version 2014.7.0.
Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

```
salt.modules.network.mod_bufsize(iface, *args, **kwargs)
   Modify network interface buffers (currently linux only)
```

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

```
salt.modules.network.mod_hostname(hostname)
   Modify hostname
```

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

```
salt.modules.network.netstat()
   Return information on open ports and states
```

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

```
salt.modules.network.ping(host, timeout=False, return_boolean=False)
   Performs an ICMP ping to a host
```

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

```
salt.modules.network.reverse_ip(ip_addr)
   Returns the reversed IP address
```
Changed in version 2015.8.0: IPv6 support

CLI Example:

```bash
salt '*' network.reverse_ip 172.17.0.4
```

`salt.modules.network.routes(family=None)`
Return currently configured routes from routing table

- Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)
- Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' network.routes
```

`salt.modules.network.subnets(interfaces=None)`
Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```bash
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

`salt.modules.network.subnets6()`
Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```bash
salt '*' network.subnets
```

`salt.modules.network.traceroute(host)`
Performs a traceroute to a 3rd party host

- Changed in version 2015.8.0: Added support for SunOS
- Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' network.traceroute archlinux.org
```

`salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)`
Send Wake On Lan packet to a host

CLI Example:

```bash
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```
21.9.304 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

• neutronclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```yaml
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```yaml
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the use_keystoneauth option in the pillar or minion config.

Note: this is required to use keystone v3 as for authentication.

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```
Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

```python
salt.modules.neutron.add_gateway_router(router, ext_network, profile=None)
```

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- **router** -- ID or name of the router
- **ext_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

Returns Added Gateway router information

```python
salt.modules.neutron.add_interface_router(router, subnet, profile=None)
```

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns Added interface information

```python
salt.modules.neutron.create_firewall_rule(protocol, action, profile=None, **kwargs)
```

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
        tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_VERSION
        source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_ADDRESS
        source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

Parameters

- **protocol** -- Protocol for the firewall rule, choose "tcp", "udp", "icmp" or "None".
- **action** -- Action for the firewall rule, choose "allow" or "deny".
- **tenant_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
**salt.modules.neutron.create_floatingip** *(floating_network, port=None, profile=None)*

Creates a new floatingIP

**CLI Example:**

```
salt '*' neutron.create_floatingip network-name port-name
```

**Parameters**

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

**Returns**

Created floatingIP information

**salt.modules.neutron.create_ikepolicy** *(name, profile=None, **kwargs)*

Creates a new IKEPolicy

**CLI Example:**

```
salt '*' neutron.create_ikepolicy ikepolicy-name
```

**Parameters**

- **name** -- Name of the IKE policy
- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

**Returns**

Created IKE policy information

**salt.modules.neutron.create_ipsec_site_connection** *(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)*

Creates a new IPsecSiteConnection

**CLI Example:**

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

**Parameters**

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPSec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer gateway ID
- **psk** -- Pre-shared key
- **admin_state_up** -- Indicates whether to enable or disable the connection, default: True
- **profile** -- Profile to build on (Optional)
- **kwargs** --
- **peer_id** -- Peer router identity for authentication. Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default: bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- Size for the connection, default: 1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns: Created IPSec site connection information

```
salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
    transform_protocol=esp auth_algorithm=sha1
    encapsulation_mode=tunnel encryption_algorithm=aes-128
```

Parameters

- **name** -- Name of the IPSec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default: aes-128 (Optional)
- **pfs** -- Perfect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns: Created IPSec policy information

```
salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** -- Name of network to create
- **admin_state_up** -- Should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- The Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- The name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- The vlan id or GRE id (Optional)
- **shared** -- Is the network shared or not (Optional)
• `profile` -- Profile to build on (Optional)

Returns  Created network information

```
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

Parameters

- `name` -- Name of port to create
- `network` -- Network name or ID
- `device_id` -- ID of device (Optional)
- `admin_state_up` -- Set admin state up to true or false, default: true (Optional)
- `profile` -- Profile to build on (Optional)

Returns  Created port information

```
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

Parameters

- `name` -- Name of router to create (must be first)
- `ext_network` -- ID or name of the external for the gateway (Optional)
- `admin_state_up` -- Set admin state up to true or false, default: true (Optional)
- `profile` -- Profile to build on (Optional)

Returns  Created router information

```
salt.modules.neutron.create_security_group(name=None, description=None, profile=None)
```

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
```

Parameters

- `name` -- Name of security group (Optional)
- `description` -- Description of security group (Optional)
- `profile` -- Profile to build on (Optional)

Returns  Created security group information

```
salt.modules.neutron.create_security_group_rule(security_group, remote_group_id=None, direction='ingress', protocol=None, port_range_min=None, port_range_max=None, ether-type='IPv4', profile=None)
```

Creates a new security group rule

CLI Example:
salt '*' neutron.show_security_group_rule security-group-rule-id

Parameters
- security_group -- Security group name or ID to add rule
- remote_group_id -- Remote security group name or ID to apply rule (Optional)
- direction -- Direction of traffic: ingress/egress, default: ingress (Optional)
- protocol -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- port_range_min -- Starting port range (Optional)
- port_range_max -- Ending port range (Optional)
- ethertype -- IPv4/IPv6, default: IPv4 (Optional)
- profile -- Profile to build on (Optional)

Returns Created security group rule information

salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)

Creates a new subnet

CLI Example:

salt '*' neutron.create_subnet network-name 192.168.1.0/24

Parameters
- network -- Network ID or name this subnet belongs to
- cidr -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- name -- Name of the subnet to create (Optional)
- ip_version -- Version to use, default is 4(IPv4) (Optional)
- profile -- Profile to build on (Optional)

Returns Created subnet information

salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, profile=None)

Creates a new VPN service

CLI Example:

salt '*' neutron.create_vpnservice router-name name

Parameters
- subnet -- Subnet unique identifier for the VPN service deployment
- router -- Router unique identifier for the VPN service
- name -- Set a name for the VPN service
- admin_state_up -- Set admin state up to true or false, default: True (Optional)
- profile -- Profile to build on (Optional)

Returns Created VPN service information

salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)

Deletes the specified firewall_rule

CLI Example:

salt '*' neutron.delete_firewall_rule firewall-rule

Parameters
- firewall_rule -- ID or name of firewall rule to delete
- profile -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)

Deletes the specified floating IP
CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

**Parameters**
- `floatingip_id` -- ID of floatingIP to delete
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False

salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)
Deltes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

**Parameters**
- `ikepolicy` -- ID or name of IKE policy to delete
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False

salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)
Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

**Parameters**
- `ipsec_site_connection` -- ID or name of ipsec site connection to delete
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False

salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

**Parameters**
- `ipsecpolicy` -- ID or name of IPSec policy to delete
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False

salt.modules.neutron.delete_network(network, profile=None)
Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

**Parameters**
- `network` -- ID or name of network to delete
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False
salt.modules.neutron.delete_port(port, profile=None)
Deletes the specified port

CLI Example:
```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

Parameters
- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)
Delete the specified tenant’s quota value

CLI Example:
```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

Returns True(Delete succeed) or False(Delete failed)

salt.modules.neutron.delete_router(router, profile=None)
Delete the specified router

CLI Example:
```
salt '*' neutron.delete_router router-name
```

Parameters
- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_security_group(security_group, profile=None)
Deletes the specified security group

CLI Example:
```
salt '*' neutron.delete_security_group security-group-name
```

Parameters
- **security_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)
Deletes the specified security group rule

CLI Example:
```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters
- **security_group_rule_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)
Returns True(Succeed) or False

salt.modules.neutron.delete_subnet(subnet, profile=None)
Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters
- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.delete_vpnservice(vpnservice, profile=None)
Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters
- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.get_quotas_tenant(profile=None)
Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns Quotas information

salt.modules.neutron.list_agents(profile=None)
List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

Parameters **profile** -- Profile to build on (Optional)

Returns agents message.

salt.modules.neutron.list_extensions(profile=None)
Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of extensions

salt.modules.neutron.list_firewall_rules(profile=None)
Fetches a list of all firewall rules for a tenant CLI Example:
salt '*' neutron.list_firewall_rules

Parameters **profile** -- Profile to build on (Optional)
Returns List of firewall rules

salt.modules.neutron.list_firewalls(*profile=None*)
Fetches a list of all firewalls for a tenant

CLI Example:

salt '*' neutron.list_firewalls

Parameters **profile** -- Profile to build on (Optional)
Returns List of firewalls

salt.modules.neutron.list_floatingips(*profile=None*)
Fetch a list of all floatingIPs for a tenant

CLI Example:

salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips *profile=openstack1

Parameters **profile** -- Profile to build on (Optional)
Returns List of floatingIP

salt.modules.neutron.list_ikepolicies(*profile=None*)
Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies *profile=openstack1

Parameters **profile** -- Profile to build on (Optional)
Returns List of IKE policy

salt.modules.neutron.list_ipsec_site_connections(*profile=None*)
Fetches all configured IPsec Site Connections for a tenant

CLI Example:

salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections *profile=openstack1

Parameters **profile** -- Profile to build on (Optional)
Returns List of IPSec site connection

salt.modules.neutron.list_ipsecpolicies(*profile=None*)
Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name *profile=openstack1

Parameters **profile** -- Profile to build on (Optional)
Returns List of IPSec policy

salt.modules.neutron.list_l3_agent_hosting_routers(*router, profile=None*)
List L3 agents hosting a router.

CLI Example:
salt '*' neutron.list_l3_agent_hosting_routers router

:param router: router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

salt.modules.neutron.list_networks(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of network

salt.modules.neutron.list_ports(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of port

salt.modules.neutron.list_quotas(profile=None)
Fetches all tenants quotas

CLI Example:

salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of quotas

salt.modules.neutron.list_routers(profile=None)
Fetches a list of all routers for a tenant

CLI Example:

salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of router

salt.modules.neutron.list_security_group_rules(profile=None)
Fetches a list of all security group rules for a tenant

CLI Example:

salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1

Parameters profile -- Profile to build on (Optional)
Returns List of security group rule
salt.modules.neutron.list_security_groups(profile=None)
Fetches a list of all security groups for a tenant

CLI Example:
```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of security group

salt.modules.neutron.list_subnets(profile=None)
Fetches a list of all networks for a tenant

CLI Example:
```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of subnet

salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)
Fetches a list of all configured VPN services for a tenant

CLI Example:
```
salt '*' neutron.list_vpnservices
```

Parameters
- **retrieve_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

Returns List of VPN service

salt.modules.neutron.remove_gateway_router(router, profile=None)
Removes an external network gateway from the specified router

CLI Example:
```
salt '*' neutron.remove_gateway_router router-name
```

Parameters
- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.remove_interface_router(router, subnet, profile=None)
Removes an internal network interface from the specified router

CLI Example:
```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters
- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False
salt.modules.neutron.show_firewall(firewall, profile=None)
    Fetches information of a specific firewall rule
    CLI Example:
    ```
salt '*' neutron.show_firewall firewall
    ```
    Parameters
    - **firewall** -- ID or name of firewall to look up
    - **profile** -- Profile to build on (Optional)
    Returns firewall information

salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
    Fetches information of a specific firewall rule
    CLI Example:
    ```
salt '*' neutron.show_firewall_rule firewall-rule-name
    ```
    Parameters
    - **ipsecpolicy** -- ID or name of firewall rule to look up
    - **profile** -- Profile to build on (Optional)
    Returns firewall rule information

salt.modules.neutron.show_floatingip(floatingip_id, profile=None)
    Fetches information of a certain floatingIP
    CLI Example:
    ```
salt '*' neutron.show_floatingip floatingip-id
    ```
    Parameters
    - **floatingip_id** -- ID of floatingIP to look up
    - **profile** -- Profile to build on (Optional)
    Returns Floating IP information

salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)
    Fetches information of a specific IKEPolicy
    CLI Example:
    ```
salt '*' neutron.show_ikepolicy ikepolicy-name
    ```
    Parameters
    - **ikepolicy** -- ID or name of ikepolicy to look up
    - **profile** -- Profile to build on (Optional)
    Returns IKE policy information

salt.modules.neutron.show_ipsec_site_connection(ipsec_site_connection, profile=None)
    Fetches information of a specific IPsecSiteConnection
    CLI Example:
    ```
salt '*' neutron.show_ipsec_site_connection connection-name
    ```
    Parameters
    - **ipsec_site_connection** -- ID or name of ipsec site connection to look up
    - **profile** -- Profile to build on (Optional)
    Returns IPsec site connection information
salt.modules.neutron.show_ipsecpolicy(ipsecpolicy, profile=None)
  Fetches information of a specific IPSecPolicy
  CLI Example:
  ```
  salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
  ```

  Parameters
  - ipsecpolicy -- ID or name of IPSec policy to look up
  - profile -- Profile to build on (Optional)
  Returns IPSec policy information

salt.modules.neutron.show_network(network, profile=None)
  Fetches information of a certain network
  CLI Example:
  ```
  salt '*' neutron.show_network network-name
  salt '*' neutron.show_network network-name profile=openstack1
  ```

  Parameters
  - network -- ID or name of network to look up
  - profile -- Profile to build on (Optional)
  Returns Network information

salt.modules.neutron.show_port(port, profile=None)
  Fetches information of a certain port
  CLI Example:
  ```
  salt '*' neutron.show_port port-id
  salt '*' neutron.show_port port-id profile=openstack1
  ```

  Parameters
  - port -- ID or name of port to look up
  - profile -- Profile to build on (Optional)
  Returns Port information

salt.modules.neutron.show_quota(tenant_id, profile=None)
  Fetches information of a certain tenant's quotas
  CLI Example:
  ```
  salt '*' neutron.show_quota tenant-id
  salt '*' neutron.show_quota tenant-id profile=openstack1
  ```

  Parameters
  - tenant_id -- ID of tenant
  - profile -- Profile to build on (Optional)
  Returns Quota information

salt.modules.neutron.show_router(router, profile=None)
  Fetches information of a certain router
  CLI Example:
  ```
  salt '*' neutron.show_router router-name
  ```

  Parameters
  - router -- ID or name of router to look up
• **profile** -- Profile to build on (Optional)

Returns  Router information

salt.modules.neutron.\texttt{show\_security\_group}(\texttt{security\_group}, \texttt{profile=None})

Fetchedes information of a certain security group

CLI Example:

\begin{verbatim}
salt '*' neutron.show_security_group security-group-name
\end{verbatim}

Parameters

• **security\_group** -- ID or name of security group to look up
• **profile** -- Profile to build on (Optional)

Returns  Security group information

salt.modules.neutron.\texttt{show\_security\_group\_rule}(\texttt{security\_group\_rule\_id}, \texttt{profile=None})

Fetchedes information of a certain security group rule

CLI Example:

\begin{verbatim}
salt '*' neutron.show_security_group_rule security-group-rule-id
\end{verbatim}

Parameters

• **security\_group\_rule\_id** -- ID of security group rule to look up
• **profile** -- Profile to build on (Optional)

Returns  Security group rule information

salt.modules.neutron.\texttt{show\_subnet}(\texttt{subnet}, \texttt{profile=None})

Fetchedes information of a certain subnet

CLI Example:

\begin{verbatim}
salt '*' neutron.show_subnet subnet-name
\end{verbatim}

Parameters

• **subnet** -- ID or name of subnet to look up
• **profile** -- Profile to build on (Optional)

Returns  Subnet information

salt.modules.neutron.\texttt{show\_vpnservice}(\texttt{vpnservice}, \texttt{profile=None}, **\texttt{kwargs})

Fetchedes information of a specific VPN service

CLI Example:

\begin{verbatim}
salt '*' neutron.show_vpnservice vpnservice-name
\end{verbatim}

Parameters

• **vpnservice** -- ID or name of vpn service to look up
• **profile** -- Profile to build on (Optional)

Returns  VPN service information

salt.modules.neutron.\texttt{update\_firewall\_rule}(\texttt{firewall\_rule}, \texttt{protocol=None}, \texttt{action=None}, \texttt{name=None}, \texttt{description=None}, \texttt{ip\_version=None}, \texttt{source\_ip\_address=None}, \texttt{destination\_ip\_address=None}, \texttt{source\_port=None}, \texttt{destination\_port=None}, \texttt{shared=None}, \texttt{enabled=None}, \texttt{profile=None})

Update a firewall rule

CLI Example:
salt 'salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL ' action=ACTION name=NAME description=DESCRIPTION ip_version=IP_VERSION source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_ADDRESS source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)

Updates a floatingIP

CLI Example:

```
salt 'salt' neutron.update_floatingip network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated floating IP information

salt.modules.neutron.update_network(network, name, profile=None)

Updates a network

CLI Example:

```
salt 'salt' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns Value of updated network information

salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)

Updates a port

CLI Example:
salt '*' neutron.update_port port-name network-name new-port-name

Parameters

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated port information

salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)

Update a tenant's quota

CLI Example:

dsalt '*' neutron.update_quota tenant-id subnet=40 router=50 network=10 floatingip=30 port=30

Parameters

- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated quota

salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)

Updates a router

CLI Example:

dsalt '*' neutron.update_router router_id name=new-router-name admin_state_up=True

Parameters

- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns Value of updated router information

salt.modules.neutron.update_security_group(security_group, name=None, description=None, profile=None)

Updates a security group

CLI Example:

dsalt '*' neutron.update_security_group security-group-name new-security-group-name
Parameters

- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated security group information

```
salt.modules.neutron.update_subnet(subnet, name, profile=None)
```

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters

- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

Returns Value of updated subnet information

```
salt.modules.neutron.update_vpnservice(vpnservice, desc, profile=None)
```

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

Returns Value of updated VPN service information

21.9.305 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends: shade

Example configuration

```
neutron:
  cloud: default

neutron:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

```
salt.modules.neutronng.compare_changes(obj, **kwargs)
```

Compare two dicts returning only keys that exist in the first dict and are different in the second one

21.9. execution modules
salt.modules.neutronng.get_openstack_cloud(auth=None)
Return an openstack_cloud

salt.modules.neutronng.get_operator_cloud(auth=None)
Return an operator_cloud

salt.modules.neutronng.list_networks(auth=None, **kwargs)
List networks
filters A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks filters={'"tenant_id":
"1dcac318a83b4610b7a7f7ba01465548"'}
```

salt.modules.neutronng.list_subnets(auth=None, **kwargs)
List subnets
filters A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets filters={'"tenant_id":
"1dcac318a83b4610b7a7f7ba01465548"'}
```

salt.modules.neutronng.network_create(auth=None, **kwargs)
Create a network
name Name of the network being created
shared [False] If True, set the network as shared
admin_state_up [True] If True, Set the network administrative state to "up"
external [False] Control whether or not this network is externally accessible
provider An optional Python dictionary of network provider options
project_id The project ID on which this network will be created
CLI Example:

```
salt '*' neutronng.network_create name=network2 shared=True admin_state_up=True external=True
salt '*' neutronng.network_create name=network3 provider={"network_type": "vlan", "segmentation_id": "4010", "physical_network": "provider"} project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.network_delete(auth=None, **kwargs)
Delete a network
name_or_id Name or ID of the network being deleted
CLI Example:

```
salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.network_get(auth=None, **kwargs)
Get a single network
filters A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.network_get name=XLB4
```
salt.modules.neutronng.security_group_create(*auth=None, **kwargs*)

Create a security group. Use security_group_get to create default.

**project_id** The project ID on which this security group will be created.

CLI Example:

```bash
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group" project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.security_group_delete(*auth=None, **kwargs*)

Delete a security group.

**name_or_id** The name or unique ID of the security group.

CLI Example:

```bash
salt '*' neutronng.security_group_delete name_or_id=secgroup1
```

salt.modules.neutronng.security_group_get(*auth=None, **kwargs*)

Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

**filters** A Python dictionary of filter conditions to push down

CLI Example:

```bash
salt '*' neutronng.security_group_get name=1dcac318a83b4610b7a7f7ba01465548
salt '*' neutronng.security_group_get name=default filters='{"tenant_id":"2e778bb64ca64a199eb526b5958d8710"}'
```

salt.modules.neutronng.security_group_rule_create(*auth=None, **kwargs*)

Create a rule in a security group.

**secgroup_name_or_id** The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

**port_range_min** The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

**port_range_max** The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

**protocol** The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

**remote_ip_prefix** The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

**remote_group_id** The remote group ID to be associated with this security group rule.

**direction** Either ingress or egress; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance.

**ethertype** Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules.

**project_id** Specify the project ID this security group will be created on (admin-only)

CLI Example:

```bash
salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup1
```

(continues on next page)
salt '*' neutronng.security_group_rule_create secgroup_name_or_
  →id=secgroup2 port_range_min=8080 port_range_max=8080 direction='egress'
salt '*' neutronng.security_group_rule_create secgroup_name_or_
  →id=0e1d1ce-7296-405e-919d-1c08217be529 protocol=icmp project_
  →id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_rule_delete(auth=None, **kwargs)
Delete a security group
name_or_id The unique ID of the security group rule
CLI Example:
salt '*' neutronng.security_group_rule_delete name_or_
  →id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_update(secgroup=None, auth=None, **kwargs)
Update a security group
secgroup Name, ID or Raw Object of the security group to update
name New name for the security group
description New description for the security group
CLI Example:
salt '*' neutronng.security_group_update secgroup=secgroup1 description="Very secure security group"
salt '*' neutronng.security_group_update secgroup=secgroup1 description="Very secure security group"
  →project_
  →id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.setup_clouds(auth=None)
Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.neutronng.subnet_create(auth=None, **kwargs)
Create a subnet
network_name_or_id The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
cidr The CIDR
ip_version The IP version, which is 4 or 6.
enable_dhcp [False] Set to True if DHCP is enabled and False if disabled
subnet_name The name of the subnet
tenant_id The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.
allocation_pools A list of dictionaries of the start and end addresses for the allocation pools.
gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.
dns_nameservers A list of DNS name servers for the subnet
host_routes A list of host route dictionaries for the subnet
ipv6_ra_mode IPv6 Router Advertisement mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
ipv6_address_mode IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
use_default_subnetpool If True, use the default subnetpool for ip_version to obtain a CIDR. It is required to pass None to the cidr argument when enabling this option.
Salt Documentation, Release 3002.6

CLI Example:
salt '*' neutronng.subnet_create network_name_or_id=network1
subnet_name=subnet1
salt '*' neutronng.subnet_create subnet_name=subnet2
network_name_or_
,→id=network2 enable_dhcp=True
allocation_pools='[{"start": "192.168.
,→199.2",
"end": "192.168.199.254"}]'
,→gateway_ip='192.168.199.1' cidr=192.168.199.0/24
salt '*' neutronng.subnet_create network_name_or_id=network1
,→name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'

subnet_

salt.modules.neutronng.subnet_delete(auth=None, **kwargs)
Delete a subnet
name Name or ID of the subnet to update
CLI Example:
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete
name=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.subnet_get(auth=None, **kwargs)
Get a single subnet
filters A Python dictionary of filter conditions to push down
CLI Example:
salt '*' neutronng.subnet_get name=subnet1

salt.modules.neutronng.subnet_update(auth=None, **kwargs)
Update a subnet
name_or_id Name or ID of the subnet to update
subnet_name The new name of the subnet
enable_dhcp Set to True if DHCP is enabled and False if disabled
gateway_ip The gateway IP address. When you specify both allocation_pools and gateway_ip, you must
ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed
with gateway_ip.
allocation_pools A list of dictionaries of the start and end addresses for the allocation pools.
dns_nameservers A list of DNS name servers for the subnet
host_routes A list of host route dictionaries for the subnet
salt '*' neutronng.subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng.subnet_update name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.
,→7"]'

21.9.306 salt.modules.nexus module
Module for fetching artifacts from Nexus 3.x
New in version 2018.3.0.
salt.modules.nexus.get_latest_release(nexus_url, repository, group_id, artifact_id, packaging,
target_dir='/tmp', target_file=None, classifier=None,
username=None, password=None)
Gets the latest release of the artifact
nexus_url URL of nexus instance
21.9. execution modules

2391


repository  Release repository in nexus to retrieve artifact from, for example: libs-releases

group_id  Group Id of the artifact

artifact_id  Artifact Id of the artifact

packaging  Packaging type (jar,war,ear,etc)

target_dir  Target directory to download artifact to (default: /tmp)

target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier  Artifcat classifier name (ex: sources,javadoc,etc). Optional parameter.

username  nexus username. Optional parameter.

password  nexus password. Optional parameter.

salt.modules.nexus.get_latest_snapshot(nexus_url, repository, group_id, artifact_id, packaging, target_dir=None, target_file=None, classifier=None, username=None, password=None)

Gets latest snapshot of the given artifact

nexus_url  URL of nexus instance

repository  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

group_id  Group Id of the artifact

artifact_id  Artifact Id of the artifact

packaging  Packaging type (jar,war,ear,etc)

target_dir  Target directory to download artifact to (default: /tmp)

target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

username  nexus username. Optional parameter.

password  nexus password. Optional parameter.

salt.modules.nexus.get_release(nexus_url, repository, group_id, artifact_id, packaging, version, target_dir=None, target_file=None, classifier=None, username=None, password=None)

Gets the specified release of the artifact

nexus_url  URL of nexus instance

repository  Release repository in nexus to retrieve artifact from, for example: libs-releases

group_id  Group Id of the artifact

artifact_id  Artifact Id of the artifact

packaging  Packaging type (jar,war,ear,etc)

version  Version of the artifact

target_dir  Target directory to download artifact to (default: /tmp)

target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

username  nexus username. Optional parameter.

password  nexus password. Optional parameter.

salt.modules.nexus.get_snapshot(nexus_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir=None, target_file=None, classifier=None, username=None, password=None)

Gets snapshot of the desired version of the artifact

nexus_url  URL of nexus instance

repository  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

group_id  Group Id of the artifact

artifact_id  Artifact Id of the artifact

packaging  Packaging type (jar,war,ear,etc)

version  Version of the artifact

target_dir  Target directory to download artifact to (default: /tmp)

target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier  Artifcat classifier name (ex: sources,javadoc,etc). Optional parameter.
username  nexus username. Optional parameter.
password  nexus password. Optional parameter.

```
salt.modules.nexus.get_snapshot_version_string(nexus_url, repository, group_id, artifact_id, packaging, version, classifier=None, username=None, password=None)
```

Gets the specific version string of a snapshot of the desired version of the artifact

- `nexus_url`  URL of nexus instance
- `repository`  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
- `group_id`  Group Id of the artifact
- `artifact_id`  Artifact Id of the artifact
- `packaging`  Packaging type (jar,war,ear,etc)
- `version`  Version of the artifact
- `classifier`  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
- `username`  nexus username. Optional parameter.
- `password`  nexus password. Optional parameter.

```
exception  salt.modules.nexus.nexusError(value)
```

21.9.307  salt.modules.nfs3

Module for managing NFS version 3.

```
salt.modules.nfs3.add_export(exports='/etc/exports', path=None, hosts=None, options=None)
```

Add an export

CLI Example:

```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```

```
salt.modules.nfs3.del_export(exports='/etc/exports', path=None)
```

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

```
salt.modules.nfs3.listExports(exports='/etc/exports')
```

List configured exports

CLI Example:

```
salt '*' nfs3.list_exports
```

```
salt.modules.nfs3.reloadExports()
```

Trigger a reload of the exports file to apply changes

CLI Example:

```
salt '*' nfs3.reload_exports
```
21.9.308 salt.modules.nftables

Support for nftables

salt.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table & chain.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```python
salt '*' nftables.append filter input
    rule='tcp dport 22 log accept'
```

IPv6:

```python
salt '*' nftables.append filter input
    rule='tcp dport 22 log accept'
    family=ipv6
```

salt.modules.nftables.build_rule(table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs)

Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.
If full is True, then table, chain and command are required. command may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.
If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full is True.
If connstate is passed in, it will automatically be changed to state.

CLI Examples:

```python
salt '*' nftables.build_rule match=state
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3
    full=True match=state state=related,established jump=accept
```

IPv6:

```python
salt '*' nftables.build_rule match=state
    connstate=related,established jump=accept
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3
    full=True match=state state=related,established jump=accept
    family=ipv6
```

salt.modules.nftables.check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```python
salt '*' nftables.check filter input
    rule='tcp dport 22 log accept'
```

IPv6:

```python
salt '*' nftables.check filter input
```

(continues on next page)
salt.modules.nftables.check_chain( table='filter', chain=None, family='ipv4' )

New in version 2014.7.0.
Check for the existence of a chain in the table

CLI Example:

```python
salt '*' nftables.check_chain filter input
IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

salt.modules.nftables.check_table( table=None, family='ipv4' )

Check for the existence of a table

CLI Example:

```python
salt '*' nftables.check_table nat
```

salt.modules.nftables.delete( table, chain=None, position=None, rule=None, family='ipv4' )

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```python
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6
salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.delete_chain( table='filter', chain=None, family='ipv4' )

New in version 2014.7.0.
Delete the chain from the specified table.

CLI Example:

```python
salt '*' nftables.delete_chain filter input
salt '*' nftables.delete_chain filter foo
IPv6:
salt '*' nftables.delete_chain filter input family=ipv6
salt '*' nftables.delete_chain filter foo family=ipv6
```
**salt.modules.nftables.delete_table** *(table, family='ipv4')*

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter
IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

**salt.modules.nftables.flush** *(table='filter', chain='', family='ipv4')*

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

**salt.modules.nftables.get_policy** *(table='filter', chain=None, family='ipv4')*

New in version 3002.

Return the current policy for the specified table/chain

- **table**: Name of the table containing the chain to check
- **chain**: Name of the chain to get the policy for
- **family**: Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_policy filter input
IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```

**salt.modules.nftables.get_rule_handle** *(table='filter', chain=None, rule=None, family='ipv4')*

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept' \ 
    family=ipv6
```

**salt.modules.nftables.get_rules** *(family='ipv4')*

Return a data structure of the current, in-memory rules

CLI Example:
salt 'salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6

salt.modules.nftables.get_rules_json(family='ipv4')
New in version 3002.
Return a list of dictionaries comprising the current, in-memory rules
family Networking family, either ipv4 or ipv6
CLI Example:
salt '*' nftables.get_rules_json
salt '*' nftables.get_rules_json family=ipv6

salt.modules.nftables.get_saved_rules(conf_file=None)
Return a data structure of the rules in the conf file
CLI Example:
salt '*' nftables.get_saved_rules

salt.modules.nftables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
Insert a rule into the specified table & chain, at the specified position.
If position is not specified, rule will be inserted in first position.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to
force users to adapt to a new method of creating rules would be irritating at best, and we already have
a parser that can handle it.
CLI Examples:
salt '*' nftables.insert filter input \
   rule='tcp dport 22 log accept'
salt '*' nftables.insert filter input position=3 \
   rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.insert filter input \
   rule='tcp dport 22 log accept' \
   family=ipv6
salt '*' nftables.insert filter input position=3 \
   rule='tcp dport 22 log accept' \
   family=ipv6

salt.modules.nftables.list_tables(family='ipv4')
Return a data structure of the current, in-memory tables
CLI Example:
salt '*' nftables.list_tables
salt '*' nftables.list_tables family=ipv6

salt.modules.nftables.new_chain(table='filter', chain=None, table_type=None, hook=None, priority=None, family='ipv4')
New in version 2014.7.0.
Create new chain to the specified table.

CLI Example:

```bash
salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo
IPv6:
salt '*' nftables.new_chain filter input family=ipv6
salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0 family=ipv6
salt '*' nftables.new_chain filter foo family=ipv6
```

**salt.modules.nftables.new_table** *(table, family='ipv4')*

New in version 2014.7.0.

Create new custom table.

CLI Example:

```bash
salt '*' nftables.new_table filter
IPv6:
salt '*' nftables.new_table filter family=ipv6
```

**salt.modules.nftables.save** *(filename=None, family='ipv4')*

Changed in version 3002.

Save the current in-memory rules to disk. On systems where /etc/nftables is a directory, a file named salt-all-in-one.nft will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:

```bash
salt '*' nftables.save /etc/nftables
```

**salt.modules.nftables.set_policy** *(table='filter', chain=None, policy=None, family='ipv4')*

New in version 3002.

Set the current policy for the specified table/chain. This only works on chains with an existing base chain.

- **table** Name of the table containing the chain to modify
- **chain** Name of the chain to set the policy for
- **policy** accept or drop
- **family** Networking family, either ipv4 or ipv6

CLI Example:

```bash
salt '*' nftables.set_policy filter input accept
IPv6:
salt '*' nftables.set_policy filter input accept family=ipv6
```

**salt.modules.nftables.version()**

Return version from nftables --version

CLI Example:
21.9.309 salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()
    Return server and build arguments
    CLI Example:
    
    salt '*' nginx.build_info

salt.modules.nginx.configtest()
    test configuration and exit
    CLI Example:
    
    salt '*' nginx.configtest

salt.modules.nginx.signal(signal=None)
    Signals nginx to start, reload, reopen or stop.
    CLI Example:
    
    salt '*' nginx.signal reload

salt.modules.nginx.status(url='http://127.0.0.1/status')
    Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule
    url The URL of the status page. Defaults to 'http://127.0.0.1/status'
    CLI Example:
    
    salt '*' nginx.status

salt.modules.nginx.version()
    Return server version from nginx -v
    CLI Example:
    
    salt '*' nginx.version

21.9.310 salt.modules.nilrt_ip module

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)
    Apply global network configuration.
    CLI Example:
    
    salt '*' ip.apply_network_settings

salt.modules.nilrt_ip.build_interface(iface, iface_type, enabled, **settings)
    Build an interface script for a network interface.
    CLI Example:
salt '*>* ip.build_interface eth0 eth <settings>

salt.modules.nilrt_ip.build_network_settings(**settings)
   Build the global network script.
   CLI Example:
   salt '*>* ip.build_network_settings <settings>

salt.modules.nilrt_ip.disable(interface)
   Disable the specified interface
   Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
   Parameters interface (str) -- interface label
   Returns True if the service was disabled, otherwise an exception will be thrown.
   Return type bool
   CLI Example:
   salt '*>* ip.disable interface-label

salt.modules.nilrt_ip.down(interface, iface_type=None)
   Disable the specified interface
   Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
   Parameters interface (str) -- interface label
   Returns True if the service was disabled, otherwise an exception will be thrown.
   Return type bool
   CLI Example:
   salt '*>* ip.down interface-label

salt.modules.nilrt_ip.enable(interface)
   Enable the specified interface
   Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
   Parameters interface (str) -- interface label
   Returns True if the service was enabled, otherwise an exception will be thrown.
   Return type bool
   CLI Example:
   salt '*>* ip.enable interface-label

salt.modules.nilrt_ip.get_interface(iface)
   Returns details about given interface.
   CLI Example:
   salt '*>* ip.get_interface eth0

salt.modules.nilrt_ip.get_interfaces_details()
   Get details about all the interfaces on the minion
   Returns information about all interfaces omitting loopback
   Return type dictionary
   CLI Example:
   salt '*>* ip.get_interfaces_details
salt.modules.nilrt_ip.get_network_settings()
    Return the contents of the global network script.

    CLI Example:
    ```
salt '*' ip.get_network_settings
    ```

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)
    Configure specified adapter to use DHCP with linklocal fallback
    Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
    Parameters interface (str) -- interface label
    Returns True if the settings were applied, otherwise an exception will be thrown.
    Return type bool
    CLI Example:
    ```
salt '*' ip.set_dhcp_linklocal_all interface-label
    ```

salt.modules.nilrt_ip.set_dhcp_only_all(interface)
    Configure specified adapter to use DHCP only
    Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
    Parameters interface (str) -- interface label
    Returns True if the settings were applied, otherwise an exception will be thrown.
    Return type bool
    CLI Example:
    ```
salt '*' ip.dhcp_only_all interface-label
    ```

salt.modules.nilrt_ip.set_ethercat(interface, master_id)
    Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it
    doesn't already use EtherCAT adapter mode, otherwise will return true.
    Parameters
    - interface -- interface label
    - master_id -- EtherCAT Master ID
    Returns True if the settings were applied, otherwise an exception will be thrown.
    CLI Example:
    ```
salt '*' ip.set_ethercat interface-label master-id
    ```

salt.modules.nilrt_ip.set_linklocal_only_all(interface)
    Configure specified adapter to use linklocal only
    Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
    Parameters interface (str) -- interface label
    Returns True if the settings were applied, otherwise an exception will be thrown.
    Return type bool
    CLI Example:
    ```
salt '*' ip.linklocal_only_all interface-label
    ```

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, name-
    servers=None)
    Configure specified adapter to use ipv4 manual settings
    Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
    Parameters
    - interface (str) -- interface label
• **address** *(str)* -- ipv4 address
• **netmask** *(str)* -- ipv4 netmask
• **gateway** *(str)* -- ipv4 gateway
• **nameservers** *(str)* -- list of nameservers servers separated by spaces (Optional)

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** bool

**CLI Example:**
```
salt '*' ip.set_static_all interface-label address netmask gateway nameservers
```

### salt.modules.nilrt_ip.up*(interface, iface_type=None)*

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**
- **interface** *(str)* -- interface label

**Returns** True if the service was enabled, otherwise an exception will be thrown.

**Return type** bool

**CLI Example:**
```
salt '*' ip.up interface-label
```

## 21.9.311 salt.modules.nix

**Work with Nix packages**

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under $HOME/.nix-profile/, and the nix store, unless specially set up, should be in /nix. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a pkg module, but explicitly as nix.*.

For more information on nix, see the nix documentation.

**salt.modules.nix.collect_garbage**

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

**Returns** How much space was freed and how many derivations were removed

**Return type** str

**Warning:** This is a destructive action on the nix store.
```
salt '*' nix.collect_garbage
```

**salt.modules.nix.install** *(pkgs, **kwargs)*

Installs a single or multiple packages via nix

**Parameters**
- **pkgs** *(list(str))* -- packages to update
- **attributes** *(bool)* -- Pass the list of packages or single package as attributes, not package names. default: False

**Returns** Installed packages. Example element: gcc-3.3.2

**Return type** list(str)
```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

salt.modules.nix.list_pkgs( `installed=True, attributes=True`)  
Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

Parameters

- **installed** *(bool)* -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** *(bool)* -- show the attributes of the packages when listing all packages. Default: True

Returns Packages installed or available, along with their attributes.

Return type *list(list(str))*

```
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

salt.modules.nix.uninstall(`pkgs`)  
Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

Parameters

- **pkgs** *(list(str))* -- List, single package to uninstall

Returns Packages that have been uninstalled

Return type *list(str)*

```
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

salt.modules.nix.upgrade(`pkgs`)  
Runs an update operation on the specified packages, or all packages if none is specified.

Parameters

- **pkgs** *(list(str))* -- List of packages to update

Returns The upgraded packages. Example element: 

```
['libxslt-1.1.0', 'libxslt-1.1.10']
```

Return type *list(tuple(str, str))*

```
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

### 21.9.312 salt.modules.nova

Module for handling OpenStack Nova calls

depends

- novaclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:
With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

**Note:** This is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

```
salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)
```

Boot (create) a new instance

- **name** Name of the new instance (must be first)
- **flavor_id** Unique integer ID for the flavor
- **image_id** Unique integer ID for the image
- **timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from `nova.flavor_list` and `nova.image_list`
salt.modules.nova.delete(instance_id, profile=None)
    Delete an instance
    instance_id  ID of the instance to be deleted
    CLI Example:
    ```
salt '*' nova.delete 1138
    ```

salt.modules.nova.flavor_create(name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None)
    Add a flavor to nova (nova flavor-create). The following parameters are required:
    name  Name of the new flavor (must be first)
    flavor_id  Unique integer ID for the new flavor
    ram  Memory size in MB
    disk  Disk size in GB
    vcpus  Number of vcpus
    CLI Example:
    ```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
    ```

salt.modules.nova.flavor_delete(flavor_id, profile=None)
    Delete a flavor from nova by id (nova flavor-delete)
    CLI Example:
    ```
salt '*' nova.flavor_delete 7
    ```

salt.modules.nova.flavor_list(profile=None)
    Return a list of available flavors (nova flavor-list)
    CLI Example:
    ```
salt '*' nova.flavor_list
    ```

salt.modules.nova.image_list(name=None, profile=None)
    Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image
    will be displayed.
    CLI Examples:
    ```
salt '*' nova.image_list
salt '*' nova.image_list myimage
    ```

salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
    Delete a key=value pair from the metadata for an image (nova image-meta set)
    CLI Examples:
    ```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
    ```

salt.modules.nova.image_meta_set(image_id=None, name=None, **kwargs)
    Sets a key=value pair in the metadata for an image (nova image-meta set)
    CLI Examples:
    ```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
    ```

salt.modules.nova.keypair_add(name, pubfile=None, pubkey=None, profile=None)
    Add a keypair to nova (nova keypair-add)
CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

salt.modules.nova.keypair_delete(name, profile=None)
Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

salt.modules.nova.keypair_list(profile=None)
Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

salt.modules.nova.list_(profile=None)
To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

salt.modules.nova.lock(instance_id, profile=None)
Lock an instance

instance_id ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

salt.modules.nova.resume(instance_id, profile=None)
Resume an instance

instance_id ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

salt.modules.nova.secgroup_create(name, description, profile=None)
Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

salt.modules.nova.secgroup_delete(name, profile=None)
Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

salt.modules.nova.secgroup_list(profile=None)
Return a list of available security groups (nova items-list)

CLI Example:
salt '***' nova.secgroup_list

salt.modules.nova.server_by_name(name, profile=None)
    Return information about a server
    name  Server Name
    CLI Example:
    salt '***' nova.server_by_name myserver profile=openstack

salt.modules.nova.server_list(profile=None)
    Return list of active servers
    CLI Example:
    salt '***' nova.server_list

salt.modules.nova.server_list_detailed(profile=None)
    Return detailed list of active servers
    CLI Example:
    salt '***' nova.server_list_detailed

salt.modules.nova.server_show(server_id, profile=None)
    Return detailed information for an active server
    CLI Example:
    salt '***' nova.server_show <server_id>

salt.modules.nova.show(server_id, profile=None)
    To maintain the feel of the nova command line, this function simply calls the server_show function.
    CLI Example:
    salt '***' nova.show

salt.modules.nova.suspend(instance_id, profile=None)
    Suspend an instance
    instance_id  ID of the instance to be suspended
    CLI Example:
    salt '***' nova.suspend 1138

salt.modules.nova.volume_attach(name, server_name, device='/dev/xvdb', profile=None, timeout=300)
    Attach a block storage volume
    name  Name of the new volume to attach
    server_name  Name of the server to attach to
    device  Name of the device on the server
    profile  Profile to build on
    CLI Example:
    salt '***' nova.volume_attach myblock slice.example.com profile=openstack
    salt '***' nova.volume_attach myblock server.example.com device='/dev/xvdb'
    → profile=openstack
salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)
Create a block storage volume
name Name of the new volume (must be first)
size Volume size
snapshot Block storage snapshot id
voltype Type of storage
profile Profile to build on

CLI Example:
salt '*' nova.volume_create myblock size=300 profile=openstack

salt.modules.nova.volume_delete(name, profile=None)
Destroy the volume
name Name of the volume
profile Profile to build on

CLI Example:
salt '*' nova.volume_delete myblock profile=openstack

salt.modules.nova.volume_detach(name, profile=None, timeout=300)
Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to detach from
profile Profile to build on

CLI Example:
salt '*' nova.volume_detach myblock profile=openstack

salt.modules.nova.volume_list(search_opts=None, profile=None)
List storage volumes
search_opts Dictionary of search options
profile Profile to use

CLI Example:
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'}\[→profile=openstack

salt.modules.nova.volume_show(name, profile=None)
Create a block storage volume
name Name of the volume
profile Profile to use

CLI Example:
salt '*' nova.volume_show myblock profile=openstack
21.9.313  salt.modules.npm

Manage and query NPM packages.

salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)

Clean cached NPM packages.

- path: The cache subpath to delete, or None to clear the entire cache
- runas: The user to run NPM with
- env: Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.
- force: Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

salt.modules.npm.cache_list(path=None, runas=None, env=None)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

- path: The cache subpath to list, or None to list the entire cache
- runas: The user to run NPM with
- env: Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

salt.modules.npm.cache_path(runas=None, env=None)

List path of the NPM cache directory.

- runas: The user to run NPM with
- env: Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' npm.cache_path
```

salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

- pkg: A package name in any format accepted by NPM, including a version identifier
- pkgs: A list of package names in the same format as the name parameter
- dir: The target directory in which to install the package, or None for global installation
- runas: The user to run NPM with
- registry: The NPM registry to install the package from.

New in version 2014.7.0.

- env: Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

New in version 2014.7.0.
silent  Whether or not to run NPM install with --silent flag.
    New in version 2016.3.0.

dry_run  Whether or not to run NPM install with --dry-run flag.
    New in version 2015.8.4.
silent  Whether or not to run NPM install with --silent flag.
    New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

```
salt.modules.npm.list_(pkg=None, dir=None, runas=None, env=None, depth=None)
List installed NPM packages.
    If no directory is specified, this will return the list of globally- installed packages.
    pkg  Limit package listing by name
    dir  The directory whose packages will be listed, or None for global installation
    runas  The user to run NPM with
        New in version 2014.7.0.
    env  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.
        New in version 2014.7.0.
    depth  Limit the depth of the packages listed
        New in version 2016.11.6,2017.7.0.

CLI Example:

```
salt '*' npm.list
```

```
salt.modules.npm.uninstall(pkg, dir=None, runas=None, env=None)
Uninstall an NPM package.
    If no directory is specified, the package will be uninstalled globally.
    pkg  A package name in any format accepted by NPM
    dir  The target directory from which to uninstall the package, or None for global installation
    runas  The user to run NPM with
    env  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.
        New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```
21.9.314 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in /var/lib/machines, while those running systemd < 219 will place them in /var/lib/container.

salt.modules.nspawn.bootstrap_container(name, dist=None, version=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

salt myminion nspawn.bootstrap_container <name>

salt.modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

salt '*' nspawn.bootstrap_salt arch1

salt.modules.nspawn.copy_to(name, source, dest, overwrite=False, makedirs=False)

Copy a file from the host into a container

name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.

CLI Example:

salt 'minion' nspawn.copy_to /tmp/foo /root/foo

salt.modules.nspawn.disable(name)

Set the named container to not be launched at boot

CLI Example:

salt myminion nspawn.enable <name>

salt.modules.nspawn.enable(name)

Set the named container to be launched at boot

CLI Example:

salt myminion nspawn.enable <name>
salt.modules.nspawn.exists(name)
   Returns true if the named container exists

   CLI Example:
   
   
   salt myminion nspawn.exists <name>

salt.modules.nspawn.info(name, **kwargs)
   Return info about a container

   Note: The container must be running for machinectl to gather information about it. If the container is stopped, then this function will start it.

   start [False] If True, then the container will be started to retrieve the info. A Started key will be in the return data if the container was started.

   CLI Example:
   
   
   salt myminion nspawn.info arch1
   salt myminion nspawn.info arch1 force_start=False

salt.modules.nspawn.list_all()
   Lists all nspawn containers

   CLI Example:
   
   
   salt myminion nspawn.list_all

salt.modules.nspawn.list_running()
   Lists running nspawn containers

   Note: nspawn.list also works to list running containers

   CLI Example:
   
   
   salt myminion nspawn.list_running
   salt myminion nspawn.list

salt.modules.nspawn.list_stopped()
   Lists stopped nspawn containers

   CLI Example:
   
   
   salt myminion nspawn.list_stopped

salt.modules.nspawn.pid(name)
   Returns the PID of a container
   name Container name

   CLI Example:
   
   
   salt myminion nspawn.pid arch1

salt.modules.nspawn.poweroff(name)
   Issue a clean shutdown to the container. Equivalent to running machinectl poweroff on the named container.
For convenience, running `nspawn.stop` (as shown in the CLI examples below) is equivalent to running `nspawn.poweroff`.

Note: `machinectl poweroff` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:
```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

`salt.modules.nspawn.pull_dkr(url, name, index)`
Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

Note: Requires systemd >= 219

```
url URL from which to download the container
name Name for the new container
index URL of the Docker index server from which to pull (must be an http:// or https:// URL).
```

CLI Examples:
```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

`salt.modules.nspawn.pull_raw(url, name, verify=False)`
Execute a `machinectl pull-raw` to download a `.qcow2` or raw disk image, and add it to `/var/lib/machines` as a new container.

Note: Requires systemd >= 219

```
url URL from which to download the container
name Name for the new container
verify [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.
```

CLI Examples:
```
```

`salt.modules.nspawn.pull_tar(url, name, verify=False)`
Execute a `machinectl pull-raw` to download a `.tar` container image, and add it to `/var/lib/machines` as a new container.

Note: Requires systemd >= 219

```
url URL from which to download the container
```
name  Name for the new container
verify  [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man
        page (section titled "Image Transfer Commands") for more information on requirements for image ver-
        ification. To perform signature verification, use `verify=signature`. For checksum verification, use
        `verify=checksum`. By default, no verification will be performed.

        CLI Examples:
        
        →.01.tar.gz arch2

salt.modules.nspawn.reboot(name, kill=False)
        Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot`
        on the named container.
        
        For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running
        `nspawn.reboot`.
        
        Note: `machinectl reboot` is only supported in systemd >= 219. On earlier systemd versions, running
        this function will instead restart the container via `systemctl`.

        CLI Examples:
        
        salt myminion nspawn.reboot arch1
        salt myminion nspawn.restart arch1

salt.modules.nspawn.remove(name, stop=False)
        Remove the named container
        
        Warning: This function will remove all data associated with the container. It will not, however, remove
        the btrfs subvolumes created by pulling container images (`nspawn.pull_raw, nspawn.pull_tar,`
        `nspawn.pull_dkr`).

stop  [False] If True, the container will be destroyed even if it is running/frozen.

        CLI Examples:
        
        salt '*' nspawn.remove foo
        salt '*' nspawn.remove foo stop=True

salt.modules.nspawn.retcode(name, cmd, no_start=False, preserve_state=True, stdin=None,
        python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
        Run `cmd.retcode` within a container
        name  Name of the container in which to run the command
        cmd  Command to run
        no_start  [False] If the container is not running, don't start it
        preserve_state  [True] After running the command, return the container to its previous state
        stdin  [None] Standard input to be used for the command
        output_loglevel  [debug] Level at which to log the output from the command. Set to quiet to suppress
        logging.
        use_vt  [False] Use SaltStack's `utils.vt` to stream output to console. Assumes output=all.
        keep_env  [None] If not passed, only a sane default PATH environment variable will be set. If True, all
        environment variables from the container's host will be kept. Otherwise, a comma-separated list (or
Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion nspawn.retcodemycontainer 'ip addr show '
```

salt.modules.nspawn.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no_start** [False] If the container is not running, don’t start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion nspawn.run mycontainer 'ifconfig -a' 
```

salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run_all` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no_start** [False] If the container is not running, don’t start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use_vt** [False] Use SaltStack’s `utils.vt` to stream output to console. Assumes `output=all`.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```bash
salt myminion nspawn.run_all mycontainer 'ip addr show' 
```

salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run_stderr` within a container
**name** Name of the container in which to run the command

**cmd** Command to run

**no_start** [False] If the container is not running, don't start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt** [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

python

```python
salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stdout` within a container

**name** Name of the container in which to run the command

**cmd** Command to run

**no_start** [False] If the container is not running, don't start it

**preserve_state** [True] After running the command, return the container to its previous state

**stdin** [None] Standard input to be used for the command

**output_loglevel** [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt** [False] Use SaltStack's utils.vt to stream output to console. Assumes output=all.

**keep_env** [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

python

```python
salt.modules.nspawn.start(name)
```

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

python

```python
salt.modules.nspawn.state(name)
```

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

python

```python
salt.modules.nspawn.terminate(name)
```

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

---

2416 Chapter 21. Salt Module Reference
Note: `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 21.9.315 salt.modules.nxos module

Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

This module supports execution using a Proxy Minion or Native Minion: 1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details. 2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

```
maturity new
platform nxos
```

Note: To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Native minion configuration options:

```
xnos:
  cookie: 'username'
  save_config: False
```

**cookie** Use the option to override the default cookie `admin:local` when connecting over UDS and use `username:local` instead. This is needed when running the salt-minion in the GuestShell using a non-admin user.

This option is ignored for SSH and NX-API Proxy minions.

**save_config** If True, `'copy running-config starting-config` is issues for every configuration command. If False, Running config is not saved to startup config. Default: True

The recommended approach is to use the `save_running_config` function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.
The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```bash
salt-call --local nxos.show 'show lldp neighbors' raw_text
```

**Note:** The functions in this module should be executed like so:

```
salt '*' nxos.<function> salt '*' nxos.get_user username=admin
```

For backwards compatibility, the following syntax will be supported until the 3001 release.

```
salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin
```

```python
salt.modules.nxos.add_config(lines, **kwargs)
Add one or more config lines to the NX-OS device running config.
lines Configuration lines to add
save_config If False, don't save configuration commands to startup configuration. If True, save configuration
to startup configuration. Default: True
```

```bash
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group network-operator'
```

**Note:** For more than one config added per command, lines should be a list.

```python
salt.modules.nxos.check_password(username, password, encrypted=False, **kwargs)
Verify user password.
username Username on which to perform password check
password Password to check
encrypted Whether or not the password is encrypted Default: False
```

```python
salt.modules.nxos.check_role(username, role, **kwargs)
Verify role assignment for user.
```

```
salt '*' nxos.check_role username=admin role=network-admin
```

```python
salt.modules.nxos.cmd(command, *args, **kwargs)
NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using
either of the following syntactic forms.
```

```
salt '*' nxos.cmd <function>
```

```
salt '*' nxos.<function>
command function from salt.modules.nxos to run
args positional args to pass to command function
kwargs key word arguments to pass to command function
```

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi$blahblahblah'
enctype=True
```

```python
salt.modules.nxos.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
Configures the Nexus switch with the specified commands.
```
This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly to the running-config.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

**template_engine:** jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**save_config** If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

**CLI Example:**

```plaintext
salt '*' nxos.config commands=\"[\'spanning-tree mode mstp\']\"
salt '*' nxos.config config_file=salt://config.txt
nenxos.config config_file=https://bit.ly/2LGLcDy context=\"\{\'servers\': [1.2.3.4]\}\"
```

salt.modules.nxos.delete_config(lines, **kwargs)
Delete one or more config lines to the switch running config.

**lines** Configuration lines to remove.

**save_config** If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

**CLI Example:**

```plaintext
salt '*' nxos.delete_config \'snmp-server community TESTSTRINGHERE group network-operator\'
```

**Note:** For more than one config deleted per command, lines should be a list.

salt.modules.nxos.find(pattern, **kwargs)
Find all instances where the pattern is in the running configuration.

```plaintext
salt '*' nxos.find \'^snmp-server.*$\'
```

**Note:** This uses the re.MULTILINE regex format for python, and runs the regex against the whole show_run
salt.modules.nxos.get_roles(username, **kwargs)
    Get roles assigned to a username.

salt.modules.nxos.get_user(username, **kwargs)
    Get username line from switch.

class modules.nxos.grains(**kwargs)
    Get grains for minion.

class modules.nxos.grains_refresh(**kwargs)
    Refresh the grains for the NX-OS device.

class modules.nxos.ping(**kwargs)
    Ping the device on the other end of the connection.

class modules.nxos.remove_user(username, **kwargs)
    Remove user from switch.
    username Username to remove
    save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

    salt '*' nxos.remove_user username=daniel

class modules.nxos.replace(old_value, new_value, full_match=False, **kwargs)
    Replace string or full line matches in switch's running config.
    If full_match is set to True, then the whole line will need to be matched as part of the old value.

    salt '*' nxos.replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'

class modules.nxos.save_running_config(**kwargs)
    Save the running configuration to startup configuration.

    salt '*' nxos.save_running_config

class modules.nxos.sendline(command, method='cli_show_ascii', **kwargs)
    Send arbitrary commands to the NX-OS device.
    command The command or list of commands to be sent. ['cmd1', 'cmd2'] is converted to 'cmd1 ; cmd2'.
    method: cli_show_ascii: Return raw test or unstructured output. cli_show: Return structured output. cli_conf: Send configuration commands to the device. Defaults to cli_show_ascii. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.
    error_pattern Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

class modules.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256', **kwargs)
    Set users password on switch.
    username Username to configure
    password Password to configure for username
    encrypted Whether or not to encrypt the password Default: False
    role Configure role for the username Default: None
    crypt_salt Configure crypt_salt setting Default: None
    algorithm Encryption algorithm Default: sha256
    save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True
salt.modules.nxos.set_password admin TestPass
salt 'nxos.set_password admin \n  password='\$5fWwQ3nfO0d.gAPHgs3SOBYYdGT3E.A' \n  encrypted=True

salt.modules.nxos.set_role(username, role, **kwargs)
Assign role to username.
username Username for role configuration
role Configure role for username
save_config If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

salt 'nxos.set_role username=daniel role=vdc-admin.

salt.modules.nxos.show(commands, raw_text=True, **kwargs)
Execute one or more show (non-configuration) commands.
commands The commands to be executed.
raw_text: True Whether to return raw text or structured data. NOTE: raw_text option is ignored for SSH proxy minion. Data is returned unstructured.
CLI Example:
salt-call --local nxos.show 'show version'
salt 'nxos.show 'show bgp sessions ; show processes' raw_text=False
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com
  →username=test password=test

salt.modules.nxos.show_run(**kwargs)
Shortcut to run show running-config on the NX-OS device.
salt 'nxos.show_run

salt.modules.nxos.show_ver(**kwargs)
Shortcut to run show version on the NX-OS device.
salt 'nxos.show_ver

salt.modules.nxos.system_info(**kwargs)
Return system information for grains of the minion.
salt 'nxos.system_info

salt.modules.nxos.unset_role(username, role, **kwargs)
Remove role from username.
username Username for role removal
role Role to remove
save_config If False, don’t save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

salt 'nxos.unset_role username=daniel role=vdc-admin
21.9.316 salt.modules.nxos_api module

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net>

**maturity** new

**platform** any

**Note:** To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

**Note:** NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

**Usage**

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api Proxy` (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** `localhost` The IP address or DNS host name of the connection device.

**username:** `admin` The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.
port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

timeout: 60  Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: True  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

When there is no certificate configuration on the device and this option is set as True (default), the commands will fail with the following error: SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581). In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as False with all the security risks considered.

Example (when not running in a nxos_api Proxy Minion):

```yaml
nxos_api:
  username: test
  password: test
```

In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a nxos_api Proxy, e.g.:

```bash
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt is installed
salt '*' nxos_api.show 'show version' raw_text=False
```

Note: Remember that the above applies only when not running in a nxos_api Proxy Minion. If you want to use the nxos_api Proxy, please follow the documentation notes for a proper setup.

```python
salt.modules.nxos_api.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

`config_file` The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`
commands  The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note:  This argument is ignored when config_file is specified.

template_engine: jinja  The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

context  Variables to add to the template context.

defaults  Default values of the context_dict.

transport: https  Specifies the type of connection transport to use. Valid values for the connection are http, and https.

host: localhost  The IP address or DNS host name of the connection device.

username: admin  The username to pass to the device to authenticate the NX-API connection.

password  The password to pass to the device to authenticate the NX-API connection.

port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

timeout: 60  Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: True  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt '*' nxos_api.config  commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config  config_file=salt://config.txt
salt '*' nxos_api.config  config_file=https://bit.ly/2LGLcDy  context="{'servers': [1.2.3.4]}"
```

salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)

Execute an arbitrary RPC request via the Nexus API.

commands  The commands to be executed.

method: cli  The type of the response, i.e., raw text (cli_ascii) or structured document (cli). Defaults to cli (structured data).

transport: https  Specifies the type of connection transport to use. Valid values for the connection are http, and https.

host: localhost  The IP address or DNS host name of the connection device.

username: admin  The username to pass to the device to authenticate the NX-API connection.

password  The password to pass to the device to authenticate the NX-API connection.

port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

timeout: 60  Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: True  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:

```
salt-call --local nxps_api.rpc 'show version'
```

salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)

Execute one or more show (non-configuration) commands.

commands  The commands to be executed.

raw_text: True  Whether to return raw text or structured data.

transport: https  Specifies the type of connection transport to use. Valid values for the connection are http, and https.

host: localhost  The IP address or DNS host name of the connection device.

username: admin  The username to pass to the device to authenticate the NX-API connection.
**password**  The password to pass to the device to authenticate the NX-API connection.
**port**  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
**timeout:** 60  Time in seconds to wait for the device to respond. Default: 60 seconds.
**verify:** True  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:
```bash
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show 'show bgp sessions' 'show processes' raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com
   --username=test password=test
```

### 21.9.317 salt.modules.nxos_upgrade module

Execution module to upgrade Cisco NX-OS Switches.

New in version xxxx.xx.x.

**This module supports execution using a Proxy Minion or Native Minion:**

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details.
2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the Guest-Shell running on the NX-OS device.

**maturity** new
**platform** nxos
**codeauthor** Michael G Wiebe

**Note:**  To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.
This is not required for NX-API over UDS.

Configuration example:
```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:
```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

salt.modules.nxos_upgrade.check_upgrade_impact(**system_image**, **kickstart_image=**None, **issu=**True, **kwargs**)

Display upgrade impact information without actually upgrading the device.
**system_image** (Mandatory Option)  Path on bootflash: to system image upgrade file.
**kickstart_image**  Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

21.9.  execution modules
**issu**  In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible.

When False: Force (disruptive) Upgrade/Downgrade. Default: True

**timeout**  Timeout in seconds for long running 'install all' impact command. Default: 900

**error_pattern**  Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```python
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

**salt.modules.nxos_upgrade.upgrade**  (system_image, kickstart_image=None, issu=True, **kwargs)

Upgrade NX-OS switch.

**system_image**  *(Mandatory Option)*  Path on bootflash: to system image upgrade file.

**kickstart_image**  Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

**issu**  Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True

**timeout**  Timeout in seconds for long running 'install all' upgrade command. Default: 900

**error_pattern**  Use the option to pass in a regular expression to search for in the output of the 'install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```python
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

### 21.9.318  salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

**depends**  pypureomapi Python module

**salt.modules.omapi.add_host**  *(mac, name=None, ip=None, ddns=False, group=None, super sede_host=False)*

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

**salt.modules.omapi.delete_host**  *(mac=None, name=None)*

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```
21.9.319 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.assign(name, value)
   Assign a single sysctl parameter for this minion
   
   CLI Example:
   
   ```
   salt '*' sysctl.assign net.inet.ip.forwarding 1
   ```

salt.modules.openbsd_sysctl.get(name)
   Return a single sysctl parameter for this minion
   
   CLI Example:
   
   ```
   salt '*' sysctl.get hw.physmem
   ```

salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
   Assign and persist a simple sysctl parameter for this minion
   
   CLI Example:
   
   ```
   salt '*' sysctl.persist net.inet.ip.forwarding 1
   ```

salt.modules.openbsd_sysctl.show(config_file=False)
   Return a list of sysctl parameters for this minion
   
   CLI Example:
   
   ```
   salt '*' sysctl.show
   ```

21.9.320 salt.modules.openbsdpkg

Package support for OpenBSD

**Note:** The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple flavors, and branches which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

- rsync
- vim--no_x11
- ruby%2.3

salt.modules.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)
   Install the passed package
   
   Return a dict containing the new package names and versions:
   
   ```
   {'<package>': {'old': '<old-version>',
                 'new': '<new-version>'}}
   ```

   CLI Example, Install one package:
salt 'x' pkg.install <package name>

CLI Example, Install more than one package:
salt 'x' pkg.install pkgs='["<package name>", "<package name>"]'

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):
salt 'x' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]

salt.modules.openbsdpkg.latest_version('names', **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
salt 'x' pkg.latest_version <package name>

salt.modules.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:

[{'<package_name>': '<version>'}]

CLI Example:
salt 'x' pkg.list_pkgs

salt.modules.openbsdpkg.purge(name=None, pkgs=None, **kwargs)
Remove a package and extra configuration files.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt 'x' pkg.purge <package name>
salt 'x' pkg.purge <package1>,<package2>,<package3>
salt 'x' pkg.purge pkgs='["foo", "bar"]'

salt.modules.openbsdpkg.remove(name=None, pkgs=None, purge=False, **kwargs)
Remove a single package with pkg_delete
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt 'salt '*' pkg.remove <package name>
salt 'salt '*' pkg.remove <package1>,<package2>,<package3>
salt 'salt '*' pkg.remove pkgs=['foo', 'bar']`

salt.modules.openbsdpkg.upgrade(name=None, pkgs=None, **kwargs)
Run a full package upgrade (pkg_add -u), or upgrade a specific package if name or pkgs is provided. name is ignored when pkgs is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```json
{'<package>': {'old': '<old-version>',
                 'new': '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkg.upgrade
salt '*' pkg.upgrade python=2.7
```

salt.modules.openbsdpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

salt.modules.openbsdpkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.321 salt.modules.openbsdrcctl_service.py

The rcctl service module for OpenBSD

salt.modules.openbsdrcctl_service.available(name)
Return True if the named service is available.

CLI Example:

```bash
salt '*' service.available sshd
```

salt.modules.openbsdrcctl_service.disable(name, **kwargs)
Disable the named service to not start at boot.

CLI Example:

```bash
salt '*' service.disable <service name>
```

salt.modules.openbsdrcctl_service.disabled(name)
Return True if the named service is disabled at boot, False otherwise.
CLI Example:

```bash
class OpenBSDRctlService:
    def enable(self, name, **kwargs):
        # Enable the named service to start at boot.
        # flags [None] Set optional flags to run the service with.
        service.flags can be used to change the default flags.

        # CLI Example:
        salt '*' service.enable <service name>
        salt '*' service.enable <service name> flags=<flags>

    def enabled(self, name, **kwargs):
        # Return True if the named service is enabled at boot and the provided flags match the configured ones (if any).
        # Return False otherwise.
        # name Service name

        # CLI Example:
        salt '*' service.enabled <service name>
        salt '*' service.enabled <service name> flags=<flags>

    def get_all(self):
        # Return all installed services.

        # CLI Example:
        salt '*' service.get_all

    def get_disabled(self):
        # Return what services are available but not enabled to start at boot.

        # CLI Example:
        salt '*' service.get_disabled

    def get_enabled(self):
        # Return what services are set to run on boot.

        # CLI Example:
        salt '*' service.get_enabled

    def missing(self, name):
        # The inverse of service.available. Return True if the named service is not available.

        # CLI Example:
        salt '*' service.missing sshd

    def reload_(self, name):
        # Reload the named service.

        # CLI Example:
        salt '*' service.reload <service name>
```
**salt.modules.openbsdrcctl_service.restart***(name)***
Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.openbsdrcctl_service.start***(name)***
Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.openbsdrcctl_service.status***(name, sig=None)***
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

**salt.modules.openbsdrcctl_service.stop***(name)***
Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.322 salt.modules.openbsdservice

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start is not available'), see [here](#).

**salt.modules.openbsdservice.available***(name)***
New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

**salt.modules.openbsdservice.disabled***(name)***
New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

**salt.modules.openbsdservice.enabled***(name, **kwargs)***
New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service name>

salt.modules.openbsdservice.get_all()
New in version 2014.7.0.
Return all available boot services
CLI Example:
salt '*' service.get_all

salt.modules.openbsdservice.get_disabled()
New in version 2014.7.0.
Return a set of services that are installed but disabled
CLI Example:
salt '*' service.get_disabled

salt.modules.openbsdservice.get_enabled()
New in version 2014.7.0.
Return a list of service that are enabled on boot
CLI Example:
salt '*' service.get_enabled

salt.modules.openbsdservice.missing(name)
New in version 2014.7.0.
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
salt '*' service.missing sshd

salt.modules.openbsdservice.reload_(name)
New in version 2014.7.0.
Reload the named service
CLI Example:
salt '*' service.reload <service name>

salt.modules.openbsdservice.restart(name)
Restart the named service
CLI Example:
salt '*' service.restart <service name>

salt.modules.openbsdservice.start(name)
Start the specified service
CLI Example:
service.start <service name>

salt.modules.openbsdservice.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- name (str) -- The name of the service to check
- sig (str) -- Signature to use to find the service via ps

Returns
True if running, False otherwise
dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
salt '*' service.status <service name> [service signature]

service.stop(name)
Stop the specified service

CLI Example:
salt '*' service.stop <service name>

21.9.323 salt.modules.openscap module

Module for OpenSCAP Management

salt.modules.openscap.xccdf(params)
Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

CLI Example:
salt '*' openscap.xccdf "eval --profile Default /usr/share/openscap/scap-yast2sec-xccdf.xml"

21.9.324 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

Maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
Maturity new
Depends
Platform linux

salt.modules.openstack_config.delete(filename, section, parameter)
Delete a value from an OpenStack configuration file.

filename The full path to the configuration file
section The section from which to delete the parameter
parameter The parameter to delete
CLI Example:
```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

```text
salt.modules.openstack_config.get(filename, section, parameter)
Get a value from an OpenStack configuration file.
filename  The full path to the configuration file
section   The section from which to search for the parameter
parameter The parameter to return
```

CLI Example:
```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

```text
salt.modules.openstack_config.set_(filename, section, parameter, value)
Set a value in an OpenStack configuration file.
filename  The full path to the configuration file
section   The section in which the parameter will be set
parameter The parameter to change
value     The value to set
```

CLI Example:
```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

### 21.9.325 salt.modules.openstack_mng module

Module for OpenStack Management

**codeauthor** Konrad Mosoń <mosonkonrad@gmail.com>

**maturity** new

**depends** openstack-utils

**platform** linux

```text
salt.modules.openstack_mng.restart_service(service_name, minimum_running_time=None)
Restart OpenStack service immediately, or only if it's running longer than specified value
```

CLI Example:
```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

```text
salt.modules.openstack_mng.start_service(service_name)
Start OpenStack service immediately
```

CLI Example:
```
salt '*' openstack_mng.start_service neutron
```

```text
salt.modules.openstack_mng.stop_service(service_name)
Stop OpenStack service immediately
```

CLI Example:
```
salt '*' openstack_mng.stop_service neutron
```
21.9.326 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.openvswitch.bridge_create(br, may_exist=True)

Creates a new bridge.

Parameters

- `br` -- A string - bridge name
- `may_exist` -- Bool, if False - attempting to create a bridge that exists returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

    salt '*' openvswitch.bridge_create br0

salt.modules.openvswitch.bridge_delete(br, if_exists=True)

Deletes bridge and all of its ports.

Parameters

- `br` -- A string - bridge name
- `if_exists` -- Bool, if False - attempting to delete a bridge that does not exist returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

    salt '*' openvswitch.bridge_delete br0

salt.modules.openvswitch.bridge_exists(br)

Tests whether bridge exists as a real or fake bridge.

Returns True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

    salt '*' openvswitch.bridge_exists br0

salt.modules.openvswitch.bridge_list()

Lists all existing real and fake bridges.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

    salt '*' openvswitch.bridge_list

salt.modules.openvswitch.interface_get_options(port)

Port's interface's optional parameters.

Parameters `port` -- A string - port name.

Returns String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

    salt '*' openvswitch.interface_get_options tap0

salt.modules.openvswitch.interface_get_type(port)

Type of port's interface.

Parameters `port` -- A string - port name.

Returns String - type of interface or empty string, False on failure.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt "" openvswitch.interface_get_type tap0

salt.modules.openvswitch.port_add(br, port, may_exist=False, internal=False)

Creates on bridge a new port named port.

Returns True on success, else False.

Parameters

- **br** -- A string - bridge name
- **port** -- A string - port name
- **may_exist** -- Bool, if False - attempting to create a port that exists returns False.
- **internal** -- A boolean to create an internal interface if one does not exist.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt "" openvswitch.port_add br0 8080

salt.modules.openvswitch.port_create_gre(br, port, id, remote)

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt "" openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)

Isolate VM traffic using VLANs.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt "" openvswitch.port_create_vlan br0 tap0 100

salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst_port** -- An integer - port to use when creating tunnelport in the switch.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt "" openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
salt.modules.openvswitch.port_get_tag(port)
   Lists tags of the port.
   Parameters port -- A string - port name.
   Returns List of tags (or empty list), False on failure.
   New in version 2016.3.0.
   CLI Example: .. code-block:: bash
      salt '*' openvswitch.port_get_tag tap0

salt.modules.openvswitch.port_list(br)
   Lists all of the ports within bridge.
   Parameters br -- A string - bridge name.
   Returns List of bridges (or empty list), False on failure.
   New in version 2016.3.0.
   CLI Example: .. code-block:: bash
      salt '*' openvswitch.port_list br0

salt.modules.openvswitch.port_remove(br, port, if_exists=True)
   Deletes port.
   Parameters
      * br -- A string - bridge name (If bridge is None, port is removed from whatever bridge
        contains it)
      * port -- A string - port name.
      * if_exists -- Bool, if False - attempting to delete a por that does not exist returns
        False. (Default True)
   Returns True on success, else False.
   New in version 2016.3.0.
   CLI Example: .. code-block:: bash
      salt '*' openvswitch.port_remove br0 8080

21.9.327 salt.modules.opkg module

Support for Opkg

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to 'pkg.install' is not available), see here.

Note: For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

salt.modules.opkg.available_version(*names, **kwargs)
   Return the latest version of the named package available for upgrade or installation. If more than one package
   name is specified, a dict of name/version pairs is returned.
   If the latest version of a given package is already installed, an empty string will be returned for that package.
   CLI Example:
      salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

21.9. execution modules
salt.modules.opkg.check_extra_requirements(pkgname, pkgver)
Check if the installed package already has the given requirements. There's nothing do to here for nipkg.py, therefore it will always return True.

salt.modules.opkg.del_repo(repo, **kwargs)
Delete a repo from /etc/opkg/*.conf

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:
```
salt '*' pkg.del_repo repo
```

salt.modules.opkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.get_repo(repo, **kwargs)
Display a repo from the /etc/opkg/*.conf

CLI Examples:
```
salt '*' pkg.get_repo repo
```

salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)
Set package in 'hold' state, meaning it will not be upgraded.
name The name of the package, e.g., 'tmux'

CLI Example:
```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.opkg.info_installed(*names, **kwargs)
Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

Parameters
- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  **Valid attributes are:** arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

  CLI example:

  ```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2><attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,packager
```

```python
salt.modules.opkg.install(name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)
```

Install the passed package, add refresh=True to update the opkg database.

**name**  The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

  CLI Example:

  ```
salt '*' pkg.install <package name>
```

**refresh**  Whether or not to refresh the package database before installing.

**version**  Install a specific version of the package, e.g. 1.2.3–0ubuntu0. Ignored if "pkgs" or "sources" is passed.

  New in version 2017.7.0.

**reinstall**  [False]  Specifying reinstall=True will use opkg install --force-reinstall rather than simply opkg install for requested packages that are already installed.

  If a version is specified with the requested package, then opkg install --force-reinstall will only be used if the installed version matches the requested version.

  New in version 2017.7.0.

**multiple package installation options:**

**pkgs**  A list of packages to install from a software repository. Must be passed as a python list.

  CLI Example:

  ```
salt '*' pkg.install pkgs=['"foo", "bar"]'
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3-0ubuntu0"}']
```

**sources**  A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

  CLI Example:

  ```
salt '*' pkg.install sources=['{"foo": "salt://foo.deb" },{"bar": "salt://bar.deb"}']
```

**install_recommends**  Whether to install the packages marked as recommended. Default is True.

**only_upgrade**  Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

  New in version 2017.7.0.

Returns a dict containing the new package names and versions:
salt.modules.opkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.opkg.list_repos(**kwargs)

Lists all repos on /etc/opkg/*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.mod_repo(repo, **kwargs)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

- repo: alias by which opkg refers to the repo.
- uri: the URI to the repo.
- compressed: defines (True or False) if the index file is compressed
- enabled: enable or disable (True or False) repository but do not remove if disabled.
- refresh: enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

salt.modules.opkg.owner(*paths, **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version <salt.modules.opkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.
If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```sh
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

```py
salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)
```

Package purges are not supported by opkg, this function is identical to `pkg.remove`.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```sh
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

```py
salt.modules.opkg.refresh_db(failhard=False, **kwargs)
```

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- **True**: Database updated successfully
- **False**: Problem updating database

- **failhard** If False, return results of failed lines as False for the package database that encountered the error.
  - If True, raise an error with a list of the package databases that encountered errors.

  New in version 2018.3.0.

CLI Example:

```sh
salt '*' pkg.refresh_db
```

```py
salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)
```

Remove packages using `opkg remove`.

- **name** The name of the package to be deleted.
- **pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

- **remove_dependencies** Remove package and all dependencies

  New in version 2019.2.0.

- **auto_remove_deps** Remove packages that were installed automatically to satisfy dependencies

  New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:

```sh
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
salt '*' pkg.remove pkgs=['foo', 'bar'] remove_dependencies=True auto_remove_deps=True
```
salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
Set package current in 'hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:
salt '* pkg.unhold <package name>

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '* pkg.unhold pkgs=['"foo", "bar"]'

salt.modules.opkg.upgrade(refresh=True, **kwargs)
Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

```
{"<package>": {"old": '<old-version>',
  "new": '<new-version>'}}
```

CLI Example:
salt '* pkg.upgrade

salt.modules.opkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '* pkg.upgrade_available <package name>

salt.modules.opkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '* pkg.version <package name>
salt '* pkg.version <package1> <package2> <package3> ...

salt.modules.opkg.version_clean(version)
Clean the version string removing extra data. There's nothing to do here for nipkg.py, therefore it will always return the given version.

salt.modules.opkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:
salt '* pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
21.9.328  salt.modules.opsgenie

Module for sending data to OpsGenie
New in version 2018.3.0.

configuration This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
        name: event.reactor
        api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
        reason: {{ data['data']["reason"] }}
        action_type: Create
```

```
salt.modules.opsgenie.post_data(api_key=None, name='OpsGenie Execution Module', reason=None, action_type=None)
```

Post data to OpsGenie. It’s designed for Salt’s Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:
api_key It’s the API Key you’ve copied while adding integration in OpsGenie.
reason It will be used as alert’s default message in OpsGenie.
action_type OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie’s custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:
name It will be used as alert’s alias. If you want to use the close functionality you must provide name field for both states like in this case.

21.9.329  salt.modules.oracle

Oracle DataBase connection module

maintainer Vladimir Bormotov <bormotov@gmail.com>
maturity new
depends cx_Oracle
platform all
configuration module provide connections for multiple Oracle DB instances.

OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar
Salt Documentation, Release 3002.6

```
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
        user/password@host[:port]/sid[ servicename as {sysdb|sysoper}]
      optional keyword servicename will determine whether it is a sid or & -service_name
    <db>:
      uri: ..... 
```

salt.modules.oracle.client_version()
Oracle Client Version

CLI Example:
```
salt '*' oracle.client_version
```

salt.modules.oracle.run_query(db, query)
Run SQL query and return result

CLI Example:
```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.show_dbs(*dbs)
Show databases configuration from pillar. Filter by *args

CLI Example:
```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.show_env()
Show Environment used by Oracle Client

CLI Example:
```
salt '*' oracle.show_env
```

```
Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'
```

salt.modules.oracle.show_pillar(item=None)
Show Pillar segment oracle:* and subitem with notation "item:subitem"

CLI Example:
```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

salt.modules.oracle.version(*dbs)
Server Version (select banner from v$version)

CLI Example:
```
salt '*' oracle.version
salt '*' oracle.version my_db
```
21.9.330 salt.modules.osquery

New in version 2015.8.0.

salt.modules.osquery.acpi_tables(attrs=None, where=None)
  Return acpi_tables information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.acpi_tables
  ```

salt.modules.osquery.alf(attrs=None, where=None)
  Return alf information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.alf
  ```

salt.modules.osquery.alf_exceptions(attrs=None, where=None)
  Return alf_exceptions information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.alf_exceptions
  ```

salt.modules.osquery.alf_explicit_auths(attrs=None, where=None)
  Return alf_explicit_auths information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.alf_explicit_auths
  ```

salt.modules.osquery.alf_services(attrs=None, where=None)
  Return alf_services information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.alf_services
  ```

salt.modules.osquery.apps(attrs=None, where=None)
  Return apps information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.apps
  ```

salt.modules.osquery.apt_sources(attrs=None, where=None)
  Return apt_sources information from osquery
  CLI Example:
  
  ```
  salt '*' osquery.apt_sources
  ```

salt.modules.osquery.arp_cache(attrs=None, where=None)
  Return arp_cache information from osquery
  CLI Example:
salt 'osquery.arp_cache`

salt.modules.osquery.block_devices(attrs=None, where=None)
    Return block_devices information from osquery
    CLI Example:
    `salt '*' osquery.block_devices`

salt.modules.osquery.certificates(attrs=None, where=None)
    Return certificates information from osquery
    CLI Example:
    `salt '*' osquery.certificates`

salt.modules.osquery.chrome_extensions(attrs=None, where=None)
    Return chrome_extensions information from osquery
    CLI Example:
    `salt '*' osquery.chrome_extensions`

salt.modules.osquery.cpuid(attrs=None, where=None)
    Return cpuid information from osquery
    CLI Example:
    `salt '*' osquery.cpuid`

salt.modules.osquery.crontab(attrs=None, where=None)
    Return crontab information from osquery
    CLI Example:
    `salt '*' osquery.crontab`

salt.modules.osquery.deb_packages(attrs=None, where=None)
    Return deb_packages information from osquery
    CLI Example:
    `salt '*' osquery.deb_packages`

salt.modules.osquery.etc_hosts(attrs=None, where=None)
    Return etc_hosts information from osquery
    CLI Example:
    `salt '*' osquery.etc_hosts`

salt.modules.osquery.etc_services(attrs=None, where=None)
    Return etc_services information from osquery
    CLI Example:
    `salt '*' osquery.etc_services`
salt.modules.osquery.file_(*args=None, where=None*)
    Return file information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.file
    ```

salt.modules.osquery.file_changes(*args=None, where=None*)
    Return file_changes information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.file_changes
    ```

salt.modules.osquery.firefox_addons(*args=None, where=None*)
    Return firefox_addons information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.firefox_addons
    ```

salt.modules.osquery.groups(*args=None, where=None*)
    Return groups information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.groups
    ```

salt.modules.osquery.hardware_events(*args=None, where=None*)
    Return hardware_events information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.hardware_events
    ```

salt.modules.osquery.hash_(*args=None, where=None*)
    Return hash information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.hash
    ```

salt.modules.osquery.homebrew_packages(*args=None, where=None*)
    Return homebrew_packages information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.homebrew_packages
    ```

salt.modules.osquery.interface_addresses(*args=None, where=None*)
    Return interface_addresses information from osquery
    
    CLI Example:
    
    ```text
    salt '*' osquery.interface_addresses
    ```

salt.modules.osquery.interface_details(*args=None, where=None*)
    Return interface_details information from osquery
    
    CLI Example:
salt '*' osquery.interface_details

salt.modules.osquery.iokit_devicetree(attrs=None, where=None)
    Return iokit_devicetree information from osquery
    CLI Example:
    ```
salt '*' osquery.iokit_devicetree
    ```

salt.modules.osquery.iokit_registry(attrs=None, where=None)
    Return iokit_registry information from osquery
    CLI Example:
    ```
salt '*' osquery.iokit_registry
    ```

salt.modules.osquery.kernel_extensions(attrs=None, where=None)
    Return kernel_extensions information from osquery
    CLI Example:
    ```
salt '*' osquery.kernel_extensions
    ```

salt.modules.osquery.kernel_info(attrs=None, where=None)
    Return kernel_info information from osquery
    CLI Example:
    ```
salt '*' osquery.kernel_info
    ```

salt.modules.osquery.kernel_integrity(attrs=None, where=None)
    Return kernel_integrity information from osquery
    CLI Example:
    ```
salt '*' osquery.kernel_integrity
    ```

salt.modules.osquery.kernel_modules(attrs=None, where=None)
    Return kernel_modules information from osquery
    CLI Example:
    ```
salt '*' osquery.kernel_modules
    ```

salt.modules.osquery.keychain_items(attrs=None, where=None)
    Return keychain_items information from osquery
    CLI Example:
    ```
salt '*' osquery.keychain_items
    ```

salt.modules.osquery.last(attrs=None, where=None)
    Return last information from osquery
    CLI Example:
    ```
salt '*' osquery.last
    ```
salt.modules.osquery.launchd(attrs=None, where=None)
    Return launchd information from osquery
    CLI Example:
    
    salt '*' osquery.launchd

salt.modules.osquery.listening_ports(attrs=None, where=None)
    Return listening_ports information from osquery
    CLI Example:
    
    salt '*' osquery.listening_ports

salt.modules.osquery.logged_in_users(attrs=None, where=None)
    Return logged_in_users information from osquery
    CLI Example:
    
    salt '*' osquery.logged_in_users

salt.modules.osquery.memory_map(attrs=None, where=None)
    Return memory_map information from osquery
    CLI Example:
    
    salt '*' osquery.memory_map

salt.modules.osquery.mounts(attrs=None, where=None)
    Return mounts information from osquery
    CLI Example:
    
    salt '*' osquery.mounts

salt.modules.osquery.nfs_shares(attrs=None, where=None)
    Return nfs_shares information from osquery
    CLI Example:
    
    salt '*' osquery.nfs_shares

salt.modules.osquery.nvram(attrs=None, where=None)
    Return nvram information from osquery
    CLI Example:
    
    salt '*' osquery.nvram

salt.modules.osquery.os_version(attrs=None, where=None)
    Return os_version information from osquery
    CLI Example:
    
    salt '*' osquery.os_version

salt.modules.osquery.osquery_extensions(attrs=None, where=None)
    Return osquery_extensions information from osquery
    CLI Example:
    
    salt '*' osquery.osquery_extensions
salt '*' osquery.osquery_extensions

salt.modules.osquery.osquery_flags(attrs=None, where=None)
Return osquery_flags information from osquery

CLI Example:
salt '*' osquery.osquery Flags

salt.modules.osquery.osquery_info(attrs=None, where=None)
Return osquery_info information from osquery

CLI Example:
salt '*' osquery.osquery_info

salt.modules.osquery.osquery_registry(attrs=None, where=None)
Return osquery_registry information from osquery

CLI Example:
salt '*' osquery.osquery_registry

salt.modules.osquery.passwd_changes(attrs=None, where=None)
Return passwd_changes information from osquery

CLI Example:
salt '*' osquery.passwd_changes

salt.modules.osquery.pci_devices(attrs=None, where=None)
Return pci_devices information from osquery

CLI Example:
salt '*' osquery.pci_devices

salt.modules.osquery.preferences(attrs=None, where=None)
Return preferences information from osquery

CLI Example:
salt '*' osquery.preferences

salt.modules.osquery.process_envs(attrs=None, where=None)
Return process_envs information from osquery

CLI Example:
salt '*' osquery.process_envs

salt.modules.osquery.process_memory_map(attrs=None, where=None)
Return process_memory_map information from osquery

CLI Example:
salt '*' osquery.process_memory_map
salt.modules.osquery.process_open_files
   Return process_open_files information from osquery
   
   CLI Example:
   ```
salt '*' osquery.process_open_files
   ```

salt.modules.osquery.process_open_sockets
   Return process_open_sockets information from osquery
   
   CLI Example:
   ```
salt '*' osquery.process_open_sockets
   ```

salt.modules.osquery.processes
   Return processes information from osquery
   
   CLI Example:
   ```
salt '*' osquery.processes
   ```

salt.modules.osquery.quarantine
   Return quarantine information from osquery
   
   CLI Example:
   ```
salt '*' osquery.quarantine
   ```

salt.modules.osquery.query
   Return time information from osquery
   
   CLI Example:
   ```
salt '*' osquery.query "select * from users;"
   ```

salt.modules.osquery.routes
   Return routes information from osquery
   
   CLI Example:
   ```
salt '*' osquery.routes
   ```

salt.modules.osquery.rpm_packages
   Return cpuid information from osquery
   
   CLI Example:
   ```
salt '*' osquery.rpm_packages
   ```

salt.modules.osquery.safari_extensions
   Return safari_extensions information from osquery
   
   CLI Example:
   ```
salt '*' osquery.safari_extensions
   ```

salt.modules.osquery.shared_memory
   Return shared_memory information from osquery
   
   CLI Example:
salt '*' osquery.shared_memory

salt.modules.osquery.shell_history(attrs=None, where=None)
    Return shell_history information from osquery
    CLI Example:
    salt '*' osquery.shell_history

salt.modules.osquery.smbios_tables(attrs=None, where=None)
    Return smbios_tables information from osquery
    CLI Example:
    salt '*' osquery.smbios_tables

salt.modules.osquery.startup_items(attrs=None, where=None)
    Return startup_items information from osquery
    CLI Example:
    salt '*' osquery.startup_items

salt.modules.osquery.suid_bin(attrs=None, where=None)
    Return suid_bin information from osquery
    CLI Example:
    salt '*' osquery.suid_bin

salt.modules.osquery.system_controls(attrs=None, where=None)
    Return system_controls information from osquery
    CLI Example:
    salt '*' osquery.system_controls

salt.modules.osquery.time_(attrs=None)
    Return time information from osquery
    CLI Example:
    salt '*' osquery.time

salt.modules.osquery.usb_devices(attrs=None, where=None)
    Return usb_devices information from osquery
    CLI Example:
    salt '*' osquery.usb_devices

salt.modules.osquery.users(attrs=None, where=None)
    Return users information from osquery
    CLI Example:
    salt '*' osquery.users
salt.modules.osquery.version()
Return version of osquery

**CLI Example:**
salt '*' osquery.version

salt.modules.osquery.xattr_where_from(attrs=None, where=None)
Return xattr_where_from information from osquery

**CLI Example:**
salt '*' osquery.xattr_where_from

salt.modules.osquery.xprotect_entries(attrs=None, where=None)
Return xprotect_entries information from osquery

**CLI Example:**
salt '*' osquery.xprotect_entries

salt.modules.osquery.xprotect_reports(attrs=None, where=None)
Return xprotect_reports information from osquery

**CLI Example:**
salt '*' osquery.xprotect_reports

### 21.9.331 salt.modules.out module

**Output Module**

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```python
{{ salt.out.string_format(complex_object, out='highstate') }}
```

salt.modules.out.html_format(data, out='nested', opts=None, **kwargs)
Return the formatted string as HTML.

**data** The JSON serializable object.

**out**: nested The name of the output to use to transform the data. Default: nested.

**opts** Dictionary of configuration options. Default: __opts__.

**kwargs** Arguments to sent to the outputter module.

**CLI Example:**
salt '*' out.html_format "{"key": 'value'}" out=yaml

salt.modules.out.out_format(data, out='nested', opts=None, **kwargs)
Return the formatted outputter string for the Python object.

**data** The JSON serializable object.

**out**: nested The name of the output to use to transform the data. Default: nested.
**opts** Dictionary of configuration options. Default: `__opts__`.
**kwargs** Arguments to sent to the outputer module.

CLI Example:
```
salt '*' out.out_format "{'key': 'value'}"
```

```python
salt.modules.out.string_format(data, out='nested', opts=None, **kwargs)
```
Return the outputer formatted string, removing the ANSI escape sequences.

- **data**: The JSON serializable object.
- **out**: `nested` The name of the output to use to transform the data. Default: `nested`.
- **opts**: Dictionary of configuration options. Default: `__opts__`.
- **kwargs**: Arguments to sent to the outputer module.

CLI Example:
```
salt '*' out.string_format "{'key': 'value'}" out=table
```

### 21.9.332 `salt.modules.pacmanpkg`

A module to wrap pacman calls, since Arch is the best ([https://wiki.archlinux.org/index.php/Arch_is_the_best](https://wiki.archlinux.org/index.php/Arch_is_the_best))

**Important**: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `pkg.install` is not available), see [here](#).

```python
salt.modules.pacmanpkg.file_dict(*packages, **kwargs)
```
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```python
salt.modules.pacmanpkg.file_list(*packages, **kwargs)
```
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```python
salt.modules.pacmanpkg.group_diff(name)
```
New in version 2016.11.0.
Lists which of a group's packages are installed and which are not installed

Compatible with yumpkg.group_diff for easy support of state/pkg.group_installed

CLI Example:
```
salt '*' pkg.group_diff 'xorg'
```

```python
salt.modules.pacmanpkg.group_info(name)
```
New in version 2016.11.0.
Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacmanpkg.group_list()

New in version 2016.11.0.

List all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Install (`pacman -S`) the specified package(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.

**sysupgrade** Whether or not to upgrade the system packages before installing. If `refresh` is set to `True` but `sysupgrade` is not specified, `-u` will be applied

*Multiple Package Installation Options:*

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs=['"foo", "bar"]'
salt '*' pkg.install pkgs=["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs=["foo", {"bar": "<1.2.3-4"}]'
```

**sources** A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.pkg.tar.xz"}, {'bar": "salt://bar.pkg.tar.xz"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```
salt.modules.pacmanpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

    salt '*' pkg.latest_version <package name>
    salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

    {'<package_name>': '<version>'}

CLI Example:

    salt '*' pkg.list_pkgs

salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```python
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When True, the return data for each package will be organized by repository.

refresh [False] When True, the package database will be refreshed (i.e. pacman -Sy) before checking for available versions.

CLI Examples:

    salt '*' pkg.list_repo_pkgs
    salt '*' pkg.list_repo_pkgs foo bar baz
    salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
    salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True

salt.modules.pacmanpkg.list_upgrades(refresh=False, root=None, **kwargs)

List all available package upgrades on this system
CLI Example:

```bash
salt '*' pkg.list_upgrades
```

salt.modules.pacmanpkg.owner(path, **kwargs)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```bash
salt '*' pkg.owner /usr/bin/apachectl salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

salt.modules.pacmanpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pacmanpkg.refresh_db(root=None, **kwargs)

Just run a `pacman -Sy`, return a dict:

```python
{'<database name>': Bool}
```

CLI Example:

```bash
salt '*' pkg.refresh_db
```

salt.modules.pacmanpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

21.9. execution modules
**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pacmanpkg.upgrade(refresh=False, root=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a pacman -Syu

**refresh** Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkg.upgrade
```

`salt.modules.pacmanpkg.upgrade_available(name, **kwargs)`

Check whether or not an upgrade is available for a given package

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacmanpkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
21.9.333  **salt.modules.pagerduty**

Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration**  This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
pagerduty.api_key: F3Rbyjlbve43rfWf2214
pagerduty.subdomain: mysubdomain
```

**salt.modules.pagerduty.create_event**(service_key=None, description=None, details=None, incident_key=None, profile=None)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details> ← profile=my-pagerduty-account
```

The following parameters are required:

- **service_key**  This key can be found by using pagerduty.list_services.
- **description**  This is a short description of the event.
- **details**  This can be a more detailed description of the event.
- **profile**  This refers to the configuration profile to use to connect to the PagerDuty service.

**salt.modules.pagerduty.list_escalation_policies**(profile=None, api_key=None)

This function is an alias of **list_policies**.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
```

**salt.modules.pagerduty.list_incidents**(profile=None, api_key=None)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

**salt.modules.pagerduty.list_maintenance_windows**(profile=None, api_key=None)

This function is an alias of **list_windows**.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account
```

**salt.modules.pagerduty.list_policies**(profile=None, api_key=None)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
```

**salt.modules.pagerduty.list_schedules**(profile=None, api_key=None)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```
CLI Example:
salt myminion pagerduty.list_schedules my-pagerduty-account

```
salt.modules.pagerduty.list_services(profile=None, api_key=None)
```
List services belonging to this account

CLI Example:
salt myminion pagerduty.list_services my-pagerduty-account

```
salt.modules.pagerduty.list_users(profile=None, api_key=None)
```
List users belonging to this account

CLI Example:
salt myminion pagerduty.list_users my-pagerduty-account

```
salt.modules.pagerduty.list_windows(profile=None, api_key=None)
```
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

21.9.334 salt.modules.pagerduty_util

Module for managing PagerDuty resource

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
pagerduty:
  pagerduty.api_key: F3Rbyjvbe43rfWFw2214
  pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

```
salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)
```

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.
Examples

```python
create_or_update_resource("user", ["id", "name", "email"])
create_or_update_resource("escalation_policies", ["id", "name"], diff=my_diff_function)
salt.modules.pagerduty_util.delete_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
delete any pagerduty resource
Helper method for absent()
Example

delete_resource("users", key, ["id", "name", "email"])
```

Example

```python
delete_resource("users", key, ["id", "name", "email"]) # delete by id or name or email
salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdomain=None, api_key=None)
List escalation_policies belonging to this account
CLI Example:
salt myminion pagerduty.get_escalation_policies
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
Get any single pagerduty resource by key.
We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:
```
get_resource('users', key, ['name', 'email'], ...)
```
This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

```pythonsalt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)
List schedules belonging to this account
CLI Example:
salt myminion pagerduty.get_schedules
salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)
List services belonging to this account
CLI Example:
salt myminion pagerduty.get_services
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
List users belonging to this account
CLI Example:
salt myminion pagerduty.get_users
```
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

Example

resource_absent("users", ["id","name","email"])  
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None, profile='pagerduty', subdomain=None, api_key=None, **kwargs)

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

Example

resource_present("users", ["id","name","email"])  

21.9.335 salt.modules.pam

Support for pam  
salt.modules.pam.read_file(file_name)

This is just a test function, to make sure parsing works

 CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

21.9.336 salt.modules.panos

Module to provide Palo Alto compatibility to Salt  

codeauthor Spencer Ervin <spencer_ervin@hotmail.com>
maturity new 
depends none 
platform unix

New in version 2018.3.0.
Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

Palo Alto Proxy Module

About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

salt.modules.panos.add_config_lock()
Prevent other users from changing configuration until the lock is released.

CLI Example:

```
salt '*' panos.add_config_lock
```

salt.modules.panos.check_antivirus()
Get anti-virus information from PaloAlto Networks server

CLI Example:

```
salt '*' panos.check_antivirus
```

salt.modules.panos.check_software()
Get software information from PaloAlto Networks server.

CLI Example:

```
salt '*' panos.check_software
```

salt.modules.panos.clear_commit_tasks()
Clear all commit tasks.

CLI Example:

```
salt '*' panos.clear_commit_tasks
```

salt.modules.panos.commit()
Commits the candidate configuration to the running configuration.

CLI Example:

```
salt '*' panos.commit
```

salt.modules.panos.deactivate_license(key_name=None)
Deactivates an installed license. Required version 7.0.0 or greater.

key_name(str): The file name of the license key installed.

CLI Example:

```
salt '*' panos.deactivate_license key_name=License_File_Name.key
```
salt.modules.panos.delete_license(key_name=None)
Remove license keys on disk.

key_name(str): The file name of the license key to be deleted.

CLI Example:
```
salt '*' panos.delete_license key_name=License_File_Name.key
```

salt.modules.panos.download_antivirus()  
Download the most recent anti-virus package.

CLI Example:
```
salt '*' panos.download_antivirus
```

salt.modules.panos.download_software_file(filename=None, synch=False)
Download software packages by filename.

Parameters
- *filename*(str) -- The filename of the PANOS file to download.
- *synch*(bool) -- If true then the file will synch to the peer unit.

CLI Example:
```
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True
```

salt.modules.panos.download_software_version(version=None, synch=False)
Download software packages by version number.

Parameters
- *version*(str) -- The version of the PANOS file to download.
- *synch*(bool) -- If true then the file will synch to the peer unit.

CLI Example:
```
salt '*' panos.download_software_version 8.0.0
salt '*' panos.download_software_version 8.0.0 True
```

salt.modules.panos.fetch_license(auth_code=None)
Get new license(s) using from the Palo Alto Network Server.

auth_code The license authorization code.

CLI Example:
```
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar
```

salt.modules.panos.get_address(address=None, vsys='1')
Get the candidate configuration for the specified get_address object. This will not return address objects that are marked as pre-defined objects.

address(str): The name of the address object.

vsys(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```
salt.modules.panos.get_address_group(addressgroup=None, vsys='1')
Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

addressgroup(str): The name of the address group.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```py
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

salt.modules.panos.get_admins_active()
Show active administrators.

CLI Example:

```py
salt '*' panos.get_admins_active
```

salt.modules.panos.get_admins_all()
Show all administrators.

CLI Example:

```py
salt '*' panos.get_admins_all
```

salt.modules.panos.get_antivirus_info()
Show information about available anti-virus packages.

CLI Example:

```py
salt '*' panos.get_antivirus_info
```

salt.modules.panos.get_arp()
Show ARP information.

CLI Example:

```py
salt '*' panos.get_arp
```

salt.modules.panos.get_cli_idle_timeout()
Show timeout information for this administrative session.

CLI Example:

```py
salt '*' panos.get_cli_idle_timeout
```

salt.modules.panos.get_cli_permissions()
Show cli administrative permissions.

CLI Example:

```py
salt '*' panos.get_cli_permissions
```

salt.modules.panos.get_disk_usage()
Report filesystem disk space usage.

CLI Example:
**salt.modules.panos.get_dns_server_config()**  
Get the DNS server configuration from the candidate configuration.  
**CLI Example:**  
```
salt '*' panos.get_dns_server_config
```

**salt.modules.panos.get_domain_config()**  
Get the domain name configuration from the candidate configuration.  
**CLI Example:**  
```
salt '*' panos.get_domain_config
```

**salt.modules.panos.get_dos_blocks()**  
Show the DoS block-ip table.  
**CLI Example:**  
```
salt '*' panos.get_dos_blocks
```

**salt.modules.panos.get_fqdn_cache()**  
Print FQDNs used in rules and their IPs.  
**CLI Example:**  
```
salt '*' panos.get_fqdn_cache
```

**salt.modules.panos.get_ha_config()**  
Get the high availability configuration.  
**CLI Example:**  
```
salt '*' panos.get_ha_config
```

**salt.modules.panos.get_ha_link()**  
Show high-availability link-monitoring state.  
**CLI Example:**  
```
salt '*' panos.get_ha_link
```

**salt.modules.panos.get_ha_path()**  
Show high-availability path-monitoring state.  
**CLI Example:**  
```
salt '*' panos.get_ha_path
```

**salt.modules.panos.get_ha_state()**  
Show high-availability state information.  
**CLI Example:**  
```
salt '*' panos.get_ha_state
```
salt.modules.panos.get_ha_transitions()
Show high-availability transition statistic information.

CLI Example:
```
salt '*' panos.get_ha_transitions
```

salt.modules.panos.get_hostname()
Get the hostname of the device.

CLI Example:
```
salt '*' panos.get_hostname
```

salt.modules.panos.get_interface_counters(name='all')
Get the counter statistics for interfaces.

Parameters

name (str) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:
```python
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

salt.modules.panos.get_interfaces(name='all')
Show interface information.

Parameters

name (str) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:
```python
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

salt.modules.panos.get_job(jid=None)
List all a single job by ID.

jid The ID of the job to retrieve.

CLI Example:
```python
salt '*' panos.get_job jid=15
```

salt.modules.panos.get_jobs(state='all')
List all jobs on the device.

state The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:
```python
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

salt.modules.panos.get_lacp()
Show LACP state.

CLI Example:
```python
salt '*' panos.get_lacp
```

salt.modules.panos.get_license_info()
Show information about owned license(s).
CLI Example:
```bash
salt '*' panos.get_license_info
```

**salt.modules.panos.get_license_tokens()**
Show license token files for manual license deactivation.

CLI Example:
```bash
salt '*' panos.get_license_tokens
```

**salt.modules.panos.get_lldp_config()**
Show lldp config for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_config
```

**salt.modules.panos.get_lldp_counters()**
Show lldp counters for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_counters
```

**salt.modules.panos.get_lldp_local()**
Show lldp local info for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_local
```

**salt.modules.panos.get_lldp_neighbors()**
Show lldp neighbors info for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_neighbors
```

**salt.modules.panos.get_local_admins()**
Show all local administrator accounts.

CLI Example:
```bash
salt '*' panos.get_local_admins
```

**salt.modules.panos.get_logdb_quota()**
Report the logdb quotas.

CLI Example:
```bash
salt '*' panos.get_logdb_quota
```

**salt.modules.panos.get_master_key()**
Get the master key properties.

CLI Example:
```bash
salt '*' panos.get_master_key
```
salt.modules.panos.get_ntp_config()
Get the NTP configuration from the candidate configuration.

CLI Example:
```
salt '*' panos.get_ntp_config
```

salt.modules.panos.get_ntp_servers()
Get list of configured NTP servers.

CLI Example:
```
salt '*' panos.get_ntp_servers
```

salt.modules.panos.get_operational_mode()
Show device operational mode setting.

CLI Example:
```
salt '*' panos.get_operational_mode
```

salt.modules.panos.get_panorama_status()
Show panorama connection status.

CLI Example:
```
salt '*' panos.get_panorama_status
```

salt.modules.panos.get_permitted_ips()
Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:
```
salt '*' panos.get_permitted_ips
```

salt.modules.panos.get_platform()
Get the platform model information and limitations.

CLI Example:
```
salt '*' panos.get_platform
```

salt.modules.panos.get_predefined_application(application=None)
Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

application(str): The name of the pre-defined application object.

CLI Example:
```
salt '*' panos.get_predefined_application saltstack
```

salt.modules.panos.get_security_rule(rulename=None, vsys='1')
Get the candidate configuration for the specified security rule.

rulename(str): The name of the security rule.

vsys(str): The string representation of the VSYS ID.

CLI Example:
salt.modules.panos.get_security_rule(rule01)

Get the candidate configuration for the specified security rule object. This will not return rules that are marked as pre-defined objects.

documentation:

- service (str): The name of the service object.
- vsys (str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
```

salt.modules.panos.get_service(service=None, vsys='1')

Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

- service (str): The name of the service object.
- vsys (str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
```

salt.modules.panos.get_service_group(servicegroup=None, vsys='1')

Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

- servicegroup (str): The name of the service group.
- vsys (str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
```

salt.modules.panos.get_session_info()

Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

salt.modules.panos.get_snmp_config()

Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```

salt.modules.panos.get_software_info()

Show information about available software packages.

CLI Example:

```
salt '*' panos.get_software_info
```

salt.modules.panos.get_system_date_time()

Get the system date/time.

CLI Example:

```
salt '*' panos.get_system_date_time
```

salt.modules.panos.get_system_files()

List important files in the system.

CLI Example:
salt.modules.panos.get_system_files

Get the system information.

CLI Example:
```
salt '*' panos.get_system_files
```

salt.modules.panos.get_system_info()

Get the system information.

CLI Example:
```
salt '*' panos.get_system_info
```

salt.modules.panos.get_system_services()

Show system services.

CLI Example:
```
salt '*' panos.get_system_services
```

salt.modules.panos.get_system_state(mask=None)

Show the system state variables.

mask  Filters by a subtree or a wildcard.

CLI Example:
```
salt '*' panos.get_system_state
salt '*' panos.get_system_state mask=cfg.ha.config.enabled
salt '*' panos.get_system_state mask=cfg.ha.*
```

salt.modules.panos.get_uncommitted_changes()

Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.

CLI Example:
```
salt '*' panos.get_uncommitted_changes
```

salt.modules.panos.get_users_config()

Get the local administrative user account configuration.

CLI Example:
```
salt '*' panos.get_users_config
```

salt.modules.panos.get_vlans()

Show all VLAN information.

CLI Example:
```
salt '*' panos.get_vlans
```

salt.modules.panos.get_xpath(xpath='')

Retrieve a specified xpath from the candidate configuration.

xpath(str): The specified xpath in the candidate configuration.

CLI Example:
```
salt '*' panos.get_xpath /config/shared/service
```

salt.modules.panos.get_zone(zone='', vsys='1')

Get the candidate configuration for the specified zone.

zone(str): The name of the zone.
vsys(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

```python
salt.modules.panos.get_zones(vsyst='I')
```
Get all the zones in the candidate configuration.

vsys(str): The string representation of the VSYS ID.

CLI Example:
```
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

```python
salt.modules.panos.install_antivirus(version=None, latest=False, synch=False, skip_commit=False)
```
Install anti-virus packages.

Parameters

- `version (str)` -- The version of the PANOS file to install.
- `latest (bool)` -- If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- `synch (bool)` -- If true, the anti-virus will synch to the peer unit.
- `skip_commit (bool)` -- If true, the install will skip committing to the device.

CLI Example:
```
salt '*' panos.install_antivirus 8.0.0
```

```python
salt.modules.panos.install_license()
```
Install the license key(s).

CLI Example:
```
salt '*' panos.install_license
```

```python
salt.modules.panos.install_software(version=None)
```
Upgrade to a software package by version.

Parameters

- `version (str)` -- The version of the PANOS file to install.

CLI Example:
```
salt '*' panos.install_license 8.0.0
```

```python
salt.modules.panos.reboot()
```
Reboot a running system.

CLI Example:
```
salt '*' panos.reboot
```

```python
salt.modules.panos.refresh_fqdn_cache(force=False)
```
Force refreshes all FQDNs used in rules.

Parameters

- `force` -- Forces all fqdn refresh

CLI Example:
```
salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True
```
salt.modules.panos.remove_config_lock()
Release config lock previously held.

CLI Example:
```
salt '*' panos.remove_config_lock
```

salt.modules.panos.resolve_address(address=None, vsys=None)
Resolve address to ip address. Required version 7.0.0 or greater.

address Address name you want to resolve.
vsys The vsys name.

CLI Example:
```
salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2
```

salt.modules.panos.save_device_config(filename=None)
Save device configuration to a named file.

filename The filename to save the configuration to.

CLI Example:
```
salt '*' panos.save_device_config foo.xml
```

salt.modules.panos.save_device_state()
Save files needed to restore device to local disk.

CLI Example:
```
salt '*' panos.save_device_state
```

salt.modules.panos.set_authentication_profile(profile=None, deploy=False)
Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

Parameters
- **profile** *(str)* -- The name of the authentication profile to set.
- **deploy** *(bool)* -- If true then commit the full candidate configuration, if false only set pending change.

CLI Example:
```
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```

salt.modules.panos.set_hostname(hostname=None, deploy=False)
Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
```
salt '*' panos.set_hostname newhostname
salt '*' panos.set_hostname newhostname deploy=True
```

salt.modules.panos.set_management_http(enabled=True, deploy=False)
Enables or disables the HTTP management service on the device.

CLI Example:
Parameters

• `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
• `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_http
salt '*' panos.set_management_http enabled=False deploy=True
```

salt.modules.panos.set_management_https `(enabled=True, deploy=False)`
Enables or disables the HTTPS management service on the device.

CLI Example:

Parameters

• `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
• `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_https
salt '*' panos.set_management_https enabled=False deploy=True
```

salt.modules.panos.set_management_icmp `(enabled=True, deploy=False)`
Enables or disables the ICMP management service on the device.

CLI Example:

Parameters

• `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
• `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_icmp
salt '*' panos.set_management_icmp enabled=False deploy=True
```

salt.modules.panos.set_management_ocsp `(enabled=True, deploy=False)`
Enables or disables the HTTP OCSP management service on the device.

CLI Example:

Parameters

• `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
• `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

salt.modules.panos.set_management_snmp `(enabled=True, deploy=False)`
Enables or disables the SNMP management service on the device.

CLI Example:

Parameters

• `enabled (bool)` -- If true the service will be enabled. If false the service will be disabled.
• `deploy (bool)` -- If true then commit the full candidate configuration, if false only set pending change.
salt.modules.panos.set_management_ssh(enabled=True, deploy=False)

Enables or disables the SSH management service on the device.

CLI Example:
Parameters
  - enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
  - deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt.modules.panos.set_management_telnet(enabled=True, deploy=False)

Enables or disables the Telnet management service on the device.

CLI Example:
Parameters
  - enabled (bool) -- If true the service will be enabled. If false the service will be disabled.
  - deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt.modules.panos.set_ntp_authentication(target=None, authentication_type=None, key_id=None, authentication_key=None, algorithm=None, deploy=False)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
Parameters
  - target (str) -- Determines the target of the authentication. Valid options are primary, secondary, or both.
  - authentication_type (str) -- The authentication type to be used. Valid options are symmetric, autokey, and none.
  - key_id (int) -- The NTP authentication key ID.
  - authentication_key (str) -- The authentication key.
  - algorithm (str) -- The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
  - deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt.modules.panos.set_ntp_servers(primary_server=None, secondary_server=None, deploy=False)

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.
CLI Example:
Parameters
- **primary_server** *(str)* -- The primary NTP server IP address or FQDN.
- **secondary_server** *(str)* -- The secondary NTP server IP address or FQDN.
- **deploy** *(bool)* -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.pool.ntp.org
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

salt.modules.panos.set_permitted_ip *(address=None, deploy=False)*
Add an IPv4 address or network to the permitted IP list.

CLI Example:
Parameters
- **address** *(str)* -- The IPv4 address or network to allow access to add to the Palo Alto device.
- **deploy** *(bool)* -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

salt.modules.panos.set_timezone*(tz=None, deploy=False)*
Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:
Parameters
- **tz** *(str)* -- The name of the timezone to set.
- **deploy** *(bool)* -- If true then commit the full candidate configuration, if false only set pending change.

```python
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```

salt.modules.panos.shutdown()
Shutdown a running system.

CLI Example:

```python
salt '*' panos.shutdown
```

salt.modules.panos.test_fib_route *(ip=None, vr='vr1')*
Perform a route lookup within active route table (fib).

**ip** *(str)*: The destination IP address to test.

**vr** *(str)*: The name of the virtual router to test.

CLI Example:

```python
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```
salt.modules.panos.test_security_policy(
    sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False)

Checks which security policy a connection will match on the device.

sourcezone (str): The source zone matched against the connection.
destinationzone (str): The destination zone matched against the connection.
source (str): The source address. This must be a single IP address.
destination (str): The destination address. This must be a single IP address.
protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.
port (int): The port number for the connection.
application (str): The application that should be matched.
category (str): The category that should be matched.
vsys (int): The numerical representation of the VSYS ID.
allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
    protocol=6 port=22
```

salt.modules.panos.unlock_admin(username=None)

Unlocks a locked administrator account.

username Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```

21.9.337 salt.modules.parallels module

Manage Parallels Desktop VMs with prlctl and prlsrvctl. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

This module requires the prlctl binary to be installed to run most functions. To run parallels.prlsrvctl, the prlsrvctl binary is required.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsrvctl (note the preceding double dash -- as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

salt.modules.parallels.clone(name, new_name, linked=False, template=False, runas=None)

Clone a VM

New in version 2016.11.0.

21.9. execution modules
Parameters

- `name (str)` -- Name/ID of VM to clone
- `new_name (str)` -- Name of the new VM
- `linked (bool)` -- Create a linked virtual machine.
- `template (bool)` -- Create a virtual machine template instead of a real virtual machine.
- `runas (str)` -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

```python
salt.modules.parallels.delete(name, runas=None)
Delete a VM
New in version 2016.11.0.
Parameters

- `name (str)` -- Name/ID of VM to clone
- `runas (str)` -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

```python
salt.modules.parallels.delete_snapshot(name, snap_name, runas=None, all=False)
Delete a snapshot
New in version 2016.11.0.
Parameters

- `name (str)` -- Name/ID of VM whose snapshot will be deleted
- `snap_name (str)` -- Name/ID of snapshot to delete
- `runas (str)` -- The user that the prlctl command will be run as
- `all (bool)` -- Delete all snapshots having the name given

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True runas=macdev
```

```python
salt.modules.parallels.exec_(name, command, runas=None)
Run a command on a VM
Parameters

- `name (str)` -- Name/ID of VM whose exec will be returned
- `command (str)` -- Command to run on the VM
- `runas (str)` -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

```python
salt.modules.parallels.exists(name, runas=None)
Query whether a VM exists
New in version 2016.11.0.
```
Parameters

- **name (str)** -- Name/ID of VM
- **runas (str)** -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

salt.modules.parallels.list_snapshots(name, snap_name=None, tree=False, names=False, runas=None)

List the snapshots

Parameters

- **name (str)** -- Name/ID of VM whose snapshots will be listed
- **snap_id (str)** -- Name/ID of snapshot to display information about. If
  tree=True is also specified, display the snapshot subtree having this snapshot as
  the root snapshot
- **tree (bool)** -- List snapshots in tree format rather than tabular format
- **names (bool)** -- List snapshots as ID, name pairs
- **runas (str)** -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

salt.modules.parallels.list_vms(name=None, info=False, all=False, args=None, runas=None, template=False)

List information about the VMs

Parameters

- **name (str)** -- Name/ID of VM to list
  Changed in version 2016.11.0: No longer implies info=True
- **info (str)** -- List extra information
- **all (bool)** -- List all non-template VMs
- **args (tuple)** -- Additional arguments given to prctl list
- **runas (str)** -- The user that the prlctl command will be run as
- **template (bool)** -- List the available virtual machine templates. The real virtual
  machines will not be included in the output
  New in version 2016.11.0.

Example:

```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```

salt.modules.parallels.prlctl(sub_cmd, args=None, runas=None)

Execute a prlctl command

Parameters

- **sub_cmd (str)** -- prlctl subcommand to execute
- **args (str)** -- The arguments supplied to prlctl <sub_cmd>
- **runas (str)** -- The user that the prlctl command will be run as

Example:
salt 'x' parallels.prlctl user list runas=macdev
salt 'x' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- 'x' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev

salt.modules.parallels.prlsrvctl(sub_cmd, args=None, runas=None)
Execute a prlsrvctl command

New in version 2016.11.0.

Parameters
• sub_cmd (str) -- prlsrvctl subcommand to execute
• args (str) -- The arguments supplied to prlsrvctl <sub_cmd>
• runas (str) -- The user that the prlsrvctl command will be run as

Example:
salt 'x' parallels.prlsrvctl info runas=macdev
salt 'x' parallels.prlsrvctl usb list runas=macdev
salt -- 'x' parallels.prlsrvctl set '--mem-limit auto' runas=macdev

salt.modules.parallels.reset(name, runas=None)
Reset a VM by performing a hard shutdown and then a restart

Parameters
• name (str) -- Name/ID of VM to reset
• runas (str) -- The user that the prlctl command will be run as

Example:
salt 'x' parallels.reset macvm runas=macdev

salt.modules.parallels.restart(name, runas=None)
Restart a VM by gracefully shutting it down and then restarting it

Parameters
• name (str) -- Name/ID of VM to restart
• runas (str) -- The user that the prlctl command will be run as

Example:
salt 'x' parallels.restart macvm runas=macdev

salt.modules.parallels.revert_snapshot(name, snap_name, runas=None)
Revert a VM to a snapshot

Parameters
• name (str) -- Name/ID of VM to revert to a snapshot
• snap_name (str) -- Name/ID of snapshot to revert to
• runas (str) -- The user that the prlctl command will be run as

Example:
salt 'x' parallels.revert_snapshot macvm base-with-updates runas=macdev

salt.modules.parallels.snapshot(name, snap_name=None, desc=None, runas=None)
Create a snapshot

Parameters
• name (str) -- Name/ID of VM to take a snapshot of
• snap_name (str) -- Name of snapshot
• desc (str) -- Description of snapshot
• runas (str) -- The user that the prlctl command will be run as

Example:
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean\n→ install with updates' runas=macdev

```python
salt.modules.parallels.snapshot_id_to_name(name, snap_id, strict=False, runas=None)
```

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned.

**Parameters**

- `name (str)`: Name/ID of VM whose snapshots are inspected
- `snap_id (str)`: ID of the snapshot
- `strict (bool)`: Raise an exception if a name cannot be found for the given `snap_id`
- `runas (str)`: The user that the prlctl command will be run as

**Example data**

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

**CLI Example:**

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66
        runas=macdev
```

```python
salt.modules.parallels.snapshot_name_to_id(name, snap_name, strict=False, runas=None)
```

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned.

**Parameters**

- `name (str)`: Name/ID of VM whose snapshots are inspected
- `snap_name (str)`: Name of the snapshot
- `strict (bool)`: Raise an exception if multiple snapshot IDs are found
- `runas (str)`: The user that the prlctl command will be run as

**CLI Example:**

```
salt '*' parallels.snapshot_name_to_id macvm original runas=macdev
```

```python
salt.modules.parallels.start(name, runas=None)
```

Start a VM

**Parameters**

- `name (str)`: Name/ID of VM to start
- `runas (str)`: The user that the prlctl command will be run as

**Example:**

```
salt '*' parallels.start macvm runas=macdev
```

```python
salt.modules.parallels.status(name, runas=None)
```

Status of a VM

**Parameters**

- `name (str)`: Name/ID of VM whose status will be returned
- `runas (str)`: The user that the prlctl command will be run as

**Example:**

```
```
21.9.338 salt.modules.parted_partition

Module for managing partitions on POSIX-like systems.

```
depends
  • parted, partprobe, lsblk (usually parted and util-linux packages)
```

Some functions may not be available, depending on your version of parted.

Check the manpage for `parted(8)` for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for `sfdisk(8)`.

```
salt.modules.parted_partition.align_check(device, part_type, partition)
  Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".
  CLI Example:
  salt '*' partition.align_check /dev/sda minimal 1
```

```
salt.modules.parted_partition.check(device, minor)
  Checks if the file system on partition <minor> has any errors.
  CLI Example:
  salt '*' partition.check 1
```

```
salt.modules.parted_partition.cp(device, from_minor, to_minor)
  Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.
  CLI Example:
  salt '*' partition.cp /dev/sda 2 3
```

```
salt.modules.parted_partition.disk_set(device, flag, state)
  Changes a flag on selected device.
  A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.
  Valid flags are:
    • cylinder_alignment
```
- pmbr_boot
- implicit_partition_table

CLI Example:
```
salt '*' partition.disk_set /dev/sda pmbr_boot "on"
```

```python
salt.modules.parted_partition.disk_toggle(device, flag)
```
Toggle the state of <flag> on <device>. Valid flags are the same as the disk_set command.

CLI Example:
```
salt '*' partition.disk_toggle /dev/sda pmbr_boot
```

```python
salt.modules.parted_partition.exists(device='')
```
Check to see if the partition exists

CLI Example:
```
salt '*' partition.exists /dev/sdb1
```

```python
salt.modules.parted_partition.get_block_device()
```
Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:
```
salt '*' partition.get_block_device
```

```python
salt.modules.parted_partition.get_id(device, minor)
```
Prints the system ID for the partition. Some typical values are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>FAT32 (vfat)</td>
</tr>
<tr>
<td>7</td>
<td>HPFS/NTFS</td>
</tr>
<tr>
<td>82</td>
<td>Linux Swap</td>
</tr>
<tr>
<td>83</td>
<td>Linux</td>
</tr>
<tr>
<td>8e</td>
<td>Linux LVM</td>
</tr>
<tr>
<td>fd</td>
<td>Linux RAID Auto</td>
</tr>
</tbody>
</table>

CLI Example:
```
salt '*' partition.get_id /dev/sda 1
```

```python
salt.modules.parted_partition.list_(device, unit=None)
```
Prints partition information of given <device>

CLI Examples:
```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

```python
salt.modules.parted_partition.mkfs(device, fs_type)
```
Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:
```
salt '*' partition.mkfs /dev/sda2 fat32
```
**salt.modules.parted_partition.mklabel** *(device, label_type)*

Create a new disklabel (partition table) of label_type.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```bash
salt '*' partition.mklabel /dev/sda msdos
```

**salt.modules.parted_partition.mkpart** *(device, part_type, fs_type= None, start=None, end=None)*

Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:

```bash
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

**salt.modules.parted_partition.mkpartfs** *(device, part_type, fs_type= None, start=None, end=None)*

The mkpartfs actually is an alias to mkpart and is kept for compatibility. To know the valid options and usage syntax read mkpart documentation.

CLI Examples:

```bash
salt '*' partition.mkpartfs /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpartfs /dev/sda primary start=0 end=639
```

**salt.modules.parted_partition.name** *(device, partition, name)*

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```bash
salt '*' partition.name /dev/sda 1 'My Documents'
```

**salt.modules.parted_partition.probe** *(devices)*

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```bash
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

**salt.modules.parted_partition.rescue** *(device, start, end)*

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```bash
salt '*' partition.rescue /dev/sda 0 8056
```

**salt.modules.parted_partition.resize** *(device, minor, start, end)*

Resizes the partition with number <minor>. 

---

2484 Chapter 21. Salt Module Reference
The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```bash
salt '*' partition.resize /dev/sda 3 200 850
```

**salt.modules.parted_partition.rm** *(device, minor)*
Removes the partition with number <minor>.

CLI Example:

```bash
salt '*' partition.rm /dev/sda 5
```

**salt.modules.parted_partition.set_** *(device, minor, flag, state)*
Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.

**Valid flags are:**
- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios_grub
- atvrecv
- diag
- legacy_boot
- msftdata
- irst
- esp
- type

CLI Example:

```bash
salt '*' partition.set /dev/sda 1 boot "on"
```

**salt.modules.parted_partition.set_id** *(device, minor, system_id)*
Sets the system ID for the partition. Some typical values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>FAT32 (vfat)</td>
</tr>
<tr>
<td>7</td>
<td>HPFS/NTFS</td>
</tr>
<tr>
<td>82</td>
<td>Linux Swap</td>
</tr>
<tr>
<td>83</td>
<td>Linux</td>
</tr>
<tr>
<td>8e</td>
<td>Linux LVM</td>
</tr>
<tr>
<td>fd</td>
<td>Linux RAID Auto</td>
</tr>
</tbody>
</table>

CLI Example:
**salt.modules.parted_partition**.system_types()

List the system types that are supported by the installed version of sfdisk

CLI Example:
```
salt '*' partition.system_types
```

**salt.modules.parted_partition**.toggle(device, partition, flag)

Toggle the state of `<flag>` on `<partition>`. Valid flags are the same as the set command.

CLI Example:
```
salt '*' partition.toggle /dev/sda 1 boot
```

### 21.9.339 salt.modules.pcs module

**Configure a Pacemaker/Corosync cluster with PCS**

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

**depends** pcs

New in version 2016.3.0.

**salt.modules.pcs**.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)

Authorize nodes to the cluster

- **nodes** a list of nodes which should be authorized to the cluster
- **pcsuser** user for communication with PCS (default: hacluster)
- **pcspasswd** password for pcsuser (default: hacluster)
- **extra_args** list of extra option for the 'pcs cluster auth' command

CLI Example:
```
salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]' pcsuser=hacluster pcspasswd=hoonetorg extra_args="[ '--force' ]"
```

**salt.modules.pcs**.cib_create(cibfile, scope='configuration', extra_args=None)

Create a CIB-file from the current CIB of the cluster

- **cibfile** name/path of the file containing the CIB
- **scope** specific section of the CIB (default: configuration)
- **extra_args** additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

**salt.modules.pcs**.cib_push(cibfile, scope='configuration', extra_args=None)

Push a CIB-file as the new CIB to the cluster

- **cibfile** name/path of the file containing the CIB
- **scope** specific section of the CIB (default: configuration)
- **extra_args** additional options for creating the CIB-file

CLI Example:
```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

**salt.modules.pcs**.cluster_node_add(node, extra_args=None)

Add a node to the pacemaker cluster via pcs command
**node**  node that should be added
**extra_args**  list of extra option for the 'pcs cluster node add' command

CLI Example:
```python
salt '*' pcs.cluster_node_add node=node2.example.org
```

**salt.modules.pcs.cluster_setup** *(nodes, pcsclusternname='pcscluster', extra_args=None)*
Setup pacemaker cluster via pcs command
**nodes**  a list of nodes which should be set up
**pcsclusternname**  Name of the Pacemaker cluster (default: pcscluster)
**extra_args**  list of extra option for the 'pcs cluster setup' command

CLI Example:
```python
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]'\n  pcsclusternname=pcscluster
```

**salt.modules.pcs.config_show** *(cibfile=None)*
Show config of cluster
**cibfile**  name/path of the file containing the CIB

CLI Example:
```python
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

**salt.modules.pcs.is_auth** *(nodes)*
Check if nodes are already authorized
**nodes**  a list of nodes to be checked for authorization to the cluster

CLI Example:
```python
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

**salt.modules.pcs.item_create** *(item, item_id, item_type, create='create', extra_args=None, cibfile=None)*
Create an item via pcs command (mainly for use with the pcs state module)
**item**  config, property, resource, constraint etc.
**item_id**  id of the item
**item_type**  item type
**create**  create command (create or set f.e., default: create)
**extra_args**  additional options for the pcs command
**cibfile**  use cibfile instead of the live CIB

**salt.modules.pcs.item_show** *(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)*
Show an item via pcs command (mainly for use with the pcs state module)
**item**  config, property, resource, constraint etc.
**item_id**  id of the item
**item_type**  item type
**show**  show command (probably None, default: show)
**extra_args**  additional options for the pcs command
**cibfile**  use cibfile instead of the live CIB

**salt.modules.pcs.prop_set** *(prop, value, extra_args=None, cibfile=None)*
Set the value of a cluster property
**prop**  name of the property
**value**  value of the property prop
**extra_args**  additional options for the pcs property command
**cibfile**  use cibfile instead of the live CIB

---

21.9. execution modules
CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_cluster.cib'
```

**salt.modules.pcs.prop_show**(prop, extra_args=None, cibfile=None)

Show the value of a cluster property

**prop** name of the property

**extra_args** additional options for the pcs property command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'
```

**salt.modules.pcs.resource_create**(resource_id, resource_type, resource_options=None, cibfile=None)

Create a resource via pcs command

**resource_id** name for the resource

**resource_type** resource type (f.e. ocf:heartbeat:IPaddr2 or VirtuallP)

**resource_options** additional options for creating the resource

**cibfile** use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' resource_type='ocf:heartbeat:galera' resource_options='["wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org", --master"]' cibfile='/tmp/cib_for_galera.cib'
```

**salt.modules.pcs.resource_show**(resource_id, extra_args=None, cibfile=None)

Show a resource via pcs command

**resource_id** name of the resource

**extra_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'
```

**salt.modules.pcs.stonith_create**(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)

Create a stonith resource via pcs command

**stonith_id** name for the stonith resource

**stonith_device_type** name of the stonith agent fence_eps, fence_xvm f.e.

**stonith_device_options** additional options for creating the stonith resource

**cibfile** use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps' stonith_device_options='["pcmk_host_map=events.example.org", "ipaddr=example.example.org", "--master", "power_wait=5", "verbose=1", "debug=/var/log/pcsd/eps_fence.log", "login=hidden", "passwd=hoonetorg"]' cibfile='/tmp/cib_for_stonith.cib'
```

**salt.modules.pcs.stonith_show**(stonith_id, extra_args=None, cibfile=None)

Show the value of a cluster stonith

**stonith_id** name for the stonith resource

CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/cib_for_stonith.cib'
```
extra_args  additional options for the pcs stonith command
    cibfile use cibfile instead of the live CIB
    CLI Example:

    salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'

21.9.340 salt.modules.pdbedit

Manage accounts in Samba’s passdb using pdbedit

    maintainer  Jorge Schrauwen <sjorge@blackdot.be>
    maturity new
    platform posix

New in version 2017.7.0.

salt.modules.pdbedit.create(login, password, password_hashed=False, machine_account=False)

    Create user account
    login  [string] login name
    password  [string] password
    password_hashed  [boolean] set if password is a nt hash instead of plain text
    machine_account  [boolean] set to create a machine trust account instead
    CLI Example:

    salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nhash
    salt '*' pdbedit.create river 1sw4ll0w3d4bug

salt.modules.pdbedit.delete(login)

    Delete user account
    login  [string] login name
    CLI Example:

    salt '*' pdbedit.delete wash

salt.modules.pdbedit.generate_nt_hash(password)

    Generate a NT HASH
    CLI Example:

    salt '*' pdbedit.generate_nt_hash my_passwd

salt.modules.pdbedit.get_user(login, hashes=False)

    Get user account details
    login  [string] login name
    hashes  [boolean] include NTHASH and LMHASH in verbose output
    CLI Example:

    salt '*' pdbedit.get kaylee

salt.modules.pdbedit.list_users(verbos=True, hashes=False)

    List user accounts
    verbos  [boolean] return all information
    hashes  [boolean] include NT HASH and LM HASH in verbose output
    CLI Example:
salt 'x' pdbedit.list

salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)

Modify user account
login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
domain [string] users domain
profile [string] profile path
script [string] logon script
drive [string] home drive
homedir [string] home directory
fullname [string] full name
account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid
user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

**Note:** if user is absent and password is provided, the user will be created

CLI Example:

```bash
salt 'x' pdbedit.modify inara fullname='Inara Serra'
salt 'x' pdbedit.modify simon password=r1v3r
salt 'x' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt 'x' pdbedit.modify mal account_control=NX
```

### 21.9.341 salt.modules.pecl

Manage PHP pecl extensions.

salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')

New in version 0.17.0.

Installs one or several pecl extensions.

**pecls** The pecl extensions to install.
**defaults** Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

**force** Whether to force the installed version or not

CLI Example:

```bash
salt 'x' pecl.install fuse
```
salt.modules.pecl.list_(channel=None)
List installed pecl extensions.
CLI Example:
```
salt '*' pecl.list
```

salt.modules.pecl.uninstall(pecls)
Uninstall one or several pecl extensions.
pecls The pecl extensions to uninstall.
CLI Example:
```
salt '*' pecl.uninstall fuse
```

salt.modules.pecl.update(pecls)
Update one or several pecl extensions.
pecls The pecl extensions to update.
CLI Example:
```
salt '*' pecl.update fuse
```

## 21.9.342 salt.modules.peeringdb module

**PeeringDB Module**

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by get_) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to [https://www.peeringdb.com/apidocs/](https://www.peeringdb.com/apidocs/).

Configuration (in the opts or Pillar):
```
peeringdb:
  username: salt
  password: 5@1t
```

salt.modules.peeringdb.get_fac(**kwargs)
Return the details of the facility identified using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

CLI Example:
```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

salt.modules.peeringdb.get_ix(**kwargs)
Return the details of an IX (Internet Exchange) using the search filters specified in the query.
Note: If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#/ix/ix_list

**CLI Example:**

```bash
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

**salt.modules.peeringdb.get_ixfac(**`**kwargs**`)**

Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#/ixfac/ixfac_list

**CLI Example:**

```bash
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```

**salt.modules.peeringdb.get_ixlan(**`**kwargs**`)**

Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#/ixlan/ixlan_list

**CLI Example:**

```bash
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

**salt.modules.peeringdb.get_ixpfx(**`**kwargs**`)**

Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#/ixpfx/ixpfx_list

**CLI Example:**

```bash
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

**salt.modules.peeringdb.get_net(**`**kwargs**`)**

Return the details of a network identified using the search filters specified in the query.
**Note:** If no `id` or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/net/net_list](https://www.peeringdb.com/apidocs/#!/net/net_list)

**CLI Example:**

```python
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

`salt.modules.peeringdb.get_netfac(**kwargs)`

Return the list of facilities used by a particular network, given the `id` or other filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netfac/netfac_list](https://www.peeringdb.com/apidocs/#!/netfac/netfac_list)

**CLI Example:**

```python
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

`salt.modules.peeringdb.get_netixlan(**kwargs)`

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the `id` argument or the other filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list](https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list)

**CLI Example:**

```python
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```

`salt.modules.peeringdb.get_org(**kwargs)`

Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

**Note:** If no `id` or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: [https://www.peeringdb.com/apidocs/#!/org/org_list](https://www.peeringdb.com/apidocs/#!/org/org_list)

**CLI Example:**

```python
salt '*' peeringdb.get_org id=2
salt '*' peeringdb.get_org city=Duesseldorf
```
salt.modules.peeringdb.get_poc(**kwargs)

Return the details of a person of contact together using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.
The available filters are documented at: https://www.peeringdb.com/apidocs/#!/poc/poc_list

CLI Example:

```
salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'
```

21.9.343 salt.modules.pf

Control the OpenBSD packet filter (PF).

codeauthor Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.

salt.modules.pf.disable()

Disable the Packet Filter.

CLI example:

```
salt '*' pf.disable
```

salt.modules.pf.enable()

Enable the Packet Filter.

CLI example:

```
salt '*' pf.enable
```

salt.modules.pf.flush(modifier)

Flush the specified packet filter parameters.

modifier: Should be one of the following:

- all
- info
- osfp
- rules
- sources
- states
- tables

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI example:

```
salt '*' pf.flush states
```

salt.modules.pf.load(file=/etc/pf.conf, noop=False)

Load a ruleset from the specific file, overwriting the currently loaded ruleset.

file: Full path to the file containing the ruleset.

noop: Don't actually load the rules, just parse them.

CLI example:
salt '*' pf.load /etc/pf.conf.d/lockdown.conf

salt.modules.pf.loglevel(level)

Set the debug level which limits the severity of log messages printed by pf(4).

**level:** Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug (OpenBSD); or none, urgent, misc, loud (FreeBSD).

CLI example:

```
salt '*' pf.loglevel emerg
```

salt.modules.pf.show(modifier)

Show filter parameters.

**modifier:** Modifier to apply for filtering. Only a useful subset of what pfctl supports can be used with Salt.

- rules
- states
- tables

CLI example:

```
salt '*' pf.show rules
```

salt.modules.pf.table(command, table, **kwargs)

Apply a command on the specified table.

**table:** Name of the table.

**command:** Command to apply to the table. Supported commands are:

- add
- delete
- expire
- flush
- kill
- replace
- show
- test
- zero

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI example:

```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", "::1"]'
```
21.9.344 salt.modules.philips_hue module

Philips HUE lamps module for proxy.
New in version 2015.8.3.

21.9.345 salt.modules.pillar

Extract the pillar data for this minion
salt.modules.pillar.ext(external, pillar=None)

Changed in version 2016.3.6, 2016.11.3, 2017.7.0: The supported ext_pillar types are now tunable using the
on_demand_ext_pillar config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar
external A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section
from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar con-
figurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and
figure out

```python
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load(""
... ext_pillar:
...  - git:
...    - issue38440 https://github.com/terminalmage/git_pillar:
...      - env: base
... "")
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': {'env': 'base'}}]}]}
```

In the above example, the value to pass would be {'git': [{'mybranch https://github.com/myuser/myrepo': {'env': 'base'}}]}. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar
rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```bash
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext '{'git': ['master https://github.com/myuser/myrepo']}
salt '*' pillar.ext '{'git': ['mybranch https://github.com/myuser/myrepo': {'env': 'base']})}"
```

salt.modules.pillar.fetch(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None,
delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the
in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict
in pillar looks like this:
To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

**key** The pillar key to get value from

**default** The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge** [False] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7, 2016.11.4, 2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists** If set to `False`, lists nested within the retrieved pillar dictionary will overwrite lists in `default`. If set to `True`, nested lists will be merged into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

New in version 2016.11.6.

**delimiter** Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv** If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

**CLI Example:**

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

**salt.modules.pillar.file_exists**(path, saltenv=None)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.
Will only work with pillar_roots, not external pillars.

Returns True if the file is found, and False otherwise.

**path** The path to the file in question. Will be treated as a relative path

**saltenv** Optional argument to restrict the search to a specific saltenv

**CLI Example:**

```bash
salt '*' pillar.file_exists foo/bar.sls
```

```python
salt.modules.pillar.filter_by(lookup_dict, pillar, merge=None, default='default', base=None)
```

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

**Parameters**

- **lookup_dict** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding lookup_dict value where the pillar value matches the pattern. For example:

  ```bash
  # this will render 'got some salt' if `role` begins with
  # 'salt'
  salt '*' pillar.filter_by '{salt*: got some salt, default:salt is not here}' role
  ```

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the lookup_dict dictionary.

  The pillar value can be a list. The function will return the lookup_dict value for a first found item in the list matching one of the lookup_dict keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from lookup_dict. This allows another dictionary to override the values in the lookup_dict.

- **default** -- default lookup_dict's key used if the pillar does not exist or if the pillar value has no match on lookup_dict. If unspecified the value is "default".

- **base** -- A lookup_dict key to use for a base dictionary. The pillar-selected lookup_dict is merged over this and then finally the merge dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

**CLI Example:**

```bash
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

```python
salt.modules.pillar.get(key, default=<class 'KeyError'>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)
```

New in version 0.14.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ".:" delimiter for the dict. This means that if a dict in pillar looks like this:

```bash
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:
pkg:apache

**key**  The pillar key to get value from
**default**  The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

**merge**  If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7, 2016.11.4, 2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

**merge_nested_lists**  If set to `False`, lists nested within the retrieved pillar dictionary will overwrite lists in `default`. If set to `True`, nested lists will be merged into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

New in version 2016.11.6.

**delimiter**  Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

**pillarenv**  If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

**saltenv**  Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

**CLI Example:**
```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.item`(*args*, **kwargs)

Return one or more pillar entries from the *in-memory pillar data*.

**delimiter**  Delimiter used to traverse nested dictionaries.

**Note:**  This is different from `pillar.get` in that no default value can be specified. `pillar.get` should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of `pillar.get` however is when it is desirable to retrieve the values of more than one key, since `pillar.get` can only retrieve one key at a time.
New in version 2015.8.0.
pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.
CLI Examples:
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz

salt.modules.pillar.items(*args, **kwargs)
Calls the master for a fresh pillar and generates the pillar data on the fly
Contrast with raw() which returns the pillar data that is currently loaded into the minion.
pillar If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.
pillar_enc If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.
pillarenv Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion’s pillarenv option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
CLI Example:
salt '*' pillar.items

salt.modules.pillar.keys(key, delimiter=\':\')
New in version 2015.8.0.
Attempt to retrieve a list of keys from the named value from the pillar.
The value can also represent a value in a nested dict using a ":\" delimiter for the dict, similar to how pillar.get works.
delimiter Specify an alternate delimiter to use when traversing a nested dict
CLI Example:
salt 'x' pillar.keys web:sites

```
salt.modules.pillar.ls(*args)
```
New in version 2015.8.0.
Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

CLI Examples:
```
salt 'x' pillar.ls
```

```
salt.modules.pillar.obfuscate(*args)
```
New in version 2015.8.0.
Same as `items()`, but replace pillar values with a simple type indication.
This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:
- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'somelogin', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:
```
salt 'x' pillar.obfuscate
```

```
salt.modules.pillar.raw(key=None)
```
Return the raw pillar data that is currently loaded into the minion.
Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:
```
salt 'x' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data:
```
salt 'x' pillar.raw key='roles'
```

### 21.9.346 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv
Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (cwd) and the Pip Binary (bin_env) salt should use. The variable pip_bin can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the cwd and bin_env options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, cwd: 'C:salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.
There is a known incompatibility between Python2 pip>=10.* and Salt <=2018.3.0. The issue is described here: https://github.com/saltstack/salt/issues/46163

```
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**user** The user under which to run pip

**cwd** Directory from which to run pip

**Note:** If the version of pip available is older than 8.0.3, the list will not include the packages pip, wheel, setuptools, or distribute even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None, allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, no_binary=None, disable_version_check=False, **kwargs)
```

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

**pkgs** Comma separated list of packages to install

**requirements** Path to requirements

**bin_env** Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**Note:** For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

**use_wheel** Prefer wheel archives (requires pip>=1.4)

**no_use_wheel** Force to not use wheel archives (requires pip>=1.4,<10.0.0)

**no_binary** Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

**log** Log file where a complete (maximum verbosity) record will be kept

**proxy** Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.
Note: If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass False as a value.

```python
timeout  Set the socket timeout (default 15 seconds)
editable install something editable (e.g. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed) find_links URL to search for packages index_url Base URL of Python Package Index extra_index_url Extra URLs of package indexes to use in addition to index_url no_index Ignore package index mirrors Specific mirror URL(s) to query (automatically adds --use-mirrors)
```

Warning: This option has been deprecated and removed in pip version 7.0.0. Please use index_url and/or extra_index_url instead.

```python
build  Unpack packages into build dir
target Install packages into target dir
download Download packages into download instead of installing them
download_cache | cache_dir Cache downloaded packages in download_cache or cache_dir dir source Check out editable packages into source dir upgrade Upgrade all packages to the newest available version force_reinstall When upgrading, reinstall all packages even if they are already up-to-date. ignore_installed Ignore the installed packages (reinstalling instead) exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup no_deps Ignore package dependencies no_install Download and unpack all packages, but don't actually install them no_download Don't download any packages, just install the ones already downloaded (completes an install run with --no-install) install_options Extra arguments to be supplied to the setup.py install command (e.g. like --install-option='--install-scripts=/usr/local/bin'). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
global_options Extra global options to be supplied to the setup.py call before the install command.
user The user under which to run pip
cwd Directory from which to run pip
pre_releases Include pre-releases in the available versions
cert Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
env_vars Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:
```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.
use_vt Use VT terminal emulation (see output while installing)
no_cache_dir Disable the cache.
extra_args pip keyword and positional arguments not yet implemented in salt
Warning: If unsupported options are passed here that are not supported in a minion's version of pip, a No such option error will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

**disable_version_check**  
Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

salt.modules.pip.is_installed(pkgname=None, bin_env=None, user=None, cwd=None)

New in version 2018.3.0.

Filter list of installed apps from freeze and return True or False if pkgname exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike pip.freeze, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

salt.modules.pip.list_(prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)

Filter list of installed apps from freeze and check to see if prefix exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike pip.freeze, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list salt
```
salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)

New in version 2017.7.3.

List all available versions of a pip package
pkg The package to check
bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
include_alpha Include alpha versions in the list
include_beta Include beta versions in the list
include_rc Include release candidates versions in the list
user The user under which to run pip
cwd Directory from which to run pip
index_url Base URL of Python Package Index .. versionadded:: 2019.2.0
extra_index_url Additional URL of Python Package Index .. versionadded:: 2019.2.0

CLI Example:
salt '*' pip.list_all_versions <package name>

salt.modules.pip.list_upgrades(bin_env=None, user=None, cwd=None)

Check whether or not an upgrade is available for all packages

CLI Example:
salt '*' pip.list_upgrades

salt.modules.pip.uninstall(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)

Uninstall packages individually or from a pip requirements file
pkgs comma separated list of packages to install
requirements Path to requirements file
bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
log Log file where a complete (maximum verbosity) record will be kept
proxy Specify a proxy in the format user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

Note: If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass False as a value.

timeout Set the socket timeout (default 15 seconds)
user The user under which to run pip
cwd Directory from which to run pip
use_vt Use VT terminal emulation (see output while installing)

CLI Example:
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin

salt.modules.pip.upgrade(bin_env=None, user=None, cwd=None, use_vt=False)
New in version 2015.5.0.
Upgrades outdated pip packages.

**Note:** On Windows you can’t update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

```{"<package>`: {'old': `<old-version>`}, 'new': `<new-version>`}`

**CLI Example:**

```salt '*' pip.upgrade```

**salt.modules.pip.upgrade_available** *(pkg, bin_env=None, user=None, cwd=None)*

New in version 2015.5.0.
Check whether or not an upgrade is available for a given package

**CLI Example:**

```salt '*' pip.upgrade_available <package name>```

**salt.modules.pip.version** *(bin_env=None, cwd=None, user=None)*

New in version 0.17.0.
Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.
If unable to detect the pip version, returns `None`.
Changed in version 3001.1: The `user` parameter was added, to allow specifying the user who runs the version command.

**CLI Example:**

```salt '*' pip.version```

### 21.9.347 salt.modules.pkg_resource

Resources needed by pkg providers

**salt.modules.pkg_resource.add_pkg** *(pkgs, name, pkgver)*

Add a package to a dict of installed packages.

**CLI Example:**

```salt '*' pkg_resource.add_pkg '{}' bind 9```

**salt.modules.pkg_resource.check_extra_requirements** *(pkgnamex, pkgver)*

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

**CLI Example:**

```salt '*' pkg_resource.check_extra_requirements <pkgnamex> <extra_requirements>```

**salt.modules.pkg_resource.format_pkg_list** *(packages, versions_as_list, attr)*

Formats packages according to parameters for list_pkgs.
**salt.modules.pkg_resource.format_version** *(epoch, version, release)*

Formats a version string for list_pkgs.

**salt.modules.pkg_resource.pack_sources** *(sources, normalize=True)*

Accepts a list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

```
'[["foo": "salt://foo.rpm"], 
  "bar": "salt://bar.rpm"]]' would become 
  
  "foo": "salt://foo.rpm", 
  "bar": "salt://bar.rpm"
```

**normalize** [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[["foo": "salt://foo.rpm"], "bar": "salt://bar.rpm"]']
```

**salt.modules.pkg_resource.parse_targets** *(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)*

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

**salt.modules.pkg_resource.sort_pkglist** *(pkgs)*

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '[[3.45, 2.13]]'
```

**salt.modules.pkg_resource.stringify** *(pkgs)*

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

**salt.modules.pkg_resource.version** *(names, **kwargs)*

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

**salt.modules.pkg_resource.version_clean** *(verstr)*

Clean the version string removing extra data. This function will simply try to call pkg.version_clean.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```
salt.modules.pkg_resource.version_compare(\texttt{ver1, oper, ver2, ignore\_epoch=False})

New in version 3001.

Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

- \texttt{ver1} The first version to be compared
- \texttt{oper} One of \texttt{==}, \texttt{!=}, \texttt{>=}, \texttt{<=}, \texttt{>}, \texttt{<}
- \texttt{ver2} The second version to be compared

**Note:** To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

- \texttt{ignore\_epoch} [\texttt{False}] If \texttt{True}, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:

\begin{verbatim}
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_epoch=True
\end{verbatim}

**CLI Examples:**

```
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_epoch=True
```

### 21.9.348 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install is not available), see [here](#).

salt.modules.pkgin.available_version(\texttt{'names, **kwargs})

This function is an alias of \texttt{latest\_version}.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**CLI Example:**

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.file_dict(\texttt{\textquotesingle packages, **kwargs})

List the files that belong to a package.

**CLI Examples:**

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```
salt.modules.pkgin.file_list(package, **kwargs)
List the files that belong to a package.

CLI Examples:
salt '*' pkg.file_list nginx

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
Install the passed package
name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository to install from.

Multiple Package Installation Options:
pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
salt '*' pkg.install pkgs='["foo","bar"]'
sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.

CLI Example:
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'

Return a dict containing the new package names and versions:

'{<package>: {"old": <old-version>, 
"new": <new-version>}}'

CLI Example:
salt '*' pkg.install <package name>

salt.modules.pkgin.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation.
If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:

'{<package_name>: '<version>}'

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.pkgin.list_upgrades(refresh=False, **kwargs)
List all available package upgrades.

New in version 2018.3.0.
refresh Whether or not to refresh the package database before installing.
**salt.modules.pkgin.normalize_name**(*pkgs, **kwargs*)

Normalize package names

**Note:** Nothing special to do to normalize, just return the original. (We do need it to be compatible with the pkg_resource provider.)

**salt.modules.pkgin.purge**(*name=None, pkgs=None, **kwargs*)

Package purges are not supported, this function is identical to **remove()**.

*name* The name of the package to be deleted.

*pkgs* A list of packages to delete. Must be passed as a python list. The *name* parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

**CLI Example:**

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

**salt.modules.pkgin.refresh_db**(*force=False, **kwargs*)

Use pkg update to get latest pkg_summary

*force* Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

**CLI Example:**

```
salt '*' pkg.refresh_db
```

**salt.modules.pkgin.remove**(*name=None, pkgs=None, **kwargs*)

*name* The name of the package to be deleted.

*pkgs* A list of packages to delete. Must be passed as a python list. The *name* parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

**CLI Example:**

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.pkgin.search**(*pkg_name, **kwargs*)

Searches for an exact match using pkgin ^package$

**CLI Example:**

```
salt '*' pkg.search 'mysql-server'
```
salt.modules.pkgin.upgrade(refresh=True, pkgs=None, **kwargs)
Run pkg upgrade, if pkgin used. Otherwise do nothing
refresh Whether or not to refresh the package database before installing.
Multiple Package Upgrade Options:
  pkgs A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```
Returns a dictionary containing the changes:
```
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

CLI Example:
```
salt '*' pkg.upgrade
```

salt.modules.pkgin.version(names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

21.9.349 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the sys.doc function:
```
salt bsdminion sys.doc pkgng
```
This module provides an interface to pkg(8). It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the providers parameter in your Minion config file, in order to use this module to manage packages, like so:
```
pkg: pkgng
```
salt.modules.pkgng.audit(jail=None, chroot=None, root=None)
Audits installed packages against known vulnerabilities

CLI Example:
salt '*' pkg.audit

**jail**  Audit packages within the specified jail

CLI Example:
```
salt '*' pkg.audit jail=<jail name or id>
```

**chroot**  Audit packages within the specified chroot (ignored if jail is specified)

**root**  Audit packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.audit chroot=/path/to/chroot
```

salt.modules.pkgng.autoremove(jail=None, chroot=None, root=None, dryrun=False)

Delete packages which were automatically installed as dependencies and are not required anymore.

dryrun  Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:
```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

salt.modules.pkgng.backup(file_name, jail=None, chroot=None, root=None)

Export installed packages into yaml+mtree file

CLI Example:
```
salt '*' pkg.backup /tmp/pkg
```

**jail**  Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:
```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

**chroot**  Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**root**  Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:
```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.check(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False)

Sanity checks installed packages

**jail**  Perform the sanity check in the specified jail

CLI Example:
```
salt '*' pkg.check jail=<jail name or id>
```

**chroot**  Perform the sanity check in the specified chroot (ignored if jail is specified)

**root**  Perform the sanity check in the specified root (ignored if jail is specified)

CLI Example:
Of the below, at least one must be set to True.

**depends** Check for and install missing dependencies.

**recompute** Recompute sizes and checksums of installed packages.

**checksum** Find invalid checksums for installed packages.

```
salt '*' pkg.check chroot=/path/to/chroot
```

```
salt '*' pkg.check depends=True
```

```
salt '*' pkg.check recompute=True
```

```
salt '*' pkg.check checksum=True
```

```
salt.modules.pkgng.clean(jail=None, chroot=None, root=None, clean_all=False, dryrun=False)
```

Cleans the local cache of fetched remote packages

```
salt '*' pkg.clean
```

```
salt '*' pkg.clean jail=<jail name or id>
```

```
salt '*' pkg.clean chroot=/path/to/chroot
```

```
salt '*' pkg.clean clean_all=True
```

```
salt '*' pkg.clean dryrun=True
```

```
salt.modules.pkgng.fetch(name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False)
```

Fetches remote packages

```
salt '*' pkg.fetch
```

```
salt '*' pkg.fetch name=mypackage
```

```
salt '*' pkg.fetch name=mypackage chroot=/path/to/chroot
```

```
salt '*' pkg.fetch name=mypackage root=/path/to/root
```

```
salt '*' pkg.fetch name=mypackage jail=<jail name or id>
```

```
salt '*' pkg.fetch name=mypackage root=<root>
```

```
salt '*' pkg.fetch name=mypackage chroot=/path/to/chroot
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository>
```

```
salt '*' pkg.fetch name=mypackage quiet=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=None glob=False
```

```
salt '*' pkg.fetch name=mypackage glob=True
```

```
salt '*' pkg.fetch name=mypackage regex=True
```

```
salt '*' pkg.fetch name=mypackage pcre=True
```

```
salt '*' pkg.fetch name=mypackage local=True
```

```
salt '*' pkg.fetch name=mypackage depends=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
glob=False
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
glob=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
regex=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
pcre=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
local=True
```

```
salt '*' pkg.fetch name=mypackage fromrepo=<repository> quiet=True
depends=True
```
salt '* pkg.fetch <package name>

**jail** Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot** Fetch package in the specified chroot (ignored if jail is specified)

**root** Fetch package in the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch_all** Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet** Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo** Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob** Treat pkg_name as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

**regex** Treat pkg_name as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

**pcre** Treat pkg_name is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

**local** Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

**depends** Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

```
salt.modules.pkgng.hold(name=None, pkgs=None, **kwargs)

Version-lock packages
```
Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.lock instead.

name The name of the package to be held.

Multiple Package Options:
pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.pkgng.install(name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstallRequires=False, regex=False, pcre=False, batch=False, **kwargs)

Install package(s) from a repository

name The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail Install the package into the specified jail

chroot Install the package into the specified chroot (ignored if jail is specified)

root Install the package into the specified root (ignored if jail is specified)

orphan Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to pkg-autoremove(8).

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```
**quiet**  Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

**reinstall_requires**  When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: require kwarg renamed to reinstall_requires

**fromrepo**  In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

**regex**  Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

**pcre**  Treat the package names as extended regular expressions.

CLI Example:

```

```

**batch**  Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

**salt.modules.pkgng.latest_version**(*`names`, **`kwargs`*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

**salt.modules.pkgng.list_locked**(**`kwargs`*)

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

**jail**  List locked packages within the specified jail

CLI Example:
```
salt '*' pkg.list_locked jail=<jail name or id>
```

**chroot** List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

**root** List locked packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_locked root=/path/to/chroot
```

```python
salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)
```

List the packages currently installed as a dict:

```
{"<package_name>": '<version>'}
```

**jail** List the packages in the specified jail

**chroot** List the packages in the specified chroot (ignored if jail is specified)

**root** List the packages in the specified root (ignored if jail is specified)

**with_origin** [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

```
salt.modules.pkgng.list_upgrades(refresh=True, **kwargs)
```

List those packages for which an upgrade is available

The fromrepo argument is also supported, as used in pkg states.

CLI Example:
```
salt '*' pkg.list_upgrades
```

**jail** List upgrades within the specified jail

CLI Example:
```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

**chroot** List upgrades within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root** List upgrades within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

```python
salt.modules.pkgng.lock(name, **kwargs)
```

Lock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully locked.

CLI Example:
```bash
salt '*' pkg.lock <package name>
```

**jail**  Lock packages within the specified jail

CLI Example:
```bash
salt '*' pkg.lock <package name> jail=<jail name or id>
```

**chroot**  Lock packages within the specified chroot (ignored if jail is specified)

CLI Example:
```bash
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

**root**  Lock packages within the specified root (ignored if jail is specified)

CLI Example:
```bash
salt '*' pkg.lock <package name> root=/path/to/chroot
```

salt.modules.pkgng.locked(name, **kwargs)
Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:
```bash
salt '*' pkg.locked <package name>
```

**jail**  Test if a package is locked within the specified jail

CLI Example:
```bash
salt '*' pkg.locked <package name> jail=<jail name or id>
```

**chroot**  Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:
```bash
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

**root**  Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:
```bash
salt '*' pkg.locked <package name> root=/path/to/chroot
```

salt.modules.pkgng.parse_config(file_name='/usr/local/etc/pkg.conf')
Return dict of uncommented global variables.

CLI Example:
```bash
salt '*' pkg.parse_config
```

**NOTE:** not working properly right now

salt.modules.pkgng.refresh_db(jail=None, chroot=None, root=None, force=False, **kwargs)
Refresh PACKAGESITE contents
Note: This function can be accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```bash
salt '*' pkg.refresh_db
```

**jail**  Refresh the pkg database within the specified jail
**chroot**  Refresh the pkg database within the specified chroot (ignored if `jail` is specified)
**root**  Refresh the pkg database within the specified root (ignored if `jail` is specified)
**force**  Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```bash
salt '*' pkg.refresh_db force=True
```

The `salt.modules.pkgng.remove` function allows you to remove a package from the database and system.

Note: This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

**name**  The package to remove

CLI Example:

```bash
salt '*' pkg.remove <package name>
```

**jail**  Delete the package from the specified jail
**chroot**  Delete the package from the specified chroot (ignored if `jail` is specified)
**root**  Delete the package from the specified root (ignored if `jail` is specified)
**all_installed**  Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```bash
salt '*' pkg.remove all all_installed=True force=True
```

**force**  Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```bash
salt '*' pkg.remove <package name> force=True
```

**glob**  Treat the package names as shell glob patterns.

CLI Example:

```bash
salt '*' pkg.remove <package name> glob=True
```

**dryrun**  Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```bash
salt '*' pkg.remove <package name> dryrun=True
```
**recurrse**  Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

**regex**  Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**  Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

---

**salt.modules.pkgng.restore**  

(reads archive created by pkg backup -d and recreates the database)

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

**jail**  Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

**chroot**  Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

**root**  Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

---

**salt.modules.pkgng.search**  

(Searches in remote package repositories)

CLI Example:

```
salt '*' pkg.search pattern
```

**jail**  Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

**chroot**  Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if jail is specified)

**root**  Perform the search using the `pkg.conf(5)` from the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

**exact**  Treat pattern as exact pattern.

CLI Example:
```
salt '*' pkg.search pattern exact=True
```

**glob**  Treat pattern as a shell glob pattern.

CLI Example:
```
salt '*' pkg.search pattern glob=True
```

**regex**  Treat pattern as a regular expression.

CLI Example:
```
salt '*' pkg.search pattern regex=True
```

**pcre**  Treat pattern as an extended regular expression.

CLI Example:
```
salt '*' pkg.search pattern pcre=True
```

**comment**  Search for pattern in the package comment one-line description.

CLI Example:
```
salt '*' pkg.search pattern comment=True
```

**desc**  Search for pattern in the package description.

CLI Example:
```
salt '*' pkg.search pattern desc=True
```

**full**  Displays full information about the matching packages.

CLI Example:
```
salt '*' pkg.search pattern full=True
```

**depends**  Displays the dependencies of pattern.

CLI Example:
```
salt '*' pkg.search pattern depends=True
```

**size**  Displays the size of the package.

CLI Example:
```
salt '*' pkg.search pattern size=True
```

**quiet**  Be quiet. Prints only the requested information without displaying many hints.

CLI Example:
```
salt '*' pkg.search pattern quiet=True
```

**origin**  Displays pattern origin.

CLI Example:
Salt Documentation, Release 3002.6

```python
salt '*' pkg.search pattern origin=True
```

**prefix** Displays the installation prefix for each package matching pattern.

CLI Example:

```python
salt '*' pkg.search pattern prefix=True
```

**salt.modules.pkgng.stats** *(local=False, remote=False, jail=None, chroot=None, root=None)*

Return pkgng stats.

CLI Example:

```python
salt '*' pkg.stats
```

**local** Display stats only for the local package database.

CLI Example:

```python
salt '*' pkg.stats local=True
```

**remote** Display stats only for the remote package database(s).

CLI Example:

```python
salt '*' pkg.stats remote=True
```

**jail** Retrieve stats from the specified jail.

CLI Example:

```python
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

**chroot** Retrieve stats from the specified chroot (ignored if jail is specified).

**root** Retrieve stats from the specified root (ignored if jail is specified).

CLI Example:

```python
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

**salt.modules.pkgng.unhold** *(name=None, pkgs=None, **kwargs)*

Remove version locks

**Note:** This function is provided primarily for compatibility with some parts of `states.pkg`. Consider using `pkg.unlock` instead.

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```python
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=['foo', 'bar']
```
salt.modules.pkgng.unlock(name, **kwargs)
Unlock the named package against reinstallation, modification or deletion.
Returns True if the named package was successfully unlocked.

CLI Example:
```
salt '*' pkg.unlock <package name>
```

jail Unlock packages within the specified jail

CLI Example:
```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

chroot Unlock packages within the specified chroot (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

root Unlock packages within the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

salt.modules.pkgng.update_package_site(new_url)
Updates remote package repo URL, PACKAGESITE var to be exact.
Must use http://, ftp://, or https:// protocol

CLI Example:
```
salt '*' pkg.update_package_site http://127.0.0.1/
```

salt.modules.pkgng.updating(name, jail=None, chroot=None, root=None, filedate=None, filename=None)
` Displays UPDATING entries of software packages

CLI Example:
```
salt '*' pkg.updating foo
```

jail Perform the action in the specified jail

CLI Example:
```
salt '*' pkg.updating foo jail=<jail name or id>
```

chroot Perform the action in the specified chroot (ignored if jail is specified)
root Perform the action in the specified root (ignored if jail is specified)

CLI Example:
```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

filedate Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:
```
salt '*' pkg.updating foo filedate=20130101
```
filename  Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

salt.modules.pkgng.upgrade('names,**kwargs)
Upgrade named or all packages (run a pkg upgrade). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

jail  Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

croot  Audit packages within the specified chroot (ignored if jail is specified)

root  Audit packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with jail or chroot.

force  Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

local  Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg upgrade.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

dryrun  Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

fromrepo  In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

CLI Example:

```
salt '*' pkg.upgrade <package name> fromrepo=repo
```

fetchonly  Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:
salt '*' pkg.upgrade <package name> fetchonly=True

```
salt.modules.pkgng.version('names', **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).

```
jail Get package version information for the specified jail
chroot Get package version information for the specified chroot (ignored if jail is specified)
root Get package version information for the specified root (ignored if jail is specified)
with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.
```

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

```
salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
```

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

```
salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)
```

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

```
jail Perform the check in the specified jail
```

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

```
chroot Perform the check in the specified chroot (ignored if jail is specified)
root Perform the check in the specified root (ignored if jail is specified)
```

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

```
origin Shows the origin of the package instead of name-version.
```

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

```
quiet Quiet output.
```

CLI Example:
21.9.350 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pkgutil.install(name=None, refresh=False, version=None, pkgs=None, **kwargs)
Install packages using the pkgutil tool.

CLI Example:
```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

pkgs A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:
```
{"<package>": {"old": '<old-version>',
                 "new": '<new-version>'}}
```

salt.modules.pkgutil.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
```
{"<package_name>": '<version>'}
```

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.list_upgrades(refresh=True, **kwargs)
List all available package upgrades on this system

CLI Example:
salt '*' pkgutil.list_upgrades

salt.modules.pkgutil.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported, this function is identical to remove().
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.pkgutil.refresh_db()
Updates the pkgutil repo database (pkgutil -U)
CLI Example:
salt '*' pkgutil.refresh_db

salt.modules.pkgutil.remove(name=None, pkgs=None, **kwargs)
Remove a package and all its dependencies which are not in use by other packages.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.pkgutil.upgrade(refresh=True)
Upgrade all of the packages to the latest available version.
Returns a dict containing the changes:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
salt '*' pkgutil.upgrade

salt.modules.pkgutil.upgrade_available(name)
Check if there is an upgrade available for a certain package
CLI Example:
salt '*' pkgutil.upgrade_available CSWpython

salt.modules.pkgutil.version(*names, **kwargs)
    Returns a version if the package is installed, else returns an empty string
    
    CLI Example:
    salt '*' pkgutil.version CSWpython

21.9.351 salt.modules.portage_config

Configure portage(5)

salt.modules.portage_config.append_to_package_conf(conf, atom='', flags=None, string='', overwrite=False)
    Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.
    
    CLI Example:
    salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -\n    \n    \n    \n    flags="['ldap', '-libvirt']"
    salt '*' portage_config.append_to_package_conf use atom="app-admin/salt-0.14.1 \n    \n    \n    flags="['ldap', '-libvirt']"

salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)
    Append a list of use flags for a given package or DEPEND atom
    
    CLI Example:
    salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -\n    \n    \n    flags="['ldap', '-\n
salt.modules.portage_config.enforce_nice_config()
    Enforce a nice tree structure for /etc/portage/package.* configuration files.
    
    See also:
    salt.modules.ebuild.ex_mod_init() for information on automatically running this when pkg is
    used.
    
    CLI Example:
    salt '*' portage_config.enforce_nice_config

salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)
    New in version 2015.8.0.
    
    Filter function to remove hidden or otherwise not normally visible USE flags from a list.
    
    @type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param
    use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE
    flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE
    flags.

salt.modules.portage_config.get_all_cpv_use(cp)
    New in version 2015.8.0.
    
    Uses portage to determine final USE flags and settings for an emerge.
salt.modules.portage_config.get_cleared_flags(cp)
New in version 2015.8.0.
Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

salt.modules.portage_config.get_flags_from_package_conf(conf, atom)
Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
salt '*' portage_config.get_flags_from_package_conf license salt

salt.modules.portage_config.get_installed_use(cp, use='USE')
New in version 2015.8.0.
Gets the installed USE flags from the VARDB.

salt.modules.portage_config.get_iuse(cp)
New in version 2015.8.0.
Gets the current IUSE flags from the tree.

salt.modules.portage_config.get_missing_flags(conf, atom, flags)
Find out which of the given flags are currently not set. CLI Example:
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl ...']"

salt.modules.portage_config.has_flag(conf, atom, flag)
Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
salt '*' portage_config.has_flag license salt Apache-2.0

salt.modules.portage_config.has_use(atom, use)
Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
salt '*' portage_config.has_use salt libvirt

salt.modules.portage_config.is_changed_uses(cp)
New in version 2015.8.0.
Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg
salt.modules.portage_config.is_present(*conf, atom*)

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

21.9.352  salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete(*queue_id*)

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL
```

salt.modules.postfix.hold(*queue_id*)

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL
```

salt.modules.postfix.requeue(*queue_id*)

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y',

`wakeup='n', maxproc='100', command=''; write_conf=True,

path='/etc/postfix/master.cf')`

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the
default, it will internally be converted to a `-`. Calling this function from the Python API is not affected by this limitation.

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:

```bash
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

`salt.modules.postfix.show_main(path='/etc/postfix/main.cf')`

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```bash
salt <minion> postfix.show_main
salt <minion> postfix.show_main path=/path/to/main.cf
```

`salt.modules.postfix.show_master(path='/etc/postfix/master.cf')`

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```bash
salt <minion> postfix.show_master
salt <minion> postfix.show_master path=/path/to/master.cf
```

`salt.modules.postfix.show_queue()`

Show contents of the mail queue

CLI Example:

```bash
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold(queue_id)`

Set held message(s) in the mail queue to unheld

CLI Example:

```bash
salt '*' postfix.unhold 5C33CA0DEA
salt '*' postfix.unhold ALL
```

### 21.9.353 `salt.modules.postgres`

Module to provide Postgres compatibility to salt.

**configuration** In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```yaml
postgresql.host: 'localhost'
postgresql.port: '5432'
postgresql.user: 'postgres' -> db user
postgresql.pass: ''
postgresql.maintenance_db: 'postgres'
```
The default for the maintenance_db is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

**note** This module uses MD5 hashing which may not be compliant with certain security audits.

**note** When installing postgres from the official postgres repos, on certain Linux distributions, either the psql or the initdb binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/`
```

salt.modules.postgres.available_extensions(  
    user=None,  
    host=None,  
    port=None,  
    maintenance_db=None,  
    password=None,  
    runas=None)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

salt.modules.postgres.create_extension(  
    name,  
    if_not_exists=None,  
    schema=None,  
    ext_version=None,  
    from_version=None,  
    user=None,  
    host=None,  
    port=None,  
    maintenance_db=None,  
    password=None,  
    runas=None)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

salt.modules.postgres.create_metadat a (  
    name,  
    ext_version=None,  
    schema=None,  
    user=None,  
    host=None,  
    port=None,  
    maintenance_db=None,  
    password=None,  
    runas=None)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadat a adminpack
```

salt.modules.postgres.datadir_exists(name)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

**name** Name of the directory to check

salt.modules.postgres.datadir_init(name,  
    auth='password',  
    user=None,  
    password=None,  
    encoding='UTF8',  
    locale=None,  
    waldir=None,  
    checksums=False,  
    runas=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:
```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

- **name** - The name of the directory to initialize
- **auth** - The default authentication method for local connections
- **password** - The password to set for the postgres user
- **user** - The database superuser name
- **encoding** - The default encoding for new databases
- **locale** - The default locale for new databases
- **waldir** - The transaction log (WAL) directory (default is to keep WAL inside the data directory)

  New in version 2019.2.0.

- **checksums** - If True, the cluster will be created with data page checksums.

  Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

- **runas** - The system user the operation should be performed on behalf of

```
salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recurse=False, runas=None)
```

Change tablespace or/and owner of database.

CLI Example:
```
salt '*' postgres.db_alter dbname owner=otheruser
```

```
salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)
```

Adds a databases to the Postgres server.

CLI Example:
```
salt '*' postgres.db_create 'dbname'
salt '*' postgres.db_create 'dbname' template=template_postgis
```

```
salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Checks if a database exists on the Postgres server.

CLI Example:
```
salt '*' postgres.db_exists 'dbname'
```

```
salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Return dictionary with information about databases of a Postgres server.

CLI Example:
```
salt '*' postgres.db_list
```

```
salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Removes a databases from the Postgres server.
CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

```
salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None,
user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

```
salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None,
maintenance_db=None, password=None, runas=None)
```

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

```
salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None,
maintenance_db=None, password=None, runas=None)
```

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

```
salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, creatoroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
   host='hostname' port='port' password='password' \
   rolepassword='rolepassword'
```

```
salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

```
salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, creatoroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolepassword=None, groups=None, runas=None)
```

Updates a postgres group

CLI Examples:
salt '***' postgres.group_update 'username' user='user'
    host='hostname' port='port' password='password'
    rolepassword='rolepassword'

salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, 
    grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, 
    password=None, runas=None)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

salt '***' postgres.has_privileges user_name table_name table 
    SELECT,INSERT maintenance_db=db_name

name  Name of the role whose privileges should be checked on object_type
object_name  Name of the object on which the check is to be performed
object_type  The object type, which can be one of the following:
    • table
    • sequence
    • schema
    • tablespace
    • language
    • database
    • group
    • function
privileges  Comma separated list of privileges to check, from the list below:
    • INSERT
    • CREATE
    • TRUNCATE
    • CONNECT
    • TRIGGER
    • SELECT
    • USAGE
    • TEMPORARY
    • UPDATE
    • EXECUTE
    • REFERENCES
    • DELETE
    • ALL
grant_option  If grant_option is set to True, the grant option check is performed
prepend  Table and Sequence object types live under a schema so this should be provided if the object is not
    under the default public schema
maintenance_db  The database to connect to
user  database username if different from config or default
password  user password if any password for a specified user
host  Database host if different from config or default
port  Database port if different from config or default
runas  System user all operations should be performed on behalf of

salt.modules.postgres.installed_extensions(user=None, host=None, port=None, 
    maintenance_db=None, password=None, runas=None)

List installed postgresql extensions
CLI Example:

```bash
salt '*' postgres.installed_extensions
```

salt.modules.postgres.is_available_extension(  
`name`, `user=None`, `host=None`, `port=None`,  
`maintenance_db=None`, `password=None`,  
`runas=None`)  

Test if a specific extension is available  

CLI Example:

```bash
salt '*' postgres.is_available_extension
```

salt.modules.postgres.is_installed_extension(  
`name`, `user=None`, `host=None`, `port=None`,  
`maintenance_db=None`, `password=None`,  
`runas=None`)  

Test if a specific extension is installed  

CLI Example:

```bash
salt '*' postgres.is_installed_extension
```

salt.modules.postgres.language_create(  
`name`,  
`maintenance_db`,  
`user=None`, `host=None`,  
`port=None`, `password=None`,  
`runas=None`)  

New in version 2016.3.0.  

Installs a language into a database  

CLI Example:

```bash
salt '*' postgres.language_create plpgsql dbname
```

name Language to install  
maintenance_db The database to install the language in  
user database username if different from config or default  
password user password if any password for a specified user  
host Database host if different from config or default  
port Database port if different from config or default  
runas System user all operations should be performed on behalf of

salt.modules.postgres.language_exists(  
`name`,  
`maintenance_db`,  
`user=None`, `host=None`,  
`port=None`, `password=None`,  
`runas=None`)  

New in version 2016.3.0.  

Checks if language exists in a database.  

CLI Example:

```bash
salt '*' postgres.language_exists plpgsql dbname
```

name Language to check for  
maintenance_db The database to check in  
user database username if different from config or default  
password user password if any password for a specified user  
host Database host if different from config or default  
port Database port if different from config or default  
runas System user all operations should be performed on behalf of

salt.modules.postgres.language_list(  
`maintenance_db`,  
`user=None`, `host=None`, `port=None`, `password=None`,  
`runas=None`)  

New in version 2016.3.0.
Return a list of languages in a database.

CLI Example:

```bash
salt '*' postgres.language_list dbname
```

- **maintenance_db** The database to check
- **user** database username if different from config or default
- **password** user password if any password for a specified user
- **host** Database host if different from config or default
- **port** Database port if different from config or default
- **runas** System user all operations should be performed on behalf of

**salt.modules.postgres.language_remove**

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```bash
salt '*' postgres.language_remove plpgsql dbname
```

- **name** Language to remove
- **maintenance_db** The database to install the language in
- **user** database username if different from config or default
- **password** user password if any password for a specified user
- **host** Database host if different from config or default
- **port** Database port if different from config or default
- **runas** System user all operations should be performed on behalf of

**salt.modules.postgres.owner_to**

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```bash
salt '*' postgres.owner_to 'dbname' 'username'
```

**salt.modules.postgres.privileges_grant**

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```bash
salt '*' postgres.privileges_grant user_name table_name table SELECT,UPDATE maintenance_db=dbname
```

- **name** Name of the role to which privileges should be granted
- **object_name** Name of the object on which the grant is to be performed
- **object_type** The object type, which can be one of the following:
  - table
  - sequence
  - schema
  - tablespace
  - language
salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name Name of the object for which the permissions should be returned

object_type The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
  • function

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default public schema

maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of
New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table
\nSELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role whose privileges should be revoked

**object_name** Name of the object on which the revoke is to be performed

**object_type** The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to revoke, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**maintenance_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
```

**query** The query string.

**user** Database username, if different from config or default.

**host** Database host, if different from config or default.

**port** Database port, if different from config or default.

**maintenance_db** The database to run the query against.
password User password, if different from the config or default.
runas User to run the command as.
write Mark query as READ WRITE transaction.

CLI Example:

```bash
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```

```python
salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)
```

Return a dict with information about users of a Postgres server.
Set return_password to True to get password hash in the result.

CLI Example:

```bash
salt '*' postgres.role_get postgres
```

```python
salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None)
```

Creates a Postgres schema.

CLI Example:

```bash
salt '*' postgres.schema_create dbname name owner='owner' \ user='user' \ db_user='user' db_password='password' \ db_host='hostname' db_port='port'
```

```python
salt.modules.postgres.schema_exists(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)
```

Checks if a schema exists on the Postgres server.

CLI Example:

```bash
salt '*' postgres.schema_exists dbname schemaname
```

```python
salt.modules.postgres.schema_get(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)
```

Return a dict with information about schemas in a database.

CLI Example:

```bash
salt '*' postgres.schema_get dbname name
```
salt.modules.postgres.schema_list(dbname, user=None, db_user=None, db_password=None, 
  db_host=None, db_port=None)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname Database name we query on
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None, 
  db_password=None, db_host=None, db_port=None)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

database name we work on
schemaname The schema’s name we’ll remove
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, 
  maintenance_db=None, password=None, new_name=None, 
  new_owner=None, set_option=None, reset_option=None, runas=None)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{"seq_page_cost": '1.1'}"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, 
  user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.
CLI Example:

```bash
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```bash
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a tablespace from the Postgres server.

CLI Example:

```bash
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Creates a Postgres user.

CLI Examples:

```bash
salt '*' postgres.user_create 'username' user='user' \
host='hostname' port='port' password='password' \ 
rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a user exists on the Postgres server.

CLI Example:

```bash
salt '*' postgres.user_exists 'username'
```

salt.modules.postgres.user_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```bash
salt '*' postgres.user_list
```

salt.modules.postgres.user_remove(username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a user from the Postgres server.
CLI Example:

```
salt '*' postgres.user_remove 'username'
```

```
salt.modules.postgres.user_update(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createdb=None, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)
```

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \ 
    host='hostname' port='port' password='password' \ 
    rolepassword='rolepassword' valid_until='valid_until'
```

```
salt.modules.postgres.version(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

### 21.9.354 salt.modules.poudriere

Support for poudriere

```
salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)
```

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

```
salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')
```

Creates a new poudriere jail if one does not exist

**NOTE** creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

```
salt.modules.poudriere.create_ports_tree()
```

Not working need to run portfetch non interactive

```
salt.modules.poudriere.delete_jail(name)
```

Deletes poudriere jail with name

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

#### Chapter 21. Salt Module Reference

2544
salt.modules.poudriere.is_jail(name)
    Return True if jail exists False if not
    CLI Example:
    ```
    salt '*' poudriere.is_jail <jail name>
    ```

salt.modules.poudriere.list_jails()
    Return a list of current jails managed by poudriere
    CLI Example:
    ```
    salt '*' poudriere.list_jails
    ```

salt.modules.poudriere.list_ports()
    Return a list of current port trees managed by poudriere
    CLI Example:
    ```
    salt '*' poudriere.list_ports
    ```

salt.modules.poudriere.make_pkgng_aware(jname)
    Make jail jname pkgng aware
    CLI Example:
    ```
    salt '*' poudriere.make_pkgng_aware <jail name>
    ```

salt.modules.poudriere.parse_config(config_file=None)
    Returns a dict of poudriere main configuration definitions
    CLI Example:
    ```
    salt '*' poudriere.parse_config
    ```

salt.modules.poudriere.update_jail(name)
    Run freebsd-update on name poudriere jail
    CLI Example:
    ```
    salt '*' poudriere.update_jail freebsd:10:x86:64
    ```

salt.modules.poudriere.update_ports_tree(ports_tree)
    Updates the ports tree, either the default or the ports_tree specified
    CLI Example:
    ```
    salt '*' poudriere.update_ports_tree staging
    ```

salt.modules.poudriere.version()
    Return poudriere version
    CLI Example:
    ```
    salt '*' poudriere.version
    ```
21.9.355 salt.modules.powerpath

powerpath support.
Assumes RedHat

salt.modules.powerpath.add_license(key)
Add a license

salt.modules.powerpath.has_powerpath()

salt.modules.powerpath.list_licenses()
returns a list of applied powerpath license keys

salt.modules.powerpath.remove_license(key)
Remove a license

21.9.356 salt.modules.proxy module

This module allows you to manage proxy settings

salt '*' network.get_http_proxy

salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')
Returns the current ftp proxy settings
network_service The network service to apply the changes to, this only necessary on macOS

   CLI Example:
   salt '*' proxy.get_ftp_proxy Ethernet

salt.modules.proxy.get_http_proxy(network_service='Ethernet')
Returns the current http proxy settings
network_service The network service to apply the changes to, this only necessary on macOS

   CLI Example:
   salt '*' proxy.get_http_proxy Ethernet

salt.modules.proxy.get_https_proxy(network_service='Ethernet')
Returns the current https proxy settings
network_service The network service to apply the changes to, this only necessary on macOS

   CLI Example:
   salt '*' proxy.get_https_proxy Ethernet

salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')
Returns the current domains that can bypass the proxy
network_service The network service to get the bypass domains from, this is only necessary on macOS

   CLI Example:
   salt '*' proxy.get_proxy_bypass

salt.modules.proxy.get_proxy_win()
Gets all of the proxy settings in one call, only available on Windows

   CLI Example:
   salt '*' proxy.get_proxy_win
salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the ftp proxy settings
server The proxy server to use
port The port used by the proxy server
user The username to use for the proxy server if required
password The password to use if required by the server
network_service The network service to apply the changes to, this only necessary on macOS
bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
network_service=Ethernet

salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.
server The proxy server to use
port The port used by the proxy server
user The username to use for the proxy server if required
password The password to use if required by the server
network_service The network service to apply the changes to, this only necessary on macOS
bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_pass
network_service=Ethernet

salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.
server The proxy server to use
port The port used by the proxy server
user The username to use for the proxy server if required
password The password to use if required by the server
network_service The network service to apply the changes to, this only necessary on macOS
bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_pass
network_service=Ethernet

salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')

Sets the domains that can bypass the proxy
domains An array of domains allowed to bypass the proxy
network_service The network service to apply the changes to, this only necessary on macOS

CLI Example:
salt '*' proxy.set_proxy_bypass "["127.0.0.1", 'localhost']"

salt.modules.proxy.set_proxy_win(server, port, types=None, bypass_hosts=None)
Sets the http proxy settings, only works with Windows.

**server** The proxy server to use

**password** The password to use if required by the server

**types** The types of proxy connections should be setup with this server. Valid types are:

- `http`
- `https`
- `ftp`

**bypass_hosts** The hosts that are allowed to bypass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="["http", "https"]"
```

## 21.9.357 salt.modules.ps

A salt interface to psutil, a system and process library. See [http://code.google.com/p/psutil](http://code.google.com/p/psutil).

**depends**

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

### salt.modules.ps.boot_time

**time_format=None**

Return the boot time in number of seconds since the epoch began.

CLI Example:

```
salt '*' ps.boot_time
```

### salt.modules.ps.cpu_percent

**interval=0.1, per_cpu=False**

Return the percent of time the CPU is busy.

- `interval` the number of seconds to sample CPU usage over
- `per_cpu` if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

### salt.modules.ps.cpu_times

**per_cpu=False**

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

- `per_cpu` if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

### salt.modules.ps.disk_io_counters

**device=None**

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
```

```
salt '*' ps.disk_io_counters device=sda1
```
salt.modules.ps.disk_partition_usage(all=False)
    Return a list of disk partitions plus the mount point, filesystem and usage statistics.
    CLI Example:
    
    ```
salt '*' ps.disk_partition_usage
    ```

salt.modules.ps.disk_partitions(all=False)
    Return a list of disk partitions and their device, mount point, and filesystem type.
    all if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.
    CLI Example:
    
    ```
salt '*' ps.disk_partitions
    ```

salt.modules.ps.disk_usage(path)
    Given a path, return a dict listing the total available space as well as the free space, and used space.
    CLI Example:
    
    ```
salt '*' ps.disk_usage /home
    ```

salt.modules.ps.get_pid_list() 
    Return a list of process ids (PIDs) for all running processes.
    CLI Example:
    
    ```
salt '*' ps.get_pid_list
    ```

salt.modules.ps.get_users() 
    Return logged-in users.
    CLI Example:
    
    ```
salt '*' ps.get_users
    ```

salt.modules.ps.kill_pid(pid, signal=15)
    Kill a process by PID.
    
    ```
salt 'minion' ps.kill_pid pid [signal=signal_number]
    ```

    pid PID of process to kill.
    signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

    Example:
    Send SIGKILL to process with PID 2000:
    
    ```
salt 'minion' ps.kill_pid 2000 signal=9
    ```

salt.modules.ps.lsof(name)
    Retrieve the lsof information of the given process name.
    CLI Example:
    
    ```
salt '*' ps.lsof apache2
    ```

salt.modules.ps.netstat(name)
    Retrieve the netstat information of the given process name.
    CLI Example:
salt '*' ps.netstat apache2

salt.modules.ps.network_io_counters(interface=None)

Return network I/O statistics.

CLI Example:

salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0

salt.modules.ps.num_cpus()

Return the number of CPUs.

CLI Example:

salt '*' ps.num_cpus

salt.modules.ps.pgrep(pattern, user=None, full=False, pattern_is_regex=False)

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

salt '*' ps.pgrep pattern [user=username] [full=(true|false)]

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.
pattern_is_regex This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.

New in version 3001.

Examples:

Find all httpd processes on all 'www' minions:

salt 'www.*' ps.pgrep httpd

Find all bash processes owned by user 'tom':

salt '*' ps.pgrep bash user=tom

salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)

Kill processes matching a pattern.

salt '*' ps.pkill pattern [user=username] [signal=signal_number] \[full=(true|false)]

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Send SIGHUP to all httpd processes on all 'www' minions:
salt 'www.*' ps.pkill httpd signal=1

Send SIGKILL to all bash processes owned by user 'tom':
salt '*' ps.pkill bash signal=9 user=tom

salt.modules.ps.proc_info(pid, attrs=None)
Return a dictionary of information for a process id (PID).

CLI Example:
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'

pid  PID of process to query.
attrs  Optional list of desired process attributes. The list of possible attributes can be found here: http://pythonhosted.org/psutil/#psutil.Process

salt.modules.ps.psaux(name)
Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:
salt '*' ps.psaux www-data.+apache2

salt.modules.ps.ss(name)
Retrieve the ss information of the given process name.

CLI Example:
salt '*' ps.ss apache2

New in version 2016.11.6.

salt.modules.ps.swap_memory()
New in version 2014.7.0.
Return a dict that describes swap memory statistics.

Note:  This function is only available in psutil version 0.6.0 and above.

CLI Example:
salt '*' ps.swap_memory

salt.modules.ps.top(num_processes=5, interval=3)
Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:
salt '*' ps.top
salt '*' ps.top 5 10

salt.modules.ps.total_physical_memory()
Return the total number of bytes of physical memory.
New in version 2014.7.0.
Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

**21.9.358 salt.modules.publish**

Publish a command from a minion to a target

```
salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5)
```
Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention
If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

```
salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None)
```
Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg=['cheese=spam','spam=cheese']
```

When running via salt-call, the via_master flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

```
salt.modules.publish.runner(fun, arg=None, timeout=5)
```

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

### 21.9.359 salt.modules.puppet

Execute puppet routines

```
salt.modules.puppet.disable(message=None)
```

New in version 2014.7.0.

Disable the puppet agent

message  New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

```
salt.modules.puppet.enable()
```

New in version 2014.7.0.
Enable the puppet agent

CLI Example:

```bash
salt '*' puppet.enable
```

`salt.modules.puppet.fact(name, puppet=False)`
Run facter for a specific fact

CLI Example:

```bash
salt '*' puppet.fact kernel
```

`salt.modules.puppet.facts(puppet=False)`
Run facter and return the results

CLI Example:

```bash
salt '*' puppet.facts
```

`salt.modules.puppet.noop(*args, **kwargs)`
Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```bash
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
  ←tags=basefiles::edit,apache::server
```

`salt.modules.puppet.plugin_sync()`
Runs a plugin sync between the puppet master and agent

CLI Example:

```bash
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.run(*args, **kwargs)`
Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```bash
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
  ←ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
  ←tags=basefiles::edit,apache::server
```

`salt.modules.puppet.status()`
New in version 2014.7.0.

Display puppet agent status

CLI Example:
salt 'salt '*' puppet.status

salt.modules.puppet.summary()
New in version 2014.7.0.
Show a summary of the last puppet agent run
CLI Example:
   salt 'salt '*' puppet.summary

21.9.360 salt.modules.purefa

Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the purestorage python package in your python installation path that is running salt.
  
  pip install purestorage

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

  1) From the minion config

  pure_tags:
  
  fa:
  
  san_ip: management vip or hostname for the FlashArray
  api_token: A valid api token for the FlashArray being managed

  2) From environment (PUREFA_IP and PUREFA_API)

  3) From the pillar (PUREFA_IP and PUREFA_API)

  maintainer Simon Dodsley (simon@purestorage.com)
  maturity new
  requires purestorage
  platform all

New in version 2018.3.0.

salt.modules.purefa.hg_create(name, host=None, volume=None)
Create a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup already exists, or if named host or volume do not exist.
New in version 2018.3.0.
name [string] name of hostgroup (truncated to 63 characters)
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup

CLI Example:
   salt 'salt '*' purefa.hg_create foo host=bar volume=vol
salt.modules.purefa.hg_delete(name)
Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).
Will return False if hostgroup is already in a deleted state.
New in version 2018.3.0.
name [string] name of hostgroup
CLI Example:
salt '*' purefa.hg_delete foo

salt.modules.purefa.hg_remove(name, volume=None, host=None)
Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup does not exist, or named host or volume are not in the hostgroup.
New in version 2018.3.0.
name [string] name of hostgroup
volume [string] name of volume to remove from hostgroup
host [string] name of host to remove from hostgroup
CLI Example:
salt '*' purefa.hg_remove foo volume=test host=bar

salt.modules.purefa.hg_update(name, host=None, volume=None)
Adds entries to a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup doesn't exist, or host or volume do not exist.
New in version 2018.3.0.
name [string] name of hostgroup
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup
CLI Example:
salt '*' purefa.hg_update foo host=bar volume=vol

salt.modules.purefa.host_create(name, iqn=None, wwn=None)
Add a host on a Pure Storage FlashArray.
Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.
New in version 2018.3.0.
name [string] name of host (truncated to 63 characters)
iqn [string] iSCSI IQN of host
wwn [string] Fibre Channel WWN of host
CLI Example:
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'

salt.modules.purefa.host_delete(name)
Delete a host on a Pure Storage FlashArray (detaches all volumes).
Will return False if the host doesn’t exist.
New in version 2018.3.0.
name [string] name of host
CLI Example:
salt '*' purefa.host_delete foo

**salt.modules.purefa.host_update**(name, iqn=None, wwn=None)

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

**name** [string] name of host

**iqn** [string] Additional iSCSI IQN of host

**wwn** [string] Additional Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

**salt.modules.purefa.pg_create**(name, hostgroup=None, host=None, volume=None, enabled=True)

Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:

- Protection Groop already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

**name** [string] name of protection group

**hostgroup** [string] name of hostgroup to add to protection group

**host** [string] name of host to add to protection group

**volume** [string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]@
~enabled=[true | false]
```

**salt.modules.purefa.pg_delete**(name, eradicate=False)

Delete a protection group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_delete foo
```

**salt.modules.purefa.pg_eradicate**(name)

Eradicate a deleted protection group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

**name** [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_eradicate foo
```

**salt.modules.purefa.pg_remove**(name, hostgroup=None, host=None, volume=None)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

Will return False in the following cases:
- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

```python
name [string] name of hostgroup
hostgroup [string] name of hostgroup to remove from protection group
host [string] name of host to remove from hostgroup
volume [string] name of volume to remove from hostgroup
```

CLI Example:

```
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

salt.modules.purefa.pg_update(name, hostgroup=None, host=None, volume=None)

Update a protection group on a Pure Storage FlashArray.

**Will return False in the following cases:**
- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

```python
name [string] name of protection group
hostgroup [string] name of hostgroup to add to protection group
host [string] name of host to add to protection group
volume [string] name of volume to add to protection group
```

CLI Example:

```
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]
```

salt.modules.purefa.snap_create(name, suffix=None)

Create a volume snapshot on a Pure Storage FlashArray.

Will return False is volume selected to snap does not exist.

New in version 2018.3.0.

```python
name [string] name of volume to snapshot
suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.
```

CLI Example:

```
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
```

salt.modules.purefa.snap_delete(name, suffix=None, eradicate=False)

Delete a volume snapshot on a Pure Storage FlashArray.

Will return False if selected snapshot does not exist.

New in version 2018.3.0.

```python
name [string] name of volume
suffix [string] name of snapshot
eradicate [boolean] Eradicate snapshot after deletion if True. Default is False
```

CLI Example:

```
salt '*' purefa.snap_delete foo suffix=snap eradicate=True
```

salt.modules.purefa.snap_eradicate(name, suffix=None)

Eradicate a deleted volume snapshot on a Pure Storage FlashArray.

Will return False if snapshot is not in a deleted state.

New in version 2018.3.0.
name  [string] name of volume
suffix  [string] name of snapshot

CLI Example:
```
salt '*' purefa.snap_eradicate foo suffix=snap
```

salt.modules.purefa.snap_volume_create(name, target, overwrite=False)
Create R/W volume from snapshot on a Pure Storage FlashArray.
Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.

New in version 2018.3.0.
name  [string] name of volume snapshot
target  [string] name of clone volume
overwrite  [boolean] overwrite clone if already exists (default: False)

CLI Example:
```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

salt.modules.purefa.volume_attach(name, host)
Attach a volume to a host on a Pure Storage FlashArray.
Host and volume must exist or else will return False.

New in version 2018.3.0.
name  [string] name of volume
host  [string] name of host

CLI Example:
```
salt '*' purefa.volume_attach foo bar
```

salt.modules.purefa.volume_clone(name, target, overwrite=False)
Clone an existing volume on a Pure Storage FlashArray.
Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.
name  [string] name of volume
target  [string] name of clone volume
overwrite  [boolean] overwrite clone if already exists (default: False)

CLI Example:
```
salt '*' purefa.volume_clone foo bar overwrite=True
```

salt.modules.purefa.volume_create(name, size=None)
Create a volume on a Pure Storage FlashArray.
Will return False if volume already exists.

New in version 2018.3.0.
name  [string] name of volume (truncated to 63 characters)
size  [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:
```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```
salt.modules.purefa.volume_delete

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist or is already in a deleted state.

New in version 2018.3.0.

**Parameters**

- name [string] name of volume
- eradicate [boolean] Eradicate volume after deletion if True. Default is False

**CLI Example:**
```
salt '*' purefa.volume_delete foo eradicate=True
```

salt.modules.purefa.volume_detach

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist or if selected volume isn't already connected to the host.

New in version 2018.3.0.

**Parameters**

- name [string] name of volume
- host [string] name of host

**CLI Example:**
```
salt '*' purefa.volume_detach foo bar
```

salt.modules.purefa.volume_eradicate

Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False if volume is not in a deleted state.

New in version 2018.3.0.

**Parameters**

- name [string] name of volume

**CLI Example:**
```
salt '*' purefa.volume_eradicate foo
```

salt.modules.purefa.volume_extend

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

**Parameters**

- name [string] name of volume
- size [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

**CLI Example:**
```
salt '*' purefa.volume_extend foo 10T
```

## 21.9.361 salt.modules.purefb

Management of Pure Storage FlashBlade
Installation Prerequisites

- You will need the purity_fb python package in your python installation path that is running salt.

  ```
  pip install purity_fb
  ```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

  1) From the minion config

  ```
  pure_tags:
  fb:
    san_ip: management vip or hostname for the FlashBlade
    api_token: A valid api token for the FlashBlade being managed
  ```

  2) From environment (PUREFB_IP and PUREFB_API)

  3) From the pillar (PUREFB_IP and PUREFB_API)

maintainer Simon Dodsley (simon@purestorage.com)

maturity new
requires purity_fb
platform all

New in version 2019.2.0.

```python
salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw,no_root_squash)', snapshot=False)
```

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

- **name** [string] name of filesystem (truncated to 63 characters)
- **proto** [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS
- **snapshot** [boolean] (Optional) Are snapshots enabled on the filesystem. Default is False
- **nfs_rules** [string] (Optional) export rules for NFS. If not specified default is 
  *(rw,no_root_squash).* Refer to Pure Storage documentation for formatting rules.
- **size** [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

```python
salt.modules.purefb.fs_delete(name, eradicate=False)
```

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn't exist or is already in a deleted state.

New in version 2019.2.0.

- **name** [string] name of filesystem
- **eradicate** [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.fs_delete foo eradicate=True
```
salt.modules.purefb.fs_eradicate(name)
   Eradicate a deleted filesystem on a Pure Storage FlashBlade.
   Will return False is filesystem is not in a deleted state.
   New in version 2019.2.0.
   name [string] name of filesystem
   CLI Example:
   
   salt '*' purefb.fs_eradicate foo

salt.modules.purefb.fs_extend(name, size)
   Resize an existing filesystem on a Pure Storage FlashBlade.
   Will return False if new size is less than or equal to existing size.
   New in version 2019.2.0.
   name [string] name of filesystem
   size [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.
   CLI Example:
   
   salt '*' purefb.fs_extend foo 10T

salt.modules.purefb.fs_update(name, rules, snapshot=False)
   Update filesystem on a Pure Storage FlashBlade.
   Allows for change of NFS export rules and enabling/disabled of snapshotting capability.
   New in version 2019.2.0.
   name [string] name of filesystem
   rules [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.
   snapshot: boolean (Optional) Enable/Disable snapshots on the filesystem. Default is False
   CLI Example:
   
   salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)'
   → snapshot=True

salt.modules.purefb.snap_create(name, suffix=None)
   Create a filesystem snapshot on a Pure Storage FlashBlade.
   Will return False if filesystem selected to snap does not exist.
   New in version 2019.2.0.
   name [string] name of filesystem to snapshot
   suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.
   CLI Example:
   
   salt '*' purefb.snap_create foo
   salt '*' purefb.snap_create foo suffix=bar

salt.modules.purefb.snap_delete(name, suffix=None, eradicate=False)
   Delete a filesystem snapshot on a Pure Storage FlashBlade.
   Will return False if selected snapshot does not exist.
   New in version 2019.2.0.
   name [string] name of filesystem
   suffix [string] name of snapshot
   eradicate [boolean] Eradicate snapshot after deletion if True. Default is False
   CLI Example:
salt documentation, release 3002.6

salt '*' purefb.snap_delete foo suffix=snap eradicate=True

salt.modules.purefb.snap_eradicate(name, suffix=None)

Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

Parameters

- name [string] name of filesystem
- suffix [string] name of snapshot

CLI Example:

salt '*' purefb.snap_eradicate foo suffix=snap

21.9.362 salt.modules.pushbullet module

Module for sending messages to Pushbullet (https://www.pushbullet.com)

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

```
pushbullet:
  api_key: 'ABC123abc123ABC123abc123ABC123ab'
```

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

salt.modules.pushbullet.push_note(device=None, title=None, body=None)

Pushing a text note.

Parameters

- device -- Pushbullet target device
- title -- Note title
- body -- Note body

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```

21.9.363 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)

New in version 2016.3.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8

salt.modules.pushover_notify.post_message(user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None)

Send a message to a Pushover user or group.

Parameters

- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

Returns
Boolean if message was sent successfully.

CLI Example:

```bash
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

21.9.364 salt.modules.pw_group

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

salt.modules.pw_group.add(name, gid=None, **kwargs)
Add the specified group

CLI Example:

```bash
salt '*' group.add foo 3456
```

salt.modules.pw_group.adduser(name, username)
Add a user in the group.

CLI Example:

```bash
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.pw_group.chgid(name, gid)
Change the gid for a named group

CLI Example:
salt.modules.pw_group.delete(name)
Remove the named group

CLI Example:
salt '*' group.delete foo

salt.modules.pw_group.deluser(name, username)
Remove a user from the group.

CLI Example:
salt '*' group.deluser foo bar

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.pw_group.getent(refresh=False)
Return info on all groups

CLI Example:
salt '*' group.getent

salt.modules.pw_group.info(name)
Return information about a group

CLI Example:
salt '*' group.info foo

salt.modules.pw_group.members(name, members_list)
Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:
salt '*' group.members foo 'user1,user2,user3,....'

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,....

21.9.365 salt.modules.pw_user

Manage users with the pw command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ‘user.info’ is not available), see here.

salt.modules.pw_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, loginclass=None, **kwargs)

Add a user to the minion

CLI Example:
Salt Documentation, Release 3002.6

```bash
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

**salt.modules.pw_user.chfullname(name, fullname)***  
Change the user's Full Name  
CLI Example:  
```bash
salt '*' user.chfullname foo "Foo Bar"
```

**salt.modules.pw_user.chgid(name, gid)***  
Change the default group of the user  
CLI Example:  
```bash
salt '*' user.chgid foo 4376
```

**salt.modules.pw_user.chgroups(name, groups, append=False)***  
Change the groups to which a user belongs  
name - Username to modify  
groups - List of groups to set for the user. Can be passed as a comma-separated list or a Python list.  
append - [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.  
CLI Example:  
```bash
salt '*' user.chgroups foo wheel,root True
```

**salt.modules.pw_user.chhome(name, home, persist=False)***  
Set a new home directory for an existing user  
name - Username to modify  
home - New home directory to set  
persist - [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.  
CLI Example:  
```bash
salt '*' user.chhome foo /home/users/foo True
```

**salt.modules.pw_user.chhomephone(name, homephone)***  
Change the user's Home Phone  
CLI Example:  
```bash
salt '*' user.chhomephone foo "7735551234"
```

**salt.modules.pw_user.chloginclass(name, loginclass, root=None)***  
Change the default login class of the user  
New in version 2016.3.5.  
CLI Example:  
```bash
salt '*' user.chloginclass foo staff
```

**salt.modules.pw_user.chroomnumber(name, roomnumber)***  
Change the user's Room Number  
CLI Example:
salt ' '*' user.chroomnumber foo 123

salt.modules.pw_user.chshell(name, shell)
Change the default shell of the user
CLI Example:
salt ' '*' user.chshell foo /bin/zsh

salt.modules.pw_user.chuid(name, uid)
Change the uid for a named user
CLI Example:
salt ' '*' user.chuid foo 4376

salt.modules.pw_user.chworkphone(name, workphone)
Change the user’s Work Phone
CLI Example:
salt ' '*' user.chworkphone foo "7735550123"

salt.modules.pw_user.delete(name, remove=False, force=False)
Remove a user from the minion
CLI Example:
salt ' '*' user.delete name remove=True force=True

salt.modules.pw_user.get_loginclass(name)
Get the login class of the user
New in version 2016.3.0.
CLI Example:
salt ' '*' user.get_loginclass foo

salt.modules.pw_user.getent(refresh=False)
Return the list of all info for all users
CLI Example:
salt ' '*' user.getent

salt.modules.pw_user.info(name)
Return user information
CLI Example:
salt ' '*' user.info root

salt.modules.pw_user.list_groups(name)
Return a list of groups the named user belongs to
CLI Example:
salt ' '*' user.list_groups foo
salt.modules.pw_user.list_users()
Return a list of all users
CLI Example:

```
salt '*' user.list_users
```

salt.modules.pw_user.rename(name, new_name)
Change the username for a named user
CLI Example:

```
salt '*' user.rename name new_name
```

21.9.366 salt.modules.pyenv
Manage python installations with pyenv.

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.

salt.modules.pyenv.default(python=None, runas=None)
Returns or sets the currently defined default python.
python= None The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.
CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

salt.modules.pyenv.do(cmdline=None, runas=None)
Execute a python command with pyenv’s shims from the user or the system.
CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

salt.modules.pyenv.do_with_python(python, cmdline, runas=None)
Execute a python command with pyenv’s shims using a specific python version.
CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

salt.modules.pyenv.install(runas=None, path=None)
Install pyenv systemwide
CLI Example:

```
salt '*' pyenv.install
```

salt.modules.pyenv.install_python(python, runas=None)
Install a python implementation.
**python** The version of python to install, should match one of the versions listed by pyenv.list
CLI Example:
```
salt '*' pyenv.install_python 2.0.0-p0
```

```
salt.modules.pyenv.is_installed(runas=None)
Check if pyenv is installed.
CLI Example:
salt '*' pyenv.is_installed
```

```
salt.modules.pyenv.list_(runas=None)
List the installable versions of python.
CLI Example:
salt '*' pyenv.list
```

```
salt.modules.pyenv.rehash(runas=None)
Run pyenv rehash to update the installed shims.
CLI Example:
salt '*' pyenv.rehash
```

```
salt.modules.pyenv.uninstall_python(python, runas=None)
Uninstall a python implementation.
**python** The version of python to uninstall. Should match one of the versions listed by pyenv.versions
CLI Example:
salt '*' pyenv.uninstall_python 2.0.0-p0
```

```
salt.modules.pyenv.update(runas=None, path=None)
Updates the current versions of pyenv and python-Build
CLI Example:
salt '*' pyenv.update
```

```
salt.modules.pyenv.versions(runas=None)
List the installed versions of python.
CLI Example:
salt '*' pyenv.versions
```

---

**21.9.367 salt.modules.qemu_img**

**Qemu-img Command Wrapper**

The qemu img command is wrapped for specific functions
```
depends qemu-img
```

```
salt.modules.qemu_img.convert(orig, dest, fmt)
Convert an existing disk image to another format using qemu-img
CLI Example:
```
```

21.9. execution modules
Salt Documentation, Release 3002.6

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

salt.modules.qemu_img.make_image(location, size, fmt)
Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:
```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

21.9.368 salt.modules.qemu_nbd

Qemu Command Wrapper
The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

salt.modules.qemu_nbd.clear(mnt)
Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:
```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}"
```

salt.modules.qemu_nbd.connect(image)
Activate nbd for an image file.

CLI Example:
```
salt '*' qemu_nbd.connect /tmp/image.raw
```

salt.modules.qemu_nbd.init(image, root=None)
Mount the named image via qemu-nbd and return the mounted roots

CLI Example:
```
salt '*' qemu_nbd.init /srv/image.qcow2
```

salt.modules.qemu_nbd.mount(nbd, root=None)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:
```
salt '*' qemu_nbd.mount /dev/nbd0
```
21.9.369 **salt.modules.quota**

Module for managing quotas on POSIX-like systems.

**salt.modules.quota.get_mode**(device)

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

**salt.modules.quota.off**(device)

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

**salt.modules.quota.on**(device)

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

**salt.modules.quota.report**(mount)

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

**salt.modules.quota.set**(device, **kwargs)

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

**salt.modules.quota.stats**()

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

**salt.modules.quota.warn**()

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```
21.9.370  salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user(name, password=None, runas=None)`
Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:
```bash
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost(vhost, runas=None)`
Adds a vhost via rabbitmqctl add_vhost.

CLI Example:
```bash
salt '*' rabbitmq add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password(name, password, runas=None)`
Changes a user's password.

CLI Example:
```bash
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password(name, password, runas=None)`
New in version 2016.3.0.
Checks if a user's password is valid.

CLI Example:
```bash
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password(name, runas=None)`
Removes a user's password.

CLI Example:
```bash
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.cluster_status(runas=None)`
return rabbitmq cluster_status

CLI Example:
```bash
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)`
Delete a policy based on rabbitmqctl clear_policy.

CLI Example:
```bash
salt '*' rabbitmq.delete_policy / HA
```

`salt.modules.rabbitmq.delete_upstream(name, runas=None)`
Deletes an upstream via rabbitmqctl clear_parameter.

Parameters
**name** (*str*) -- The name of the upstream to delete.
**runas** (*str*) -- The name of the user to run the command as.

**CLI Example:**
```
salt '*' rabbitmq.delete_upstream upstream_name
```

New in version 3000.

`salt.modules.rabbitmq.delete_user(name, runas=None)`
Deletes a user via rabbitmqctl delete_user.

**CLI Example:**
```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.delete_vhost(vhost, runas=None)`
Deletes a vhost rabbitmqctl delete_vhost.

**CLI Example:**
```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.disable_plugin(name, runas=None)`
Disable a RabbitMQ plugin via the rabbitmq-plugins command.

**CLI Example:**
```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.enable_plugin(name, runas=None)`
Enable a RabbitMQ plugin via the rabbitmq-plugins command.

**CLI Example:**
```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset(runas=None)`
Forcefully Return a RabbitMQ node to its virgin state

**CLI Example:**
```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster(host, user='rabbit', ram_node=None, runas=None)`
Join a rabbit cluster

**CLI Example:**
```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

`salt.modules.rabbitmq.list_available_plugins(runas=None)`
Returns a list of the names of all available plugins (enabled and disabled).

**CLI Example:**
```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.list_enabled_plugins(runas=None)`
Returns a list of the names of the enabled plugins.

**CLI Example:**
```
salt '*' rabbitmq.list_enabled_plugins

salt.modules.rabbitmq.list_permissions(\textit{vhost}, runas=None)
\begin{quote}
Lists permissions for vhost via rabbitmqctl list_permissions
\end{quote}

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_permissions /myvhost
\end{verbatim}

salt.modules.rabbitmq.list_policies(\textit{vhost}='/', runas=None)
\begin{quote}
Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.
\end{quote}

Reference: \url{http://www.rabbitmq.com/ha.html}

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_policies
\end{verbatim}

salt.modules.rabbitmq.list_queues(runas=None, "args")
\begin{quote}
Returns queue details of the / virtual host
\end{quote}

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_queues messages consumers
\end{verbatim}

salt.modules.rabbitmq.list_queues_vhost(\textit{vhost}, runas=None, "args")
\begin{quote}
Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead.
\end{quote}

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_queues_vhost messages consumers
\end{verbatim}

salt.modules.rabbitmq.list_upstreams(runas=None)
\begin{quote}
Returns a dict of upstreams based on rabbitmqctl list_parameters.
\end{quote}

Parameters runas (str) -- The name of the user to run this command as.

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_upstreams
\end{verbatim}

New in version 3000.

salt.modules.rabbitmq.list_user_permissions(\textit{name}, runas=None)
\begin{quote}
List permissions for a user via rabbitmqctl list_user_permissions
\end{quote}

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_user_permissions user
\end{verbatim}

salt.modules.rabbitmq.list_users(runas=None)
\begin{quote}
Return a list of users based off of rabbitmqctl user_list.
\end{quote}

CLI Example:

\begin{verbatim}
salt '*' rabbitmq.list_users
\end{verbatim}

salt.modules.rabbitmq.list_vhosts(runas=None)
\begin{quote}
Return a list of vhost based on rabbitmqctl list_vhosts.
CLI Example:

```bash
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)`

Return whether the plugin is enabled.

CLI Example:

```bash
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

`salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)`

Return whether the policy exists based on rabbitmqctl list_policies.

CLI Example:

```bash
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.reset(runas=None)`

Return a RabbitMQ node to its virgin state

CLI Example:

```bash
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.set_permissions(vhost, user, conf='.*', write='.*', read='.*', runas=None)`

Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```bash
salt '*' rabbitmq.set_permissions myvhost myuser
```

`salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None, apply_to=None)`

Set a policy based on rabbitmqctl set_policy.

CLI Example:

```bash
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.set_upstream(name, uri, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None)`

Configures an upstream via rabbitmqctl set_parameter. This can be an exchange-upstream, a queue-upstream or both.

Parameters

- **name (str)** -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

Parameters

- **uri (str)** -- The AMQP URI(s) for the upstream.
- **prefetch_count (int)** -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect_delay (int)** -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1

21.9. execution modules
• **ack_mode** *(str)* -- Determines how the link should acknowledge messages. If set to `on-confirm` (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to `on-publish`, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to `no-ack`, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.

• **trust_user_id** *(bool)* -- Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

**Parameters**

• **exchange** *(str)* -- The name of the upstream exchange. Default is to use the same name as the federated exchange.

• **max_hops** *(int)* -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.

• **expires** *(int)* -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x.expires" argument for the upstream queue.

• **message_ttl** *(int)* -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is `None`, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.

• **ha_policy** *(str)* -- Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is `None`, meaning the queue is not HA.

The following parameter applies to federated queues only:

**Parameters**

• **queue** *(str)* -- The name of the upstream queue. Default is to use the same name as the federated queue.

• **runas** *(str)* -- The name of the user to run the command as.

CLI Example:

```bash
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_hops=1
trust_user_id=True uri=amqp://hostname
```

New in version 3000.

**salt.modules.rabbitmq.set_user_tags**(name, tags, runas=None)

Add user tags via rabbitmqctl set_user_tags

CLI Example:
salt '*' rabbitmq.set_user_tags myadmin administrator

```
salt.modules.rabbitmq.start_app(runas=None)
```

Start the RabbitMQ application.

CLI Example:
```
salt '*' rabbitmq.start_app
```

```
salt.modules.rabbitmq.status(runas=None)
```

Return rabbitmq status

CLI Example:
```
salt '*' rabbitmq.status
```

```
salt.modules.rabbitmq.stop_app(runas=None)
```

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:
```
salt '*' rabbitmq.stop_app
```

```
salt.modules.rabbitmq.upstream_exists(name, runas=None)
```

Return whether the upstream exists based on rabbitmqctl list_parameters.

Parameters

- name (str) -- The name of the upstream to check for.
- runas (str) -- The name of the user to run the command as.

CLI Example:
```
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

```
salt.modules.rabbitmq.user_exists(name, runas=None)
```

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:
```
salt '*' rabbitmq.user_exists rabbit_user
```

```
salt.modules.rabbitmq.vhost_exists(name, runas=None)
```

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:
21.9.371 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

```
rallydev:
    username: myuser@example.com
    password: 123pass
```

salt.modules.rallydev.list_items(name)
List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

salt.modules.rallydev.list_users()
List the users

CLI Example:

```
salt myminion rallydev.list_users
```

salt.modules.rallydev.query_item(name, query_string, order='Rank')
Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)' Rank
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

salt.modules.rallydev.query_user(query_string, order='UserName')
Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

salt.modules.rallydev.show_artifact(id_)
Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

salt.modules.rallydev.show_item(name, id_)
Show an item

CLI Example:
salt myminion rallydev.show_<item name> <item id>
salt.modules.rallydev.show_user(id_)
    Show a user
    CLI Example:
    salt myminion rallydev.show_user <user id>
salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)
    Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.
    CLI Example:
    salt myminion rallydev.update_<item name> <item id>
    field = <field>
    value = <value>
    postdata = <post data>
salt.modules.rallydev.update_user(id_, field, value)
    Update a user
    CLI Example:
    salt myminion rallydev.update_user <user id> <field> <new value>

21.9.372 salt.modules.random_org

Module for retrieving random information from Random.org
New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying
both in a configuration profile in the salt master/minion config.
For example:

    random_org:
        api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
        api_version: 1

salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)
List all Slack users.
Parameters
    • api_key -- The Random.org api key.
    • api_version -- The Random.org api version.
    • format -- Specifies the format in which the blobs will be returned. Values allowed
        are base64 and hex.
Returns The user list.
CLI Example:

    salt '*' get_integers number=5 min=1 max=6
    salt '*' get_integers number=5 min=1 max=6

salt.modules.random_org.generateDecimalFractions(api_key=None, api_version=None, **kwargs)
Generates true random decimal fractions
Parameters
- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the \([1,1e4]\) range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the \([1,20]\) range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

**Returns** A list of decimal fraction

**CLI Example:**
```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4 → replacement=True
```

salt.modules.random_org.generateGaussians(*api_key=None, api_version=None, **kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

**Parameters**
- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the \([1,1e4]\) range.
- **mean** -- The distribution's mean. Must be within the \([-1e6,1e6]\) range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the \([-1e6,1e6]\) range.
- **significantDigits** -- The number of significant digits to use. Must be within the \([2,20]\) range.

**Returns** The user list.

**CLI Example:**
```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0 → significantDigits=8
```

salt.modules.random_org.generateIntegers(*api_key=None, api_version=None, **kwargs*)

Generate random integers

**Parameters**
- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the \([-1e9,1e9]\) range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the \([-1e9,1e9]\) range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.
Returns A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

```
salt.modules.random_org.generateStrings (api_key=None, api_version=None, **kwargs)
Generate random strings.

Parameters
- api_key -- The Random.org api key.
- api_version -- The Random.org api version.
- number -- The number of strings to generate.
- length -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
- characters -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- replacement -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=abcdefghijklmnopqrstuvwxyz
salt '*' random_org.generateStrings number=10 length=16 characters=abcdefghijklmnopqrstuvwxyz
```

```
salt.modules.random_org.generateUUIDs (api_key=None, api_version=None, **kwargs)
Generate a list of random UUIDs

Parameters
- api_key -- The Random.org api key.
- api_version -- The Random.org api version.
- number -- How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

```
salt.modules.random_org.getUsage (api_key=None, api_version=None)
Show current usages statistics

Parameters
- api_key -- The Random.org api key.
- api_version -- The Random.org api version.

Returns The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage
salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=1
```

21.9. execution modules
21.9.373 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

salt.modules.rbac_solaris.auth_add(user, auth)
Add authorization to user
user [string] username
auth [string] authorization name
CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.auth_get(user, computed=True)
List authorization for user
user [string] username
computed [boolean] merge results from auths command into data from user_attr
CLI Example:

```
salt '*' rbac.auth_get leo
```

salt.modules.rbac_solaris.auth_list()
List all available authorization
CLI Example:

```
salt '*' rbac.auth_list
```

salt.modules.rbac_solaris.auth_rm(user, auth)
Remove authorization from user
user [string] username
auth [string] authorization name
CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.profile_add(user, profile)
Add profile to user
user [string] username
profile [string] profile name
CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

salt.modules.rbac_solaris.profile_get(user, default_hidden=True)
List profiles for user
user [string] username
default_hidden [boolean] hide default profiles
CLI Example:

```
salt '*' rbac.profile_get leo
dsalt '*' rbac.profile_get leo default_hidden=False
```

salt.modules.rbac_solaris.profile_list(default_only=False)
List all available profiles
**default_only**  [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

**salt.modules.rbac_solaris.profile_rm**(user, profile)

Remove profile from user

user  [string] username
profile  [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

**salt.modules.rbac_solaris.role_add**(user, role)

Add role to user

user  [string] username
role  [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

**salt.modules.rbac_solaris.role_get**(user)

List roles for user

user  [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

**salt.modules.rbac_solaris.role_list()**

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

**salt.modules.rbac_solaris.role_rm**(user, role)

Remove role from user

user  [string] username
role  [string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```
21.9.374 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

**salt.modules.rbenv.default**(ruby=None, runas=None)

Returns or sets the currently defined default ruby

ruby The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

**salt.modules.rbenv.do**(cmdline, runas=None, env=None)

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

**salt.modules.rbenv.do_with_ruby**(ruby, cmdline, runas=None)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

**salt.modules.rbenv.install**(runas=None, path=None)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

**salt.modules.rbenv.install_ruby**(ruby, runas=None)

Install a ruby implementation.

ruby The version of Ruby to install, should match one of the versions listed by `rbenv.list`

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

**salt.modules.rbenv.is_installed**(runas=None)

Check if rbenv is installed

CLI Example:
salt '*' rbenv.is_installed

salt.modules.rbenv.list_(runas=None)
  List the installable versions of ruby
  runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
  CLI Example:
  ```
salt '*' rbenv.list
  ```

salt.modules.rbenv.rehash(runas=None)
  Run rbenv rehash to update the installed shims
  runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
  CLI Example:
  ```
salt '*' rbenv.rehash
  ```

salt.modules.rbenv.uninstall_ruby(ruby, runas=None)
  Uninstall a ruby implementation.
  ruby The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.
  runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
  CLI Example:
  ```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
  ```

salt.modules.rbenv.update(runas=None, path=None)
  Updates the current versions of rbenv and ruby-build
  runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
  CLI Example:
  ```
salt '*' rbenv.update
  ```

salt.modules.rbenv.versions(runas=None)
  List the installed versions of ruby
  CLI Example:
  ```
salt '*' rbenv.versions
  ```

21.9.375 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.disable()
  Disable RDP the service on the server
  CLI Example:
  ```
salt '*' rdp.disable
  ```

salt.modules.rdp.disconnect_session(session_id)
  Disconnect a session.
Parameters

**session_id** -- The numeric Id of the session.

Returns

A boolean representing whether the disconnect succeeded.

CLI Example:

```bash
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

**salt.modules.rdp.enable()**

Enable RDP the service on the server

CLI Example:

```bash
salt '*' rdp.enable
```

**salt.modules.rdp.get_session(session_id)**

Get information about a session.

Parameters

**session_id** -- The numeric Id of the session.

Returns

A dictionary of session information.

CLI Example:

```bash
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

**salt.modules.rdp.list_sessions(logged_in_users_only=False)**

List information about the sessions.

Parameters

**logged_in_users_only** -- If True, only return sessions with users logged in.

Returns

A list containing dictionaries of session information.

CLI Example:

```bash
salt '*' rdp.list_sessions
```

**salt.modules.rdp.logoff_session(session_id)**

Initiate the logoff of a session.

Parameters

**session_id** -- The numeric Id of the session.

Returns

A boolean representing whether the logoff succeeded.

CLI Example:

```bash
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

**salt.modules.rdp.status()**

Show if rdp is enabled on the server

CLI Example:

```bash
salt '*' rdp.status
```
21.9.376 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

**configuration** This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```python
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

salt.modules.redismod.bgrewriteaof(*host=None, port=None, db=None, password=None*)

Asynchronously rewrite the append-only file

CLI Example:

```bash
salt '*' redis.bgrewriteaof
```

salt.modules.redismod.bgsave(*host=None, port=None, db=None, password=None*)

Asynchronously save the dataset to disk

CLI Example:

```bash
salt '*' redis.bgsave
```

salt.modules.redismod.config_get(*pattern='*', host=None, port=None, db=None, password=None*)

Get redis server configuration values

CLI Example:

```bash
salt '*' redis.config_get
salt '*' redis.config_get port
```

salt.modules.redismod.config_set(*name, value, host=None, port=None, db=None, password=None*)

Set redis server configuration values

CLI Example:

```bash
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.dbsize(*host=None, port=None, db=None, password=None*)

Return the number of keys in the selected database

CLI Example:

```bash
salt '*' redis.dbsize
```

salt.modules.redismod.delete(*keys, **connection_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```bash
salt '*' redis.delete foo
```

salt.modules.redismod.exists(*key, host=None, port=None, db=None, password=None*)

Return true if the key exists in redis
**CLI Example:**
```
salt '*' redis.exists foo
```

```
salt.modules.redismod.expire(key, seconds, host=None, port=None, db=None, password=None)
```
Set a keys time to live in seconds

**CLI Example:**
```
salt '*' redis.expire foo 300
```

```
salt.modules.redismod.expireat(key, timestamp, host=None, port=None, db=None, password=None)
```
Set a keys expire at given UNIX time

**CLI Example:**
```
salt '*' redis.expireat foo 140000000
```

```
salt.modules.redismod.flushall(host=None, port=None, db=None, password=None)
```
Remove all keys from all databases

**CLI Example:**
```
salt '*' redis.flushall
```

```
salt.modules.redismod.flushdb(host=None, port=None, db=None, password=None)
```
Remove all keys from the selected database

**CLI Example:**
```
salt '*' redis.flushdb
```

```
salt.modules.redismod.get_key(key, host=None, port=None, db=None, password=None)
```
Get redis key value

**CLI Example:**
```
salt '*' redis.get_key foo
```

```
salt.modules.redismod.get_master_ip(host=None, port=None, password=None)
```
Get host information about slave

**CLI Example:**
```
salt '*' redis.get_master_ip
```

```
salt.modules.redismod.hdel(key, *fields, **options)
```
Delete one of more hash fields.

New in version 2017.7.0.

**CLI Example:**
```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

```
salt.modules.redismod.hexists(key, field, host=None, port=None, db=None, password=None)
```
Determine if a hash fields exists.

New in version 2017.7.0.

**CLI Example:**
salt.hexists(foo_hash, bar_field)

salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)
Get specific field value from a redis hash, returns dict

CLI Example:
salt '*' redis.hget foo_hash bar_field

salt.modules.redismod.hgetall(key, host=None, port=None, db=None, password=None)
Get all fields and values from a redis hash, returns dict

CLI Example:
salt '*' redis.hgetall foo_hash

salt.modules.redismod.hincrby(key, field, increment=1, host=None, port=None, db=None, password=None)
Increment the integer value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
salt '*' redis.hincrby foo_hash bar_field 5

salt.modules.redismod.hincrbyfloat(key, field, increment=1.0, host=None, port=None, db=None, password=None)
Increment the float value of a hash field by the given number.
New in version 2017.7.0.

CLI Example:
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17

salt.modules.redismod.hlen(key, host=None, port=None, db=None, password=None)
Returns number of fields of a hash.
New in version 2017.7.0.

CLI Example:
salt '*' redis.hlen foo_hash

salt.modules.redismod.hmget(key, *fields, **options)
Returns the values of all the given hash fields.
New in version 2017.7.0.

CLI Example:
salt '*' redis.hmget foo_hash bar_field1 bar_field2

salt.modules.redismod.hmset(key, **fieldvals)
Sets multiple hash fields to multiple values.
New in version 2017.7.0.

CLI Example:
**salt.hscan**

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

**salt.hset**

```
salt '*' redis.hset foo_hash bar_field bar_value
```

**salt.hsetnx**

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

**salt.hvals**

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

**salt.info**

```
salt '*' redis.info
```

**salt.key_type**

```
salt '*' redis.type foo
```

**salt.keys**

```
salt '*' redis.keys
salt '*' redis.keys test *
```
salt.modules.redismod.**lastsave**(host=None, port=None, db=None, password=None)
Get the UNIX time in seconds of the last successful save to disk

CLI Example:
```
salt '*' redis.lastsave
```

salt.modules.redismod.**llen**(key, host=None, port=None, db=None, password=None)
Get the length of a list in Redis

CLI Example:
```
salt '*' redis.llen foo_list
```

salt.modules.redismod.**lrange**(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a list in Redis

CLI Example:
```
salt '*' redis.lrange foo_list 0 10
```

salt.modules.redismod.**ping**(host=None, port=None, db=None, password=None)
Ping the server, returns False on connection errors

CLI Example:
```
salt '*' redis.ping
```

salt.modules.redismod.**save**(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk

CLI Example:
```
salt '*' redis.save
```

salt.modules.redismod.**sentinel_get_master_ip**(master, host=None, port=None, password=None)
Get ip for sentinel master

CLI Example:
```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

salt.modules.redismod.**set_key**(key, value, host=None, port=None, db=None, password=None)
Set redis key value

CLI Example:
```
salt '*' redis.set_key foo bar
```

salt.modules.redismod.**shutdown**(host=None, port=None, db=None, password=None)
Synchronously save the dataset to disk and then shut down the server

CLI Example:
```
salt '*' redis.shutdown
```

salt.modules.redismod.**slaveof**(master_host=None, master_port=None, host=None, port=None, db=None, password=None)
Make the server a slave of another instance, or promote it as master
CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

salt.modules.redismod.smembers(key, host=None, port=None, db=None, password=None)
Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

salt.modules.redismod.time(host=None, port=None, db=None, password=None)
Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

salt.modules.redismod.zcard(key, host=None, port=None, db=None, password=None)
Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

salt.modules.redismod.zrange(key, start, stop, host=None, port=None, db=None, password=None)
Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

21.9.377 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER
Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \). The following are valid methods of passing the key on the CLI:

**Using single backslashes:** "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)

**Using double backslashes:** SOFTWARE\\Python

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"=""C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe" -s"
"NvBackend"=""C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.exe"
"BTMTrayAgent"="rundll32.exe "C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.dll",TrayApp"
```

In this example these are the values for each:

**Hive:** HKEY_LOCAL_MACHINE

**Key and subkeys:** SOFTWARE\Microsoft\Windows\CurrentVersion\Run

**Value:**

- There are 3 value names:
  - RTHDVCPL
  - NvBackend
  - BTMTrayAgent

- Each value name has a corresponding value

**depends**

- salt.utils.win_reg

**salt.modules.reg.broadcast_change()**

Refresh the windows environment.

**Note:** This will only effect new processes and windows. Services will not see the change until the system restarts.

**Returns** True if successful, otherwise False

**Return type** bool
CLI Example:

```
salt '*' reg.broadcast_change
```

**salt.modules.reg.delete_key_recursive** *(hive, key, use_32bit_registry=False)*

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

**Parameters**

- **hive** *(str)* -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* -- The key to remove (looks like a path)

- **use_32bit_registry** *(bool)* -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

A dictionary listing the keys that deleted successfully as well as those that failed to delete.

**Return type** *dict*

CLI Example:
The following example will remove `delete_me` and all its subkeys from the SOFTWARE key in HKEY_LOCAL_MACHINE:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

**salt.modules.reg.delete_value** *(hive, key, vname=None, use_32bit_registry=False)*

Delete a registry value entry or the default value for a key.

**Parameters**

- **hive** *(str)* -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* -- The key (looks like a path) to the value name.

- **vname** *(str)* -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.

- **use_32bit_registry** *(bool)* -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

True if successful, otherwise False

**Return type** *bool*

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\\Salt' 'version'
```

**salt.modules.reg.import_file** *(source, use_32bit_registry=False)*

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

**Parameters**

- **source** *(str)* -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)

- **use_32bit_registry** *(bool)* -- If the value of this parameter is True then the
REG file will be imported into the Windows 32 bit registry. Otherwise the Windows
64 bit registry will be used.

Returns True if successful, otherwise an error is raised
Return type bool

Raises
• ValueError -- If the value of source is an invalid path or otherwise causes cp.
cache_file to return False
• CommandExecutionError -- If reg.exe exits with a non-0 exit code

CLI Example:

```bash
salt machine1 reg.import_file salt://win/printer_config/110_Canon/postinstall_config.reg
```

salt.modules.reg.key_exists(hive, key, use_32bit_registry=False)
Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters
• hive (str) -- The hive to connect to
• key (str) -- The key to check
• use_32bit_registry (bool) -- Look in the 32bit portion of the registry

Returns True if exists, otherwise False
Return type bool

CLI Example:

```bash
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

salt.modules.reg.list_keys(hive, key=None, use_32bit_registry=False)
Enumerates the subkeys in a registry key or hive.

Parameters
• hive (str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
• key (str) -- The key (looks like a path) to the value name. If a key is not passed, the
  keys under the hive will be returned.
• use_32bit_registry (bool) -- Accesses the 32bit portion of the registry on 64
  bit installations. On 32bit machines this is ignored.

Returns A list of keys/subkeys under the hive or key.
Return type list

CLI Example:

```bash
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

salt.modules.reg.list_values(hive, key=None, use_32bit_registry=False)
Enumerates the values in a registry key or hive.

Note: The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of
values.

Parameters
• hive (str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU

21.9. execution modules 2595
- HKEY_USER or HKU
- HKEY_CLASSES_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.

- **use_32bit_registry** *(bool)* -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns** A list of values under the hive or key.

**Return type** list

---

### CLI Example:

```
salt '*.' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip
```

---

**salt.modules.reg.read_value** *(hive, key, vname=None, use_32bit_registry=False)*

Reads a registry value entry or the default value for a key. To read the default value, don’t pass **vname**

**Parameters**

- **hive** *(str)* -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* -- The key (looks like a path) to the value name.

- **vname** *(str)* -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.

- **use_32bit_registry** *(bool)* -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**

A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

- bool: Returns False if the key is not found

  If **vname** is not passed:
  - Returns the first unnamed value (Default) as a string.
  - Returns none if first unnamed value is empty.

**Return type** dict

---

**CLI Example:**

The following will get the value of the version value name in the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*.' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

---

**CLI Example:**

The following will get the default value of the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```
salt '*.' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

---

**salt.modules.reg.set_value** *(hive, key, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, volatile=False)*

Sets a value in the registry. If **vname** is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

**Parameters**

- **hive** *(str)* -- The name of the hive. Can be one of the following
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU
- HKEY_CLASSES_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC

- **key** *(str)* -- The key (looks like a path) to the value name.
- **vname** *(str)* -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** *(str, int, list, bytes)* -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in **vtype**. The correspondence is as follows:

- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary.

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed.

**Note:** This parameter is optional. If vdata is not passed, the Key will be created with no associated item/value pairs.

- **vtype** *(str)* -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry** *(bool)* -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** *(bool)* -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
This will set the version value to 2015.5.2 in the SOFTWARE\Salt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' = '2015.5.2'
```

**CLI Example:**
This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

**CLI Example:**
In this next example vdata is properly quoted and should succeed.
Salt Documentation, Release 3002.6

```python
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data'
    → vtype=REG_SZ vdata='1.2'
```

**CLI Example:**
This is an example of using vtype REG_BINARY.

```python
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data'
    → vtype=REG_BINARY vdata='Salty Data'
```

**CLI Example:**
An example of using vtype REG_MULTI_SZ is as follows:

```python
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data'
    → vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

```python
salt.modules.reg.value_exists(hive, key, vname, use_32bit_registry=False)
```

Check that the value/data pair is found in the registry.

New in version 3000.

**Parameters**
- **hive (str)** -- The hive to connect to
- **key (str)** -- The key to check in
- **vname (str)** -- The name of the value/data pair you're checking
- **use_32bit_registry (bool)** -- Look in the 32bit portion of the registry

**Returns**
True if exists, otherwise False

**Return type**
bool

**CLI Example:**

```python
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\CurrentVersion
    → CommonFilesDir
```

21.9.378 salt.modules.rest_pkg

Package support for the REST example

```python
salt.modules.rest_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
```

```python
salt.modules.rest_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)
```

```python
salt.modules.rest_pkg.list_pkgs(versions_as_list=False, **kwargs)
```

```python
salt.modules.rest_pkg.remove(name=None, pkgs=None, **kwargs)
```

```python
salt.modules.rest_pkg.upgrade(refresh=True, skip_verify=True, **kwargs)
```

```python
salt.modules.rest_pkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```python
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
21.9.379  salt.modules.rest_sample_utils module

Utility functions for the rest_sample

salt.modules.rest_sample_utils.fix_outage()
   "Fix" the outage
   CLI Example:
   ```
salt 'rest-sample-proxy' rest_sample.fix_outage
   ```

salt.modules.rest_sample_utils.get_test_string()
   Helper function to test cross-calling to the __proxy__ dunder.
   CLI Example:
   ```
salt 'rest-sample-proxy' rest_sample.get_test_string
   ```

21.9.380  salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.enabled(name, sig=None)
   Only the 'redbull' service is 'enabled' in the test

salt.modules.rest_service.get_all()
   Return a list of all available services
   New in version 2015.8.0.
   CLI Example:
   ```
salt '*' service.get_all
   ```

salt.modules.rest_service.list_()
   Return a list of all available services.
   CLI Example:
   ```
salt '*' service.list
   ```

salt.modules.rest_service.restart(name, sig=None)
   Restart the specified service with rest_sample
   New in version 2015.8.0.
   CLI Example:
   ```
salt '*' service.restart <service name>
   ```

salt.modules.rest_service.running(name, sig=None)
   Return whether this service is running.
   New in version 2015.8.0.

salt.modules.rest_service.start(name, sig=None)
   Start the specified service on the rest_sample
   New in version 2015.8.0.

21.9. execution modules
Salt Documentation, Release 3002.6

CLI Example:

```bash
salt '*' service.start <service name>
```

`salt.modules.rest_service.status(name, sig=None)`

Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**

- `name` *(str)* -- The name of the service to check
- `sig` *(str)* -- Not implemented

**Returns**

True if running, False otherwise

dict: Maps service name to True if running, False otherwise

**Return type**

`bool`

CLI Example:

```bash
salt '*' service.status <service name>
```

`salt.modules.rest_service.stop(name, sig=None)`

Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```bash
salt '*' service.stop <service name>
```

### 21.9.381 `salt.modules.restartcheck module`

`salt.modules.restartcheck.restartcheck(ignorelist=None, blacklist=None, excludepid=None, **kwargs)`

Analyzes files opened by running processes and seeks for packages which need to be restarted.

**Parameters**

- `ignorelist` -- string or list of packages to be ignored.
- `blacklist` -- string or list of file paths to be ignored.
- `excludepid` -- string or list of process IDs to be ignored.
- `verbose` -- boolean, enables extensive output.
- `timeout` -- int, timeout in minute.

**Returns**

{ 'result': False, 'comment': '<reason>' }  String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

**Return type**

Dict on error

New in version 2015.8.3.

CLI Example: .. code-block:: bash

```bash
salt '*' restartcheck.restartcheck
```

2600 Chapter 21. Salt Module Reference
21.9.382 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.get_fun(returner, fun)
    Return info about last time fun was called on each minion

    CLI Example:
    ```
    salt '*' ret.get_fun mysql network.interfaces
    ```

salt.modules.ret.get_jid(returner, jid)
    Return the information for a specified job id

    CLI Example:
    ```
    salt '*' ret.get_jid redis 20421104181954700505
    ```

salt.modules.ret.get_jids(returner)
    Return a list of all job ids

    CLI Example:
    ```
    salt '*' ret.get_jids mysql
    ```

salt.modules.ret.get_minions(returner)
    Return a list of all minions

    CLI Example:
    ```
    salt '*' ret.get_minions mysql
    ```

21.9.383 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.apply_network_settings(**settings)
    Apply global network configuration.

    CLI Example:
    ```
    salt '*' ip.apply_network_settings
    ```

salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)
    Build an interface script for a network interface.

    CLI Example:
    ```
    salt '*' ip.build_interface eth0 eth <settings>
    ```

salt.modules.rh_ip.build_network_settings(**settings)
    Build the global network script.

    CLI Example:
    ```
    salt '*' ip.build_network_settings <settings>
    ```
salt.modules.rh_ip.build_routes(iface, **settings)
Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.rh_ip.down(iface, iface_type)
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.rh_ip.get_interface(iface)
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.rh_ip.get_network_settings()
Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.rh_ip.get_routes(iface)
Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.rh_ip.up(iface, iface_type)
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

21.9.384 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start’ is not available), see [here](#).

salt.modules.rh_service.available(name, limit='')
Return True if the named service is available. Use the limit param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```
salt.modules.rh_service.delete(name, **kwargs)
    Delete the named service
    New in version 2016.3.
    CLI Example:
    ```
salt '*' service.delete <service name>
    ```

salt.modules.rh_service.disable(name, **kwargs)
    Disable the named service to start at boot
    CLI Example:
    ```
salt '*' service.disable <service name>
    ```

salt.modules.rh_service.disabled(name)
    Check to see if the named service is disabled to start on boot
    CLI Example:
    ```
salt '*' service.disabled <service name>
    ```

salt.modules.rh_service.enable(name, **kwargs)
    Enable the named service to start at boot
    CLI Example:
    ```
salt '*' service.enable <service name>
    ```

salt.modules.rh_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot
    CLI Example:
    ```
salt '*' service.enabled <service name>
    ```

salt.modules.rh_service.get_all(limit='')
    Return all installed services. Use the limit param to restrict results to services of that type.
    CLI Example:
    ```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
    ```

salt.modules.rh_service.get_disabled(limit='')
    Return the disabled services. Use the limit param to restrict results to services of that type.
    CLI Example:
    ```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
    ```

salt.modules.rh_service.get_enabled(limit='')
    Return the enabled services. Use the limit param to restrict results to services of that type.
    CLI Examples:
salt.modules.rh_service.missing(name, limit='')

The inverse of service.available. Return True if the named service is not available. Use the limit param to restrict results to services of that type.

CLI Examples:

```plaintext
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.reload_(name)

Reload the named service

CLI Example:

```plaintext
salt '*' service.reload <service name>
```

salt.modules.rh_service.restart(name)

Restart the named service

CLI Example:

```plaintext
salt '*' service.restart <service name>
```

salt.modules.rh_service.start(name)

Start the specified service

CLI Example:

```plaintext
salt '*' service.start <service name>
```

salt.modules.rh_service.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

  - name (str) -- The name of the service to check
  - sig (str) -- Signature to use to find the service via ps

Returns

  True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```plaintext
salt '*' service.status <service name> [service signature]
```

salt.modules.rh_service.stop(name)

Stop the specified service

CLI Example:

```plaintext
salt '*' service.stop <service name>
```
21.9.385 salt.modules.riak

Riak Salt Module

salt.modules.riak.cluster_commit()
Commit Cluster Changes

   Changed in version 2015.8.0.
   CLI Example:
   ```
salt '*' riak.cluster_commit
   ```

salt.modules.riak.cluster_join(username, hostname)
Join a Riak cluster

   Changed in version 2015.8.0.
   CLI Example:
   ```
salt '*' riak.cluster_join <user> <host>
   ```

   username - The riak username to join the cluster
   hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_leave(username, hostname)
Leave a Riak cluster

   New in version 2015.8.0.
   CLI Example:
   ```
salt '*' riak.cluster_leave <username> <host>
   ```

   username - The riak username to join the cluster
   hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_plan()
Review Cluster Plan

   Changed in version 2015.8.0.
   CLI Example:
   ```
salt '*' riak.cluster_plan
   ```

salt.modules.riak.member_status()
Get cluster member status

   Changed in version 2015.8.0.
   CLI Example:
   ```
salt '*' riak.member_status
   ```

salt.modules.riak.services()
List available services on a node

   New in version 2015.8.0.
   CLI Example:
   ```
salt '*' riak.services
   ```
salt.modules.riak.start()

Start Riak

CLI Example:
```
salt '*' riak.start
```

salt.modules.riak.status()

Current node status

New in version 2015.8.0.

CLI Example:
```
salt '*' riak.status
```

salt.modules.riak.stop()

Stop Riak

Changed in version 2015.8.0.

CLI Example:
```
salt '*' riak.stop
```

salt.modules.riak.test()

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:
```
salt '*' riak.test
```

21.9.386 salt.modules.rpm_lowpkg

Support for rpm

salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

**path** Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

**saltenv** [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:
```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

salt.modules.rpm_lowpkg.checksum(**paths, **kwargs)

Return if the signature of a RPM file is valid.

**root** use root as top level directory (default: "/")

CLI Example:
```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```
salt.modules.rpm_lowpkg.diff(package_path, path)
Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters
- package -- Full pack of the RPM file
- path -- Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI example:
```salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf```

salt.modules.rpm_lowpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root use root as top level directory (default: "/")

CLI Examples:
```salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict```

salt.modules.rpm_lowpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root use root as top level directory (default: "/")

CLI Examples:
```salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list```

salt.modules.rpm_lowpkg.info(*packages, **kwargs)
Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters
- packages --
- attr -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- all_versions -- Return information for all installed versions of the packages
- root -- use root as top level directory (default: "/")

Returns

CLI example:
```salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_
versions=True```

salt.modules.rpm_lowpkg.list_pkgs(*packages, **kwargs)
List the packages currently installed in a dict:

```{"<package_name>": '<<version>>'}```
CLI Example:

```
salt '*' lowpkg.list_pkgs
```

`salt.modules.rpm_lowpkg.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

`salt.modules.rpm_lowpkg.owner(*paths, **kwargs)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.rpm_lowpkg.verify(*packages, **kwargs)`

Runs an rpm -Va on a system, and returns the results in a dict.

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument.

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)`

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

`ignore_epoch` [False] Set to True to ignore the epoch when comparing versions.

New in version 2015.8.10, 2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```
21.9.387 salt.modules rpmbuild pkgbuilder

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuilder interface

salt.modules.rpmbuild pkgbuilder.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuilder')

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuilder.build mock epel-7-x86_64 /var/www/html
   https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/
   python-libnacl.spec
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

salt.modules.rpmbuild pkgbuilder.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.
keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion’s Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

\Q+BFciIfQBCADAPCtzx7I5RI\32escCMZ\PzaEK\We7\bIX\1em\4K\CK\k\Bo\x47IG\54b\iw82PCE8Y1\jf9\Uk\2m\3RK\V\p\3Y\c\7A\p\3g\j\6V\O\4ys\V\v\Z\28Ub\nh\P\sx\I\k\0f2cq\8qc
\.

-----BEGIN PGP PUBLIC KEY BLOCK-----
```
(continues on next page)

env  Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Noteworthy: This parameter is not used for making *yum* repositories.

use_passphrase  [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in *keyid*. Passphrase is received from Pillar data which could be passed on the command line with *pillar* parameter.

```
pillar={'"gpg_passphrase" : "my_passphrase"'}
```

New in version 3001.1.

RHEL 8 and above leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

gnupghome  [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with *keyid*.

User to create the repository as, and optionally sign packages.

Noteworthy: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout  [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_pkgbuild.make_src_pkg(*dest_dir*,  *spec*,  *sources*,  *env=None, template=None, saltenv='base', runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/  
https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-
libnacl.spec
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```
This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

Changed in version 2017.7.0.

**dest_dir** The directory on the minion to place the built package(s)

**spec** The location of the spec file (used for rpms)

**sources** The list of package sources

**env** A dictionary of environment variables to be set prior to execution.

**template** Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

**saltenv** The saltenv to use for files downloaded from the salt filesever

**runas** The user to run the build process as

New in version 2018.3.3.

---

**Note:** using SHA256 as digest and minimum level dist el6

### 21.9.388 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into opts will overwrite options passed into pillar.

salt.modules.rsync.**config**(conf_path='/etc/rsyncd.conf')

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from cmd.run_all.

Returns the contents of the rsync config file

**conf_path** [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

salt.modules.rsync.**rsync**(src, dst, delete=False, force=False, update=False, passwordfile=None, exclude=None, excludefrom=None, dryrun=False, rsh=None, additional_opts=None, saltenv='base')

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from cmd.run_all.

Rsync files from src to dst

**src** The source location where files will be rsynced from.

**dst** The destination location where files will be rsynced to.

**delete** [False] Whether to enable the rsync --delete flag, which will delete extraneous files from dest dirs

**force** [False] Whether to enable the rsync --force flag, which will force deletion of dirs even if not empty.

**update** [False] Whether to enable the rsync --update flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.

**passwordfile** A file that contains a password for accessing an rsync daemon. The file should contain just the password.

**exclude** Whether to enable the rsync --exclude flag, which will exclude files matching a PATTERN.

**excludefrom** Whether to enable the rsync --excludefrom flag, which will read exclude patterns from a file.
**dryrun** [False] Whether to enable the rsync \texttt{--dry-run} flag, which will perform a trial run with no changes made.

**rsh** Whether to enable the rsync \texttt{--rsh} flag, to specify the remote shell to use.

**additional_opts** Any additional rsync options, should be specified as a list.

**saltenv**
Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True passwordfile=/etc/pass.crt exclude=exclude/dir
```

```
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
```

```
salt '*' rsync.rsync /path/to/src delete=True exclude=[exclude1/dir, exclude2/dir] additional_opts=["--partial", "--bwlimit=5000"]'
```

**salt.modules.rsync.version()**

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from \texttt{cmd.run_all}.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

---

### 21.9.389 salt.modules.runit

**runit** service module (http://smarden.org/runit)

This module is compatible with the \texttt{service} states, so it can be used to maintain services using the \texttt{provider} argument:

```
myservice:
  service:
    - running
    - \texttt{provider}: runit
```

Provides virtual \texttt{service} module on systems using runit as init.

Service management rules (\texttt{sv} command):

```
service Sn is ENABLED if file SERVICE_DIR/$n/run exists service $n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/$n/run exists service $n is DISABLED if AVAILABLE but not ENABLED

SERVICE_DIR/$n is normally a symlink to an AVAIL_SVR_DIR/$n folder
```

Service auto-start/stop mechanism:

```
sv (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.
```

Service's alias:

```
Service sva is an alias of service svc when AVAIL_SVR_DIR/sva symlinks to folder AVAIL_SVR_DIR/svc.
svc can't be enabled if it is already enabled through an alias already enabled, since sv files are stored in folder SERVICE_DIR/svc/.
```
XBPS package management uses a service’s alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

```python
salt.modules.runit.add_svc_avail_path(path)
   Add a path that may contain available services. Return True if added (or already present), False on error.
   path directory to add to AVAIL_SVR_DIRS
```

```python
salt.modules.runit.available(name)
   Returns True if the specified service is available, otherwise returns False.
   name the service's name
```

```
salt '*' runit.available <service name>
```

```python
salt.modules.runit.disable(name, stop=False, **kwargs)
   Don't start service name at boot Returns True if operation is successful
   name the service's name
   stop if True, also stops the service
```

```
salt '*' service.disable <name> [stop=True]
```

```python
salt.modules.runit.disabled(name)
   Return True if the named service is disabled, False otherwise
   name the service's name
```

```
salt '*' service.disabled <service name>
```

```python
salt.modules.runit.enable(name, start=False, **kwargs)
   Start service name at boot. Returns True if operation is successful
   name the service's name
   start [False] If True, start the service once enabled.
```

```
salt '*' service.enable <name> [start=True]
```

```python
salt.modules.runit.enabled(name)
   Return True if the named service is enabled, False otherwise
   name the service's name
```

```
salt '*' service.enabled <service name>
```

```python
sicl.modules.runit.full_restart(name)
   Calls runit.restart()
   name the service's name
```

```
salt '*' runit.full_restart <service name>
```

```python
sicl.modules.runit.get_all()
   Return a list of all available services
```

```
salt '*' runit.get_all()
```
salt 'r' runit.get_all

salt.modules.runit.get_disabled()
   Return a list of all disabled services
   CLI Example:
   salt 'r' service.get_disabled

salt.modules.runit.get_enabled()
   Return a list of all enabled services
   CLI Example:
   salt 'r' service.get_enabled

salt.modules.runit.get_svc_alias()
   Returns the list of service's name that are aliased and their alias path(s)

salt.modules.runit.get_svc_avail_path()
   Return list of paths that may contain available services

salt.modules.runit.get_svc_broken_path(name='**')
   Return list of broken path(s) in SERVICE_DIR that match name
   A path is broken if it is a broken symlink or can not be a runit service
   name a glob for service name. default is '**'
   CLI Example:
   salt 'r' runit.get_svc_broken_path <service name>

salt.modules.runit.missing(name)
   The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False.
   name the service's name
   CLI Example:
   salt 'r' runit.missing <service name>

salt.modules.runit.reload_(name)
   Reload service
   name the service's name
   CLI Example:
   salt 'r' runit.reload <service name>

salt.modules.runit.remove(name)
   Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.
   name the service's name
   CLI Example:
   salt 'r' service.remove <name>

salt.modules.runit.restart(name)
   Restart service
   name the service's name
   CLI Example:
salt '*' runit.restart <service name>

salt.modules.runit.show(name)
  Show properties of one or more units/jobs or the manager
  name the service's name
  CLI Example:
  
  salt '*' service.show <service name>

salt.modules.runit.start(name)
  Start service
  name the service's name
  CLI Example:
  
  salt '*' runit.start <service name>

salt.modules.runit.status(name, sig=None)
  Return True if service is running
  name the service's name
  sig signature to identify with ps
  CLI Example:
  
  salt '*' runit.status <service name>

salt.modules.runit.status_autostart(name)
  Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.
  name the service's name
  CLI Example:
  
  salt '*' runit.status_autostart <service name>

salt.modules.runit.stop(name)
  Stop service
  name the service's name
  CLI Example:
  
  salt '*' runit.stop <service name>

21.9.390 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

salt.modules.rvm.do(ruby, command, runas=None, cwd=None, env=None)
  Execute a command in an RVM controlled environment.
  ruby Which ruby to use
  command The rvm command to execute
  runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
  cwd The directory from which to run the rvm command. Defaults to the user's home directory.
  CLI Example:
  
  salt '*' rvm.do 2.0.0 <command>

salt.modules.rvm.gemset_copy(source, destination, runas=None)
  Copy all gems from one gemset to another.

21.9. execution modules
source  The name of the gemset to copy, complete with ruby version

destination The destination gemset

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

    salt '*' rvm.gemset_copy foobar bazquo

salt.modules.rvm.gemset_create(ruby, gemset, runas=None)

Creates a gemset.

ruby  The ruby version for which to create the gemset

gemset  The name of the gemset to create

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

    salt '*' rvm.gemset_create 2.0.0 foobar

salt.modules.rvm.gemset_delete(ruby, gemset, runas=None)

Delete a gemset

ruby  The ruby version to which the gemset belongs

gemset  The gemset to delete

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

    salt '*' rvm.gemset_delete 2.0.0 foobar

salt.modules.rvm.gemset_empty(ruby, gemset, runas=None)

Remove all gems from a gemset.

ruby  The ruby version to which the gemset belongs

gemset  The gemset to empty

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

    salt '*' rvm.gemset_empty 2.0.0 foobar

salt.modules.rvm.gemset_list(ruby='default', runas=None)

List all gemsets for the given ruby.

ruby  [default] The ruby version for which to list the gemsets

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

    salt '*' rvm.gemset_list

salt.modules.rvm.gemset_list_all(runas=None)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
salt '*' rvm.gemset_list_all

```python
salt.modules.rvm.get(version='stable', runas=None)
```
Update RVM

```python
version [stable] Which version of RVM to install, (e.g. stable or head)
```

CLI Example:

```bash
salt '*' rvm.get
```

```python
salt.modules.rvm.install(runas=None)
```
Install RVM system-wide

```python
runas The user under which to run the rvm installer script. If not specified, then it be run as the user under
```

which Salt is running.

CLI Example:

```bash
salt '*' rvm.install
```

```python
salt.modules.rvm.install_ruby(ruby, runas=None, opts=None, env=None)
```
Install a ruby implementation.

```python
ruby The version of ruby to install
```

```python
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
```

running.

```python
env Environment to set for the install command. Useful for exporting compilation flags such as
```

RUBY_CONFIGURE_OPTS

```python
opts List of options to pass to the RVM installer (ie -C, --patch, etc)
```

CLI Example:

```bash
salt '*' rvm.install_ruby 1.9.3-p385
```

```python
salt.modules.rvm.is_installed(runas=None)
```
Check if RVM is installed.

CLI Example:

```bash
salt '*' rvm.is_installed
```

```python
salt.modules.rvm.list_(runas=None)
```
List all rvm-installed rubies

```python
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
```

running.

CLI Example:

```bash
salt '*' rvm.list
```

```python
salt.modules.rvm.reinstall_ruby(ruby, runas=None, env=None)
```
Reinstall a ruby implementation

```python
ruby The version of ruby to reinstall
```

```python
runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
```

running.

CLI Example:

```bash
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

```python
salt.modules.rvm.rubygems(ruby, version, runas=None)
```
Installs a specific rubygems version in the given ruby

```python
ruby The ruby for which to install rubygems
```

21.9. execution modules
version  The version of rubygems to install, or 'remove' to use the version that ships with 1.9
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
running.
CLI Example:
salt '*' rvm.rubygems 2.0.0 1.8.24

```
salt.modules.rvm.set_default(ruby, runas=None)
```
Set the default ruby
ruby  The version of ruby to make the default
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
running.
CLI Example:
salt '*' rvm.set_default 2.0.0

```
salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, *binaries)
```
Install RVM wrapper scripts
ruby_string  Ruby/gemset to install wrappers for
wrapper_prefix  What to prepend to the name of the generated wrapper binaries
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is
running.
binaries  [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby,
gem, rake, irb, rdoc, ri and testrb are generated.
CLI Example:
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>

21.9.391 salt.modules.s3

Connection module for Amazon S3

configuration  This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the
instance through Instance Profiles. Dynamic credentials are then automatically obtained from
AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

**Warning:** This is literally the pillar key s3.keyid or the config option s3.keyid, not:

```
s3:
  keyid: blah
```

A service_url may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A role_arn may also be specified in the configuration:
**s3.role_arn**: arn:aws:iam::111111111111:role/my-role-to-assume

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

**s3.path_style**: True

This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

**s3.https_enable**: True

SSL verification may also be turned off in the configuration:

**s3.verify_ssl**: False

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

**s3.location**: eu-central-1

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

```python
salt.modules.s3.delete(bucket='', path=None, action=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```python
salt.modules.s3.get(bucket='', path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

List the contents of a bucket, or return an object from a bucket. Set `return_bin` to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:
Salt Documentation, Release 3002.6

salt myminion s3.get mybucket myfile.png return_bin=True

CLI Example to save the binary contents of an object to a local file:
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

<table>
<thead>
<tr>
<th>acl</th>
</tr>
</thead>
<tbody>
<tr>
<td>cors</td>
</tr>
<tr>
<td>lifecycle</td>
</tr>
<tr>
<td>policy</td>
</tr>
<tr>
<td>location</td>
</tr>
<tr>
<td>logging</td>
</tr>
<tr>
<td>notification</td>
</tr>
<tr>
<td>tagging</td>
</tr>
<tr>
<td>requestPayment</td>
</tr>
<tr>
<td>versioning</td>
</tr>
<tr>
<td>website</td>
</tr>
</tbody>
</table>

To perform an action on a bucket:
salt myminion s3.get mybucket myfile.png action=acl

```
salt.modules.s3.head(bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:
salt myminion s3.head mybucket salt myminion s3.head mybucket myfile.png

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:
salt myminion s3.put mybucket

CLI Example to upload an object to a bucket:
salt myminion s3.put mybucket remotepath local_file=/path/to/file

21.9.392 salt.modules.s6 module

s6 service module

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the enabled argument is not available with this provider.

codeauthor Marek Skrobacki <skrobul@skrobul.com>

```
salt.modules.s6.available(name)
```

Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' s6.available foo

salt.modules.s6.full_restart(name)
   Calls s6.restart() function
   CLI Example:
   
   salt '*' s6.full_restart <service name>

salt.modules.s6.get_all()
   Return a list of all available services
   CLI Example:
   
   salt '*' s6.get_all

salt.modules.s6.missing(name)
   The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.
   CLI Example:
   
   salt '*' s6.missing foo

salt.modules.s6.reload_(name)
   Send a HUP to service via s6
   CLI Example:
   
   salt '*' s6.reload <service name>

salt.modules.s6.restart(name)
   Restart service via s6. This will stop/start service
   CLI Example:
   
   salt '*' s6.restart <service name>

salt.modules.s6.start(name)
   Starts service via s6
   CLI Example:
   
   salt '*' s6.start <service name>

salt.modules.s6.status(name, sig=None)
   Return the status for a service via s6, return pid if running
   CLI Example:
   
   salt '*' s6.status <service name>

salt.modules.s6.stop(name)
   Stops service via s6
   CLI Example:
   
   salt '*' s6.stop <service name>
salt.modules.s6.term(name)
    Send a TERM to service via s6
    
    CLI Example:
    
    salt '*' s6.term <service name>

21.9.393  salt.modules.salt_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

salt.modules.salt_proxy.configure_proxy(proxyname, start=True)
    Create the salt proxy file and start the proxy process if required
    
    Parameters
    • proxyname -- Name to be used for this proxy (should match entries in pillar)
    • start -- Boolean indicating if the process should be started default = True
    
    CLI Example:
    
    salt deviceminion salt_proxy.configure_proxy p8000

salt.modules.salt_proxy.is_running(proxyname)
    Check if the salt-proxy process associated with this proxy (name) is running.
    Returns True if the process is running False otherwise
    
    Parameters proxyname -- String name of the proxy (p8000 for example)
    
    CLI Example:
    
    salt deviceminion salt_proxy.is_running p8000

21.9.394  salt.modules.salt_version

Access Salt’s elemental release code-names.

New in version 3000.

Salt’s feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```jinja
{% a boolean check #}
{% set option_deprecated = salt['salt_version.less_than']("3001") %}

{% if option_deprecated %}
    <use old syntax>
{% else %}
    <use new syntax>
{% endif %}
```
salt.modules.salt_version.equal(name)
   Returns a boolean (True) if the minion's current version code name matches the named version.
   name  The release code name to check the version against.
   CLI Example:
   ```
salt '*' salt_version.equal 'Oxygen'
``` 

salt.modules.salt_version.get_release_number(name)
   Returns the release number of a given release code name in a MAJOR.PATCH format.
   If the release name has not been given an assigned release number, the function returns a string. If the release
   cannot be found, it returns None.
   name  The release code name for which to find a release number.
   CLI Example:
   ```
salt '*' salt_version.get_release_number 'Oxygen'
``` 

salt.modules.salt_version.greater_than(name)
   Returns a boolean (True) if the minion's current version code name is greater than the named version.
   name  The release code name to check the version against.
   CLI Example:
   ```
salt '*' salt_version.greater_than 'Oxygen'
``` 

salt.modules.salt_version.less_than(name)
   Returns a boolean (True) if the minion's current version code name is less than the named version.
   name  The release code name to check the version against.
   CLI Example:
   ```
salt '*' salt_version.less_than 'Oxygen'
``` 

21.9.395 salt.modules.saltcheck

A module for testing the logic of states and highstates

codeauthor  William Cannon <william.cannon@gmail.com>
maturity  new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml.
Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with
all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and
named saltcheck-tests. Tests for a state should be created in files ending in *.tst and placed in the
saltcheck-tests folder. tst files are run through the salt rendering system, enabling tests to be written in
yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple
tests can be specified in a tst file. Multiple tst files can be created in the saltcheck-tests folder, and should
be named the same as the associated state. The id of a test works in the same manner as in salt state files and should
be unique and descriptive.

New in version 3000: The saltcheck-tests folder can be customized using the
saltcheck_test_location minion configuration setting. This setting is a relative path from the for-
mula's salt:// path to the test files.
Usage

Example Default file system layout:

```
/srv/salt/apache/
   init.sls
   config.sls
   saltcheck-tests/
       init.tst
       config.tst
       deployment_validation.tst
```

Alternative example file system layout with custom saltcheck_test_location:

**Minion configuration:**

```
saltcheck_test_location: tests/integration/saltcheck
```

**Filesystem layout:**

```
/srv/salt/apache/
   init.sls
   config.sls
   tests/integration/saltcheck/
       init.tst
       config.tst
       deployment_validation.tst
```

Tests can be run for each state by name, for all apache/saltcheck/*.tst files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of saltcheck.run_state_tests, but will not be automatically run by saltcheck.run_highstate_tests.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

**Saltcheck Keywords**

- **module_and_function**: (str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The saltcheck.state_apply module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.
- **args**: (list) Optional arguments passed to the salt module
- **kwargs**: (dict) Optional keyword arguments to be passed to the salt module
- **assertion**: (str) One of the supported assertions and required except for saltcheck.state_apply Tests which fail the assertion and expected_return, cause saltcheck to exit which a non-zero exit code.
- **expected_return**: (str) Required except by assertEmpty, assertNotEmpty, assertTrue, assertFalse. The return of module_and_function is compared to this value in the assertion.
**assertion_section**: (str) Optional keyword used to parse the module_and_function return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

**assertion_section_delimiter**: (str) Optional delimiter to use when splitting a nested structure. Defaults to ':'

**print_result**: (bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to True.

**output_details**: (bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If print_result is False, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to False

**pillar_data**: (dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.

**skip**: (bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single `module_and_function` call. The `assertion`, `expected_return`, `assertion_section`, and `assertion_section_delimiter` keys can be placed in a list under an `assertions` key. See the multiple assertions example below.

### Sample Cases/Examples

#### Basic Example

```
**echo_test_hello**:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
    assertion: assertEqual
    expected_return: 'hello'
```

#### Example with jinja

```
{% for package in ["apache2", "openssh"] %}
  # or another example #
  # for package in salt['pillar.get']("packages") #
  test_{% for package %}_latest:
    module_and_function: pkg.upgrade_available
    args:
      - {{ package }}
    assertion: assertFalse
{% endfor %}
```
Example with setup state including pillar

```yaml
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```

Example with jinja

```jinja
{% for package in "apache2", "openssh" %}
{% # or another example #}
{% # for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```yaml
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```
Example with skip

```python
package_latest:
    module_and_function: pkg.upgrade_available
    args:
        - apache2
    assertion: assertFalse
    skip: True
```

Example with assertion_section

```python
validate_shell:
    module_and_function: user.info
    args:
        - root
    assertion: assertEquals
    expected_return: /bin/bash
    assertion_section: shell
```

Example with a nested assertion_section

```python
validate_smb_signing:
    module_and_function: lgpo.get
    args:
        - 'Machine'
    kwargs:
        return_full_policy_names: True
    assertion: assertEquals
    expected_return: Enabled
    assertion_section: 'Computer Configuration|Microsoft network client: Digitally sign communications (always)'
    assertion_section_delimiter: '|
```

Example suppressing print results

```python
validate_env_nameNode:
    module_and_function: hadoop.dfs
    args:
        - text
        - /oozie/common/env.properties
    expected_return: nameNode = hdfs://nameservice2
    assertion: assertNotIn
    print_result: False
```
Example with multiple assertions and output_details

```python
multiple_validations:
    module_and_function: network.netstat
    assertions:
    - assertion: assertEqual
        assertion_section: "0:program"
        expected_return: "systemd-resolve"
    - assertion: assertEqual
        assertion_section: "0:proto"
        expected_return: "udp"
    output_details: True
```

Supported assertions

- `assertEqual`
- `assertNotEqual`
- `assertTrue`
- `assertFalse`
- `assertIn`
- `assertNotIn`
- `assertGreater`
- `assertGreaterEqual`
- `assertLess`
- `assertLessEqual`
- `assertEmpty`
- `assertNotEmpty`

**Warning:** The `saltcheck.state_apply` function is an alias for `state.apply`. If using the `ACL system saltcheck.*` might provide more capability than intended if only `saltcheck.run_state_tests` and `saltcheck.run_highstate_tests` are needed.

```python
salt.modules.saltcheck.parallel_scheck(data)
```
triggers salt-call in parallel

```python
salt.modules.saltcheck.report_highstate_tests(saltenv=None)
```
Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

```python
salt.modules.saltcheck.run_highstate_tests(saltenv=None, only_fails=False)
```
Execute all tests for states assigned to the minion through highstate and return results

Parameters
**saltenv (str)** -- optional saltenv. Defaults to base

**onlyfails (bool)** -- boolean to only print failure results

CLI Example:
```
salt '*' saltcheck.run_highstate_tests
```

```python
salt.modules.saltcheck.run_state_tests(state, saltenv=None, check_all=False, only_fails=False)
```
Execute tests for a salt state and return results. Nested states will also be tested.

**Parameters**

- **state (str)** -- state name for which to run associated .tst test files
- **saltenv (str)** -- optional saltenv. Defaults to base
- **check_all (bool)** -- boolean to run all tests in state/saltcheck-tests directory
- **only_fails (bool)** -- boolean to only print failure results

CLI Example:
```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

```python
salt.modules.saltcheck.run_test(**kwargs)
```
Execute one saltcheck test and return result.

**Parameters**

**arg test (keyword)**

CLI Example:
```
salt '*' saltcheck.run_test
test={'"module_and_function": "test.echo", "assertion": "assertEqual", "expected_return": "This works!", "args":["This works!"] }'
```

```python
salt.modules.saltcheck.state_apply(state_name, **kwargs)
```
Runs state.apply with given options to set up test data. Intended to be used for optional test setup or teardown.

Reference the state.apply module documentation for arguments and usage options.

CLI Example:
```
salt '*' saltcheck.state_apply postfix
```

---

### 21.9.396 salt.modules.saltcloudmod

Control a salt cloud system.

```python
salt.modules.saltcloudmod.create(name, profile)
```
Create the named vm.

CLI Example:
```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```
21.9.397 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends
  - esky Python module for update functionality

salt.modules.saltutil.clear_cache()
Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

salt.modules.saltutil.clear_job_cache(hours=24)
Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)
Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

salt.modules.saltutil.findCachedJob(jid)
Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:
saltutil.find_job(jid)

Return the data for a specific job id that is currently running.

jid The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:  
    --------
    arg:     
    - 30
    fun:     
    test.sleep
    jid:     
    20160503150049487736
    pid:     
    9601
    ret:     
    my-minion
    tgt:     
    my-minion
    tgt_type: 
    glob
    user:    
    root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:  
    --------
```

saltutil.is_running(fun)

If the named function is running return the data associated with it/them. The argument can be a glob.

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

saltutil.kill_all_jobs()

Sends a kill signal (SIGKILL 9) to all currently running jobs.

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

saltutil.kill_job(jid)

Sends a kill signal (SIGKILL 9) to the named salt job's process.

CLI Example:
salt '*' saltutil.kill_job <job id>

salt.modules.saltutil.list_extmods()
New in version 2017.7.0.
List Salt modules which have been synced externally
CLI Examples:
salt '*' saltutil.list_extmods

salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)
Loads minion modules from an environment so that they can be used in pillars for that environment
CLI Example:
salt '*' saltutil.mmodule base test.ping

salt.modules.saltutil.refresh_beacons()
Signal the minion to refresh the beacons.
CLI Example:
salt '*' saltutil.refresh_beacons

salt.modules.saltutil.refresh_grains(**kwargs)
New in version 2016.3.6, 2016.11.4, 2017.7.0.
Refresh the minion's grains without syncing custom grains modules from salt://_grains.

Note: The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

refresh_pillar  [True] Set to False to keep pillar data from being refreshed.
CLI Examples:
salt '*' saltutil.refresh_grains

salt.modules.saltutil.refresh_matchers()
Signal the minion to refresh its matchers.
CLI Example:
salt '*' saltutil.refresh_matchers

salt.modules.saltutil.refresh_modules(**kwargs)
Signal the minion to refresh the module and grain data
The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.
CLI Example:
salt '*' saltutil.refresh_modules

salt.modules.saltutil.refresh_pillar(wait=False, timeout=30)
Signal the minion to refresh the in-memory pillar data. See In-Memory Pillar Data vs. On-Demand Pillar Data.
Parameters
- **wait**(bool, optional) -- Wait for pillar refresh to complete, defaults to False.
- **timeout**(int, optional) -- How long to wait in seconds, only used when wait is True, defaults to 30.

**Returns**

Boolean status, True when the pillar_refresh event was fired successfully.

**CLI Example:**

```
$ salt '*' saltutil.refresh_pillar
$ salt '*' saltutil.refresh_pillar wait=True timeout=60
```

`salt.modules.saltutil.regen_keys()`

Used to regenerate the minion keys.

**CLI Example:**

```
$ salt '*' saltutil.regen_keys
```

`salt.modules.saltutil.revoke_auth()`

**preserve_minion_cache=False**

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

**CLI Example:**

```
$ salt '*' saltutil.revoke_auth
```

`salt.modules.saltutil.runner()`

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

**name** The name of the function to run

**kwarg** Any keyword arguments to pass to the runner function

**CLI Example:**

```
$ salt master_minion saltutil.runner jobs.list_jobs
$ salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{'foo': 'bar'}"
```

`salt.modules.saltutil.running()`

Return the data on all running salt processes on the minion

**CLI Example:**

```
$ salt '*' saltutil.running
```

`salt.modules.saltutil.signal_job()`

Sends a signal to the named salt job's process

**CLI Example:**

```
$ salt '*' saltutil.signal_job <job id> 15
```

`salt.modules.saltutil.sync_all()`

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when refresh is set to True.
Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

**refresh** [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to **False** to prevent this refresh.

**Important:** If this function is executed using a *module.run* state, the SLS file will not have access to newly synced execution modules unless a *refresh* argument is added to the state, like so:

```python
load_my_custom_module:
    module.run:
        - name: saltutil.sync_all
        - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

**extmod_whitelist** [None] dictionary of modules to sync based on type

**extmod_blacklist** [None] dictionary of modules to blacklist based on type

**CLI Examples:**

```sh
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist=\{'modules':(['custom_module'])\}
```

**salt.modules.saltutil.sync_beacons**(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.1.

Sync beacons from salt://_beacons to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to **False** to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**CLI Example:**

```sh
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

**salt.modules.saltutil.sync_clouds**(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2017.7.0.

Sync cloud modules from salt://_cloud to the minion

**saltenv** [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to **False** to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

**salt.modules.saltutil.sync_engines**

```
salt.modules.saltutil.sync_engines(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2016.3.0.

Sync engine modules from salt://_engines to the minion

* saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

* refresh: [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.

* extmod_whitelist: [None] comma-separated list of modules to sync

* extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

**salt.modules.saltutil.sync_executors**

```
salt.modules.saltutil.sync_executors(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 3000.

Sync executors from salt://_executors to the minion

* saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

* refresh: [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

* extmod_whitelist: [None] comma-separated list of modules to sync

* extmod_blacklist: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev
```

**salt.modules.saltutil.sync_grains**

```
salt.modules.saltutil.sync_grains(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 0.10.0.

Sync grains modules from salt://_grains to the minion

* saltenv: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the top files will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.

* refresh: [True] If True, refresh the available execution modules and recompile pillar data for the minion.

  This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

* extmod_whitelist: [None] comma-separated list of modules to sync

21.9. execution modules
extmod_blacklist  [None] comma-separated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 2015.8.0.

Sync log handlers from salt://_log_handlers to the minion

**saltenv**  The filesystem environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

**refresh**  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

**extmod_whitelist**  [None] comma-separated list of modules to sync
**extmod_blacklist**  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

salt.modules.saltutil.sync_matchers(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)
New in version 2019.2.0.

Sync engine modules from salt://_matchers to the minion

**saltenv**  The filesystem environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

**refresh**  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.

**extmod_whitelist**  [None] comma-separated list of modules to sync
**extmod_blacklist**  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

salt.modules.saltutil.sync_modules(salenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
New in version 0.10.0.

Sync execution modules from salt://_modules to the minion

**saltenv**  The filesystem environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

**refresh**  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.
**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```yaml
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
      - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

```bash
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

```python
salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

Sync outputters from `salt://_output` to the minion

**saltenv** The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

```python
salt.modules.saltutil.sync_outputters(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

**saltenv** The filesserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the `top files` will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```bash
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```
salt.modules.saltutil.sync_pillar(
saltenv=None,
refresh=True,
extmod_whitelist=None,
extmod_blacklist=None)

New in version 2015.8.11,2016.3.2.
Sync pillar modules from the salt://_pillar directory on the Salt fileserver. This function is
environment-aware, pass the desired environment to grab the contents of the _pillar directory from that
environment. The default environment, if none is specified, is base.
refresh [True] Also refresh the execution modules available to the minion, and refresh pillar data.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

salt.modules.saltutil.sync_proxymodules(
saltenv=None,
refresh=False,
extmod_whitelist=None,
extmod_blacklist=None)

New in version 2015.8.2.
Sync proxy modules from salt://_proxy to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a
comma-separated list.
If not passed, then all environments configured in the top files will be checked for proxy modules to
sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed
even if no new proxy modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

salt.modules.saltutil.sync_renderers(
saltenv=None,
refresh=True,
extmod_whitelist=None,
extmod_blacklist=None)

New in version 0.10.0.
Sync renderers from salt://_renderers to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a
comma-separated list.
If not passed, then all environments configured in the top files will be checked for renderers to sync. If
no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed
even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this
refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.sync_renderers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  - If not passed, then all environments configured in the `top files` will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.
- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

- `salt '*' saltutil.sync_renderers saltenv=dev`
- `salt '*' saltutil.sync_renderers saltenv=base,dev`

salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.8, 2015.8.3.

Sync returners from `salt://_returners` to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  - If not passed, then all environments configured in the `top files` will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.
- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Example:

- `salt '*' saltutil.sync_returners`
- `salt '*' saltutil.sync_returners saltenv=dev`

salt.modules.saltutil.sync_serializers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.0.

Sync serializers from `salt://_serializers` to the minion

- **saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  - If not passed, then all environments configured in the `top files` will be checked for serializer modules to sync. If no top files are found, then the `base` environment will be synced.
- **refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to False to prevent this refresh.
- **extmod_whitelist** [None] comma-separated list of modules to sync
- **extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*/' saltutil.sync_serializers
salt '*/' saltutil.sync_serializers saltenv=dev
salt '*/' saltutil.sync_serializers saltenv=base,dev

salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.
Sync state modules from salt://_states to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*/' saltutil.sync_states
salt '*/' saltutil.sync_states saltenv=dev
salt '*/' saltutil.sync_states saltenv=base,dev

salt.modules.saltutil.sync_thorium(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2018.3.0.
Sync Thorium modules from salt://_thorium to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.
refresh: True If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.
extmod_whitelist comma-separated list of modules to sync
extmod_blacklist comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*/' saltutil.sync_thorium
salt '*/' saltutil.sync_thorium saltenv=base,dev

salt.modules.saltutil.sync_utils(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2014.7.0.
Sync utility modules from salt://_utils to the minion
saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.
refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.term_all_jobs()
Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:
salt '*' saltutil.term_all_jobs

salt.modules.saltutil.term_job(jid)
Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:
salt '*' saltutil.term_job <job id>

salt.modules.saltutil.update(version=None)
Update the salt minion from the URL defined in opts['update_url'] SaltStack, Inc provides the latest builds here:
update_url: https://repo.saltstack.com/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.
The version number is optional and will default to the most recent version available at opts['update_url'].
Returns details about the transaction upon completion.

CLI Examples:
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3

salt.modules.saltutil.wheel(name, *args, **kwargs)
Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.
name The name of the function to run
args Any positional arguments to pass to the wheel function. A common example of this would be the match arg needed for key functions.

New in version v2015.8.11.
kwargs Any keyword arguments to pass to the wheel function

CLI Example:
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected

Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.
21.9.398  salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

salt.modules.schedule.add(name, **kwargs)
Add a job to the schedule

CLI Example:
```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args='[date >> /tmp/date.log]'
```

salt.modules.schedule.build_schedule_item(name, **kwargs)
Build a schedule job

CLI Example:
```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

salt.modules.schedule.copy(name, target, **kwargs)
Copy scheduled job to another minion or minions.

CLI Example:
```
salt '*' schedule.copy jobname target
```

salt.modules.schedule.delete(name, **kwargs)
Delete a job from the minion's schedule

CLI Example:
```
salt '*' schedule.delete job1
```

salt.modules.schedule.disable(**kwargs)
Disable all scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.disable
```

salt.modules.schedule.disable_job(name, **kwargs)
Disable a job in the minion's schedule

CLI Example:
```
salt '*' schedule.disable_job job1
```

salt.modules.schedule.enable(**kwargs)
Enable all scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.enable
```

salt.modules.schedule.enable_job(name, **kwargs)
Enable a job in the minion's schedule
CLI Example:
```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled(name=None)`
List a Job only if its enabled
- If job is not specified, indicate if the scheduler is enabled or disabled.
- New in version 2015.5.3.

CLI Example:
```
salt '*' schedule.is_enabled
schedules.is_enabled
```

`salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True)`
List the jobs currently scheduled on the minion

CLI Example:
```
salt '*' schedule.list
# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

`salt.modules.schedule.modify(name, **kwargs)`
Modify an existing job in the schedule

CLI Example:
```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

`salt.modules.schedule.move(name, target, **kwargs)`
Move scheduled job to another minion or minions.

CLI Example:
```
salt '*' schedule.move jobname target
```

`salt.modules.schedule.postpone_job(name, current_time, new_time, **kwargs)`
Postpone a job in the minion’s schedule
- Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.
- New in version 2018.3.0.

CLI Example:
```
salt '*' schedule.postpone_job job current_time new_time
salt '*' schedule.postpone_job job current_time new_time time_fmt="%Y-%m-%dT%H:%M:%S"
```

`salt.modules.schedule.purge(**kwargs)`
Purge all the jobs currently scheduled on the minion
CLI Example:
```
salt '*' schedule.purge
```

**salt.modules.schedule.reload()**
Reload saved scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.reload
```

**salt.modules.schedule.run_job(name, force=False)**
Run a scheduled job on the minion immediately

CLI Example:
```
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
```
Force the job to run even if it is disabled.

**salt.modules.schedule.save(**kwargs)**
Save all scheduled jobs on the minion

CLI Example:
```
salt '*' schedule.save
```

**salt.modules.schedule.show_next_fire_time(name, **kwargs)**
Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:
```
salt '*' schedule.show_next_fire_time job_name
```

**salt.modules.schedule.skip_job(name, current_time, **kwargs)**
Skip a job in the minion's schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:
```
salt '*' schedule.skip_job job time
```

### 21.9.399 salt.modules.scp module

**SCP Module**

New in version 2019.2.0.

Module to copy files via SCP

**salt.modules.scp_mod.get(remote_path, local_path='', recursive=False, preserve_times=False, **kwargs)**
Transfer files and directories from remote host to the localhost of the Minion.
remote_path  Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

recursive: False  Transfer files and directories recursively.
preserve_times: False  Preserve mtime and atime of transferred files and directories.
hostname  The hostname of the remote device.
port: 22  The port of the remote device.
username  The username required for SSH authentication on the device.
password  Used for password authentication. It is also used for private key decryption if passphrase is not given.
passphrase  Used for decrypting private keys.
pkey  An optional private key to use for authentication.
key_filename  The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout  An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10  The channel socket timeout in seconds.
buff_size: 16384  The size of the SCP send buffer.
allow_agent: True  Set to False to disable connecting to the SSH agent.
look_for_keys: True  Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout  An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout  An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False  Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, 
                           saltenv='base', **kwargs)

Transfer files and directories to remote host.
files  A single path or a list of paths to be transferred.
remote_path  The path on the remote device where to store the files.
recursive: True  Transfer files and directories recursively.
preserve_times: False  Preserve mtime and atime of transferred files and directories.
hostname  The hostname of the remote device.
port: 22  The port of the remote device.
username  The username required for SSH authentication on the device.
password  Used for password authentication. It is also used for private key decryption if passphrase is not given.
passphrase  Used for decrypting private keys.
pkey  An optional private key to use for authentication.
key_filename  The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout  An optional timeout (in seconds) for the TCP connect.
socket_timeout: 10  The channel socket timeout in seconds.
buff_size: 16384  The size of the SCP send buffer.
allow_agent: True  Set to False to disable connecting to the SSH agent.
look_for_keys: True  Set to False to disable searching for discoverable private key files in ~/.ssh/
banner_timeout  An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout  An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: False  Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```
21.9.400 salt.modules.scsi

SCSI administration module

salt.modules.scsi.ls_(get_size=True)

List SCSI devices, with details

CLI Examples:

salt '*' scsi.ls  
salt '*' scsi.ls get_size=False

- get_size [True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the '-s' option in lsscsi.

- New in version 2015.5.10.

salt.modules.scsi.rescan_all(host)

List scsi devices

CLI Example:

salt '*' scsi.rescan_all 0

21.9.401 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.delete(uri)

Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully deleted, return False.

CLI Example:

salt '*' sdb.delete sdb://mymemcached/foo

salt.modules.sdb.get(uri, strict=False)

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided is not valid, then it will be returned as-is, unless strict=True was passed.

CLI Example:

salt '*' sdb.get sdb://mymemcached/foo strict=True

salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt['sdb.get_or_set_hash']('some_mysql_user_pass') }}'
```
CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

```
salt.modules.sdb.set_(uri, value)
```

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

### 21.9.402 salt.modules.seed

Virtual machine image management tools

```
salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)
```

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \[gen_key=(true|false)] [approve_key=(true|false)] \[install=(true|false)]
```

- **path** Full path to the directory, device, or disk image on the target minion's file system.
- **id** Minion id with which to seed the path.
- **config** Minion configuration options. By default, the 'master' option is set to the target host's 'master'.
- **approve_key** Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.
- **install** Install salt-minion, if absent. Default: true.
- **prep_install** Prepare the bootstrap script, but don't run it. Default: false

```
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None)
```

Generate keys and config and put them in a tmp directory.

- **pub_key** absolute path or file content of an optional preseeded salt key
- **priv_key** absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \[id=minion_id] [approve_key=(true|false)]
```

```
salt.modules.seed.prep_bootstrap(mpt)
```

Update and get the random script to a random place

CLI Example:
21.9.403 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

salt.modules.selinux.fcontext_add_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

`name` filespec of the file or directory. Regex syntax is allowed.

`file_type` The SELinux filetype specification. Use one of `[a, f, d, c, b, s, l, p]`. See also `man semanage-fcontext`. Defaults to `a` (all files).

`sel_type` SELinux context type. There are many.

`sel_user` SELinux user. Use `semanage login -l` to determine which ones are available to you.

`sel_level` The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_policy my-policy
```

salt.modules.selinux.fcontext_apply_policy(name, recursive=False)

New in version 2017.7.0.

Applies SELinux policies to filespec using `restorecon [-R] filespec`. Returns dict with changes if successful, the output of the restorecon command otherwise.

`name` filespec of the file or directory. Regex syntax is allowed.

`recursive` Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

salt.modules.selinux.fcontext_delete_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

`name` filespec of the file or directory. Regex syntax is allowed.

`file_type` The SELinux filetype specification. Use one of `[a, f, d, c, b, s, l, p]`. See also `man semanage-fcontext`. Defaults to `a` (all files).

`sel_type` SELinux context type. There are many.

CLI Example:
**sel_user**  SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel_level**  The MLS range of the SELinux context.

CLI Example:

```
salt 'salt.' selinux.fcontext_delete_policy my-policy
```

```{.python}
salt.modules.selinux.fcontext_get_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- `filespec` (the name supplied and matched)
- `filetype` (the descriptive name of the filetype supplied)
- `sel_user`, `sel_role`, `sel_type`, `sel_level` (the selinux context)

**name**  filespec of the file or directory. Regex syntax is allowed.

**filetype**  The SELinux filetype specification. Use one of `[a, f, d, c, b, s, l, p]`. See also `man semanage-fcontext`.

Defaults to `a` (all files).

CLI Example:

```
salt 'salt.' selinux.fcontext_get_policy my-policy
```

```{.python}
salt.modules.selinux.fcontext_policy_is_applied(name, recursive=False)
```

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

**name**  filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt 'salt.' selinux.fcontext_policy_is_applied my-policy
```

```{.python}
salt.modules.selinux.filetype_id_to_string(filetype='a')
```

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in `semanage fcontext -l`).

```{.python}
salt.modules.selinux.getconfig()
```

Return the selinux mode from the config file

CLI Example:

```
salt 'salt.' selinux.getconfig
```

```{.python}
salt.modules.selinux.getenforce()
```

Return the mode selinux is running in

CLI Example:

```
salt 'salt.' selinux.getenforce
```

```{.python}
salt.modules.selinux.getsebool(boolean)
```

Return the information on a specific selinux boolean

CLI Example:
salt '*' selinux.getsebool virt_use_usb

**salt.modules.selinux.getsemod(module)**

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

**salt.modules.selinux.install_semod(module_path)**

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

**salt.modules.selinux.list_sebool()**

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

**salt.modules.selinux.list_semod()**

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

**salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)**

New in version 2019.2.0.

Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

- **name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
- **sel_type** The SELinux Type. Required.
- **protocol** The protocol for the port, tcp or udp. Required if name is not formatted.
- **port** The port or port range. Required if name is not formatted.
- **sel_range** The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_add_policy add tcp/8080 http_port_t
salt '*' selinux.port_add_policy add foobar http_port_t protocol=tcp port=8091
```

**salt.modules.selinux.port_delete_policy(name, protocol=None, port=None)**

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

- **name** The protocol and port spec. Can be formatted as (tcp|udp)/(port|port-range).
- **protocol** The protocol for the port, tcp or udp. Required if name is not formatted.
The port or port range. Required if name is not formatted.

CLI Example:

```shell
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

salt.modules.selinux.port_get_policy(name, sel_type=None, protocol=None, port=None)

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:
- `sel_type` (the selinux type)
- `proto` (the protocol)
- `port` (the port(s) and/or port range(s))

**name**  The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

**sel_type**  The SELinux Type.

**protocol**  The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

**port**  The port or port range. Required if name is not formatted.

CLI Example:

```shell
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

salt.modules.selinux.remove_semod(module)

Remove SELinux module

CLI Example:

```shell
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.selinux_fs_path()

Return the location of the SELinux VFS directory

CLI Example:

```shell
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.setenforce(mode)

Set the SELinux enforcing mode

CLI Example:

```shell
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.setsebool(boolean, value, persist=False)

Set the value for a boolean

CLI Example:

```shell
salt '*' selinux.setsebool virt_use_usb off
```

salt.modules.selinux.setsebools(pairs, persist=False)

Set the value of multiple booleans

CLI Example:
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'

salt.modules.selinux.setmod(module, state)
Enable or disable an SELinux module.

CLI Example:
salt '*' selinux.setmod nagios Enabled

New in version 2016.3.0.

21.9.404  salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

maintainer  Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>
maturity  new
depends  sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
  rotation: 90
```

salt.modules.sensehat.clear(color=None)
Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'
```

salt.modules.sensehat.get_humidity()
Get the percentage of relative humidity from the humidity sensor.

salt.modules.sensehat.get_pixel(x, y)
Returns the color of a single pixel on the LED matrix.

x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

Note: Please read the note for get_pixels

salt.modules.sensehat.get_pixels()
Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.

Note: When using set_pixels the pixel values can sometimes change when you read them again using get_pixels. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5
bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

```python
salt.modules.sensehat.get_pressure()

Gets the current pressure in Millibars from the pressure sensor.
```

```python
salt.modules.sensehat.get_temperature()

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.
```

```python
salt.modules.sensehat.get_temperature_from_humidity()

Gets the temperature in degrees Celsius from the humidity sensor.
```

```python
salt.modules.sensehat.get_temperature_from_pressure()

Gets the temperature in degrees Celsius from the pressure sensor.
```

```python
salt.modules.sensehat.low_light(low_light=True)

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```bash
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False
```

```python
salt.modules.sensehat.set_pixel(x, y, color)

Sets a single pixel on the LED matrix to a specified color.

- `x` The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
- `y` The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
- `color` The new color of the pixel as a list of `[R, G, B]` values.

CLI Example:

```bash
salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

```python
salt.modules.sensehat.set_pixels(pixels)

Sets the entire LED matrix based on a list of 64 pixel values

- `pixels` A list of 64 `[R, G, B]` color values.
```

```python
salt.modules.sensehat.show_image(image)

Displays an 8 x 8 image on the LED matrix.

- `image` The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```bash
salt 'raspberry' sensehat.show_image /tmp/my_image.png
```

```python
salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)

Displays a single letter on the LED matrix.

- `letter` The letter to display.
- `text_color` The color in which the letter is shown. Defaults to `[255, 255, 255]` (white).
- `back_color` The background color of the display. Defaults to `[0, 0, 0]` (black).

CLI Example:

```bash
```
```python
salt 'raspberry' sensehat.show_letter 'O'
salt 'raspberry' sensehat.show_letter 'X' '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter 'B' '[0, 0, 255]' '[255, 255, 0]'

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)

Displays a message on the LED matrix.

**message**  The message to display

**msg_type**  The type of the message. Changes the appearance of the message.

Available types are:

<table>
<thead>
<tr>
<th>Type</th>
<th>Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>error</td>
<td>red text</td>
</tr>
<tr>
<td>warning</td>
<td>orange text</td>
</tr>
<tr>
<td>success</td>
<td>green text</td>
</tr>
<tr>
<td>info</td>
<td>blue text</td>
</tr>
</tbody>
</table>

**scroll_speed**  The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

**text_color**  The color in which the message is shown. Defaults to '[255, 255, 255]' (white).

**back_color**  The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255, 0, 0]' 0.2
```

### 21.9.405 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

```python
salt.modules.sensors.sense(chip, fahrenheit=False)

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:

```
/usr/bin/sensors

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)
```

Given the above, the chip is 'coretemp-isa-0000'.
```
21.9.406 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

salt.modules.serverdensity_device.create(name, **params)
   Function to create device in Server Density. For more info, see the API docs.
   CLI Example:
   
   salt '*' serverdensity_device.create lama
   salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768

salt.modules.serverdensity_device.delete(device_id)
   Delete a device from Server Density. For more information, see the API docs.
   CLI Example:
   
   salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4

salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')
   Returns requested Server Density authentication value from pillar.
   CLI Example:
   
   salt '*' serverdensity_device.get_sd_auth <val>

salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)
   Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).
   CLI Example:
   
   salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
   salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498

salt.modules.serverdensity_device.ls(**params)
   List devices in Server Density
   Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.
   CLI Example:
   
   salt '*' serverdensity_device.ls
   salt '*' serverdensity_device.ls name=lama
   salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768

salt.modules.serverdensity_device.update(device_id, **params)
   Updates device information in Server Density. For more information see the API docs.
   CLI Example:
   
   salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
   →group=lama_band
   salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama
   →group=rock_lamas swapSpace=512
21.9.407 salt.modules.servicenow module

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

depends servicenow_rest python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
    instance_name: '
    username: '
    password: '
```

salt.modules.servicenow.delete_record(table, sys_id)
Delete an existing record

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)
Run a non-structured (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

salt.modules.servicenow.set_change_request_state(change_id, state='approved')
Set the approval state of a change request/record

Parameters
- **change_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

salt.modules.servicenow.update_record_field(table, sys_id, field, value)
Update the value of a record's field in a servicenow table

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:
21.9.408 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.call_hook(message, attachment=None, color='good', short=False, identifier=None, channel=None, username=None, icon_emoji=None)

Send message to Slack incoming webhook.

**Parameters**
- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.find_room(name, api_key=None)

Find a room by name and return it.

**Parameters**
- **name** -- The room name.
- **api_key** -- The Slack admin api key.

**Returns** The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
```

salt.modules.slack_notify.find_user(name, api_key=None)

Find a user by name and return it.

**Parameters**
- **name** -- The user name.
- **api_key** -- The Slack admin api key.

**Returns** The user object.

CLI Example:
salt '...' slack.find_user name="ThomasHatch"
salt '...' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.modules.slack_notify.list_rooms(api_key=None)
List all Slack rooms.
Parameters api_key -- The Slack admin api key.
Returns The room list.
CLI Example:
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.modules.slack_notify.list_users(api_key=None)
List all Slack users.
Parameters api_key -- The Slack admin api key.
Returns The user list.
CLI Example:
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15

salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None)
Send a message to a Slack channel.
Parameters
  • channel -- The channel name, either will work.
  • message -- The message to send to the Slack channel.
  • from_name -- Specify who the message is from.
  • api_key -- The Slack api key, if not specified in the configuration.
  • icon -- URL to an image to use as the icon for this message
Returns Boolean if message was sent successfully.
CLI Example:
salt '...' slack.post_message channel="Development Room" message="Build is done"
← from_name="Build Server"

21.9.409 salt.modules.slackware_service
The service module for Slackware

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.slackware_service.available(name)
Returns True if the specified service is available, otherwise returns False.

New in version 3002.
CLI Example:
salt 'salt' service.available sshd

salt.modules.slackware_service.disable(name, **kwargs)
    Disable the named service to start at boot
    New in version 3002.
    CLI Example:
    ```
salt 'salt' service.disable <service name>
    ```

salt.modules.slackware_service.disabled(name)
    Return True if the named service is enabled, false otherwise
    New in version 3002.
    CLI Example:
    ```
salt 'salt' service.disabled <service name>
    ```

salt.modules.slackware_service.enable(name, **kwargs)
    Enable the named service to start at boot
    New in version 3002.
    CLI Example:
    ```
salt 'salt' service.enable <service name>
    ```

salt.modules.slackware_service.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    New in version 3002.
    CLI Example:
    ```
salt 'salt' service.enabled <service name>
    ```

salt.modules.slackware_service.force_reload(name)
    Force-reload the named service
    New in version 3002.
    CLI Example:
    ```
salt 'salt' service.force_reload <service name>
    ```

salt.modules.slackware_service.get_all()
    Return all available boot services
    New in version 3002.
    CLI Example:
    ```
salt 'salt' service.get_all
    ```

salt.modules.slackware_service.get_disabled()
    Return a set of services that are installed but disabled
    New in version 3002.
    CLI Example:
salt '*' service.get_disabled

salt.modules.slackware_service.get_enabled()
Return a list of service that are enabled on boot
New in version 3002.
CLI Example:
salt '*' service.get_enabled

salt.modules.slackware_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
New in version 3002.
CLI Example:
salt '*' service.missing sshd

salt.modules.slackware_service.reload_(name)
Reload the named service
New in version 3002.
CLI Example:
salt '*' service.reload <service name>

salt.modules.slackware_service.restart(name)
Restart the named service
New in version 3002.
CLI Example:
salt '*' service.restart <service name>

salt.modules.slackware_service.start(name)
Start the specified service
New in version 3002.
CLI Example:
salt '*' service.start <service name>

salt.modules.slackware_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
New in version 3002.
Parameters
- name (str) -- The name of the service to check
- sig (str) -- Signature to use to find the service via ps
Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
Return type bool
CLI Example:
salt 'salt '*' service.status <service name> [service signature]

salt.modules.slackware_service.stop(name)
Stop the specified service
New in version 3002.
CLI Example:
salt 'salt '*' service.stop <service name>

**21.9.410** salt.modules.slsutil

Utility functions for use with or in SLS files

salt.modules.slsutil.banner(width=72, commentchar='%', borderchar='%', blockstart=None, blockend=None, title=None, text=None, newline=False)
Create a standardized comment block to include in a templated file.
A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

Parameters
- *width* -- The width, in characters, of the banner. Default is 72.
- *commentchar* -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like '//', are supported. If the file's syntax does not support line comments (such as XML), use the blockstart and blockend options.
- *borderchar* -- The character to use in the top and bottom border of the comment box. Must be a single character.
- *blockstart* -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with blockend
- *blockend* -- The character sequence to use at the end of a block comment. Should be used in conjunction with blockstart
- *title* -- The first field of the comment block. This field appears centered at the top of the box.
- *text* -- The second field of the comment block. This field appears left-justified at the bottom of the box.
- *newline* -- Boolean value to indicate whether the comment block should end with a newline. Default is False.

Example 1 - the default banner:

```python
{{ salt['slsutil.banner']() }}
```

# # THIS FILE IS MANAGED BY SALT - DO NOT EDIT #
# # The contents of this file are managed by Salt. Any changes to this file may be overwritten automatically and without warning. #

Example 2 - a Javadoc-style banner:
salt.modules.slsutil.boolstr(value, true='true', false='false')
Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.

Parameters
- **value** -- The boolean value to be converted
- **true** -- The value to return if value is True
- **false** -- The value to return if value is False

In this example, a pillar named smtp:encrypted stores a boolean value, but the template that uses that value needs yes or no to be written, based on the boolean value.

Note: this is written on two lines for clarity. The same result could be achieved in one line.

{% set encrypted = salt[pillar.get]("smtp:encrypted", false) %}
use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}

Result (assuming the value is True):

use_tls: yes

salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)
Deserialize a Python object using one of the available serializer modules.

CLI Example:

salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}'
Jinja Example:

```jinja
{% set python_object = salt.slsutil.deserialize('json',
    '{{"foo": "Foo!"}}') %}
```

`salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)`

Merge a data structure into another by choosing a merge strategy

**Strategies:**
- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

`salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)`

New in version 2019.2.0.

Merge a list of objects into each other in order

**Parameters**
- `lst` (Iterable) -- List of objects to be merged.
- `strategy` (String) -- Merge strategy. See `utils.dictupdate`.
- `renderer` (String) -- Renderer type. Used to determine strategy when strategy is 'smart'.
- `merge_lists` (Bool) -- Defines whether to merge embedded object lists.

CLI Example:

```
$ salt-call --output=txt slsutil.merge_all '[{foo: Foo}, {foo: Bar}]'
local: {u'foo': u'Bar'}
```

`salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)`

Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt filesystem URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

**Parameters**
- `path` -- The path to a file on Salt's filesystem (any URIs supported by `cp.get_url`) or on the local file system.
- `string` -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- `default_renderer` -- The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- `kwargs` -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

---

21.9. execution modules
Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

{% set apache = salt.slsutil.renderer('map.sls') %}

CLI Example:

salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'

Jinja Example:

{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'} %}

salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)

Merge upd recursively into dest

If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated when recursive_update=True.

CLI Example:

salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'}
21.9.411 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadm.avail(search=None, verbose=False)
Return a list of available images
search [string] search keyword
verbose [boolean (False)] toggle verbose output
CLI Example:

```yaml
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

salt.modules.smartos_imgadm.delete(uuid)
Remove an installed image
uuid [string] Specifies uuid to import
CLI Example:

```yaml
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.docker_to_uuid(uuid)
Get the image uuid from an imported docker image

New in version 2019.2.0.

salt.modules.smartos_imgadm.get(uuid)
Return info on an installed image
uuid [string] uuid of image
CLI Example:

```yaml
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.import_image(uuid, verbose=False)
Import an image from the repository
uuid [string] uuid to import
verbose [boolean (False)] toggle verbose output
CLI Example:

```yaml
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.list_installed(verbose=False)
Return a list of installed images
verbose [boolean (False)] toggle verbose output
Changed in version 2019.2.0: Docker images are now also listed
CLI Example:

```yaml
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

salt.modules.smartos_imgadm.show(uuid)
Show manifest of a given image
uuid [string] uuid of image
CLI Example:
**salt.modules.smartos_imgadm.source_add** *(source, source_type='imgapi')*

Add a new source

- **source** [string] source url to add
- **source_type** [string (imgapi)] source type, either imgapi or docker

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```

**salt.modules.smartos_imgadm.source_delete** *(source)*

Delete a source

- **source** [string] source url to delete

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_delete https://updates.joyent.com
```

**salt.modules.smartos_imgadm.sources** *(verbose=False)*

Return a list of available sources

- **verbose** [boolean (False)] toggle verbose output

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.sources
```

**salt.modules.smartos_imgadm.update_installed** *(uuid=’’)*

Gather info on unknown image(s) (locally installed)

- **uuid** [string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

**salt.modules.smartos_imgadm.vacuum** *(verbose=False)*

Remove unused images

- **verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

**salt.modules.smartos_imgadm.version** *

Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```
21.9.412 salt.modules.smartos_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

New in version 2016.11.0.

salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)

Add a new nictag

**name** [string] name of new nictag
**mac** [string] mac of parent interface or 'etherstub' to create a ether stub
**mtu** [int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```

salt.modules.smartos_nictagadm.delete(name, force=False)

Delete nictag

**name** [string] nictag to delete
**force** [boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)

Check if nictags exists

**nictag** [string] one or more nictags to check
**verbose** [boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)

List all nictags

**include_etherstubs** [boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)

Update a nictag

**name** [string] name of nictag
**mac** [string] optional new mac for nictag
**mtu** [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.vms(nictag)

List all vms connect to nictag

**nictag** [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```
21.9.413 salt.modules.smartos_virt

virsh compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.get_macs(domain)
Return a list of MAC addresses from the named VM

CLI Example:
```
salt '*' virt.get_macs <domain>
```

salt.modules.smartos_virt.init(**kwargs)
Initialize a new VM

CLI Example:
```
salt '*' virt.init image_uuid='...' alias='...' [ ...]
```

salt.modules.smartos_virt.list_active_vms()
Return a list of uuids for active virtual machine on the minion

CLI Example:
```
salt '*' virt.list_active_vms
```

salt.modules.smartos_virt.list_domains()
Return a list of virtual machine names on the minion

CLI Example:
```
salt '*' virt.list_domains
```

salt.modules.smartos_virt.list_inactive_vms()
Return a list of uuids for inactive virtual machine on the minion

CLI Example:
```
salt '*' virt.list_inactive_vms
```

salt.modules.smartos_virt.reboot(domain)
Reboot a domain via ACPI request

CLI Example:
```
salt '*' virt.reboot <domain>
```

salt.modules.smartos_virt.setmem(domain, memory)
Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM: this would require a restart of the VM.

CLI Example:
```
salt '*' virt.setmem <domain> 512
```

salt.modules.smartos_virt.shutdown(domain)
Send a soft shutdown signal to the named vm

CLI Example:
salt '*' virt.shutdown <domain>

**salt.modules.smartos_virt.start(domain)**
Start a defined domain

CLI Example:
```
salt '*' virt.start <domain>
```

**salt.modules.smartos_virt.stop(domain)**
Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:
```
salt '*' virt.destroy <domain>
```

**salt.modules.smartos_virt.vm_info(domain)**
Return a dict with information about the specified VM on this CN

CLI Example:
```
salt '*' virt.vm_info <domain>
```

**salt.modules.smartos_virt.vm_virt_type(domain)**
Return VM virtualization type: OS or KVM

CLI Example:
```
salt '*' virt.vm_virt_type <domain>
```

### 21.9.414 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

**salt.modules.smartos_vmadm.create(from_file=None, **kwargs)**
Create a new vm

* from_file [string] json file to create the vm from; if present, all other options will be ignored

* kwargs [string|int|...] options to set for the vm

CLI Example:
```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[ { "nic_tag": "admin", "ip": "198.51.100.123", ... }, {...} ]' [...]
```

**salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')**
Create snapshot of a vm

* vm [string] vm to be targeted

* name [string]

  * snapshot name The snapshot must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

* key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:
```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```
salt.modules.smartos_vmadm.delete(\textit{vm}, \textit{key='uuid'})
\begin{itemize}
\item \textit{vm} [string] vm to be deleted
\item \textit{key} [string [uuid|alias|hostname]] value type of 'vm' parameter
\end{itemize}

\textbf{CLI Example:}
\begin{verbatim}
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
\end{verbatim}

salt.modules.smartos_vmadm.delete_snapshot(\textit{vm}, \textit{name}, \textit{key='uuid'})
\begin{itemize}
\item \textit{vm} [string] vm to be targeted
\item \textit{name} [string]
\item \textit{snapshot name} The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_::%] to comply with ZFS restrictions.
\item \textit{key} [string [uuid|alias|hostname]] value type of 'vm' parameter
\end{itemize}

\textbf{CLI Example:}
\begin{verbatim}
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
\end{verbatim}

salt.modules.smartos_vmadm.get(\textit{vm}, \textit{key='uuid'})
\begin{itemize}
\item \textit{vm} [string] vm to be targeted
\item \textit{key} [string [uuid|alias|hostname]] value type of 'vm' parameter
\end{itemize}

\textbf{CLI Example:}
\begin{verbatim}
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
\end{verbatim}

salt.modules.smartos_vmadm.info(\textit{vm}, \textit{info_type='all'}, \textit{key='uuid'})
\begin{itemize}
\item \textit{vm} [string] vm to be targeted
\item \textit{info_type} [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return
\item \textit{key} [string [uuid|alias|hostname]] value type of 'vm' parameter
\end{itemize}

\textbf{CLI Example:}
\begin{verbatim}
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
\end{verbatim}

salt.modules.smartos_vmadm.list_vms(\textit{search=None}, \textit{sort=None}, \textit{order='uuid,type,ram,state,alias'}, \textit{keyed=True})
\begin{itemize}
\item \textit{search} [string] vmadm filter property
\item \textit{sort} [string] vmadm sort (-s) property
\item \textit{order} [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
\item \textit{keyed} [boolean]
\end{itemize}

\textbf{specified if the output should be an array (False) or dict (True)} For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

\textbf{CLI Example:}
\begin{verbatim}
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
\end{verbatim}
salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)

Return a list of VMs using lookup

search [string] vmadm filter property
order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
one [boolean] return only one result (vmadm's -1)

CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')

Reboot a vm

vm [string] vm to be rebooted
force [boolean] force reboot of vm if true
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.receive(uuid, source)

Receive a vm from a directory

uuid [string] uuid of vm to be received
source [string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')

Reprovision a vm

vm [string] vm to be reprovisioned
image [string] uuid of new image
key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-→11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')

Rollback snapshot of a vm

vm [string] vm to be targeted
name [string] snapshot name

The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [\-_.%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.send(vm, target, key='uuid')

Send a vm to a directory
**vm** [string] vm to be sent
**target** [string] target directory
**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.start(**vm**, **options**=None, **key**='uuid')

Start a vm

**vm** [string] vm to be started
**options** [string] optional additional options
**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=/path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.stop(**vm**, **force**=False, **key**='uuid')

Stop a vm

**vm** [string] vm to be stopped
**force** [boolean] force stop of vm if true
**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.sysrq(**vm**, **action**='nmi', **key**='uuid')

Send non-maskable interrupt to vm or capture a screenshot

**vm** [string] vm to be targeted
**action** [string] nmi or screenshot -- Default: nmi
**key** [string [uuid|alias|hostname]] value type of `vm` parameter

CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

salt.modules.smartos_vmadm.update(**vm**, **from_file**=None, **key**='uuid', **kwargs**)  

Update a new vm

**vm** [string] vm to be updated
**from_file** [string] json file to update the vm with -- if present, all other options will be ignored
**key** [string [uuid|alias|hostname]] value type of `vm` parameter
**kwargs** [string|int|...] options to update for the vm

CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_memory=1024
```
21.9.415 salt.modules.smbios

Interface to SMBIOS/DMI
(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMIdecode

```
salt.modules.smbios.get(string, clean=True)
```
Get an individual DMI string from SMBIOS info

**string**
The string to fetch. DMIdecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

**clean**
Don’t return well-known false information
(invalid UUID’s, serial 000000000’s, etcetera)
Defaults to True

CLI Example:
```
salt '*' smbios.get system-uuid clean=False
```

```
salt.modules.smbios.records(rec_type=None, fields=None, clean=True)
```
Return DMI records from SMBIOS

21.9. execution modules
**type** Return only records of type(s) The SMBIOS specification defines the following DMI types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>BIOS</td>
</tr>

</table>

**clean**

Don't return well-known false information
(invalid UUID's, serial 00000000's, etcetera)

Defaults to **True**

---

CLI Example:
**21.9.416 salt.modules.smf_service**

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

- **salt.modules.smf_service.available(name)**
  
  Returns True if the specified service is available, otherwise returns False.
  
  We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names
  
  CLI Example:
  
  ```
salt '*' service.available net-snmp
  ```

- **salt.modules.smf_service.disable(name, **kwargs)**
  
  Disable the named service to start at boot
  
  CLI Example:
  
  ```
salt '*' service.disable <service name>
  ```

- **salt.modules.smf_service.disabled(name)**
  
  Check to see if the named service is disabled to start on boot
  
  CLI Example:
  
  ```
salt '*' service.disabled <service name>
  ```

- **salt.modules.smf_service.enable(name, **kwargs)**
  
  Enable the named service to start at boot
  
  CLI Example:
  
  ```
salt '*' service.enable <service name>
  ```

- **salt.modules.smf_service.enabled(name, **kwargs)**
  
  Check to see if the named service is enabled to start on boot
  
  CLI Example:
  
  ```
salt '*' service.enabled <service name>
  ```

- **salt.modules.smf_service.get_all()**
  
  Return all installed services
  
  CLI Example:
  
  ```
salt '*' service.get_all
  ```
salt.modules.smf_service.get_disabled()
Return the disabled services

CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.smf_service.get_enabled()
Return the enabled services

CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.smf_service.get_running()
Return the running services

CLI Example:
```
salt '*' service.get_running
```

salt.modules.smf_service.get_stopped()
Return the stopped services

CLI Example:
```
salt '*' service.get_stopped
```

salt.modules.smf_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' service.missing net-snmp
```

salt.modules.smf_service.reload_(name)
Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.smf_service.restart(name)
Restart the named service

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.smf_service.start(name)
Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.smf_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Not implemented

**Returns** True if running, False otherwise

**Return type** bool

CLI Example:
```
salt '*' service.status <service name>
```

salt.modules.smf_service.stop(name)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

## 21.9.417 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

**depends**
- smtplib python module

**configuration** This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```
salt.modules.smtp.send_msg(recipient, message, subject='Message from Salt', sender=None, server=None, use_ssl='True', username=None, password=None, profile=None, attachments=None)

Send a message to an SMTP recipient. To send a message to multiple recipients, the recipients should be in a comma-separated Python string. Designed for use in states.

CLI Examples:

```
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com,admin2@example.com' 'This is a salt module test for multiple recipients' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.com'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.com' attachments='[/var/log/messages]'
```

21.9.418 salt.modules.snapper module

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>
codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>
depends dbus Python module.
depends snapper http://snapper.io, available in most distros
maturity new
platform Linux

salt.modules.snapper.changed_files(config='root', num_pre=None, num_post=None)

Returns the files changed between two snapshots

cfg Configuration name.
num_pre first snapshot ID to compare. Default is last snapshot
num_post last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.create_baseline(tag='baseline', config='root')

Creates a snapshot marked as baseline

tag Tag name for the baseline
config Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.create_config(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)

Creates a new Snapper configuration
name  Name of the new Snapper configuration.
subvolume  Path to the related subvolume.
fstype  Filesystem type of the subvolume.
template  Configuration template to use. (Default: default)
extra_opts  Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
←template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
←extraOpts={"NUMBER_CLEANUP": False}"
```

```
salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, description=None, cleanup_algorithm='number', userdata=None, **kwargs)
```

Creates an snapshot

```
salt.modules.snapper.delete_snapshot(config='root', snapshots_ids=None)
```

Deletes an snapshot

```
salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)
```

Returns the differences between two snapshots

```
salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)
```

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

```
salt.modules.snapper.diff_jid(jid, config='root')
```

Returns the changes applied by a jid
jid  The job id to lookup
config Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.get_config(name='root')
Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.get_snapshot(number=0, config='root')
Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot
```

salt.modules.snapper.list_configs()
List all available configs

CLI example:

```
salt '*' snapper.list_configs
```

salt.modules.snapper.list_snapshots(config='root')
List available snapshots

CLI example:

```
salt '*' snapper.list_snapshots config=myconfig
```

salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')
Modify attributes of an existing snapshot.

config Configuration name. (Default: root)
snapshot_id ID of the snapshot to be modified.
cleanup Change the cleanup method of the snapshot. (str)
description Change the description of the snapshot. (str)
userdata Change the userdata dictionary of the snapshot. (dict)

CLI example:

```
salt '*' snapper.modify_snapshot snapshot_id=54 description="my snapshot description"
salt '*' snapper.modify_snapshot snapshot_id=54 description="my snapshot description"
salt '*' snapper.modify_snapshot snapshot_id=54 userdata="{"foo": "bar"}"
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

salt.modules.snapper.run(function, *args, **kwargs)
Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function Salt function to call.
config Configuration name. (default: "root")
description A description for the snapshots. (default: None)
userdata Data to include in the snapshot metadata. (default: None)
cleanup_algorithm Snapper cleanup algorithm. (default: "number")
*args args for the function to call. (default: None)
**kwargs  kwargs for the function to call (default: None)
This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```shell
salt '*' snapper.run file.append args='[/etc/motd, "some text"]'
```

salt.modules.snapper.set_config(name='root', **kwargs)
Set configuration values

CLI example:

```shell
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```shell
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.status(config='root', num_pre=None, num_post=None)
Returns a comparison between two snapshots

config Configuration name.

num_pre first snapshot ID to compare. Default is last snapshot

num_post last snapshot ID to compare. Default is 0 (current state)

CLI example:

```shell
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.status_to_string(dbus_status)
Converts a numeric dbus snapper status into a string

CLI Example:

```shell
salt '*' snapper.status_to_string <dbus_status>
```

salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)
Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

**Warning:** If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.

You to undo changes between num_pre and the current version of the files use num_post=0.

CLI Example:

```shell
salt '*' snapper.undo
```

salt.modules.snapper.undo_jid(jid, config='root')
Undo the changes applied by a salt job

jid The job id to lookup

config Configuration name.

CLI Example:
21.9.419 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform solaris,illumos

New in version 2016.3.0.
salt.modules.solaris_fmadm.acquit(fmri)
    Acquit resource or acquit case
    fmri: string fmri or uuid
    CLI Example:
    ```
salt '*' fmadm.acquit fmri | uuid
    ```
salt.modules.solaris_fmadm.config()
    Display fault manager configuration
    CLI Example:
    ```
salt '*' fmadm.config
    ```
salt.modules.solaris_fmadm.faulty()
    Display list of faulty resources
    CLI Example:
    ```
salt '*' fmadm.faulty
    ```
salt.modules.solaris_fmadm.flush(fmri)
    Flush cached state for resource
    fmri: string fmri
    CLI Example:
    ```
salt '*' fmadm.flush fmri
    ```
salt.modules.solaris_fmadm.healthy()
    Return whether fmadm is reporting faults
    CLI Example:
    ```
salt '*' fmadm.healthy
    ```
salt.modules.solaris_fmadm.list_records(after=None, before=None)
    Display fault management logs
    after [string] filter events after time, see man fmdump for format
    before [string] filter events before time, see man fmdump for format
    CLI Example:
    ```
salt '*' fmadm.list
    ```
salt.modules.solaris_fmadm.load(path)
  Load specified fault manager module
  path: string  path of fault manager module
  CLI Example:

  salt '*' fmadm.load /module/path

salt.modules.solaris_fmadm.repaired(fmri)
  Notify fault manager that resource has been repaired
  fmri: string  fmri
  CLI Example:

  salt '*' fmadm.repaired fmri

salt.modules.solaris_fmadm.replaced(fmri)
  Notify fault manager that resource has been replaced
  fmri: string  fmri
  CLI Example:

  salt '*' fmadm.repaired fmri

salt.modules.solaris_fmadm.reset(module, serd=None)
  Reset module or sub-component
  module: string  module to unload
  serd [string]  serd sub module
  CLI Example:

  salt '*' fmadm.reset software-response

salt.modules.solaris_fmadm.show(uuid)
  Display log details
  uuid: string  uuid of fault
  CLI Example:

  salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1

salt.modules.solaris_fmadm.unload(module)
  Unload specified fault manager module
  module: string  module to unload
  CLI Example:

  salt '*' fmadm.unload software-response

21.9.420  salt.modules.solaris_group

Manage groups on Solaris

Important:  If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

salt.modules.solaris_group.add(name, gid=None, **kwargs)
  Add the specified group
  CLI Example:

21.9.  execution modules
salt '*' group.add foo 3456

salt.modules.solaris_group.chgid(name, gid)
Change the gid for a named group
CLI Example:
salt '*' group.chgid foo 4376

salt.modules.solaris_group.delete(name)
Remove the named group
CLI Example:
salt '*' group.delete foo

salt.modules.solaris_group.getent(refresh=False)
Return info on all groups
CLI Example:
salt '*' group.getent

salt.modules.solaris_group.info(name)
Return information about a group
CLI Example:
salt '*' group.info foo

21.9.421 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

salt.modules.solaris_shadow.default_hash()
Returns the default hash used for unset passwords
CLI Example:
salt '*' shadow.default_hash

salt.modules.solaris_shadow.del_password(name)
Delete the password from name user
CLI Example:
salt '*' shadow.del_password username

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')
Generate hashed password
Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

**password**  Plaintext password to be hashed.
**crypt_salt**  Cryptographic salt. If not given, a random 8-character salt will be generated.
**algorithm**  The following hash algorithms are supported:
- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'\n    algorithm=sha256
```

salt.modules.solaris_shadow.info(name)
Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.solaris_shadow.set_maxdays(name, maxdays)
Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

salt.modules.solaris_shadow.set_mindays(name, mindays)
Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

salt.modules.solaris_shadow.set_password(name, password)
Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: openssl passwd -1 <plaintext password>

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

salt.modules.solaris_shadow.set_warndays(name, warndays)
Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```
21.9.422 salt.modules.solaris_system

Support for reboot, shutdown, etc
This module is assumes we are using solaris-like shutdown
New in version 2016.3.0.

salt.modules.solaris_system.halt()
Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.solaris_system.init(state)
Change the system runlevel on sysV compatible systems

CLI Example:
```
state [string] Init state
```
```
salt '*' system.init 3
```

salt.modules.solaris_system.poweroff()
Poweroff a running system

CLI Example:
```
salt '*' system.poweroff
```

salt.modules.solaris_system.reboot(delay=0, message=None)
Reboot the system
```
delay [int] Optional wait time in seconds before the system will be rebooted.
message [string] Optional message to broadcast before rebooting.
```

CLI Example:
```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

salt.modules.solaris_system.shutdown(delay=0, message=None)
Shutdown a running system
```
delay [int] Optional wait time in seconds before the system will be shutdown.
message [string] Optional message to broadcast before rebooting.
```

CLI Example:
```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```
21.9.423  salt.modules.solaris_user

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

```python
salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, **kwargs)
```

Add a user to the minion

CLI Example:
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.solaris_user.chfullname(name, fullname)
```

Change the user's Full Name

CLI Example:
```
salt '*' user.chfullname foo "Foo Bar"
```

```python
salt.modules.solaris_user.chgid(name, gid)
```

Change the default group of the user

CLI Example:
```
salt '*' user.chgid foo 4376
```

```python
salt.modules.solaris_user.chgroups(name, groups, append=False)
```

Change the groups to which a user belongs

- **name** Username to modify
- **groups** List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
- **append** [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:
```
salt '*' user.chgroups foo wheel,root True
```

```python
salt.modules.solaris_user.chhome(name, home, persist=False)
```

Set a new home directory for an existing user

- **name** Username to modify
- **home** New home directory to set
- **persist** [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:
```
salt '*' user.chhome foo /home/users/foo True
```

```python
salt.modules.solaris_user.chhomephone(name, homephone)
```

Change the user's Home Phone

CLI Example:
```
salt '*' user.chhomephone foo "7735551234"
```
salt.modules.solaris_user.chroomnumber(name, roomnumber)
    Change the user's Room Number
    CLI Example:
    ```
salt '*' user.chroomnumber foo 123
    ```

salt.modules.solaris_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    ```
salt '*' user.chshell foo /bin/zsh
    ```

salt.modules.solaris_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    ```
salt '*' user.chuid foo 4376
    ```

salt.modules.solaris_user.chworkphone(name, workphone)
    Change the user's Work Phone
    CLI Example:
    ```
salt '*' user.chworkphone foo "7735550123"
    ```

salt.modules.solaris_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    ```
salt '*' user.delete name remove=True force=True
    ```

salt.modules.solaris_user.getent(refresh=False)
    Return the list of all info for all users
    CLI Example:
    ```
salt '*' user.getent
    ```

salt.modules.solaris_user.info(name)
    Return user information
    CLI Example:
    ```
salt '*' user.info root
    ```

salt.modules.solaris_user.list_groups(name)
    Return a list of groups the named user belongs to
    CLI Example:
    ```
salt '*' user.list_groups foo
    ```

salt.modules.solaris_user.list_users()
    Return a list of all users
    CLI Example:
Salt Documentation, Release 3002.6

salt '*' user.list_users

salt.modules.solaris_user.rename(name, new_name)
Change the username for a named user
CLI Example:
salt '*' user.rename name new_name

21.9.424 salt.modules.solarisipspkg

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to 'pkg.install' is not available), see here.

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the
default pkg module for Solaris 11 (and later).
If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg
provider in sls for each package:

mypackage:
  pkg.installed:
    - provider: pkgutil

Or you can override it globally by setting the providers parameter in your Minion config file like this:

providers:
  pkg: pkgutil

Or you can override it globally by setting the providers parameter in your Minion config file like this:

providers:
  pkg: pkgutil

salt.modules.solarisipspkg.available_version(*names, **kwargs)
This function is an alias of latest_version.
The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is
returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for
that package.
Please use pkg.latest_version as pkg.available_version is being deprecated.
Changed in version 2019.2.0: Support for multiple package names added.
CLI Example:
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail

21.9. execution modules
salt.modules.solarisipspkg.get_fmri(name, **kwargs)
Returns FMRI from partial name. Returns empty string ("") if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:
salt '*' pkg.get_fmri bash

salt.modules.solarisipspkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)
Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```json
{
'package': {
'old': '<old-version>',
'new': '<new-version>'
}
}
```

Multiple Package Installation Options:
- **pkgs** A list of packages to install. Must be passed as a python list.
  
  CLI Example:
  
  ```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['"foo", "bar"]'
  ```

salt.modules.solarisipspkg.is_installed(name, **kwargs)
Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:
salt '*' pkg.is_installed bash

salt.modules.solarisipspkg.latest_version(*names, **kwargs)
The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail

salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)
List the currently installed packages as a dict:

```json
{
'<package_name>': '<version>'
}
```

CLI Example:
salt '*' pkg.list_pkgs
salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)
Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than pkg update -vn, because pkg update hides packages that require newer version of pkg://solaris/entire (which means that they can be upgraded only from the global zone). If pkg://solaris/entire is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use refresh=True to refresh the package database.

refresh [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, refresh defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:
```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

salt.modules.solarisipspkg.normalize_name(name, **kwargs)
Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:
```
salt '*' pkg.normalize_name vim
```

salt.modules.solarisipspkg.purge(name, **kwargs)
Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:
```
salt '*' pkg.purge <package name>
```

salt.modules.solarisipspkg.refresh_db(full=False, **kwargs)
Updates the remote repos database.

full : False
Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:
```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

salt.modules.solarisipspkg.remove(name=None, pkgs=None, **kwargs)
Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

name  The name of the package to be deleted.

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:
salt 'x' pkg.remove <package name>
salt 'x' pkg.remove tcsh
salt 'x' pkg.remove pkg://solaris/shell/tcsh
salt 'x' pkg.remove pkgs='["foo", "bar"]'

```
salt.modules.solarisipspkg.search(name, versions_as_list=False, **kwargs)
```
Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globes are also supported.

CLI Example:
```
salt '* pkg.search bash
```

```
salt.modules.solarisipspkg.upgrade(refresh=False, **kwargs)
```
Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constraints linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:
```
{ '<package>':  { 'old': '<old-version>', 'new': '<new-version>' }}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg update command.

CLI Example:
```
salt '* pkg.upgrade
```

```
salt.modules.solarisipspkg.upgrade_available(name, **kwargs)
```
Check if there is an upgrade available for a certain package. Accepts full or partial FMRI. Returns all matches found.

CLI Example:
```
salt '* pkg.upgrade_available apache-22
```

```
salt.modules.solarisipspkg.version('names, **kwargs)
```
Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:
```
salt 'x' pkg.version vim
salt 'x' pkg.version foo bar baz
salt 'x' pkg_resource.version pkg://solaris/entire"
21.9.425 salt.modules.solarispkg

Package support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

**CLI Examples:**

# Installing a data stream pkg that already exists on the minion

```
salt '*' pkg.install sources='[["<pkg name>": "/dir/on/minion/<pkg filename>"]]
```

# Installing a data stream pkg that exists on the salt master

```
salt '*' pkg.install sources='[["<pkg name>": "salt://pkgs/<pkg filename>"]]'
```

# Installing a data stream pkg that exists on a HTTP server

```
salt '*' pkg.install sources='[["<pkg name>": "http://packages.server.com/<pkg filename>"]]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass 'current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

**CLI Example:**

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[["SMCLogcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"]]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
```

(continues on next page)
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
action=nocheck
basedir=default

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]' admin_instance="overwrite"
```

SLS Example:

```
# Overiding the 'instance' adminfile option when used in a state
SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
      - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]' admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states
<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.

```
salt.modules.solarispkg.latest_version(*names, **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

```bash
salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)
```
List the packages currently installed as a dict:

```json
{ '<package_name>': '<version>' }
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

```bash
salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)
```
Package purges are not supported, this function is identical to `remove()`.

name  The name of the package to be deleted

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```bash
salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)
```
Remove packages with pkgrm

name  The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```ini
email=
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:
Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.solarispkg.upgrade_available(name, **kwargs)
```

Check whether or not an upgrade is available for a given package

CLI Example:

```bash
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.solarispkg.version(*names, **kwargs)
```

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

**21.9.426 salt.modules.solr**

Apache Solr Salt Module

Author: Jed Glazner  Version: 0.2.1  Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

**Coming Features in 0.3**

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded
Override these in the minion config

solr.cores  A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.
solr.baseurl  The root level URL to access solr via HTTP
solr.request_timeout  The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.
solr.type  Possible values are 'master' or 'slave'
solr.backup_path  The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.
solr.num_backups  For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.
solr.init_script  The full path to your init script with start/stop options
solr.dih.options  A list of options to pass to the DIH.

Required Options for DIH

clean  [False] Clear the index before importing
commit  [True] Commit the documents to the index upon completion
optimize  [True] Optimize the index after commit is complete
verbose  [True] Get verbose output

salt.modules.solr.abort_import(<handler>, host=None, core_name=None, verbose=False)
MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master
handler  [str] The name of the data import handler.
host  [str (None)] The solr host to query. __opts__['host'] is default.
core  [str (None)] The core the handler belongs to.
verbose  [boolean (False)] Run the command with verbose output.
Return : dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

salt.modules.solr.backup(<host=None, core_name=None, append_core_to_path=False>)
Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.
host  [str (None)] The solr host to query. __opts__['host'] is default.
core_name  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
append_core_to_path  [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.
Return : dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*i' solr.backup music

salt.modules.solr.core_status(
    host=None, 
    core_name=None)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str] The name of the core to reload

Return : dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt 'i' solr.core_status None music

salt.modules.solr.delta_import(
    handler, 
    host=None, 
    core_name=None, 
    options=None, extra=None)

Submits an import command to the specified handler using specified options. This command can only be run
if the minion is configured with solr.type=master

handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication.
leave blank to use __opts__ defaults. options will be merged with __opts__
extra [dict ()] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt 'i' solr.delta_import dataimport None music {'clean':True}

salt.modules.solr.full_import(
    handler, 
    host=None, 
    core_name=None, 
    options=None, extra=None)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run
if the minion is configured with solr.type: 'master'

handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication.
leave blank to use __opts__ defaults. options will be merged with __opts__
extra [dict ()] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt 'i' solr.full_import dataimport None music {'clean':True}

salt.modules.solr.import_status(
    handler, 
    host=None, 
    core_name=None, 
    verbose=False)

Submits an import command to the specified handler using specified options. This command can only be run
if the minion is configured with solr.type: 'master'

handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
verbose [boolean (False)] Specifies verbose output
Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.import_status dataimport None music False

salt.modules.solr.is_replication_enabled(host=None, core_name=None)
SLAVE CALL Check for errors, and determine if a slave is replicating or not.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.is_replication_enabled music

salt.modules.solr.lucene_version(core_name=None)
Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.lucene_version

salt.modules.solr.match_index_versions(host=None, core_name=None)
SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
Return: dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.match_index_versions music

salt.modules.solr.optimize(host=None, core_name=None)
Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return : dict<str,obj>:
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }

CLI Example:
salt '*' solr.optimize music

salt.modules.solr.ping(host=None, core_name=None)
Does a health check on solr, makes sure solr can talk to the indexes.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return : dict<str,obj>:
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }

CLI Example:
salt '*' solr.ping music

salt.modules.solr.reload_core(host=None, core_name=None)
MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core.
While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all
new request will go to the "new" core, and the "old" core will be unloaded.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str] The name of the core to reload
Return : dict<str,obj>:
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }

CLI Example:
salt '*' solr.reload_core None music

Return data is in the following format:

{ 'success':bool, 'data':dict, 'errors':list, 'warnings':list }

salt.modules.solr.reload_import_config(handler, host=None, core_name=None, verbose=False)
MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master'
type
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
verbose [boolean (False)] Run the command with verbose output.
Return : dict<str,obj>:
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }

CLI Example:
salt 'x' solr.reload_import_config dataimport None music {clean:True}

salt.modules.solr.replication_details(host=None, core_name=None)
Get the full replication details.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
    or if you want to check all cores.
    Return : dict<str,obj>:
        {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt 'x' solr.replication_details music

salt.modules.solr.set_is_polling(polling, host=None, core_name=None)
SLAVE CALL Prevent the slaves from polling the master for updates.
    polling [boolean] True will enable polling. False will disable it.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
    or if you want to check all cores.
    Return : dict<str,obj>:
        {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt 'x' solr.set_is_polling False

salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)
MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves
replicating during indexing or when clearing the index.
    status [boolean] Sets the replication status to the specified state.
    host [str (None)] The solr host to query. __opts__['host'] is default.
    core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
    or if you want to set the status on all cores.
    Return : dict<str,obj>:
        {'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt 'x' solr.set_replication_enabled false, None, music

salt.modules.solr.signal(signal=None)
Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the
solr host. Additionally Solr doesn't ship with an init script so one must be created.
    signal [str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'
    CLI Example:
salt 'x' solr.signal restart

salt.modules.solr.version(core_name=None)
Gets the solr version for the core specified. You should specify a core here as all the cores will run under the
same servlet container and so will all have the same version.
core_name  [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```python
{ 'success':boolean, 'data':dict, 'errors':list, 'warnings':list }
```

CLI Example:

```bash
salt '*' solr.version
```

### 21.9.427 salt.modules.solrcloud module

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

```python
salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']
```

Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1

```python
salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']
```

Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll

```python
salt.modules.solrcloud.alias_exists(alias_name, **kwargs)
```

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
salt '*' solrcloud.alias_exists my_alias
```

```python
salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)
```

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
salt '*' solrcloud.alias_get my_alias
```

```python
salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)
```

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
salt '*' solrcloud.alias_set my_alias collections=[collection1, colletion2]
```

```python
salt.modules.solrcloud.cluster_status(**kwargs)
```

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
```
salt 'salt' solrcloud.cluster_status

salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)

Create a backup for a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt 'salt' solrcloud.core_backup collection_name /mnt/nfs_backup

salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)

Create a backup for all collection present on the server.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt 'salt' solrcloud.core_backup /mnt/nfs_backup

salt.modules.solrcloud.collection_check_options(options)

Check collections options

CLI Example:
salt 'salt' solrcloud.collection_check_options '{"replicationFactor":4}'

salt.modules.solrcloud.collection_create(collection_name, options=None, **kwargs)

Create a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:
salt 'salt' solrcloud.collection_create collection_name

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"

salt 'salt' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}

Cores options may be passed using the "properties" key in options. Do not include property "name"

salt 'salt' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":/srv/solr/ hugePartitionSollection"}}

salt.modules.solrcloud.collection_creation_options()

Get collection option list that can only be defined at creation

CLI Example:
salt 'salt' solrcloud.collection_creation_options

salt.modules.solrcloud.collection_exists(collection_name, **kwargs)

Check if a collection exists
Additional parameters (kwargs) may be passed, they will be proxied to http.query
```
Salt Documentation, Release 3002.6

CLI Example:

```bash
salt '*' solrcloud.collection_exists collection_name
```

**salt.modules.solrcloud.collection_get_options**(*collection_name, **kwargs*)

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
salt '*' solrcloud.collection_get_options collection_name
```

**salt.modules.solrcloud.collection_list**(**kwargs**)

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
salt '*' solrcloud.collection_list
```

**salt.modules.solrcloud.collection_reload**(*collection, **kwargs*)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```bash
salt '*' solrcloud.collection_reload collection_name
```

**salt.modules.solrcloud.collection_set_options**(*collection_name, options, **kwargs*)

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```bash
salt '*' solrcloud.collection_set_options collection_name options=
   →"replicationFactor":4
```

**salt.modules.solrcloud.log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>**

Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

### 21.9.428 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0..

**depends**

- splunk-sdk python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:
salt.modules.splunk.create_user(email, profile='splunk', **kwargs)
create a splunk user by name/email

CLI Example:
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser

salt.modules.splunk.delete_user(email, profile='splunk')
Delete a splunk user by email

CLI Example:
salt myminion splunk_user.delete 'user@example.com'

salt.modules.splunk.get_user(email, profile='splunk', **kwargs)
Get a splunk user by name/email

CLI Example:
salt myminion splunk.get_user 'user@example.com' user_details=false salt myminion splunk.get_user 'user@example.com' user_details=true

salt.modules.splunk.list_users(profile='splunk')
List all users in the splunk DB

CLI Example:
salt myminion splunk.list_users

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)
Create a splunk user by email

CLI Example:
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"

21.9.429 salt.modules.splunk_search

Module for interop with the Splunk API
New in version 2015.5.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

21.9. execution modules
salt.modules.splunk_search.create(name, profile='splunk', **kwargs)
Create a splunk search

CLI Example:
splunk_search.create 'my search name' search='error msg'

salt.modules.splunk_search.delete(name, profile='splunk')
Delete a splunk search

CLI Example:
splunk_search.delete 'my search name'

salt.modules.splunk_search.get(name, profile='splunk')
Get a splunk search

CLI Example:
splunk_search.get 'my search name'

salt.modules.splunk_search.list_(profile='splunk')
List splunk searches (names only)

CLI Example: splunk_search.list

salt.modules.splunk_search.list_all(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')
Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where "description_contains in description"

is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in
name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the
prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:
1. Make a "backup" of all existing searches $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" >
   legacy_searches.sls
2. Get all searches with new prefixed names $ salt-call splunk_search.list_all "prefix="**MANAGED BY
   SALT**" --out=txt | sed "s/local: //" > managed_searches.sls
3. Insert the managed searches into splunk $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls
   $ salt-call state.sls remove_legacy_searches.sls
6. Get all searches again, verify no changes $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" >
   final_searches.sls $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)
Update a splunk search

CLI Example:
splunk_search.update 'my search name' sharing=app
21.9.430 salt.modules.sqlite3

Support for SQLite3

**salt.modules.sqlite3.fetch**(db=None, sql=None)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:
```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

**salt.modules.sqlite3.indexes**(db=None)
Show all indices in the database, for people with poor spelling skills

CLI Example:
```
salt '*' sqlite3.indexes /root/test.db
```

**salt.modules.sqlite3.indices**(db=None)
Show all indices in the database

CLI Example:
```
salt '*' sqlite3.indices /root/test.db
```

**salt.modules.sqlite3.modify**(db=None, sql=None)
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:
```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

**salt.modules.sqlite3.sqlite_version()**
Return version of sqlite

CLI Example:
```
salt '*' sqlite3.sqlite_version
```

**salt.modules.sqlite3.tables**(db=None)
Show all tables in the database

CLI Example:
```
salt '*' sqlite3.tables /root/test.db
```

**salt.modules.sqlite3.version()**
Return version of pysqlite

CLI Example:
```
salt '*' sqlite3.version
```
21.9.431 salt.modules.ssh

Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys(user=None, config='ssh/authorized_keys', fingerprint_hash_type=None)

Return the authorized keys for users

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' ssh.auth_keys</td>
<td>Return the authorized keys for users</td>
</tr>
<tr>
<td>salt '*' ssh.auth_keys root</td>
<td></td>
</tr>
<tr>
<td>salt '*' ssh.auth_keys user=root</td>
<td></td>
</tr>
<tr>
<td>salt '*' ssh.auth_keys user=&quot;[user1, user2]&quot;</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.ssh.check_key(user, key, enc, comment, options, config='ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)

Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' ssh.check_key &lt;user&gt; &lt;key&gt; &lt;enc&gt; &lt;comment&gt; &lt;options&gt;</td>
<td>Check to see if a key needs updating, returns &quot;update&quot;, &quot;add&quot; or &quot;exists&quot;</td>
</tr>
</tbody>
</table>

salt.modules.ssh.check_key_file(user, source, config='ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' ssh.check_key_file root salt://ssh/keyfile</td>
<td>Check a keyfile from a source destination against the local keys and return the keys to change</td>
</tr>
</tbody>
</table>

salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' ssh.check_known_host &lt;user&gt; &lt;hostname&gt; key='AAAA...FAaQ=='</td>
<td>Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).</td>
</tr>
</tbody>
</table>

salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' ssh.get_known_host_entries &lt;user&gt; &lt;hostname&gt;</td>
<td>Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.</td>
</tr>
</tbody>
</table>
salt.modules.ssh.hash_known_hosts(user=None, config=None)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user hash known hosts of this user
config path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

salt.modules.ssh.host_keys(keydir=None, private=True, certs=True)

Return the minion’s host keys

CLI Example:

```python
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

salt.modules.ssh.key_is_encrypted(key)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a `Proc-Type` header with `ENCRYPTED` in the value. If found, returns `True`, otherwise returns `False`.

CLI Example:

```python
salt '*' ssh.key_is_encrypted /root/id_rsa
```

salt.modules.ssh.recv_known_host_entries(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

hostname The name of the remote host (e.g. "github.com")
enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss
port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.
hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.
timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.
fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from `md5` to `sha256`

CLI Example:

```python
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

salt.modules.ssh.rm_auth_key(user, key, config='.ssh/authorized_keys', fingerprint_hash_type=None)

Remove an authorized key from the specified user’s authorized key file
Salt Documentation, Release 3002.6

CLI Example:

```bash
salt '*' ssh.rm_auth_key <user> <key>
```

salt.modules.ssh.rm_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```bash
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.rm_known_host(user=None, hostname=None, config=None, port=None)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```bash
salt '*' ssh.rm_known_host <user> <hostname>
```

salt.modules.ssh.set_auth_key(user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```bash
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

salt.modules.ssh.set_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```bash
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.set_known_host(user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

- **user** The user who owns the ssh authorized keys file to modify
- **hostname** The name of the remote host (e.g. "github.com")
- **fingerprint** The fingerprint of the key which must be present in the known_hosts file (optional if key specified)
- **key** The public key which must be presented in the known_hosts file (optional if fingerprint specified)
- **port** optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.
- **enc** Defines what type of key is being used, can be ed25519, edsa ssh-rsa or ssh-dss
- **config** The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.
- **hash_known_hosts** [True] Hash all hostnames and addresses in the known hosts file.
- **timeout** [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.
New in version 2016.3.0.

**fingerprint_hash_type** The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:...:xx' enc='ssh-rsa' config='~/.ssh/known_hosts'
```

**salt.modules.ssh.user_keys** *(user=None, pubfile=None, prvfile=None)*

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/~home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=['user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

**21.9.432 salt.modules.ssh_pkg**

Service support for the REST example

**salt.modules.ssh_pkg.install** *(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)*

**salt.modules.ssh_pkg.list_pkgs** *(versions_as_list=False, **kwargs)*

**salt.modules.ssh_pkg.remove** *(name=None, pkgs=None, **kwargs)*

**21.9.433 salt.modules.ssh_service module**

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

**salt.modules.ssh_service.enabled** *(name, sig=None)*

Only the 'redbull' service is 'enabled' in the test

**salt.modules.ssh_service.get_all()**

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.ssh_service.list()**

Return a list of all available services.

CLI Example:
salt 'service.list

salt.modules.ssh_service.restart(name, sig=None)
    Restart the specified service with rest_sample CLI Example:
    salt 'service.restart <service name>

salt.modules.ssh_service.running(name, sig=None)
    Return whether this service is running.

salt.modules.ssh_service.start(name, sig=None)
    Start the specified service on the ssh_sample
    CLI Example:
    salt 'service.start <service name>

salt.modules.ssh_service.status(name, sig=None)
    Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    • name (str) -- The name of the service to check
    • sig (str) -- Not implemented
    Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise
    Return type bool
    CLI Example:
    salt 'service.status <service name>

salt.modules.ssh_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    CLI Example:
    salt 'service.stop <service name>

21.9.434 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won’t hit the fileserver except for salt:// links in the states themselves.

salt.modules.state.apply_(mods=None, **kwargs)
    New in version 2015.5.0.
    This function will call state.highstate or state.sls based on the arguments passed to this function. It exists as a more intuitive way of applying states.
APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```sh
call '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in top.sls:

- **test**  Run states in test-only (dry-run) mode
- **mock**  The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

  New in version 2015.8.4.

- **pillar**  Custom Pillar values, passed as a dictionary of key-value pairs

```sh
call '*' state.apply stuff pillar='{"foo": "bar"}"
```

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

- **exclude**  Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```sh
call '*' state.apply exclude=bar,baz
call '*' state.apply exclude=foo*
call '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

- **queue**  [False]  Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.

- **localconfig**  Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```sh
call '*' state.apply localconfig=/path/to/minion.yml
```

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)

To apply individual SLS files, pass them as a comma-separated list:

```sh
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
call '*' state.apply stuff

# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
call '*' state.apply stuff,pkgs

# Run the states configured in a more deeply nested directory such as salt://my/
→organized/stuff.sls (or salt://my/organized/stuff/init.sls)
call '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

- **test**  Run states in test-only (dry-run) mode
mock  The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

pillar  Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

queue  [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent  [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

saltenv  Specify a salt filesserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

pillarenv  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig  Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

sync_mods  If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

Note: This option is ignored when no SLS files are specified, as a highstate automatically syncs all custom module types.

New in version 2017.7.8, 2018.3.3, 2019.2.0.

salt.modules.state.check_request(name=None)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:
salt '...' state.check_request

salt.modules.state.clear_cache()
Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.
Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states
CLI Example:
salt '...' state.clear_cache

salt.modules.state.clear_request(name=None)
New in version 2015.5.0.
Clear out the state execution request without executing it
CLI Example:
salt '...' state.clear_request

salt.modules.state.disable(states)
Disable state runs.
CLI Example:
salt '...' state.disable highstate
salt '...' state.disable highstate,test.succeed_without_changes

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.disable bind.config

salt.modules.state.enable(states)
Enable state function or sls run
CLI Example:
salt '...' state.enable highstate
salt '...' state.enable test.succeed_without_changes

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.
salt '*' state.enable bind.config

salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')
Watch Salt’s event bus and block until the given tag is matched
New in version 2016.3.0.
Changed in version 2019.2.0: tagmatch can now be either a glob or regular expression.
This is useful for utilizing Salt’s event bus from shell scripts or for taking simple actions directly from the CLI.
Enable debug logging to see ignored events.
Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master’s event socket file.
- **pretty** -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.get_pauses(jid=None)`

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

`salt.modules.state.high(data, test=None, queue=False, **kwargs)`

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

`salt.modules.state.highstate(test=None, queue=False, **kwargs)`

Retrieve the state data from the salt master for this minion and execute it

test Run states in test-only (dry-run) mode
pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.highstate stuff pillar='{"foo": "bar"}"
```

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{"id": 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a saltenv
parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_toexclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

**salt.modules.state.id_exists** *(ids, mods, test=None, queue=False, **kwargs)*
Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to `state.sls_exists`, returns True or False. The default environment is base, use `saltenv` to specify a different environment.

New in version 2019.2.0.

**saltenv** Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

**salt.modules.state.list_disabled**()
List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

**salt.modules.state.low** *(data, queue=False, **kwargs)*
Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}"
```

**salt.modules.state.orchestrate** *(mods, saltenv='base', test=None, exclude=None, pillar=None, pil-

larenv=None)*

New in version 2016.11.0.
Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation
- Full Orchestrate Tutorial
- Docs for the salt state module salt.states.saltmod

CLI Examples:

```bash
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

**salt.modules.state.pause**(jid, state_id=None, duration=None)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```yaml
vim:
    pkg.installed: []
```

The state_id to pass to pause is `vim`

CLI Examples:

```bash
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

**salt.modules.state.pkg**(pkg_path, pkg_sum, hash_type, test=None, **kwargs)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```bash
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

**salt.modules.state.request**(mods=None, **kwargs)

New in version 2015.5.0.

Request that the local admin execute a state run via `salt-call state.run_request`. All arguments match those of state.apply.

CLI Example:

```bash
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

**salt.modules.state.resume**(jid, state_id=None)

Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```yaml
vim:
    pkg.installed: []
```
The state_id to pass to `rm_pause` is `vim`

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

**salt.modules.state.run_request(**name='default', **kwargs)**

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

**salt.modules.state.running**(concurrent=False)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

**salt.modules.state.show_highstate**(queue=False, **kwargs)**

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

**salt.modules.state.show_low_sls**(mods, test=None, queue=False, **kwargs)**

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

* saltenv Specify a salt fileserver environment to be used when applying states
* pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

* pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

**salt.modules.state.show_lowstate**(queue=False, **kwargs)**

List out the low data that will be applied to this minion

CLI Example:
salt '*' state.show_lowstate

```python
salt.modules.state.show_sls(mods, test=None, queue=False, **kwargs)
```
Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

```
salt.modules.state.show_sls core,edit.vim saltenv=dev
```

salt.modules.state.show_state_usage(queue=False, **kwargs)
Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

```
salt.modules.state.show_state_usage
```

salt.modules.state.show_states(queue=False, **kwargs)
Returns the list of states that will be applied on highstate.

```
salt.modules.state.show_states
```

New in version 2019.2.0.

salt.modules.state.show_top(queue=False, **kwargs)
Return the top data that the minion will use for a highstate

```
salt.modules.state.show_top
```

salt.modules.state.single(fun, name, test=None, queue=False, **kwargs)
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

```
salt.modules.state.single pkg.installed name=vim
```

salt.modules.state.sls(mods, test=None, exclude=None, queue=False, sync_mods=None, **kwargs)
Execute the states in one or more SLS files

```
salt.modules.state.sls
```
salt '* state.sls stuff pillar='{"foo": "bar"}'}

**Note:** Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

**pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```bash
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=bar
salt '*' state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```

**queue** [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig** Optionally, instead of using the minion config file, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

**mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

**sync_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```bash
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,2019.2.0.

CLI Example:
# Run the states configured in salt://example.sls (or salt://example/init.sls)
```
salt '*' state.apply example
```

# Run the states configured in salt://core.sls (or salt://core/init.sls)
# and salt://edit/vim.sls (or salt://edit/vim/init.sls)
```
salt '*' state.sls core,edit.vim
```

# Run the states configured in a more deeply nested directory such as salt://my/
→ nested/state.sls (or salt://my/nested/state/init.sls)
```
salt '*' state.sls my.nested.state
```

```
salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'
→ 's'}]"
salt '*' state.sls my.slsfile pillar="{'foo': 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.sls_exists(mods, test=None, queue=False, **kwargs)
Tests for the existence of a specific SLS or list of SLS files on the master. Similar to state.show_sls, rather than returning state details, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.
```
saltenv Specify a salt files server environment from which to look for the SLS files specified in the mods argument
```

CLI Example:
```
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

salt.modules.state.sls_id(id_, mods, test=None, queue=False, **kwargs)
Call a single ID from the named module(s) and handle all requisites

The state ID comes before the module ID(s) on the command line.
```
id ID to call
```
```
mods Comma-delimited list of modules to search for given id and its requisites
```
New in version 2014.7.0.
```
saltenv [base] Specify a salt files server environment to be used when applying states
```
```
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
```
```
pillarenv Custom Pillar values, passed as a dictionary of key-value pairs
```

```
Note: Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.
```

New in version 2018.3.0.
```
CLI Example:
```
salt '*' state.sls_id my_state my_module pillar='"foo": "bar"
```

salt.modules.state.soft_kill(jid, state_id=None)
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given
state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

**salt.modules.state.template**(tem, queue=False, **kwargs)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

**salt.modules.state.template_str**(tem, queue=False, **kwargs)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

**salt.modules.state.test**(*args, **kwargs)

New in version 3001.

Alias for `state.apply` with the kwarg `test` forced to `True`.

This is a nicety to avoid the need to type out `test=True` and the possibility of a typo causing changes you do not intend.

**salt.modules.state.top**(topfn, test=None, queue=False, **kwargs)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

`queue` [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

`saltenv` Specify a salt fileserver environment to be used when applying states

`pillarenv` Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
```
21.9.435 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

salt.modules.status.all_status()
    Return a composite of all status data and info for this minion. Warning: There is a LOT here!
    CLI Example:
    ```
salt '*' status.all_status
    ```

salt.modules.status.cpuinfo()
    Changed in version 2016.3.2: Return the CPU info for this minion
    Changed in version 2016.11.4: Added support for AIX
    Changed in version 2018.3.0: Added support for NetBSD and OpenBSD
    CLI Example:
    ```
salt '*' status.cpuinfo
    ```

salt.modules.status.cpustats()
    Return the CPU stats for this minion
    Changed in version 2016.11.4: Added support for AIX
    Changed in version 2018.3.0: Added support for OpenBSD
    CLI Example:
    ```
salt '*' status.cpustats
    ```

salt.modules.status.custom()
    Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:
    ```
    status.cpustats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
    ```
    Where status refers to status.py, cpustats is the function where we get our data, and custom is this function. It is followed by a list of keys that we want returned.
    This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.
    By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!
    CLI Example:
    ```
salt '*' status.custom
    ```

salt.modules.status.diskstats()
    Changed in version 2016.3.2: Return the disk stats for this minion
    Changed in version 2016.11.4: Added support for AIX
    CLI Example:
    ```
salt '*' status.diskstats
    ```
salt.modules.status.diskusage(*args)

Return the disk usage for this minion

Usage:

```bash
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```bash
salt '*' status.diskusage # usage for all filesystems
salt '*' status.diskusage /tmp  # usage for / and /tmp
salt '*' status.diskusage ext? # usage for ext[234] filesystems
salt '*' status.diskusage / ext? # usage for / and all ext filesystems
```

salt.modules.status.loadavg()

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.loadavg
```

:raises CommandExecutionError: If the system cannot report loadaverages to Python

salt.modules.status.master(master=None, connected=True)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.master
```

salt.modules.status.meminfo()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```bash
salt '*' status.meminfo
```

salt.modules.status.netdev()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.netdev
```

salt.modules.status.netstats()

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

salt.modules.status.nproc()
Return the number of processing units available on this system
Changed in version 2016.11.4: Added support for AIX
Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

salt.modules.status.pid(sig)
Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via `ps`. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

salt.modules.status.ping_master(master)
New in version 2016.3.0.
Sends ping request to the given master. Fires `__master_failback` event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

salt.modules.status.procs()
Return the process data
Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

salt.modules.status.proxy_reconnect(proxy_name, opts=None)
Forces proxy minion reconnection when not alive.
proxy_name The virtual name of the proxy module.

CLI Example:

```
salt '' status.proxy_reconnect rest_sample
```

salt.modules.status.time_(format=%A, %d. %B %Y %I:%M%p)
New in version 2016.3.0.
Return the current time on the minion, formatted based on the format parameter.
Default date format: Monday, 27. July 2015 07:55AM

CLI Example:
salt 'hostname' status.time
salt 'hostname' status.time '%s'

salt.modules.status.uptime()
Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a cmd.run call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:
salt 'hostname' status.uptime

salt.modules.status.version()
Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2016.11.4: Added support for OpenBSD

CLI Example:
salt 'hostname' status.version

salt.modules.status.vmstats()
Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:
salt 'hostname' status.vmstats

salt.modules.status.w()
Return a list of logged in users for this minion, using the w command

CLI Example:
salt 'hostname' status.w

21.9.436 salt.modules.statuspage

StatusPage
Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

21.9. execution modules
salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Insert a new entry under a specific endpoint.

**endpoint: incidents**  Insert under this specific endpoint.
**page_id**  Page ID. Can also be specified in the config file.
**api_key**  API key. Can also be specified in the config file.
**api_version**  1  API version. Can also be specified in the config file.
**api_url**  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_id='993vgplshj12'
```

Example output:

```
minion:
    ----------
    comment:
    out:
    ----------
    created_at:
      2017-01-05T19:35:27.135Z
    description:
      None
    group_id:
      993vgplshj12
    id:
      mjkmtt5lhdgc
    name:

```

salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)

Remove an entry from an endpoint.

**endpoint: incidents**  Request a specific endpoint.
**page_id**  Page ID. Can also be specified in the config file.
**api_key**  API key. Can also be specified in the config file.
**api_version**  1  API version. Can also be specified in the config file.
**api_url**  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='f tgks51sfs2d'
```

Example output:

```
minion:
    ----------
(continues on next page)
```
salt.modules.statuspage.retrieve(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)

Retrieve a specific endpoint from the Statuspage API.

- **endpoint**: incidents  Request a specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

**CLI Example:**

```
salt 'minion' statuspage.retrieve components
```

**Example output:**

```diff

- updated_at:
salt.modules.statuspage.update(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

- **id** (The unique ID of the endpoint entry.)
- **endpoint** (Endpoint name.)
- **page_id** (Page ID. Can also be specified in the config file.)
- **api_key** (API key. Can also be specified in the config file.)
- **api_version** (API version. Can also be specified in the config file.)
- **api_url** (Custom API URL in case the user has a StatusPage service running in a custom environment.)

CLI Example:
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved

Example output:

minion:

21.9.437 salt.modules.supervisord

Provide the service module for system supervisor or supervisord in a virtualenv

salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)
    Activates any updates in config for process/group.
    user user to run supervisorctl as
    conf_file path to supervisord config file
    bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

    salt '*' supervisord.add <name>

salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)
    Run any custom supervisorctl command
    user user to run supervisorctl as
    conf_file path to supervisord config file
    bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
    CLI Example:

    salt '*' supervisord.custom "mstop '*gunicorn*'"

salt.modules.supervisord.options(name, conf_file=None)
    New in version 2014.1.0.
    Read the config file and return the config options for a given process
name  Name of the configured process  
conf_file  path to supervisord config file  

CLI Example:

```
salt '*' supervisord.options foo
```

```
salt.modules.supervisord.remove(name, user=None, conf_file=None, bin_env=None)
```

Removes process/group from active config  
user  user to run supervisorctl as  
conf_file  path to supervisord config file  
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed  

CLI Example:

```
salt '*' supervisord.remove <name>
```

```
salt.modules.supervisord.reread(user=None, conf_file=None, bin_env=None)
```

Reload the daemon's configuration files  
user  user to run supervisorctl as  
conf_file  path to supervisord config file  
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed  

CLI Example:

```
salt '*' supervisord.reread
```

```
salt.modules.supervisord.restart(name='all', user=None, conf_file=None, bin_env=None)
```

Restart the named service. Process group names should not include a trailing asterisk.  
user  user to run supervisorctl as  
conf_file  path to supervisord config file  
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed  

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>: 
```

```
salt.modules.supervisord.start(name='all', user=None, conf_file=None, bin_env=None)
```

Start the named service. Process group names should not include a trailing asterisk.  
user  user to run supervisorctl as  
conf_file  path to supervisord config file  
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed  

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>: 
```

```
salt.modules.supervisord.status(name=None, user=None, conf_file=None, bin_env=None)
```

List programs and its state  
user  user to run supervisorctl as  
conf_file  path to supervisord config file  
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed  

CLI Example:

```
salt '*' supervisord.status
```

```
salt.modules.supervisord.status_bool(name, expected_state=None, user=None, conf_file=None, bin_env=None)
```

Check for status of a specific supervisord process and return boolean result.
name  name of the process to check
expected_state  search for a specific process state. If set to None - any process state will match.
user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_bool nginx expected_state='RUNNING'
```

**salt.modules.supervisord.status_raw**(*name=None, user=None, conf_file=None, bin_env=None*)

Display the raw output of status
user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_raw
```

**salt.modules.supervisord.stop**(*name='all', user=None, conf_file=None, bin_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.
user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

**salt.modules.supervisord.update**(*user=None, conf_file=None, bin_env=None, name=None*)

Reload config and add/remove/update as necessary
user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed
name  name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

### 21.9.438 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

**salt.modules.suse_apache.a2dismod**(*mod*)

Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

**salt.modules.suse_apache.a2enmod**(*mod*)

Runs a2enmod for the given mod.

CLI Example:
salt 'salt '*' apache.a2enmod vhost_alias

salt.modules.suse_apache.check_mod_enabled(mod)
Checks to see if the specific apache mod is enabled.
This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:
salt 'salt '*' apache.check_mod_enabled status

21.9.439 salt.modules.svn
Subversion SCM

salt.modules.svn.add(cwd, targets, user=None, username=None, password=None, *opts)
Add files to be tracked by the Subversion working-copy checkout

cwd The path to the Subversion repository
targets [None] files and directories to pass to the command as arguments
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
salt 'salt '*' svn.add /path/to/repo /path/to/new/file

salt.modules.svn.checkout(cwd, remote, target=None, user=None, username=None, password=None, *opts)
Download a working copy of the remote Subversion repository directory or file

cwd The path to the Subversion repository
remote [None] URL to checkout
target [None] The name to give the file or directory working copy Default: svn uses the remote basename
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
salt 'salt '*' svn.checkout /path/to/repo svn://remote/repo

salt.modules.svn.commit(cwd, targets=None, msg=None, user=None, username=None, password=None, *opts)
Commit the current directory, files, or directories to the remote Subversion repository

cwd The path to the Subversion repository
targets [None] files and directories to pass to the command as arguments Default: svn uses '.'
msg [None] Message to attach to the commit log
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:
salt.modules.svn.diff(cwd, targets=None, user=None, username=None, password=None, *opts)
Return the diff of the current directory, files, or directories from the remote Subversion repository
    cwd  The path to the Subversion repository
    targets [None] files and directories to pass to the command as arguments Default: svn uses ‘.’
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.diff /path/to/repo

salt.modules.svn.export(cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', *opts)
Create an unversioned copy of a tree.
    cwd  The path to the Subversion repository
    remote [None] URL and path to file or directory checkout
    target [None] The name to give the file or directory working copy Default: svn uses the remote basename
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:

    salt '*' svn.export /path/to/repo svn://remote/repo

salt.modules.svn.info(cwd, targets=None, user=None, username=None, password=None, fmt='str')
Display the Subversion information from the checkout.
    cwd  The path to the Subversion repository
    targets [None] files, directories, and URLs to pass to the command as arguments svn uses ‘.’ by default
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    fmt  [str] How to fmt the output from info. (str, xml, list, dict)
    CLI Example:

    salt '*' svn.info /path/to/svn/repo

salt.modules.svn.remove(cwd, targets, msg=None, user=None, username=None, password=None, *opts)
Remove files and directories from the Subversion repository
    cwd  The path to the Subversion repository
    targets [None] files, directories, and URLs to pass to the command as arguments
    msg  [None] Message to attach to the commit log
    user [None] Run svn as a user other than what the minion runs as
    username [None] Connect to the Subversion server as another user
    password [None] Connect to the Subversion server with this password

    New in version 0.17.0.
    CLI Example:
salt '*' svn.remove /path/to/repo /path/to/repo/remove

salt.modules.svn.status(cwd, targets=None, user=None, username=None, password=None, *opts)

Display the status of the current directory, files, or directories in the Subversion repository

cwd  The path to the Subversion repository

targets  [None] files, directories, and URLs to pass to the command as arguments Default: svn uses '.'

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

salt '*' svn.status /path/to/repo

salt.modules.svn.switch(cwd, remote, target=None, user=None, username=None, password=None, *opts)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

cwd  The path to the Subversion repository

remote  [None] URL to switch

target  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

CLI Example:

salt '*' svn.switch /path/to/repo svn://remote/repo

salt.modules.svn.update(cwd, targets=None, user=None, username=None, password=None, *opts)

Update the current directory, files, or directories from the remote Subversion repository

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments Default: svn uses '.'

user  [None] Run svn as a user other than what the minion runs as

password  [None] Connect to the Subversion server with this password

New in version 0.17.0.

username  [None] Connect to the Subversion server as another user

CLI Example:

salt '*' svn.update /path/to/repo

21.9.440 salt.modules.swarm

Docker Swarm Module using Docker’s Python SDK

codeauthor  Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.
## Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

### Docker Python SDK

```
pip install -U docker
```

```python
class swarm.joinswarm(remote_addr=<class 'int'>, listen_addr=<class 'int'>, token=<class 'str'>):
    Join a Swarm Worker to the cluster
    remote_addr The manager node you want to connect to for the swarm
    listen_addr Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)
    token Either the manager join token or the worker join token. You can get the worker or manager token via salt '*' swarm.swarm_tokens
```

CLI Example:
```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0' token='SWMTKN-1-64tux2g0701r84ofq93zppc1h0pe081akq45owe9ts61f30x4t-06trjugdu7x2z47j938s541l'
```

```python
class swarm.leave_swarm(force=<class 'bool'>):
    Force the minion to leave the swarm
    force Will force the minion/worker/manager to leave the swarm
```

CLI Example:
```
salt '*' swarm.leave_swarm force=False
```

```python
class swarm.node_ls(server=<class 'str'>):
    Displays Information about Swarm Nodes with passing in the server
    server The minion/server name
```

CLI Example:
```
salt '*' swarm.node_ls server=minion1
```

```python
class swarm.remove_node(node_id=<class 'str'>, force=<class 'bool'>):
    Remove a node from a swarm and the target needs to be a swarm manager
    node_id The node id from the return of swarm.node_ls
    force Forcefully remove the node/minion from the service
```

CLI Example:
```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

```python
class swarm.remove_service(service=<class 'str'>):
    Remove Swarm Service
    service The name of the service
```

CLI Example:
```
salt '*' swarm.remove_service service=Test_Service
```

21.9. execution modules
salt.modules.swarm.service_create(image=<class 'str'>, name=<class 'str'>, command=<class 'str'>, hostname=<class 'str'>, replicas=<class 'int'>, target_port=<class 'int'>, published_port=<class 'int'>)

Create Docker Swarm Service Create

image  The docker image
name   Is the service name
command The docker command to run in the container at launch
hostname The hostname of the containers
replicas How many replicas you want running in the swarm
target_port The target port on the container
published_port port that's published on the host/os

CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service
      command=None hostname=salthttpd replicas=6 target_port=80 published_port=80
```

salt.modules.swarm.swarm_init(advertise_addr=<class 'str'>, listen_addr=<class 'int'>, force_new_cluster=<class 'bool'>)

Initialize Docker on Minion as a Swarm Manager

advertise_addr The ip of the manager
listen_addr Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567
force_new_cluster Force a new cluster if True is passed

CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0'
      force_new_cluster=False
```

salt.modules.swarm.swarm_service_info(service_name=<class 'str'>)

Swarm Service Information

service_name The name of the service that you want information on about the service

CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```

salt.modules.swarm.swarm_tokens()

Get the Docker Swarm Manager or Worker join tokens

CLI Example:

```
salt '*' swarm.swarm_tokens
```

salt.modules.swarm.update_node(availability=<class 'str'>, node_name=<class 'str'>, role=<class 'str'>, node_id=<class 'str'>, version=<class 'int'>)

Updates docker swarm nodes/needs to target a manager node/minion

availability Drain or Active
node_name minion/node
role role of manager or worker
node_id The Id and that can be obtained via swarm.node_ls
version Is obtained by swarm.node_ls

CLI Example:

```
salt '*' swarm.update_node availability=drain node_name=minion2
      role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```
21.9.441 salt.modules.swift

Module for handling OpenStack Swift calls

Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

depends

- swiftclient Python module

configuration

This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion's config file. For example:

```python
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```python
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.password: verybadpass
# or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.password: verybadpass
# or
  keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```python
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

salt.modules.swift.delete(cont, path=None, profile=None)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```python
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```python
salt myminion swift.delete mycontainer remoteobject
```

salt.modules.swift.get(cont=None, path=None, local_file=None, return_bin=False, profile=None)

List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.
CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

```
salt.modules.swift.head()
```

```
salt.modules.swift.put(cont, path=None, local_file=None, profile=None)
```

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

21.9.442 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

```
salt.modules.sysbench.cpu()
```

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

```
salt.modules.sysbench.fileio()
```

This tests for the file read and write operations. Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size. The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

```
salt.modules.sysbench.memory()
```

This tests the memory for read and write operations.
CLI Examples:

```
salt '*' sysbench.memory
```

```python
salt.modules.sysbench.mutex()

Tests the implementation of mutex
```

CLI Examples:

```
salt '*' sysbench.mutex
```

```python
salt.modules.sysbench.ping()
```

```python
salt.modules.sysbench.threads()

This tests the performance of the processor's scheduler
```

CLI Example:

```
salt '*' sysbench.threads
```

### 21.9.443 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

```python
salt.modules.sysfs.attr(key, value=None)

Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned
```

Returns  value or bool

CLI example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

```python
salt.modules.sysfs.interfaces(root)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.
```

CLI example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
    "r": [
        "state",

Note:
• 'r' interfaces are read-only
• 'w' interfaces are write-only (e.g. actions)
• 'rw' are interfaces that can both be read or written

salt.modules.sysfs.read(key, root='')
Read from SysFS
Parameters
key -- file or path in SysFS; if key is a list then root will be prefixed on each key
Returns
the full (tree of) SysFS attributes under key

CLI example:
salt '* sysfs.read class/net/em1/statistics

salt.modules.sysfs.target(key, full=True)
Return the basename of a SysFS key path
Parameters
• key -- the location to resolve within SysFS
• full -- full path instead of basename
Returns
fullpath or basename of path

CLI example:
salt '* sysfs.read class/ttyS0

salt.modules.sysfs.write(key, value)
Write a SysFS attribute/action

CLI example:
21.9.444 `salt.modules.syslog_ng`

Module for getting information about syslog-ng

```python
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor =~ 'performance'
```

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

```python
class salt.modules.syslog_ng.Argument(value='')
A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.
Does not need examples.
built()
```
class salt.modules.syslog_ng.NamedStatement(type, id='', options=None)
It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

class salt.modules.syslog_ng.Option(type='', params=None)
A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

add_parameter(param)

build()
  Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.Parameter(iterable=None, join_body_on='')
An Option has one or more Parameter instances.

Does not need examples.

class salt.modules.syslog_ng.ParameterValue(iterable=None, join_body_on='')
A TypedParameter can have one or more values.

Does not need examples.

class salt.modules.syslog_ng.SimpleParameter(value='')
A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
  file(
    '/var/log/messages'
  );
};
```

/var/log/messages is a SimpleParameter.

Does not need examples.

build()
  Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.SimpleParameterValue(value='')
A ParameterValuem which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

build()
  Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.Statement(type, id='', options=None, has_name=True)
It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child(option)

build_header()
  Builds the header of a syslog-ng configuration object.
build_tail()

Builds the tail of a syslog-ng configuration object.

definitions

exceptions

Salt Documentation, Release 3002.6

build_tail()

Builds the tail of a syslog-ng configuration object.

exception salt.modules.syslog_ng.SyslogNgError

class salt.modules.syslog_ng.TypedParameter(type='', values=None)

A Parameter, which has a type:

destination d_tcp {
   tcp(
      ip(127.0.0.1)
   );
};

ip(127.0.0.1) is a TypedParameter.

Does not need examples.

add_value(value)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.TypedParameterValue(type='', arguments=None)

We have to go deeper...

A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

destination d_tcp {
   tcp(
      ip(127.0.0.1)
   );
};

ip(127.0.0.1) is a TypedParameter.

Does not need examples.

add_argument(arg)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.UnnamedStatement(type, options=None)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog_ng.config(name, config, write=True)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id
config : the parsed YAML code
write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

salt '*' syslog_ng.config name='s_local' config='{{'tcp':['ip':127.0.0.1},{ 'port':1233}]}}'
salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/\n  → syslog-ng.conf
```

salt.modules.syslog_ng.get_config_file()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.reload_(name)

Reloads syslog-ng. This function is intended to be used from states.

If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

salt.modules.syslog_ng.set_binary_path(name)

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don’t need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

salt.modules.syslog_ng.set_config_file(name)

Sets the configuration’s name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin\n  → config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```
salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persistent_file=None, control=None, worker_threads=None)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If syslog_ng.set_config_file, is called before, this function will use the set binary path.

CLI Example:
```
salt '*' syslog_ng.start
```

salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)

Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:
```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.stop(name=None)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If syslog_ng.set_config_file is called before, this function will use the set binary path.

CLI Example:
```
salt '*' syslog_ng.stop
```

salt.modules.syslog_ng.version(syslog_ng_sbin_dir=None)

Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:
```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.write_config(config, newlines=2)

Writes the given parameter config into the config file. This function is intended to be used from states.

If syslog_ng.set_config_file, is called before, this function will use the set config file.

CLI Example:
```
salt '*' syslog_ng.write_config config='# comment'
```

salt.modules.syslog_ng.write_version(name)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If syslog_ng.set_config_file, is called before, this function will use the set config file.

CLI Example:
```
salt '*' syslog_ng.write_version name="3.6"
```
21.9.445 salt.modules.sysmod

The sys module provides information about the available functions on the minion

```
salt.modules.sysmod.argspec(module='')
```

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.**'
```

```
salt.modules.sysmod.doc('args')
```

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

```
salt.modules.sysmod.list_functions(\'args, **kwargs\')
```

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

```
salt.modules.sysmod.list_modules(\'args\')
```

List the modules loaded on the minion
New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

```
salt.modules.sysmod.list_renderers(*args)
```

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

```
salt.modules.sysmod.list_returner_functions(*args, **kwargs)
```

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

```
salt.modules.sysmod.list_returners(*args)
```

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

```
salt.modules.sysmod.list_runner_functions(*args, **kwargs)
```

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:
Runner function names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

`salt.modules.sysmod.list_runners(*args)`
List the runners loaded on the minion
New in version 2014.7.0.
CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

`salt.modules.sysmod.list_state_functions(*args, **kwargs)`
List the functions for all state modules. Optionally, specify a state module or modules from which to list.
New in version 2014.7.0.
CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.list_state_modules(*args)`
List the modules loaded on the minion
New in version 2014.7.0.
CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.
New in version 2015.5.0.
salt '*' sys.list_state_modules 'mysql_*'

**salt.modules.sysmod.reload_modules()**

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

**salt.modules.sysmod.renderer_doc(***args**)**

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

**salt.modules.sysmod.returner_argspec(**module=**)**

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

**salt.modules.sysmod.returner_doc(***args**)**

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.
salt '*' sys.returner_doc 'sqlite3.get_*'

salt.modules.sysmod.runner_argspec(module='')
Return the argument specification of functions in Salt runner modules.
New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

salt.modules.sysmod.runner_doc(*args)
Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple runners/functions can be specified.
New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

salt.modules.sysmod.state_argspec(module='')
Return the argument specification of functions in Salt state modules.
New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

salt.modules.sysmod.state_doc(*args)
Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.
Multiple states/functions can be specified.
New in version 2014.7.0.
State names can be specified as globs.
New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

```
salt.modules.sysmod.state_schema(module='')
Return a JSON Schema for the given state function(s)
New in version 2016.3.0.
```

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

### 21.9.4.46 salt.modules.sysrc

src module for FreeBSD

```
salt.modules.sysrc.get(**kwargs)
Return system rc configuration variables
```

```
salt '*' sysrc.get includeDefaults=True
```

```
salt.modules.sysrc.remove(name, **kwargs)
Remove system rc configuration variables
```

```
salt '*' sysrc.remove name=sshd_enable
```

```
salt.modules.sysrc.set(name, value, **kwargs)
Set system rc configuration variables
```

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

21.9.447 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

Note: If you have configured a wrapper such as molly-guard to intercept interactive shutdown commands, be aware that calling system.halt, system.poweroff, system.reboot, and system.shutdown with salt-call will hang indefinitely while the wrapper script waits for user input. Calling them with salt will work as expected.

salt.modules.system.get_computer_desc()
Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.
Returns Value of PRETTY_HOSTNAME if this does not exist False.
Return type str

CLI Example:
salt '*' system.get_computer_desc

salt.modules.system.get_computer_name()
Get hostname.

CLI Example:
salt '*' network.get_hostname

salt.modules.system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.
Returns True if the a reboot request was witnessed, False otherwise
Return type bool

CLI Example:
salt '*' system.get_reboot_required_witnessed

salt.modules.system.get_system_date(utc_offset=None)
Get the system date
Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.
Returns Returns the system date.
Return type str

CLI Example:
salt '*' system.get_system_date

salt.modules.system.get_system_date_time(utc_offset=None)
Get the system date/time
Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.
Returns Returns the system time in YYYY-MM-DD hh:mm:ss format.
Return type str

CLI Example:
salt.modules.system.get_system_time(utc_offset=None)

Get the system time.

Parameters
utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns
Returns the system time in HH:MM:SS AM/PM format.

Return type str

CLI Example:
salt '*' system.get_system_time

salt.modules.system.halt()

Halt a running system

CLI Example:
salt '*' system.halt

salt.modules.system.has_settable_hwclock()

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:
salt '*' system.has_settable_hwclock

salt.modules.system.init(runlevel)

Change the system runlevel on sysV compatible systems

CLI Example:
salt '*' system.init 3

salt.modules.system.poweroff()

Poweroff a running system

CLI Example:
salt '*' system.poweroff

salt.modules.system.reboot(at_time=None)

Reboot the system

at_time  The wait time in minutes before the system will be rebooted.

CLI Example:
salt '*' system.reboot

salt.modules.system.set_computer_desc(desc)

Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

Parameters
desc (str) -- The computer description

Returns
False on failure. True if successful.

CLI Example:
salt '*' system.set_computer_desc "Michael's laptop"
salt.modules.system.set_computer_name(hostname)

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

salt.modules.system.set_reboot_required_witnessed()

This function is used to remember that an event indicating that a reboot is required was witnessed. This
function writes to a temporary filesystem so the event gets cleared upon reboot.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

salt.modules.system.set_system_date(newdate, utc_offset=None)

Set the system date. Use <mm-dd-yy> format for the date.

Parameters

- **newdate** *(str)* -- The date to set. Can be any of the following formats:
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-Y
  - MM/DD/YYYY
  - MM/DD/Y
  - YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not
passed, the current system value for that element will be used. For example, if you don't pass the year, the
current system year will be used. (Used by set_system_date and set_system_time)

Updates hardware clock, if present, in addition to software (kernel) clock.

Parameters

- **years** *(int)* -- Years digit, ie: 2015
- **months** *(int)* -- Months digit: 1 - 12
- **days** *(int)* -- Days digit: 1 - 31
- **hours** *(int)* -- Hours digit: 0 - 23
- **minutes** *(int)* -- Minutes digit: 0 - 59
- **seconds** *(int)* -- Seconds digit: 0 - 59
- **utc_offset** *(str)* -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'-0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns True if successful. Otherwise False.

Return type bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 '-0500'
```

salt.modules.system.set_system_time(newtime, utc_offset=None)

Set the system time.

Parameters
• **newtime** *(str)* -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

    Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

• **utc_offset** *(str)* -- The utc offset in 4 digit (+0600) format with an optional sign (+/)-. Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

    **Returns** Returns True if successful. Otherwise False.
    **Return type** bool

    CLI Example:

    ```
    salt '*' system.set_system_time '{11:20}'
    ```

salt.modules.system.shutdown*(at_time=)None)*

    Shutdown a running system
    **at_time** The wait time in minutes before the system will be shutdown.

    CLI Example:

    ```
    salt '*' system.shutdown 5
    ```

21.9.448 salt.modules.system_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

salt.modules.system_profiler.applications()

    Return the results of a call to system_profiler -xml -detail full SPApplicationsDataType as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

    Note that this can take a long time depending on how many applications are installed on the target Mac.

    CLI Example:

    ```
    salt '*' systemprofiler.applications
    ```

salt.modules.system_profiler.receipts()

    Return the results of a call to system_profiler -xml -detail full SPInstallHistoryDataType as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

    CLI Example:

    ```
    salt '*' systemprofiler.receipts
    ```

21.9. execution modules
21.9.449 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start is not available'), see [here](#).

**Important:** This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

salt.modules.systemd_service.available(name)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd_service.disable(name, no_block=False, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Disable the named service to not start when the system boots

**no_block** [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd_service.disabled(name, root=None)

Return if the named service is disabled from starting on boot

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.systemd_service.enable(name, no_block=False, unmask=False, unmask_runtime=False, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Enable the named service to start when the system boots

**no_block** [False] Set to True to start the service using --no-block.

New in version 2017.7.0.
unmask  [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime  [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

root  Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.systemd_service.enabled(name, root=None, **kwargs)

Return if the named service is enabled to start on boot

root  Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.systemd_service.excs(root=None)

New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

root  Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.excs
```

salt.modules.systemd_service.firstboot(locale=None, locale_message=None, keymap=None, timezone=None, hostname=None, machine_id=None, root=None)

New in version TBD.

Call systemd-firstboot to configure basic settings of the system

locale  Set primary locale (LANG=)

locale_message  Set message locale (LC_MESSAGES=)

keymap  Set keymap

timezone  Set timezone

hostname  Set host name

machine_id  Set machine ID

root  Operate on an alternative filesystem root

CLI Example:

```
salt '*' service.firstboot keymap=jp locale=en_US.UTF-8
```

salt.modules.systemd_service.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block  [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask  [False] Set to True to remove an indefinite mask before attempting to force-reload the service.
New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

**unmask_runtime**  [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

**salt.modules.systemd_service.get_all** *(root=None)*

Return a list of all available services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.systemd_service.get_disabled** *(root=None)*

Return a list of all disabled services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.systemd_service.get_enabled** *(root=None)*

Return a list of all enabled services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.systemd_service.get_running()**

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

**salt.modules.systemd_service.get_static** *(root=None)*

New in version 2015.8.5.

Return a list of all static services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_static
```

**salt.modules.systemd_service.mask** *(name, runtime=False, root=None)*

New in version 2015.5.0.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, **systemd-run(1)** is now used to isolate commands run by this function from the **salt-minion** daemon's control group. This is done to avoid a race condition in cases where the **salt-minion** service is restarted while a service is being modified. If desired, usage of **systemd-run(1)** can be suppressed by setting a **config option** called **systemd.scope**, with a value of **False** (no quotes).

Mask the specified service with systemd
**runtime** [False] Set to True to mask this service only until the next reboot

New in version 2015.8.5.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

salt.modules.systemd_service.masked(name, runtime=False, root=None)

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then False will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new runtime argument is set. If runtime is False, this function will return True if an indefinite mask is set for the named service (otherwise False will be returned). If runtime is False, this function will return True if a runtime mask is set, otherwise False.

Check whether or not a service is masked

**runtime** [False] Set to True to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to True. Otherwise, it will check for an indefinite mask.

**root** Enable/disable/mask unit files in the specified root directory

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

salt.modules.systemd_service.missing(name)

New in version 2014.1.0.

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Reload the specified service with systemd

**no_block** [False] Set to True to reload the service using --no-block.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to reload the service.
New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

**unmask_runtime** [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.systemd_service.restart

```python
salt.modules.systemd_service.restart(name, no_block=False, unmask=False, unmask_runtime=False)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Restart the specified service with systemd

**no_block** [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

**unmask_runtime** [False] Set to True to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.systemd_service.show

```python
salt.modules.systemd_service.show(name, root=None)
```

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.systemd_service.start

```python
salt.modules.systemd_service.start(name, no_block=False, unmask=False, unmask_runtime=False)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Start the specified service with systemd

**no_block** [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

**unmask** [False] Set to True to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

**unmask_runtime** [False] Set to True to remove a runtime mask before attempting to start the service.
New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.systemd_service.status(name, sig=None)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- `name` (str) -- The name of the service to check
- `sig` (str) -- Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
```
salt '*' service.status <service name> [service signature]
```

salt.modules.systemd_service.stop(name, no_block=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Stop the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

CLI Example:
```
salt '*' service.stop <service name>
```

salt.modules.systemd_service.systemctl_reload()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:
```
salt '*' service.systemctl_reload
```

salt.modules.systemd_service.unmask_(name, runtime=False, root=None)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Unmask the specified service with systemd

runtime [False] Set to True to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running systemctl is-enabled on the service. However, since it is possible to both have
both indefinite and runtime masks on a service simultaneously, this function now removes a runtime
mask only when this argument is set to True, and otherwise removes an indefinite mask.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

### 21.9.450 salt.modules.telegram

Module for sending messages via Telegram.

**configuration** In order to send a message via the Telegram, certain configuration is required in
/etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```
telemetry.chat_id: '123456789'
telemetry.token: '00000000-xxxxxxxxxxxxxxxxxxxxx'
```

**salt.modules.telegram.post_message** *(message, chat_id=None, token=None)*

Send a message to a Telegram chat.

**Parameters**

- `message` -- The message to send to the Telegram chat.
- `chat_id` -- (optional) The Telegram chat id.
- `token` -- (optional) The Telegram API token.

**Returns** Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

### 21.9.451 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

**configuration** This module accepts explicit telemetry credentials or can also read api key credentials

In the minion's config file:

```
telemetry.telemetry_api_keys:
- abc123  # Key 1
- efg321  # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

**depends** requests

**salt.modules.telemetry.create_alarm** *(deployment_id, metric_name, data, api_key=None, pro-
file='telemetry')*

create an telemetry alarms.

data is a dict of alert configuration data.

**Returns** (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry

salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None, api_key=None, profile='telemetry')
def delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.
Returns (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')
get all the alarms set up against the current deployment
Returns dictionary of alarm information

CLI Example:
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None, profile='telemetry')
Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config
Returns dictionary or list of dictionaries.

CLI Example:
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry
salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry

salt.modules.telemetry.get_notification_channel_id(notify_channel, profile='telemetry')
Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

notify_channel Email escalation policy
profile A dict of telemetry config information.

CLI Example:
salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry

salt.modules.telemetry.update_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
update an telemetry alarms. data is a dict of alert configuration data.
Returns (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry

21.9.452 salt.modules.temp

Simple module for creating temporary directories and files
This is a thin wrapper around Pythons tempfile module
New in version 2015.8.0.
salt.modules.temp.dir(suffix='', prefix='tmp', parent=None)
Create a temporary directory

CLI Example:
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
salt.modules.temp.file(suffix='', prefix='tmp', parent=None)
Create a temporary file

CLI Example:
```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent=':/var/run/
```

### 21.9.453 salt.modules.test

Module for running arbitrary tests

salt.modules.test.arg(*args, **kwargs)
Print out the data passed into the function *args and **kwargs, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {"args": args, "kwargs": kwargs}.

CLI Example:
```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='a: 1, b: "hello")'
```

salt.modules.test.arg_clean(*args, **kwargs)
Like test.arg but cleans kwargs of the __pub* items CLI Example:
```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='a: 1, b: "hello")'
```

salt.modules.test.arg_repr(*args, **kwargs)
Print out the data passed into the function *args and **kwargs, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {"args": repr(args), "kwargs": repr(kwargs)}.

CLI Example:
```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='a: 1, b: "hello")'
```

salt.modules.test.arg_type(*args, **kwargs)
Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the minion

CLI Example:
```
salt '*' test.arg_type 1 'int'
```

salt.modules.test.assertion(assertion)
Assert the given argument

CLI Example:
```
salt '*' test.assertion False
```

salt.modules.test.attr_call()
Call grains.items via the attribute

CLI Example:
```
salt '*' test.attr_call
```
salt.modules.test.collatz(start)
Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:
```
salt '*' test.collatz 3
```

salt.modules.test.conf_test()
Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:
```
salt '*' test.conf_test
```

salt.modules.test.cross_test(func, args=None)
Execute a minion function via the __salt__ object in the test module, used to verify that the minion functions can be called via the __salt__ module.

CLI Example:
```
salt '*' test.cross_test file.gid_to_group 0
```

salt.modules.test.echo(text)
Return a string - used for testing the connection

CLI Example:
```
salt '*' test.echo 'foo bar baz quo qux'
```

salt.modules.test.exception(message='Test Exception')
Raise an exception
Optionally provide an error message or output the full stack.

CLI Example:
```
salt '*' test.exception 'Oh noes!'
```

salt.modules.test.false_()
Always return False

CLI Example:
```
salt '*' test.false
```

salt.modules.test.fib(num)
Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.
This function is designed to have terrible performance.

CLI Example:
```
salt '*' test.fib 3
```

salt.modules.test.get_opts()
Return the configuration options passed to this minion

CLI Example:
salt 'test.get_opts

salt.modules.test.kwarg("**kwargs")
Print out the data passed into the function **kwargs, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:
salt 'test.kwarg num=1 txt="two" env='a: 1, b: "hello"'

salt.modules.test.missing_func()

salt.modules.test.module_report()
Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:
salt 'test.module_report

salt.modules.test.not_loaded()
List the modules that were not loaded by the salt loader system

CLI Example:
salt 'test.not_loaded

salt.modules.test.opts_pkg()
Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:
salt 'test.opts_pkg

salt.modules.test.outputter(data)
Test the outputter, pass in data to return

CLI Example:
salt 'test.outputter foobar

salt.modules.test.ping()
Used to make sure the minion is up and responding. Not an ICMP ping.
Returns True.

CLI Example:
salt 'test.ping

salt.modules.test.provider(module)
Pass in a function name to discover what provider is being used

CLI Example:
salt 'test.provider service

salt.modules.test.providers()
Return a dict of the provider names and the files that provided them
CLI Example:

```shell
salt '*' test.providers
```

salt.modules.test.raise_exception(name, *args, **kwargs)
Raise an exception. Built-in exceptions and those in salt.exceptions can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return False.

This function is designed to test Salt's exception and return code handling.

CLI Example:

```shell
salt '*' test.raise_exception TypeError "An integer is required"
salt '*' test.raise_exception salt.exceptions.CommandExecutionError "Something went wrong"
```

salt.modules.test.rand_sleep(max=60)
Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```shell
salt '*' test.rand_sleep 60
```

salt.modules.test.random_hash(size=9999999999, hash_type=None)
New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from test.rand_str to test.random_hash

Generates a random number between 1 and size, then returns a hash of that number. If no hash_type is passed, the hash_type specified by the minion's hash_type config option is used.

CLI Example:

```shell
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512
```

salt.modules.test.retcode(code=42)
Test that the returncode system is functioning correctly

CLI Example:

```shell
salt '*' test.retcode 42
```

salt.modules.test.sleep(length)
Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```shell
salt '*' test.sleep 20
```

salt.modules.test.stack()
Return the current stack trace

CLI Example:

```shell
salt '*' test.stack
```

salt.modules.test.true_()
Always return True
salt.modules.test.try_(module, return_try_exception=False, **kwargs)
Try to run a module command. On an exception return None. If return_try_exception is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:

```yaml
{% for i in range(0,230) %}
    {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.\'\'\'+i) | yaml(False) }}
{% endfor %}
```

salt.modules.test.tty(*args, **kwargs)
Deprecated! Moved to cmdmod.

CLI Example:

```yaml
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.version()
Return the version of salt on the minion

CLI Example:

```yaml
salt '*' test.version
```

salt.modules.test.versions()
This function is an alias of versions_report.
Returns versions of components used by salt

CLI Example:

```yaml
salt '*' test.versions_report
```

salt.modules.test.versions_information()
Report the versions of dependent and system software

CLI Example:

```yaml
salt '*' test.versions_information
```

salt.modules.test.versions_report()
Returns versions of components used by salt

CLI Example:

```yaml
salt '*' test.versions_report
```
21.9.454 salt.modules.test_virtual

Module for running arbitrary tests with a __virtual__ function

```
salt.modules.test_virtual.ping()
```

21.9.455 salt.modules.testinframod module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the __all__ variable exposed by the testinfra.modules namespace.

21.9.456 salt.modules.textfsm_mod module

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

```
depends
  - textfsm Python library
```

**Note:** For Python 2/3 compatibility, it is more recommended to install the jtextfsm library: pip install jtextfsm.

```
salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')
```

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

- **template_path** The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:
  - **salt:**//, to fetch the template from the Salt fileserver.
  - http:// or https://
  - ftp://
  - s3://
  - swift://

- **raw_text:** None The unstructured text to be parsed.

- **raw_text_file:** None Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the template_path argument.

- **saltenv:** base Salt fileserver environment from which to retrieve the file. Ignored if template_path is not a salt:// URL.

**CLI Example:**

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
  →file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_
  →text='Hostname: router.abc ... snip ...'
```

Jinja template example:
Raw text example:

Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]

TextFSM Example:

Value Chassis ($+)
Value Required Model ($+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*)

Start
# Support multiple chassis systems.
^\S+$$ -> Continue.Record
^[Chassis]:$$
^Model: ${Model}
^JUNOS Base OS boot \[${Boot}\]
^JUNOS Software Release \[${Base}\]
^JUNOS Base OS Software Suite \[${Base}\]
^JUNOS Kernel Software Suite \[${Kernel}\]
^JUNOS Crypto Software Suite \[${Crypto}\]
^JUNOS Online Documentation \[${Documentation}\]
^JUNOS Routing Software Suite \[${Routing}\]

Output example:

```json
{
    "comment": "",
    "result": true,
    "out": [
    {
        "kernel": "9.1S3.5",
        "documentation": "9.1S3.5",
        "boot": "9.1S3.5",
        "crypto": "9.1S3.5",
        "chassis": "",
        "routing": "9.1S3.5",
        "base": "9.1S3.5",
        "model": "mx960"
    }
}
```
salt.modules.textfsm_mod.index(command, platform=None, platform_grain_name=None, platform_column_name=None, output=None, output_file=None, textfsm_path=None, index_file=None, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `execute` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

- **command**  The command executed on the device, to get the output.
- **platform**  The platform name, as defined in the TextFSM index file.

**Note:** For ease of use, it is recommended to define the TextFSM index file with values that can be matched using the grains.

- **platform_grain_name**  The name of the grain used to identify the platform name in the TextFSM index file.

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

**Note:** This option is ignored when `platform` is specified.

- **platform_column_name**  The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

**Note:** This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

- **output**  The raw output from the device, to be parsed and extract the structured data.
- **output_file**  The path to a file that contains the raw output from the device, used to extract the structured data.

- **textfsm_path**  The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

**Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

- **index_file**  The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

21.9. execution modules 2773
Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

**saltenv**: `base` Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a salt:// URL.

**include_empty**: `False` Include empty files under the `textfsm_path`.

**include_pat** Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

**exclude_pat** Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/
  →juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
  →example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
  →example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor
  →platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```

| Template, Hostname, Vendor, Command | .*, Juniper, sh[[ow]] ve[[rsion]] |

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usage inside a Jinja template:

```
{% set command = 'sh ver' %}
{% set output = salt.net.cli(command) %}
{% set textfsm_extract = salt.textfsm.index(command, output=output) %}
```
21.9.457 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

salt.modules.timezone.get_hwclock()
Get current hardware clock setting (UTC or localtime)

   CLI Example:
   ```
salt '*' timezone.get_hwclock
   ```

salt.modules.timezone.get_offset()
Get current numeric timezone offset from UCT (i.e. -0700)

   CLI Example:
   ```
salt '*' timezone.get_offset
   ```

salt.modules.timezone.get_zone()
Get current timezone (i.e. America/Denver)

   Changed in version 2016.11.4.

   Note: On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

   CLI Example:
   ```
salt '*' timezone.get_zone
   ```

salt.modules.timezone.get_zonecode()
Get current timezone (i.e. PST, MDT, etc)

   CLI Example:
   ```
salt '*' timezone.get_zonecode
   ```

salt.modules.timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

   CLI Example:
   ```
salt '*' timezone.set_hwclock UTC
   ```

salt.modules.timezone.set_zone(timezone)
Unlinks, then symlinks /etc/localtime to the set timezone.

   The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

   CLI Example:
   ```
salt '*' timezone.set_zone 'America/Denver'
   ```

   Changed in version 2016.11.4.

   Note: On AIX operating systems, Posix values are also allowed, see below
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

salt.modules.timezone.zone_compare(timezone)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-link operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:
salt '*' timezone.zone_compare 'America/Denver'

21.9.458 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

configuration Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki`
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little

Created Private Key: '/etc/pki/my_little/my_little_ca_cert.key'
Created CA "my_little_ca": '/etc/pki/my_little_ca/my_little_ca_cert.crt'

# salt-call tls.create_csr my_little CN=www.example.com

Created Private Key: '/etc/pki/my_little/certs/www.example.com.key
Created CSR for "www.example.com": '/etc/pki/my_little/certs/www.example.com.csr'

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com

Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.crt`
```

CLI Example #2: Creating a client request and its signed certificate

```

```
CLI Example #3: Creating both a server and client req + cert for the same CN

```python
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key.";
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr.";

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists
  (doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_server.key.";
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_server.csr.";

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists
  (DOH!)
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```python
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_client.key.";
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_\n    server.csr.";

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing \
    cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_\n    completely_different.crt
```

```
salt.modules.tls.ca_exists(ca_name, cacert_path=None, ca_filename=None)
Verify whether a Certificate Authority (CA) already exists
ca_name name of the CA
cacert_path absolute path to ca certificates root directory
```
ca_filename  alternative filename for the CA

    New in version 2015.5.3.
    CLI Example:

    salt '*' tls.ca_exists test_ca /etc/certs

salt.modules.tls.cert_base_path(cacert_path=None)
    Return the base path for certs from CLI or from options
    cacert_path  absolute path to ca certificates root directory
    CLI Example:

    salt '*' tls.cert_base_path

salt.modules.tls.cert_info(cert, digest='sha256')
    Return information for a particular certificate
    cert  path to the certificate PEM file or string
    
        Changed in version 2018.3.4.
    digest  what digest to use for fingerprinting
    CLI Example:

    salt '*' tls.cert_info /dir/for/certs/cert.pem

salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fix-mode=False, cacert_path=None, ca_filename=None, digest='sha256', onlyif=None, unless=None, replace=False)
    Create a Certificate Authority (CA)
    ca_name  name of the CA
    bits  number of RSA key bits, default is 2048
    days  number of days the CA will be valid, default is 365
    CN  common name in the request, default is "localhost"
    C  country, default is "US"
    ST  state, default is "Utah"
    L  locality, default is "Centerville", the city where SaltStack originated
    O  organization, default is "SaltStack"
    OU  organizational unit, default is None
    emailAddress  email address for the CA owner, default is None
    cacert_path  absolute path to ca certificates root directory
    ca_filename  alternative filename for the CA
    
        New in version 2015.5.3.
    digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL
        (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
    replace  Replace this certificate even if it exists
    
        New in version 2015.5.1.
    Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns
    assuming the CA certificate already exists.
    If the following values were set:

    ca.cert_base_path='/etc/pki'
    ca_name='koji'

    the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key

CLI Example:

salt '*' tls.create_ca test_ca

```
salt.modules.tls.create_ca_signed_cert(
    ca_name, CN, days=365, cacert_path=None, 
    ca_filename=None, cert_path=None, 
    cert_filename=None, digest='sha256', cert_type=None, 
    type_ext=False, replace=False)
```

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN **must** match an existing CSR generated by create_csr. If it does not, this method does nothing.

- **ca_name** name of the CA
- **CN** common name matching the certificate signing request
- **days** number of days certificate is valid, default is 365 (1 year)
- **cacert_path** absolute path to ca certificates root directory
- **ca_filename** alternative filename for the CA
- **cert_path** full path to the certificates directory
- **cert_filename** alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of cert_type. type_ext will be completely overridden.
- **digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
- **replace** Replace this certificate even if it exists
- **cert_type** string. Either 'server' or 'client' (see create_csr() for details).
  
  If create_csr(type_ext=True) this function **must** be called with the same cert_type so it can find the CSR file.

**Note:** create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

- **type_ext** bool. If set True, use cert_type as an extension to the CN when formatting the filename.
  
  e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt
  
  This facilitates the context where both types are required for the same subject
  
  If cert_filename is not None, setting type_ext has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:
CLI Example:

```bash
cat '*'
tls.create_ca_signed_cert test localhost
```

salt.modules.tls.create_csr(
    ca_name,  # name of the CA
    bits=2048,  # number of RSA key bits, default is 2048
    CN='localhost',  # common name in the request, default is "localhost"
    C='US',  # country, default is "US"
    ST='Utah',  # state, default is "Utah"
    L='Salt Lake City',  # locality, default is "Centerville", the city where SaltStack originated
    O='SaltStack',  # organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
    OU=None,  # organizational unit, default is None
    emailAddress=None,  # email address for the request, default is None
    subjectAltName=None,  # valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with
    emailAddress='me@i.like.pie.com',  # this value:
    cacert_path=None,  # certificate path
    ca_filename=None,  # certificate filename
    csr_path=None,  # certificate path
    csr_filename=None,  # certificate filename
    digest='sha256',  # digest
    type_ext=False,  # extend the filename
    cert_type='server',  # server or client
    replace=False
)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

- **ca_name** name of the CA
- **bits** number of RSA key bits, default is 2048
- **CN** common name in the request, default is "localhost"
- **C** country, default is "US"
- **ST** state, default is "Utah"
- **L** locality, default is "Centerville", the city where SaltStack originated
- **O** organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
- **OU** organizational unit, default is None
- **emailAddress** email address for the request, default is None
- **subjectAltName** valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with
  example: `['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']`

New in version 2015.8.0.

- **cert_type** Specify the general certificate type. Can be either server or client. Indicates the set of common extensions added to the CSR.

  ```
  server: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'serverAuth',
    'keyUsage': 'digitalSignature, keyEncipherment'
  }

  client: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'clientAuth',
    'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
  }
  ```

- **type_ext** boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

  The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved

- **replace** Replace this signing request even if it exists

New in version 2015.5.1.
Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```python
certi_base_path='/etc/pki'
c_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location with appropriate permissions:

```bash
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

```python
salt.modules.tls.create_empty_crl(ca_name, cacert_path=None, ca_filename=None,
crl_file=None, digest='sha256')
```

Create an empty Certificate Revocation List.

New in version 2015.8.0.

- **ca_name** name of the CA
- **cacert_path** absolute path to ca certificates root directory
- **ca_filename** alternative filename for the CA

New in version 2015.5.3.

- **crl_file** full path to the CRL file
- **digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'
               crl_file='/etc/openvpn/team1/crl.pem'
```

```python
salt.modules.tls.create_pkcs12(ca_name, CN, passphrase='', cacert_path=None, replace=False)
```

Create a PKCS#12 browser certificate for a particular Certificate (CN)

- **ca_name** name of the CA
- **CN** common name matching the certificate signing request
- **passphrase** used to unlock the PKCS#12 certificate when loaded into the browser
- **cacert_path** absolute path to ca certificates root directory
- **replace** Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```python
certi_base_path='/etc/pki'
c_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```
salt '*' tls.create_pkcs12 test localhost

salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, cacert_path=None, cert_filename=None, digest='sha256', replace=False)

Create a Self-Signed Certificate (CERT)

- **tls_dir** location appended to the ca.cert_base_path, default is 'tls'
- **bits** number of RSA key bits, default is 2048
- **CN** common name in the request, default is "localhost"
- **C** country, default is "US"
- **ST** state, default is "Utah"
- **L** locality, default is "Centerville", the city where SaltStack originated
- **O** organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised
- **OU** organizational unit, default is None
- **emailAddress** email address for the request, default is None
- **cacert_path** absolute path to ca certificates root directory
- **digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
- **replace** Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)

Get the certificate path or content

- **ca_name** name of the CA
- **as_text** if true, return the certificate content instead of the path
- **cacert_path** absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca_test_ca as_text=False cacert_path=/etc/certs
```

salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)

Get the certificate path or content
**salt.modules.tls.get_ca_signed_cert**

Get the certificate path or content

- **ca_name**: name of the CA
- **CN**: common name of the certificate
- **as_text**: if true, return the certificate content instead of the path
- **cacert_path**: absolute path to certificates root directory
- **cert_filename**: alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```bash
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/etc/certs
```

**salt.modules.tls.get_ca_signed_key**

Get the certificate path or content

- **ca_name**: name of the CA
- **CN**: common name of the certificate
- **as_text**: if true, return the certificate content instead of the path
- **cacert_path**: absolute path to certificates root directory
- **key_filename**: alternative filename for the key, useful when using special characters

New in version 2015.5.3.

CLI Example:

```bash
salt '*' tls.get_ca_signed_key test_ca CN=localhost as_text=False cacert_path=/etc/certs
```

**salt.modules.tls.get_expiration_date**

Get a certificate's expiration date

- **cert**: Full path to the certificate
- **date_format**: By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.

CLI Examples:

```bash
salt '*' tls.get_expiration_date /path/to/foo.crt
dsalt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'
```

**salt.modules.tls.get_extensions**

Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.

New in version 2015.8.0.

- **cert_type**: The type of certificate such as server or client.

CLI Example:

```bash
salt '*' tls.get_extensions client
```

**salt.modules.tls.maybe_fix_ssl_version**

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

- **ca_name**: ca authority name
- **cacert_path**: absolute path to ca certificates root directory
- **ca_filename**: alternative filename for the CA

New in version 2015.5.3.
**CLI Example:**

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

salt.modules.tls.revoke_cert(ca_name, CN, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, crl_file=None, digest='sha256')

Revoke a certificate.

New in version 2015.8.0.

- **ca_name** Name of the CA.
- **CN** Common name matching the certificate signing request.
- **cacert_path** Absolute path to ca certificates root directory.
- **ca_filename** Alternative filename for the CA.
- **cert_path** Path to the cert file.
- **cert_filename** Alternative filename for the certificate, useful when using special characters in the CN.
- **crl_file** Full path to the CRL file.
- **digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

**CLI Example:**

```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca' →
crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.set_ca_path(cacert_path)

If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations

**CLI Example:**

```
salt '*' tls.set_ca_path /etc/certs
```

salt.modules.tls.validate(cert, ca_name, crl_file)

New in version Neon.

Validate a certificate against a given CA/CRL.

- **cert** path to the certificate PEM file or string
- **ca_name** name of the CA
- **crl_file** full path to the CRL file

## 21.9.459 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won’t work.

**configuration**

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:
tomcat-manager:
  user: <username>
  passwd: <password>

or the old format:

tomcat-manager.user: <username>
tomcat-manager.passwd: <password>

Also configure a user in the conf/tomcat-users.xml file:

```xml
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:

- if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:
  
  JVM Vendor: Sun Microsystems Inc.
  JVM Version: 1.6.0_43-b01
  OS Architecture: amd64
  OS Name: Linux
  OS Version: 2.6.32-358.el6.x86_64
  Tomcat Version: Apache Tomcat/7.0.37

salt.modules.tomcat.deploy_war(
  war, context, force='no', url='http://localhost:8080/manager',
  saltenv='base', timeout=180, temp_war_location=None, version=True)

Deploy a WAR file

- `war` absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function
- `context` the context path to deploy
- `force` [False] set True to deploy the webapp even one is deployed in the context
- `url` [http://localhost:8080/manager] the URL of the server manager webapp
- `saltenv` [base] the environment for WAR file in used by salt.modules.cp.get_url function
- `timeout` [180] timeout for HTTP request
- `temp_war_location` [None] use another location to temporarily copy to war file by default the system's temp directory is used
- `version` ["] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

CLI Examples:

```bash
cp module
cp module
```

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
```

salt.modules.tomcat.extract_war_version(war)

```
Extract the version from the war file name. There does not seem to be a standard for encoding the version into
the war file name

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

salt.modules.tomcat.fullversion()

```
Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)

```
Find memory leaks in tomcat
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)

```
list all the deployed webapps
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

salt.modules.tomcat.passwd(passwd, user='', alg='sha1', realm=None)

```
This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the
$CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```
```
salt '*' tomcat.passwd secret
tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'

salt.modules.tomcat.reload_(app, url='http://localhost:8080/manager', timeout=180)
  Reload the webapp
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request
  CLI Examples:
salt '*' tomcat.reload /jenkins
  salt '*' tomcat.reload /jenkins http://localhost:8080/manager

salt.modules.tomcat.serverinfo(url='http://localhost:8080/manager', timeout=180)
  return details about the server
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request
  CLI Examples:
salt '*' tomcat.serverinfo
  salt '*' tomcat.serverinfo http://localhost:8080/manager

salt.modules.tomcat.sessions(app, url='http://localhost:8080/manager', timeout=180)
  return the status of the webapp sessions
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request
  CLI Examples:
salt '*' tomcat.sessions /jenkins
  salt '*' tomcat.sessions /jenkins http://localhost:8080/manager

salt.modules.tomcat.signal(signal=None)
  Signals catalina to start, stop, securestart, forcestop.
  CLI Example:
salt '*' tomcat.signal start

salt.modules.tomcat.start(app, url='http://localhost:8080/manager', timeout=180)
  Start the webapp
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout timeout for HTTP request
  CLI Examples:
salt '*' tomcat.start /jenkins
  salt '*' tomcat.start /jenkins http://localhost:8080/manager

salt.modules.tomcat.status(url='http://localhost:8080/manager', timeout=180)
  Used to test if the tomcat manager is up
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request
  CLI Examples:
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager

salt.modules.tomcat.status_webapp(app, url='http://localhost:8080/manager', timeout=180)
return the status of the webapp (stopped | running | missing)
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager

salt.modules.tomcat.stop(app, url='http://localhost:8080/manager', timeout=180)
Stop the webapp
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager

salt.modules.tomcat.undeploy(app, url='http://localhost:8080/manager', timeout=180)
Undeploy a webapp
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager

salt.modules.tomcat.version()
Return server version from catalina.sh version

CLI Example:
salt '*' tomcat.version

21.9.460 salt.modules.trafficserver

Apache Traffic Server execution module.
New in version 2015.8.0.
traffic_ctl is used to execute individual Traffic Server commands and to script multiple commands in a shell.
salt.modules.trafficserver.alarms()
List all alarm events that have not been acknowledged (cleared).
salt '*' trafficserver.alarms

salt.modules.trafficserver.bounce_cluster()
**salt.modules.trafficserver.bounce_local**(drain=False)

**drain**
This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

**salt.modules.trafficserver.clear_alarms**(alarm)

Clear (acknowledge) an alarm event. The arguments are "all" for all current alarms, a specific alarm number (e.g. "1"), or an alarm string identifier (e.g. "MGMT_ALARM_PROXY_CONFIG_ERROR").

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

**salt.modules.trafficserver.clear_cluster()**

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

**salt.modules.trafficserver.clear_node()**

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

**salt.modules.trafficserver.match_config**(regex)

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

**salt.modules.trafficserver.match_metric**(regex)

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

**salt.modules.trafficserver.offline**(path)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```
salt '*' trafficserver.offline /path/to/cache
```

**salt.modules.trafficserver.read_config**(args)

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```
**salt.modules.trafficserver.**

**read_metric**(*args*)

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

**trafficserver.**

**refresh**()

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
salt '*' trafficserver.refresh
```

**restart_cluster**()

Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

**restart_local**(drain=False)

Restart the traffic_manager and traffic_server processes on the local node.

drain This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

**set_config**(variable, value)

Set the value of a Traffic Server configuration variable.

variable Name of a Traffic Server configuration variable.

value The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

**shutdown**()

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

**startup**()

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

**status**()

Show the current proxy server status, indicating if we’re running or not.

```
salt '*' trafficserver.status
```

**zero_cluster**()

Reset performance statistics to zero across the cluster.
```
salt '*' trafficserver.zero_cluster
```

salt.modules.trafficserver.zero_node()
Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

### 21.9.461 salt.modules.travisci

Commands for working with travisci.

**depends** pyOpenSSL >= 16.0.0

salt.modules.travisci.verify_webhook(signature, body)
Verify the webhook signature from travisci

- **signature** The signature header from the webhook header
- **body** The full payload body from the webhook post

**Note:** The body needs to be the urlencoded version of the body.

```
salt '*' travisci.verify_webhook 'M6NucCX5722bx1sQs7e...' 'payload=%7B%22repository...'
```

### 21.9.462 salt.modules.tuned

Interface to Red Hat tuned-adm module

- **maintainer** Syed Ali <alicsyed@gmail.com>
- **maturity** new
- **depends** tuned-adm
- **platform** Linux

salt.modules.tuned.active()
Return current active profile

```
salt '*' tuned.active
```

salt.modules.tuned.list()
List the profiles available

```
salt '*' tuned.list
```

salt.modules.tuned.off()
Turn off all profiles

```
salt '*' tuned.off
```
21.9.463 salt.modules.twilio_notify

Module for notifications via Twilio
New in version 2014.7.0.

depends

- twilio python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with pillar_opts set to True).

For example:

```
my-twilio-account:
  twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
  twilio.auth_token: mytoken
```

salt.modules.twilio_notify.send_sms(profile, body, to, from_)
Send an sms

CLI Example:

twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'

21.9.464 salt.modules.udev

Manage and query udev info
New in version 2015.8.0.

salt.modules.udev.env(dev)
Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

salt.modules.udev.exportdb()
Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

salt.modules.udev.info(dev)
Extract all info delivered by udevadm

CLI Example:
salt.modules.udev.links(dev)
Return all udev-created device symlinks

CLI Example:

```python
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.name(dev)
Return the actual dev name(s?) according to udev for dev

CLI Example:

```python
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

salt.modules.udev.path(dev)
Return the physical device path(s?) according to udev for dev

CLI Example:

```python
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

21.9.465 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of "initctl show-config" to determine if all service dependencies are enabled to start on boot. For example, see the "start on" condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[2] example upstart configuration file:

```ini
lightdm
emits login-session-start
emits desktop-session-start
```

(continues on next page)
emits desktop-shutdown
start on (((filesystem and runlevel \([06]\)) and started dbus) and (drm-device-added
→
card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel
→
PREVLEVEL=S)
stop on runlevel \([016]\)

Warning: This module should not be used on Red Hat systems. For these, the rh_service module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

salt.modules.upstart_service.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' service.available sshd

salt.modules.upstart_service.disable(name, **kwargs)
Disable the named service from starting on boot

CLI Example:
salt '*' service.disable <service name>

salt.modules.upstart_service.disabled(name)
Check to see if the named service is disabled to start on boot

CLI Example:
salt '*' service.disabled <service name>

salt.modules.upstart_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>

salt.modules.upstart_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot

CLI Example:
salt '*' service.enabled <service name>

salt.modules.upstart_service.force_reload(name)
Force-reload the named service

CLI Example:
salt '*' service.force_reload <service name>

salt.modules.upstart_service.full_restart(name)
Do a full restart (stop/start) of the named service

CLI Example:
salt '★' service.full_restart <service name>

salt.modules.upstart_service.get_all()
  Return all installed services
  CLI Example:
  ```
salt '★' service.get_all
  ```

salt.modules.upstart_service.get_disabled()
  Return the disabled services
  CLI Example:
  ```
salt '★' service.get_disabled
  ```

salt.modules.upstart_service.get_enabled()
  Return the enabled services
  CLI Example:
  ```
salt '★' service.get_enabled
  ```

salt.modules.upstart_service.missing(name)
  The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
  CLI Example:
  ```
salt '★' service.missing sshd
  ```

salt.modules.upstart_service.reload_(name)
  Reload the named service
  CLI Example:
  ```
salt '★' service.reload <service name>
  ```

salt.modules.upstart_service.restart(name)
  Restart the named service
  CLI Example:
  ```
salt '★' service.restart <service name>
  ```

salt.modules.upstart_service.start(name)
  Start the specified service
  CLI Example:
  ```
salt '★' service.start <service name>
  ```

salt.modules.upstart_service.status(name, sig=None)
  Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
  Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
  Parameters
  - name (str) -- The name of the service to check
• **sig**(*str*) -- Signature to use to find the service via ps

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.upstart_service.**stop**(name)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

### 21.9.466 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.**check_exists**(name)

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.**checks_list**()

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

salt.modules.uptime.**create**(name, **params)

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation https://github.com/fzaninotto/uptime for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.**delete**(name)

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```
21.9.467 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info is not available'), see here.

salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname='', roomnumber='', workphone='', homephone='', other='', createhome=True, loginclass=None, nologinit=False, root=None, usergroup=None)

Add a user to the minion

name   Username LOGIN to add
uid    User ID of the new account
gid    Name or ID of the primary group of the new account
groups List of supplementary groups of the new account
home   Home directory of the new account
shell  Login shell of the new account
unique If not True, the user account can have a non-unique UID
system Create a system account
fullname GECOS field for the full name
roomnumber GECOS field for the room number
workphone GECOS field for the work phone
homephone GECOS field for the home phone
other  GECOS field for other information
createhome Create the user's home directory
loginclass Login class for the new account (OpenBSD)
nologinit Do not add the user to the lastlog and faillog databases
root   Directory to chroot into
usergroup Create and add the user to a new primary group of the same name

CLI Example:

salt '*' user.add name <uid> <gid> <groups> <home> <shell>

salt.modules.useradd.chfullname(name, fullname, root=None)

Change the user's Full Name

name   User to modify
fullname GECOS field for the full name
root   Directory to chroot into

CLI Example:

salt '*' user.chfullname foo "Foo Bar"

salt.modules.useradd.chgid(name, gid, root=None)

Change the default group of the user

name   User to modify
gid    Force use GID as new primary group
root   Directory to chroot into

CLI Example:

salt '*' user.chgid foo 4376

salt.modules.useradd.chgroups(name, groups, append=False, root=None)

Change the groups to which this user belongs

21.9. execution modules
name  User to modify

**groups**  Groups to set for the user

**append**  [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

**root**  Directory to chroot into

**CLI Examples:**

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

**salt.modules.useradd.chhome** (*name*, *home*, *persist=False*, *root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

**name**  User to modify

**home**  New home directory for the user account

**persist**  Move contents of the home directory to the new location

**root**  Directory to chroot into

**CLI Example:**

```
salt '*' user.chhome foo /home/users/foo True
```

**salt.modules.useradd.chhomephone** (*name*, *homephone*, *root=None*)

Change the user's Home Phone

**name**  User to modify

**homephone**  GECOS field for the home phone

**root**  Directory to chroot into

**CLI Example:**

```
salt '*' user.chhomephone foo 7735551234
```

**salt.modules.useradd.chloginclass** (*name*, *loginclass*, *root=None*)

Change the default login class of the user

**name**  User to modify

**loginclass**  Login class for the new account

**root**  Directory to chroot into

---

**Note:** This function only applies to OpenBSD systems.

**CLI Example:**

```
salt '*' user.chloginclass foo staff
```

**salt.modules.useradd.chother** (*name*, *other*, *root=None*)

Change the user's other GECOS attribute

**name**  User to modify

**other**  GECOS field for other information

**root**  Directory to chroot into

**CLI Example:**

```
salt '*' user.chother foobar
```

**salt.modules.useradd.chroomnumber** (*name*, *roomnumber*, *root=None*)

Change the user's Room Number

**CLI Example:**
**salt modules.useradd.chshell**

Change the default shell of the user

name User to modify
shell New login shell for the user account
root Directory to chroot into

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

**salt modules.useradd.chuid**

Change the uid for a named user

name User to modify
uid New UID for the user account
root Directory to chroot into

CLI Example:

```
salt '*' user.chuid foo 4376
```

**salt modules.useradd.chworkphone**

Change the user's Work Phone

name User to modify
workphone GECOS field for the work phone
root Directory to chroot into

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

**salt modules.useradd.delete**

Remove a user from the minion

name Username to delete
remove Remove home directory and mail spool
force Force some actions that would fail otherwise
root Directory to chroot into

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

**salt modules.useradd.get_loginclass**

Get the login class of the user

name User to get the information

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.get_loginclass foo
```

**salt modules.useradd.getent**

Return the list of all info for all users

refresh Force a refresh of user information
root Directory to chroot into

CLI Example:
salt '*' user.getent

salt.modules.useradd.info(name, root=None)
    Return user information
    name  User to get the information
    root  Directory to chroot into
    CLI Example:
    
    salt '*' user.info root

salt.modules.useradd.list_groups(name)
    Return a list of groups the named user belongs to
    name  User to get the information
    CLI Example:
    
    salt '*' user.list_groups foo

salt.modules.useradd.list_users(root=None)
    Return a list of all users
    root  Directory to chroot into
    CLI Example:
    
    salt '*' user.list_users

salt.modules.useradd.primary_group(name)
    Return the primary group of the named user
    New in version 2016.3.0.
    name  User to get the information
    CLI Example:
    
    salt '*' user.primary_group saltadmin

salt.modules.useradd.rename(name, new_name, root=None)
    Change the username for a named user
    name  User to modify
    new_name  New value of the login name
    root  Directory to chroot into
    CLI Example:
    
    salt '*' user.rename name new_name

21.9.468 salt.modules.uwsgi

    maintainer  Peter Baumgartner <pete@lincolnloop.com>
    maturity  new
    platform  all

salt.modules.uwsgi.stats(socket)
    Return the data from uwsgi --connect-and-read as a dictionary.
    socket  The socket the uWSGI stats server is listening on
    CLI Example:
21.9.469 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for sdb://vagrant_sdb_data

Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

salt.modules.vagrant.destroy(name)

Destroy and delete a virtual machine. (vagrant destroy -f)

This also removes the salt_id name defined by vagrant.init.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

salt.modules.vagrant.get_machine_id(machine, cwd)

returns the salt_id name of the Vagrant VM

Parameters

- `machine` -- the Vagrant machine name
- `cwd` -- the path to Vagrantfile

Returns salt_id name

salt.modules.vagrant.get_ssh_config(name, network_mask='', get_private_key=False)

Retrieve hints of how you might connect to a Vagrant VM.

Parameters

- `name` -- the salt_id of the machine
- `network_mask` -- a CIDR mask to search for the VM's address
- `get_private_key` -- (default: False) return the key used for ssh login

Returns a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_key=True
```
The returned dictionary contains:

- `key_filename`: the name of the private key file on the VM host computer
- `ssh_username`: the username to be used to log in to the VM
- `ssh_host`: the IP address used to log in to the VM. (This will usually be 127.0.0.1)
- `ssh_port`: the TCP port used to log in to the VM. (This will often be 2222)
- `[ip_address:]` (if `network_mask` is defined. see below)
- `[private_key:]` (if `get_private_key` is True) the private key for `ssh_username`

About `network_mask`:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a `config.vm.network "public_network"` statement in your Vagrantfile.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ifconfig" command to the VM (using ssh to `ssh_host:ssh_port`) and return the IP address of the first interface it can find which matches your mask.

```
salt.modules.vagrant.get_vm_info(name)
get the information for a VM.

Parameters
name -- salt_id name

Returns
dictionary of {'machine': x, 'cwd': y, ...}.
```

```
salt.modules.vagrant.init(name, cwd=None, machine='', runas=None, start=False, vagrant_provider='', vm=None)
Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters
- name -- The salt_id name you will use to control this VM
- cwd -- The path to the directory where the Vagrantfile is located
- machine -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
- runas -- The username on the host who owns the Vagrant work files.
- start -- (default: False) Start the virtual machine now.
- vagrant_provider -- The name of a Vagrant VM provider (if not the default).
- vm -- Optionally, all the above information may be supplied in this dictionary.

Returns
A string indicating success, or False.
```

CLI Example:
```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

```
salt.modules.vagrant.list_active_vms(cwd=None)
Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:
```
salt '*' vagrant.list_active_vms  cwd=/projects/project_1
```

```
salt.modules.vagrant.list_domains()
Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where
```
they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

**salt.modules.vagrant.list_inactive_vms(cwd=None)**

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

**salt.modules.vagrant.pause(name)**

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

**salt.modules.vagrant.reboot(name, provision=False)**

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

**Parameters**

- **name** -- The salt_id name you will use to control this VM
- **provision** -- (False) also re-run the Vagrant provisioning scripts.

**salt.modules.vagrant.shutdown(name)**

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

**salt.modules.vagrant.start(name)**

Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

**salt.modules.vagrant.stop(name)**

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```
salt.modules.vagrant.version()

Return the version of Vagrant on the minion

CLI Example:
```
salt '*' vagrant.version
```

salt.modules.vagrant.vm_state(name='', cwd=None)

Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the cwd directory.

CLI Example:
```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': '', # Vagrant machine name
         'state': '', # string indicating machine state, like 'running'
         'provider': '', # the Vagrant VM provider
         'name': ''} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary machine, which you defined by leaving the machine parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

### 21.9.470 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

**Note:** These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.ban(ban_expression)

Add ban to the varnish cache

CLI Example:
```
salt '*' varnish.ban ban_expression
```

salt.modules.varnish.ban_list()

List varnish cache current bans

CLI Example:
```
salt '*' varnish.ban_list
```

salt.modules.varnish.param_set(param, value)

Set a param in varnish cache

CLI Example:
```
salt '*' varnish.param_set param value
```

```
salt.modules.varnish.param_show(param=None)
    Show params of varnish cache
    CLI Example:
    
salt '*' varnish.param_show param

salt.modules.varnish.purge()
    Purge the varnish cache
    CLI Example:
    
salt '*' varnish.purge

salt.modules.varnish.version()
    Return server version from varnishd -V
    CLI Example:
    
salt '*' varnish.version

21.9.471 salt.modules.vault module

Functions to interact with Hashicorp Vault.
    maintainer SaltStack
    maturity new
    platform all
    note If you see the following error, you'll need to upgrade requests to at least 2.4.2

<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to load ext__pillar vault: {'error': "request() got an unexpected keyword argument 'json'"}

configuration The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.
    Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

    vault:
        url: https://vault.service.domain:8200
        verify: /etc/ssl/certs/certificates.crt
        role_name: minion_role
        auth:
            method: approle
            role_id: 11111111-2222-3333-4444-111111111111
            secret_id: 11111111-1111-1111-1111-111111111111
        policies:
            - saltstack/minions
            - saltstack/minion/{minion}
            ... more policies
        keys:
            - n63/TbrQuL3xaIW7ZpuXj/tIIfnK1/MbVxO4vT3wYD2A
            - S90wCvMRhERAE4NVVELYB5w/Me6+urgUr24xGK44Uy3
            - F1j4b7Jkq850NS6Kboiy5LaJ9xY8dWJvB3fcaW+A6rAvl
            - 1cYtvjKJNDVam9c7HNqJUFINk4PYyAXIpjkH/sluzPv
            - 3pPK5X6GtwLhNOFv1U2elahECz3HpRufNXJFYLw6lid

21.9. execution modules  2805
url  Url to your Vault installation. Required.

verify For details please see https://requests.readthedocs.io/en/master/user/advanced/#ssl-cert-verification

New in version 2018.3.0.

role_name  Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

For details please see: https://www.vaultproject.io/api/auth/token/index.html#create-token

Example configuration: https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration

auth Currently only token and approle auth types are supported. Required.

Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: https://www.vaultproject.io/docs/auth/approle.html

The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

```yaml
vault:
  url: https://vault.service.domain:8200
  auth:
    method: token
    token: sdb://osenv/VAULT_TOKEN
  osenv:
    driver: env

export VAULT_TOKEN=11111111-1111-1111-1111-1111111111111
```

Configuration keys uses or ttl may also be specified under auth to configure the tokens generated on behalf of minions to be reused for the defined number of uses or length of time in seconds. These settings may also be configured on the minion when allow_minion_override is set to True in the master config.

Defining uses will cause the salt master to generate a token with that number of uses rather than a single use token. This multi-use token will be cached on the minion. The type of minion cache can be specified with token_backend: session or token_backend: disk. The value of session is the default, and will store the vault information in memory only for that session. The value of disk will write to an on disk file, and persist between state runs (most helpful for multi-use tokens).

```
vault:
  auth:
    method: token
    token: xxxxxx
    uses: 10
    ttl: 43200
    allow_minion_override: True
    token_backend: disk

.. versionchanged:: 3001
```
policies Policies that are assigned to minions when requesting a token. These can either be static, eg saltstack/minions, or templated with grain values, eg, my-policies/{grains[os]}. {minion} is shorthand for grains[id], saltstack/minion/{minion}.

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template saltstack/by-role/{grains[roles]}, and a minion having these grains:

```yaml
grains:
  roles:
    - web
    - database
```

The minion will have the policies saltstack/by-role/web and saltstack/by-role/database.

Optional. If policies is not configured, saltstack/minions and saltstack/minion/{minion} are used as defaults.

---

**Note**: list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

keys List of keys to use to unseal vault server with the vault.unseal runner.

Add this segment to the master configuration file, or /etc/salt/mastere.d/peer_run.conf:

```yaml
peer_run:
  .*:
    - vault.generate_token
```

**salt.modules.vault.clear_token_cache()**

Changed in version 3001.

Delete minion Vault token cache file

CLI Example:

```bash
salt '*' vault.clear_token_cache
```

**salt.modules.vault.delete_secret(path)**

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```bash
salt '*' vault.delete_secret "secret/my/secret"
```

**salt.modules.vault.destroy_secret(path, *args)**

New in version 3001.

Destroy specified secret version at the path in vault. The vault policy used must allow this. Only supported on Vault KV version 2

CLI Example:

```bash
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```
salt.modules.vault.list_secrets(path, default=<class 'salt.exceptions.CommandExecutionError'>)

Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

salt.modules.vault.read_secret(path, key=None, metadata=False, default=<class 'salt.exceptions.CommandExecutionError'>)

Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

Return the value of key at path in vault, or entire secret

Parameters

metadata -- Optional - If using KV v2 backend, display full results, including metadata

New in version 3001.

Jinja Example:

```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}

{{ salt['vault'].read_secret('/secret/my/secret', 'some-key', metadata=True)[%data%] }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}

secrets:
    first: {{ supersecret.first }}
    second: {{ supersecret.second }}
```

salt.modules.vault.write_raw(path, raw)

Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password": "bar"}'
```

salt.modules.vault.write_secret(path, **kwargs)

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

21.9.472 salt.modules.vbox_guest

VirtualBox Guest Additions installer

salt.modules.vbox_guest.additions_install(**kwargs)

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually Right Ctrl).

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.
CLI Example:
```bash
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters
- **reboot (bool)** -- reboot computer to complete installation
- **upgrade_os (bool)** -- upgrade OS (to ensure the latest version of kernel and developer tools are installed)

Returns
- version of VirtualBox Guest Additions or string with error

salt.modules.vbox_guest.additions_mount()
Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:
```bash
salt '*' vbox_guest.additions_mount
```

Returns
- True or OSError exception

salt.modules.vbox_guest.additions_remove(**kwargs)
Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:
```bash
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters
- **force (bool)** -- force VirtualBox Guest Additions removing

Returns
- True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.additions_umount(mount_point)
Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:
```bash
salt '*' vbox_guest.additions_umount
```

Parameters
- **mount_point** -- directory VirtualBox Guest Additions is mounted to

Returns
- True or a string with error

salt.modules.vbox_guest.additions_version()
Check VirtualBox Guest Additions version.

CLI Example:
```bash
salt '*' vbox_guest.additions_version
```

Returns
- version of VirtualBox Guest Additions or False if they are not installed

salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument `users`. Access will be denied to the users not listed in `users` argument.
See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']

Parameters
- **name** (str) -- name of the user to grant access to auto-mounted shared folders to
- **users** (list of str) -- list of names of users to grant access to auto-mounted shared folders to (if specified, name will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.list_shared_folders_users()
List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

salt '*' vbox_guest.list_shared_folders_users

Returns list of users who have access to auto-mounted shared folders

### 21.9.473 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the vboxdrv kernel module is not loaded, this module can automatically load it by configuring autoload_vboxdrv in /etc/salt/minion:

```
autoload_vboxdrv: True
```

The default for this setting is False.

depends virtualbox

salt.modules.vboxmanage.clonemedium(  medium=None,  uuid_in=None,  file_in=None,  uuid_out=None,  file_out=None,  mformat=None,  variant=None,  existing=False, **kwargs)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```
salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, base_folder=None, new_uuid=None, **kwargs)

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

salt.modules.vboxmanage.destroy(name)

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')

Return a list of a specific type of item. The following items are available:

- vms
- runningvms
- ostypes
- hostdvds
- hostfloppies
- innets
- bridgedifs
- hostonlyifs
- natnets
- dhcpservers
- hostinfo
- hostcpuids
- hddbacksends
- hdds
- dvfs
- floppy
- usbhost
- usbfilters
- systemproperties
- extpacks
- groups
- webcams
- screenshotformats

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless details is set to True. By default, items are grouped by the UUID field, but not all items contain that field. In those cases, another field must be specified.

salt.modules.vboxmanage.list_nodes()

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

salt.modules.vboxmanage.list_nodes_full()

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

salt.modules.vboxmanage.list_nodes_min()

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

salt.modules.vboxmanage.list_ostypes()

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

salt.modules.vboxmanage.register(filename)

Register a VM

CLI Example:
salt ' * ' vboxmanage.register my_vm_filename

salt.modules.vboxmanage.start(name)
    Start a VM
    CLI Example:
    salt ' * ' vboxmanage.start my_vm

salt.modules.vboxmanage.stop(name)
    Stop a VM
    CLI Example:
    salt ' * ' vboxmanage.stop my_vm

salt.modules.vboxmanage.unregister(name, delete=False)
    Unregister a VM
    CLI Example:
    salt ' * ' vboxmanage.unregister my_vm_filename

salt.modules.vboxmanage.vboxcmd()
    Return the location of the VBoxManage command
    CLI Example:
    salt ' * ' vboxmanage.vboxcmd

21.9.474 salt.modules.vcenter module

Module used to access the vcenter proxy connection methods
salt.modules.vcenter.get_details()

21.9.475 salt.modules.victorops

Support for VictorOps
New in version 2015.8.0.
Requires an api_key in /etc/salt/minion:

<table>
<thead>
<tr>
<th>victorops:</th>
</tr>
</thead>
<tbody>
<tr>
<td>api_key:</td>
</tr>
<tr>
<td>'280d4699-a817-4719-ba6f-ca56e573e44f'</td>
</tr>
</tbody>
</table>

salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)
    Create an event in VictorOps. Designed for use in states.
    The following parameters are required:
    Parameters message_type -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.
    The following parameters are optional:
    Parameters
• **routing_key** -- The key for where messages should be routed. By default, sent to 'everyone' route.
• **entity_id** -- The name of alerting entity. If not provided, a random name will be assigned.
• **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp_fmt The date format for the timestamp parameter.

**Parameters**

- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.
- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

**Returns** A dictionary with result, entity_id, and message if result was failure.

**CLI Example:**

```bash
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone'
   entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key='everyone'
   entity_id='hostname/diskspace' ack_message='Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone'
   entity_id='hostname/diskspace'
```

The following parameters are required: message_type

**21.9.476 salt.modules.virt**

Work with virtual machines managed by libvirt

**depends**

- libvirt Python module
- libvirt client
- qemu-img
- grep
Connection

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
  connection:
    uri: lxc:///  
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```
virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
  auth:
    username: user
    password: secret
```

Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the `ssh`, `libssh` and `libssh2` transports. Note that `libssh2` is likely to fail as it doesn't read the `known_hosts` file. Libvirt may also have been built without `libssh` or `libssh2` support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using `connection`, `username` and `password` parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the `virt:connection` is.

```
salt 'hypervisor' virt.list_domains connection=lxc:///  
```

The calls not using the libvirt connection setup are:

- `seed_non_shared_migrate`
- `virt_type`
- `is_*hyper`
- all migration functions
- `libvirt ESX URI format`
- `libvirt URI format`
- `libvirt authentication configuration`
Units

Units specification

New in version 3002.

The string should contain a number optionally followed by a unit. The number may have a decimal fraction. If the unit is not given then MiB are set by default. Units can optionally be given in IEC style (such as MiB), although the standard single letter style (such as M) is more convenient.

Valid units include:

<table>
<thead>
<tr>
<th>Standard</th>
<th>IEC</th>
<th>Standard</th>
<th>IEC</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Unit</td>
<td>Name</td>
<td>Name</td>
<td>Factor</td>
</tr>
<tr>
<td>B</td>
<td>Bytes</td>
<td>B</td>
<td>Bytes</td>
<td>1</td>
</tr>
<tr>
<td>K</td>
<td>KiB</td>
<td>Kilobytes</td>
<td>Kibibytes</td>
<td>2**10</td>
</tr>
<tr>
<td>M</td>
<td>MiB</td>
<td>Megabytes</td>
<td>Mebibytes</td>
<td>2**20</td>
</tr>
<tr>
<td>G</td>
<td>GiB</td>
<td>Gigabytes</td>
<td>Gibibytes</td>
<td>2**30</td>
</tr>
<tr>
<td>T</td>
<td>TiB</td>
<td>Terabytes</td>
<td>Tebibytes</td>
<td>2**40</td>
</tr>
<tr>
<td>P</td>
<td>PiB</td>
<td>Petabytes</td>
<td>Pebibytes</td>
<td>2**50</td>
</tr>
<tr>
<td>E</td>
<td>EiB</td>
<td>Exabytes</td>
<td>Exbibytes</td>
<td>2**60</td>
</tr>
<tr>
<td>Z</td>
<td>ZiB</td>
<td>Zettabytes</td>
<td>Zebibytes</td>
<td>2**70</td>
</tr>
<tr>
<td>Y</td>
<td>YiB</td>
<td>Yottabytes</td>
<td>Yobibytes</td>
<td>2**80</td>
</tr>
</tbody>
</table>

Additional decimal based units:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>KB</td>
<td>10**3</td>
</tr>
<tr>
<td>MB</td>
<td>10**6</td>
</tr>
<tr>
<td>GB</td>
<td>10**9</td>
</tr>
<tr>
<td>TB</td>
<td>10**12</td>
</tr>
<tr>
<td>PB</td>
<td>10**15</td>
</tr>
<tr>
<td>EB</td>
<td>10**18</td>
</tr>
<tr>
<td>ZB</td>
<td>10**21</td>
</tr>
<tr>
<td>YB</td>
<td>10**24</td>
</tr>
</tbody>
</table>

salt.modules.virt.all_capabilities(**kwargs)

Return the host and domain capabilities in a single call.

New in version 3001.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.all_capabilities
```

salt.modules.virt.capabilities(**kwargs)

Return the hypervisor connection capabilities.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
New in version 2019.2.0.

CLI Example:
```
salt '*' virt.capabilities
```

salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)

Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.cpu_baseline
```

salt.modules.virt.create_xml_path(path, **kwargs)

Start a transient domain based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.create_xml_path <path to XML file on the node>
```

salt.modules.virt.create_xml_str(xml, **kwargs)

Start a transient domain based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt 'salt '*' virt.create_xml_str <XML in string format>

salt.modules.virt.ctrl_alt_del(*vm, **kwargs)
    Sends CTRL+ALT+DEL to a VM

    Parameters
    • vm -- domain name
    • connection -- libvirt connection URI, overriding defaults
        New in version 2019.2.0.
    • username -- username to connect with, overriding defaults
        New in version 2019.2.0.
    • password -- password to connect with, overriding defaults
        New in version 2019.2.0.

    CLI Example:
    salt 'salt '*' virt.ctrl_alt_del <domain>

salt.modules.virt.define_vol_xml_path(*path, pool=None, **kwargs)
    Define a volume based on the XML-file path passed to the function

    Parameters
    • path -- path to a file containing the libvirt XML definition of the volume
    • pool -- storage pool name to define the volume in. If defined, this parameter will
        override the configuration setting.
        New in version 3001.
    • connection -- libvirt connection URI, overriding defaults
        New in version 2019.2.0.
    • username -- username to connect with, overriding defaults
        New in version 2019.2.0.
    • password -- password to connect with, overriding defaults
        New in version 2019.2.0.

    CLI Example:
    salt 'salt '*' virt.define_vol_xml_path <path to XML file on the node>

salt.modules.virt.define_vol_xml_str(*xml, pool=None, **kwargs)
    Define a volume based on the XML passed to the function

    Parameters
    • xml -- libvirt XML definition of the storage volume
    • pool -- storage pool name to define the volume in. If defined, this parameter will
        override the configuration setting.
        New in version 3001.
    • connection -- libvirt connection URI, overriding defaults
        New in version 2019.2.0.
    • username -- username to connect with, overriding defaults
        New in version 2019.2.0.
    • password -- password to connect with, overriding defaults
        New in version 2019.2.0.

    CLI Example:
The storage pool where the disk image will be defined is default unless changed with the pool parameter or a configuration like this:

```
    virt:
        storagepool: mine
```

salt.modules.virt.define_xml_path(path, **kwargs)

Define a persistent domain based on the XML-file path passed to the function

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

salt.modules.virt.define_xml_str(xml, **kwargs)

Define a persistent domain based on the XML passed to the function

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

salt.modules.virt.delete_snapshots(name, *names, **kwargs)

Delete one or more snapshots of the given VM.

- **name** -- domain name
- **names** -- names of the snapshots to remove
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...

salt.modules.virt.domain_capabilities(emuator=None, arch=None, machine=None, domain=None, **kwargs)
Return the domain capabilities given an emulator, architecture, machine or virtualization type.
New in version 2019.2.0.

Parameters
- emulator -- return the capabilities for the given emulator binary
- arch -- return the capabilities for the given CPU architecture
- machine -- return the capabilities for the given emulated machine type
- domain -- return the capabilities for the given virtualization type.
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.
If none of the parameters is provided, the libvirt default one is returned.

CLI Example:
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'

salt.modules.virt.freecpu(**kwargs)
Return an int representing the number of unallocated cpus on this hypervisor

Parameters
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.freecpu

salt.modules.virt.freemem(**kwargs)
Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

Parameters
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.freemem
salt.modules.virt.full_info(**kwargs)
Return the node_info, vm_info and freemem
Parameters
• connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username -- username to connect with, overriding defaults
  New in version 2019.2.0.
• password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.full_info
```

salt.modules.virt.get_disks(vm_, **kwargs)
Return the disks of a named vm
Parameters
• vm -- name of the domain
• connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username -- username to connect with, overriding defaults
  New in version 2019.2.0.
• password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_disks <domain>
```

salt.modules.virt.get_graphics(vm_, **kwargs)
Returns the information on vnc for a given vm
Parameters
• vm -- name of the domain
• connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• username -- username to connect with, overriding defaults
  New in version 2019.2.0.
• password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_graphics <domain>
```

salt.modules.virt.get_hypervisor()
Returns the name of the hypervisor running on this node or None.
Detected hypervisors:
• kvm
• xen
• bhyve

CLI Example:
salt '*' virt.get_hypervisor

New in version 2019.2.0: the function and the kvm, xen and bhyve hypervisors support

salt.modules.virt.get_loader(vm_, **kwargs)
Returns the information on the loader for a given vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

CLI Example:
salt '*' virt.get_loader <domain>

New in version Fluorine.

salt.modules.virt.get_macs(vm_, **kwargs)
Return a list off MAC addresses from the named vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_macs <domain>

class get_nics

salt.modules.virt.get_nics(vm_, **kwargs)
Return info about the network interfaces of a named vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- username -- username to connect with, overriding defaults
  New in version 2019.2.0.
- password -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.get_nics <domain>

class get_profiles

salt.modules.virt.get_profiles(hypervisor=None, **kwargs)
Return the virt profiles for hypervisor.

Currently there are profiles for:
- nic
- disk

Parameters
- **hypervisor** -- override the default machine type.
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=vmware
```

salt.modules.virt.get_xml(vm_, **kwargs)

Returns the XML for a given vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.get_xml <domain>
```

salt.modules.virt.init(name, cpu, mem, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, graphics=None, os_type=None, arch=None, boot=None, boot_dev=None, **kwargs)

Initialize a new vm

Parameters

- **name** -- name of the virtual machine to create
- **cpu** -- Number of virtual CPUs to assign to the virtual machine
- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are `boot`, `current`, `max`, `slots`, `hard_limit`, `soft_limit`, `swap_hard_limit` and `min_guarantee`. The structure of the dictionary is documented in `Memory parameter definition`. Both decimal and binary base are supported. Detail unit specification is documented in `Units specification`. Please note that the value for `slots` must be an integer.

```python
{
    'boot': 1g,
    'current': 1g,
    'max': 1g,
    'slots': 10,
    'hard_limit': '1024',
    'soft_limit': '512m',
    'swap_hard_limit': '1g',
    'min_guarantee': '512mb'
}
```
Changed in version 3002.

- **nic** -- NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the interfaces parameter. If set to None, no profile will be used.
- **interfaces** -- List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in *Network Interfaces Definitions*.

New in version 2019.2.0.

- **hypervisor** -- the virtual machine type. By default the value will be computed according to the virtual host capabilities.
- **start** -- True to start the virtual machine after having defined it (Default: True)
- **disk** -- Disk profile to use (Default: 'default'). If set to None, no profile will be used.
- **disks** -- List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in *Disks Definitions*.

New in version 2019.2.0.

- **saltenv** -- Fileserver environment (Default: 'base'). See *cp module for more details*
- **seed** -- True to seed the disk image. Only used when the *image* parameter is provided. (Default: True)
- **install** -- install salt minion if absent (Default: True)
- **pub_key** -- public key to seed with (Default: None)
- **priv_key** -- public key to seed with (Default: None)
- **seed_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')
- **graphics** -- Dictionary providing details on the graphics device to create. (Default: None) See *Graphics Definition* for more details on the possible values.

New in version 2019.2.0.

- **os_type** -- type of virtualization as found in the //os/type element of the libvirt definition. The default value is taken from the host capabilities, with a preference for hvm.

New in version 2019.2.0.

- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but x86_64 is prefed over i686.

New in version 2019.2.0.

- **config** -- minion configuration to use when seeding. See *seed module for more details*
- **boot_dev** -- String of space-separated devices to boot from (Default: 'hd')
- **serial_type** -- Serial device type. One of 'pty', 'tcp' (Default: None)
- **telnet_port** -- Telnet port to use for serial device of type tcp.
- **console** -- True to add a console device along with serial one (Default: True)
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the
dictionary. The structure of the dictionary is documented in *Boot parameters definition*. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file and modify the XML accordingly. To boot VM with UEFI, specify loader and nvram path or specify 'efi': True if your libvirtd version is >= 5.2.0 and QEMU >= 3.0.0.

New in version 3000.

```json
{
    'kernel': '/root/f8-i386-vmlinuz',
    'initrd': '/root/f8-i386-initrd',
    'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/ →',
    'loader': '/usr/share/OVMF/OVMF_CODE.fd',
    'nvram': '/usr/share/OVMF/OVMF_VARS.ms.fd'
}
```

- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be hd, fd, cdrom or network.

By default, the value will "hd".

**Boot parameters definition**

The boot parameters dictionary can contains the following properties:

- **kernel** The URL or path to the kernel to run the virtual machine with.
- **initrd** The URL or path to the initrd file to run the virtual machine with.
- **cmdline** The parameters to pass to the kernel provided in the *kernel* property.
- **loader** The path to the UEFI binary loader to use.

New in version 3001.

- **nvram** The path to the UEFI data template. The file will be copied when creating the virtual machine.

New in version 3001.

- **efi** A boolean value.

New in version sodium.

**Memory parameter definition**

Memory parameter can contain the following properties:

- **boot** The maximum allocation of memory for the guest at boot time
- **current** The actual allocation of memory for the guest
- **max** The run time maximum memory allocation of the guest
- **slots** specifies the number of slots available for adding memory to the guest
- **hard_limit** the maximum memory the guest can use
- **soft_limit** memory limit to enforce during memory contention
- **swap_hard_limit** the maximum memory plus swap the guest can use
- **min_guarantee** the guaranteed minimum memory allocation for the guest
Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:
- **name**: Name of the network interface. This is only used as a key to merge with the profile data.
- **type**: Network type. One of 'bridge', 'network'.
- **source**: The network source, typically the bridge or network name.
- **mac**: The desired mac address, computed if `None` (Default: `None`).
- **model**: The network card model (Default: depends on the hypervisor).

Disks Definitions

Disk dictionaries can contain the following properties:
- **name**: Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.
- **format**: Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)
- **size**: Disk size in MiB.
- **pool**: Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor and the virt:storagepool configuration)
  Changed in version 3001.
  If the value contains no '/', it is considered a pool name where to create a volume. Using volumes will be mandatory for some pools types like rdb, iscsi, etc.
- **model**: One of the disk busses allowed by libvirt (Default: depends on hypervisor)
  See the libvirt disk element documentation for the allowed bus types.
- **image**: Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: `None`).
  Note that some pool types do not support uploading an image. This list can evolve with libvirt versions.
- **overlay_image**: True to create a Qcow2 disk image with `image` as backing file. If False the file pointed to by the `image` property will simply be copied. (Default: `False`)
  Changed in version 3001.
  This property is only valid on path-based disks, not on volumes. To create a volume with a backing store, set the backing_store_path and backing_store_format properties.
- **backing_store_path**: Path to the backing store image to use. This can also be the name of a volume to use as backing store within the same pool.
  New in version 3001.
- **backing_store_format**: Image format of the disk or volume to use as backing store. This property is mandatory when using backing_store_path to avoid problems.
  New in version 3001.
- **source_file**: Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be `None` for devices that have no associated image like cdroms.
  Changed in version 3001.
  For volume disks, this can be the name of a volume already existing in the storage pool.
- **device**: Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: `'disk'`)
- **hostname_property**: When using ZFS volumes, setting this value to a ZFS property ID will make Salt store the name of the virtual machine inside this property. (Default: `None`)
- **sparse_volume**: Boolean to specify whether to use a thin provisioned ZFS volume.
  Example profile for a bhyve VM with two ZFS disks. The first is cloned from the specified image. The second disk is a thin provisioned volume.
The graphics dictionary can have the following properties:

- **type**: Graphics type. The possible values are *none*, 'spice', 'vnc' and other values allowed as a libvirt graphics type (Default: None)

  See the libvirt graphics element documentation for more details on the possible types.

- **port**: Port to export the graphics on for vnc, spice and rdp types.

- **tls_port**: Port to export the graphics over a secured connection for spice type.

- **listen**: Dictionary defining on what address to listen on for vnc, spice and rdp. It has a **type** property with address and None as possible values, and an **address** property holding the IP or hostname to listen on.

  By default, not setting the **listen** part of the dictionary will default to listen on all addresses.

**CLI Example**

```bash
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

The disk images will be created in an image folder within the directory defined by the **virt:images** option. Its default value is /srv/salt-images/ but this can changed with such a configuration:

```bash
salt.modules.virt.images = /data/my/vm/images/
```

**salt.modules.virt.is_hyper()**

Returns a bool whether or not this node is a hypervisor of any kind

**CLI Example:**

```bash
salt '*' virt.is_hyper
```

**salt.modules.virt.list_active_vms(**kwargs**)**

Return a list of names for active virtual machine on the minion

**Parameters**

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.virt.list_domains(**kwargs)
Return a list of available domains.
Parameters
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.virt.list_inactive_vms(**kwargs)
Return a list of names for inactive virtual machine on the minion
Parameters
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.virt.list_networks(**kwargs)
List all virtual networks.
Parameters
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_networks
```

salt.modules.virt.list_pools(**kwargs)
List all storage pools.
Parameters
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt '*' virt.list_pools

salt.modules.virt.list_snapshots(domain=None, **kwargs)

List available snapshots for certain vm or for all.

Parameters

- `domain` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>

salt.modules.virt.migrate(vm_, target, ssh=False, **kwargs)

Shared storage migration

Parameters

- `vm` -- domain name
- `target` -- target libvirt URI or host name
- `ssh` -- True to connect over ssh

Deprecated since version 3002.

- `kwargs` --
  
  - `live`: Use live migration. Default value is True.
  - `persistent`: Leave the domain persistent on destination host. Default value is True.
  - `undefinesource`: Undefine the domain on the source host. Default value is True.
  - `offline`: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - `max_bandwidth`: The maximum bandwidth (in MiB/s) that will be used.
  - `max_downtime`: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - `parallel_connections`: Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - `compressed`: Activate compression.
  - `comp_methods`: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
  - `comp_mt_level`: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
  - `comp_mt_threads`: Set number of compress threads on source host.
  - `comp_MT_dthreads`: Set number of decompress threads on target host.
  - `comp_xbzrle_cache`: Set the size of page cache for xbzrle compression in bytes.
  - `copy_storage`: Migrate non-shared storage. It must be one of the following values: all (full disk copy) or incremental (Incremental copy)
postcopy: Enable the use of post-copy migration.
postcopy_bandwidth: The maximum bandwidth allowed in post-copy phase (MiB/s)
username: Username to connect with target host
password: Password to connect with target host

New in version 3002.

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor URI>
salt src virt.migrate guest qemu+ssh://dst/system
salt src virt.migrate guest qemu+tls://dst/system
salt src virt.migrate guest qemu+tcp://dst/system
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporttunnel

```
salt.modules.virt.migrate_non_shared(vm_, target, ssh=False, **kwargs)
```

Attempt to execute non-shared storage "all" migration

Parameters:
- vm -- domain name
- target -- target libvirt host name
- ssh -- True to connect over ssh

Deprecation since version 3002.

Parameters:
- kwags --
  - live: Use live migration. Default value is True.
  - persistent: Leave the domain persistent on destination host. Default value is True.
  - undefinesource: Undefine the domain on the source host. Default value is True.
  - offline: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - max_bandwidth: The maximum bandwidth (in MiB/s) that will be used.
  - max_downtime: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - parallel_connections: Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - compressed: Activate compression.
  - comp_methods: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
  - comp_mt_level: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
  - comp_mt_threads: Set number of compress threads on source host.
  - comp_mt_dthreads: Set number of decompress threads on target host.
  - comp_xbzrle_cache: Set the size of page cache for xbzrle compression in bytes.
  - postcopy: Enable the use of post-copy migration.
  - postcopy_bandwidth: The maximum bandwidth allowed in post-copy phase (MiB/s)
  - username: Username to connect with target host
– password: Password to connect with target host
New in version 3002.

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporttunnel

salt.modules.virt.migrate_non_shared_inc(vm_, target, ssh=False, **kwargs)
Attempt to execute non-shared storage "inc" migration

Parameters

- **vm** -- domain name
- **target** -- target libvirt host name
- **ssh** -- True to connect over ssh

Deprecated since version 3002.

- **kwargs** --
  - **live**: Use live migration. Default value is True.
  - **persistent**: Leave the domain persistent on destination host. Default value is True.
  - **undefinesource**: Undefine the domain on the source host. Default value is True.
  - **offline**: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - **max_bandwidth**: The maximum bandwidth (in MiB/s) that will be used.
  - **max_downtime**: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - **parallel_connections**: Specify a number of parallel network connections to be used to send memory pages to the destination host.
  - **compressed**: Activate compression.
  - **comp_methods**: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
    - **comp_mt_level**: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
    - **comp_mt_threads**: Set number of compress threads on source host.
    - **comp_mt_dthreads**: Set number of decompress threads on target host.
    - **comp_xbzrle_cache**: Set the size of page cache for xbzrle compression in bytes.
    - **postcopy**: Enable the use of post-copy migration.
    - **postcopy_bandwidth**: The maximum bandwidth allowed in post-copy phase (MiB/s)
    - **username**: Username to connect with target host
    - **password**: Password to connect with target host

New in version 3002.

CLI Example:

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

A tunnel data migration can be performed by setting this in the configuration:
**virt:**
  
  **tunnel:** True

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporttunnel

```python
salt.modules.virt.migrate_start_postcopy(vm_)
```

Starts post-copy migration. This function has to be called while live migration is in progress and it has been initiated with the `postcopy=True` option.

CLI Example:
```
salt '*' virt.migrate_start_postcopy <domain>
```

```python
salt.modules.virt.nesthash()
```

create default dict that allows arbitrary level of nesting

```python
salt.modules.virt.network_define(name, bridge, forward, ipv4_config=...)
```

Create libvirt network.

**Parameters**

- **name** -- Network name
- **bridge** -- Bridge name
- **forward** -- Forward mode(bridge, router, nat)
- **vport** -- Virtualport type
- **tag** -- Vlan tag
- **autostart** -- Network autostart (default True)
- **start** -- Network start (default True)
- **ipv4_config** -- IP v4 configuration Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.
  
  New in version 3000.
- **ipv6_config** -- IP v6 configuration Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.
  
  New in version 3000.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**IP configuration definition**

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

- **cidr** CIDR notation for the network. For example '192.168.124.0/24'
- **dhcp_ranges** A list of dictionary with 'start' and 'end' properties.

CLI Example:
```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

```python
salt.modules.virt.network_get_xml(name, **kwars)
```

Return the XML definition of a virtual network

**Parameters**

- **name** -- libvirt network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
New in version 3000.

CLI Example:
```
salt '*' virt.network_get_xml default
```

```
salt.modules.virt.network_info(name=None, **kwargs)
```
Return information on a virtual network provided its name.

Parameters
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_info default
```

```
salt.modules.virt.network_set_autostart(name, state='on', **kwargs)
```
Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

Parameters
- `name` -- virtual network name
- `state` -- 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*" virt.network_set_autostart <pool> <on | off>
```

```
salt.modules.virt.network_start(name, **kwargs)
```
Start a defined virtual network.

Parameters
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_start default
```

```
salt.modules.virt.network_stop(name, **kwargs)
```
Stop a defined virtual network.

Parameters
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.
CLI Example:

```
salt '*' virt.network_stop default
```

`salt.modules.virt.network_undefine(name, **kwargs)`

Remove a defined virtual network. This does not stop the virtual network.

**Parameters**

- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_undefine default
```

`salt.modules.virt.node_info(**kwargs)`

Return a dict with information about this node

**Parameters**

- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.virt.pause(vm_, **kwargs)`

Pause the named vm

**Parameters**

- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pause <domain>
```

`salt.modules.virt.pool_build(name, **kwargs)`

Build a defined libvirt storage pool.

**Parameters**

- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.
salt Documentation, Release 3002.6

CLI Example:

```
salt '*virt.pool_build default
```

salt.modules.virt.pool_capabilities(**kwargs)
Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types
could be listed as supported while they are not. To distinguish between the two cases, check the value of the
computed property.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*virt.pool_capabilities
```

salt.modules.virt.pool_define(name, ptype, target=None, permissions=None,
source_devices=None, source_dir=None, source_initiator=None,
source_adapter=None, source_hosts=None, source_auth=None,
source_name=None, source_format=None, transient=False,
start=True, **kwargs)
Create libvirt pool.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for
  filesystem-based pool types. See Permissions definition for more details on this struc-
  ture.
- **source_devices** -- List of source devices for pools backed by physical devices.
  (Default: None)

  Each item in the list is a dictionary with path and optionally part_separator
  keys. The path is the qualified name for iSCSI devices.

  Report to this libvirt page for more information on the use of part_separator
- **source_dir** -- Path to the source directory for pools of type dir, netfs or
  gluster. (Default: None)
- **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
- **source_adapter** -- SCSI source definition. The value is a dictionary
  with type, name, parent, managed, parent_wwnn, parent_wwpn,
  parent_fabric_wwn, wwnn, wwpn and parent_address keys.

  The parent_address value is a dictionary with unique_id and address keys.
  The address represents a PCI address and is itself a dictionary with domain, bus,
  slot and function properties. Report to this libvirt page for the meaning and
  possible values of these properties.
- **source_hosts** -- List of source for pools backed by storage from remote servers.
  Each item is the hostname optionally followed by the port separated by a colon. (De-
  fault: None)
- **source_auth** -- Source authentication details. (Default: None)
The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```python
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

```python
source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'usage',
        'value': 'mycluster_myname'
    }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- Identifier of name-based sources.
- **source_format** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **start** -- Pool start (default True)
- **transient** -- When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force `start` to True. (Default: False)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**Permissions definition**

The permissions are described by a dictionary containing the following keys:
- **mode** The octal representation of the permissions. (Default: 0711)
- **owner** the numeric user ID of the owner. (Default: from the parent folder)
- **group** the numeric ID of the group. (Default: from the parent folder)
- **label** the SELinux label. (Default: None)
CLI Example:

Local folder pool:

```bash
salt '*' virt.pool_define somewe pool dir target=/srv/mypool
  permissions="{'mode': '0744', 'owner': 107, 'group': 107 }
```

CIFS backed pool:

```bash
salt '*' virt.pool_define myshare netfs source_format=cifs
  source_dir=samba_share source_hosts="['example.com']" target=/mnt/
```

New in version 2019.2.0.

salt.modules.virt.pool_delete(name, **kwargs)
Delete the resources of a defined libvirt storage pool.

Parameters
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.pool_delete default
```

salt.modules.virt.pool_get_xml(name, **kwargs)
Return the XML definition of a virtual storage pool.

Parameters
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```bash
salt '*' virt.pool_get_xml default
```

salt.modules.virt.pool_info(name=None, **kwargs)
Return information on a storage pool provided its name.

Parameters
- `name` -- libvirt storage pool name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.pool_info default
```

salt.modules.virt.pool_list_volumes(name, **kwargs)
List the volumes contained in a defined libvirt storage pool.
Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.pool_list_volumes <pool>
```

```
salt.modules.virt.pool_refresh(name, **kwargs)

Refresh a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt '*virt.pool_refresh default
```

```
salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters

- **name** -- libvirt storage pool name
- **state** -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt "*" virt.pool_set_autostart <pool> <on | off>
```

```
salt.modules.virt.pool_start(name, **kwargs)

Start a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```bash
salt '*virt.pool_start default
```

```
salt.modules.virt.pool_stop(name, **kwargs)

Stop a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_stop default
```

salt.modules.virt.pool_undefine(name, **kwargs)
Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters
• **name** -- libvirt storage pool name
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_undefine default
```

salt.modules.virt.pool_update(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_initiator=None, source_adapter=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, test=False, **kwargs)
Update a libvirt storage pool if needed. If called with test=True, this is also reporting whether an update would be performed.

Parameters
• **name** -- Pool name
• **ptype** -- Pool type. See libvirt documentation for the possible values.
• **target** -- Pool full path target
• **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
• **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)
  Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.
  Report to this libvirt page for more information on the use of part_separator
• **source_dir** -- Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
• **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
• **source_adapter** -- SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.
  The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
• **source_hosts** -- List of source for pools backed by storage from remote servers.
  Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
• **source_auth** -- Source authentication details. (Default: None)

   The value is a dictionary with *type*, *username* and *secret* keys. The type can be one of *ceph* for Ceph RBD or *chap* for iSCSI sources.

   The *secret* value links to a libvirt secret object. It is a dictionary with *type* and *value* keys. The type value can be either *uuid* or *usage*.

   Examples:

   ```python
   source_auth={
     'type': 'ceph',
     'username': 'admin',
     'secret': {
       'type': 'uuid',
       'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
     }
   }
   ```

   ```python
   source_auth={
     'type': 'chap',
     'username': 'myname',
     'secret': {
       'type': 'usage',
       'uuid': 'mycluster_myname'
     }
   }
   ```

   Since 3000, instead the source authentication can only contain *username* and *password* properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

• **source_name** -- Identifier of name-based sources.

• **source_format** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.

• **test** -- run in dry-run mode if set to True

• **connection** -- libvirt connection URI, overriding defaults

• **username** -- username to connect with, overriding defaults

• **password** -- password to connect with, overriding defaults

**Example:**

Local folder pool:

```python
salt '*' virt.pool_update somepool dir target=/srv/mypool
                             permissions="{'mode': '0744' 'owner': 107, 'group': 107 }"
```

CIFS backed pool:

```python
salt '*' virt.pool_update myshare netfs source_format=cifs
                     source_dir=samba_share source_hosts="[example.com]" target=/mnt/
                     cifs
```

New in version 3000.

```
salt.modules.virt.purge(vm_, dirs=False, removable=False, **kwargs)
```

Recursively destroy and delete a persistent virtual machine, pass True for dir's to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!
Parameters

- **vm** -- domain name
- **dirs** -- pass True to remove containing directories
- **removables** -- pass True to remove removable devices
  
  New in version 2019.2.0.
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```python
salt '*' virt.purge <domain>
```

`salt.modules.virt.reboot(name, **kwargs)`

Reboot a domain via ACPI request

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```python
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset(vm_, **kwargs)`

Reset a VM by emulating the reset button on a physical machine

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```python
salt '*' virt.reset <domain>
```

`salt.modules.virt.resume(vm_, **kwargs)`

Resume the named vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

**CLI Example:**
```
salt 'all' virt.resume <domain>
```

salt.modules.virt.revert_snapshot(name, vm_snapshot=None, cleanup=False, **kwargs)
Revert snapshot to the previous from current (if available) or to the specific.

**Parameters**
- **name** -- domain name
- **vm_snapshot** -- name of the snapshot to revert
- **cleanup** -- Remove all newer than reverted snapshots. Values: True or False (default False).
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

**CLI Example:**
```
salt 'all' virt.revert <domain>
salt 'all' virt.revert <domain> <snapshot>
```

salt.modules.virt.seed_non_shared_migrate(disks, force=False)
Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

**Parameters**
- **disks** -- the list of disk data as provided by virt.get_disks
- **force** -- skip checking the compatibility of source and target disk images if True. (default: False)

**CLI Example:**
```
salt 'all' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.set_autostart(vm_, state='on', **kwargs)
Set the autostart flag on a VM so that the VM will start with the host system on reboot.

**Parameters**
- **vm** -- domain name
- **state** -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.
CLI Example:
```
salt "*" virt.set_autostart <domain> <on | off>
```

```
salt.modules.virt.setmem(vm_, memory, config=False, **kwargs)
```
Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

**Parameters**
- `vm` -- name of the domain
- `memory` -- memory amount to set in MB
- `config` -- if True then libvirt will be asked to modify the config as well
- `connection` -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt 'my_domain' virt.setmem 768
```

```
salt.modules.virt.setvcpus(vm_, vcpus, config=False, **kwargs)
```
Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

**Parameters**
- `vm` -- name of the domain
- `vcpus` -- integer representing the number of CPUs to be assigned
- `config` -- if True then libvirt will be asked to modify the config as well
- `connection` -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt 'my_domain' virt.setvcpus 4
```

```
salt.modules.virt.shutdown(vm_, **kwargs)
```
Send a soft shutdown signal to the named vm

**Parameters**
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.shutdown <domain>
```

```python
salt.modules.virt.snapshot(domain, name=None, suffix=None, **kwargs)
Create a snapshot of a VM.

Parameters
- `domain` -- domain name
- `name` -- Name of the snapshot. If the name is omitted, then will be used original
domain name with ISO 8601 time as a suffix.
- `suffix` -- Add suffix for the new name. Useful in states, where such snapshots can
be distinguished from manually created.
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:
```
salt '*' virt.snapshot <domain>
```

```
salt.modules.virt.start(name, **kwargs)
Start a defined domain

Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.start <domain>
```

```
salt.modules.virt.stop(name, **kwargs)
Hard power down the virtual machine, this is equivalent to pulling the power.

Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.stop <domain>
```
salt.modules.virt.undefine(**kwargs)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

Parameters
  - vm -- domain name
  - connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  - username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  - password -- password to connect with, overriding defaults
    New in version 2019.2.0.

CLI Example:

```
salt '*' virt.undefine <domain>
```

salt.modules.virt.update(name, cpu=0, mem=0, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, live=True, boot=None, test=False, boot_dev=None, **kwargs)

Update the definition of an existing domain.

Parameters
  - name -- Name of the domain to update
  - cpu -- Number of virtual CPUs to assign to the virtual machine
  - mem -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are boot, current, max, slots, hard_limit, soft_limit, swap_hard_limit and min.guarantee. The structure of the dictionary is documented in Memory parameter definition. Both decimal and binary base are supported. Detail unit specification is documented in Units specification. Please note that the value for slots must be an integer.

  - mem:
    - hard_limit: null
    - soft_limit: null

  Changed in version 3002.
  - disk_profile -- disk profile to use
  - disks -- Disk definitions as documented in the init() function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
  - nic_profile -- network interfaces profile to use
  - interfaces -- Network interface definitions as documented in the init() function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
  - graphics -- The new graphics definition as defined in Graphics Definition. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to {'type': 'none'}.
  - live -- False to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If True, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: True)
  - connection -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults
• **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to [Boot parameters definition](#) for the complete boot parameter description.

To update any boot parameters, specify the new path for each. To remove any boot parameters, pass `None` object, for instance: 'kernel': `None`. To switch back to BIOS boot, specify ('loader': `None` and 'nvram': `None`) or 'efi': `False`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

SLS file Example:

```yaml
- boot:
    loader: null
    nvram: null
```

New in version 3000.

• **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will "hd".

New in version 3002.

• **test** -- run in dry-run mode if set to `True`

New in version 3001.

**Returns**

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```python
{
    'definition': True,
    'cpu': True,
    'mem': True,
    'disks': {'attached': [list of actually attached disks],
              'detached': [list of actually detached disks]},
    'nics': {'attached': [list of actually attached nics],
             'detached': [list of actually detached nics]},
    'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.update domain cpu=2 mem=1024
```

salt.modules.virt.virt_type()

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

salt.modules.virt.vm_cputime(
  vm=\`None\`, **kwargs)

Return cputime used by the vms on this hyper in a list of dicts:

**Parameters**
Salt Documentation, Release 3002.6

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

```python
[  'your-vm': {  'cputime' <int>,  'cputime_percent' <int>,  },  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_cputime
```

salt.modules.virt.vm_diskstats(*vm_=None, **kwargs*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters
- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

```python
[  'your-vm': {    'rd_req' : 0,    'rd_bytes' : 0,    'wr_req' : 0,    'wr_bytes' : 0,    'errs' : 0  },  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_blockstats
```

salt.modules.virt.vm_info(*vm_=None, **kwargs*)

Return detailed information about the vms on this hyper in a list of dicts:

```python
[  'your-vm': {    'name' : 'your-vm',    'state' : 'running',    'num_cpu': 4,    'guest_cpu_used': 2.0,    'disk_size': 1000000,    'memory': 4096,    'hypervisor': 'virsh',    'hypervisor_version': '1.2.6',    'virtual_memory': 4096,  },  ...
]```
Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

```python
[
    'your-vm': {
        'cpu': <int>,
        'maxMem': <int>,
        'mem': <int>,
        'state': '<state>',
        'cputime': <int>
    },
    ...,
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.virt.vm_netstats(vm_=None, **kwargs)

Return combined network counters used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

```python
[
    'your-vm': {
        'rx_bytes': 0,
        'rx_packets': 0,
        'rx_errs': 0,
        'rx_drop': 0,
        'tx_bytes': 0,
        'tx_packets': 0,
        'tx_errs': 0,
        'tx_drop': 0
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.virt.vm_state

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

Parameters

- `vm` -- name of the domain
- `connection` -- libvirt connection URI, overriding defaults
  - New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  - New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  - New in version 2019.2.0.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

salt.modules.virt.volume_define

Create libvirt volume.

Parameters

- `pool` -- name of the pool to create the volume in
- `name` -- name of the volume to define
- `size` -- capacity of the volume to define in MiB
- `allocation` -- allocated size of the volume in MiB. Defaults to 0.
- `format` -- volume format. The allowed values are depending on the pool type. Check the `virt.pool_capabilities` output for the possible values and the default.
- `type` -- type of the volume. One of file, block, dir, network, netdiri, ploop or None. By default, the type is guessed by libvirt from the pool type.
- `permissions` -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- `backing_store` -- dictionary describing a backing file for the volume. It must contain a `path` property pointing to the base volume and a `format` property defining the format of the base volume.

The base volume format will not be guessed for security reasons and is thus mandatory.
- `nocow` -- disable COW for the volume.
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults
CLI Example:

Volume on ESX:

```
salt '*' virt.volume_define "[local-storage]" myvm/myvm.vmdk vmdk 8192
```

QCow2 volume with backing file:

```
salt '*' virt.volume_define default myvm.qcow2 qcow2 8192
  → permissions="{"mode": "0775", "owner": "123", "group": "345"}"
  → backing_store="{"path": "/path/to/base.img", "format": "raw"}"
  → nocow=True
```

New in version 3001.

```
salt.modules.virt.volume_delete(pool, volume, **kwargs)
```
Delete a libvirt managed volume.

Parameters

- **pool** -- libvirt storage pool name
- **volume** -- name of the volume to delete
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

```
salt.modules.virt.volume_infos(pool=None, volume=None, **kwargs)
```
Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

Parameters

- **pool** -- libvirt storage pool name (default: None)
- **volume** -- name of the volume to get infos from (default: None)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

```
salt.modules.virt.volume_upload(pool, name, file, offset=0, length=0, sparse=False, **kwargs)
```
Create libvirt volume.

Parameters

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **file** -- the file to upload to the volume
- **offset** -- where to start writing the data in the volume
- **length** -- amount of bytes to transfer to the volume
- **sparse** -- set to True to preserve data sparseness.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
**CLI Example:**

```
salt '*' virt.volume_upload default myvm.qcow2 /path/to/disk.qcow2
```

New in version 3001.

**21.9.477 salt.modules.virtualenv**

Create virtualenv environments.

New in version 0.17.0.

```
salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False, distribute=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, pip=False, symlinks=None, upgrade=None, user=None, use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

- **path** The path to the virtualenv to be created
- **venv_bin** The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.
- **system_site_packages** [False] Passthrough argument given to virtualenv or pyvenv
- **distribute** [False] Passthrough argument given to virtualenv
- **pip** [False] Install pip after creating a virtual environment. Implies `distribute=True`
- **clear** [False] Passthrough argument given to virtualenv or pyvenv
- **python** [None (default)] Passthrough argument given to virtualenv
- **extra_search_dir** [None (default)] Passthrough argument given to virtualenv
- **never_download** [None (default)] Passthrough argument given to virtualenv if True
- **prompt** [None (default)] Passthrough argument given to virtualenv if not None
- **symlinks** [None] Passthrough argument given to pyvenv if True
- **upgrade** [None] Passthrough argument given to pyvenv if True
- **user** [None] Set ownership for the virtualenv

**Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created.

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

Example of using `--always-copy` environment variable (in case your fs doesn't support symlinks).

(continues on next page)
This will copy files into the virtualenv instead of symlinking them.

```yaml
- env:
  - VIRTUALENV_ALWAYS_COPY: 1
```

salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv Path to the virtualenv.
distribution Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```bash
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

venv Path to the virtualenv
package Name of the package in which the resource resides
resource Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```bash
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.xml
```

salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv Path to the virtualenv
package Name of the package in which the resource resides
resource Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```bash
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

salt.modules.virtualenv_mod.get_site_packages(venv)

Return the path to the site-packages directory of a virtualenv

venv Path to the virtualenv.

CLI Example:

```bash
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

salt.modules.virtualenv_mod.virtualenv_ver(venv_bin, user=None, **kwargs)

return virtualenv version if exists
21.9.478 salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
New in version 2019.2.0.

codeauthor Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the vmd service to be running on the OpenBSD target machine.

salt.modules.vmctl.create_disk(name, size)
Create a VMM disk with the specified name and size.
size: Size in megabytes, or use a specifier such as M, G, T.

CLI Example:

```
salt '*' vmctl.create_disk /path/to/disk.img size=10G
```

salt.modules.vmctl.load(path)
Load additional configuration from the specified file.
path  Path to the configuration file.

CLI Example:

```
salt '*' vmctl.load path=/etc/vm.switches.conf
```

salt.modules.vmctl.reload()
Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:

```
salt '*' vmctl.reload
```

salt.modules.vmctl.reset(all=False, vms=False, switches=False)
Reset the running state of VMM or a subsystem.
all:  Reset the running state.
switches:  Reset the configured switches.
vms:  Reset and terminate all VMs.

CLI Example:

```
salt '*' vmctl.reset all=True
```

salt.modules.vmctl.start(name=None, id=None, bootpath=None, disk=None, disks=None, local_iface=False, memory=None, nics=0, switch=None)
Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.
name:  Name of the defined VM.
id:  VM id.
bootpath:  Path to a kernel or BIOS image to load.
disk:  Path to a single disk to use.
disks:  List of multiple disks to use.
local_iface:  Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.
memory:  Memory size of the VM specified in megabytes.
switch:  Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:
```python
salt '>*' vmctl.start 2  # start VM with id 2
salt '>*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk='/disk.
```

salt.modules.vmctl.status(name=None, id=None)

List VMs running on the host, or only the VM specified by id. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

**CLI Example:**

```python
salt '>*' vmctl.status  # to list all VMs
salt '>*' vmctl.status name=web1 # to get a single VM
```

salt.modules.vmctl.stop(name=None, id=None)

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

**name:** Name of the defined VM.

**id:** VM id.

**CLI Example:**

```python
salt '>*' vmctl.stop name=alpine
```

### 21.9.479 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

**codeauthor** Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

**Dependencies**

- pyVmomi Python Module
- ESXCLI

**pyVmomi**

PyVmomi can be installed via pip:

```bash
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:
pip install pyVmomi==5.5.0.2014.1.1

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

**vSphere Automation SDK**

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-python.git
```

**Note:** The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

The module is currently in version 1.0.3 (as of 8/26/2019)

**ESXCLI**

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host’s syslog configuration.

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The ntpd service is restricted to an Enterprise Plus license, while ssh is available via the Standard license.

Please see the vSphere Comparison page for more information.
About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a host location, username, and password. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you’ll get a list of hosts associated with that vCenter Server:

```bash
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you’re using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```bash
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user> <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```bash
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-password>
local:
- 10.4.28.150:
  Coredump Config:
```

(continues on next page)
salt.modules.vsphere.add_capacity_to_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Adds capacity disks to the disk group with the specified cache disk.

- **cache_disk_id** The canonical name of the cache disk.
- **capacity_disk_ids** A list containing canonical names of the capacity disks to add.
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.add_capacity_to_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']
```

salt.modules.vsphere.add_host_to_dvs(host, username, password, vmknic_name, vnic_name, dvs_name, target_portgroup_name, uplink_portgroup_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

- **host** The location of the vCenter server.
- **username** The username used to login to the vCenter server.
- **password** The password used to login to the vCenter server.
- **vmknic_name** The name of the virtual NIC to migrate.
- **vnic_name** The name of the physical NIC to migrate.
- **dvs_name** The name of the Distributed Virtual Switch.
- **target_portgroup_name** The name of the distributed portgroup in which to migrate the virtual NIC.
- **uplink_portgroup_name** The name of the uplink portgroup in which to migrate the physical NIC.
- **protocol** Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
- **host_names**: An array of VMware host names to migrate
- **verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```python
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
    username='administrator@vsphere.corp.com' password='vsphere_password'
    vmknic_name='vmk0' vnic_name='vnic0' dvs_name='DSwitch'
    target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-DVUplinks-181'
    protocol='https' port='443', host_names=['esxi1.corp.com','esxi2.corp.com','esxi3.corp.com']
```

**Return Example:**
This was very difficult to figure out. VMware's PyVmomi documentation at
https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst (which is a copy
says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which
physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host
to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does
what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```xml
<UpdateNetworkConfig xmlns="urn:vim25">
  <this type="HostNetworkSystem">networkSystem-187</this>
  <config>
    <vswitch>
      <changeOperation>edit</changeOperation>
      <name>vSwitch0</name>
      <spec>
        <numPorts>7812</numPorts>
      </spec>
    </vswitch>
    <proxySwitch>
      <changeOperation>edit</changeOperation>
      <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
      <spec>
        <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBacking">
          <pnicSpec><pnicDevice>vmnic0</pnicDevice></pnicSpec>
        </backing>
      </spec>
    </proxySwitch>
    <portgroup>
      <changeOperation>remove</changeOperation>
      <spec>
        <name>Management Network</name>
        <vlanId>-1</vlanId>
        <vswitchName />
        <policy />
      </spec>
    </portgroup>
    <vnic>
      <changeOperation>edit</changeOperation>
      <device>vmk0</device>
      <portgroup />
      <spec>
        <distributedVirtualPort>
          <switchUuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</switchUuid>
          <portgroupKey>dvportgroup-191</portgroupKey>
        </distributedVirtualPort>
      </spec>
    </vnic>
  </config>
  <changeMode>modify</changeMode>
</UpdateNetworkConfig>
```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write:

```python
salt.modules.vsphere.add_license(key, description, safety_checks=True, service_instance=None)
```

- **key** License key.
- **description** License description added in as a label.
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
salt '*' vsphere.add_license key=<license_key> desc='License desc'

```python
salt.modules.vsphere.assign_default_storage_policy_to_datastore(policy, datastore, service_instance=None)
```

Assigns a storage policy as the default policy to a datastore.

- **policy** Name of the policy to assign.
- **datastore** Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
salt '*' vsphere.assign_default_storage_policy_to_datastore
    policy='policy name' datastore=dsl
```

salt.modules.vsphere.assign_license(license_key, license_name, entity, entity_display_name, safety_checks=True, service_instance=None)

Assigns a license to an entity

- **license_key** Key of the license to assign. See _get_entity docstrings for format.
- **license_name** Display name of license
- **entity** Dictionary representation of an entity
- **entity_display_name** Entity name used in logging
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```python
salt '*' vsphere.assign_license
    license_key=00000:00000
    license_name=test
    entity={
        type:cluster,
        datacenter:dc,
        cluster:cl
    }
```

salt.modules.vsphere.attach_tag(object_id, tag_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (CategoryModel.cardinality) and associability (CategoryModel.associable_types) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:

```bash
salt vm_minion vsphere.attach_tag domain-c2283
    → urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-38865467cfbe:GLOBAL
```

**Parameters**
- **object_id** (str) -- The identifier of the input object.
- **tag_id** (str) -- The identifier of the tag object.
- **managed_obj** (str) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

**Returns** The list of all tag identifiers that correspond to the tags attached to the given object.
Return type list of tags
Raise Unauthorized if you do not have the privilege to read the object.
Raise Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.compare_vm_configs(new_config, current_config)

Comparisons virtual machine current and new configuration, the current is the one which is deployed now, and
the new is the target config. Returns the differences between the objects in a dictionary, the keys are the
configuration parameter keys and the values are differences objects: either list or recursive difference
new_config: New config dictionary with every available parameter
current_config Currently deployed configuration

salt.modules.vsphere.configure_host_cache(enabled, datastore=None, swap_size_MiB=None, service_instance=None)

Configures the host cache on the selected host.
enabled Boolean flag specifying whether the host cache is enabled.
datastore Name of the datastore that contains the host cache. Must be set if enabled is true.
swap_size_MiB Swap size in Mibibytes. Needs to be set if enabled is true. Must be smaller than the datastore
size.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.configure_host_cache enabled=False
salt '*' vsphere.configure_host_cache enabled=True datastore=ds1

swap_size_MiB=1024

salt.modules.vsphere.coredump_network_enable(host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable ESXi core dump collection. Returns True if coredumps are enabled and returns False if core
dump is not enabled. If there was an error, the error will be the value printed in the Error key dictionary for
the given host.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
enabled Python True or False to enable or disable coredumps.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore Optionally set to path to the credential store file.

CLI Example:

# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password

esxi_hosts='[esxi-1.host.com, esxi-2.host.com]' → True

salt.modules.vsphere.create_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value
config dict Dictionary with the config values of the new cluster.
datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default
value is None.

cluster  Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```python
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=${cluster_dict} cluster=c1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=${cluster_dict}
```

salt.modules.vsphere.create_datacenter(datacenter_name, service_instance=None)

Creates a datacenter.

Supported proxies: esxdatacenter
datacenter_name  The datacenter name

```python
salt '*' vsphere.create_datacenter dc1
```

salt.modules.vsphere.create_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Creates disk group on an ESXi host with the specified cache and capacity disks.

- cache_disk_id  The canonical name of the disk to be used as a cache. The disk must be ssd.
- capacity_disk_ids  A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.
- safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

```python
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']
```

salt.modules.vsphere.create_dvportgroup(portgroup_dict, portgroup_name, dvs, service_instance=None)

Creates a distributed virtual portgroup.

Note: The portgroup_name param will override any name already set in portgroup_dict.

- portgroup_dict  Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).
- portgroup_name  Name of the portgroup to be created.
- dvs  Name of the DVS that will contain the portgroup.

```python
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
    portgroup_name=pg1 dvs=dvs1
```

salt.modules.vsphere.create_dvs(dvs_dict, dvs_name, service_instance=None)

Creates a distributed virtual switch (DVS).

Note: The dvs_name param will override any name set in dvs_dict.

- dvs_dict  Dict representation of the new DVS (example in salt.states.dvs)
- dvs_name  Name of the DVS to be created.

```python
salt '*' vsphere.create_dvs dvs dict=${dvs_dict} dvs_name=dvs_name
```

salt.modules.vsphere.create_storage_policy(policy_name, policy_dict, service_instance=None)

21.9. execution modules
Creates a storage policy.

Supported capability types: scalar, set, range.

**policy_name** Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.

**policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
    policy_dict="$policy_dict"
```

salt.modules.vsphere.create_tag(name, description, category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Create a tag under a category with given description.

CLI Example:

```
salt vm_minion vsphere.create_tag
```

Parameters

- **server** (basestring) -- Target DNS or IP of vCenter client.
- **username** (basestring) -- Username associated with the vCenter client.
- **password** (basestring) -- Password associated with the vCenter client.
- **name** (str) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (str) -- Given description of tag category.
- **category_id** (str) -- Value of category_id representative of the category created previously.
- **verify_ssl** (boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle** (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

Returns The identifier of the created tag.

Return type str

Raise AlreadyExists if the name provided in the create_spec is the name of an already existing tag in the input category.

Raise InvalidArgument if any of the input information in the create_spec is invalid.

Raise NotFound if the category for in the given create_spec does not exist in the system.

Raise Unauthorized if you do not have the privilege to create tag.

salt.modules.vsphere.create_tag_category(name, description, cardinality, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Create a category with given cardinality.

CLI Example:

```
salt vm_minion vsphere.create_tag_category
```

Parameters

- **name** (str) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (str) -- Given description of tag category.
- **cardinality** (str) -- The associated cardinality (SINGLE, MULTIPLE) of the category.
- **server** (basestring) -- Target DNS or IP of vCenter center.
- **username** (basestring) -- Username associated with the vCenter center.
- **password** (basestring) -- Password associated with the vCenter center.
verify_ssl (boolean) -- Verify the SSL certificate. Default: True
ca_bundle (basestring) -- Path to the ca bundle to use when verifying SSL certificates.

Returns Identifier of the created category.
Return type str

Raise AlreadyExists if the name provided in the create_spec is the name of an already existing category.
Raise InvalidArgument if any of the information in the create_spec is invalid.
Raise Unauthorized if you do not have the privilege to create a category.

salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)

Creates a virtual machine container.

CLI Example:
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ...

vm_name Name of the virtual machine
cpu Properties of CPUs for freshly created machines
memory Memory size for freshly created machines
image Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
version Virtual machine container hardware version
datacenter Datacenter where the virtual machine will be deployed (mandatory)
datastore Datastore where the virtual machine files will be placed
placement Resource pool or cluster or host or folder where the virtual machine will be deployed
devices interfaces

interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True

disks

  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'

cscsi_devices
scsi_devices:
controller: 'SCSI controller 0'
type: paravirtual
bus_sharing: no_sharing

serial_ports
serial_ports:
  adapter: 'Serial port 1'
type: network
backing:
  uri: 'telnet://something:port'
direction: <client|server>
filename: 'service_uri'
connectable:
  allow_guest_control: True
  connected: True
  start_connected: True
  yield: False

cd_drives
cd_drives:
  adapter: 'CD/DVD drive 0'
controller: 'IDE 0'
device_type: datastore_iso_file
datastore_iso_file:
  path: path_to_iso
connectable:
  allow_guest_control: True
  connected: True
  start_connected: True

advanced_config Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore(datastore_name, disk_id, vmfs_major_version,
safety_checks=True, service_instance=None)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name The name of the datastore to be created.
disk_id The disk id (canonical name) on which the datastore is created.
vmfs_major_version The VMFS major version.
safety_checks Specify whether to perform safety check or to skip the checks and try performing the required
task. Default is True.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
vmfs_major_version=5

salt.modules.vsphere.delete_advanced_configs(vm_name, datacenter, advanced_configs,
service_instance=None)

Removes extra config parameters from a virtual machine
vm_name Virtual machine name
datacenter Datacenter name where the virtual machine is available
advanced_configs List of advanced config values to be removed
service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.delete_tag(tag_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

Parameters

- **tag_id** *(str)* -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

*Raise* `AlreadyExists` if the name provided in the create_spec is the name of an already existing category.

*Raise* `InvalidArgument` if any of the information in the create_spec is invalid.

*Raise* `Unauthorized` if you do not have the privilege to create a category.

```
salt.modules.vsphere.delete_tag_category(category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

Parameters

- **category_id** *(str)* -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

*Raise* `NotFound` if the tag for the given tag_id does not exist in the system.

*Raise* `Unauthorized` if you do not have the privilege to delete the tag.

*Raise* `Unauthenticated` if the user can not be authenticated.

```
salt.modules.vsphere.delete_vm(name, datacenter, placement=None, power_off=False, service_instance=None)
```

Deletes a virtual machine defined by name and placement

- **name** Name of the virtual machine
- **datacenter** Datacenter of the virtual machine
- **placement** Placement information of the virtual machine
- **service_instance** vCenter service instance for connection and configuration

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

```
salt.modules.vsphere.disconnect(service_instance)
```

Disconnects from a vCenter or ESXi host

*Note*: Should be used by state functions, not invoked directly.
service_instance  Service instance (vim.ServiceInstance)

CLI Example:
  See note above.
salt.modules.vsphere.enable_firewall_ruleset(
    host, username, password, ruleset_enable,
    ruleset_name, protocol=None, port=None,
    esxi_hosts=None, credstore=None)

Enable or disable an ESXi firewall rule set.

  host  The location of the host.
  username  The username used to login to the host, such as root.
  password  The password used to login to the host.
  ruleset_enable  True to enable the ruleset, false to disable.
  ruleset_name  Name of ruleset to target.
  protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
  port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
  esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
  credstore  Optionally set to path to the credential store file.

    Returns  A standard cmd.run_all dictionary, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True →'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password →True 'syslog'  esxi_hosts=['[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.erase_disk_partitions(
  disk_id=None, scsi_address=None, service_instance=None)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id  Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
scsi_address  Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```bash
salt '*' vsphere.erase_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
salt '*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'
```
salt.modules.vsphere.esxcli_cmd(
  cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None)

Run an ESXCLI command directly on the host or list of hosts.

  host  The location of the host.
  username  The username used to login to the host, such as root.
  password  The password used to login to the host.
  cmd_str  The ESXCLI command to run. Note: This should not include the -s, -u, -p, -h, --protocol, or --portnumber arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.
  protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
  port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
**esxi_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**CLI Example:**

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
  → 'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
  → 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.get_advanced_configs**( `vm_name`, `datacenter`, `service_instance=None` )

Returns extra config parameters from a virtual machine advanced config list

- **vm_name** Virtual machine name
- **datacenter** Datacenter name where the virtual machine is available
- **service_instance** vCenter service instance for connection and configuration

**salt.modules.vsphere.get_coredump_network_config**( `host`, `username`, `password`, `protocol=None`, `port=None`, `esxi_hosts=None`, `credstore=None` )

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **esxi_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

**Returns** A dictionary with the network configuration, or, if getting the network config failed, an error message retrieved from the standard `cmd.run_all` dictionary, per host.

**CLI Example:**

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-password
  → esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.get_firewall_status**( `host`, `username`, `password`, `protocol=None`, `port=None`, `esxi_hosts=None`, `credstore=None` )

Show status of all firewall rule sets.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **esxi_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.
Returns Nested dictionary with two toplevel keys rulesets and success success will be True or False depending on query success rulesets will list the rulesets and their statuses if success was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
← esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_host_cache(service_instance=None)

Returns the host cache configuration on the proxy host.

- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.get_host_cache
```

salt.modules.vsphere.get_host_datetime(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the date/time information for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get date/time information.

If host_names is not provided, the date/time information will be retrieved for the host location instead. This is useful when service instance connection information is used for a single ESXi host.

- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
← host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ntp_config(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the NTP configuration information for a given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as root.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.
If host_names is not provided, the NTP configuration will be retrieved for the host location instead.

This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password

←host_names='[esxi-1.host.com, esxi-2.host.com]'!
```

salt.modules.vsphere.get_proxy_type()

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns <undefined> otherwise.

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

salt.modules.vsphere.get_service_instance_via_proxy(service_instance=None)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

Note: Should be used by state functions not invoked directly.

CLI Example: See note above

salt.modules.vsphere.get_service_policy(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the service name's policy for a given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

service_name

The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- ldtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.
If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```sh
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd'  
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_service_running(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the service name's running state for a given host or list of hosts.

host  The location of the host.

username  The username used to login to the host, such as root.

password  The password used to login to the host.

service_name  The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host_names is not provided, the service's running state will be retrieved for the host location instead.

This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```sh
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'  
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ssh_key(host, username, password, protocol=None, port=None, certificate_verify=None)

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.
Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate. Default: True

**Returns** True if upload is successful

CLI Example:

```bash
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_verify=True
```

```bash
salt.modules.vsphere.get_syslog_config(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)
```

Retrieve the syslog configuration.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password

salt.modules.vsphere.get_vm(name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)
```

Returns vm object properties.

- **name** Name of the virtual machine.
- **datacenter** Datacenter name.
- **vm_properties** List of vm properties.
- **traversal_spec** Traversal Spec object(s) for searching.
- **parent_ref** Container Reference object for searching under a given object.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```bash
salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)
```

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.

- **name** Name of the virtual machine
- **datacenter** Datacenter’s name where the virtual machine is available
- **objects** Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set
service_instance  vCenter service instance for connection and configuration

salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success
None on failure
name  Name of the virtual machine
datacenter  Datacenter name
datastore  Datastore where the virtual machine files are stored
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vmotion_enabled(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the VMotion enabled status for a given host or a list of host_names. Returns True if VMotion is enabled,
False if it is not enabled.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password → host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Returns a list of VSAN-eligible disks for a given host or list of host_names.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:
salt.modules.vsphere.get_vsan_enabled(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the VSAN enabled status for a given host or a list of host_names. Returns True if VSAN is enabled, False if it is not enabled, and None if a VSAN Host Config is unset, per host.

**host**  The location of the host.

**username**  The username used to login to the host, such as root.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

If host_names is not provided, the VSAN status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**  Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password

# host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.gets_service_instance_via_proxy(fn)

Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (vim.ServiceInstance) to the decorated function.

Supported proxies: esxi, esxcluster, esxdatacenter.

**Notes**

1. The decorated function must have a service_instance parameter or a **kwargs type argument (name of argument is not important); 2. If the service_instance parameter is already defined, the value is passed through to the decorated function; 3. If the service_instance parameter in not defined, the connection is created using the proxy details and the service instance is returned.

**CLI Example:** None, this is a decorator

salt.modules.vsphere.list_assigned/licenses(entity, entity_display_name, license_keys=None, service_instance=None)

Lists the licenses assigned to an entity.

**entity**  Dictionary representation of an entity. See _get_entity docstrings for format.

**entity_display_name**  Entity name used in logging

**license_keys**  List of license keys to be retrieved. Default is None.

**service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
salt 'vsphere.list_assigned_licenses
entity={type:cluster,datacenter:dc,cluster:cl}
entity_display_name=cl

salt.modules.vsphere.list_attached_tags(object_id, managed_obj='ClusterComputeResource',
server=None, username=None, password=None,
service_instance=None, verify_ssl=None,
ca_bundle=None)

List existing tags a user has access to.

CLI Example:
salt vm_minion vsphere.list_attached_tags domain-c2283

Parameters
- **object_id**(str) -- The identifier of the input object.
- **managed_obj**(str) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server**(basestring) -- Target DNS or IP of vCenter center.
- **username**(basestring) -- Username associated with the vCenter center.
- **password**(basestring) -- Password associated with the vCenter center.
- **verify_ssl**(boolean) -- Verify the SSL certificate. Default: True
- **ca_bundle**(basestring) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
The list of all tag identifiers that correspond to the tags attached to the given object.

Return type list of tags
Raise Unauthorized if you do not have the privilege to read the object.
Raise Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.list_capability_definitions(service_instance=None)

Returns a list of the metadata of all capabilities in the vCenter.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt 'vsphere.list_capabilities

salt.modules.vsphere.list_cluster(datacenter=None, cluster=None, service_instance=None)

Returns a dict representation of an ESX cluster.

datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

# vcenter proxy
salt 'vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt 'vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt 'vsphere.list_cluster

salt.modules.vsphere.list_clusters(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of clusters for the specified host.
host The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```python
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters(
    host, username, password, protocol=None, port=None,
    verify_ssl=True)

Returns a list of datacenters for the specified host.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```python
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datacenters_via_proxy(
    datacenter_names=None, service_instance=None)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter
datacenter_names  List of datacenter names. Default is None.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```python
salt '*' vsphere.list_datacenters_via_proxy
salt '*' vsphere.list_datacenters_via_proxy dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

salt.modules.vsphere.list_datastore_clusters(
    host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of datastore clusters for the specified host.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```python
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores(
    host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of datastores for the specified host.
host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```shell
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores_via_proxy(datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datastore_names  List of the names of datastores to filter on
backing_disk_ids  List of canonical names of the backing disks of the datastores to filer. Default is None.
backing_disk_scsi_addresses  List of scsi addresses of the backing disks of the datastores to filter. Default is None.

```shell
salt '*' vsphere.list_datastores_via_proxy
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

salt.modules.vsphere.list_default_storage_policy_of_datastore(datastore, service_instance=None)

Returns a list of datastores assign the storage policies.

datastore  Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

```shell
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

salt.modules.vsphere.list_default_vsan_policy(service_instance=None)

Returns the default vsan storage policy.

```shell
salt '*' vsphere.list_default_vsan_policy
```

salt.modules.vsphere.list_storage_policies(policy_names=None, service_instance=None)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id  Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
scsi_address  Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

```shell
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

salt.modules.vsphere.list_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id  Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
scsi_address  Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).

```shell
salt '*' vsphere.list_disk_partitions
```
salt 'vsphere.list_disk_partitions scsi_address='vmhba0:C0:T0:L0'
salt 'vsphere.list_disk_partitions disk_id='naa.0000000000000001'

salt.modules.vsphere.list_diskgroups(cache_disk_ids=None, service_instance=None)
Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disk canonical names. If no filtering is applied, all disk groups are returned.
cache_disk_ids: List of cache disk canonical names of the disk groups to be retrieved. Default is None.
use_proxy_details Specify whether to use the proxy minion's details instead of the arguments
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt 'vsphere.list_diskgroups'
salt 'vsphere.list_diskgroups  cache_disk_ids='[naa.000000000000001]'

salt.modules.vsphere.list_disks(disk_ids=None, scsi_addresses=None, service_instance=None)
Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.
disk_ids: List of disk canonical names to be retrieved. Default is None.
scsi_addresses List of scsi addresses of disks to be retrieved. Default is None
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt 'vsphere.list_disks'
salt 'vsphere.list_disks  disk_ids='[naa.00, naa.001]'
salt 'vsphere.list_disks
  scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'

salt.modules.vsphere.list_dvportgroups(dvs=None, portgroup_names=None, service_instance=None)
Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.
dvs Name of the DVS containing the portgroups. Default value is None.
portgroup_names List of portgroup names to look for. If None, all portgroups are returned. Default value is None
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt 'vsphere.list_dvportgroups'
salt 'vsphere.list_dvportgroups  dvs=ds1
salt 'vsphere.list_dvportgroups  portgroup_names=[pg1]'
salt 'vsphere.list_dvportgroups  dvs=ds1  portgroup_names=[pg1]

salt.modules.vsphere.list_dvs(host, username, password, protocol=None, port=None, verify_ssl=True)
Returns a list of distributed virtual switches for the specified host.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True
**salt.modules.vsphere.list_dvss**(datacenter=\`None\`, dvs_names=\`None\`, service_instance=\`None\`)  
Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.  
  
- **datacenter**  
The datacenter to look for DVSs in. Default value is None.  
- **dvs_names**  
List of DVS names to look for. If None, all DVSs are returned. Default value is None.

```bash  
salt '*' vsphere.list_dvss  
salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]  
```

**salt.modules.vsphere.list_folders**(host, username, password, protocol=\`None\`, port=\`None\`, verify_ssl=\`True\`)  
Returns a list of folders for the specified host.  
  
- **host**  
The location of the host.  
- **username**  
The username used to login to the host, such as \`root\`.  
- **password**  
The password used to login to the host.  
- **protocol**  
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is \`https\`.  
- **port**  
Optionally set to alternate port if the host is not using the default port. Default port is 443.  
- **verify_ssl**  
Verify the SSL certificate. Default: True

CLI Example:

```bash  
salt '*' vsphere.list_folders 1.2.3.4 root bad-password  
```

**salt.modules.vsphere.list_hosts**(host, username, password, protocol=\`None\`, port=\`None\`, verify_ssl=\`True\`)  
Returns a list of hosts for the specified VMware environment.  
  
- **host**  
The location of the host.  
- **username**  
The username used to login to the host, such as \`root\`.  
- **password**  
The password used to login to the host.  
- **protocol**  
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is \`https\`.  
- **port**  
Optionally set to alternate port if the host is not using the default port. Default port is 443.  
- **verify_ssl**  
Verify the SSL certificate. Default: True

CLI Example:

```bash  
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password  
```

**salt.modules.vsphere.list_hosts_via_proxy**(hostnames=\`None\`, datacenter=\`None\`, cluster=\`None\`, service_instance=\`None\`)  
Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name.  
  
- **hostnames**  
Hostnames to filter on.  
- **datacenter name**  
Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.  
- **cluster name**  
Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.  
- **service_instance**  
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```bash  
salt '*' vsphere.list_hosts_via_proxy  
salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]  
```
salt modules.vsphere.list_licenses

Lists all licenses on a vCenter.

- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

    salt '*' vsphere.list_licenses

salt modules.vsphere.list_networks

Returns a list of networks for the specified host.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl** Verify the SSL certificate. Default: True

    CLI Example:

    salt '*' vsphere.list_networks 1.2.3.4 root bad-password

salt modules.vsphere.list_non_ssds

Returns a list of Non-SSD disks for the given host or list of host_names.

**Note:** In the pyVmomi StorageSystem, ScsiDisks may, or may not have an ssd attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have ssd = true, it will end up in the non_ssds list here.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

    If host_names is not provided, Non-SSD disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.
- **verify_ssl** Verify the SSL certificate. Default: True

    CLI Example:

    # Used for single ESXi host connection information
    salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

    # Used for connecting to a vCenter Server
    salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password

    "host_names='[esxi-1.host.com, esxi-2.host.com]'"
salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of resource pools for the specified host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Returns a list of SSDs for the given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

If host_names is not provided, SSDs will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password
  host_names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.list_storage_policies(policy_names=None, service_instance=None)

Returns a list of storage policies.

- **policy_names**: Names of policies to list. If None, all policies are listed. Default is None.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

salt.modules.vsphere.list_tag_categories(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```
Parameters
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

Returns Value(s) of category_id.
Return type list of str

`salt.modules.vsphere.list_tags` *(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)*

List existing tags a user has access to.

CLI Example:
```
salt vm_minion vsphere.list_tags
```

Parameters
- **server** *(basestring)* -- Target DNS or IP of vCenter center.
- **username** *(basestring)* -- Username associated with the vCenter center.
- **password** *(basestring)* -- Password associated with the vCenter center.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

Returns Value(s) of tag_id.
Return type list of str

`salt.modules.vsphere.list_uplink_dvportgroup` *(dvs, service_instance=None)*

Returns the uplink portgroup of a distributed virtual switch.

`salt.modules.vsphere.list_vapps` *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of vApps for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:
```
# list vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

`salt.modules.vsphere.list_vms` *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of VMs for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```bash
salt '***' vsphere.list_vms 1.2.3.4 root bad-password
```

salt.modules.vsphere.power_off_vm(name, datacenter=None, service_instance=None)
  Powers off a virtual machine specified by its name.
  name  Name of the virtual machine
datacenter  Datacenter of the virtual machine
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```bash
salt '***' vsphere.power_off_vm name=my_vm
```

salt.modules.vsphere.power_on_vm(name, datacenter=None, service_instance=None)
  Powers on a virtual machine specified by its name.
  name  Name of the virtual machine
datacenter  Datacenter of the virtual machine
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```bash
salt '***' vsphere.power_on_vm name=my_vm
```

salt.modules.vsphere.register_vm(name, datacenter, placement, vmx_path, service_instance=None)
  Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list
  name  Name of the virtual machine
datacenter  Datacenter of the virtual machine
placement  Placement dictionary of the virtual machine, host or cluster
vmx_path:  Full path to the vmx file, datastore name should be included
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```bash
salt.modules.vsphere.remove_capacity_from_diskgroup(cache_disk_id, capacity_disk_ids, data_evacuation=True, safety_checks=True, service_instance=None)
```

Remove capacity disks from the disk group with the specified cache disk.
  cache_disk_id  The canonical name of the cache disk.
capacity_disk_ids  A list containing canonical names of the capacity disks to add.
data_evacuation  Specifies whether to gracefully evacuate the data on the capacity disks before removing
                 them from the disk group. Default value is True.
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required
                 task. Default value is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```bash
salt '***' vsphere.remove_capacity_from_diskgroup
  cache_disk_id='naa.000000000000001'
capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

salt.modules.vsphere.remove_datastore(datastore, service_instance=None)
  Removes a datastore. If multiple datastores an error is raised.
  datastore  Datastore name
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
salt 'vsphere.remove_datastore ds_name

salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, service_instance=None)

Remove the diskgroup with the specified cache disk.

- **cache_disk_id** The canonical name of the cache disk.
- **data_accessibility** Specifies whether to ensure data accessibility. Default value is True.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt 'vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'

salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)

Removes a distributed virtual portgroup.

- **portgroup** Name of the portgroup to be removed.
- **dvs** Name of the DVS containing the portgroups.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt 'vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1'

salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, service_instance=None)

Renames a datastore. The datastore needs to be visible to the proxy.

- **datastore_name** Current datastore name.
- **new_datastore_name** New datastore name.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

salt 'vsphere.rename_datastore old_name new_name'

salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None, credstore=None)

Reset the syslog service to its default settings.

Valid syslog_config values are logdir, loghost, logdir-unique, default-rotate, default-size, default-timeout, or all for all of these.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **syslog_config** List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

syslog_config can be passed as a quoted, comma-separated string, e.g.

```
# Used for ESXi host connection information
salt 'vsphere.reset_syslog_config my.esxi.host root bad-password
   →syslog_config='logdir,loghost'
```
# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
   
   → syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.service_restart(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Restart the named service for the given host or list of hosts.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'
   
   → host_names='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.service_start(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Start the named service for the given host or list of hosts.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
• TSM
• SSH
• lbtd
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'  #
  → host_names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.service_stop(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Stop the named service for the given host or list of hosts.

host  The location of the host.

username  The username used to login to the host, such as root.

password  The password used to login to the host.

service_name  
The name of the service for which to set the policy. Supported service names are:

• DCUI
• TSM
• SSH
• lbtd
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for
a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to stop the
service.

If host_names is not provided, the service will be stopped for the host location instead. This is useful
for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh' →
host_names=['[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.set_ntp_config(host, user, password, ntp_servers, protocol=None, port=None, host_names=None, verify_ssl=True)

Set NTP configuration for a given host of list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **ntp_servers** A list of servers that should be added to and configured for the specified host's NTP configuration.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100, 192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password '[192.174.1.100, 192.174.1.200]' host_names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.set_service_policy(host, user, password, sname, policy, protocol=None, port=None, host_names=None, verify_ssl=True)

Set the service name's policy for a given host or list of hosts.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **sname** The name of the service for which to set the policy. Supported service names are:
  - DCUI
  - TSM
  - SSH
  - Ibtid
  - Isassd
  - Iwiod
  - Netlogond
  - Ntpd
  - Sfcbd-watchdog
  - Snmpd
  - Vprobed
  - Vpxa
  - Xorg

- **policy** The policy to set for the service. For example, 'automatic'.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the
service policy.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd'
   → 'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd'
   → 'automatic'   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.set_syslog_config**

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

**host** ESXi or vCenter host to connect to.

**username** User to connect as, usually root.

**password** Password to connect with.

**syslog_config** Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are logdir, loghost, default-rotate`, ``default-size, default-timeout, and logdir-unique.

**config_value** Value for the above parameter. For loghost, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(Reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**firewall** Enable the firewall rule set for syslog. Defaults to True.

**reset_service** After a successful parameter set, reset the service. Defaults to True.

**esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

**Returns** Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

**CLI Example:**

```bash
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password loghost
   → ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password loghost
   → ssl://localhost:5432,tcp://10.1.0.1:1514
   → '[esxi-1.host.com, esxi-2.host.com]'
```
salt.modules.vsphere.supports_proxies('proxy_types')
Decorator to specify which proxy types are supported by a function
proxy_types: Arbitrary list of strings with the supported types of proxies

salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)
Reload the syslog service so it will pick up any changes.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary. This dictionary will at least have a retcode key. If retcode is 0 the command was successful.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
-> esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.system_info(host, username, password, protocol=None, port=None, verify_ssl=True)
Return system information about a VMware environment.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```bash
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

salt.modules.vsphere.test_vcenter_connection(service_instance=None)
Checks if a connection is to a vCenter

CLI Example:

```bash
salt '*' vsphere.test_vcenter_connection
```

salt.modules.vsphere.unregister_vm(name, datacenter, placement=None, power_off=False, service_instance=None)
Unregisters a virtual machine defined by name and placement
name Name of the virtual machine
datacenter Datacenter of the virtual machine
placement Placement information of the virtual machine
service_instance vCenter service instance for connection and configuration
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter

salt.modules.vsphere.update_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Updates a cluster.

config_dict Dictionary with the config values of the new cluster.
datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict

salt.modules.vsphere.update_dvportgroup(portgroup_dict, portgroup, dvs, service_instance=True)

Updates a distributed virtual portgroup.

portgroup_dict Dictionary with the values the portgroup should be update with (example in salt.states.dvs).
portgroup Name of the portgroup to be updated.
dvs Name of the DVS containing the portgroups.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1 dvs=dvs1

salt.modules.vsphere.update_dvs(dvs_dict, dvs, service_instance=None)

Updates a distributed virtual switch (DVS).

Note: Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in dvs_dict will be ignored.

dvs_dict Dictionary with the values the DVS should be update with (example in salt.states.dvs)
dvs Name of the DVS to be updated.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1

salt.modules.vsphere.update_host_datetime(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

If host_names is not provided, the date/time will be updated for the host location instead. This is useful
for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
← host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.update_host_password
```

Update the password for a given host.

**host** The location of the ESXi host.

**username** The username used to login to the ESXi host, such as root.

**password** The password used to login to the ESXi host.

**new_password** The new password that will be updated for the provided username on the ESXi host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-bad-password
```

```python
salt.modules.vsphere.update_storage_policy
```

Updates a storage policy.

Supported capability types: scalar, set, range.

**policy** Name of the policy to update.

**policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_storage_policy policy='policy name' policy_dict="$policy_dict"
```

```python
salt.modules.vsphere.update_vm
```

Updates the configuration of the virtual machine if the config differs.

**vm_name** Virtual Machine name to be updated

**cpu** CPU configuration options

**memory** Memory configuration options

**version** Virtual machine container hardware version

**image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

**interfaces** Network interfaces configuration options

**disks** Disks configuration options

**scsi_devices** SCSI devices configuration options

21.9. execution modules 2891
serial_ports Serial ports configuration options
datacenter Datacenter where the virtual machine is available
datastore Datastore where the virtual machine config files are available
cd_dvd_drives CD/DVD drives configuration options
advanced_config Advanced config parameters to be set for the virtual machine
service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.upload_ssh_key(host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=None)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

Parameters
- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **ssh_key** -- Public SSH key, will be added to authorized_keys on ESXi
- **ssh_key_file** -- File containing the SSH key. Use 'ssh_key' or ssh_key_file, but not both.
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate. Default: True

Returns Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:
```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file='/etc/salt/my_keys/my_key.pub'
```

salt.modules.vsphere.vmotion_disable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Disable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VMotion.

If host_names is not provided, VMotion will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:
```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vmotion_enable(host, username, password, protocol=None, port=None, host_names=None, device='vmk0', verify_ssl=True)
Enable vMotion for a given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

If host_names is not provided, VMotion will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

device  The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to vmk0.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password
  → host_names=['[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vsan_add_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the host's VSAN system for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
  → host_names=['[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vsan_disable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Disable VSAN for a given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.vsan_enable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Enable VSAN for a given host or list of host_names.

host  The location of the host.

username  The username used to login to the host, such as root.

password  The password used to login to the host.

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port  Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

21.9.480  salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don't use htpasswd to use the webutil module name.

salt.modules.webutil.useradd(pwfile, user, password, opts='', runas=None)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

pwfile  Path to htpasswd file

user  User name

password  User password

opts  Valid options that can be passed are:
• \( n \) Don’t update file; display results on stdout.
• \( m \) Force MD5 encryption of the password (default).
• \( d \) Force CRYPT encryption of the password.
• \( p \) Do not encrypt the password (plaintext).
• \( s \) Force SHA encryption of the password.

**runas** The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

**salt.modules.webutil.userdel** *(pwfile, user, runas=None, all_results=False)*

Delete a user from the specified htpasswd file.

**pwfile** Path to htpasswd file
**user** User name
**runas** The system user to run htpasswd command with

**all_results** Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

**salt.modules.webutil.verify** *(pwfile, user, password, opts='', runas=None)*

Return True if the htpasswd file exists, the user has an entry, and their password matches.

**pwfile** Fully qualified path to htpasswd file
**user** User name
**password** User password
**opts** Valid options that can be passed are:
  • \( m \) Force MD5 encryption of the password (default).
  • \( d \) Force CRYPT encryption of the password.
  • \( p \) Do not encrypt the password (plaintext).
  • \( s \) Force SHA encryption of the password.
**runas** The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

## 21.9.481 salt.modules.win_auditchannel module

A salt module for modifying the audit policies on the machine.

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings are broken down into nine categories:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
• Logon/Logoff
• Object Access
• Policy Change
• Privilege Use
• System

The get_settings function will return the subcategories for all nine of the above categories in one dictionary along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

• No Auditing
• Success
• Failure
• Success and Failure

CLI Example:

```
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon" category
salt * auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and Failure
salt * auditpol.set_setting name="Credential Validation" value="Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting name="Credential Validation" value="No Auditing"
```

salt.modules.win_auditpol.get_setting(name)
Get the current configuration for the named audit setting

Parameters

name (str) -- The name of the setting to retrieve

Returns
The current configuration for the named setting

Return type
str

Raises

• KeyError -- On invalid setting name
• CommandExecutionError -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting "Credential Validation"
```

salt.modules.win_auditpol.get_settings(category="All")
Get the current configuration for all audit settings specified in the category

Parameters
category (str) -- One of the nine categories to return. Can also be All to return the settings for all categories. Valid options are:
• Account Logon
• Account Management
• Detailed Tracking
• DS Access
• Logon/Logoff
• Object Access
• Policy Change
• Privilege Use
• System
• All
Default value is All

Returns
A dictionary containing all subcategories for the specified category along with their current configuration
Return type dict
Raises
• KeyError -- On invalid category
• CommandExecutionError -- If an error is encountered retrieving the settings

CLI Example:
```
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon" category
salt * auditpol.get_settings "Account Logon"
```

```
salt.modules.win_auditpol.set_setting(name, value)
Set the configuration for the named audit setting

Parameters
• name (str) -- The name of the setting to configure
• value (str) -- The configuration for the named value. Valid options are:
  - No Auditing
  - Success
  - Failure
  - Success and Failure

Returns True if successful
Return type bool
Raises
• KeyError -- On invalid name or value
• CommandExecutionError -- If an error is encountered modifying the setting

CLI Example:
```
# Set the state of the "Credential Validation" setting to Success and Failure
salt * auditpol.set_setting "Credential Validation" "Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting "Credential Validation" "No Auditing"
```
21.9.482 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

salt.modules.win_autoruns.list()

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

21.9.483 salt.modules.win_certutil module

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

salt.modules.win_certutil.add_store(source, store, retcode=False, saltenv='base')

Add the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file
store The certificate store to add the certificate to
retcode If true, return the retcode instead of stdout. Default is False
saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.del_store(source, store, retcode=False, saltenv='base')

Delete the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file
store The certificate store to delete the certificate from
retcode If true, return the retcode instead of stdout. Default is False
saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.get_cert_serial(cert_file)

Get the serial number of a certificate file

cert_file The certificate file to find the serial for

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

salt.modules.win_certutil.get_stored_cert_serials(store)

Get all of the certificate serials in the specified store

store The store to get all the certificate serials from

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```
21.9.484  salt.modules.win_dacl

Manage DACLs on Windows

depends
  • winreg Python module

salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)

add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to add permission: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:
```
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey', 'Registry\domain\fakeuser', 'FULLCONTROL', 'ALLOW', 'KEY&SUBKEYS'
```

salt.modules.win_dacl.check_ace(path, objectType, user=None, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)

Checks a path to verify the ACE (access control entry) specified exists

Parameters
  • path -- path to the file/reg key
  • objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
  • user -- user that the ACL is for
  • permission -- permission to test for (READ, FULLCONTROL, etc)
  • acetype -- the type of ACE (ALLOW or DENY)
  • propagation -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
  • exactPermissionMatch -- the ACL must match exactly. IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:
```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

salt.modules.win_dacl.check_inheritance(path, objectType, user=None)

Check a specified path to verify if inheritance is enabled

Parameters
  • path -- path of the registry key or file system object to check
  • objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
  • user -- if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:
```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

class  salt.modules.win_dacl.daclConstants

DACL constants used throughout the module
getAceTypeBit(t)
    returns the acetype bit of a text value

getaAceTypeText(t)
    returns the textual representation of a acetype bit

ggetObjectTypeBit(t)
    returns the bit value of the string object type

getPermissionBit(t, m)
    returns a permission bit of the string permission value for the specified object type

getPermissionText(t, m)
    returns the permission textual representation of a specified permission bit/object type

getPropagationBit(t, p)
    returns the propagation bit of a text value

getPropagationText(t, p)
    returns the textual representation of a propagation bit

getSecurityHkey(s)
    returns the necessary string value for an HKEY for the win32security module

processPath(path, objectType)
    processes a path/object type combo and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(path, objectType, copy=True)
    Disable inheritance on an object
    Parameters
    • path -- The path to the object
    • objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
    • copy -- True will copy the Inherited ACEs to the DACL before disabling inheritance
    Returns (dict): A dictionary containing the results

    CLI Example:
    salt 'minion-id' win_dacl.disable_inheritance c: emp directory

salt.modules.win_dacl.enable_inheritance(path, objectType, clear=False)
    enable/disable inheritance on an object
    Parameters
    • path -- The path to the object
    • objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
    • clear -- True will remove non-Inherited ACEs from the ACL
    Returns (dict): A dictionary containing the results

    CLI Example:
    salt 'minion-id' win_dacl.enable_inheritance c: emp directory

salt.modules.win_dacl.get(path, objectType, user=None)
    Get the ACL of an object. Will filter by user if one is provided.
    Parameters
    • path -- The path to the object
    • objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
    • user -- A user name to filter by
    Returns (dict): A dictionary containing the ACL

    CLI Example:
salt 'minion-id' win_dacl.get c: emp directory

```
salt.modules.win_dacl.rm_ace(path, objectType, user, permission=None, acetype=None, propagation=None)
```

remove an ace to an object

- **path**: path to the object (i.e. `c:\temp\file`, `HKEY_LOCAL_MACHINE\SOFTWARE\KEY`, etc)
- **user**: user to remove permission
- **permission**: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY)
- **propagation**: how the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey'
salt 'myminion' win_dacl.rm_ace 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

### 21.9.485 salt.modules.win_disk

Module for gathering disk information on Windows

**depends**

- win32api Python module

```
salt.modules.win_disk.usage()
```

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

### 21.9.486 salt.modules.win_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

```
salt.modules.win_dism.add_capability(capability, source=None, limit_access=False, image=None, restart=False)
```

Install a capability

**Parameters**

- **capability** *(str)* -- The capability to install
- **source** *(Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit_access** *(Optional[bool])* -- Prevent DISM from contacting Windows Update for the source package
- **image** *(Optional[str])* -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** *(Optional[bool])* -- Reboot the machine if required by the install

**Raises**

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.
Returns A dictionary containing the results of the command
Return type dict

CLI Example:
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0

```
salt.modules.win_dism.add_feature(feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)
```

Install a feature using DISM

Parameters
- feature (str) -- The feature to install
- package (Optional[str]) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- source (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- limit_access (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package
- enable_parent (Optional[bool]) -- True will enable all parent features of the specified feature
- image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command
Return type dict

CLI Example:
salt '*' dism.add_feature NetFx3

```
salt.modules.win_dism.add_package(package, ignore_check=False, prevent_pending=False, image=None, restart=False)
```

Install a package using DISM

Parameters
- package (str) -- The package to install. Can be a .cab file, a .msu file, or a folder

Note: An .msu package is supported only when the target image is offline, either mounted or applied.

- ignore_check (Optional[bool]) -- Skip installation of the package if the applicability checks fail
- prevent_pending (Optional[bool]) -- Skip the installation of the package if there are pending online actions
- image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- restart (Optional[bool]) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command
Return type dict

CLI Example:
salt '*' dism.add_package C:\Packages\package.cab

```
salt.modules.win_dism.available_capabilities(image=None)
```

List the capabilities available on the system

Parameters
- image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns A list of available capabilities

Return type `list`

CLI Example:

```
salt '*' dism.installed_capabilities
```

**salt.modules.win_dism.available_features**(image=None)

List the features available on the system

Parameters `image` *(Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

Returns A list of available features

Return type `list`

CLI Example:

```
salt '*' dism.available_features
```

**salt.modules.win_dism.get_capabilities**(image=None)

List all capabilities on the system

Parameters `image` *(Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns A list of capabilities

Return type `list`

CLI Example:

```
salt '*' dism.get_capabilities
```

**salt.modules.win_dism.get_features**(package=None, image=None)

List features on the system or in a package

Parameters

- `package` *(Optional[str]*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

  This can also be the name of a package as listed in `dism.installed_packages`

- `image` *(Optional[str]*) -- The path to the root directory of an offline Windows image. If `None` is passed, the running operating system is targeted. Default is `None`.

Returns A list of features

Return type `list`

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab
```

(continues on next page)
# Return all features in the calc package
salt '*\' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~<x86-en~1.0.0.0

salt.modules.win_dism.installed_capabilities(image=None)
List the capabilities installed on the system

Parameters:
  - **image** *(Optional)* [str] -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises:
- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns:
A list of installed capabilities

Return type: list

CLI Example:
salt '*\' dism.installed_capabilities

salt.modules.win_dism.installed_features(image=None)
List the features installed on the system

Parameters:
  - **image** *(Optional)* [str] -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns:
A list of installed features

Return type: list

CLI Example:
salt '*\' dism.installed_features

salt.modules.win_dism.installed_packages(image=None)
List the packages installed on the system

Parameters:
  - **image** *(Optional)* [str] -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns:
A list of installed packages

Return type: list

CLI Example:
salt '*\' dism.installed_packages

salt.modules.win_dism.package_info(package, image=None)
Display information about a package

Parameters:
- **package** [str] -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed.
- **image** *(Optional)* [str] -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns:
A dictionary containing the results of the command

Return type: dict

CLI Example:
salt '*\' dism. package_info C:\packages\package.cab

salt.modules.win_dism.remove_capability(capability, image=None, restart=False)
Uninstall a capability
Parameters
- **capability (str)** -- The capability to be removed
- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart (Optional[bool])** -- Reboot the machine if required by the install

Raises
- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. **Server editions of Windows use ServerManager instead.**

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.remove_feature(feature, remove_payload=False, image=None, restart=False)

Disables the feature.

Parameters
- **feature (str)** -- The feature to uninstall
- **remove_payload (Optional[bool])** -- Remove the feature's payload. Must supply source when enabling in the future.
- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart (Optional[bool])** -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
```
salt '*' dism.remove_feature NetFx3
```

salt.modules.win_dism.remove_package(package, image=None, restart=False)

Uninstall a package

Parameters
- **package (str)** -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages
- **image (Optional[str])** -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart (Optional[bool])** -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo-6595b6144ccf1df~x86~en-1.0.0.0

# Remove the package.cab (does not remove C: \packages \package.cab)
salt '*' dism.remove_package C: \packages \package.cab
```
21.9.487  salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.add_dns(ip, interface='Local Area Connection', index=1)
Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and
the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

salt.modules.win_dns_client.dns_dhcp(interface='Local Area Connection')
Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

salt.modules.win_dns_client.get_dns_config(interface='Local Area Connection')
Get the type of DNS configuration (dhcp / static).

Parameters

- `interface (str)` -- The name of the network interface. This is the
  in the Network Connection Details for the device
  (Description)

Returns True if DNS is configured, otherwise False

Return type  bool

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

salt.modules.win_dns_client.get_dns_servers(interface='Local Area Connection')
Return a list of the configured DNS servers of the specified interface

Parameters

- `interface (str)` -- The name of the network interface. This is the name as
  appears in the Control Panel under Network Connections (it)

Returns A list of dns servers

Return type  list

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

salt.modules.win_dns_client.rm_dns(ip, interface='Local Area Connection')
Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```
21.9.488 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the psget module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

```python
salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')
```

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the source option.

**Parameters**

- `path (str)` -- Local path to the directory that contains the .mof configuration file to apply. Required.
- `source (str)` -- Path to the directory that contains the .mof file on the file_roots. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at path will be applied. Optional.
- `salt_env (str)` -- The salt environment to use when copying your source. Default is 'base'

**Returns**

True if successful, otherwise False

**Return type**

bool

CLI Example:

To apply a config that already exists on the system

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/\WebSiteConfiguration
```

```python
salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')
```

Compile a config from a PowerShell script (.ps1)

**Parameters**

- `path (str)` -- Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
- `source (str)` -- Path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
- `config_name (str)` -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
- `config_data (str)` -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is com-
piled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config_data_source** *(str)* -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.

- **script_parameters** *(str)* -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt_env** *(str)* -- The salt environment to use when copying the source. Default is 'base'

**Returns**
A dictionary containing the results of the compilation

**Return type** *dict*

**CLI Example:**
To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

**salt.modules.win_dsc.get_config()**
Get the current DSC Configuration

**Returns**
A dictionary representing the DSC Configuration on the machine

**Return type** *dict*

**Raises** *
CommandExecutionError* -- On failure

**CLI Example:**
```
salt '*' dsc.get_config
```

**salt.modules.win_dsc.get_config_status()**
Get the status of the current DSC Configuration

**Returns**
A dictionary representing the status of the current DSC Configuration on the machine

**Return type** *dict*

**CLI Example:**
```
salt '*' dsc.get_config_status
```

**salt.modules.win_dsc.get_lcm_config()**
Get the current Local Configuration Manager settings

**Returns**
A dictionary representing the Local Configuration Manager settings on the machine

**Return type** *dict*

**CLI Example:**
```
salt '*' dsc.get_lcm_config
```

**salt.modules.win_dsc.remove_config**(reset=False)
Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.
New in version 2017.7.5.

**Parameters**

- **reset** *(bool)* -- Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:
  - File: DSCStatusHistory.mof
  - File: DSCEngineCache.mof
  - Dir: ConfigurationStatus

  Default is False

  **Warning:** remove_config may fail to reset the DSC environment if any of the files in the ConfigurationStatus directory. If you wait a few minutes and run again, it may complete successfully.

**Returns**

- True if successful

**Return type** *bool*

**Raises** *CommandExecutionError* -- On failure

**CLI Example:**

```
salt '*' dsc.remove_config True
```

---

**salt.modules.win_dsc.restore_config()**

Reapplies the previous configuration.

New in version 2017.7.5.

**Note:** The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

**Returns**

- True if successfully restored

**Return type** *bool*

**Raises** *CommandExecutionError* -- On failure

**CLI Example:**

```
salt '*' dsc.restore_config
```

---

**salt.modules.win_dsc.run_config()**

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config_name` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

**Parameters**

- **path** *(str)* -- The local path to the PowerShell script that contains the DSC Configuration. Required.

- **source** *(str)* -- The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.

- **config_name** *(str)* -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** *(str)* -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

  New in version 2017.7.0.

- **config_data_source** *(str)* -- The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

  New in version 2017.7.0.

- **script_parameters** *(str)* -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

  New in version 2017.7.0.

- **salt_env** *(str)* -- The salt environment to use when copying the source. Default is 'base'

  **Returns** True if successfully compiled and applied, otherwise False

  **Return type** bool

  CLI Example:

  To compile a config from a script that already exists on the system:

  ```bash
  salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1
  ```

  To cache a config script to the system from the master and compile it:

  ```bash
  salt '*' dsc.run_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
  ```

  **salt.modules.win_dsc.set_lcm_config** *(config_mode=None, config_mode_freq=None, refresh_freq=None, reboot_if_needed=None, action_after_reboot=None, refresh_mode=None, certificate_id=None, configuration_id=None, allow_module_overwrite=None, debug_mode=False, status_retention_days=None)*

  For detailed descriptions of the parameters see: https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig

  **config_mode** *(str)*: How the LCM applies the configuration. Valid values are:
  - ApplyOnly
  - ApplyAndMonitor
  - ApplyAndAutoCorrect

  **config_mode_freq** *(int)*: How often, in minutes, the current configuration is checked and applied. Ignored if `config_mode` is set to `ApplyOnly`. Default is 15.

  **refresh_mode** *(str)*: How the LCM gets configurations. Valid values are:
  - Disabled
  - Push
  - Pull

  **refresh_freq** *(int)*: How often, in minutes, the LCM checks for updated configurations. (pull mode only)

  Default is 30.

  **reboot_if_needed** *(bool)*: Reboot the machine if needed after a configuration is applied. Default is False.

  **action_after_reboot** *(str)*: Action to take after reboot. Valid values are:
  - ContinueConfiguration
  - StopConfiguration

  **certificate_id** *(guid)*: A GUID that specifies a certificate used to access the configuration: (pull mode)

  **configuration_id** *(guid)*: A GUID that identifies the config file to get from a pull server. (pull mode)
allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:
• None
• ForceModuleImport
• All

status_retention_days (int): Number of days to keep status of the current config.

Note: Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documentation on MSDN for more details.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
salt '*' dsc.set_lcm_config ApplyOnly

salt.modules.win_dsc.test_config()
Tests the current applied DSC Configuration
Returns  True if successfully applied, otherwise False
Return type  bool

CLI Example:
salt '*' dsc.test_config

21.9.489 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends
• win32api
• win32file
• win32con
• salt.utils.win_dacl

exception salt.modules.win_file.WindowsError

salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)
Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters
• path (str) -- The full path to the directory.
• ret (dict) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
• owner (str) -- The owner to set for the directory.
• grant_perms (dict) -- A dictionary containing the user/group and the basic permissions to check/grant, ie: {'user': {'perms': 'basic_permission'}}. Default is None.
• deny_perms (dict) -- A dictionary containing the user/group and permissions to check/deny. Default is None.
• **inheritance** *(bool)* -- True will check if inheritance is enabled and enable it. False will check if inheritance is disabled and disable it. Default is True.

• **reset** *(bool)* -- True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

**Returns** A dictionary of changes that have been made

**Return type** dict

**CLI Example:**
```
# To see changes to C:\Temp\ if the 'Users' group is given 'read & execute'
salt '*' file.check_perms C:\Temp\ {} Administrators "{'Users': {'perms': 'read_'}
# Locally using salt call
salt-call file.check_perms C:\Temp\ {} Administrators "{'Users': {'perms': 'read_'
# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ {} Administrators "{'jsnuffy': {'perms': ['
```

salt.modules.win_file.chgrp*(path, group)*

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the ‘primary group’ of a file, use file .chpgrp.

To set group permissions use file.set_perms

**Parameters**

• **path** *(str)* -- The path to the file or directory

• **group** *(str)* -- The group (unused)

**Returns** None

**CLI Example:**
```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

salt.modules.win_file.chown*(path, user, group=None, pgroup=None, follow_symlinks=True)*

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a ‘primary group’ property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the ‘primary group’ property and understand the implications, pass the Windows only parameter, pgroup, instead.

**Parameters**

• **path** *(str)* -- The path to the file or directory
- **user** *(str)* -- The name of the user to own the file
- **group** *(str)* -- The group (not used)
- **pgroup** *(str)* -- The primary group to assign
- **follow_symlinks** *(bool)* -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** True if successful, otherwise error

**Return type** bool

**CLI Example:**
```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

salt.modules.win_file.chpgrp *(path, group)*

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**
- **path** *(str)* -- The path to the file or directory
- **pgroup** *(str)* -- The primary group to assign

**Returns** True if successful, otherwise error

**Return type** bool

**CLI Example:**
```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt '"None"'
```

salt.modules.win_file.get_attributes *(path)*

Return a dictionary object with the Windows file attributes for a file.

**Parameters**
- **path** *(str)* -- The path to the file or directory

**Returns** A dictionary of file attributes

**Return type** dict

**CLI Example:**
```
salt '*' file.get_attributes c:\temp\a.txt
```

salt.modules.win_file.get_gid *(path, follow_symlinks=True)*

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the ‘primary group’ of a file, use `file.get_pgid`.

**Parameters**
- **path** *(str)* -- The path to the file or directory
- **follow_symlinks** *(bool)* -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True
Returns The gid of the owner
Return type str
CLI Example:
```
salt '*' file.get_gid c:\temp\test.txt
```

```
salt.modules.win_file.get_group(path, follow_symlinks=True)
```
Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgroup`.

Parameters
- **path** (str) -- The path to the file or directory
- **follow_symlinks** (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner
Return type str
CLI Example:
```
salt '*' file.get_group c:\temp\test.txt
```

```
salt.modules.win_file.get_mode(path)
```
Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

Parameters **path** (str) -- The path to the file or directory

Returns None
CLI Example:
```
salt '*' file.get_mode /etc/passwd
```

```
salt.modules.win_file.get_pgid(path, follow_symlinks=True)
```
Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters
- **path** (str) -- The path to the file or directory
- **follow_symlinks** (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The gid of the primary group
Return type str
CLI Example:
```
salt '*' file.get_pgid c:\temp\test.txt
```
salt.modules.win_file.get_pgroup(path, follow_symlinks=True)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the get_pgid function which will return the SID, including for the system 'None' group.

Parameters
- **path** (str) -- The path to the file or directory
- **follow_symlinks** (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the primary group
Return type str

CLI Example:
salt '*' file.get_pgroup c:\temp\test.txt

salt.modules.win_file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters
- **path** (str) -- The path to the file or directory
- **follow_symlinks** (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The uid of the owner
Return type str

CLI Example:
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False

salt.modules.win_file.get_user(path, follow_symlinks=True)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters
- **path** (str) -- The path to the file or directory
- **follow_symlinks** (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner
Return type str

CLI Example:
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False

salt.modules.win_file.gid_to_group(gid)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.
For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

**Parameters**
- **gid** *(str)* -- The gid of the group
- **Returns** The name of the group
- **Return type** str

**CLI Example:**
```bash
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

### `salt.modules.win_file.group_to_gid(group)`
Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, ” is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

**Parameters**
- **group** *(str)* -- The name of the group
- **Returns** The gid of the group
- **Return type** str

**CLI Example:**
```bash
salt '*' file.group_to_gid administrators
```

### `salt.modules.win_file.is_link(path)`
Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

**Parameters**
- **path** *(str)* -- The path to a file or directory
- **Returns** True if path is a symlink, otherwise False
- **Return type** bool

**CLI Example:**
```bash
salt '*' file.is_link /path/to/link
```

### `salt.modules.win_file.lchown(path, user=None, group=None, pgroup=None)`
Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a ‘primary group’ property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the ‘primary group’ property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to ‘None’, it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

**Parameters**
- **path** *(str)* -- The path to the file or directory
- **user** *(str)* -- The name of the user to own the file
- **group** *(str)* -- The group (not used)
- **pgroup** *(str)* -- The primary group to assign
Returns True if successful, otherwise error

Return type bool

CLI Example:

```bash
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

```
salt.modules.win_file.makedirs(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)
```

Ensure that the parent directory containing this path is available.

Parameters

- **path (str)** -- The full path to the directory.

  **Note:** The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is C:\temp\test, then it would be treated as C:\temp\ but if the path ends with a trailing slash like C:\temp\test\, then it would be treated as C:\temp\test\.

- **owner (str)** -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.

- **grant_perms (dict)** -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
  ```

- **deny_perms (dict)** -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

- **inheritance (bool)** -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.

- **reset (bool)** -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful, otherwise error

Return type bool

Raises CommandExecutionError -- If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"
```

(continues on next page)
# Locally using salt call
salt-call file.makedirs C:\Temp\Administrators "{'Users': {'perms': 'read_execute
→', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"

salt.modules.win_file.makedirs_perms(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=True)

Set owner and permissions for each directory created.

Parameters

- **path (str)** -- The full path to the directory.
- **owner (str)** -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms (dict)** -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the **perms** parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}
```

- **deny_perms (dict)** -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the **grant_perms** parameter. Remember, deny permissions supersede grant permissions.
- **inheritance (bool)** -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created
- **reset (bool)** -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful, otherwise raises an error

Return type bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\Administrators "{'Users': {'perms': 'read_execute
→'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```
salt.modules.win_file.mkdir(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the directory is available and permissions are set.

Parameters

- **path** *(str)* -- The full path to the directory.
- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, i.e. {'user': {'perms': 'basic_permission'}}. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```python
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
```

To set advanced permissions use a list for the `perms` parameter, i.e:

```python
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Returns True if successful

Return type bool

Raises **CommandExecutionError** -- If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:|Temp|Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.readlink(path)

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters **path** *(str)* -- The path to the symlink

Returns The path that the symlink points to
### Return type
str

#### CLI Example:
```
salt '*' file.readlink /path/to/link
```

#### salt.modules.win_file.remove(path, force=False)
Remove the named file or directory

- **Parameters**
  - `path (str)` -- The path to the file or directory to remove.
  - `force (bool)` -- Remove even if marked Read-Only. Default is False

- **Returns**
  True if successful, False if unsuccessful

- **Return type**
  bool

#### CLI Example:
```
salt '*' file.remove C:\Temp
```

#### salt.modules.win_file.set_attributes(path=None, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)
Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

- **Parameters**
  - `path (str)` -- The path to the file or directory
  - `archive (bool)` -- Sets the archive attribute. Default is None
  - `hidden (bool)` -- Sets the hidden attribute. Default is None
  - `normal (bool)` -- Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
  - `notIndexed (bool)` -- Sets the indexed attribute. Default is None
  - `readonly (bool)` -- Sets the readonly attribute. Default is None
  - `system (bool)` -- Sets the system attribute. Default is None
  - `temporary (bool)` -- Sets the temporary attribute. Default is None

- **Returns**
  True if successful, otherwise False

- **Return type**
  bool

#### CLI Example:
```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

#### salt.modules.win_file.set_mode(path, mode)
Set the mode of a file

This just calls get_mode, which returns None because we don't use mode on Windows

- **Parameters**
  - `path` -- The path to the file or directory
  - `mode` -- The mode (not used)

- **Returns**
  None

#### CLI Example:
```
salt '*' file.set_mode /etc/passwd 0644
```

#### salt.modules.win_file.set_perms(path, grant_perms=None, deny_perms=None, inheritance=True, reset=False)
Set permissions for the given path

- **Parameters**
  - `path (str)` -- The full path to the directory.
• **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default for applies_to is *this_folder_subfolders_files*. Specify another applies_to setting like this:

```python
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
```

To set advanced permissions use a list for the **perms** parameter, ie:

```python
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}
```

To see a list of available attributes and applies to settings see the documentation for salt.utils.win_dacl.

A value of *None* will make no changes to the **grant** portion of the DACL. Default is *None*.

• **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the **grant_perms** parameter. Remember, deny permissions supersede grant permissions.

A value of *None* will make no changes to the **deny** portion of the DACL. Default is *None*.

• **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is False.

• **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

*Returns* True if successful

*Return type* bool

* Raises *CommandExecutionError* -- If unsuccessful

CLI Example:

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:\Temp "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.stats*(path, hash_type='sha256', follow_symlinks=True)*

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).
Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the ‘primary group’ is required, it can be accessed in the `pgroup` and `pgid` properties.

**Parameters**
- `path (str)` -- The path to the file or directory
- `hash_type (str)` -- The type of hash to return
- `follow_symlinks (bool)` -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** A dictionary of file/directory stats

**Return type**  dict

**CLI Example:**
```
salt '*' file.stats /etc/passwd
```

```
salt.modules.win_file.symlink(src, link)
Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn’t, an error will be raised.

**Parameters**
- `src (str)` -- The path to a file or directory
- `link (str)` -- The path to the link

**Returns** True if successful, otherwise False

**Return type**  bool

**CLI Example:**
```
salt '*' file.symlink /path/to/file /path/to/link
```

```
salt.modules.win_file.uid_to_user(uid)
Convert a uid to a user name

**Parameters**  `uid (str)` -- The user id to lookup

**Returns** The name of the user

**Return type**  str

**CLI Example:**
```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

```
salt.modules.win_file.user_to_uid(user)
Convert user name to a uid

**Parameters**  `user (str)` -- The user to lookup

**Returns** The user id of the user

**Return type**  str

**CLI Example:**
```
salt '*' file.user_to_uid myusername
```
**21.9.490**  **salt.modules.win_firewall**

Module for configuring Windows Firewall using netsh

salt.modules.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

**Parameters**

- **name**(str) -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport**(int) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol**(Optional[str]) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action**(Optional[str]) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir**(Optional[str]) -- The direction. Can be in or out.
- **remoteip**(Optional[str]) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses
  Can be combinations of the above separated by commas.

**Returns**  True if successful

**Return type**  bool

**Raises**  CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

salt.modules.win_firewall.delete_rule(name=None, localport=None, protocol=None, dir=None, remoteip=None)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

**Parameters**

- **name**(str) -- The name of the rule to delete. If the name `all` is used you must
specify additional parameters.

- **localport (Optional [str])** -- The port of the rule. If protocol is not specified, protocol will be set to tcp
- **protocol (Optional [str])** -- The protocol of the rule. Default is tcp when localport is specified
- **dir (Optional [str])** -- The direction of the rule.
- **remoteip (Optional [str])** -- The remote IP of the rule.

Returns True if successful
Return type bool
Raises **CommandExecutionError** -- If the command fails

CLI Example:

```bash
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named # 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

**salt.modules.win_firewall.disable (profile='allprofiles')**

Disable firewall profile

Parameters **profile (Optional [str])** -- The name of the profile to disable. Default is allprofiles. Valid options are:
- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns True if successful
Return type bool
Raises **CommandExecutionError** -- If the command fails

CLI Example:

```bash
salt '*' firewall.disable
```

**salt.modules.win_firewall.enable (profile='allprofiles')**

New in version 2015.5.0.

Enable firewall profile

Parameters **profile (Optional [str])** -- The name of the profile to enable. Default is allprofiles. Valid options are:
- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns True if successful
Return type bool
Raises **CommandExecutionError** -- If the command fails

CLI Example:
salt '*

```python
salt.modules.win_firewall.get_all_profiles(store='local')
```

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- `store (str)` -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - `lgpo`
  - `local`

  Default is `local`

**Returns**

A dictionary containing the specified settings for each profile

**Return type**

`dict`

**CLI Example:**

```
# Get all firewall settings for all profiles
salt * firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group policy
salt * firewall.get_all_settings lgpo
```

```python
salt.modules.win_firewall.get_all_settings(domain, store='local')
```

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- `profile (str)` -- The firewall profile to query. Valid options are:
  - `domain`
  - `public`
  - `private`

- `store (str)` -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - `lgpo`
  - `local`

  Default is `local`

**Returns**

A dictionary containing the specified settings

**Return type**

`dict`

**CLI Example:**

```
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

```python
salt.modules.win_firewall.get_config()
```

Get the status of all the firewall profiles

**Returns**

A dictionary of all profiles on the system

**Return type**

`dict`

**Raises**

`CommandExecutionError` -- If the command fails
CLI Example:
```
salt '*' firewall.get_config
```

`salt.modules.win_firewall.get_rule(name='all')`
New in version 2015.5.0.
Display all matching rules as specified by name

**Parameters**
- **name** *(Optional)* *(str)* -- The full name of the rule. All will return all rules.
  Default is all

**Returns**
A dictionary of all rules or rules that match the name exactly

**Return type** *dict*

**Raises** *CommandExecutionError* -- If the command fails

CLI Example:
```
salt '*' firewall.get_rule 'MyAppPort'
```

`salt.modules.win_firewall.get_settings(profile, section, store='local')`
Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.
New in version 2018.3.4.
New in version 2019.2.0.

**Parameters**
- **profile** *(str)* -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **section** *(str)* -- The property to query within the selected profile. Valid options are:
  - firewallpolicy: inbound/outbound behavior
  - logging: firewall logging settings
  - settings: firewall properties
  - state: firewalls state (on | off)
- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local

**Returns**
A dictionary containing the properties for the specified profile

**Return type** *dict*

**Raises**
- *CommandExecutionError* -- If an error occurs
- *ValueError* -- If the parameters are incorrect

CLI Example:
```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

`salt.modules.win_firewall.rule_exists(name)`
New in version 2016.11.6.
Checks if a firewall rule exists in the firewall policy

Parameters
- **name (str)** -- The name of the rule

Returns
- True if exists, otherwise False

Return type
- bool

CLI Example:

```bash
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

salt.modules.win_firewall.set_firewall_settings(profile, inbound=None, outbound=None, store='local')

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
- **profile (str)** -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **inbound (str)** -- The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured
  Default is None
- **outbound (str)** -- The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured
  Default is None
- **store (str)** -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local

Returns
- True if successful

Return type
- bool

Raises
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Set the inbound setting for the domain profile to block inbound
# connections
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound
# connections
salt * firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group
# policy to block inbound and allow outbound
```

(continues on next page)
Modify firewall settings:

```python
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound' outbound='allowoutbound' store='lgpo'
```

salt.modules.win_firewall.set_logging_settings(profile, setting, value, store='local')

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile (str)** -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting (str)** -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize

- **value (str)** -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

  allowedconnections:
  - enable
  - disable
  - notconfigured

  droppedconnections:
  - enable
  - disable
  - notconfigured

  filename:
  - Full path and name of the firewall log file
  - notconfigured

  maxfilesize:
  - 1 - 32767
  - notconfigured

Note: **notconfigured** can only be used when using the lgpo store

- **store (str)** -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is **local**

Returns **True** if successful

Return type **bool**

Raises

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo
```

(continues on next page)
# Don't log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\system32\LogFiles\Firewall\pfirewall.log

# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048

salt.modules.win_firewall.set_settings(profile, setting, value, store='local')

Configure firewall settings.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile**(str) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting**(str) -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast

- **value**(str) -- The value to apply to the setting. Valid options are
  - enable
  - disable
  - notconfigured

Note: **notconfigured** can only be used when using the lgpo store

- **store**(str) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

Returns True if successful

Return type bool

Raises

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
salt.modules.win_firewall.set_state(profile, state, store='local')

Configure the firewall state.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** (str) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **state** (str) -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

Note: **notconfigured** can only be used when using the lgpo store

- **store** (str) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

Returns True if successful

Returns type bool

Raises

- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Turn the firewall off when the domain profile is active
salt '*' firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in # the local group policy
salt '*' firewall.set_state public on lgpo
```

21.9.491 salt.modules.win_groupadd

Manage groups on Windows

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

salt.modules.win_groupadd.add(name, **kwargs)

Add the specified group

Parameters

- **name** (str) -- The name of the group to add

Returns True if successful, otherwise False

Returns type bool

CLI Example:

```
salt '*' group.add foo
```
salt.modules.win_groupadd.adduser(name, username, **kwargs)

Add a user to a group

Parameters

- name (str) -- The name of the group to modify
- username (str) -- The name of the user to add to the group

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' group.adduser foo username
```
	salt.modules.win_groupadd.delete(name, **kwargs)

Remove the named group

Parameters name (str) -- The name of the group to remove

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' group.delete foo
```
	salt.modules.win_groupadd.deluser(name, username, **kwargs)

Remove a user from a group

Parameters

- name (str) -- The name of the group to modify
- username (str) -- The name of the user to remove from the group

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' group.deluser foo username
```
	salt.modules.win_groupadd.getent(refresh=False)

Return info on all groups

Parameters refresh (bool) -- Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True the __context__ will be refreshed with current data and returned. Default is False

Returns A list of groups and their information

CLI Example:

```
salt '*' group.getent
```
	salt.modules.win_groupadd.info(name)

Return information about a group

Parameters name (str) -- The name of the group for which to get information

Returns A dictionary of information about the group

Return type dict

CLI Example:

```
salt '*' group.info foo
```
	salt.modules.win_groupadd.list_groups(refresh=False)

Return a list of groups

Parameters refresh (bool) -- Refresh the info for all groups in __context__. If False only the groups in __context__ will be returned. If True, the __context__ will be refreshed with current data and returned. Default is False
Returns A list of groups on the machine
Return type list
CLI Example:
salt '*' group.list_groups

salt.modules.win_groupadd.members(name, members_list, **kwargs)
   Ensure a group contains only the members in the list
Parameters
   • name (str) -- The name of the group to modify
   • members_list (str) -- A single user or a comma separated list of users. The group
   will contain only the users specified in this list.
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' group.members foo 'user1,user2,user3'

21.9.492 salt.modules.win_iis module
Microsoft IIS site management via WebAdministration powershell module
maintainer Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>
platform Windows
depends PowerShell
depends WebAdministration module (PowerShell) (IIS)
New in version 2016.3.0.
salt.modules.win_iis.create_app(name, site, sourcepath, apppool=None)
   Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application
already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters
   • name (str) -- The IIS application.
   • site (str) -- The IIS site name.
   • sourcepath (str) -- The physical path.
   • apppool (str) -- The name of the IIS application pool.
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
   apppool='site0'
salt.modules.win_iis.create_apppool(name)
   Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application
pool already exists with a different configuration. It will not modify the configuration of an existing
application pool.

Parameters  

**name** *(str)* -- The name of the IIS application pool.

Returns True if successful, otherwise False

Return type  *bool*

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

salt.modules.win_iis.create_backup(name)
Backup an IIS Configuration on the System.
New in version 2017.7.0.

Note: Backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Parameters  

**name** *(str)* -- The name to give the backup

Returns True if successful, otherwise False

Return type  *bool*

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

salt.modules.win_iis.create_binding(site, hostheader='', ipaddress='*', port=80, protocol='http', sslflags=None)
Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters  

- **site** *(str)* -- The IIS site name.
- **hostheader** *(str)* -- The host header of the binding. Usually a hostname.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **protocol** *(str)* -- The application protocol of the binding.
- **sslflags** *(str)* -- The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False

Return type  *bool*

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.create_cert_binding(name, site, hostheader='', ipaddress='', port=443, sslflags=0)
Assign a certificate to an IIS Web Binding.
New in version 2016.11.0.
Note: The web binding that the certificate is being assigned to must already exist.

Parameters

- `name (str)` -- The thumbprint of the certificate.
- `site (str)` -- The IIS site name.
- `hostheader (str)` -- The host header of the binding.
- `ipaddress (str)` -- The IP address of the binding.
- `port (int)` -- The TCP port of the binding.
- `sslflags (int)` -- Flags representing certificate type and certificate storage of the binding.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```

```
salt.modules.win_iis.create_site(name='My Test Site' sourcepath='c:\stage' apppool='TestPool' hostheader='', ipaddress='*', port=80, protocol='http')
```

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters

- `name (str)` -- The IIS site name.
- `sourcepath (str)` -- The physical path of the IIS site.
- `apppool (str)` -- The name of the IIS application pool.
- `hostheader (str)` -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- `ipaddress (str)` -- The IP address of the binding.
- `port (int)` -- The TCP port of the binding.
- `protocol (str)` -- The application protocol of the binding. (http, https, etc.)

Returns True if successful, otherwise False.

Return type `bool`

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool='TestPool'
```

```
salt.modules.win_iis.create_vdir(name, site, sourcepath, app='/')
```

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.
Parameters

- **name** *(str)* -- The virtual directory name.
- **site** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path.
- **app** *(str)* -- The IIS application.

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\inetpub\vdirs\→vd0'
```

`salt.modules.win_iis.get_container_setting(name, container, settings)`

Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters

- **name** *(str)* -- The name of the IIS container.
- **container** *(str)* -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** *(dict)* -- A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.

Return type **dict**

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools' settings="["processModel.identityType"]"
```

`salt.modules.win_iis.get_webapp_settings(name, site, settings)`

Get the value of the setting for the IIS web application.

New in version 2017.7.0.

Note: Params are case sensitive

Parameters

- **name** *(str)* -- The name of the IIS web application.
- **site** *(str)* -- The site name contains the web application. Example: Default Web Site
- **settings** *(str)* -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.

Return type **dict**

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site' settings="["physicalPath","applicationPool"]"
```

`salt.modules.win_iis.get_webconfiguration_settings(name, settings)`

Get the webconfiguration settings for the IIS PSPath.

Parameters

- **name** *(str)* -- The PSPath of the IIS webconfiguration settings.
- **settings** *(list)* -- A list of dictionaries containing setting name and filter.

Returns A list of dictionaries containing setting name, filter and value.
Return type  dict

CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:' settings="[{'name':
  'enabled', 'filter': 'system.webServer/security/authentication/
anonymousAuthentication'}]]"
```

**salt.modules.win_iis.list_apppools()**

List all configured IIS application pools.

**Returns**  A dictionary of IIS application pools and their details.

**Return type**  dict

CLI Example:

```
salt '*' win_iis.list_apppools
```

**salt.modules.win_iis.list_apps(site)**

Get all configured IIS applications for the specified site.

**Parameters**  

- `site (str)` -- The IIS site name.

**Returns**  A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

**salt.modules.win_iis.list_backups()**

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

**Note:** Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\ System32\inetsrv\backup` folder.

**Returns**  A dictionary of IIS Configurations backed up on the system.

**Return type**  dict

CLI Example:

```
salt '*' win_iis.list_backups
```

**salt.modules.win_iis.list_bindings(site)**

Get all configured IIS bindings for the specified site.

**Parameters**  

- `site (str)` -- The name if the IIS Site

**Returns**  A dictionary of the binding names and properties.

**Return type**  dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

**salt.modules.win_iis.list_cert_bindings(site)**

List certificate bindings for an IIS site.

New in version 2016.11.0.

**Parameters**  

- `site (str)` -- The IIS site name.

**Returns**  A dictionary of the binding names and properties.

**Return type**  dict

CLI Example:
**salt.modules.win_iis.list_sites()**

List all the currently deployed websites.

- **Returns**: A dictionary of the IIS sites and their properties.
- **Return type**: dict

**CLI Example:**

```
salt '*' win_iis.list_sites
``` 

**salt.modules.win_iis.list_vdirs(site, app='/')**

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

- **Parameters**
  - `site` (**str**): The IIS site name.
  - `app` (**str**): The IIS application.
- **Returns**: A dictionary of the virtual directory names and properties.
- **Return type**: dict

**CLI Example:**

```
salt '*' win_iis.list_vdirs site
``` 

**salt.modules.win_iis.list_worker_processes(apppool)**

Returns a list of worker processes that correspond to the passed application pool.

- **New in version 2017.7.0.**
- **Parameters**
  - `apppool` (**str**): The application pool to query
- **Returns**: A dictionary of worker processes with their process IDs
- **Return type**: dict

**CLI Example:**

```
salt '*' win_iis.list_worker_processes 'My App Pool'
``` 

**salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)**

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

- **New in version 2017.7.0.**
- **Parameters**
  - `site` (**str**): The IIS site name.
  - `binding` (**str**): The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, `*:80: salt.com`
  - `hostheader` (**str**): The host header of the binding. Usually the hostname.
  - `ipaddress` (**str**): The IP address of the binding.
  - `port` (**int**): The TCP port of the binding.
  - `sslflags` (**str**): The flags representing certificate type and storage of the binding.
- **Returns**: True if successful, otherwise False
- **Return type**: bool

**CLI Example:**

```
The following will seat the host header of binding `*:80:` for `site0` to `example.com`
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.com'
```
salt.modules.win_iis.modify_site(name, sourcepath=None, apppool=None)
Modify a basic website in IIS.

Parameters
- name (str) -- The IIS site name.
- sourcepath (str) -- The physical path of the IIS site.
- apppool (str) -- The name of the IIS application pool.

Returns True if successful, otherwise False.
Return type bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:
```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool='NewTestPool'
```

salt.modules.win_iis.remove_app(name, site)
Remove an IIS application.

Parameters
- name (str) -- The application name.
- site (str) -- The IIS site name.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.remove_apppool(name)
Remove an IIS application pool.

Parameters name (str) -- The name of the IIS application pool.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

salt.modules.win_iis.remove_backup(name)
Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters name (str) -- The name of the backup to remove

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' win_iis.remove_backup backup_20170209
```

salt.modules.win_iis.remove_binding(site, hostheader='', ipaddress='*', port=80)
Remove an IIS binding.

Parameters
- site (str) -- The IIS site name.
- hostheader (str) -- The host header of the binding.
- ipaddress (str) -- The IP address of the binding.
- port (int) -- The TCP port of the binding.
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='', port=443)
Remove a certificate from an IIS Web Binding.
New in version 2016.11.0.

Note:  This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters

- **name (str)** -- The thumbprint of the certificate.
- **site (str)** -- The IIS site name.
- **hostheader (str)** -- The host header of the binding.
- **ipaddress (str)** -- The IP address of the binding.
- **port (int)** -- The TCP port of the binding.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.remove_site(name)
Delete a website from IIS.

Parameters **name (str)** -- The IIS site name.

Returns  True if successful, otherwise False
Return type  bool

Note:  This will not remove the application pool used by the site.

CLI Example:
```
salt '*' win_iis.remove_site name='My Test Site'
```

salt.modules.win_iis.remove_vdir(name, site, app='/')
Remove an IIS virtual directory.

Parameters

- **name (str)** -- The virtual directory name.
- **site (str)** -- The IIS site name.
- **app (str)** -- The IIS application.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

salt.modules.win_iis.restart_apppool(name)
Restart an IIS application pool.

21.9. execution modules
New in version 2016.11.0.

Parameters **name** *(str)* -- The name of the IIS application pool.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' win_iis.restart_apppool name='MyTestPool'
```

salt.modules.win_iis.restart_site(name)

Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** *(str)* -- The name of the website to restart.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' win_iis.restart_site name='My Test Site'
```

salt.modules.win_iis.set_container_setting(name, container, settings)

Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

* **name** *(str)* -- The name of the IIS container.
* **container** *(str)* -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
* **settings** *(dict)* -- A dictionary of the setting names and their values.

Returns True if successful, otherwise False
Return type bool

CLI Example:

```bash
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools'
settings="\{'managedPipeLineMode': 'Integrated'}"
```

salt.modules.win_iis.set_webapp_settings(name, site, settings)

Configure an IIS application.

New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case sensitive.

Parameters

* **name** *(str)* -- The IIS application.
* **site** *(str)* -- The IIS site name.
* **settings** *(str)* -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns A boolean representing whether all changes succeeded.
Return type bool

CLI Example:

```bash
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="\{"physicalPath": 'C:\site0', 'apppool': 'site0'}"
```
salt.modules.win_iis.set_webconfiguration_settings(name, settings)
Set the value of the setting for an IIS container.

Parameters
- name (str) -- The PSPath of the IIS webconfiguration settings.
- settings (list) -- A list of dictionaries containing setting name, filter and value.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```bash
salt '*' win_iis.set_webconfiguration_settings name='IIS:' settings='[{{'name': 'enabled', 'filter': 'system.webServer/security/authentication/anonymousAuthentication', 'value': False}}]
```

salt.modules.win_iis.start_apppool(name)
Start an IIS application pool.

New in version 2017.7.0.

Parameters  name (str) -- The name of the App Pool to start.
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```bash
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.start_site(name)
Start a Web Site in IIS.

New in version 2017.7.0.

Parameters  name (str) -- The name of the website to start.
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```bash
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.stop_apppool(name)
Stop an IIS application pool.

New in version 2017.7.0.

Parameters  name (str) -- The name of the App Pool to stop.
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```bash
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.stop_site(name)
Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters  name (str) -- The name of the website to stop.
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```bash
salt '*' win_iis.stop_site name='My Test Site'
```
Salt Documentation, Release 3002.6

21.9.493 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.disable(iface)
Disable an interface

CLI Example:
```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.enable(iface)
Enable an interface

CLI Example:
```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_ip.get_all_interfaces()
Return configs for all interfaces

CLI Example:
```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_ip.get_default_gateway()
Set DNS source to DHCP on Windows

CLI Example:
```
salt -G 'os_family:Windows' ip.get_default_gateway
```

salt.modules.win_ip.get_interface(iface)
Return the configuration of a network interface

CLI Example:
```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

salt.modules.win_ip.get_subnet_length(mask)
Convenience function to convert the netmask to the CIDR subnet length

CLI Example:
```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

salt.modules.win_ip.is_disabled(iface)
Returns True if interface is disabled, otherwise False

CLI Example:
```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

salt.modules.win_ip.is_enabled(iface)
Returns True if interface is enabled, otherwise False

CLI Example:
```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```
salt.modules.win_ip.raw_interface_configs()
    Return raw configs for all interfaces
    CLI Example:
    ```shell
    salt -G 'os_family:Windows' ip.raw_interface_configs
    ```

salt.modules.win_ip.set_dhcp_all(iface)
    Set both IP Address and DNS to DHCP
    CLI Example:
    ```shell
    salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
    ```

salt.modules.win_ip.set_dhcp_dns(iface)
    Set DNS source to DHCP on Windows
    CLI Example:
    ```shell
    salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
    ```

salt.modules.win_ip.set_dhcp_ip(iface)
    Set Windows NIC to get IP from DHCP
    CLI Example:
    ```shell
    salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
    ```

salt.modules.win_ip.set_static_dns(iface, *addrs)
    Set static DNS configuration on a Windows NIC
    Parameters
        • iface (str) -- The name of the interface to set
        • addrs -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([]). If undefined or None no changes will be made.
    Returns A dictionary containing the new DNS settings
    Return type dict
    CLI Example:
    ```shell
    salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1
    -->
    salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.252' '192.168.1.253'
    ```

salt.modules.win_ip.set_static_ip(iface, addr, gateway=None, append=False)
    Set static IP configuration on a Windows NIC
    Parameters
        • iface The name of the interface to manage
        • addr IP address with subnet length (ex. 10.1.2.3/24). The ip.get_subnet_length function can be used to calculate the subnet length from a netmask.
        • gateway [None] If specified, the default gateway will be set to this value.
        • append [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets addr as the only address on the interface.
    CLI Example:
    ```shell
    salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
    -->
    gateway=10.1.2.1
    salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
    -->append=True
    ```
21.9.494 salt.modules.win_lgpo module

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows server.

New in version 2016.11.0.

Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module’s `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

    depends

    - pywin32 Python module
    - lxml
    - uuid
    - struct
    - salt.utils.win_reg

salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)

Get a policy value

Parameters

- **policy_class** (str) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return_full_policy_names** (bool) -- True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- **hierarchical_return** (bool) -- True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- **adml_language** (str) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return_not_configured** (bool) -- Include Administrative Template policies that are ‘Not Configured’ in the return data

Returns A dictionary containing the policy values for the specified class
Return type  dict
CLI Example:
salt '*' lgpo.get machine return_full_policy_names=True

Get the current settings for a single policy on the machine

Parameters
- **policy_name** (str) -- The name of the policy to retrieve. Can be the any of the names or aliases returned by lgpo.get_policy_info
- **policy_class** (str) -- The policy class. Must be one of machine or user
- **adml_language** (str) -- The language code for the adml file to use for localization. The default is en-US
- **return_value_only** (bool) -- True will return only the value for the policy, without the name of the policy. return_full_policy_names and hierarchical_return will be ignored. Default is True
- **return_full_policy_names** (bool) -- Returns the full policy name regardless of what was passed in policy_name

Note: This setting applies to sub-elements of the policy if they exist. The value passed in policy_name will always be used as the policy name when this setting is False

- **hierarchical_return** (bool) -- Returns a hierarchical view of the policy showing its parents

Returns A dictionary containing the policy settings

Return type  dict
CLI Example:

# Using the policy id
salt * lgpo.get_policy LockoutDuration machine
salt * lgpo.get_policy AutoUpdateCfg machine

# Using the full name
salt * lgpo.get_policy "Account lockout duration" machine
salt * lgpo.get_policy "Configure Automatic Updates" machine

# Using full path and name
salt * lgpo.get_policy "Windows Components\Windows Update\Configure Automatic Updates" machine

Returns information about a specified policy

Parameters
- **policy_name** (str) -- The name of the policy to lookup
- **policy_class** (str) -- The class of policy, i.e. machine, user, both
- **adml_language** (str) -- The ADML language to use for Administrative Template data lookup

Returns Information about the specified policy

Return type  dict
CLI Example:
salt '*' lgpo.get_policy_info ' Maximum password age' machine
You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, `Access data sources across domains` exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```bash
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine
```

```
local:  
   message:
      policy_aliases:
         - Turn off the "Order Prints" picture task
         - ShellRemoveOrderPrints_2
         - System\Internet Communication Management\Internet Communication
      - settings\Turn off the "Order Prints" picture task
      policy_class:
         machine
      policy_elements:
      policy_found:
         True
      policy_name:
         ShellRemoveOrderPrints_2
      rights_assignment:
         False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```powershell
PS>salt-call --local lgpo.get_policy_info "Turn off the "\"Order Prints\" picture task"
machine
```

```
local:  
   message:
      policy_aliases:
         - Turn off the "Order Prints" picture task
         - ShellRemoveOrderPrints_2
         - System\Internet Communication Management\Internet Communication
      - settings\Turn off the "Order Prints" picture task
      policy_class:
         machine
      policy_elements:
      policy_found:
         True
      policy_name:
         Turn off the "Order Prints" picture task
      rights_assignment:
         False
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```
internet_communications_settings:
   lgpo.set:
```

(continues on next page)
- computer_policy:
  Turn off the "Order Prints" picture task: Enabled

internet_communications_settings:
lgpo.set:
  - computer_policy:
    ShellRemoveOrderPrints_2: Enabled

When using the full path, it might be a good idea to use single quotes around the path:

internet_communications_settings:
lgpo.set:
  - computer_policy:
    'System\Internet Communication Management\Internet Communication settings\Turn off the "Order Prints" picture task': 'Enabled'

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the .admx files. If you know nothing about .admx/.adml relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml | % { Select-String -Path C:\Windows\PolicyDefinitions\en-US\ICM.adml:152: <string id="ShellRemoveOrderPrints" turn off the "Order Prints" picture task</string> C:\Windows\PolicyDefinitions\en-US\ICM.adml:153: <string id="ShellRemoveOrderPrints_Help">This policy setting specifies whether the "Order Prints Online" task is available from Picture Tasks in Windows folders. C:\Windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online Wizard is used to download a list of providers and allow users to order prints online. C:\Windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy setting, the task "Order Prints Online" is removed from Picture Tasks in File Explorer folders.
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx | % { Select-String -Path C:\Windows\PolicyDefinitions\ICM.admx:661: <policy name="ShellRemoveOrderPrints_1" class="User" displayName="$(string.ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName="NoOnlinePrintsWizard"> C:\Windows\PolicyDefinitions\ICM.admx:671: <policy name="ShellRemoveOrderPrints_2" class="Machine" displayName="$(string.ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName="NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the class="Machine" and class="User" (which details if it is a computer policy or user policy respectively) the ShellRemoveOrderPrints_2 is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumulative_rights_assignments=True, adml_language='en-US')

Set a local server policy.

Parameters

- **computer_policy (dict)** -- A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/"Disabled", then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:

These policies can be specified using the GUI display name or the key name from the _policy_info class in this module. The GUI display name is also contained in the _policy_info class in this module.

Administrative Template Policies:

These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.

- **user_policy (dict)** -- The same setup as the computer_policy, except with data to configure the local user policy.

- **cumulative_rights_assignments (bool)** -- Determine how user rights assignment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy

  If False, only the users specified will get the right (any existing will have the right revoked)

- **adml_language (str)** -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True is successful, otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{"LockoutDuration": 2, 'RestrictAnonymous': 'Enabled', 'AuditProcessTracking': 'Succes, Failure'}"
```
salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True, adml_language='en-US')

Set a single computer policy

Parameters

- **name** *(str)* -- The name of the policy to configure
- **setting** *(str)* -- The setting to configure the named policy with
- **cumulative_rights_assignments** *(bool)* -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** *(str)* -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```bash
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

salt.modules.win_lgpo.set_user_policy(name, setting, adml_language='en-US')

Set a single user policy

Parameters

- **name** *(str)* -- The name of the policy to configure
- **setting** *(str)* -- The setting to configure the named policy with
- **adml_language** *(str)* -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True if successful, Otherwise False

Return type **bool**

CLI Example:

```bash
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control Panel" Enabled
```

21.9.495 salt.modules.win_license module

This module allows you to manage windows licensing via slmgr.vbs

```bash
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.activate()

Attempt to activate the current machine via Windows Activation

CLI Example:

```bash
salt '*' license.activate
```

salt.modules.win_license.info()

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```bash
salt '*' license.info
```
salt.modules.win_license.install(product_key)
    Install the given product key
    CLI Example:
    ```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
    ```

salt.modules.win_license.installed(product_key)
    Check to see if the product key is already installed.
    Note: This is not 100% accurate as we can only see the last 5 digits of the license.
    CLI Example:
    ```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
    ```

salt.modules.win_license.licensed()
    Return true if the current machine is licensed correctly
    CLI Example:
    ```
salt '*' license.licensed
    ```

salt.modules.win_license.uninstall()
    Uninstall the current product key
    CLI Example:
    ```
salt '*' license.uninstall
    ```

21.9.496 salt.modules.win_network

Module for gathering and managing network information

salt.modules.win_network.connect(host, port=None, **kwargs)
    Test connectivity to a host using a particular port from the minion.
    New in version 2016.3.0.
    CLI Example:
    ```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4 timeout=3
    ```

salt.modules.win_network.dig(host)
    Performs a DNS lookup with dig
    Note: dig must be installed on the Windows minion
    CLI Example:
    ```
salt '*' network.dig archlinux.org
    ```

salt.modules.win_network.get_route(ip)
    Return routing information for given destination ip
New in version 2016.11.5.

CLI Example:
```
salt '*' network.get_route 10.10.10.10
```

**salt.modules.win_network.hw_addr(iface)**
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:
```
salt '*' network.hw_addr 'Wireless Connection #1'
```

**salt.modules.win_network.hwaddr(iface)**
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:
```
salt '*' network.hw_addr 'Wireless Connection #1'
```

**salt.modules.win_network.in_subnet(cidr)**
Returns True if host is within specified subnet, otherwise False

CLI Example:
```
salt '*' network.in_subnet 10.0.0.0/16
```

**salt.modules.win_network.interfaces()**
Return a dictionary of information about all the interfaces on the minion

CLI Example:
```
salt '*' network.interfaces
```

**salt.modules.win_network.interfaces_names()**
Return a list of all the interfaces names

CLI Example:
```
salt '*' network.interfaces_names
```

**salt.modules.win_network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)**
Returns a list of IPv4 addresses assigned to the host.

- **interface** Only IP addresses from that interface will be returned.
- **include_loopback** [False] Include loopback 127.0.0.1 IPv4 address.
- **cidr**
  Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

  Changed in version 2019.2.0.

- **type** If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

  Changed in version 2019.2.0.

CLI Example:
```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```
salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False, cidr=None)

Returns a list of IPv6 addresses assigned to the host.
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback ::1 IPv6 address.
cidr Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```python
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.ipaddrs(interface=None, include_loopback=False, cidr=None, type=None)

This function is an alias of ip_addrs.

Returns a list of IPv4 addresses assigned to the host.
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback 127.0.0.1 IPv4 address.
cidr Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.
type If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Changed in version 2019.2.0.

CLI Example:

```python
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

salt.modules.win_network.ipaddrs6(interface=None, include_loopback=False, cidr=None)

This function is an alias of ip_addrs6.

Returns a list of IPv6 addresses assigned to the host.
interface Only IP addresses from that interface will be returned.
include_loopback [False] Include loopback ::1 IPv6 address.
cidr Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```python
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.is_private(ip_addr)

Check if the given IP address is a private address

New in version 2019.2.0.

CLI Example:

```python
salt '*' network.is_private 10.0.0.3
```

salt.modules.win_network.netstat()

Return information on open ports and states

CLI Example:
salt '*' network.netstat

salt.modules.win_network.nslookup(host)
Query DNS for information about a domain or ip address
CLI Example:

salt '*' network.nslookup archlinux.org

salt.modules.win_network.ping(host, timeout=False, return_boolean=False)
Performs a ping to a host
CLI Example:

salt '*' network.ping archlinux.org

New in version 2016.11.0.
Return a True or False instead of ping output.

salt '*' network.ping archlinux.org return_boolean=True

Set the time to wait for a response in seconds.

salt '*' network.ping archlinux.org timeout=3

salt.modules.win_network.subnets()
Returns a list of subnets to which the host belongs
CLI Example:

salt '*' network.subnets

salt.modules.win_network.traceroute(host)
Performs a traceroute to a 3rd party host
CLI Example:

salt '*' network.traceroute archlinux.org

21.9.497  salt.modules.win_ntp

Management of NTP servers on Windows
New in version 2014.1.0.

salt.modules.win_ntp.get_servers()
Get list of configured NTP servers
CLI Example:

salt '*' ntp.get_servers

salt.modules.win_ntp.set_servers('servers')
Set Windows to use a list of NTP servers
CLI Example:
21.9.498  salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable. Only the ones that listen to the WM_SETTINGCHANGE message [http://support.microsoft.com/kb/104011](http://support.microsoft.com/kb/104011)

**salt.modules.win_path.add**(*path*, *index=None, **kwargs*)

Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

*path*  Directory to add to path

*index*  Optionally specify an index at which to insert the directory

*rehash*  [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:

```python
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='1'
```

**salt.modules.win_path.exists**(*path*)

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Returns boolean True if path exists, False if not

CLI Example:

```python
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

**salt.modules.win_path.get_path**()

Returns a list of items in the SYSTEM path

CLI Example:

```python
salt '*' win_path.get_path
```

**salt.modules.win_path.rehash**()

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

**Note:** This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See [MSDN Documentation](http://msdn.microsoft.com/en-us/library/windows/desktop/aa384968%28v=vs.85%29.aspx)

CLI Example:

```python
salt '*' win_path.rehash
```

**salt.modules.win_path.remove**(*path, **kwargs*)

Remove the directory from the SYSTEM path

Returns boolean True if successful, False if unsuccessful
**rehash** [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:

```bash
salt '*' win_path.remove 'c:\\python27'
```

### 21.9.499 salt.modules.win_pkg

A module to manage software on Windows

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

The following functions require the existence of a windows repository metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

**salt.modules.win_pkg.compare_versions**(*ver1='', oper='==', ver2='*)

Compare software package versions. Made public for use with Jinja

**Parameters**

- `ver1` *(str)* -- A software version to compare
- `oper` *(str)* -- The operand to use to compare
- `ver2` *(str)* -- A software version to compare

**Returns** True if the comparison is valid, otherwise False

**Return type** bool

CLI Example:

```bash
salt '*' pkg.compare_versions 1.2 >= 1.3
```
salt.modules.win_pkg.genrepo(**kwargs)
Generate package metadata db based on files within the winrepo_source_dir

Kwargs:
- saltenv (str): Salt environment. Default: base
- verbose (bool): Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default False.
- failhard (bool): If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

Note:
- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

Returns A dictionary of the results of the command
Return type dict

CLI Example:
```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

salt.modules.win_pkg.get_package_info(name, saltenv='base')
Return package info. Returns empty map if package not available.

salt.modules.win_pkg.get_repo_data(saltenv='base')
Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters saltenv (str) -- Salt environment. Default base
Returns A dict containing contents of metadata db.
Return type dict

CLI Example:
```
salt '*' pkg.get_repo_data
```

salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)
Install the passed package(s) on the system using winrepo

Parameters
- name (str) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- refresh (bool) -- Boolean value representing whether or not to refresh the winrepo db. Default False.
- pkgs (list) -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:
```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:
- version (str): The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.
If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs='[foo', 'bar']" version=1.2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

`extra_install_flags (str)`: Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

`saltenv (str)`: Salt environment. Default 'base'

`report_reboot_exit_codes (bool)`: If the installer exits with a recognized exit code indicating that a reboot is required, the module function `win_system.set_reboot_required_witnessed` will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

**Returns**

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

**Return type** dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

**WinRepo Definition File Examples**:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don’t want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
```

(continues on next page)
reboot: False

cache_file: 'salt://win/repo/ntp/install.ini'
install_flags: '/USEFILE=C:salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'

uninstaller: 'NTP/uninst.exe'

The following example demonstrates the use of cache_dir. It assumes a file named install.ini resides in the same directory as the installer.

ntp:
4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'

salt.modules.win_pkg.latest_version(*names, **kwargs)

    Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

    If the latest version of a given package is already installed, an empty string will be returned for that package.

    **Note:** Since this is looking for the latest version available, a refresh_db will be triggered by default. This can take some time. To avoid this set refresh to False.

    **Parameters** names (str) -- A single or multiple names to lookup

    **Kwargs:**
    saltenv (str): Salt environment. Default base
    refresh (bool): Refresh package metadata. Default True

    **Returns** A dictionary of packages with the latest version available

    **Return type** dict

    CLI Example:

    salt '*' pkg.latest_version <package name>
    salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.win_pkg.list_available(*names, **kwargs)

    Return a list of available versions of the specified package.

    **Parameters** names (str) -- One or more package names

    **Kwargs:**
    saltenv (str): The salt environment to use. Default base.
    refresh (bool): Refresh package metadata. Default False.
    return_dict_always (bool): Default False dict when a single package name is queried.

    **Returns** The package name with its available versions

    **Return type** dict

    CLI Example:
salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs)

List the packages currently installed.

Note: To view installed software as displayed in the Add/Remove Programs, set include_components and include_updates to False.

Parameters

- **versions_as_list (bool)** -- Returns the versions as a list
- **include_components (bool)** -- Include sub components of installed software. Default is True
- **include_updates (bool)** -- Include software updates and Windows updates. Default is True

Kwargs:

- **saltenv (str)**: The salt environment to use. Default base
- **refresh (bool)**: Refresh package metadata. Default False

Returns A dictionary of installed software with versions installed

Return type dict

{'<package_name>': '<version>'}

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades on this system

Parameters

- **refresh (bool)** -- Refresh package metadata. Default True

Kwargs:

- **saltenv (str)**: Salt environment. Default base

Returns A dictionary of packages with available upgrades

Return type dict

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.win_pkg.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported on Windows, this function is identical to remove().

Note: At some point in the future, pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.

New in version 0.16.0.

Parameters

- **name (str)** -- The name of the package to be deleted.
• **version**(str) -- The version of the package to be deleted. If this option is used in combination with the pkgs option below, then this version will be applied to all targeted packages.

• **pkgs**(list) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

**Kwargs:**

saltenv (str): Salt environment. Default base
refresh (bool): Refresh package metadata. Default False

**Returns**

A dict containing the changes.

**Return type**

dict

**CLI Example:**

```
salt '*pkg.purge <package name>
salt '*pkg.purge <package1>, <package2>, <package3>
salt '*pkg.purge pkgs=['foo', 'bar']
```

salt.modules.win_pkg.refresh_db(**kwargs)**

Generates the local software metadata database (winrepo.p) on the minion. The database is stored in a serialized format located by default at the following location:

C:\salt\var\cache\salt\minion\files\base\win\repo-ng\winrepo.p

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from winrepo_source_dir (default salt://win/repo-ng) and cache them in <cachedir>files<saltenv><winrepo_source_dir> (default: C:\salt\var\cache\salt\minion\files\base\win\repo-ng)
- Call pkg.genrepo to parse the package definition files and generate the repository metadata database file (winrepo.p)
- Return the report received from pkg.genrepo

The default winrepo directory on the master is /srv/salt/win/repo-ng. All files that end with .sls in this and all subdirectories will be used to generate the repository metadata database (winrepo.p).

**Note:**

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

**Note:** There is no need to call pkg.refresh_db every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

- winrepo_cache_expire_min
- winrepo_cache_expire_max

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

**Warning:** Directories and files fetched from <winrepo_source_dir> (/srv/salt/win/repo-ng) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see Windows Software Repository

**Arguments:**
saltenv (str): Salt environment. Default: base
verbose (bool): Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'
failhard (bool): If True, an error will be raised if any repo SLS files fails to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

Returns A dictionary containing the results of the database refresh.
Return type dict

Note: A result with a total: 0 generally means that the files are in the wrong location on the master. Try running the following command on the minion: salt-call -l debug pkg.refresh saltenv=base

Warning: When calling this command from a state using module.run be sure to pass failhard: False. Otherwise the state will report failure if it encounters a bad software definition file.

CLI Example:
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base

salt.modules.win_pkg.remove(name=None, pkgs=None, **kwargs)
Remove the passed package(s) from the system using winrepo

New in version 0.16.0.
Parameters
• name (str) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
• pkgs (list) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:
version (str): The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

Returns
Returns a dict containing the changes.
If the package is removed by pkg.remove:
[<package>: {old: '<old-version>', new: '<new-version>'}]
If the package is already uninstalled:
[<package>: {current: 'not installed'}]

Return type dict

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt.modules.win_pkg.upgrade(**kwargs)
Upgrade all software. Currently not implemented

**Note**: This feature is not yet implemented for Windows.

**Returns** Empty dict, until implemented
**Return type** dict

CLI Example:
salt '*' pkg.upgrade

salt.modules.win_pkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package
**Parameter**: name (str) -- The name of a single package

**Kwarg**: refresh (bool): Refresh package metadata. Default True saltenv (str): The salt environment. Default base

**Returns** True if new version available, otherwise False
**Return type** bool

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.win_pkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Parameter**: name (str) -- One or more package names

**Returns** version string when a single package is specified. dict: The package name(s) with the installed versions.
**Return type** str

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
21.9.500 salt.modules.win_pki module

platform Windows
depends
  • PowerShell 4
  • PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password='')

Export the certificate to a file from the given certificate store.

Parameters
  • name (str) -- The destination path for the exported certificate file.
  • thumbprint (str) -- The thumbprint value of the target certificate.
  • cert_format (str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
  • context (str) -- The name of the certificate store location context.
  • store (str) -- The name of the certificate store.
  • password (str) -- The password of the certificate. Only applicable to pfx format.

Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```bash
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

salt.modules.win_pki.get_cert_file(name, cert_format='cer', password='')

Get the details of the certificate file.

Parameters
  • name (str) -- The filesystem path of the certificate file.
  • cert_format (str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
  • password (str) -- The password of the certificate. Only applicable to pfx format.

Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A dictionary of the certificate thumbprints and properties.

Return type dict

CLI Example:

```bash
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.get_certs(context='LocalMachine', store='My')

Get the available certificates in the given store.

Parameters
  • context (str) -- The name of the certificate store location context.
  • store (str) -- The name of the certificate store.

Returns A dictionary of the certificate thumbprints and properties.
Return type: dict

CLI Example:
```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.get_stores()
Get the certificate location contexts and their corresponding stores.

Returns: A dictionary of the certificate location contexts and stores.

Return type: dict

CLI Example:
```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')

Import the certificate file into the given certificate store.

Parameters:
- `name (str)` -- The path of the certificate file to import.
- `cert_format (str)` -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- `context (str)` -- The name of the certificate store location context.
- `store (str)` -- The name of the certificate store.
- `exportable (bool)` -- Mark the certificate as exportable. Only applicable to pfx format.
- `password (str)` -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- `saltenv (str)` -- The environment the file resides in.

Returns: A boolean representing whether all changes succeeded.

Return type: bool

CLI Example:
```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

salt.modules.win_pki.remove_cert/thumbprint, context='LocalMachine', store='My')

Remove the certificate from the given certificate store.

Parameters:
- `thumbprint (str)` -- The thumbprint value of the target certificate.
- `context (str)` -- The name of the certificate store location context.
- `store (str)` -- The name of the certificate store.

Returns: A boolean representing whether all changes succeeded.

Return type: bool

CLI Example:
```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku='')

Check the certificate for validity.

Parameters:
- `thumbprint (str)` -- The thumbprint value of the target certificate.
- `context (str)` -- The name of the certificate store location context.
- `store (str)` -- The name of the certificate store.
- `untrusted_root (bool)` -- Whether the root certificate is required to be trusted in chain building.
- `dns_name (str)` -- The DNS name to verify as valid for the certificate.
eku (str) -- The enhanced key usage object identifiers to verify for the certificate chain.

Returns A boolean representing whether the certificate was considered valid.

Return type bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

21.9.501 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

```
salt.modules.win_powercfg.get_disk_timeout(scheme=None)
Get the current disk timeout of the given scheme

Parameters scheme (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

• SCHEME_BALANCED - Balanced
• SCHEME_MAX - Power saver
• SCHEME_MIN - High performance

Returns A dictionary of both the AC and DC settings

Return type dict

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

```
salt.modules.win_powercfg.get_hibernate_timeout(scheme=None)
Get the current hibernate timeout of the given scheme

Parameters scheme (str): The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

• SCHEME_BALANCED - Balanced
• SCHEME_MAX - Power saver
• SCHEME_MIN - High performance

Returns A dictionary of both the AC and DC settings

Return type dict

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

```
salt.modules.win_powercfg.get_monitor_timeout(scheme=None)
Get the current monitor timeout of the given scheme

Parameters scheme (str) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

• SCHEME_BALANCED - Balanced
• SCHEME_MAX - Power saver
• SCHEME_MIN - High performance

Returns A dictionary of both the AC and DC settings
```
Return type `dict`
CLI Example:
salt '*' powercfg.get_monitor_timeout

```
salt.modules.win_powercfg.get_standby_timeout(scheme=None)
```
Get the current standby timeout of the given scheme

**scheme (str):** The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

**Returns** A dictionary of both the AC and DC settings

**Return type** `dict`

CLI Example:
salt '*' powercfg.get_standby_timeout

```
salt.modules.win_powercfg.set_disk_timeout(timeout, power='ac', scheme=None)
```
Set the disk timeout in minutes for the given power scheme

**Parameters**
- `timeout (int)` -- The amount of time in minutes before the disk will timeout
- `power (str)` -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- `scheme (str)` -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:
```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

```
salt.modules.win_powercfg.set_hibernate_timeout(timeout, power='ac', scheme=None)
```
Set the hibernate timeout in minutes for the given power scheme

**Parameters**
- `timeout (int)` -- The amount of time in minutes before the computer hibernates
- `power (str)` -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- `scheme (str)` -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

**Returns** True if successful, otherwise False

**Return type** `bool`

CLI Example:
Sets the hibernate timeout to 30 minutes on Battery

```
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

```
salt.modules.win_powercfg.set_monitor_timeout(timeout, power='ac', scheme=None)
```

Set the monitor timeout in minutes for the given power scheme

Parameters

- `timeout (int)` -- The amount of time in minutes before the monitor will timeout
- `power (str)` -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- `scheme (str)` -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

Returns True if successful, otherwise False

```
CLI Example:

# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

```
salt.modules.win_powercfg.set_standby_timeout(timeout, power='ac', scheme=None)
```

Set the standby timeout in minutes for the given power scheme

Parameters

- `timeout (int)` -- The amount of time in minutes before the computer sleeps
- `power (str)` -- Set the value for AC or DC power. Default is `ac`. Valid options are:
  - `ac` (AC Power)
  - `dc` (Battery)
- `scheme (str)` -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - `SCHEME_BALANCED` - Balanced
  - `SCHEME_MAX` - Power saver
  - `SCHEME_MIN` - High performance

Returns True if successful, otherwise False

```
CLI Example:

# Sets the system standby timeout to 30 minutes
salt '*' powercfg.set_standby_timeout 30
```

salt.modules.win_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0
- PSGet

Support for PowerShell

```
salt.modules.win_psget.avail_modules(desc=False)
```

List available modules in registered Powershell module repositories.
Parameters `desc` (bool) -- If `True`, the verbose description will be returned.

CLI Example:
```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

salt.modules.win_psget.bootstrap()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:
```
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.get_repository(name)

Get the details of a local PSGet repository

Parameters `name` (str) -- Name of the repository

CLI Example:
```
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.install(name, minimum_version=None, required_version=None, scope=None, repository=None)

Install a Powershell module from powershell gallery on the system.

Parameters
- `name` (str) -- Name of a Powershell module
- `minimum_version` (str) -- The maximum version to install, e.g. 1.23.2
- `required_version` (str) -- Install a specific version
- `scope` (str) -- The scope to install the module to, e.g. CurrentUser, Computer
- `repository` (str) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:
```
salt 'win01' psget.install PowerPlan
```

salt.modules.win_psget.list_modules(desc=False)

List currently installed PSGet Modules on the system.

Parameters `desc` (bool) -- If `True`, the verbose description will be returned.

CLI Example:
```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

salt.modules.win_psget.register_repository(name, location, installation_policy=None)

Register a PSGet repository on the local machine

Parameters
- `name` (str) -- The name for the repository
- `location` (str) -- The URI for the repository
- `installation_policy` (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:
```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/ →packages
```

salt.modules.win_psget.remove(name)

Remove a Powershell DSC module from the system.

Parameters `name` (str) -- Name of a Powershell DSC module
CLI Example:

```bash
salt 'win01' psget.remove PowerPlan
```

**salt.modules.win_psget.update**(name, maximum_version=None, required_version=None)

Update a PowerShell module to a specific version, or the newest

**Parameters**

- **name**(str) -- Name of a Powershell module
- **maximum_version**(str) -- The maximum version to install, e.g. 1.23.2
- **required_version**(str) -- Install a specific version

CLI Example:

```bash
salt 'win01' psget.update PowerPlan
```

21.9.503  **salt.modules.win_servermanager**

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

**maintainer** Shane Lee <slee@saltstack.com>

**platform** Windows Server 2008R2 or greater

**depends** PowerShell module ServerManager

**salt.modules.win_servermanager.install**(feature, recurse=False, restart=False, source=None, exclude=None)

Install a feature

**Note:** Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

**Note:** Some features take a long time to complete un/installation, set `-t` with a long timeout

**Parameters**

- **feature**(str, list) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
New in version 2018.3.0: Added the ability to pass a list of features to be installed.
- **recurse**(Options[bool]) -- Install all sub-features. Default is False
- **restart**(Optional[bool]) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False
- **source**(Optional[str]) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **exclude**(Optional[str]) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

**Warning:** As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in
exclude will be installed with other sub-features and will then be removed. If
the feature named in "exclude" is not a sub-feature of one of the installed
items it will still be removed.

Returns  A dictionary containing the results of the install
Return type  dict

CLI Example:

```bash
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited
# string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install ['XPS-Viewer', 'SNMP-Service', 'RemoteAccess'], True recurse=True exclude="Web-Server"
```

salt.modules.win_servermanager.list_available()
List available features to install

Returns  A list of available features as returned by the Get-WindowsFeature PowerShell com-
mand
Return type  str

CLI Example:

```bash
salt '*' win_servermanager.list_available
```

salt.modules.win_servermanager.list_installed()
List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

Returns  A dictionary of installed features
Return type  dict

CLI Example:

```bash
salt '*' win_servermanager.list_installed
```

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)
Remove an installed feature

Note:  Some features require a reboot after installation/uninstallation. If one of these features are modified,
then other features cannot be installed until the server is restarted. Additionally, some features take a while
to complete installation/uninstallation, so it is a good idea to use the -t option to set a longer timeout.

Parameters

- **feature (str, list)** -- The name of the feature(s) to remove. This can be a single
feature, a string of features in a comma delimited list (no spaces), or a list of features.
  New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- **remove_payload (Optional[bool])** -- True will cause the feature to be re-
moved from the side-by-side store (%SystemDrive%:Windows\WinSxS). De-
fault is False

- **restart** *(Optional [bool])* -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

**Returns** A dictionary containing the results of the uninstall

**Return type** *dict*

**CLI Example:**

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

### 21.9.504 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: - Rewritten to use PyWin32

**salt.modules.win_service.available**(name)

Check if a service is available on the system.

**Parameters**

- **name** *(str)* -- The name of the service to check

**Returns** True if the service is available, False otherwise

**Return type** *bool*

**CLI Example:**

```
salt '*' service.available <service name>
```

**salt.modules.win_service.create**(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)

Create the named service.

New in version 2015.8.0.

**Parameters**

- **name** *(str)* -- Specifies the service name. This is not the display_name
- **bin_path** *(str)* -- Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args** *(str)* -- Any additional arguments required by the service binary.
- **display_name** *(str)* -- The name to be displayed in the service manager. If not passed, the name will be used
- **description** *(str)* -- A description of the service
- **service_type** *(str)* -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** *(str)* -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
- disabled: Service cannot be started

- **start_delayed**(bool) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set. Default is False

- **error_control**(str) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user

- **load_order_group**(str) -- The name of the load order group to which this service belongs

- **dependencies**(list) -- A list of services or load ordering groups that must start before this service

- **account_name**(str) -- The name of the account under which the service should run. For own type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .LocalSystem

- **account_password**(str) -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.

- **run_interactive**(bool) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** A dictionary containing information about the new service

**Return type** dict

**CLI Example:**
```
salt '*' service.create <service name> <path to exe> display_name='display name'
```

salt.modules.win_service.create_win_salt_restart_task()
Create a task in Windows task scheduler to enable restarting the salt-minion

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' service.create_win_salt_restart_task()
```

salt.modules.win_service.delete(name, timeout=90)
Delete the named service

**Parameters**
- **name**(str) -- The name of the service to delete
- **timeout**(int) -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

**Returns**
- **True** if successful, otherwise **False**. Also returns **True** if the service is not present
Return type  bool

CLI Example:

```
salt '*' service.delete <service name>
```

```python
salt.modules.win_service.disable(name, **kwargs)
```

Disable the named service to start at boot

**Parameters**
- `name (str)` -- The name of the service to disable

**Returns**
- True if disabled, False otherwise

**Return type**  bool

CLI Example:

```
salt '*' service.disable <service name>
```

```python
salt.modules.win_service.disabled(name)
```

Check to see if the named service is disabled to start on boot

**Parameters**
- `name (str)` -- The name of the service to check

**Returns**
- True if the service is disabled

**Return type**  bool

CLI Example:

```
salt '*' service.disabled <service name>
```

```python
salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)
```

Enable the named service to start at boot

**Parameters**
- `name (str)` -- The name of the service to enable.
- `start_type (str)` -- Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual`: Service must be started manually
  - `disabled`: Service cannot be started
- `start_delayed (bool)` -- Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.

**Returns**
- True if successful, False otherwise

**Return type**  bool

CLI Example:

```
salt '*' service.enable <service name>
```

```python
salt.modules.win_service.enabled(name, **kwargs)
```

Check to see if the named service is enabled to start on boot

**Parameters**
- `name (str)` -- The name of the service to check

**Returns**
- True if the service is set to start

**Return type**  bool

CLI Example:

```
salt '*' service.enabled <service name>
```

```python
salt.modules.win_service.execute_salt_restart_task()
```

Run the Windows Salt restart task

**Returns**
- True if successful, otherwise False

**Return type**  bool
CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

salt.modules.win_service.get_all()  
Return all installed services  
    
Returns Returns a list of all services on the system.  
    
Return type list  

CLI Example:

```
salt '*' service.get_all
```

salt.modules.win_service.get_disabled()  
Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.  
    
Returns A list of disabled services.  
    
Return type list  

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.win_service.get_enabled()  
Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.  
    
Returns A list of enabled services  
    
Return type list  

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.win_service.get_service_name("args")  
The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.  

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.  

If arguments are passed, create a dict of Display Names and Service Names  
    
Returns A dictionary of display names and service names  
    
Return type dict  

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

salt.modules.win_service.getsid(name)  
Return the SID for this windows service  
    
Parameters name (str) -- The name of the service for which to return the SID  
    
Returns A string representing the SID for the service  
    
Return type str  

CLI Example:

```
salt '*' service.getsid <service name>
```

salt.modules.win_service.info(name)  
Get information about a service on the system
**Parameters** name *(str)* -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

**Returns** A dictionary containing information about the service.

**Return type** dict

CLI Example:

```bash
salt '*' service.info spooler
```

**salt.modules.win_service.missing**(name)

The inverse of `service.available`.

**Parameters** name *(str)* -- The name of the service to check

**Returns** True if the service is missing, False otherwise

**Return type** bool

CLI Example:

```bash
salt '*' service.missing <service name>
```

**salt.modules.win_service.modify**(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

**Parameters**

- **name (str)** -- The name of the service. Can be found using the `service.get_service_name` function
- **bin_path (str)** -- The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe_args (str)** -- Any arguments required by the service executable
- **display_name (str)** -- The name to display in the service manager
- **description (str)** -- The description to display for the service
- **service_type (str)** -- Specifies the service type. Default is `own`. Valid options are as follows:
  - `kernel`: Driver service
  - `filesystem`: File system driver service
  - `adapter`: Adapter driver service (reserved)
  - `recognizer`: Recognizer driver service (reserved)
  - `own` (default): Service runs in its own process
  - `share`: Service shares a process with one or more other services
- **start_type (str)** -- Specifies the service start type. Valid options are as follows:
  - `boot`: Device driver that is loaded by the boot loader
  - `system`: Device driver that is started during kernel initialization
  - `auto`: Service that automatically starts
  - `manual`: Service must be started manually
  - `disabled`: Service cannot be started
- **start_delayed (bool)** -- Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.
- **error_control (str)** -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - `normal`: Error is logged and a message box is displayed
  - `severe`: Error is logged and computer attempts a restart with the last known
good configuration
- critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
- ignore: Error is logged and startup continues, no notification is given to the user

- **load_order_group** *(str)* -- The name of the load order group to which this service belongs
- **dependencies** *(list)* -- A list of services or load ordering groups that must start before this service
- **account_name** *(str)* -- The name of the account under which the service should run. For **own** type services this should be in the *domain\username* format. The following are examples of valid built-in service accounts:
  - NT AuthorityLocalService
  - NT AuthorityNetworkService
  - NT AuthorityLocalSystem
  - .LocalSystem
- **account_password** *(str)* -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive** *(bool)* -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** a dictionary of changes made

**Return type** dict

**CLI Example:**
```
salt '*' service.modify spooler start_type=disabled
```

salt.modules.win_service.restart(*name*, **timeout=90)**

Restart the named service. This issues a stop command followed by a start.

**Parameters**

- **name** -- The name of the service to restart.

**Note:** If the name passed is *salt-minion* a scheduled task is created and executed to restart the salt-minion service.

- **timeout** *(int)* -- The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

**Note:** The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

New in version 2017.7.9,2018.3.4.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' service.restart <service name>
```

salt.modules.win_service.start(*name*, **timeout=90)**

Start the specified service.
Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

Parameters
- **name** *(str)* -- The name of the service to start
  - **timeout** *(int)* -- The time in seconds to wait for the service to start before returning.
    Default is 90 seconds
    New in version 2017.7.9, 2018.3.4.

Returns
- **True** if successful, otherwise **False**. Also returns **True** if the service is already started

Return type: **bool**

CLI Example:

```bash
salt '*' service.start <service name>
```

---

salt.modules.win_service.status(*name, *args, **kwargs)*

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters **name** *(str)* -- The name of the service to check

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type: **bool**

CLI Example:

```bash
salt '*' service.status <service name>
```

---

salt.modules.win_service.stop(*name, timeout=90)*

Stop the specified service

Parameters
- **name** *(str)* -- The name of the service to stop
  - **timeout** *(int)* -- The time in seconds to wait for the service to stop before returning.
    Default is 90 seconds
    New in version 2017.7.9, 2018.3.4.

Returns
- **True** if successful, otherwise **False**. Also returns **True** if the service is already stopped

Return type: **bool**

CLI Example:

```bash
salt '*' service.stop <service name>
```
21.9.505 salt.modules.win_shadow

Manage the shadow file

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

salt.modules.win_shadow.info(name)
Return information for the specified user. This is just returns dummy data so that salt states can work.

**Parameters**
- name (str) -- The name of the user account to show.

**CLI Example:**
salt '*' shadow.info root

salt.modules.win_shadow.require_password_change(name)
Require the user to change their password the next time they log in.

**Parameters**
- name -- The name of the user account to require a password change.

**Returns**
- True if successful. False if unsuccessful.

**Return type** bool

**CLI Example:**
salt '*' shadow.require_password_change <username>

salt.modules.win_shadow.set_expire(name, expire)
Set the expiration date for a user account.

**Parameters**
- name -- The name of the user account to edit.
- expire -- The date the account will expire.

**Returns**
- True if successful. False if unsuccessful.

**Return type** bool

**CLI Example:**
salt '*' shadow.set_expire <username> 2016/7/1

salt.modules.win_shadow.set_password(name, password)
Set the password for a named user.

**Parameters**
- name (str) -- The name of the user account
- password (str) -- The new password

**Returns**
- True if successful. False if unsuccessful.

**Return type** bool

**CLI Example:**
salt '*' shadow.set_password root mysecretpassword

salt.modules.win_shadow.unlock_account(name)
Unlocks a user account.

**Parameters**
- name -- The name of the user account to unlock.

**Returns**
- True if successful. False if unsuccessful.

**Return type** bool

**CLI Example:**
salt '*' shadow.unlock_account <username>
21.9.506  salt.modules.win_smtp_server module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

depends wmi

salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False, server='SmtpSvc/1')

Get the IPGrant list for the SMTP virtual server.

Parameters
- as_wmi_format (bool) -- Returns the connection IPs as a list in the format WMI expects.
- server (str) -- The SMTP server name.

Returns A dictionary of the IP and subnet pairs.

Return type dict

CLI Example:
salt '*' win_smtp_server.get_connection_ip_list

salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')

Get the active log format for the SMTP virtual server.

Parameters server (str) -- The SMTP server name.

Returns A string of the log format name.

Return type str

CLI Example:
salt '*' win_smtp_server.get_log_format

salt.modules.win_smtp_server.get_log_format_types()

Get all available log format names and ids.

Returns A dictionary of the log format names and ids.

Return type dict

CLI Example:
salt '*' win_smtp_server.get_log_format_types

salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')

Get the RelayIpList list for the SMTP virtual server.

Parameters server (str) -- The SMTP server name.

Returns A list of the relay IPs.

Return type list

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:
salt '*' win_smtp_server.get_relay_ip_list

salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')

Get the value of the setting for the SMTP virtual server.

Parameters
- settings (str) -- A list of the setting names.
- server (str) -- The SMTP server name.
Returns: A dictionary of the provided settings and their values.

**Return type**: `dict`

**CLI Example**:
```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

**salt.modules.win_smtp_server.get_servers()**

Get the SMTP virtual server names.

**Returns**: A list of the SMTP virtual servers.

**Return type**: `list`

**CLI Example**:
```
salt '*' win_smtp_server.get_servers
```

**salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')**

Set the IPGrant list for the SMTP virtual server.

**Parameters**

- `addresses (str)` -- A dictionary of IP + subnet pairs.
- `grant_by_default (bool)` -- Whether the addresses should be a blacklist or whitelist.
- `server (str)` -- The SMTP server name.

**Returns**: A boolean representing whether the change succeeded.

**Return type**: `bool`

**CLI Example**:
```
salt '*' win_smtp_server.set_connection_ip_list addresses="{'127.0.0.1': '255.255.→255.255'}"
```

**salt.modules.win_smtp_server.set_log_format(log_format, server='SmtpSvc/1')**

Set the active log format for the SMTP virtual server.

**Parameters**

- `log_format (str)` -- The log format name.
- `server (str)` -- The SMTP server name.

**Returns**: A boolean representing whether the change succeeded.

**Return type**: `bool`

**CLI Example**:
```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

**salt.modules.win_smtp_server.set_relay_ip_list(addresses=None, server='SmtpSvc/1')**

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
'0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
'0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
'255.255.255.255', '127.0.0.1']
```

**Note**: Setting the list to None corresponds to the restrictive ‘Only the list below’ GUI parameter with an empty...
access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters
- **addresses** *(str)* -- A list of the relay IPs. The order of the list is important.
- **server** *(str)* -- The SMTP server name.

Returns
A boolean representing whether the change succeeded.
Return type **bool**

CLI Example:
```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1']"
```

salt.modules.win_smtp_server ```

``` set_server_setting ``` (settings, server='SmtpSvc/1')
Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters
- **settings** *(str)* -- A dictionary of the setting names and their values.
- **server** *(str)* -- The SMTP server name.

Returns
A boolean representing whether all changes succeeded.
Return type **bool**

CLI Example:
```
salt '*' win_smtp_server.set_server_setting settings="{'MaxRecipients': '500'}"
```

21.9.507 salt.modules.win_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

salt.modules.win_snmp.get_agent_service_types()
Get the sysServices types that can be configured.
Returns
A list of service types.
Return type **list**

CLI Example:
```
salt '*' win_snmp.get_agent_service_types
```

salt.modules.win_snmp.get_agent_settings()
Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.
Returns
A dictionary of the agent settings.
Return type **dict**

CLI Example:
```
salt '*' win_snmp.get_agent_settings
```

salt.modules.win_snmp.get_auth_traps_enabled()
Determine whether the host is configured to send authentication traps.
Returns
True if traps are enabled, otherwise False
Return type **bool**

21.9. execution modules
CLI Example:
```
salt '*' win_snmp.get_auth_traps_enabled
```

salt.modules.win_snmp.get_community_names()  
Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:
```
TestCommunity:  
    Managed by GPO
```

Community names managed normally will denote the permission instead:
```
TestCommunity:  
    Read Only
```

Returns A dictionary of community names and permissions.  
Return type dict

CLI Example:
```
salt '*' win_snmp.get_community_names
```

salt.modules.win_snmp.get_permission_types()  
Get the permission types that can be configured for communities.  

Returns A list of permission types.  
Return type list

CLI Example:
```
salt '*' win_snmp.get_permission_types
```

salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)  
Manage the SNMP sysContact, sysLocation, and sysServices settings.  

Parameters  
• contact (str, optional) -- The SNMP contact.  
• location (str, optional) -- The SNMP location.  
• services (list, optional) -- A list of selected services. The possible service names can be found via win_snmp.get_agent_service_types. To disable all services pass a list of None, ie: ['None']

Returns True if successful, otherwise False  
Return type bool

CLI Example:
```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'
services=['Physical']
```

salt.modules.win_snmp.set_auth_traps_enabled(status=True)  
Manage the sending of authentication traps.  

Parameters status (bool) -- True to enable traps. False to disable.  
Returns True if successful, otherwise False  
Return type bool

CLI Example:
```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```
salt.modules.win_snmp.set_community_names(community)  
Manage the SNMP accepted community names and their permissions.

Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError.

Parameters:  
community (dict) -- A dictionary of SNMP community names and permissions. The possible permissions can be found via win_snmp.get_permission_types.

Returns:  
True if successful, otherwise False

Return type: bool

Raises: CommandExecutionError -- If SNMP settings are being managed by Group Policy

CLI Example:

```bash
salt '*' win_snmp.set_community_names communities="{'TestCommunity': 'Read Only'}"
```

**21.9.508 salt.modules.win_status**

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

class Modules

salt.modules.win_status.cpuload()
New in version 2015.8.0.
Return the processor load as a percentage
CLI Example:
salt '*' status.cpuload

salt.modules.win_status.cpustats()
Return information about the CPU.
Returns dict: A dictionary containing information about the CPU stats
CLI Example:
salt '*' status.cpustats

salt.modules.win_status.diskusage(human_readable=False, path=None)
New in version 2015.8.0.
Return the disk usage for this minion
human_readable [False] If True, usage will be in KB/MB/GB etc.
CLI Example:
salt '*' status.diskusage path=c:/salt

salt.modules.win_status.loadavg()
Returns counter information related to the load of the machine
Returns A dictionary of counters
Return type dict
CLI Example:
salt '*' status.loadavg

salt.modules.win_status.master(master=None, connected=True)
New in version 2015.5.0.
Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.
CLI Example:
salt '*' status.master

salt.modules.win_status.meminfo()
Return information about physical and virtual memory on the system
Returns  A dictionary of information about memory on the system

Return type  dict

CLI Example:
salt * status.meminfo

salt.modules.win_status.procs(count=False)
Return the process data
count  [False] If True, this function will simply return the number of processes.
    New in version 2015.8.0.

CLI Example:
salt '*' status.procs
salt '*' status.procs count

salt.modules.win_status.saltmem(human_readable=False)
New in version 2015.8.0.
Returns the amount of memory that salt is using
human_readable  [False] return the value in a nicely formatted number

CLI Example:
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True

salt.modules.win_status.uptime(human_readable=False)
New in version 2015.8.0.
Return the system uptime for the machine

Parameters  human_readable (bool) -- Return uptime in human readable format if True,
otherwise return seconds. Default is False

    Note: Human readable format is days, hours:min:sec. Days will only be displayed
if more than 0

Returns  The uptime in seconds or human readable format depending on the value of
human_readable

Return type  str

CLI Example:
salt '*' status.uptime
salt '*' status.uptime human_readable=True

salt.modules.win_status.vmstats()
Return information about the virtual memory on the machine

Returns  A dictionary of virtual memory stats

Return type  dict

CLI Example:
salt * status.vmstats
21.9.509 salt.modules.win_system

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

    depends
        • pywintypes
        • win32api
        • win32con
        • win32net
        • wmi

salt.modules.win_system.get_computer_desc()
    Get the Windows computer description
    Returns Returns the computer description if found. Otherwise returns False.
    Return type str
    CLI Example:

    salt 'minion-id' system.get_computer_desc

salt.modules.win_system.get_computer_name()
    Get the Windows computer name
    Returns Returns the computer name if found. Otherwise returns False.
    Return type str
    CLI Example:

    salt 'minion-id' system.get_computer_name

salt.modules.win_system.get_domain_workgroup()
    Get the domain or workgroup the computer belongs to.
    New in version 2015.5.7.
    New in version 2015.8.2.
    Returns The name of the domain or workgroup
    Return type str
    CLI Example:

    salt 'minion-id' system.get_domain_workgroup

salt.modules.win_system.get_hostname()
    Get the hostname of the windows minion
    New in version 2016.3.0.
    Returns Returns the hostname of the windows minion
    Return type str
    CLI Example:

    salt 'minion-id' system.get_hostname

salt.modules.win_system.get_pending_component_servicing()
    Determine whether there are pending Component Based Servicing tasks that require a reboot.
    New in version 2016.11.0.
    Returns True if there are pending Component Based Servicing tasks, otherwise False
Return type `bool`

CLI Example:

```bash
salt '*' system.get_pending_component_servicing
```

**salt.modules.win_system.get_pending_component_servicing()**

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, `None` will be returned. If there was an error retrieving the pending computer name, `False` will be returned, and an error message will be logged to the minion log.

- **Returns**: Returns the pending name if pending restart. Returns `None` if not pending restart.
- **Return type**: `str`

CLI Example:

```bash
salt 'minion-id' system.get_pending_component_servicing
```

**salt.modules.win_system.get_pending_computer_name()**

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

- **Returns**: `True` if there is a pending domain join action, otherwise `False`
- **Return type**: `bool`

CLI Example:

```bash
salt '*' system.get_pending_domain_join
```

**salt.modules.win_system.get_pending_domain_join()**

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

- **Returns**: `True` if there are pending file rename operations, otherwise `False`
- **Return type**: `bool`

CLI Example:

```bash
salt '*' system.get_pending_file_rename
```

**salt.modules.win_system.get_pending_file_rename()**

Determine whether there is a reboot pending.

New in version 2016.11.0.

- **Returns**: `True` if the system is pending reboot, otherwise `False`
- **Return type**: `bool`

CLI Example:

```bash
salt '*' system.get_pending_reboot
```

**salt.modules.win_system.get_pending_reboot()**

Determine which check is signalling that the system is pending a reboot. Useful in determining why your system is signalling that it needs a reboot.

New in version 3001.

- **Returns**: A dictionary of the results of each system that would indicate a pending reboot
- **Return type**: `dict`

CLI Example:

```bash
salt '*' system.get_pending_reboot_details
```

**salt.modules.win_system.get_pending_reboot_details()**

Determine which check is signalling that the system is pending a reboot. Useful in determining why your system is signalling that it needs a reboot.

New in version 3001.
salt.modules.win_system.get_pending_servermanager()
Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

Returns True if there are pending Server Manager tasks, otherwise False
Return type bool
CLI Example:
```
salt '*' system.get_pending_servermanager
```

salt.modules.win_system.get_pending_update()
Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

Returns True if there are pending updates, otherwise False
Return type bool
CLI Example:
```
salt '*' system.get_pending_update
```

salt.modules.win_system.get_pending_windows_update()
Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

Returns True if the Windows Update system reports a pending update, otherwise False
Return type bool
CLI Example:
```
salt '*' system.get_pending_windows_update
```

salt.modules.win_system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns True if the Requires reboot registry flag is set to 1, otherwise False
Return type bool
CLI Example:
```
salt '*' system.get_reboot_required_witnessed
```

salt.modules.win_system.get_system_date()
Get the Windows system date

Returns Returns the system date
Return type str
CLI Example:
```
salt '*' system.get_system_date
```

salt.modules.win_system.get_system_info()
Get system information.
Note: Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped.

Returns Dictionary containing information about the system to include name, description, version, etc...
Return type dict

CLI Example:
salt 'minion-id' system.get_system_info

salt.modules.win_system.get_system_time()
Get the system time.
    Returns Returns the system time in HH:MM:SS AM/PM format.
    Return type str
    
    CLI Example:
    salt 'minion-id' system.get_system_time

salt.modules.win_system.halt(timeout=5, in_seconds=False)
Halt a running system.
    Parameters
        • timeout(int) -- Number of seconds before halting the system. Default is 5 seconds.
        • in_seconds(bool) -- Whether to treat timeout as seconds or minutes.
        New in version 2015.8.0.
    Returns True if successful, otherwise False
    Return type bool
    
    CLI Example:
    salt '*' system.halt 5 True

salt.modules.win_system.init(runlevel)
Change the system runlevel on sysV compatible systems. Not applicable to Windows

    CLI Example:
    salt '*' system.init 3

salt.modules.win_system.join_domain(domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)
Join a computer to an Active Directory domain. Requires a reboot.
    Parameters
        • domain (str) -- The domain to which the computer should be joined, e.g. example.com
        • username (str) -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
        • password (str) -- Password of the specified user
        • account_ou (str) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com
        • account_exists (bool) -- If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
• `restart` *(bool)* -- True will restart the computer after a successful join. Default is False

  New in version 2015.8.2/2015.5.7.

  Returns: Returns a dictionary if successful, otherwise False

  Return type: dict

  CLI Example:

  ```
  salt 'minion-id' system.join_domain domain='domain.tld' \
    username='joinuser' password='joinpassword' \ 
    account_ou='ou=clients,ou=org,dc=domain,dc=tld' \ 
    account_exists=False, restart=True
  ```

  ```
  salt.modules.win_system.lock()
  ```

  Lock the workstation.

  Returns: True if successful, otherwise False

  Return type: bool

  CLI Example:

  ```
  salt 'minion-id' system.lock
  ```

  salt.modules.win_system.poweroff(*timeout=5, in_seconds=False*)

  Power off a running system.

  Parameters

  • `timeout` *(int)* -- Number of seconds before powering off the system. Default is 5 seconds.
  
  • `in_seconds` *(bool)* -- Whether to treat timeout as seconds or minutes.

  New in version 2015.8.0.

  Returns: True if successful, otherwise False

  Return type: bool

  CLI Example:

  ```
  salt '*' system.poweroff 5
  ```

  salt.modules.win_system.reboot(*timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False*)

  Reboot a running system.

  Parameters

  • `timeout` *(int)* -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.
  
  • `in_seconds` *(bool)* -- True will cause the `timeout` parameter to be in seconds. False will be in minutes. Default is False.

  New in version 2015.8.0.

  • `wait_for_reboot` *(bool)* -- True will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is False.

  New in version 2015.8.0.

  • `only_on_pending_reboot` *(bool)* -- If this is set to True, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using `order: last`). Default is False.

  Returns: True if successful (a reboot will occur), otherwise False

  Return type: bool

  CLI Example:
```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

```
salt.modules.win_system.set_computer_desc(desc=None)
Set the Windows computer description
Parameters desc (str) -- The computer description
Returns Description if successful, otherwise False
Return type str
CLI Example:
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

```
salt.modules.win_system.set_computer_name(name)
Set the Windows computer name
Parameters name (str) -- The new name to give the computer. Requires a reboot to take effect.
Returns Returns a dictionary containing the old and new names if successful. False if not.
Return type dict
CLI Example:
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

```
salt.modules.win_system.set_domain_workgroup(workgroup)
Set the domain or workgroup the computer belongs to.
New in version 3001.
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt 'minion-id' system.set_domain_workgroup LOCAL
```

```
salt.modules.win_system.set_hostname(hostname)
Set the hostname of the windows minion, requires a restart before this will be updated.
New in version 2016.3.0.
Parameters hostname (str) -- The hostname to set
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt 'minion-id' system.set_hostname newhostname
```

```
salt.modules.win_system.set_reboot_required_witnessed()
This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the HKLM hive:
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name 'Reboot required' will be assigned the value of 1.
```
For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

salt.modules.win_system.set_system_date(newdate)

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters

- `newdate (str)` -- The date to set. Can be any of the following formats
  - YYYY-MM-DD
  - MM-DD-YYYY
  - MM-DD-YY
  - MM/DD/YYYY
  - MM/DD/YY
  - YYYY/MM/DD

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Parameters

- `years (int)` -- Years digit, ie: 2015
- `months (int)` -- Months digit: 1 - 12
- `days (int)` -- Days digit: 1 - 31
- `hours (int)` -- Hours digit: 0 - 23
- `minutes (int)` -- Minutes digit: 0 - 59
- `seconds (int)` -- Seconds digit: 0 - 59

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

salt.modules.win_system.set_system_time(newtime)

Set the system time.

Parameters

- `newtime (str)` -- The time to set. Can be any of the following formats:
  - HH:MM:SS AM/PM
  - HH:MM AM/PM
  - HH:MM:SS (24 hour)
  - HH:MM (24 hour)

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```
salt.modules.win_system.shutdown

Shutdown a running system.

Parameters

- **message** *(str)* -- The message to display to the user before shutting down.
- **timeout** *(int)* -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the system.shutdown_abort function.

If timeout is not zero, InitiateSystemShutdown displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the lpMessage parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by system.shutdown_abort.

Default is 5 minutes
- **in_seconds** *(bool)* -- True will cause the **timeout** parameter to be in seconds. False will be in minutes. Default is False.
- **force_close** *(bool)* -- True will force close all open applications. False will display a dialog box instructing the user to close open applications. Default is True.
- **reboot** *(bool)* -- True restarts the computer immediately after shutdown. False powers down the system. Default is False.
- **only_on_pending_reboot** *(bool)* -- If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.

Returns True if successful (a shutdown or reboot will occur), otherwise False

Return type bool

CLI Example:

```bash
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

salt.modules.win_system.shutdown_abort()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.shutdown_hard()

Shutdown a running system with no timeout or warning.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```bash
salt '*' system.shutdown_hard
```
salt.modules.win_system.start_time_service()
Start the Windows time service
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' system.start_time_service

salt.modules.win_system.stop_time_service()
Stop the Windows time service
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' system.stop_time_service

salt.modules.win_system.unjoin_domain(username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False)
Unjoin a computer from an Active Directory Domain. Requires a restart.
Parameters
- **username (str)** -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like user@domain.tld or domain.tld\user. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be None.
- **password (str)** -- The password of the specified user
- **domain (str)** -- The domain from which to unjoin the computer. Can be None
- **workgroup (str)** -- The workgroup to join the computer to. Default is WORKGROUP

New in version 2015.8.2/2015.5.7.
- **disable (bool)** -- True to disable the computer account in Active Directory. Default is False
- **restart (bool)** -- True will restart the computer after successful unjoin. Default is False

New in version 2015.8.2/2015.5.7.
Returns a dictionary if successful, otherwise False
Return type dict
CLI Example:
salt 'minion-id' system.unjoin_domain restart=True
salt 'minion-id' system.unjoin_domain username='unjoinuser' \ password='unjoinpassword' disable=True \ restart=True
21.9.510 salt.modules.win_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear
triggers and actions. You can list all tasks, folders, triggers, and actions.

salt.modules.win_task.add_action(name=None, location='\', action_type='Execute', **kwargs)

Add an action to a task.

Parameters

- name (str) -- The name of the task to which to add the action.
- location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- action_type (str) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each action_type:

Execute

Execute a command or an executable

- cmd (str): (required) The command or executable to run.
- arguments (str): (optional) Arguments to be passed to the command or executable.
  To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass cscript.exe in the cmd parameter and pass the script in the arguments parameter as follows:
  - cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'

  Batch files do not need an interpreter and may be passed to the cmd parameter directly.

- start_in (str): (optional) The current working directory for the command.

Email

Send and email. Requires server, from, and to or cc.

- from (str): The sender
- reply_to (str): Who to reply to
- to (str): The recipient
- cc (str): The CC recipient
- bcc (str): The BCC recipient
- subject (str): The subject of the email
- body (str): The Message Body of the email
- server (str): The server used to send the email
- attachments (list): A list of attachments. These will be the paths to the files to attach. ie: attachments="['C:\attachment1.txt', 'C:\attachment2.txt']"

Message

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

- title (str): The dialog box title.
- message (str): The dialog box message body

Returns A dictionary containing the task configuration
Return type  dict

CLI Example:

```bash
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```python
salt.modules.win_task.add_trigger(name=None, location=None, trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)
```

Add a trigger to a Windows Scheduled task

Note: Arguments are parsed by the YAML loader and are subject to yaml's idiosyncrasies. Therefore, time values in some formats (%H:%M:%S and %H:%M) should to be quoted. See YAML IDIOSYNCRASIES for more details.

Parameters

- **name (str)** -- The name of the task to which to add the trigger.
- **location (str)** -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **trigger_type (str)** -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger_enabled (bool)** -- Boolean value that indicates whether the trigger is enabled.
- **start_date (str)** -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start_time (str)** -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end_date (str)** -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
- `%m-%d-%y`
- `%m-%d-%Y`
- `%m/%d/%y`
- `%m/%d/%Y`
- `%Y/%m/%d`

- **end_time (str)** -- The time when the trigger is deactivated. If this is not passed with **end_date** it will be set to midnight. Can be one of the following formats:
  - `%I:%M:%S %p`
  - `%I:%M %p`
  - `%H:%M:%S`
  - `%H:%M`

- **random_delay (str)** -- The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

**Note:** This parameter applies to the following trigger types
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay

- **repeat_interval (str)** -- The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

- **repeat_duration (str)** -- How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day

- **repeat_stop_at_duration_end (bool)** -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

- **execution_time_limit (str)** -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

- **delay (str)** -- The time the trigger waits after its activation to start the task. Valid
values are:
- 15 seconds
- 30 seconds
- 1 minute
- 30 minutes
- 1 hour
- 8 hours
- 1 day

Note: This parameter applies to the following trigger types:
- OnLogon
- OnBoot
- Event
- OnTaskCreation
- OnSessionChange

kwargs
There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event
The trigger will be fired by an event.

subscription (str): An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

Once
No special parameters required.

Daily
The task will run daily.

days_interval (int): The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly
The task will run weekly.

weeks_interval (int): The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

days_of_week (list): Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

Monthly
The task will run monthly.

months_of_year (list): Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

days_of_month (list): Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

last_day_of_month (bool): Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

Note: You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter
'last_day_of_month' equal to True.

**MonthlyDay**
The task will run monthly on the specified day.

- **months_of_year** (list): Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.
- **weeks_of_month** (list): Sets the weeks of the month during which the task runs. Should be a list. ie: ['First', 'Third']. Valid options are:
  - First
  - Second
  - Third
  - Fourth
- **last_week_of_month** (bool): Boolean value that indicates that the task runs on the last week of the month.
- **days_of_week** (list): Sets the days of the week during which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

**OnIdle**
No special parameters required.

**OnTaskCreation**
No special parameters required.

**OnBoot**
No special parameters required.

**OnLogon**
No special parameters required.

**OnSessionChange**
The task will be triggered by a session change.

- **session_user_name** (str): Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.
- **state_change** (str): Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
  - ConsoleConnect: When you connect to a user session (switch users)
  - ConsoleDisconnect: When you disconnect a user session (switch users)
  - RemoteConnect: When a user connects via Remote Desktop
  - RemoteDisconnect: When a user disconnects via Remote Desktop
  - SessionLock: When the workstation is locked
  - SessionUnlock: When the workstation is unlocked

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```bash
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_enabled=True start_date=2016/12/1 start_time="12:01"
```

salt.modules.win_task.clear_triggers(name, location='\')
Remove all triggers from the task.

**Parameters**
- **name** (str) -- The name of the task from which to clear all triggers.
- **location** (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False
Return type  bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

salt.modules.win_task.create_folder(name, location='\')
Create a folder in which to create tasks.

Parameters
• name (str) -- The name of the folder. This will be displayed in the task scheduler.
• location (str) -- A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns  True if successful, otherwise False

Return type  bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

salt.modules.win_task.create_task(name, location='\', user_name='System', password=None, force=False, **kwargs)
Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:
• edit_task()
• add_action()
• add_trigger()

Parameters
• name (str) -- The name of the task. This will be displayed in the task scheduler.
• location (str) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
• user_name (str) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
• password (str) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
• force (bool) -- If the task exists, overwrite the existing task.

Returns  True if successful, otherwise False

Return type  bool

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_→type=Execute cmd='del /Q /S C:\Temp' trigger_type=Once start_date=2016-12-1 →start_time=01:00
```

salt.modules.win_task.create_task_from_xml(name, location='\', xml_text=None, xml_path=None, user_name='System', password=None)
Create a task based on XML. Source can be a file or a string of XML.

Parameters
• name (str) -- The name of the task. This will be displayed in the task scheduler.
• location (str) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
• xml_text (str) -- A string of xml representing the task to be created. This will be overridden by xml_path if passed.
• **xml_path** *(str)* -- The path to an XML file on the local system containing the xml that defines the task. This will override xml_text
• **user_name** *(str)* -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
• **password** *(str)* -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

**Returns**  
True if successful, otherwise False  
str: A string with the error message if there is an error

**Return type**  
bool

**Raises**  
• **ArgumentValueError** -- If arguments are invalid  
• **CommandExecutionError** --

**CLI Example:**
salt '* task.create_task_from_xml <task_name> xml_path=C:\task.xml

salt.modules.win_task.delete_folder(name, location='\\')  
Delete a folder from the task scheduler.

**Parameters**
• **name** *(str)* -- The name of the folder to delete.
• **location** *(str)* -- A string value representing the location of the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**  
True if successful, otherwise False

**Return type**  
bool

**CLI Example:**
salt 'minion-id' task.delete_folder <folder_name>

salt.modules.win_task.delete_task(name, location='\\')  
Delete a task from the task scheduler.

**Parameters**
• **name** *(str)* -- The name of the task to delete.
• **location** *(str)* -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**  
True if successful, otherwise False

**Return type**  
bool

**CLI Example:**
salt 'minion-id' task.delete_task <task_name>

salt.modules.win_task.edit_task(name=None, location='\\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

**Parameters**
• **name** *(str)* -- The name of the task. This will be displayed in the task scheduler.
• **location** *(str)* -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
• **user_name** *(str)* -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

• **password** *(str)* -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

**Note:** The combination of user_name and password determine how the task runs. For example, if a username is passed without at password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

• **description** *(str)* -- A string representing the text that will be displayed in the description field in the task scheduler.

• **enabled** *(bool)* -- A boolean value representing whether or not the task is enabled.

• **hidden** *(bool)* -- A boolean value representing whether or not the task is hidden.

• **run_if_idle** *(bool)* -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.

• **idle_duration** *(str)* -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

• **idle_wait_timeout** *(str)* -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

• **idle_stop_on_end** *(bool)* -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

• **idle_restart** *(bool)* -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.

• **ac_only** *(bool)* -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.

• **stop_if_on_batteries** *(bool)* -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.

• **wake_to_run** *(bool)* -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.

• **run_if_network** *(bool)* -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.

• **network_id** *(guid)* -- GUID value that identifies a network profile.

• **network_name** *(str)* -- Sets the name of a network profile. The name is used for display purposes.

• **allow_demand_start** *(bool)* -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
• **start_when_available** *(bool)* -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.

• **restart_every** *(str)* -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

• **restart_count** *(int)* -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.

• **execution_time_limit** *(bool, str)* -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days

• **force_stop** *(bool)* -- Boolean value that indicates that the task may be terminated by using TerminateProcess.

• **delete_after** *(bool, str)* -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days

• **multiple_instances** *(str)* -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue
  - No New Instance
  - Stop Existing

Returns True if successful, otherwise False

Return type bool

CLI Example:
```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

salt.modules.win_task.info*(name, location='\')*

Get the details about a task in the task scheduler.

Parameters

• **name** *(str)* -- The name of the task for which to return the status

• **location** *(str)* -- A string value representing the location of the task. Default is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns A dictionary containing the task configuration
Return type: `dict`

CLI Example:
```
salt 'minion-id' task.info <task_name>
```

```python
salt.modules.win_task.list_actions(name, location='\')

List all actions that pertain to a task in the specified location.

Parameters:
- `name` (*str*): The name of the task for which list actions.
- `location` (*str*): A string value representing the location of the task from which to list actions. Default is `\`, which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns: Returns a list of actions.
Return type: `list`
```

CLI Example:
```
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

```python
tsali.modules.win_task.list_folders(location='\')

List all folders located in a specific location in the task scheduler.

Parameters:
- `location` (*str*): A string value representing the folder from which you want to list tasks. Default is `\`, which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns: Returns a list of folders.
Return type: `list`
```

CLI Example:
```
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

```python
tsali.modules.win_task.list_tasks(location='\')

List all tasks located in a specific location in the task scheduler.

Parameters:
- `location` (*str*): A string value representing the folder from which you want to list tasks. Default is `\`, which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns: Returns a list of tasks.
Return type: `list`
```

CLI Example:
```
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

```python
tsali.modules.win_task.list_triggers(name, location='\')

List all triggers that pertain to a task in the specified location.

Parameters:
- `name`:*str*
- `location`:*str*
```

21.9. execution modules 3007
• **name (str)** -- The name of the task for which list triggers.
• **location (str)** -- A string value representing the location of the task from which to list triggers. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** Returns a list of triggers.
**Return type** list

**CLI Example:**

```yaml
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

---

salt.modules.win_task.run(*name, location='\',*)

Run a scheduled task manually.

**Parameters**

• **name (str)** -- The name of the task to run.
• **location (str)** -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False
**Return type** bool

**CLI Example:**

```yaml
salt 'minion-id' task.run <task_name>
```

---

salt.modules.win_task.run_wait(*name, location='\',*)

Run a scheduled task and return when the task finishes

**Parameters**

• **name (str)** -- The name of the task to run.
• **location (str)** -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns** True if successful, otherwise False
**Return type** bool

**CLI Example:**

```yaml
salt 'minion-id' task.run_wait <task_name>
```

---

salt.modules.win_task.status(*name, location='\',*)

Determine the status of a task. Is it Running, Queued, Ready, etc.

**Parameters**

• **name (str)** -- The name of the task for which to return the status
• **location (str)** -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

The current status of the task. Will be one of the following:

• Unknown
• Disabled
• Queued
• Ready
• Running

**Return type** str

**CLI Example:**
salt 'minion-id' task.list_status <task_name>

salt.modules.win_task.

```
stop(name, location='\\')
```

Stop a scheduled task.

**Parameters**

- `name (str)` -- The name of the task to stop.
- `location (str)` -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).

**Returns**

- True if successful, otherwise False

**Return type**

`bool`

**CLI Example:**

```
salt 'minion-id' task.list_stop <task_name>
```

21.9.511 salt.modules.win_timezone

Module for managing timezone on Windows systems.

**class** salt.modules.win_timezone.TzMapper

```
add(k, v)
get_unix(key, default=None)
get_win(key, default=None)
list_unix()
list_win()
remove(k)
```

salt.modules.win_timezone.

```
get_hwclock()
```

Get current hardware clock setting (UTC or local time)

**Note:** The hardware clock is always local time on Windows so this will always return "localtime"

**CLI Example:**

```
salt '*' timezone.get_hwclock
```

salt.modules.win_timezone.

```
get_offset()
```

Get current numeric timezone offset from UTC (i.e. -0700)

**Returns**

- Offset from UTC

**Return type**

`str`

**CLI Example:**

```
salt '*' timezone.get_offset
```

salt.modules.win_timezone.

```
get_zone()
```

Get current timezone (i.e. America/Denver)

**Returns**

- Timezone in unix format

**Return type**

`str`

**Raises**

- `CommandExecutionError` -- If timezone could not be gathered

**CLI Example:**
salt 'hydrate' timezone.get_zone

salt.modules.win_timezone.get_zonecode()
Get current timezone (i.e. PST, MDT, etc)
Returns An abbreviated timezone code
Return type str
CLI Example:
salt 'hydrate' timezone.get_zonecode

salt.modules.win_timezone.list(unix_style=True)
Return a list of Timezones that this module supports. These can be in either Unix or Windows format.
New in version 2018.3.3.
Parameters unix_style (bool) -- True returns Unix-style timezones. False returns Windows-style timezones. Default is True
Returns A list of supported timezones
Return type list
CLI Example:
# Unix-style timezones
salt 'hydrate' timezone.list
# Windows-style timezones
salt 'hydrate' timezone.list unix_style=False

salt.modules.win_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

Note: The hardware clock is always local time on Windows so this will always return False

CLI Example:
salt 'hydrate' timezone.set_hwclock UTC

salt.modules.win_timezone.set_zone(timezone)
Sets the timezone using the tzutil.
Parameters timezone (str) -- A valid timezone
Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError -- If invalid timezone is passed
CLI Example:
salt 'hydrate' timezone.set_zone 'America/Denver'

salt.modules.win_timezone.zone_compare(timezone)
Compares the given timezone with the machine timezone. Mostly useful for running state checks.
Parameters timezone (str) -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the timezone.list function
Returns True if they match, otherwise False
Return type bool
Example:
salt 'hydrate' timezone.zone_compare 'America/Denver'
21.9.512  salt.modules.win_useradd

Module for managing Windows Users

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info is not available'), see here.

depends

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

Note: This currently only works with local user accounts, not domain accounts

salt.modules.win_useradd.add(name, password=None, fullname=None, description=None,
                              groups=None, home=None, homedrive=None, profile=None, logonscript=None)

Add a user to the minion.

Parameters

- **name (str)** -- User name
- **password (str, optional)** -- User's password in plain text.
- **fullname (str, optional)** -- The user's full name.
- **description (str, optional)** -- A brief description of the user account.
- **groups (str, optional)** -- A list of groups to add the user to. (see chgroups)
- **home (str, optional)** -- The path to the user's home directory.
- **homedrive (str, optional)** -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile (str, optional)** -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses its default profile directory.
- **logonscript (str, optional)** -- Path to a login script to run when the user logs on.

Returns  True if successful. False is unsuccessful.

Return type  bool

CLI Example:

```
salt '*' user.add name password
```

salt.modules.win_useradd.addgroup(name, group)

Add user to a group

Parameters

- **name (str)** -- The user name to add to the group
- **group (str)** -- The name of the group to which to add the user
Returns: True if successful, otherwise False
Return type: bool

CLI Example:
```
salt '*' user.addgroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.chfullname(name, fullname)
Change the full name of the user

Parameters:
- **name (str)** -- The user name for which to change the full name
- **fullname (str)** -- The new value for the full name

Returns: True if successful, otherwise False
Return type: bool

CLI Example:
```
salt '*' user.chfullname user 'First Last'
```

salt.modules.win_useradd.chgroups(name, groups, append=True)
Change the groups this user belongs to, add append=False to make the user a member of only the specified groups

Parameters:
- **name (str)** -- The user name for which to change groups
- **groups (str, list)** -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append (bool, optional)** -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns: True if successful, otherwise False
Return type: bool

CLI Example:
```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

salt.modules.win_useradd.chhome(name, home, **kwargs)
Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters:
- **name (str)** -- The name of the user whose home directory you wish to change
- **home (str)** -- The new location of the home directory

Returns: True if successful, otherwise False
Return type: bool

CLI Example:
```
salt '*' user.chhome foo \fileservr\home\foo True
```

salt.modules.win_useradd.chprofile(name, profile)
Change the profile directory of the user

Parameters:
- **name (str)** -- The name of the user whose profile you wish to change
- **profile (str)** -- The new location of the profile

Returns: True if successful, otherwise False
Return type: bool

CLI Example:
```
salt '*' user.chprofile foo \fileservr\profiles\foo
```
salt.modules.win_useradd.current(sam=False)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters

- **sam** (bool, optional) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

Returns

- **Returns** Returns username

Return type

- **str**

CLI Example:

```
salt '*' user.current
```

salt.modules.win_useradd.delete(name, purge=False, force=False)

Remove a user from the minion

Parameters

- **name** (str) -- The name of the user to delete
- **purge** (bool, optional) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** (bool, optional) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns

- **True** if successful, otherwise **False**

Return type

- **bool**

CLI Example:

```
salt '*' user.delete name
```

salt.modules.win_useradd.getUserSid(username)

Get the Security ID for the user

Parameters

- **username** (str) -- The user name for which to look up the SID

Returns

- **The user SID**

Return type

- **str**

CLI Example:

```
salt '*' user.getUserSid jsnuffy
```

salt.modules.win_useradd.getent(refresh=False)

Return the list of all info for all users

Parameters

- **refresh** (bool, optional) -- Refresh the cached user information. Useful when used from within a state function. Default is False.

Returns

- **A dictionary containing information about all users on the system**

Return type

- **dict**

CLI Example:

```
salt '*' user.getent
```

salt.modules.win_useradd.info(name)

Return user information

Parameters

- **name** (str) -- Username for which to display information

Returns

- **A dictionary containing user information**
  - **fullname**
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- password_never_expires
- disallow_change_password
- gid

Return type dict
CLI Example:
```
salt '*' user.info jsnuffy
```

salt.modules.win_useradd.list_groups(name)
Return a list of groups the named user belongs to
Parameters name (str) -- The user name for which to list groups
Returns A list of groups to which the user belongs
Return type list
CLI Example:
```
salt '*' user.list_groups foo
```

salt.modules.win_useradd.list_users()
Return a list of all users on Windows
Returns A list of all users on the system
Return type list
CLI Example:
```
salt '*' user.list_users
```

salt.modules.win_useradd.removegroup(name, group)
Remove user from a group
Parameters
- name (str) -- The user name to remove from the group
- group (str) -- The name of the group from which to remove the user
Returns True if successful, otherwise False
Return type bool
CLI Example:
```
salt '*' user.removegroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.rename(name, new_name)
Change the username for a named user
Parameters

- **name (str)** -- The user name to change
- **new_name (str)** -- The new name for the current user

**Returns**
True if successful, otherwise False

**Return type**
bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

```text
salt.modules.win_useradd.setpassword(name, password)
```

Set the user's password

**Parameters**

- **name (str)** -- The user name for which to set the password
- **password (str)** -- The new password

**Returns**
True if successful, otherwise False

**Return type**
bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

```text
salt.modules.win_useradd.update(name, password=None, fullname=None, description=None, home=None, homedrive=None, logonscript=None, profile=None, expiration_date=None, expired=None, account_disabled=None, unlock_account=None, password_neverExpires=None, disallow_change_password=None)
```

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

**Parameters**

- **name (str)** -- The user name to update.
- **password (str, optional)** -- New user password in plain text.
- **fullname (str, optional)** -- The user's full name.
- **description (str, optional)** -- A brief description of the user account.
- **home (str, optional)** -- The path to the user's home directory.
- **homedrive (str, optional)** -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript (str, optional)** -- The path to the logon script.
- **profile (str, optional)** -- The path to the user's profile directory.
- **expiration_date (date, optional)** -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired (bool, optional)** -- Pass True to expire the account. The user will be prompted to change their password at the next logon. Pass False to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the expiration_date as well.
- **account_disabled (bool, optional)** -- True disables the account. False enables the account.
- **unlock_account (bool, optional)** -- True unlocks a locked user account. False is ignored.
- **password_neverExpires (bool, optional)** -- True sets the password to never expire. False allows the password to expire.
- **disallow_change_password (bool, optional)** -- True blocks the user from changing the password. False allows the user to change the password.

**Returns**
True if successful. False is unsuccessful.

**Return type**
bool
21.9.513  salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- `win_wua.available`
- `win_wua.list`

This is an easy way to find additional information about updates available to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list_>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

`depends  salt.utils.win_update`
salt.modules.win_wua.available(software=True, drivers=True, summary=False,
    skip_installed=True, skip_hidden=True, skip_mandatory=False,
    skip_reboot=False, categories=None, severities=None, on-
    line=True)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than list(). Good for finding a specific GUID or KB.

Parameters

- **software** (bool) -- Include software updates in the results. Default is True
- **drivers** (bool) -- Include driver updates in the results. Default is True
- **summary** (bool) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed** (bool) -- Skip updates that are already installed. Default is True
- **skip_hidden** (bool) -- Skip updates that have been hidden. Default is True
- **skip_mandatory** (bool) -- Skip mandatory updates. Default is False
- **skip_reboot** (bool) -- Skip updates that require a reboot. Default is False
- **categories** (list) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** (list) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:
- Critical
- Important

- **online** (bool) -- Tells the Windows Update Agent go online to update its local update database. True will go online. False will use the local update database as is. Default is True

New in version 3001.

Returns

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
}}
```

(continues on next page)
Return type  dict

CLI Examples:

```bash
# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.available categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.available severities=['Critical']

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=['Feature Packs','Windows 8.1'] summary=True
```

salt.modules.win_wua.download(names)

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using list_updates and setting download=True.

**Parameters**

- `names` *(str, list)* -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

---

**Note:** An error will be raised if there are more results than there are items in the names list.
parameter

**Returns** A dictionary containing the details about the downloaded updates

**Return type** dict

**CLI Example:**

```bash
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab', 'KB2131233']
```

salt.modules.win_wua.get(name, download=False, install=False, online=True)

New in version 2017.7.0.

Returns details for the named update

**Parameters**

- **name (str)** -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you're looking for.
- **download (bool)** -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install (bool)** -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.
- **online (bool)** -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

New in version 3001.

**Returns**

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <has the EULA been accepted>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [
        '<category 1>',
        '<category 2>',
        ...
    ]
}}
```

**Return type** dict

**CLI Examples:**

---

21.9. execution modules
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:
# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'

```bash
salt.modules.win_wua.get_needs_reboot()
```

Determines if the system needs to be rebooted.

Returns True if the system requires a reboot, otherwise False

Return type bool

CLI Examples:

```bash
salt '*' win_wua.get_needs_reboot
```

```bash
salt.modules.win_wua.get_wu_settings()
```

Get current Windows Update settings.

Returns A dictionary of Windows Update settings:

**Featured Updates**: Boolean value that indicates whether to display notifications for featured updates.

**Group Policy Required (Read-only)**: Boolean value that indicates whether Group Policy requires the Automatic Updates service.

**Microsoft Update**: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

**Needs Reboot**: Boolean value that indicates whether the machine is in a reboot pending state.

**Non Admins Elevated**: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

**Notification Level**: Number 1 to 4 indicating the update level:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

**Read Only (Read-only)**: Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates**: Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day**: Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time**: Time at which Automatic Updates installs or uninstalls updates.

Return type dict

CLI Examples:
salt 's' win_wua.get_wu_settings

salt.modules.win_wua.install(names)
New in version 2017.7.0.
Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

Parameters
- names (str, list) -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns
- A dictionary containing the details about the installed updates

Return type dict

CLI Examples:
# Normal Usage
salt 's' win_wua.install KB12323211

salt.modules.win_wua.installed(summary=False, kbs_only=False)
New in version 3001.
Get a list of all updates that are currently installed on the system.

Note: This list may not necessarily match the Update History on the machine. This will only show the updates that apply to the current build of Windows. So, for example, the system may have shipped with Windows 10 Build 1607. That machine received updates to the 1607 build. Later the machine was upgraded to a newer feature release, 1803 for example. Then more updates were applied. This will only return the updates applied to the 1803 build and not those applied when the system was at the 1607 build.

Parameters
- summary (bool) -- Return a summary instead of a detailed list of updates. True will return a Summary, False will return a detailed list of installed updates. Default is False
- kbs_only (bool) -- Only return a list of KBs installed on the system. If this parameter is passed, the summary parameter will be ignored. Default is False

Returns
- Returns a dictionary of either a Summary or a detailed list of updates installed on the system when kbs_only=False
- list: Returns a list of KBs installed on the system when kbs_only=True

Return type dict

CLI Examples:
# Get a detailed list of all applicable updates installed on the system
salt 's' win_wua.installed

# Get a summary of all applicable updates installed on the system
salt 's' win_wua.installed summary=True

# Get a simple list of KBs installed on the system
salt 's' win_wua.installed kbs_only=True
Returns a detailed list of available updates or a summary. If `download` or `install` is `True` the same list will be downloaded and/or installed.

**Parameters**

- `software (bool)` -- Include software updates in the results. Default is `True`
- `drivers (bool)` -- Include driver updates in the results. Default is `False`
- `summary (bool)` --
  - `True`: Return a summary of updates available for each category.
  - `False` (default): Return a detailed list of available updates.
- `skip_installed (bool)` -- Skip installed updates in the results. Default is `True`
- `download (bool)` -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates. Default is `False`
- `install (bool)` -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates. Default is `False`
- `categories (list)` -- Specify the categories to list. Must be passed as a list. All categories returned by default.
- `severities (list)` -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Categories include the following:
- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

Severities include the following:
- Critical
- Important

- `online (bool)` -- Tells the Windows Update Agent go online to update its local update database. `True` will go online. `False` will use the local update database as is. Default is `True`

New in version 3001.

**Returns**

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{ '<GUID>': {  
  'Title': <title>,
  
(continues on next page)
```
{'KB': <KB>,
'GUID': <the globally unique identifier for the update>,
'Description': <description>,
'Downloaded': <has the update been downloaded>,
'Installed': <has the update been installed>,
'Mandatory': <is the update mandatory>,
'UserInput': <is user input required>,
'EULAAccepted': <has the EULA been accepted>,
'Severity': <update severity>,
'NeedsReboot': <is the update installed and awaiting reboot>,
'RebootBehavior': <will the update require a reboot>,
'Categories': [  
  '<category 1>',
  '<category 2>',
  ...
]
}}

Summary of Updates:
{'Total': <total number of updates returned>,
'Available': <updates that are not downloaded or installed>,
'Downloaded': <updates that are downloaded but not installed>,
'Installed': <updates installed (usually 0 unless installed=True)>,
'Categories': {
  <category 1>: <total for that category>,
  <category 2>: <total for category 2>,
  ...
}}

Return type: dict

CLI Examples:

# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True

salt.modules.win_wua.set_wu_settings(level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:
- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2
Parameters

- **level** (*int*) -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** (*bool*) -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) -- Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (*bool*) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** (*str*) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the `##:##` 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns

Returns a dictionary containing the results.

Return type  *dict*

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

salt.modules.win_wua.uninstall(*names*)

New in version 2017.7.0.

Uninstall updates.

Parameters

- **names** (*str, list*) -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns

A dictionary containing the details about the uninstalled updates.

Return type  *dict*

CLI Examples:

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab', '12345678-abcd-1234-abcd-1234567890ab'],
```
21.9.514 salt.modules.win_wusa

Microsoft Update files management via wusa.exe

maintainer Thomas Lemarchand

platform Windows

depends PowerShell

New in version 2018.3.4.

salt.modules.win_wusa.install(path, restart=False)
Install a KB from a .msu file.

Parameters
- **path** (str) -- The full path to the msu file to install
- **restart** (bool) -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

Returns True if successful, otherwise False

Return type bool

Raise: CommandExecutionError: If the package is already installed or an error is encountered

CLI Example:

```bash
salt '*' wusa.install C:/temp/KB123456.msu
```

salt.modules.win_wusa.is_installed(name)
Check if a specific KB is installed.

Parameters **name** (str) -- The name of the KB to check

Returns True if installed, otherwise False

Return type bool

CLI Example:

```bash
salt '*' wusa.is_installed KB123456
```

salt.modules.win_wusa.list()

Get a list of updates installed on the machine

Returns A list of installed updates

Return type list

CLI Example:

```bash
salt '*' wusa.list
```

salt.modules.win_wusa.uninstall(path, restart=False)
Uninstall a specific KB.

Parameters
- **path** (str) -- The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall
- **restart** (bool) -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError -- If an error is encountered

CLI Example:
Module to manage Windows software repo on a Standalone Minion

For documentation on Salt's Windows Repo feature, see [here](#).

salt.modules.winrepo.genrepodoc

Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:

```
salt-call winrepo.genrepo
```

salt.modules.winrepo.show_sls

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified in name

Parameters

- str(saltenv) -- The name/path of the package you want to view. This can be the path to a file on the minion file system or a file on the local file system.
- str(cache, (minion)) -- The default environment is base

Returns Returns a dictionary containing the rendered data structure

Return type dict

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

salt.modules.winrepo.update_git_repos(clean=False)

Checkout git repos containing Windows Software Package Definitions.
Important: This function requires Git for Windows to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

**clean**  [False] Clean repocachedirs which are not configured under `winrepo_remotes`.

**Note:** This option only applies if either pygit2 or GitPython is installed into Salt’s bundled Python.

**Warning:** This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

### 21.9.516 salt.modules.wordpress module

This module is used to manage Wordpress installations

**depends**  wp binary from http://wp-cli.org/

**class**  `salt.modules.wordpress.Plugin(name, status, update, versino)`

- **name**  Alias for field number 0
- **status**  Alias for field number 1
- **update**  Alias for field number 2
- **versino**  Alias for field number 3

**salt.modules.wordpress.activate(name, path, user)**

Activate a wordpress plugin

- **name**  Wordpress plugin name
- **path**  path to wordpress install location
- **user**  user to run the command as

CLI Example:

```
salt '*' wordpress.activate HyperDB /var/www/html apache
```

**salt.modules.wordpress.deactivate(name, path, user)**

Deactivate a wordpress plugin

- **name**  Wordpress plugin name
- **path**  path to wordpress install location
- **user**  user to run the command as

CLI Example:
salt 'salt '*'wordpress.deactivate HyperDB /var/www/html apache

salt.modules.wordpress.install(path, user, admin_user, admin_password, admin_email, title, url)
Run the initial setup functions for a wordpress install
path  path to wordpress install location
user  user to run the command as
admin_user  Username for the Administrative user for the wordpress install
admin_password  Initial Password for the Administrative user for the wordpress install
admin_email  Email for the Administrative user for the wordpress install
title  Title of the wordpress website for the wordpress install
url  Url for the wordpress install

CLI Example:
salt 'salt '*'wordpress.install /var/www/html apache dwallace password123
     → dwallace@example.com "Daniel's Awesome Blog" https://blog.dwallace.com

salt.modules.wordpress.is_installed(path, user=None)
Check if wordpress is installed and setup
path  path to wordpress install location
user  user to run the command as

CLI Example:
salt 'salt '*'wordpress.is_installed /var/www/html apache

salt.modules.wordpress.list_plugins(path, user)
List plugins in an installed wordpress path
path  path to wordpress install location
user  user to run the command as

CLI Example:
salt 'salt '*'wordpress.list_plugins /var/www/html apache

salt.modules.wordpress.show_plugin(name, path, user)
Show a plugin in a wordpress install and check if it is installed
name  Wordpress plugin name
path  path to wordpress install location
user  user to run the command as

CLI Example:
salt 'salt '*'wordpress.show_plugin HyperDB /var/www/html apache

21.9.517  salt.modules.x509
Manage X509 certificates
New in version 2015.8.0.

depends  M2Crypto

salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)
Create an X509 certificate.
path:  Path to write the certificate to.
text:  If True, return the PEM text without writing to a file. Default False.
overwrite: If True (default), create_certificate will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

kwargs: Any of the properties below can be included as additional keyword arguments.

ca_server: Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See signing_policy for details. Also, the salt master must permit peers to call the sign_remote_certificate function.

Example:

```
/etc/salt/master.d/peer.conf

peer:
  .*
  - x509.sign_remote_certificate
```

subject properties: Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

- C: 2 letter Country code
- CN: Certificate common name, typically the FQDN.
- Email: Email address
- GN: Given Name
- L: Locality
- O: Organization
- OU: Organization Unit
- SN: SurName
- ST: State or Province

signing_private_key: A path or string of the private key in PEM format that will be used to sign this certificate. If neither signing_cert, public_key, or csr are included, it will be assumed that this is a self-signed certificate, and the public key matching signing_private_key will be used to create the certificate.

signing_private_key_passphrase: Passphrase used to decrypt the signing_private_key.

signing_cert: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key: The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your public_key and only the public_key will be sent across the network to the CA. If neither public_key or csr are specified, it will be assumed that this is a self-signed certificate, and the public key derived from signing_private_key will be used. Specify either public_key or csr, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

public_key_passphrase: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints: X509v3 Basic Constraints extension.

extensions: The following arguments set X509v3 Extension values. If the value starts with critical, the extension will be marked as critical.

Some special extensions are subjectKeyIdentifier and authorityKeyIdentifier.

subjectKeyIdentifier can be an explicit value or it can be the special string hash. hash will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.
authorityKeyIdentifier Use values acceptable to the openssl CLI tools. This will automatically populate authorityKeyIdentifier with the subjectKeyIdentifier of signing_cert. If this is a self-signed cert these values will be the same.

- **basicConstraints**: X509v3 Basic Constraints
- **keyUsage**: X509v3 Key Usage
- **extendedKeyUsage**: X509v3 Extended Key Usage
- **subjectKeyIdentifier**: X509v3 Subject Key Identifier
- **issuerAltName**: X509v3 Issuer Alternative Name
- **subjectAltName**: X509v3 Subject Alternative Name
- **crlDistributionPoints**: X509v3 CRL Distribution Points
- **issuingDistributionPoint**: X509v3 Issuing Distribution Point
- **certificatePolicies**: X509v3 Certificate Policies
- **policyConstraints**: X509v3 Policy Constraints
- **inhibitAnyPolicy**: X509v3 Inhibit Any Policy
- **nameConstraints**: X509v3 Name Constraints
- **nsCertType**: X509v3 OCSP No Check
- **nsComment**: Netscape Comment
- **nameConstraints**: Netscape Certificate Type

**days_valid**: The number of days this certificate should be valid. This sets the notAfter property of the certificate. Defaults to 365.

- **version**: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so version=3 sets the certificate version field to 0x2.

- **serial_number**: The serial number to assign to this certificate. If omitted a random serial number of size serial_bits is generated.

- **serial_bits**: The number of bits to use when randomly generating a serial number. Defaults to 64.

- **algorithm**: The hashing algorithm to be used for signing this certificate. Defaults to sha256.

- **copypath**: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.

- **prepend_cn**: If set to True, the CN and a dash will be prepended to the copypath's filename.

Example:

```
peer:
  .*:
    - match.compound
```

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
```

(continues on next page)
The above signing policy can be invoked with `signing_policy=www`

**not_before**: Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

**not_after**: Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.

New in version 3001.

CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/pki/myca.key' csr='/etc/pki/myca.csr'
```

**salt.modules.x509.create_crl**

Create a CRL

**Depends**
- PyOpenSSL Python module

**path**: Path to write the CRL to.

**text**: If True, return the PEM text without writing to a file. Default False.

**signing_private_key**: A path or string of the private key in PEM format that will be used to sign the CRL.

This is required.

**signing_private_key_passphrase**: Passphrase to decrypt the private key.

**signing_cert**: A certificate matching the private key that will be used to sign the CRL. This is required.

**revoked**: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `not_after` key. This is redundant if the certificate key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are unspecified, keyCompromise, CACompromise, affiliationChanged, superseded, cessationOfOperation and certificateHold.

**include_expired**: Include expired certificates in the CRL. Default is False.

**days_valid**: The number of days that the CRL should be valid. This sets the Next Update field in the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key \  signing_private_key=/etc/pki/ca.key \  signing_cert=/etc/pki/ca.crt \  revoked="\{\'compromised-web-key\': \{\'certificate\': '/etc/pki/certs/www1.crt', \"revocation_date\': '2015-03-01 00:00:00'}\}"
```

(continues on next page)
salt.modules.x509.create_csr(path=None, text=False, **kwargs)

Create a certificate signing request.

path: Path to write the certificate to.
text: If True, return the PEM text without writing to a file. Default False.
algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.
kwags: The subject, extension and version arguments from x509.create_certificate can be used.

CLI Example:
```
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN='My Cert'
```

salt.modules.x509.create_private_key(path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True)

Creates a private key in PEM format.

path: The path to write the file to, either path or text are required.
text: If True, return the PEM text without writing to a file. Default False.
bits: Length of the private key in bits. Default 2048
passphrase: Passphrase for encrypting the private key
cipher: Cipher for encrypting the private key. Has no effect if passphrase is None.
verbose: Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:
```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

salt.modules.x509.expired(certificate)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.
certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.expired '/etc/pki/mycert.crt'
```

salt.modules.x509.get_pem_entries(glob_path)

Returns a dict containing PEM entries in files matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:
```
salt '*' x509.get_pem_entries '/etc/pki/*.crt'
```

salt.modules.x509.get_pem_entry(text, pem_type=None)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues
text: Text containing the X509 PEM entry to be returned or path to a file containing the text.
pem_type: If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:
```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQ

```
salt.modules.x509.get_private_key_size(private_key, passphrase=None)
    Returns the bit length of a private key in PEM format.
    private_key: A path or PEM encoded string containing a private key.
    CLI Example:
    
    salt '*' x509.get_private_key_size /etc/pki/mycert.key

salt.modules.x509.get_public_key(key, passphrase=None, asObj=False)
    Returns a string containing the public key in PEM format.
    key: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.
    CLI Example:
    
    salt '*' x509.get_public_key /etc/pki/mycert.cer

salt.modules.x509.get_signing_policy(signing_policy_name)
    Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.
    CLI Example:
    
    salt '*' x509.get_signing_policy www

salt.modules.x509.read_certificate(certificate)
    Returns a dict containing details of a certificate. Input can be a PEM string or file path.
    certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.
    CLI Example:
    
    salt '*' x509.read_certificate /etc/pki/mycert.crt

salt.modules.x509.read_certificates(glob_path)
    Returns a dict containing details of all certificates matching a glob
    glob_path: A path to certificates to be read and returned.
    CLI Example:
    
    salt '*' x509.read_certificates "*/etc/pki/*/*.crt"

salt.modules.x509.read_crl(crl)
    Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.
    Depends
        - OpenSSL command line tool
    crl: A path or PEM encoded string containing the CRL to read.
    CLI Example:
    
    salt '*' x509.read_crl /etc/pki/mycrl.crl

salt.modules.x509.read_csr(csr)
    Returns a dict containing details of a certificate request.
    Depends
        - OpenSSL command line tool
    csr: A path or PEM encoded string containing the CSR to read.
    CLI Example:
salt 'x' x509.read_csr /etc/pki/mycert.csr

salt.modules.x509.sign_remote_certificate(argdic, **kwargs)
Request a certificate to be remotely signed according to a signing policy.
argdic: A dict containing all the arguments to be passed into the create_certificate function. This will become
kwargs when passed to create_certificate.
kwargs: kwargs delivered from publish.publish
CLI Example:

salt 'x' x509.sign_remote_certificate argdic=val/"{'public_key': '/etc/pki/www.key',  
\signing_policy': 'www'}" __pub_id='www1'

salt.modules.x509.verify_crl(crl, cert)
Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's
inability to get them from CSR objects.
crl: The CRL to verify
cert: The certificate to verify the CRL against
CLI Example:

salt 'x' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt

salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)
Verify that 'private_key' matches 'public_key'
private_key: The private key to verify, can be a string or path to a private key in PEM format.
public_key: The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another
private key.
passphrase: Passphrase to decrypt the private key.
CLI Example:

salt 'x' x509.verify_private_key private_key=/etc/pki/myca.key \  
\public_key=/etc/pki/myca.crt

salt.modules.x509.verify_signature(certificate, signing_pub_key=None,  
signing_pub_key_passphrase=None)
Verify that certificate has been signed by signing_pub_key
certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.
signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another
private key.
signing_pub_key_passphrase: Passphrase to the signing_pub_key if it is an encrypted private key.
CLI Example:

salt 'x' x509.verify_signature /etc/pki/mycert.pem \  
signing_pub_key=/etc/pki/myca.crt

salt.modules.x509.will_expire(certificate, days)
Returns a dict containing details of a certificate and whether the certificate will expire in the specified number
of days. Input can be a PEM string or file path.
New in version 2016.11.0.
certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM for-
matted text of the certificate.
CLI Example:

salt 'x' x509.will_expire "/etc/pki/mycert.crt" days=30
salt.modules.x509.write_pem(text, path, overwrite=True, pem_type=None)
Writes out a PEM string fixing any formatting or whitespace issues before writing.

text: PEM string input to be written out.
path: Path of the file to write the PEM out to.
overwrite: If True (default), write_pem will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.
pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

CLI Example:
```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBlgA..." path=/etc/pki/mycert.crt
```

21.9.518 salt.modules.xapi_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it will fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:
2. http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/

salt.modules.xapi_virt.freecpu()
Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:
```
salt '*' virt.freecpu
```

salt.modules.xapi_virt.freemem()
Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:
```
salt '*' virt.freemem
```

salt.modules.xapi_virt.full_info()
Return the node_info, vm_info and freemem

CLI Example:
```
salt '*' virt.full_info
```

salt.modules.xapi_virt.get_disks(vm_)
Return the disks of a named vm

CLI Example:
```
salt '*' virt.get_disks <vm name>
```

salt.modules.xapi_virt.get_macs(vm_)
Return a list off MAC addresses from the named vm
CLI Example:
```
salt '*' virt.get_macs <vm name>
```

`salt.modules.xapi_virt.get_nics(vm_)`
Return info about the network interfaces of a named vm

CLI Example:
```
salt '*' virt.get_nics <vm name>
```

`salt.modules.xapi_virt.is_hyper()`
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:
```
salt '*' virt.is_hyper
```

`salt.modules.xapi_virt.list_domains()`
Return a list of virtual machine names on the minion

CLI Example:
```
salt '*' virt.list_domains
```

`salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)`
Migrates the virtual machine to another hypervisor

CLI Example:
```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl] [change_home_server]
```

Optional values:
- `live` Use live migration
- `port` Use a specified port
- `node` Use specified NUMA node on target
- `ssl` use ssl connection for migration
- `change_home_server` change home server for managed domains

`salt.modules.xapi_virt.node_info()`
Return a dict with information about this node

CLI Example:
```
salt '*' virt.node_info
```

`salt.modules.xapi_virt.pause(vm_)`
Pause the named vm

CLI Example:
```
salt '*' virt.pause <vm name>
```

`salt.modules.xapi_virt.reboot(vm_)`
Reboot a domain via ACPI request

CLI Example:
```python
salt '*' virt.reboot <vm name>

salt.modules.xapi_virt.reset(vm_)
Reset a VM by emulating the reset button on a physical machine

CLI Example:
```
salt '*' virt.reset <vm name>
```

salt.modules.xapi_virt.resume(vm_)
Resume the named vm

CLI Example:
```
salt '*' virt.resume <vm name>
```

salt.modules.xapi_virt.setmem(vm_, memory)
Changes the amount of memory allocated to VM.
Memory is to be specified in MB

CLI Example:
```
salt '*' virt.setmem myvm 768
```

salt.modules.xapi_virt.setvcpus(vm_, vcpus)
Changes the amount of vcpus allocated to VM.
vcpus is an int representing the number to be assigned

CLI Example:
```
salt '*' virt.setvcpus myvm 2
```

salt.modules.xapi_virt.shutdown(vm_)
Send a soft shutdown signal to the named vm

CLI Example:
```
salt '*' virt.shutdown <vm name>
```

salt.modules.xapi_virt.start(config_)
Start a defined domain

CLI Example:
```
salt '*' virt.start <path to Xen cfg file>
```

salt.modules.xapi_virt.stop(vm_)
Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:
```
salt '*' virt.stop <vm name>
```

salt.modules.xapi_virt.vcpu_pin(vm_, vcpu, cpus)
Set which CPUs a VCPU can use.

CLI Example:
```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6

salt.modules.xapi_virt.vm_cputime(vm_=-None)
Return cputime used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'cputime' <int>
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
salt '*' virt.vm_cputime

salt.modules.xapi_virt.vm_diskstats(vm_=-None)
Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs' : 0,
        'io_write_kbs' : 0
    },
    ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
salt '*' virt.vm_diskstats

salt.modules.xapi_virt.vm_info(vm_=-None)
Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:
salt '*' virt.vm_info

salt.modules.xapi_virt.vm_netstats(vm_=-None)
Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs' : 0,
        'io_total_read_kbs' : 0,
        'io_total_write_kbs' : 0,
        'io_write_kbs' : 0
    }
]
```

(continues on next page)
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

**salt.modules.xapi_virt.vm_state**(vm_=None)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

### 21.9.519 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

**salt.modules.xbpspkg.add_repo**(repo, conffile='/usr/share/xbps.d/15-saltstack.conf')

Add an XBPS repository to the system.

- **repo** url of repo to add (persistent).
- **conffile** path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

**salt.modules.xbpspkg.available_version**(names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

```
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.xbpspkg.del_repo**(repo, **kwargs)

Remove an XBPS repository from the system.

- **repo** url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

**salt.modules.xbpspkg.get_repo**(repo, **kwargs)

Display information about the repo.

CLI Examples:
salt '*' pkg.get_repo 'repo-url'

salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install the passed package

name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository (url) to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

salt.modules.xbpspkg.latest_version('names', **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ... 
```

salt.modules.xbpspkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```
[{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.xbpspkg.list_repos(**kwargs)

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```
salt.modules.xbpspkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages

CLI Example:
```
salt '*' pkg.list_upgrades
```

salt.modules.xbpspkg.refresh_db(**kwargs)
Update list of available packages from installed repos

CLI Example:
```
salt '*' pkg.refresh_db
```

salt.modules.xbpspkg.remove(name=None, pkgs=None, recursive=True, **kwargs)
name The name of the package to be deleted.
recursive Also remove dependent packages (not required elsewhere). Default mode: enabled.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:
```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

salt.modules.xbpspkg.upgrade(refresh=True, **kwargs)
Run a full system upgrade
refresh Whether or not to refresh the package database before installing. Default is True.
Returns a dictionary containing the changes:
```
{
    '<package>': {'old': '<old-version>', 'new': '<new-version>'}
}
```

CLI Example:
```
salt '*' pkg.upgrade
```

salt.modules.xbpspkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.xbpspkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
21.9.520 salt.modules.xfs

Module for managing XFS file systems.

salt.modules.xfs.defragment(device)
Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:
```
salt '*' xfs.defragment /dev/sda1
```

salt.modules.xfs.devices()
Get known XFS formatted devices on the system.

CLI Example:
```
salt '*' xfs.devices
```

salt.modules.xfs.dump(device, destination, level=0, label=None, noerase=None)
Dump filesystem device to the media (file, tape etc).

Required parameters:
- device: XFS device, content of which to be dumped.
- destination: Specifies a dump destination.

Valid options are:
- label: Label of the dump. Otherwise automatically generated label is used.
- level: Specifies a dump level of 0 to 9.
- noerase: Pre-erase media.

Other options are not used in order to let xfsdump use its default values, as they are most optimal. See the xfsdump(8) manpage for a more complete description of these options.

CLI Example:
```
salt '*' xfs.dump /dev/sda1 /destination/on/the/client
salt '*' xfs.dump /dev/sda1 /destination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /destination/on/the/client noerase=True
```

salt.modules.xfs.estimate(path)
Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:
```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info(device)
Get filesystem geometry information.

CLI Example:
```
salt '*' xfs.info /dev/sda1
```

salt.modules.xfs.inventory()
Display XFS dump inventory without restoration.

CLI Example:
salt 'x' xfs.inventory

salt.modules.xfs.mkfs(\texttt{device}, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None)

Create a file system on the specified device. By default wipes out with force.

General options:
• \texttt{label}: Specify volume label.
• \texttt{ssize}: Specify the fundamental sector size of the filesystem.
• \texttt{noforce}: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:
• \texttt{bso}: Block size options.
• \texttt{gmo}: Global metadata options.
• \texttt{dso}: Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.
• \texttt{ino}: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
• \texttt{lso}: Log section options.
• \texttt{nmo}: Naming options.
• \texttt{rso}: Realtime section options.

See the \texttt{mkfs.xfs(8)} manpage for a more complete description of corresponding options description.

CLI Example:

salt 'x' xfs.mkfs /dev/sda1
salt 'x' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt 'x' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'

salt.modules.xfs.modify(\texttt{device}, label=None, lazy_counting=None, uuid=None)

Modify parameters of an XFS filesystem.

CLI Example:

salt 'x' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt 'x' xfs.modify /dev/sda1 uuid=False
salt 'x' xfs.modify /dev/sda1 uuid=True

salt.modules.xfs.prune_dump(\texttt{sessionid})

Prunes the dump session identified by the given session id.

CLI Example:

salt 'x' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c

21.9.521 salt.modules.xml

XML file manager

New in version 3000.

salt.modules.xml.get_attribute(\texttt{file, element})

Return the attributes of the matched xpath element.

CLI Example:

salt 'x' xml.get_attribute /tmp/test.xml ".//element[@id='3']"
salt.modules.xml.get_value(file, element)
Returns the value of the matched xpath element

CLI Example:
```
salt '*' xml.get_value /tmp/test.xml "./element"
```

salt.modules.xml.set_attribute(file, element, key, value)
Set the requested attribute key and value for matched xpath element.

CLI Example:
```
salt '*' xml.set_attribute /tmp/test.xml "./element[@id='3']" editedby "gal"
```

salt.modules.xml.set_value(file, element, value)
Sets the value of the matched xpath element

CLI Example:
```
salt '*' xml.set_value /tmp/test.xml "./element" "new value"
```

21.9.522 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

depends
- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

configuration This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourcename
  xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:
```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMessageBot(jid, password, recipient, msg)
classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')
    Alternate constructor that accepts multiple recipients and rooms

start(event)

class salt.modules.xmpp.SleekXMPPMUC(name='')

filter(record)
    Determine if the specified record is to be logged.
    Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record
    may be modified in-place.

salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)
    Send a message to an XMPP recipient. Designed for use in states.
    CLI Examples:
    
    >>> xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' → profile='my-xmpp-account'
    >>> xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test' → jid='myuser@xmpp.example.com/salt' password='verybadpass'

salt.modules.xmpp.send_msg_multi(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)
    Send a message to an XMPP recipient, support send message to multiple recipients or chat room.
    CLI Examples:
    
    >>> xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com'] 'This is a salt module test' → profile='my-xmpp-account'
    >>> xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=['secret@conference.xmpp.example.com'] 'This is a salt module test' → jid='myuser@xmpp.example.com/salt' password='verybadpass'

21.9.523 salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to 'pkg.install' is not available), see here.

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in
2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

class salt.modules.yumpkg.AvailablePackages(*args, **kwargs)
salt.modules.yumpkg.clean_metadata(**kwargs)
    New in version 2014.1.0.
    
    Cleans local yum metadata. Functionally identical to refresh_db().
    CLI Example:
salt '*' pkg.clean_metadata

salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)
    Delete a repo from <basedir> (default basedir: all dirs in reposdir yum option).
    If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.
    CLI Examples:
    salt '*' pkg.del_repo myrepo
    salt '*' pkg.del_repo myrepo basedir=/path/to/dir
    salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir

salt.modules.yumpkg.diff(*paths, **kwargs)
    Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.
    Parameters path -- Full path to the installed file
    Returns Difference string or raises and exception if examined file is binary.
    CLI example:
    salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers

salt.modules.yumpkg.download(*packages, **kwargs)
    New in version 2015.5.0.
    Download packages to the local disk. Requires yumdownloader from yum-utils package.
    Note: yum-utils will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.
    CLI example:
    salt '*' pkg.download httpd
    salt '*' pkg.download httpd postfix

salt.modules.yumpkg.file_dict(*packages, **kwargs)
    New in version 2014.1.0.
    List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).
    CLI Examples:
    salt '*' pkg.file_list httpd
    salt '*' pkg.file_list httpd postfix
    salt '*' pkg.file_list

salt.modules.yumpkg.file_list(*packages, **kwargs)
    New in version 2014.1.0.
    List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).
    CLI Examples:
salt.modules.yumpkg.get_repo(repo, basedir=None, **kwargs)

Display a repo from <basedir> (default basedir: all dirs in reposdir yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.group_diff(name)

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in `pkg.group_info`.

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

salt.modules.yumpkg.group_info(name, expand=False, ignore_groups=None)

New in version 2014.1.0.

Changed in version 3001,2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key type has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to mandatory, optional, and default for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

name Name of the group to query

expand [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

ignore_groups [None] This parameter can be used to pass a list of groups to ignore when expanding sub-groups. It is used during recursion in order to prevent expanding the same group multiple times.

New in version 3001.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around pkg.install, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:
skip Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

include Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```

Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

---

**salt.modules.yumpkg.group_list()**

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```bash
salt '*' pkg.group_list
```

**salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)**

New in version 2014.7.0.

Version-lock packages

**Note:** Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

name The name of the package to be held.

Multiple Package Options:

pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['"foo", "bar"]'
```

**salt.modules.yumpkg.info_installed(names, **kwargs)**

Return the information of the named package(s), installed on the system.

**Parameters**

- `all_versions` - Include information for all versions of the packages installed on the minion.

**CLI example:**

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
```

salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkg=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to clean the yum database before package is installed.

- `name` The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

**CLI Example:**

```
salt '*' pkg.install <package name>
```

- `refresh` Whether or not to update the yum database before executing.

- `reinstall` Specifying `reinstall=True` will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

- `skip_verify` Skip the GPG verification check (e.g., `--nogpgcheck`)

- `downloadonly` Only download the packages, do not install.

- `version` Install a specific version of the package, e.g. `1.2.3-4.el5`. Ignored if "pkgs" or "sources" is passed.

  Changed in version 2018.3.0: version can now contain comparison operators (e.g. `>=2.0`, etc.)

- `update_holds` [False] If `True`, and this function would update the package version, any packages held using the `yum/dnf` "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

  New in version 2016.11.0.

- `setopt` A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the `yum/dnf` command that is run.

**CLI Example:**

```
salt '*' pkg.install foo setopt='obsoletes=0,plugins=0'
```
New in version 2019.2.0.

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

**ignore_epoch** [False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Examples:

```bash
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```bash
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
--normalize=False
```

New in version 2014.7.0.

**diff_attr**: If a list of package attributes is specified, returned value will contain them, eg:

```json
{"<package>": {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>',
  },
  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'
  }}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:
salt.modules.yumpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.yumpkg.list_downloaded(**kwargs)

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

salt.modules.yumpkg.list_holds(pattern='\[w+(?:\[.-\]\[^-]+)*\]', full=True)

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.

List information on locked packages

**Note:** Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**pattern** \[w+(?:\[.-\]\[^-]+)*\] Regular expression used to match the package name

**full** [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.

CLI Example:
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False

salt.modules.yumpkg.list_installed_patches(**kwargs)
New in version 2017.7.0.
List installed advisory patches on the system.
CLI Examples:
salt '*' pkg.list_installed_patches

salt.modules.yumpkg.list_patches(refresh=False, **kwargs)
New in version 2017.7.0.
List all known advisory patches from available repos.
refresh   force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.
CLI Examples:
salt '*' pkg.list_patches

salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

versions_as_list: If set to true, the versions are provided as a list

```
{ '<package_name>': ['<version>', '<version>']}
```
attr: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{ '<package_name>': [{'version': 'version', 'arch': 'arch'}] }
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.
New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]
```

salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)
New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using *pkg.hold* will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use byrepo=True.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.
Warning: Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a yum list installed and yum list available are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2',
             '4.1.2-15.el6_5.1',
             '4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.29.2.el6',
               '2.6.32-431.23.3.el6',
               '2.6.32-431.20.5.el6',
               '2.6.32-431.20.3.el6',
               '2.6.32-431.17.1.el6',
               '2.6.32-431.11.2.el6',
               '2.6.32-431.5.1.el6',
               '2.6.32-431.3.1.el6',
               '2.6.32-431.1.2.0.1.el6',
               '2.6.32-431.el6']
}

# With byrepo=True
{
    'base': {
              'bash': ['4.1.2-15.el6_4'],
              'kernel': ['2.6.32-431.el6']
            },
    'updates': {
      'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
      'kernel': ['2.6.32-431.29.2.el6',
                 '2.6.32-431.23.3.el6',
                 '2.6.32-431.20.5.el6',
                 '2.6.32-431.20.3.el6',
                 '2.6.32-431.17.1.el6',
                 '2.6.32-431.11.2.el6',
                 '2.6.32-431.5.1.el6',
                 '2.6.32-431.3.1.el6',
                 '2.6.32-431.1.2.0.1.el6',
                 '2.6.32-431.el6']
    }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 2017.7.0.

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')
byrepo [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

setopt A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

salt.modules.yumpkg.list_repos(basedir=None, **kwargs)
\nLists all repos in <basedir> (default: all dirs in reposdir yum option).

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.list_upgrades(refresh=True, **kwargs)
\nCheck whether or not an upgrade is available for all packages

The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)
\nModify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

- **repo** name by which the yum refers to the repo
- **name** a human-readable name for the repo
- **baseurl** the URL for yum to reference
- **mirrorlist** the URL for yum to reference

Key/Value pairs may also be removed from a repo’s configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

salt.modules.yumpkg.modified(*packages, **flags)
\nList the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system’s RPM database.
New in version 2015.5.0.

Filtering by flags (True or False):
- **size**: Include only files where size changed.
- **mode**: Include only files which file’s mode has been changed.
- **checksum**: Include only files which MD5 checksum has been changed.
- **device**: Include only files which major and minor numbers has been changed.
- **symlink**: Include only files which are symbolic link contents.
- **owner**: Include only files where owner has been changed.
- **group**: Include only files where group has been changed.
- **time**: Include only files where modification time of the file has been changed.
- **capabilities**: Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```bash
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

**salt.modules.yumpkg.normalize_name(name)**

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```bash
salt '*' pkg.normalize_name zsh.x86_64
```

**salt.modules.yumpkg.owner(**paths**, **kwargs)**

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```bash
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

**salt.modules.yumpkg.parse_arch(name)**

Parse name and architecture from the specified package name.

CLI Example:

```bash
salt '*' pkg.parse_arch zsh.x86_64
```

**salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)**

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon’s control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see KillMode in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.  

---

21.9. execution modules
name  The name of the package to be purged
Multiple Package Options:
pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
      option is passed.
New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' pkg.purge &lt;package name&gt;</td>
</tr>
<tr>
<td>salt '*' pkg.purge &lt;package1&gt;,&lt;package2&gt;,&lt;package3&gt;</td>
</tr>
<tr>
<td>salt '*' pkg.purge pkgs='[&quot;foo&quot;, &quot;bar&quot;]'</td>
</tr>
</tbody>
</table>

salt.modules.yumpkg.refresh_db(**kwargs)
Check the yum repos for updated packages
Returns:
• True: Updates are available
• False: An error occurred
• None: No updates are available
repo  Refresh just the specified repo
disablerepo  Do not refresh the specified repo
enablerepo  Refresh a disabled repo using this option
branch  Add the specified branch when refreshing
disableexcludes  Disable the excludes defined in your config files. Takes one of three options: - all - disable
                all excludes - main - disable excludes defined in [main] in yum.conf - repoid - disable excludes defined
                for that repo
setopt  A comma-separated or Python list of key=value options. This list will be expanded and --setopt
        prepended to each in the yum/dnf command that is run.
        New in version 2019.2.0.

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' pkg.refresh_db</td>
</tr>
</tbody>
</table>

salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now
used to isolate commands which modify installed packages from the salt-minion daemon's control group. This
is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion
service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage
of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False
(no quotes).
Remove packages
name  The name of the package to be removed
Multiple Package Options:
pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
      option is passed.
New in version 0.16.0.
Returns a dict containing the changes.

CLI Example:
salt '*

    pkg.remove <package name>

salt '*

    pkg.remove <package1>,<package2>,<package3>

salt '*

    pkg.remove pkgs='["foo", "bar"]'

```
salt.modules.yumpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
```

New in version 2014.7.0.

Remove version locks

**Note**: Requires the appropriate versionlock plugin package to be installed:

- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>

salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

```
salt.modules.yumpkg.update(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs)
```

New in version 2019.2.0.

Calls **pkg.upgrade** with obsoletes=False. Mirrors the CLI behavior of yum update. See **pkg.upgrade** for further documentation.

```
salt '*' pkg.update
```

```
salt.modules.yumpkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, **kwargs)
```

Run a full system upgrade (a yum upgrade or dnf upgrade), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see **KillMode** in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a **config option** called systemd.scope, with a value of False (no quotes).

Changed in version 2019.2.0: Added **obsoletes** and **minimal** arguments

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')
enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')
disablerepos (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepos='somerepo')
disableexcludes Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.

name The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

salt '*' pkg.upgrade name=openssl

New in version 2016.3.0.

pkgs A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'

New in version 2016.3.0.

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

salt -G role=nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
  --normalize=False

New in version 2016.3.0.

minimal [False] Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the 'newest' package match which fixes a problem that affects your system.

salt '*' pkg.upgrade minimal=True

New in version 2019.2.0.

obsoletes [True] Controls whether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

salt '*' pkg.upgrade obsoletes=False

New in version 2019.2.0.
setopt  A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

Note:  To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

```bash
salt '*' pkg.upgrade security=True exclude='kernel*' 
```

salt.modules.yumpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pkg.upgrade_available <package name> 
```

salt.modules.yumpkg.verify('names, **kwargs)
Runs an rpm -Va on a system, and returns the results in a dict
Pass options to modify rpm verify behavior using the `verify_options` keyword argument
Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:
```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

salt.modules.yumpkg.version('names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ... 
```

salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:
```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002' 
```
21.9.524 salt.modules.zabbix module

Support for Zabbix

optdepends
• zabbix server

configuration This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion’s config file. Zabbix url should be also specified.

```yaml
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with _connection_prefix.

```yaml
zabbix.apiinfo_version _connection_user=Admin _connection_
~password=zabbix _connection_url=http://host/zabbix/
```

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.zabbix.apiinfo_version(**connection_args**)
Retrieve the version of the Zabbix API.

New in version 2016.3.0.

Parameters
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.apiinfo_version

salt.modules.zabbix.compare_params(defined, existing, return_old_value=False)
Compares Zabbix object definition against existing Zabbix object.

Parameters
• defined -- Zabbix object definition taken from sls file.
• existing -- Existing Zabbix object taken from result of an API call.
• return_old_value -- Default False. If True, returns dict("old"=old_val, "new"=new_val) for rollback purpose.

Returns Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

salt.modules.zabbix.configuration_import(config_file, rules=none, file_format='xml', **connection_args**)

New in version 2017.7.

Imports Zabbix configuration specified in file to Zabbix server.

Parameters
• config_file -- File with Zabbix config (local or remote)
• rules -- Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI)
• **file_format** -- Config file format (default: xml)
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

CLI Example:

```
salt '*' zabbix.configuration_import salt://zabbix/config/zabbix_templates.xml → "{'screens': {'createMissing': True, 'updateExisting': True}}"
```

salt.modules.zabbix.get_object_id_by_params(obj, params=None, **connection_args)

New in version 2017.7.

Get ID of single Zabbix object specified by its name.

**Parameters**

- **obj** -- Zabbix object type
- **params** -- Parameters by which object is uniquely identified
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

object ID

salt.modules.zabbix.get_zabbix_id_mapper()

New in version 2017.7.

Make ZABBIX_ID_MAPPER constant available to state modules.

**Returns**

ZABBIX_ID_MAPPER

salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)

New in version 2016.3.0.

Create new host

---

**Note:** This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

**return:** ID of the created host.

**CLI Example:**

```
salt '*' zabbix.host_create technicalname 4
interfaces='{"type": 1, "main": 1, "useip": 1, "ip": "192.168.3.1", "dns": "", "port": 10050}"
visible_name='Host Visible Name' inventory_mode=0 inventory='{"alias": "something_"'}

salt.modules.zabbix.host_delete(hostids, **connection_args)
Delete hosts.
New in version 2016.3.0.
Parameters
• hostids -- Hosts (hostids) to delete.
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts.
CLI Example: .. code-block:: bash
salt '*' zabbix.host_delete 10106

salt.modules.zabbix.host_exists(host=None, hostid=None, name=None, node=None, nodeids=None, **connection_args)
Checks if at least one host that matches the given filter criteria exists.
New in version 2016.3.0.
Parameters
• host -- technical name of the host
• hostids -- Hosts (hostids) to delete.
• name -- visible name of the host
• node -- name of the node the hosts must belong to (zabbix API < 2.4)
• nodeids -- IDs of the node the hosts must belong to (zabbix API < 2.4)
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts, False on failure.
CLI Example: .. code-block:: bash
salt '*' zabbix.host_exists 'Zabbix server'

salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)
Retrieve hosts according to the given parameters.
New in version 2016.3.0.

Parameters
• host -- technical name of the host
• name -- visible name of the host
• hostids -- ids of the hosts
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash
   salt '*' zabbix.host_get 'Zabbix server'

salt.modules.zabbix.host_inventory_get(hostids, **connection_args)
Retrieve host inventory according to the given parameters. See: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters
• **hostids** -- Return only host interfaces used by the given hosts.
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash
   salt '*' zabbix.host_inventory_get 101054

salt.modules.zabbix.host_inventory_set(hostid, **connection_args)
Update host inventory items NOTE: This function accepts all standard host: keyword argument names for
inventory see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters
• **hostid** -- ID of the host to update
• **clear_old** -- Set to True in order to remove all existing inventory items before setting the specified items
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the updated host, False on failure.

CLI Example: .. code-block:: bash
   salt '*' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_old=True

salt.modules.zabbix.host_list(**connection_args)
Retrieve all hosts.

New in version 2016.3.0.

Parameters
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
...connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_list

salt.modules.zabbix.host_update(hostid, **connection_args)
New in version 2016.3.0.
Update existing hosts

Note: This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for host objects and the documentation for updating hosts.

Parameters
- hostid -- ID of the host to update
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- visible_name -- string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns ID of the updated host.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_update 10084 name='Zabbix server2'

salt.modules.zabbix.hostgroup_create(name, **connection_args)
New in version 2016.3.0.
Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- name -- name of the host group
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host group.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostgroup_create MyNewGroup

salt.modules.zabbix.hostgroup_delete(hostgroupids, **connection_args)
Delete the host group.

New in version 2016.3.0.

Parameters
• **hostgroupids** -- IDs of the host groups to delete
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**  
ID of the deleted host groups, False on failure.

**CLI Example:**
```bash
salt '*' zabbix.hostgroup_delete 23
```

salt.modules.zabbix.hostgroup_exists(name=None, groupid=None, node=None, nodeids=None, **connection_args)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

**Parameters**

• **name** -- names of the host groups
• **groupid** -- host group IDs
• **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
• **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**  
True if at least one host group exists, False if not or on failure.

**CLI Example:**
```bash
salt '*' zabbix.hostgroup_exists MyNewGroup
```

salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None, **connection_args)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

**Note:** This function accepts all standard hostgroup.get properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**

• **name** -- names of the host groups
• **groupid** -- host group IDs
• **node** -- name of the node the host groups must belong to
• **nodeids** -- IDs of the nodes the host groups must belong to
• **hostids** -- return only host groups that contain the given hosts
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

**Returns**  
Array with host groups details, False if no convenient host group found or on failure.

**CLI Example:**
```bash
salt '*' zabbix.hostgroup_get MyNewGroup
```
salt.modules.zabbix.hostgroup_list(**connection_args)

Retrieve all host groups.

New in version 2016.3.0.

**Parameters**
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash
   
salt '*' zabbix.hostgroup_list

salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)

Update existing host group

**Note:** This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of updated host groups.

CLI Example: .. code-block:: bash
   
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'

salt.modules.zabbix.hostinterface_create(hostid, ip='', dns='', main=1, if_type=1, useip=1, port=None, **connection_args)

Create new host interface

**Note:** This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
**salt.modules.zabbix.hostinterface_create**

```
interfaceids = 10105
hostinterface_create(hostmeta, **connection_args)
```

New in version 2016.3.0.

Returns

ID of the created host interface, False on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

**salt.modules.zabbix.hostinterface_delete**

```
interfaceids = 50
hostinterface_delete(**connection_args)
```

New in version 2016.3.0.

Returns

ID of deleted host interfaces, False on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_delete 50
```

**salt.modules.zabbix.hostinterface_get**

```
hostids = 101054
hostinterface_get(hostmeta, **connection_args)
```

New in version 2016.3.0.

Returns

Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example:

```
salt '*' zabbix.hostinterface_get 101054
```

**salt.modules.zabbix.hostinterface_update**

```
interfaceid = 12
hostinterface_update(interfaceid, **connection_args)
```

New in version 2016.3.0.

Update host interface

Note: This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see here.

**Parameters**

- **hostids**
  - Return only host interfaces used by the given hosts.

- **connection_user**
  - Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **connection_password**
  - Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **connection_url**
  - Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
zabbix version, see here.

Parameters
- `interfaceid` -- ID of the hostinterface to update
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash
```
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2
```

salt.modules.zabbix.mediatype_create(name, mediatype, **connection_args)
Create new mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- `mediatype` -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- `exec_path` -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- `gsm_modem` -- exec path - Required for sms type, see Zabbix API docs
- `smtp_email` -- email address from which notifications will be sent, required for email type
- `smtp_helo` -- SMTP HELO, required for email type
- `smtp_server` -- SMTP server, required for email type
- `status` -- whether the media type is enabled - 0: enabled, 1: disabled
- `username` -- authentication user, required for Jabber and Ez Texting types
- `passwd` -- authentication password, required for Jabber and Ez Texting types
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created mediatype.

CLI Example:
```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com' smtp_server='mailserver.example.com' smtp_helo='zabbix@example.com'
```

salt.modules.zabbix.mediatype_delete(mediatypeids, **connection_args)
Delete mediatype

Parameters
- `interfaceids` -- IDs of the mediatypes to delete
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns ID of deleted mediatype, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.mediatype_delete 3

salt.modules.zabbix.mediatype_get(name=None, mediatypeids=None, **connection_args)
Retrieve mediatype details according to the given parameters.

Parameters
• name -- Name or description of the mediatype
• mediatypeids -- ids of the mediatypes
• connection_args (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:
https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get

Returns Array with mediatype details, False if no mediatype found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.mediatype_get name='Email' salt '*' zabbix.mediatype_get mediatypeids='["1", "2", "3"]'

salt.modules.zabbix.mediatype_update(mediatypeid, name=False, mediatype=False, **connection_args)
Update existing mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
• mediatypeid -- ID of the mediatype to update
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the updated mediatypes, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_update 8 name="Email update"

salt.modules.zabbix.run_query(method, params, **connection_args)
Send Zabbix API call

Parameters
• method -- actual operation to perform via the API
• params -- parameters required for specific method
• connection_args (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:
Returns Response from Zabbix API

CLI Example: .. code-block:: bash
   salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", "status": "5"}'

salt.modules.zabbix.substitute_params(input_object, extend_params=None, filter_key='name', **kwargs)

New in version 2017.7.

Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query_object" and "query_name".

Parameters

• **input_object** -- Zabbix object type specified in state file
• **extend_params** -- Specify query with params
• **filter_key** -- Custom filtering key (default: name)
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Params structure with values converted to string for further comparison purposes

salt.modules.zabbix.template_get(name=None, host=None, templateids=None, **connection_args)

Retrieve templates according to the given parameters.

Parameters

• **host** -- technical name of the template
• **name** -- visible name of the template
• **hostids** -- ids of the templates
• **connection_args** (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names depend on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash
   salt '*' zabbix.template_get name='Template OS Linux' salt '*' zabbix.template_get templateids=["10050", "10001"]

salt.modules.zabbix.user_addmedia(userids, active, mediatypeid, period, sendto, severity, **connection_args)

Add new media to multiple users.

New in version 2016.3.0.

Parameters

• **userids** -- ID of the user that uses the media
• **active** -- Whether the media is enabled (0 enabled, 1 disabled)
• **mediatyeid** -- ID of the media type used by the media
• **period** -- Time when the notifications can be sent as a time period
• **sendto** -- Address, user name or other identifier of the recipient
• **severity** -- Trigger severities to send notifications about
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created media.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'
sendto='support2@example.com' severity=63

salt.modules.zabbix.user_create(alias, passwd, usgrps, **connection_args)
New in version 2016.3.0.

Create new zabbix user

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usgrps** -- user groups to add the user to
- **connection_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns On success string with id of the created user.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'

salt.modules.zabbix.user_delete(users, **connection_args)
Delete zabbix users.

New in version 2016.3.0.

Parameters

- **users** -- array of users (userids) to delete
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success array with userids of deleted users.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_delete 15

salt.modules.zabbix.user_deletemedia(mediaids, **connection_args)
Delete media by id.

New in version 2016.3.0.

Parameters

- **mediaids** -- IDs of the media to delete
• `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted media, False on failure.

CLI Example:
```
salt '*' zabbix.user_deletemedia 27
```

```
salt.modules.zabbix.
```

```
user_exists
```

Checks if user with given alias exists.

New in version 2016.3.0.

Parameters

- `alias` -- user alias
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if user exists, else False.

CLI Example:
```
salt '*' zabbix.user_exists james
```

```
salt.modules.zabbix.
```

```
user_get
```

Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters

- `alias` -- user alias
- `userids` -- return only users with the given IDs
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details of convenient users, False on failure of if no user found.

CLI Example:
```
salt '*' zabbix.user_get james
```

```
salt.modules.zabbix.
```

```
user_getmedia
```

New in version 2016.3.0.

Retrieve media according to the given parameters

Note: This function accepts all standard usermedia.get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- `userids` -- return only media that are used by the given users
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** List of retrieved media, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_getmedia

salt.modules.zabbix.user_list(**connection_args)**
Retrieve all of the configured users.

New in version 2016.3.0.

**Parameters**
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with user details.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_list

salt.modules.zabbix.user_update( **connection_args)**
Update existing users

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- `userid` -- id of the user to update
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Id of the updated user on success.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_update 16 visible_name='James Brown'

salt.modules.zabbix.usergroup_create( **connection_args)**

New in version 2016.3.0.

Create new user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- `name` -- name of the user group
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
IDs of the created user groups.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_create GroupName

salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)

New in version 2016.3.0.

**Parameters**
- `usergroupids` -- IDs of the user groups to delete
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
IDs of the deleted user groups.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_delete 28

salt.modules.zabbix.usergroup_exists(name=None, node=None, nodeids=None, **connection_args)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

**Parameters**
- `name` -- names of the user groups
- `node` -- name of the node the user groups must belong to (This will override the nodeids parameter.)
- `nodeids` -- IDs of the nodes the user groups must belong to
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_exists Guests

salt.modules.zabbix.usergroup_get(name=None, usrgpids=None, userids=None, **connection_args)

New in version 2016.3.0.

Retrieve user groups according to the given parameters

**Note:** This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- `name` -- names of the user groups
• **usrgrpids** -- return only user groups with the given IDs
• **userids** -- return only user groups that contain the given users
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_get Guests

salt.modules.zabbix.usergroup_list(**connection_args)
Retrieve all enabled user groups.

New in version 2016.3.0.

Parameters
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with enabled user groups details, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_list

salt.modules.zabbix.usergroup_update(usrgrpid, **connection_args)
Update existing user group

New in version 2016.3.0.

Parameters
• **usrgrpid** -- ID of the user group to update.
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_update 8 name=guestsRenamed

salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)
Create new host usermacro.

Parameters
• **macro** -- name of the host usermacro
• **value** -- value of the host usermacro
• **hostid** -- hostid or templateid
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created host usermacro.

**CLI Example:**

```bash
salt '*' zabbix.usermacro_create '{SNMP_COMMUNITY}' 'public' 1
```

salt.modules.zabbix.usermacro_createglobal(macro, value, **connection_args)

Create new global usermacro.

**Parameters**

• **macro** -- name of the global usermacro
• **value** -- value of the global usermacro
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created global usermacro.

**CLI Example:**

```bash
salt '*' zabbix.usermacro_createglobal '{SNMP_COMMUNITY}' 'public'
```

salt.modules.zabbix.usermacro_delete(macroids, **connection_args)

Delete host usermacros.

**Parameters**

• **macroids** -- macroids of the host usermacros
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted host usermacro.

**CLI Example:**

```bash
salt '*' zabbix.usermacro_delete 21
```

salt.modules.zabbix.usermacro_deleteglobal(macroids, **connection_args)

Delete global usermacros.

**Parameters**

• **macroids** -- macroids of the global usermacros
• **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.
Retrieves user macros according to the given parameters.

**Parameters**
- `macro` -- name of the usermacro
- `hostids` -- Return macros for the given hostids
- `templateids` -- Return macros for the given templateids
- `hostmacroids` -- Return macros with the given hostmacroids
- `globalmacroids` -- Return macros with the given globalmacroids (implies `globalmacro=True`)
- `globalmacro` -- if True, returns only global macros
- `connection_args` *(optional)* -- `connection_user`: zabbix user (can also be set in opts or pillar, see module's docstring) `connection_password`: zabbix password (can also be set in opts or pillar, see module's docstring) `connection_url`: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

**Returns** Array with usermacro details, False if no usermacro found or on failure.

**CLI Example:**
```
salt '*' zabbix.usermacro_get macro='{$SNMP_COMMUNITY}'
```

Updates existing host usermacro.

**Parameters**
- `hostmacroid` -- id of the host usermacro
- `value` -- new value of the host usermacro
- `connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the update host usermacro.

**CLI Example:**
```
salt '*' zabbix.usermacro_update hostmacroid=1 value='public'
```

Updates existing global usermacro.

**Parameters**
- `globalmacroid` -- id of the host usermacro
- `value` -- new value of the host usermacro
- `connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the update global usermacro.

**CLI Example:**
```
salt '*' zabbix.usermacro_updateglobal globalmacroid=value connection_args
```
salt '*' zabbix.usermacro_updateglobal 1 'public'

21.9.525 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by minitage’s buildout maker

**Note:** The zc.buildout integration is still in beta; the API is subject to change

**General notes**

You have those following methods:

- **upgrade_bootstrap**
- **bootstrap**
- **run_buildout**
- **buildout**

```python
salt.modules.zcbuildout.bootstrap(*a, **kw)
```

Run the buildout bootstrap dance (python bootstrap.py).

- `directory` directory to execute in
- `config` alternative buildout configuration file to use
- `runas` User used to run buildout as
- `env` environment variables to set when running
- `buildout_ver` force a specific buildout version (1 | 2)
- `test_release` buildout accept test release
- `offline` are we executing buildout in offline mode
- `distribute` Forcing use of distribute
- `new_st` Forcing use of setuptools >= 0.7
- `python` path to a python executable to use in place of default (salt one)
- `onlyif` Only execute cmd if statement on the host return 0
- `unless` Do not execute cmd if statement on the host return 0
- `use_vt` Use the new salt VT to stream output [experimental]

CLI Example:

```bash
salt '*' buildout.bootstrap /srv/mybuildout
```

```python
salt.modules.zcbuildout.buildout(*a, **kw)
```

Run buildout in a directory.

- `directory` directory to execute in
- `config` buildout config to use
- `parts` specific buildout parts to run
- `runas` user used to run buildout as
- `env` environment variables to set when running
- `buildout_ver` force a specific buildout version (1 | 2)
- `test_release` buildout accept test release
- `new_st` Forcing use of setuptools >= 0.7
- `distribute` use distribute over setuptools if possible
**offline** does buildout run offline

**python** python to use

**debug** run buildout with -D debug flag

**onlyif** Only execute cmd if statement on the host return 0

**unless** Do not execute cmd if statement on the host return 0

**newest** run buildout in newest mode

**verbose** run buildout in verbose mode (-vvvvv)

**use_vt** Use the new salt VT to stream output [experimental]

CLI Example:

```bash
salt '*' buildout.buildout /srv/mybuildout
```

```python
salt.modules.zcbuildout.run_buildout(*a, **kw)
Run a buildout in a directory.

directory directory to execute in
config alternative buildout configuration file to use
offline are we executing buildout in offline mode
runas user used to run buildout as
eval environment variables to set when running
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
force run buildout unconditionally
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
```

CLI Example:

```bash
salt '*' buildout.run_buildout /srv/mybuildout
```

```python
salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)
Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

directory directory to execute in
offline are we executing buildout in offline mode
buildout_ver forcing to use a specific buildout version (1 | 2)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
```

CLI Example:

```bash
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

21.9.526 **salt.modules.zenoss**

Module for working with the Zenoss API

New in version 2016.3.0.

**depends** requests

**configuration** This module requires a 'zenoss' entry in the master/minion config.

For example:
**zenoss**:
- **hostname**: https://zenoss.example.com
- **username**: admin
- **password**: admin123
- **verify_ssl**: True
- **ca_bundle**: /etc/ssl/certs/ca-certificates.crt

`salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost', prod_state=1000)`

A function to connect to a zenoss server and add a new device entry.

**Parameters**
- **device** -- (Optional) Will use the grain 'fqdn' by default.
- **device_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

**CLI Example**: `salt '*' zenoss.add_device`

`salt.modules.zenoss.device_exists(device=None)`

Check to see if a device already exists in Zenoss.

**Parameters**
- **device** -- (Optional) Will use the grain 'fqdn' by default

**CLI Example**: `salt '*' zenoss.device_exists`

`salt.modules.zenoss.find_device(device=None)`

Find a device in Zenoss. If device not found, returns None.

**Parameters**
- **device** -- (Optional) Will use the grain 'fqdn' by default

**CLI Example**: `salt '*' zenoss.find_device`

`salt.modules.zenoss.set_prod_state(prod_state, device=None)`

A function to set the prod_state in zenoss.

**Parameters**
- **prod_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain 'fqdn' by default.

**CLI Example**: `salt zenoss.set_prod_state 1000 hostname`

---

21.9.527 salt.modules.zfs

Module for running ZFS command

**Codeauthor** Nitin Madhok <nmadhok@clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>

**Maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**Maturity** new

**Depends** salt.utils.zfs

**Platform** illumos, freebsd, linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

`salt.modules.zfs.bookmark(snapshot, bookmark)`

Creates a bookmark of the given snapshot
Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

salt.modules.zfs.clone(name_a, name_b, **kwargs)
Creates a clone of the given snapshot.
* name_a [string] name of snapshot
* name_b [string] name of filesystem or volume
* create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
* properties [dict] additional zfs properties (-o)

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

New in version 2016.3.0.

CLI Example:
```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

salt.modules.zfs.create(name, **kwargs)
Create a ZFS File System.
* name [string] name of dataset or volume
* volume_size [string] if specified, a zvol will be created instead of a dataset
* sparse [boolean] create sparse volume
* create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
* properties [dict] additional zfs properties (-o)

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

New in version 2015.5.0.

CLI Example:
salt.modules.zfs.destroy(name, **kwargs)

Destroy a ZFS File System.

- **name** [string] name of dataset, volume, or snapshot
- **force** [boolean] force an unmount of any file systems using the unmount -f command.
- **recursive** [boolean] recursively destroy all children. (-r)
- **recursive_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

salt.modules.zfs.diff(name_a, name_b=None, **kwargs)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

- **name_a** [string] name of snapshot
- **name_b** [string] (optional) name of snapshot or filesystem
- **show_changetime** [boolean] display the path's inode change time as the first column of output. (default = True)
- **show_indication** [boolean] display an indication of the type of file. (default = True)
- **parsable** [boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

salt.modules.zfs.exists(name, **kwargs)

Check if a ZFS filesystem or volume or snapshot exists.

- **name** [string] name of dataset
- **type** [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

salt.modules.zfs.get("dataset", **kwargs)

Displays properties for the given datasets.

- **dataset** [string] name of snapshot(s), filesystem(s), or volume(s)
- **properties** [string] comma-separated list of properties to list, defaults to all
- **recursive** [boolean] recursively list children
**depth** [int] recursively list children to depth
**fields** [string] comma-separated list of fields to include, the name and property field will always be added
**type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
**source** [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.
**parsable** [boolean] display numbers in parsable (exact) values (default = True). .. versionadded:: 2018.3.0

**Note:** If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharefs,mountpoint"
  →[recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
  →fields=value depth=1
```

**salt.modules.zfs.hold** *(tag, *snapshot, **kwargs)*

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

**Note:** Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

**tag** [string] name of tag
**snapshot** [string] name of snapshot(s)
**recursive** [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It’s is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```bash
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
  →mydataset@myothersnapshot
```

**salt.modules.zfs.holds**( *snapshot, **kwargs)*

Lists all existing user references for the given snapshot or snapshots.

**snapshot** [string] name of snapshot
**recursive** [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:
salt '∗' zfs.hold myzpool/mydataset@baseline

salt.modules.zfs.inherit(prop, name, **kwargs)
Clears the specified property
prop [string] name of property
name [string] name of the filesystem, volume, or snapshot
recursive [boolean] recursively inherit the given property for all children.
revert [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.
New in version 2016.3.0.

CLI Example:
salt '∗' zfs.inherit canmount myzpool/mydataset [recursive=True|False]

salt.modules.zfs.list_(name=None, **kwargs)
Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.
name [string] name of dataset, volume, or snapshot
recursive [boolean] recursively list children
depth [int] limit recursion to depth
properties [string] comma-separated list of properties to list, the name property will always be added
type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
sort [string] property to sort on (default = name)
order [string [ascending|descending]] sort order (default = ascending)
parsable [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0
New in version 2015.5.0.

CLI Example:
salt '∗' zfs.list
salt '∗' zfs.list myzpool/mydataset [recursive=True|False]
salt '∗' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"

salt.modules.zfs.list_mount()
List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:
salt '∗' zfs.list_mount

salt.modules.zfs.mount(name=None, **kwargs)
Mounts ZFS file systems
name [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)
overlay [boolean] perform an overlay mount.
options [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.
New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.
CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

`salt.modules.zfs.promote(name)`
Promotes a clone file system to no longer be dependent on its "origin" snapshot.

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

`name` [string] name of clone-filesystem

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

`salt.modules.zfs.release(tag, *snapshot, **kwargs)`
Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

**Note:** The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the `zfs destroy` command return EBUSY.

`tag` [string] name of tag

`snapshot` [string] name of snapshot(s)

`recursive` [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/mydataset@myothersnapshot
```

`salt.modules.zfs.rename(name, new_name, **kwargs)`
Rename or Relocate a ZFS File System.

`name` [string] name of dataset, volume, or snapshot

`new_name` [string] new name of dataset, volume, or snapshot
force [boolean] force unmount any filesystems that need to be unmounted in the process.
create_parent [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are au-
tomatically mounted according to the mountpoint property inherited from their parent.
recursive [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only
dataset that can be renamed recursively.
New in version 2015.5.0.

CLI Example:
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset

salt.modules.zfs.rollback(name, **kwargs)
Roll back the given dataset to a previous snapshot.
name [string] name of snapshot
recursive [boolean] destroy any snapshots and bookmarks more recent than the one specified.
recursive_all [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those
snapshots.
force [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

Warning: When a dataset is rolled back, all data that has changed since the snapshot is discarded, and
the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to
a snapshot other than the most recent one.
In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:
salt '*' zfs.rollback myzpool/mydataset@yesterday

salt.modules.zfs.set(*dataset, **kwargs)
Sets the property or list of properties to the given value(s) for each dataset.
dataset [string] name of snapshot(s), filesystem(s), or volume(s)
properties [string] additional zfs properties pairs

Note: properties are passed as key-value pairs. e.g.
    compression=off

Note: Only some properties can be edited.
See the Properties section for more information on what properties can be set and acceptable values.
Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P,
E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

CLI Example:
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
←canmount=off
salt.modules.zfs.snapshot(*snapshot, **kwargs)
Creates snapshots with the given names.

*snapshot [string] name of snapshot(s)
*recursive [boolean] recursively create snapshots of all descendent datasets.
*properties [dict] additional zfs properties (-o)

**Note:** ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```python
properties={'property1': 'value1', 'property2': 'value2'}
```

New in version 2016.3.0.

CLI Example:

```shell
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/ →myotherdataset@yesterday [recursive=True]
```

salt.modules.zfs.unmount(name, **kwargs)
Unmounts ZFS file systems

*name [string] name of the filesystem, you can use None to unmount all mounted filesystems.
*force [boolean] forcefully unmount the file system, even if it is currently in use.

**Warning:** Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** Passing `-a` as name is deprecated and will be removed in 3001.

CLI Example:

```shell
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

21.9.528 salt.modules.zk_concurrency

Concurrency controls in zookeeper

**depends** kazoo

**configuration** See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)
Get lock (with optional timeout)

- **path** The path in zookeeper where the lock is.
- **zk_hosts** Zookeeper connect string.
- **identifier** Name to identify this minion, if unspecified defaults to hostname.
- **max_concurrency** Maximum number of lock holders.
- **timeout** Timeout to wait for the lock. A None timeout will block forever.
- **ephemeral_lease** Whether the locks in zookeeper should be ephemeral.
- **force** Forcibly acquire the lock regardless of available slots.

Example:

```bash
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.lock_holders

- **path** The path in zookeeper where the lock is.
- **zk_hosts** Zookeeper connect string.
- **identifier** Name to identify this minion, if unspecified defaults to hostname.
- **max_concurrency** Maximum number of lock holders.
- **timeout** Timeout to wait for the lock. A None timeout will block forever.
- **ephemeral_lease** Whether the locks in zookeeper should be ephemeral.

Example:

```bash
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.party_members

- **path** The path in zookeeper where the lock is.
- **zk_hosts** Zookeeper connect string.
- **min_nodes** The minimum number of nodes expected to be present in the party.
- **blocking** The boolean indicating if we need to block until min_nodes are available.

Example:

```bash
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True
```

salt.modules.zk_concurrency.unlock

- **path** The path in zookeeper where the lock is.
- **zk_hosts** Zookeeper connect string.
- **identifier** Name to identify this minion, if unspecified defaults to hostname.
- **max_concurrency** Maximum number of lock holders.
- **timeout** Timeout to wait for the lock. A None timeout will block forever.
- **ephemeral_lease** Whether the locks in zookeeper should be ephemeral.

Example:
```
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

### 21.9.529  `salt.modules.znc`

**znc** - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

```python
salt.modules.znc.buildmod(modules)
```

Build module using `znc-buildmod`

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

```python
salt.modules.znc.dumpconf()
```

Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

```python
salt.modules.znc.rehashconf()
```

Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

```python
salt.modules.znc.version()
```

Return server version from `znc --version`

CLI Example:

```
salt '*' znc.version
```

### 21.9.530  `salt.modules.zoneadm`

Module for Solaris 10's `zoneadm`

**maintainer** Jorge Schrauwen <sjorge@blackdot.be>

**maturity** new

**platform** OmniOS, OpenIndiana, SmartOS, OpenSolaris, Solaris 10

New in version 2017.7.0.

**Warning:** Oracle Solaris 11's `zoneadm` is not supported by this module!

```python
salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)
```

Attach the specified zone.

- **zone** [string] name of the zone
- **force** [boolean] force the zone into the "installed" state with no validation
brand_opts  [string] brand specific options to pass
CLI Example:

salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True

salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)
Boot (or activate) the specified zone.
zone  [string] name or uuid of the zone
single  [boolean] boots only to milestone svc:/milestone/single-user:default.
altinit  [string] valid path to an alternative executable to be the primordial process.
smf_options  [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.
CLI Example:

salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose

salt.modules.zoneadm.clone(zone, source, snapshot=None)
Install a zone by copying an existing installed zone.
zone  [string] name of the zone
source  [string] zone to clone from
snapshot  [string] optional name of snapshot to use as source
CLI Example:

salt '*' zoneadm.clone clementine dolores

salt.modules.zoneadm.detach(zone)
Detach the specified zone.
zone  [string] name or uuid of the zone
CLI Example:

salt '*' zoneadm.detach kissy

salt.modules.zoneadm.halt(zone)
Halt the specified zone.
zone  [string] name or uuid of the zone
Note: To cleanly shutdown the zone use the shutdown function.

CLI Example:

salt '*' zoneadm.halt hector

salt.modules.zoneadm.install(zone, nodataset=False, brand_opts=None)
Install the specified zone from the system.
zone  [string] name of the zone
nodataset  [boolean] do not create a ZFS file system
brand_opts  [string] brand specific options to pass
CLI Example:

salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
salt.modules.zoneadm.list_zones(verbosetrue, 
                       installed=False, configured=False,
                       hide_global=True)

List all zones
verbosetrue [boolean] display additional zone information
installed [boolean] include installed zones in output
configured [boolean] include configured zones in output
hide_global [boolean] do not include global zone

CLI Example:
```
salt '*' zoneadm.list
```

salt.modules.zoneadm.move(zone, zonepath)
Move zone to new zonepath.
zone [string] name or uuid of the zone
zonepath [string] new zonepath

CLI Example:
```
salt '*' zoneadm.move meave /sweetwater/meave
```

salt.modules.zoneadm.ready(zone)
Prepares a zone for running applications.
zone [string] name or uuid of the zone

CLI Example:
```
salt '*' zoneadm.ready clementine
```

salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)
Restart the zone. This is equivalent to a halt boot sequence.
zone [string] name or uuid of the zone
single [boolean] boots only to milestone svc:/milestone/single-user:default.
altinit [string] valid path to an alternative executable to be the primordial process.
smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)
Gracefully shutdown the specified zone.
zone [string] name or uuid of the zone
reboot [boolean] reboot zone after shutdown (equivalent of shutdown -i 6 -g 0 -y)
single [boolean] boots only to milestone svc:/milestone/single-user:default.
altinit [string] valid path to an alternative executable to be the primordial process.
smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:
```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

salt.modules.zoneadm.uninstall(zone)
Uninstall the specified zone from the system.
zone [string] name or uuid of the zone
Warning: The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:
```
salt '*' zoneadm.uninstall teddy
```

```
salt.modules.zoneadm.verify(zone)
```
Check to make sure the configuration of the specified zone can safely be installed on the machine.
```
zone [string] name of the zone
```
CLI Example:
```
salt '*' zoneadm.verify dolores
```

```
salt.modules.zoneadm.verify(zone)
```

### 21.9.531 salt.modules.zonecfg

Module for Solaris 10's zonecfg
```
maintainer Jorge Schrauwen <sjorge@blackdot.be>
```
maturity new
```
platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10
```
depend salt.modules.file

New in version 2017.7.0.

Warning: Oracle Solaris 11's zonecfg is not supported by this module!

```
salt.modules.zonecfg.add_resource(zone, resource_type, **kwargs)
```
Add a resource
```
zone [string] name of zone
resource_type [string] type of resource
kwargs [string|int|...] resource properties
```
CLI Example:
```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value=
"'(priv=privileged,limit=33554432,action=deny)'
```

```
salt.modules.zonecfg.clear_property(zone, key)
```
Clear a property
```
zone [string] name of zone
key [string] name of property
```
CLI Example:
```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

```
salt.modules.zonecfg.create(zone, brand, zonepath, force=False)
```
Create an in-memory configuration for the specified zone.
```
zone [string] name of zone
brand [string] brand name
zonepath [string] path of zone
force [boolean] overwrite configuration
```
CLI Example:
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe

```python
salt.modules.zonecfg.create_from_template(zone, template)

Create an in-memory configuration from a template for the specified zone.
zone [string] name of zone
template [string] name of template

Warning: existing config will be overwritten!
```

CLI Example:
```
salt '*' zonecfg.create_from_template leo tallgeese
```

```python
salt.modules.zonecfg.delete(zone)

Delete the specified configuration from memory and stable storage.
zone [string] name of zone

CLI Example:
```
salt '*' zonecfg.delete epyon
```

```python
salt.modules.zonecfg.export(zone, path=None)

Export the configuration from memory to stable storage.
zone [string] name of zone
path [string] path of file to export to

CLI Example:
```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

```python
salt.modules.zonecfg.import_(zone, path)

Import the configuration to memory from stable storage.
zone [string] name of zone
path [string] path of file to export to

CLI Example:
```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

```python
salt.modules.zonecfg.info(zone, show_all=False)

Display the configuration from memory
zone [string] name of zone
show_all [boolean] also include calculated values like capped-cpu, cpu-shares, ...

CLI Example:
```
salt '*' zonecfg.info tallgeese
```

```python
salt.modules.zonecfg.remove_resource(zone, resource_type, resource_key, resource_value)

Remove a resource
zone [string] name of zone
resource_type [string] type of resource
resource_key [string] key for resource selection
resource_value [string] value for resource selection

Note: Set resource_selector to None for resource that do not require one.
```
CLI Example:
```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

salt.modules.zonecfg.set_property(zone, key, value)
Set a property
- `zone` [string] name of zone
- `key` [string] name of property
- `value` [string] value of property

CLI Example:
```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

salt.modules.zonecfg.update_resource(zone, resource_type, resource_selector, **kwargs)
Add a resource
- `zone` [string] name of zone
- `resource_type` [string] type of resource
- `resource_selector` [string] unique resource identifier
- `kwargs` [string|int|...] resource properties

Note: Set resource_selector to None for resource that do not require one.

CLI Example:
```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory value='(priv=privileged,limit=33554432,action=deny)'
```

21.9.532 salt.modules.zookeeper

Zookeeper Module
- maintainer SaltStack
- maturity new
- platform all
- depends kazoo

New in version 2018.3.0.

Configuration

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
zookeeper:
  hosts: zool,zoo2,zoo3
default_acl:
  - username: daniel
    password: test
    read: true
    write: true
    create: true
```
If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```yaml
zookeeper:
  prod:
    hosts: zoo1,zoo2,zoo3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    username: daniel
    password: test
  dev:
    hosts:
      - dev1
      - dev2
      - dev3
    default_acl:
      - username: daniel
        password: test
        read: true
        write: true
        create: true
        delete: true
        admin: true
    username: daniel
    password: test
```

`salt.modules.zookeeper.create(path, value='', acls=None, ephemeral=False, sequence=False, makepath=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)`

Create Znode

- **path**: path of znode to create
- **value**: value to assign to znode (Default: ")
- **acls**: list of acl dictionaries to be assigned (Default: None)
- **ephemeral**: indicate node is ephemeral (Default: False)
- **sequence**: indicate node is suffixed with a unique index (Default: False)
- **makepath**: Create parent paths if they do not exist (Default: False)
- **profile**: Configured Zookeeper profile to authenticate with (Default: None)
- **hosts**: Lists of Zookeeper Hosts (Default: `127.0.0.1:2181`)
- **scheme**: Scheme to authenticate with (Default: `digest`)
- **username**: Username to authenticate (Default: None)
- **password**: Password to authenticate (Default: None)
- **default_acl**: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:
salt minion1 zookeeper.create /test/name daniel profile=prod

salt.modules.zookeeper.delete(path, version=-1, recursive=False, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Delete znode
path path to znode
version only delete if version matches (Default: -1 (always matches))
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)
scheme Scheme to authenticate with (Default: ’digest’)
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.delete /test/name profile=prod

salt.modules.zookeeper.ensure_path(path, acls=None, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Ensure Znode path exists
path Parent path to create
acls list of acls dictionaries to be assigned (Default: None)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)
scheme Scheme to authenticate with (Default: ’digest’)
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.ensure_path /test/name profile=prod

salt.modules.zookeeper.exists(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Check if path exists
path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)
scheme Scheme to authenticate with (Default: ’digest’)
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:
salt minion1 zookeeper.exists /test/name profile=prod

salt.modules.zookeeper.get(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Get value saved in znode
path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: ’127.0.0.1:2181)
scheme Scheme to authenticate with (Default: ’digest’)
username Username to authenticate (Default: None)
### Zookeeper

**Password**
Password to authenticate (Default: None)

**Default acl**
Default acls to assign if a node is created in this connection (Default: None)

**CLI Example:**
```
salt minion1 zookeeper.get /test/name profile=prod
```

**salt.modules.zookeeper.get_acls**

```python
salt.modules.zookeeper.get_acls(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Get acls on a znode

- **path** path to znode
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

**CLI Example:**
```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

**salt.modules.zookeeper.get_children**

```python
salt.modules.zookeeper.get_children(path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)
```

Get children in znode path

- **path** path to check
- **profile** Configured Zookeeper profile to authenticate with (Default: None)
- **hosts** Lists of Zookeeper Hosts (Default: '127.0.0.1:2181)
- **scheme** Scheme to authenticate with (Default: 'digest')
- **username** Username to authenticate (Default: None)
- **password** Password to authenticate (Default: None)
- **default_acl** Default acls to assign if a node is created in this connection (Default: None)

**CLI Example:**
```
salt minion1 zookeeper.get_children /test profile=prod
```

**salt.modules.zookeeper.make_digest_acl**

```python
salt.modules.zookeeper.make_digest_acl(username, password, read=False, write=False, create=False, delete=False, admin=False, allperms=False)
```

Generate acl object

**Note:** This is heavily used in the zookeeper state and probably is not useful as a cli module

- **username** username of acl
- **password** plain text password of acl
- **read** read acl
- **write** write acl
- **create** create acl
- **delete** delete acl
- **admin** admin acl
- **allperms** set all other acls to True

**CLI Example:**
```
salt minion1 zookeeper.make_digest_acl username=daniel password=mypass read=True write=True create=True delete=True admin=True allperms=True
```
salt.modules.zookeeper.set(path, value, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Update znode with new value

- path: znode to update
- value: value to set in znode
- version: only update znode if version matches (Default: -1 (always matches))
- profile: Configured Zookeeper profile to authenticate with (Default: None)
- hosts: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- scheme: Scheme to authenticate with (Default: 'digest')
- username: Username to authenticate (Default: None)
- password: Password to authenticate (Default: None)
- default_acl: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

salt.modules.zookeeper.set_acls(path, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None)

Set acls on a znode

- path: path to znode
- acls: list of acl dictionaries to set on the znode
- version: only set acls if version matches (Default: -1 (always matches))
- profile: Configured Zookeeper profile to authenticate with (Default: None)
- hosts: Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
- scheme: Scheme to authenticate with (Default: 'digest')
- username: Username to authenticate (Default: None)
- password: Password to authenticate (Default: None)
- default_acl: Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set_acls /test/name acls=[{"username": "gtmanfred", "password": "test", "all": True}] profile=prod
```

21.9.533 salt.modules.zpool

Module for running ZFS zpool command

- codeauthor: Nitin Madhok <nmadhok@clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
- maintainer: Jorge Schrauwen <sjorge@blackdot.be>
- maturity: new
- depends: salt.utils.zfs
- platform: illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

salt.modules.zpool.add(zpool, *vdevs, **kwargs)

Add the specified vdev's to the given storage pool

- zpool: [string] Name of storage pool
- vdevs: [string] One or more devices
- force: [boolean] Forces use of device

CLI Example:
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]

salt.modules.zpool.attach(zpool, device, new_device, force=False)
Attach specified device to zpool
zpool [string] Name of storage pool
device [string] Existing device name too
new_device [string] New device name (to be attached to device)
force [boolean] Forces use of device
CLI Example:
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]

salt.modules.zpool.clear(zpool, device=None)
Clears device errors in a pool.

**Warning:** The device must not be part of an active pool configuration.
zpool [string] name of storage pool
device [string] (optional) specific device to clear

New in version 2018.3.1.

CLI Example:
salt '*' zpool.clear mypool
salt '*' zpool.clear mypool /path/to/dev

salt.modules.zpool.create(zpool, *vdevs, **kwargs)
Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3
zpool [string] Name of storage pool
vdevs [string] One or move devices
force [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.
mountpoint [string] Sets the mount point for the root dataset
altroot [string] Equivalent to "-o cachefile=none,altroot=root"
properties [dict] Additional pool properties
filesystem_properties [dict] Additional filesystem properties
createboot [boolean] create a boot partition

New in version 2018.3.0.

CLI Examples:
salt '*' zpool.create myzpool /path/to/vdev1 [...][force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...][force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 /path/to/vdev4 /path/to/vdev5 [...][force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [\...\] properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [\...\] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [\...\] \[force=True|False\]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/to/vdev3 [\...\] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [\...\] mirror /path/to/vdev2 [\...\] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [\...\] log mirror /path/to/vdev1 [\...\] cache /path/to/vdev2 [\...\] spare /path/to/vdev3 [\...\] [force=True|False]
```

```
salt.modules.zpool.create_file_vdev(size, 'vdevs')
```

Creates file based virtual devices for a zpool

CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [/path/to/vdev2] [\...\]
```

Note: Depending on file size, the above command may take a while to return.

```
salt.modules.zpool.destroy(zpool, force=False)
```

Destroys a storage pool

- **zpool** [string] Name of storage pool
- **force** [boolean] Force destroy of pool

CLI Example:

```
salt '*' zpool.destroy myzpool
```

```
salt.modules.zpool.detach(zpool, device)
```

Detaches specified device to zpool

- **zpool** [string] Name of storage pool
- **device** [string] Device to detach

CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```
salt.modules.zpool.exists(zpool)
    Check if a ZFS storage pool is active
    zpool [string] Name of storage pool
    CLI Example:
    salt '*' zpool.exists myzpool

salt.modules.zpool.export(*pools, **kwargs)
    New in version 2015.5.0.
    Export storage pools
    pools [string] One or more storage pools to export
    force [boolean] Force export of storage pools
    CLI Example:
    salt '*' zpool.export myzpool ... [force=True|False]
    salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]

salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)
    New in version 2016.3.0.
    Retrieves the given list of properties
    zpool [string] Name of storage pool
    prop [string] Optional name of property to retrieve
    show_source [boolean] Show source of property
    parsable [boolean] Display numbers in parsable (exact) values
    New in version 2018.3.0.
    CLI Example:
    salt '*' zpool.get myzpool

salt.modules.zpool.healthy()
    Check if all zpools are healthy
    New in version 2016.3.0.
    CLI Example:
    salt '*' zpool.healthy

salt.modules.zpool.history(zpool=None, internal=False, verbose=False)
    New in version 2016.3.0.
    Displays the command history of the specified pools, or all pools if no pool is specified
    zpool [string] Optional storage pool
    internal [boolean] Toggle display of internally logged ZFS events
    verbose [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed
    CLI Example:
    salt '*' zpool.upgrade myzpool

salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)
    New in version 2015.5.0.
    Import storage pools or list pools available for import
    zpool [string] Optional name of storage pool
    new_name [string] Optional new name for the storage pool
mntopts [string] Comma-separated list of mount options to use when mounting datasets within the pool.
force [boolean] Forces import, even if the pool appears to be potentially active.
altroot [string] Equivalent to "-o cachefile=none,altroot=root"

dir [string] Searches for devices or files in dir, multiple dirs can be specified as follows: dir="dir1,dir2"

no_mount [boolean] Import the pool without mounting any file systems.
only_destroyed [boolean] Imports destroyed pools only. This also sets force=True.
recovery [bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don't import nolog: allow import without log device, recent transactions might be lost

**Note:** If feature flags are not support this forced to the default of 'false'

---

**Warning:** When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

properties [dict] Additional pool properties

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```python
properties="{'property1': 'value1', 'property2': 'value2'}"
```

---

**CLI Example:**

```bash
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir="/tmp"
```

---

**salt.modules.zpool.iostat(zpool=None, sample_time=5, parsable=True)**
Display I/O statistics for the given pools

- **zpool** [string] optional name of storage pool
- **sample_time** [int] seconds to capture data before output default a sample of 5 seconds is used
- **parsable** [boolean] display data in pythonic values (True, False, Bytes,...)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

**CLI Example:**

```bash
salt '*' zpool.iostat myzpool
```

---

**salt.modules.zpool.labelclear(device, force=False)**
Removes ZFS label information from the specified device

- **device** [string] Device name; must not be part of an active pool configuration.
- **force** [boolean] Treat exported or foreign devices as inactive

**CLI Example:**

```bash
salt '*' zpool.labelclear /path/to/dev
```

---

**salt.modules.zpool.list_(properties='size,alloc,free,frag,health', zpool=None, parsable=True)**

New in version 2015.5.0.
Return information about (all) storage pools

zpool  [string] optional name of storage pool
properties  [string] comma-separated list of properties to list
parsable  [boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

Note: The name property will always be included, while the frag property will get removed if not available

zpool  [string] optional zpool

Note: Multiple storage pool can be provided as a space separated list

CLI Example:

```
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank
```

salt.modules.zpool.offline(zpool, *vdevs, **kwargs)
New in version 2015.5.0.
Ensure that the specified devices are offline

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use temporary=True.

zpool  [string] name of storage pool
vdevs  [string] One or more devices
temporary  [boolean] Enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

salt.modules.zpool.online(zpool, *vdevs, **kwargs)
New in version 2015.5.0.
Ensure that the specified devices are online

zpool  [string] name of storage pool
vdevs  [string] one or more devices
expand  [boolean] Expand the device to use all available space.

Note: If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...] [temporary=True|False]
```

salt.modules.zpool.reguid(zpool)
Generates a new unique identifier for the pool
Warning: You must ensure that all devices in this pool are online and healthy before performing this action.

`zpool` [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reguid myzpool
```

**salt.modules.zpool.reopen**(`zpool`

Reopen all the vdevs associated with the pool

`zpool` [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reopen myzpool
```

**salt.modules.zpool.replace**(`zpool`, `old_device`, `new_device=None`, `force=False`

Replaces `old_device` with `new_device`

Note: This is equivalent to attaching `new_device`, waiting for it to resilver, and then detaching `old_device`.

The size of `new_device` must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

```
zpool [string] Name of storage pool
old_device [string] Old device to replace
new_device [string] Optional new device
force [boolean] Forces use of new_device, even if its appears to be in use.
```

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

**salt.modules.zpool.scrub**(`zpool`, `stop=False`, `pause=False`

Scrub a storage pool

`zpool` [string] Name of storage pool

`stop` [boolean] If True, cancel ongoing scrub

`pause` [boolean] If True, pause ongoing scrub

New in version 2018.3.0.

Note: Pause is only available on recent versions of ZFS.

If both pause and stop are True, then stop will win.

CLI Example:

```
salt '*' zpool.scrub myzpool
```

**salt.modules.zpool.set**(`zpool`, `prop`, `value`

Sets the given property on the specified pool
zpool [string] Name of storage pool
prop [string] Name of property to set
value [string] Value to set for the specified property
New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

**salt.modules.zpool.split**(zpool, newzpool, **kwargs)
New in version 2018.3.0.

Splits devices off pool creating newpool.

**Note:** All vdevs in pool must be mirrors. At the time of the split, newzpool will be a replica of zpool.

After splitting, do not forget to import the new pool!

zpool [string] Name of storage pool
newzpool [string] Name of new storage pool
mountpoint [string] Sets the mount point for the root dataset
altroot [string] Sets altroot for newzpool
properties [dict] Additional pool properties for newzpool

**CLI Examples:**

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

**Note:** Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

**Example:**

```
salt '*' zpool.split datamirror databackup properties="{'readonly': 'on'}"
```

**CLI Example:**

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

**salt.modules.zpool.status**(zpool=None)
Return the status of the named zpool
zpool [string] optional name of storage pool
New in version 2016.3.0.

**CLI Example:**

```
salt '*' zpool.status myzpool
```

**salt.modules.zpool.upgrade**(zpool=None, version=None)
New in version 2016.3.0.

Enables all supported features on the given pool
zpool [string] Optional storage pool, applies to all otherwize
version [int] Version to upgrade to, if unspecified upgrade to the highest possible

**Warning:** Once this is done, the pool will no longer be accessible on systems that do not support feature
flags. See zpool-features(5) for details on compatibility with systems that support feature flags, but do not
support all features enabled on the pool.

CLI Example:
salt '*' zpool.upgrade myzpool

### 21.9.534 salt.modules.zypperpkg

Package support for openSUSE via the zypper package manager

**depends**

- rpm Python module. Install with zypper install rpm-python

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a
different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

**class** salt.modules.zypperpkg.Wildcard(zypper)

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'1.2.3.4' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

**Parameters**

- **ptn** -- Pattern

**Returns**

Query range

Z_OP = ['<', '<=', '=', '>=', '>']

salt.modules.zypperpkg.add_lock(packages, root=None, **kwargs)

Add a package lock. Specify packages to lock by exact name.

**root** operate on a different root directory.

CLI Example:

salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>,<package2>,<package3>
salt '*' pkg.add_lock pkgs=['"foo", "bar"]

salt.modules.zypperpkg.clean_locks(root=None)

Remove unused locks that do not currently (with regard to repositories used) lock any package.

**root** Operate on a different root directory.

CLI Example:

salt '*' pkg.clean_locks

salt.modules.zypperpkg.del_repo(repo, root=None)

Delete a repo.

**root** operate on a different root directory.

CLI Examples:
salt '*' pkg.del_repo alias

salt.modules.zypperpkg.diff(*paths, **kwargs)
Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

The root parameter can also be passed via the keyword argument.

Parameters path -- Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers

salt.modules.zypperpkg.download(*packages, **kwargs)
Download packages to the local disk.
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
root operate on a different root directory.

CLI example:
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix

salt.modules.zypperpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list

salt.modules.zypperpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

The root parameter can also be passed via the keyword argument.

CLI Examples:
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list

salt.modules.zypperpkg.get_repo(repo, root=None, **kwargs)
Display a repo.
root operate on a different root directory.

CLI Example:
salt '*' pkg.get_repo alias

salt.modules.zypperpkg.info_available(*names, **kwargs)
Return the information of the named package available for the system.
refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.
root operate on a different root directory.
CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

```
salt.modules.zypperpkg.info_installed('names, **kwargs)
```

Returns the information of the named package(s), installed on the system.

**Parameters**

- **names** -- Names of the packages to get information about.
- **attr** -- Comma-separated package attributes. If no ‘attr’ is specified, all available attributes returned.
  
  _Valid attributes are:_ version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **errors** -- Handle RPM field errors. If ‘ignore’ is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If ‘report’ is chosen, then a field with a mistake is not returned, instead a ‘N/A (broken)’ (not available, broken) text is placed.
  
  _Valid attributes are:_ ignore, report
- **all_versions** -- Include information for all versions of the packages installed on the minion.
- **root** -- Operate on a different root directory.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
salt '*' pkg.info_installed <package1> attr=version,vendor all_versions=True
salt '*' pkg.info_installed <package1> attr=version, all_versions=True
salt '*' pkg.info_installed <package1> attr=version, errors=ignore
salt '*' pkg.info_installed <package1> attr=version, errors=report
```

```
salt.modules.zypperpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, no_recommends=False, root=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to force a ‘zypper refresh’ before package is installed.

**name** The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**fromrepo** Specify a package repository to install from.
downloadonly Only download the packages, do not install.
skip_verify Skip the GPG verification check (e.g., --no-gpg-checks)
version Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a
version number (ex. '>1.2.3-4'). This parameter is ignored if pkgs or sources is passed.
resolve_capabilities If this option is set to True zypper will take capabilities into account. In this case names
which are just provided by a package will get installed. Default is False.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific
version number can be specified by using a single-element dict representing the package and its version.
As with the version parameter above, comparison operators can be used to target a specific version
of a package.

CLI Examples:

    salt '*' pkg.install pkgs=['"foo", "bar"]'
    salt '*' pkg.install pkgs=["foo", {'bar": "1.2.3-4"}]
    salt '*' pkg.install pkgs=["foo", {'bar": "<1.2.3-4"}]

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names,
and the values being the source URI or local path to the package.

CLI Example:

    salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.rpm"}]

ignore_repo_failure Zypper returns error code 106 if one of the repositories are not available for various
reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

no_recommends Do not install recommended packages, only required ones.

root operate on a different root directory.

diff_attr: If a list of package attributes is specified, returned value will contain them, eg:

    [{'<package>': {'old': {'version': '<old-version>',
                            'arch': '<old-arch>'},
                   'new': {'version': '<new-version>',
                            'arch': '<new-arch>'}}}]

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.
Returns a dict containing the new package names and versions:

    {'<package>': {'old': '<old-version>',
                   'new': '<new-version>'}}

If an attribute list is specified in diff_attr, the dict will also contain any specified attribute, eg:

    {'<package>': {'old': {'version': '<old-version>',
                            'arch': '<old-arch>'},
                   'new': {'version': '<new-version>',
                            'arch': '<new-arch>'}}}
salt.modules.zypperpkg.latest_version (*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

root operate on a different root directory.

CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypperpkg.list_downloaded (root=None, **kwargs)

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

root operate on a different root directory.

CLI example:

```
salt '*' pkg.list_downloaded
```

salt.modules.zypperpkg.list_installed_patches (root=None, **kwargs)

New in version 2017.7.0.

List installed advisory patches on the system.

root operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

salt.modules.zypperpkg.list_installed_patterns (root=None)

List installed patterns on the system.

root operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

salt.modules.zypperpkg.list_locks (root=None)

List current package locks.

root operate on a different root directory.

Return a dict containing the locked package with attributes:

```
{'<package>': {'case_sensitive': '<case_sensitive>',
               'match_type': '<match_type>',
               'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

salt.modules.zypperpkg.list_patches (refresh=False, root=None, **kwargs)

New in version 2017.7.0.
List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root** operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_patches
```

salt.modules.zypperpkg.list_patterns(refresh=False, root=None)

List all known patterns from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root** operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_patterns
```

salt.modules.zypperpkg.list_pkgs(versions_as_list=False, root=None, includes=None, **kwargs)

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

**versions_as_list:** If set to true, the versions are provided as a list

```
{'<package_name>': ['<version>, '<version>']}
```

**root:** operate on a different root directory.

**includes:** List of types of packages to include (package, patch, pattern, product) By default packages are always included

**attr:** If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```
{'<package_name>': [{'version': 'version', 'arch': 'arch'}]}
```

Valid attributes are:

- epoch
- version
- release
- arch
- install_date
- install_date_time

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

**removed:** not supported

**purge_desired:** not supported

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]'
```

salt.modules.zypperpkg.list_products(all=False, refresh=False, root=None)

List all available or installed SUSE products.

**all** List all products available or only installed. Default is False.

**refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

**root** operate on a different root directory.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```
salt.modules.zypperpkg.list_provides(root=None, **kwargs)

New in version 2018.3.0.

List package provides of installed packages as a dict. `{<provided_name>: [{'package_name': '', 'package_name': '', ...}]}

root operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_provides
```

salt.modules.zypperpkg.list_repo_pkgs(*args, **kwargs)

New in version 2017.7.5,2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a pkg.installed state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.3-83.3.1',
             '4.3-82.6'],
    'vim': ['7.4.326-12.1']
}
{
    'OSS': {
        'bash': ['4.3-82.6'],
        'vim': ['7.4.326-12.1']
    },
    'OSS Update': {
        'bash': ['4.3-83.3.1']
    }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When True, the return data for each package will be organized by repository.

root operate on a different root directory.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*$' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*$' fromrepo='OSS Updates'
```

salt.modules.zypperpkg.list_repos(root=None, **kwargs)

Lists all repos.

root operate on a different root directory.

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.zypperpkg.list_upgrades(refresh=True, root=None, **kwargs)

List all available package upgrades on this system
refresh  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.
root  operate on a different root directory.

CLI Example:
```
salt '*' pkg.list_upgrades
```

```
salt.modules.zypperpkg.mod_repo(repo, **kwargs)
```
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

- **repo** or **alias**  alias by which Zyper refers to the repo
- **url, mirrorlist or baseurl**  the URL for Zyper to reference
- **enabled**  Enable or disable (True or False) repository, but do not remove if disabled.
- **refresh**  Enable or disable (True or False) auto-refresh of the repository.
- **cache**  Enable or disable (True or False) RPM files caching.
- **gpgcheck**  Enable or disable (True or False) GPG check for this repository.
- **gpgautoimport**  [False] If set to True, automatically trust and import public GPG key for the repository.
- **root**  operate on a different root directory.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:
```
salt '*' pkg.mod_repo alias alias=new_alias
dsalt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/
```

```
salt.modules.zypperpkg.modified(*packages, **flags)
```
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):
- **size**  Include only files where size changed.
- **mode**  Include only files which file's mode has been changed.
- **checksum**  Include only files which MD5 checksum has been changed.
- **device**  Include only files which major and minor numbers has been changed.
- **symlink**  Include only files which are symbolic link contents.
- **owner**  Include only files where owner has been changed.
- **group**  Include only files where group has been changed.
- **time**  Include only files where modification time of the file has been changed.
- **capabilities**  Include only files where capabilities differ or not. Note: supported only on newer RPM versions.
- **root**  operate on a different root directory.

CLI Examples:
```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

```
salt.modules.zypperpkg.normalize_name(name)
```
Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:
Salt Documentation, Release 3002.6

```
salt '*' pkg.normalize_name zsh.x86_64
```

salt.modules.zypperpkg.owner('paths', **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

The root parameter can also be passed via the keyword argument.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.zypperpkg.parse_arch(name)

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

salt.modules.zypperpkg.purge(name=None, pkgs=None, root=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a zypper -n remove -u name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

root Operate on a different root directory.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.zypperpkg.refresh_db(force=None, root=None)

Trigger a repository refresh by calling zypper refresh. Refresh will run with --force if the "force=True" flag is passed on the CLI or refreshdb_force is set to true in the pillar. The CLI option overrides the pillar setting.

It will return a dict:

```
{"<database name>": Bool}
```

root operate on a different root directory.
Salt Documentation, Release 3002.6

CLI Example:

```bash
salt '*' pkg.refresh_db [force=true|false]
```

Pillar Example:

```yaml
zypper:
    refreshdb_force: false
```

salt.modules.zypperpkg.remove(name=None, pkgs=None, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

**name** The name of the package to be deleted.

Multiple Package Options:

- **pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.
- **root** Operate on a different root directory.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.zypperpkg.remove_lock(packages, root=None, **kwargs)

Remove specified package lock.

**root** operate on a different root directory.

CLI Example:

```bash
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
salt '*' pkg.remove_lock pkgs='["foo", "bar"]'
```

salt.modules.zypperpkg.resolve_capabilities(pkgs, refresh=False, root=None, **kwargs)

New in version 2018.3.0.

Convert name provides in **pkgs** into real package names if **resolve_capabilities** parameter is set to True. In case of **resolve_capabilities** is set to False the package list is returned unchanged. **refresh** force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed. **root** operate on a different root directory.

**resolve_capabilities** If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

CLI Examples:

```bash
salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl
```
salt.modules.zypperpkg.search(criteria, refresh=False, **kwargs)
List known packages, available to the system.
refresh  force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
mismatch (str) One of exact, words, substrings. Search for an exact match or for the whole words only. Default to substrings to patch partial words.
provides (bool) Search for packages which provide the search strings.
requires (bool) Search for packages which require the search strings.
suggests (bool) Search for packages which suggest the search strings.
conflicts (bool) Search packages conflicting with search strings.
obsoletes (bool) Search for packages which obsolete the search strings.
file_list (bool) Search for a match in the file list of packages.
search_descriptions (bool) Search also in package summaries and descriptions.
case_sensitive (bool) Perform case-sensitive search.
installed_only (bool) Show only installed packages.
not_installed_only (bool) Show only packages which are not installed.
details (bool) Show version and repository
root operate on a different root directory.
 CLI Examples:

```
salt '*' pkg.search <criteria>
```

salt.modules.zypperpkg.upgrade(refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, no_recommends=False, root=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade, a zypper upgrade
refresh  force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.
dryrun  If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False
dist_upgrade  Perform a system dist-upgrade. Default: False
fromrepo  Specify a list of package repositories to upgrade from. Default: None
novendorchange  If set to True, no allow vendor changes. Default: False
skip_verify  Skip the GPG verification check (e.g., --no-gpg-checks)
no_recommends  Do not install recommended packages, only required ones.
root  Operate on a different root directory.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade dist_upgrade=True fromrepo='["MyRepoName"]'
←novendorchange=True
salt '*' pkg.upgrade dist_upgrade=True dryrun=True
```

salt.modules.zypperpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package
**refresh** force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

**root** operate on a different root directory.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.zypperpkg.verify`(*names, **kwargs*)

Runs an `rpm -Va` on a system, and returns the results in a dict. Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument.

The root parameter can also be passed via the keyword argument.

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

`salt.modules.zypperpkg.version`(*names, **kwargs*)

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**root** operate on a different root directory.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.zypperpkg.version_cmp`*ver1, ver2, ignore_epoch=False, **kwargs*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `ver1 < ver2`, 0 if `ver1 == ver2`, and 1 if `ver1 > ver2`. Return None if there was a problem making the comparison.

**ignore_epoch** [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

## 21.10 netapi modules

  - /minions
  - /jobs
  - /run
  - /events
  - /hook
  - /keys
  - /ws
  - /stats

A script to start the CherryPy WSGI server

This is run by salt-api and started in a multiprocess.
A REST API for Salt

Note: This module is Experimental on Windows platforms and supports limited configurations:

- doesn’t support PAM authentication (i.e. external_auth: auto)
- doesn’t support SSL (i.e. disable_ssl: True)

depends
- CherryPy Python module.

Note: there is a known SSL traceback for CherryPy versions 3.2.5 through 3.7.x. Please use version 3.2.3 or the latest 10.x version instead.

optdepends
- ws4py Python module for websockets support.

client_libraries
- Java: https://github.com/SUSE/salt-netapi-client
- Python: https://github.com/saltstack/pepper

setup
All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include salt-api in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)

2. Install CherryPy. (Read the version caveat in the section above.)

   Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

   1. Install the PyOpenSSL package.
   2. Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

   ```
   salt-call --local tls.create_self_signed_cert
   ```

4. Edit the master config to create at least one external auth user or group following the full external auth instructions.

5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!).)

   ```
   rest_cherrypy:
   port: 8000
   ssl_crt: /etc/pki/tls/certs/localhost.crt
   ssl_key: /etc/pki/tls/certs/localhost.key
   ```

6. Restart the `salt-master` daemon.

7. Start the `salt-api` daemon.
configuration  All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port  Required
The port for the webserver to listen on.

host  [0.0.0.0] The socket interface for the HTTP server to listen on.

debug  [False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log.access_file  Path to a file to write HTTP access logs.
New in version 2016.11.0.

log.error_file  Path to a file to write HTTP error logs.
New in version 2016.11.0.

ssl_crt  The path to a SSL certificate. (See below)

ssl_key  The path to the private key for your SSL certificate. (See below)

ssl_chain (Optional when using PyOpenSSL) the certificate chain to pass to Context.
load_verify_locations.

disable_ssl  A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

webhook_disable_auth  [False] The Webhook URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

webhook_url  [/hook] Configure the URL endpoint for the Webhook entry point.

thread_pool  [100] The number of worker threads to start up in the pool.

socket_queue_size  [30] Specify the maximum number of HTTP connections to queue.

expire_responses  [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire_responses" configuration setting, which corresponds to the timeout_monitor setting in CherryPy, is no longer supported in CherryPy versions >= 12.0.0.

max_request_body_size  [1048576] Maximum size for the HTTP request body.

collect_stats  [False] Collect and report statistics about the CherryPy server

Reports are available via the Stats URL.

stats_disable_auth  [False] Do not require authentication to access the /stats endpoint.
New in version 2018.3.0.

static  A filesystem path to static HTML/JavaScript/CSS/image assets.

static_path  [/static] The URL prefix to use when serving static assets out of the directory specified in the static setting.

enable_sessions  [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

New in version 2017.7.0.
**app** [index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom X-Auth-Token header instead and consider disabling the enable_sessions setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

**app_path** [/app] The URL prefix to use for serving the HTML file specified in the app setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

**root_prefix** [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

---

**Authentication**

Authentication is performed by passing a session token with each request. Tokens are generated via the Login URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named X-Auth-Token.

For example, using curl:

```bash
curl -sSk https://localhost:8000/login \
   -H 'Accept: application/x-yaml' \ 
   -d username=saltdev \ 
   -d password=saltdev \ 
   -d eauth=pam
```

Copy the token value from the output and include it in subsequent requests:

```bash
curl -sSk https://localhost:8000 \
   -H 'Accept: application/x-yaml' \ 
   -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \ 
   -d client=local \ 
   -d tgt='*' \ 
   -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```bash
# Write the cookie file:
# Write the cookie file:
curl -sSk https://localhost:8000/login \
   -c ~/cookies.txt \
   -H 'Accept: application/x-yaml' \ 
   -d username=saltdev \ 
   -d password=saltdev \ 
   -d eauth=auto

# Read the cookie file:
```

(continues on next page)
curl -sSk https://localhost:8000 \
  -b ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping

Another example using the requests library in Python:

```python
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json=
    {'username': 'saltdev',
     'password': 'saltdev',
     'eauth': 'auto',
    })
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[[
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'},
]])
>>> resp.json()
{u'return': [...snip...]
}
```

See also:

You can bypass the session handling via the Run URL.

Usage

This interface directly exposes Salt's Python API. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000 -H 'Content-type: application/json' \
   -d '[[
     "client": "local",
     "tgt": ",",
     "fun": "test.ping"
   ]]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
{"return": [["jerry": true]]}
```

The request body must be an array of commands. Use this workflow to build a command:
1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The client field is a reference to the main Python classes used in Salt's Python API. Read the full Client APIs documentation, but in short:

- "local" uses LocalClient which sends commands to Minions. Equivalent to the salt CLI command.
- "runner" uses RunnerClient which invokes runner modules on the Master. Equivalent to the salt-run CLI command.
- "wheel" uses WheelClient which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the key wheel module exposes similar functionality as the salt-key CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the full list of client interfaces.

Each client requires different arguments and sometimes has different syntax. For example, LocalClient requires the tgt argument because it forwards the command to Minions and the other client interfaces do not. LocalClient also takes arg (array) and kwarg (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. RunnerClient and WheelClient are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the test.arg execution function using LocalClient and the test.arg runner function using RunnerClient; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json' -d '"

21.10. netapi modules
One more example, this time with more commonly used functions:

curl -b /tmp/cookies.txt -sS -l localhost:8000 -H 'Content-type: application/json' -d '  [  {    "client": "local",    "tgt": "+",    "fun": "state.sls",    "kwarg": {      "mods": "apache",      "pillar": {        "lookup": {          "wwwdir": "/srv/httpd/htdocs"        }      }    }  },  {    "client": "runner",    "fun": "cloud.create",    "provider": "my-ec2-provider",    "instances": "my-centos-6",    "image": "ami-1624987f",    "delvol_on_destroy": true  }]
'
HTTP/1.1 200 OK
[...snip...]
{  "return": [    {      "jerry": {        "pkg_|-install_apache_|-httpd_|-installed": {"...snip..."}}}]}
Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the Content-Type header.
- Specify the desired data format for the response body with the Accept header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -ssik https://localhost:8000 \
  -b ~/cookies.txt \ 
  -d client=runner \ 
  -d fun='jobs.lookup_jid' \ 
  -d jid='20150129182456704682'
```

urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the arg parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., ?foo[]=fooone&foo[]=footwo. This is not supported; send ?foo=fooone&foo=footwo instead, or send JSON or YAML.

A note about curl

The -d flag to curl does not automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the --data-urlencode flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \ 
  -H "Accept: application/json" \ 
  -d username='myapiuser' \ 
  --data-urlencode password='1234+' \ 
  -d eauth='pam'
```
Performance Expectations and Recommended Usage

This module provides a thin wrapper around Salt's Python API. Executing a Salt command via rest_cherrypy is directly analogous to executing a Salt command via Salt's CLI (which also uses the Python API) -- they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn't do it at the CLI don't do it via this API.

Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own LocalClient, which instantiates its own listener to the Salt event bus, and sends out its own periodic saltutil.find_job queries to determine if a Minion is still running the command. Not exactly a lightweight operation.

Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. rest_cherrypy can be configured not to time-out long responses via the expire_responses setting, and both LocalClient and RunnerClient have their own timeout parameters that may be passed as top-level keywords:

```
curl -b /tmp/cookies.txt -ssI localhost:8000 -H 'Content-type: application/json' -d '
[
  {
    "client": "local",
    "tgt": ",",
    "fun": "test.sleep",
    "kwarg": {"length": 30},
    "timeout": 60
  },
  {
    "client": "runner",
    "fun": "test.sleep",
    "kwarg": {"s_time": 30},
    "timeout": 60
  }
]
'``
Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and salt-api is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt’s job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt’s `Returner system`.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt’s event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherrypy` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of `rest_cherrypy` to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As `salt-api` is a thin wrapper around Salt’s Python API, also keep an eye on the performance of Salt when testing.

Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in issue 26505, but until that issue is closed `rest_cherrypy` will remain the officially recommended REST API.

Deployment

The `rest_cherrypy` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

**salt-api using the CherryPy server**

The default configuration is to run this module using `salt-api` to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

**Using a WSGI-compliant web server**

This module may be deployed on any WSGI-compliant server such as Apache with mod_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherrypy` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:
<VirtualHost *:80>
  ServerName example.com
  ServerAlias *.example.com

  ServerAdmin webmaster@example.com

  LogLevel warn
  ErrorLog /var/www/example.com/logs/error.log
  CustomLog /var/www/example.com/logs/access.log combined

  DocumentRoot /var/www/example.com/htdocs

  WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>

REST URI Reference

/

class salt.netapi.rest_cherrypy.app.LowDataAdapter

The primary entry point to Salt's REST API

**GET()**

An explanation of the API with links of where to go next

**GET /**

Request Headers

- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

curl -i localhost:8000

Example response:

HTTP/1.1 200 OK
Content-Type: application/json

**POST**

Mock out specified imports.

This allows autodoc to do its thing without having oodles of req'd installed libs. This doesn't work with import * imports.

This Mock class can be configured to return a specific values at specific names, if required.

https://read-the-docs.readthedocs.io/en/latest/faq.html#i-get-import-errors-on-libraries-that-depend-on-c-modules
**/login**

class salt.netapi.rest_cherrypy.app.Login(*args, **kwargs)
Log in to receive a session token

*Authentication information.*

**GET()**
Present the login interface

**GET /login**
An explanation of how to log in.

**Status Codes**
- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
curl -i localhost:8000/login

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

Example response:
```
HTTP/1.1 200 OK
Content-Type: text/html
```

**POST(****kwargs**)

*Authenticate* against Salt's eauth system

**POST /login**
Request Headers
- **X-Auth-Token** -- a session token from Login.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Form Parameters
- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

**Status Codes**
- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
curl -si localhost:8000/login \
-c ~/cookies.txt \ 
-H "Accept: application/json" \ 
-H "Content-Type: application/json" \ 
-d '{
    "username": "saltuser",
    "password": "saltuser",
    "eauth": "auto"
}'
Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;
Path=/

{"return": {
    "token": "6d1b722e",
    "start": 1363805943.776223,
    "expire": 1363849143.776224,
    "user": "saltuser",
    "eauth": "pam",
    "perms": [
        "grains.*",
        "status.*",
        "sys.*",
        "test.*"
    ]
}}
```

/logout

class salt.netapi.rest_cherrypy.app.Logout

Class to remove or invalidate sessions

**POST()**

Destroy the currently active session and expire the session cookie

/minions

class salt.netapi.rest_cherrypy.app.Minions

Convenience URLs for working with minions

**GET(mid=None)**

A convenience URL for getting lists of minions or getting minion details

**GET /minions/(mid)**

Request Headers

- `X-Auth-Token` -- a session token from `Login`
- `Accept` -- the desired response format.

Status Codes

- `200` -- success
- `401` -- authentication required
- `406` -- requested Content-Type not available
curl -i localhost:8000/minions/ms-3

GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml
return:
- ms-3:
  grains.items:
  ...

POST(**kwargs)
Start an execution command and immediately return the job id

POST /minions
Request Headers
- **X-Auth-Token** -- a session token from Login.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Response Headers
- **Content-Type** -- the format of the response body; depends on the Accept request header.

Status Codes
- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The client option will be set to local_async().

Example request:
curl -sSi localhost:8000/minions \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -d '[{"tgt": "*", "fun": "status.diskusage"}]

POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json
tgt=*&fun=status.diskusage

Example response:
HTTP/1.1 202 Accepted
Content-Length: 86

(continues on next page)
/jobs

class salt.netapi.rest_cherrypy.app.Jobs

GET (jid=None, timeout="")
A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET /jobs/{jid}
List jobs or show a single job from the job cache.

Request Headers
- X-Auth-Token -- a session token from Login.
- Accept -- the desired response format.

Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

Example request:
curl -i localhost:8000/jobs

Example response:
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Target: jerry
  Target-type: glob

Example request:
curl -i localhost:8000/jobs/20121130104633606931
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
Minions:
- jerry
Target: '*'
Target-type: glob
User: saltdev
jid: '20121130104633606931'

return:
- jerry:
  - - 0
  - - 1
  - - 1
  - - 2
  - - 6.9141387939453125e-06

/run

class salt.netapi.rest_cherrypy.app.Run
Run commands bypassing the normal session handling.

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest_cherrypy simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the mk_token function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

POST(**kwargs)
Run commands bypassing the normal session handling. Otherwise, this URL is identical to the root URL (/).

POST /run
An array of lowstate data describing Salt commands must be sent in the request body.

Status Codes
- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available
Example request:

```bash
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \ 
-H 'Content-type: application/json' \ 
-d '][{
  "client": "local",
  "tgt": ":*",
  "fun": "test.ping",
  "username": "saltdev",
  "password": "saltdev",
  "eauth": "auto"
}]]' 
```

Or using a Salt Eauth token:

```bash
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \ 
-H 'Content-type: application/json' \ 
-d '][{
  "client": "local",
  "tgt": ":*",
  "fun": "test.ping",
  "token": "<salt eauth token here>"
}]]' 
```

Example response:

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[['"client": "local", "tgt": ":*", "fun": "test.ping", "username": "saltdev",
  "password": "saltdev", "eauth": "auto"]]
```

The /run endpoint can also be used to issue commands using the salt-ssh subsystem. When using salt-ssh, eauth credentials must also be supplied, and are subject to eauth access-control lists.

All SSH client requests are synchronous.

Example SSH client request:

```bash
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \ 
-d client='ssh' \
```

(continues on next page)
(continued from previous page)

```bash
-d tgt='*' \
-d username='saltdev' \
-d password='saltdev' \
-d eauth='auto' \
-d fun='test.ping'
```

POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

Example SSH response:

```
return:
- silver:
  _stamp: '2020-09-08T23:04:28.912609'
  fun: test.ping
  fun_args: []
  id: silver
  jid: '20200908230427905565'
  retcode: 0
  return: true
```

/events

class salt.netapi.rest_cherrypy.app.Events

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

GET (token=None, salt_token=None)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Query Parameters

- **token** -- optional parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g.,
  ```
curl -NsS localhost:8000/events?token=308650d
  ```
- **salt_token** -- optional parameter containing a raw Salt eauth token (not to be confused with the token returned from the /login URL). E.g.,
  ```
curl -NsS localhost:8000/events?salt_token=30742765
  ```
Example request:

curl -NsS localhost:8000/events

GET /events HTTP/1.1
Host: localhost:8000

Example response:

Note, the tag field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8
retry: 400
tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}
tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid': '20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}

The event stream can be easily consumed via JavaScript:

```javascript
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') }
source.onerror = function(err) { console.error(err) }
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream _before_ creating any events.
- Process SSE events directly as they arrive and don’t wait for any other process to “complete” first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt’s event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available adjacent to this file. It can be viewed by pointing a browser at the /app endpoint in a running rest_cherrypy instance.

Or using CORS:

```javascript
var source = new EventSource('/events?token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.
Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
   while IFS= read -r line ; do 
     echo $line 
   done
```

Here is an example of using awk to filter events based on tag:

```
curl -NsS localhost:8000/events | \
   awk ' 
     BEGIN { RS=""; FS="\n" } 
     $1 ~ /^tag: salt/job/\[[0-9]+/new$/ { print $0 } 
   ', 
   tag: salt/job/20140112010149808995/new
   data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob ↩", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions ↩": ["jerry"]}}
```

/`hook`

**class** `salt.netapi.rest_cherrypy.app.Webhook`
A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

**Note:** Be mindful of security
Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The `Content-Type` header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:
language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success
    → -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"

See also:

Events & Reactor, reactor

POST (*args, **kwargs)
Fire an event in Salt with a custom event tag and data

POST /hook
Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available
- 413 -- request body is too large

Example request:

curl -sS localhost:8000/hook \
    -H 'Content-type: application/json' \
    -d '{"foo": "Foo!", "bar": "Bar!"}'

Example response:

HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL https://localhost:8000/hook/mycompany/build/success which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

Event fired at Fri Feb 14 17:40:11 2014
******************************
Tag: salt/netapi/hook/mycompany/build/success
Data: 
  {'_stamp': '2014-02-14_17:40:11.440996',
   'headers': {
     'X-My-Secret-Key': 'F0fAgoQjIT@W',
     'Content-Length': '37',
     'Content-Type': 'application/json',
   
}}
Salt's Reactor could listen for the event:

```python
reactor:
  - 'salt/netapi/hook/mycompany/build/*':
    - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```python
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'  
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}
```

### /keys

**class salt.netapi.rest_cherrypy.app.Keys**

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

**GET(mid=None)**

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

**GET /keys/** *(mid)*

List all keys or show a specific key

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
    - master.pem
    - master.pub
  minions:
    - jerry
  minions_pre: []
  minions_rejected: []

Example request:

curl -i localhost:8000/keys/jerry

GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml

Example response:

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:

POST(**kwargs)
Easily generate keys for a minion and auto-accept the new key
Accepts all the same parameters as the key.gen_accept.

Note: A note about curl. Avoid using the -i flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```bash
%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
  -d mid=jerry \
  -d username=kickstart \
  -d password=kickstart \
  -d eauth=pam \n| tar -C /etc/salt/pki/minion -xf -
```
(continues on next page)
mkdir -p /etc/salt/minion.d
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end

POST /keys
Generate a public and private key and return both as a tarball
Authentication credentials must be passed in the request.

Status Codes
- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
curl -sSk https://localhost:8000/keys \
-d mid=jerry \
-d username=kickstart \
-d password=kickstart \
-d eauth=pam \
-o jerry-salt-keys.tar

Example response:
HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar
jerry.pub0000644000000000000000000000070300000000000000010730 0ustar 0
→0000000000000

/ws

class salt.netapi.rest_cherrypy.app.WebsocketEndpoint
Open a WebSocket connection to Salt's event bus
The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:

Events & Reactor

GET(token=None, **kwargs)
Return a websocket connection of Salt's event stream

GET /ws/(token)
Query format_events The event stream will undergo server-side formatting if the format_events URL parameter is included in the request. This can be useful to avoid formatting on the client-side:
curl -NsS <...snip...> localhost:8000/ws?format_events

Reqheader X-Auth-Token an authentication token from Login.
Status 101 switching to the websockets protocol
Status 401 authentication required
Status 406 requested Content-Type not available

Example request:

curl -NsSk \
-H 'X-Auth-Token: ffedf49d' \
-H 'Host: localhost:8000' \
-H 'Connection: Upgrade' \
-H 'Upgrade: websocket' \
-H 'Origin: https://localhost:8000' \
-H 'Sec-WebSocket-Version: 13' \
-H 'Sec-WebSocket-Key: "$(echo -n $RANDOM | base64)"' \
localhost:8000/ws

GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d

Example response:

HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13

An authentication token may optionally be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

curl -NsS <...snip...> localhost:8000/ws/ffedf49d

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };
source.send('websocket client ready');
source.close();
```

Or via Python, using the Python module websocket-client for example.

```python
# Note, you must be authenticated!
from websocket import create_connection
(continues on next page)```
Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

`/stats`

```python
ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()
ws.close()
```

21.10.2 rest_tornado

A non-blocking REST API for Salt

```
depends
- tornado Python module
```

**configuration** All authentication is done through Salt’s `external auth` system which requires additional configuration not described here.

In order to run rest_tornado with the salt-master add the following to the Salt master config file.

```
rest_tornado:
    # can be any port
    port: 8000
    # address to bind to (defaults to 0.0.0.0)
    address: 0.0.0.0
    # socket backlog
    backlog: 128
```
Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the `SaltAuthHandler` URL.

The token may be sent in one of two ways:

- Include a custom header named `X-Auth-Token`.
- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:

You can bypass the session handling via the `RunSaltAPIHandler` URL.

CORS

`rest_tornado` supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the `cors_origin` config key.

You can allow all origins by setting `cors_origin` to `*`.

You can allow only one origin with this configuration:

```
rest_tornado:
  cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
  cors_origin:
    - http://salt.yourcompany.com
    - http://salt-preprod.yourcampany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, `rest_tornado` will check if the Origin header is in the allowed list if it’s the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It’s complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.
Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the `Content-Type` header.
- Specify the desired data format for the response body with the `Accept` header.

Data sent in POST and PUT requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

**lowstate**  A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the `LocalClient()` Python API interface.

The following example (in JSON format) causes Salt to execute two commands:

```json
[
    {
        "client": "local",
        "tgt": ",",
        "fun": "test.fib",
        "arg": ["10"]
    },
    {
        "client": "runner",
        "fun": "jobs.lookup_jid",
        "jid": "20130603122505459265"
    }
]
```

Multiple commands in a Salt API request will be executed in serial and makes no guarantees that all commands will run. Meaning that if `test.fib` (from the example above) had an exception, the API would still execute "jobs.lookup_jid".

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
  ms-2: true
- ms-1: foo
  ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
  - ms-1: true
  - ms-2: true
```

**x-www-form-urlencoded**

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the `curl` command.
For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one, arg=two` will be sent as `arg[]=one, arg[]=two`. This is not supported; send JSON or YAML instead.

### A Websockets add-on to saltnado

```python
depends
  • tornado Python module
```

In order to enable saltnado_websockets you must add `websockets: True` to your saltnado config block.

```yaml
rest_tornado:
  # can be any port
  port: 8000
  ssl_crt: /etc/pki/api/certs/server.crt
  # no need to specify ssl_key if cert and key
  # are in one single file
  ssl_key: /etc/pki/api/certs/server.key
  debug: False
  disable_ssl: False
  websockets: True
```

### All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```bash
% curl -si localhost:8000/login
-H "Accept: application/json"
-d username='salt'
-d password='salt'
-d eauth='pam'
```

Which results in the response
In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!
// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/' + 'd0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); }; 

// Other handlers
source.onerror = function(e) { console.debug('error!', e); }; 

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); }; 

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the tornado client:

```python
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/' + 'd0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a self signed cert
```
Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt’s event stream by signaling **websocket client ready**.

**Formatted Events**

Exposes formatted "real-time" events from Salt’s event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` endpoint.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:
- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt’s presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```bash
% curl -si localhost:8000/login \
  -H "Accept: application/json" \
  -d username='salt' \
  -d password='salt' \
  -d eauth='pam'
```

Which results in the response

```json
{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}
```

In this example the `token` returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/' + d0ce6c1a37e99dcc0374392f272fe19c0090cca7);

// Get Salt's "real time" event stream.
```

(continues on next page)
source.onopen = function() { source.send('websocket client ready'); }; 

// Other handlers
source.onerror = function(e) { console.debug('error!', e); }; 

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); }; 

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```python
# Note, you must be authenticated!
from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
   →d0ce6c1a37e99d0c0374392f272fe19c00900c7a7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
   print ws.recv()  # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
   →self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling websocket client ready.

Example responses

Minion information is a dictionary keyed by each connected minion's id (mid), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- connection drops
  - requires running manage.present periodically every loop_interval seconds
- minion addition
- minion removal

```python
# Not all grains are shown
data: {
   "minions": {
```

(continues on next page)
Job information is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's jid.

```json
data: {
  "jobs": {
    "20140609153646699137": {
      "tgt_type": "glob",
      "jid": "20140609153646699137",
      "tgt": "*",
      "start_time": "2014-06-09T15:36:46.700315",
      "state": "complete",
      "fun": "test.ping",
      "minions": {
        "minion1": {
          "return": true,
          "retcode": 0,
          "success": true
        }
      }
    }
  }
}
```

Setup

REST URI Reference

- `/`
- `/login`
- `/minions`
- `/jobs`
- `/run`
- `/events`
- `/hook`
class salt.netapi.rest_tornado.saltnado.SaltAPIHandler(application, request, **kwargs)

Main API handler for base "/"

disbatch()
Disbatch all lowstates to the appropriate clients

get()
An endpoint to determine salt-api capabilities

GET /
Request Headers
- **Accept** -- the desired response format.

Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

Example request:
curl -i localhost:8000

GET / HTTP/1.1
Host: localhost:8000
Accept: application/json

Example response:
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 83

{"clients": ["local", "local_async", "runner", "runner_async"], "return": "Welcome"}

post()
Send one or more Salt commands (lowstates) in the request body

POST /
Request Headers
- **X-Auth-Token** -- a session token from SaltAuthHandler.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Response Headers
- **Content-Type** -- the format of the response body; depends on the Accept request header.

Status Codes
- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

lowstate data describing Salt commands must be sent in the request body.

Example request:
curl -si https://localhost:8000 \
  -H "Accept: application/x-yaml" \
  -H "X-Auth-Token: d40d1e1e" \
  -d client=local \
  -d tgt='*' \
  -d fun='test.ping' \
  -d arg

POST / HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
X-Auth-Token: d40d1e1e
Content-Length: 36
Content-Type: application/x-www-form-urlencoded

fun=test.ping&arg&client=local&tgt=*

Example response:

Responses are an in-order list of the lowstate's return data. In the event of an exception running a command the return will be a string instead of a mapping.

HTTP/1.1 200 OK
Content-Length: 200
Allow: GET, HEAD, POST
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true

multiple commands

Note that if multiple lowstate structures are sent, the Salt API will execute them in serial, and will not stop execution upon failure of a previous job. If you need to have commands executed in order and stop on failure please use compound-command-execution.

/login

class salt.netapi.rest_tornado.saltnado.SaltAuthHandler(application, request, **kwargs)

Handler for login requests

get()

All logins are done over post, this is a parked endpoint

GET /login

Status Codes
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
curl -i localhost:8000/login

GET /login HTTP/1.1
Host: localhost:8000
Accept: application/json

Example response:

HTTP/1.1 401 Unauthorized
Content-Type: application/json
Content-Length: 58

{"status": "401 Unauthorized", "return": "Please log in"}

post() Authenticate against Salt's eauth system

**POST /login**

Request Headers
- **X-Auth-Token** -- a session token from SaltAuthHandler.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Form Parameters
- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

Status Codes
- **200** -- success
- **400** -- bad request
- **401** -- authentication required
- **406** -- requested Content-Type not available
- **500** -- internal server error

Example request:

curl -si localhost:8000/login \
-H "Accept: application/json" \
-d username='saltuser' \
-d password='saltpass' \
-d eauth='pam'

POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/x-www-form-urlencoded
Accept: application/json
username=saltuser&password=saltpass&eauth=pam

Example response:

HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT; Path=/
/minions

```python
class salt.netapi.rest_tornado.saltnado.MinionSaltAPIHandler(application, request, **kwargs)
    
    A convenience endpoint for minion related functions

    get(mid=None)
    A convenience URL for getting lists of minions or getting minion details

    GET /minions/(mid)
    Request Headers
    • X-Auth-Token -- a session token from SaltAuthHandler.
    • Accept -- the desired response format.

    Status Codes
    • 200 -- success
    • 401 -- authentication required
    • 406 -- requested Content-Type not available

    Example request:
    curl -i localhost:8000/minions/ms-3

    GET /minions/ms-3 HTTP/1.1
    Host: localhost:8000
    Accept: application/x-yaml

    Example response:
    HTTP/1.1 200 OK
    Content-Length: 129005
    Content-Type: application/x-yaml

    return:
    - ms-3:
      grains.items:
      ...
```

```python
post()
Start an execution command and immediately return the job id

POST /minions
```
Request Headers
- **X-Auth-Token** -- a session token from *SaltAuthHandler*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Response Headers
- **Content-Type** -- the format of the response body; depends on the **Accept** request header.

Status Codes
- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

---

*lowstate* data describing Salt commands must be sent in the request body. The *client* option will be set to *local_async()*.

Example request:
```bash
curl -sSi localhost:8000/minions
   -H "Accept: application/x-yaml"
   -d tgt='*
   -d fun='status.diskusage'
```

Example response:
```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
```

---

### /jobs

**class** `salt.netapi.rest_tornado.saltnado.JobsSaltAPIHandler`(*application*, *request*, **kwargs)

A convenience endpoint for job cache data

**get**(jid=None)
A convenience URL for getting lists of previously run jobs or getting the return from a single job

**GET** /jobs/(jid)
List jobs or show a single job from the job cache.

Status Codes
- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:
**curl** -i localhost:8000/jobs

**GET /jobs HTTP/1.1**
Host: localhost:8000
Accept: application/x-yaml

**Example response:**

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Target: jerry
  Target-type: glob

**Example request:**

curl -i localhost:8000/jobs/20121130104633606931

**GET /jobs/20121130104633606931 HTTP/1.1**
Host: localhost:8000
Accept: application/x-yaml

**Example response:**

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
- jerry:
  - 0
  - 1
  - 1
  - 2
  - 6.9141387939453125e-06
class salt.netapi.rest_tornado.saltnado.RunSaltAPIHandler

Endpoint to run commands without normal session handling

post()

Run commands bypassing the normal session handling

POST /run

This entry point is primarily for "one-off" commands. Each request must pass full Salt authentication credentials. Otherwise this URL is identical to the root URL (/).

lowstate data describing Salt commands must be sent in the request body.

Status Codes

• 200 -- success
• 401 -- authentication required
• 406 -- requested Content-Type not available

Example request:

```bash
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-d client='local' \
-d tgt='*' \
-d fun='test.ping' \
-d username='saltdev' \
-d password='saltdev' \
-d eauth='pam'
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```
/events

class salt.netapi.rest_tornado.saltnado.EventsSaltAPIHandler(application, request, **kwargs)

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

get()

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- 200 -- success
- 401 -- authentication required
- 406 -- requested Content-Type not available

Example request:

curl -NsS localhost:8000/events

GET /events HTTP/1.1
Host: localhost:8000

Example response:

HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8
retry: 400

data: {'tag': '', 'data': {'minions': ['ms-4', 'ms-3', 'ms-2', 'ms-1', 'ms-0 →']}}

data: {'tag': '20130802115730568475', 'data': {'jid': '20130802115730568475', → 'return': True, 'retcode': 0, 'success': True, 'cmd': '_return', 'fun': → 'test.ping', 'id': 'ms-1'}}

The event stream can be easily consumed via JavaScript:

```javascript
// Note, you must be authenticated! -->
var source = new EventSource('/events');
source.onopen = function() { console.debug('opening') };
source.onerror = function(e) { console.debug('error!', e) };
source.onmessage = function(e) { console.debug(e.data) };
```

Or using CORS:

```javascript
var source = new EventSource('/events', {withCredentials: true});
```
Some browser clients lack CORS support for the EventSource() API. Such clients may instead pass the X-Auth-Token value as an URL parameter:

```
curl -NsS localhost:8000/events/6d1b722e
```

It is also possible to consume the stream via the shell. Records are separated by blank lines; the data: and tag: prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's -N flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | while IFS= read -r line ; do echo $line done
```

Here is an example of using awk to filter events based on tag:

```
curl -NsS localhost:8000/events | awk 'BEGIN { RS="\n"; FS="\"\" } $1 ~ /^tag: salt/job/\[0-9]+\//new\$/ { print $0 } "tag: salt/job/20140112010149808995/new data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12 01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions": ["jerry"]}}
```

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.
Salt Documentation, Release 3002.6

The event data is taken from the request body. The Content-Type header is respected for the payload.
The event tag is prefixed with salt/netapi/hook and the URL path is appended to the end. For example,
a POST request sent to /hook/mycompany/myapp/mydata will produce a Salt event with the tag salt/
netapi/hook/mycompany/myapp/mydata.
The following is an example .travis.yml file to send notifications to Salt of successful test runs:
language: python
script: python -m unittest tests
after_success:
- 'curl -sS http://saltapi-url.example.com:8000/hook/travis/build/success -d
,→branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"'

See also:
Events, Reactor
post(tag_suffix=None)
Fire an event in Salt with a custom event tag and data
POST /hook
Status Codes
• 200 -- success
• 401 -- authentication required
• 406 -- requested Content-Type not available
• 413 -- request body is too large
Example request:
curl -sS localhost:8000/hook -d foo='Foo!' -d bar='Bar!'
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/x-www-form-urlencoded
foo=Foo&bar=Bar!

Example response:
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json
{"success": true}

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL http://localhost:8000/hook/mycompany/build/success which contains the result of a build and the SHA of the version that was built as JSON. That would then produce
the following event in Salt that could be used to kick off a deployment via Salt's Reactor:
Event fired at Fri Feb 14 17:40:11 2014
*************************
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
'headers': {
'X-My-Secret-Key': 'F0fAgoQjIT@W',
(continues on next page)

3160

Chapter 21. Salt Module Reference


Salt’s Reactor could listen for the event:

```
reactor:
    - 'salt/netapi/hook/mycompany/build/*':
      - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %
{% set build = data.get('post', {}) %}
{% if secret_key == 'F0fAgQoQjIT@W' and build.result == True %}
deploy_my_app:
    cmd.state.sls:
        - tgt: 'application*'
        - arg:
            - myapp.deploy
            - kwarg:
                pillar:
                    revision: {{ revision }}
{% endif %}
```

### 21.10.3 rest_wsgi

A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt’s `external auth` system.

**Usage**

- All requests must be sent to the root URL (`/`).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

**See also:**

rest_cherrypy

The `rest_cherrypy` module is more full-featured, production-ready, and has builtin security features.
Deployment

The rest_wsgi netapi module is a standard Python WSGI app. It can be deployed one of two ways.

Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with mod_wsgi or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

salt-api using a development-only server

If run directly via the salt-api daemon it uses the wsgiref.simple_server() that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. This server does not use encryption; please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via salt-api is not recommended!

In order to start this module via the salt-api daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

Usage examples

**POST /**

Example request for a basic `test.ping`:

```
% curl -sS -i \
   -H 'Content-Type: application/json' \
   -d '\['"eauth":"pam","username":"saltdev","password":"saltdev","client":\"local","tgt":"*","fun":"test.ping"\']' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": ["ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": 0, "true"]}
```

Example request for an asynchronous `test.ping`:

```
% curl -sS -i \
   -H 'Content-Type: application/json' \
   -d '\['"eauth":"pam","username":"saltdev","password":"saltdev","client":\"local_async","tgt":"*","fun":"test.ping"\']' localhost:8001
```

Example response:
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2", "ms--1", "ms--0"]}]

Example request for looking up a job ID:

```
% curl -sS -i \
-H 'Content-Type: application/json' \
-d '[["eauth": "pam", "username": "saltdev", "password": "saltdev", "client": "runner", "fun": "jobs.lookup_jid", "jid": "20130412192112593739"]]' localhost:8001
```

Example response:

HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0": true}]

form lowstate A list of lowstate data appropriate for the client interface you are calling.

status 200 success
status 401 authentication required

### 21.11 output modules

Follow one of the below links for further information and examples

- **json** Display return data in JSON format
- **highstate** Outputter for displaying results of state runs
- **json_out** Display return data in JSON format
- **key** Display salt-key output
- **nested** Recursively display nested data
- **newline_values_only** Display values only, separated by newlines
- **no_out Quiet** Display no output
- **no_return** Display output for minions that did not return
- **overstateStage** Display clean output of an overstate stage
- **pony** Display Pony output data structure
- **pprint_out** Python pretty-print (pprint)
- **profile** Display profiling data in a table format
- **progress** Display return data as a progress bar
- **raw** Display raw output data structure
- **table_out** Display output in a table format
- **txt** Simple text outputter
- **virt_query** virt.query outputter
- **yaml_out** Display return data in YAML format
21.11.1 salt.output.dson

Display return data in DSON format

This outputter is intended for demonstration purposes. Information on the DSON spec can be found here. This outputter requires Dogeon (installable via pip)

```
salt.output.dson.output(data, **kwargs)
```

Print the output data in JSON

21.11.2 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

**state_verbose** By default `state_verbose` is set to `True`, setting this to `False` will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of `True` and no changes will not be printed

**state_output:** The highstate outputter has six output modes, `full`, `terse`, `mixed`, `changes` and `filter`

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`.
  - For `exclude`, state.highstate expects a list of states to be excluded (or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: `exclude=True`.
  - For `terse`, state.highstate expects simply `True` or `False`.

These can be set as such from the command line, or in the Salt config as `state_output_exclude` or `state_output_terse`, respectively.

The output modes have one modifier:

```
full_id, terse_id, mixed_id, changes_id and filter_id
```

If `_id` is used, then the corresponding form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.

**state_tabular:** If `state_output` uses the terse output, set this to `True` for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If `state_output: filter` is set in the configuration file:
salt '*' state.highstate exclude=None,True

means to exclude no states from the highstate and turn on terse output.

salt twd state.highstate exclude=problemstate1,problemstate2,False

means to exclude states problemstate1 and problemstate2 from the highstate, and use regular output.

Example output for the above highstate call when top.sls defines only one other state to apply to minion twd:

twd:
Summary for twd
-----------
Succeeded: 1 (changed=1)
Failed: 0
-----------
Total states run: 1

Example output with no special settings in configuration files:

myminion:
----------
   ID: test.ping
   Function: module.run
   Result: True
   Comment: Module function test.ping executed
   Changes: 
   -----------
   ret:
       True

Summary for myminion
----------
Succeeded: 1
Failed: 0
----------
Total: 0

salt.output.highstate.output(data, **kwargs)
The HighState Outputer is only meant to be used with the state.highstate function, or a function that returns highstate return data.

21.11.3 salt.output.json_out

Display return data in JSON format

configuration The output format can be configured in two ways: Using the --out-indent CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the output-indent setting in the Master or Minion configuration file with one of the following values:

- Null: put each minion return on a single line.
- pretty: use four-space indents and sort the keys.
• An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

CLI Example:

```
salt '*' foo.bar --out=json
```

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

CLI Example:

```
salt '*' foo.bar --out=json
```

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

CLI Example:

```
salt '*' foo.bar --out=json
```

### 21.11.4 salt.output.key

Display salt-key output

The salt-key command makes use of this outputter to format its output.

```
salt.output.key.output(data, **kwargs)
```

Read in the dict structure generated by the salt key API methods and print the structure.

### 21.11.5 salt.output.nested

Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```
myminion:
  --
  foo:
    --
    bar:
      baz
    dictionary:
      --
      abc:
        123
      def:
        456
    list:
      Hello
      World
```

```
**class** salt.output.nested.NestDisplay(*retcode=0*)
Manage the nested display contents

**display**(ret, indent, prefix, out)
Recursively iterate down through data structures to determine output

**ustring**(indent, color, msg, prefix='', suffix='', endc=None)

salt.output.nested.output(ret, **kwargs)
Display ret data

### 21.11.6 salt.output.newline_values_only

Display values only, separated by newlines

New in version 2015.5.0.

This outputer is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion’s values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

**Warning:** As noted above, this outputer will discard the minion ID. If the minion ID is important, then an outputer that returns the full return dictionary in a parsable format (such as json, pprint, or yaml) may be more suitable.

### Example 1

salt '*' foo.bar --out=newline_values_only

**Input**

```python
{
    'myminion': ['127.0.0.1', '10.0.0.1'],
    'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

**Output**

```bash
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```
Example 2

```bash
salt '*' foo.bar --out=newline_values_only
```

Input

```json
{
    'myminion': 8,
    'second-minion': 10
}
```

Output

```
8
10
```

```python
salt.output.newline_values_only.output(data, **kwargs)
  Display modified ret data
```

21.11.7 salt.output.no_out_quiet

Display no output

No output is produced when this outputter is selected

CLI Example:

```bash
salt '*' foo.bar --out=quiet
```

```python
salt.output.no_out_quiet.output(ret, **kwargs)
  Don't display data. Used when you only are interested in the return.
```

21.11.8 salt.output.no_return

Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
  Minion did not return
```

```python
class salt.output.no_return.NestDisplay
  Create generator for nested output
    display(ret, indent, prefix, out)
      Recursively iterate down through data structures to determine output
```
salt.output.no_return.output(ret, **kwargs)
   Display ret data

21.11.9 salt.output.overstatestage

Display clean output of an overstate stage

This outtputer is used to display Orchestrate Runner stages, and should not be called directly.

salt.output.overstatestage.output(data, **kwargs)
   Format the data for printing stage information from the overstate system

21.11.10 salt.output.pony module

Display Pony output data structure

   depends
      • ponysay CLI program

Display output from a pony. Ponies are better than cows because everybody wants a pony.

Example output:

```python
< {'local': True} >
```

CLI Example:

```
salt '*' foo.bar --out=pony
```

salt.output.pony.output(data, **kwargs)
   Mane function
21.11.11 salt.output.pprint_out

Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint.pformat` and prints the results.

CLI Example:

```
salt '*' foo.bar --out=pprint
```

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
                      'dictionary': {'abc': 123, 'def': 456},
                      'list': ['Hello', 'World']}}}
```

```
salt.output.pprint_out.output(data, **kwargs)
    Print out via pretty print
```

21.11.12 salt.output.profile

Display profiling data in a table format

Show profile data for returners that would normally show a highstate output.

CLI Example:

```
salt '*' state.apply something --out=profile
```

Attempt to output the returns of state.sls and state.highstate as a table of names, modules and durations that looks somewhat like the following:

```
<table>
<thead>
<tr>
<th>name</th>
<th>mod. fun</th>
<th>duration (ms)</th>
</tr>
</thead>
<tbody>
<tr>
<td>I-fail-unless-stmt</td>
<td>other.function</td>
<td>-1.0000</td>
</tr>
<tr>
<td>old-minion-config</td>
<td>grains.list_present</td>
<td>1.1200</td>
</tr>
<tr>
<td>salt-data</td>
<td>group.present</td>
<td>48.3800</td>
</tr>
<tr>
<td>/etc/salt/minion</td>
<td>file.managed</td>
<td>63.1450</td>
</tr>
</tbody>
</table>
```

To get the above appearance, use settings something like these:

```
out.table.separate_rows: False
out.table.justify: 'left
out.table.delim: ''
out.table.prefix: ''
out.table.suffix: ''
```

```
salt.output.profile.output(data, **kwargs)
    Display the profiling data in a table format.
```
21.11.13 salt.output.progress

Display return data as a progress bar

```python
salt.output.progress.output(ret, bar, **kwargs)
```

Update the progress bar

```python
salt.output.progress.progress_iter(progress)
```

Initialize and return a progress bar iter

21.11.14 salt.output.raw

Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the pprint outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

CLI Example:

```bash
salt '*' foo.bar --out=raw
```

Example output:

```
salt '*' foo.bar --out=table
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': 123, 'def': 456}}}}
```

```python
salt.output.raw.output(data, **kwargs)
```

Rather basic....

21.11.15 salt.output.table_out

Display output in a table format

New in version 2017.7.0.

The table outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
----------
comment:
----------
out:
----------
```

<table>
<thead>
<tr>
<th>Active</th>
<th>Interface</th>
<th>Last Move</th>
<th>Mac</th>
<th>Moves</th>
<th>Static</th>
<th>Vlan</th>
</tr>
</thead>
<tbody>
<tr>
<td>True</td>
<td>ae1.900</td>
<td>0.0</td>
<td>40:A6:77:5A:50:01</td>
<td>0</td>
<td>False</td>
<td>111</td>
</tr>
<tr>
<td>True</td>
<td>ae1.111</td>
<td>0.0</td>
<td>64:16:8D:32:26:58</td>
<td>0</td>
<td>False</td>
<td>111</td>
</tr>
<tr>
<td>True</td>
<td>ae1.111</td>
<td>0.0</td>
<td>8C:60:4F:73:2D:57</td>
<td>0</td>
<td>False</td>
<td>111</td>
</tr>
</tbody>
</table>

(continues on next page)
CLI Example:
```
salt '!' foo.bar --out=table
```

```python
class salt.output.table_out.TableDisplay(has_header=True, row_delimiter='-', delim=' | ', justify='center', separate_rows=True, prefix='| ', suffix=' | ', width=50, wrapfunc=None)

Manage the table display content.

display(ret, indent, out, rows_key=None, labels_key=None)
    Display table(s).

display_rows(rows, labels, indent)
    Prepares row content and displays.

prepare_rows(rows, indent, has_header)
    Prepare rows content to be displayed.

ustring(indent, color, msg, prefix='', suffix='', endc=None)
    Build the unicode string to be displayed.

wrap_onspace(text)
    When the text inside the column is longer then the width, will split by space and continue on the next line.

salt.output.table_out.output(ret, **kwargs)
    Display the output as table.
```

Parameters

- `nested_indent(*)` -- integer, specify the left alignment.
- `has_header(*)` -- boolean specifying if header should be displayed. Default: True.
- `row_delimiter(*)` -- character to separate rows. Default: `-`.
- `delim(*)` -- character to separate columns. Default: `" | "`.
- `justify(*)` -- text alignment. Default: `center`.
- `separate_rows(*)` -- boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- `prefix(*)` -- character at the beginning of the row. Default: `"| "`.
- `suffix(*)` -- character at the end of the row. Default: `"| "`.
- `width(*)` -- column max width. Default: 50.
- `rows_key(*)` -- display the rows under a specific key.
- `labels_key(*)` -- use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- `title(*)` -- display title when only one table is selected (using the `rows_key` argument).
21.11.16 salt.output.txt

Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

CLI Example:

```bash
salt '*' foo.bar --out=txt
```

```python
salt.output.txt.output(data, **kwargs)
    Output the data in lines, very nice for running commands
```

21.11.17 salt.output.virt_query

virt.query outputter

Used to display the output from the virt.query runner.

```python
salt.output.virt_query.output(data, **kwargs)
    Display output for the salt-run virt.query function
```

21.11.18 salt.output.yaml_out

Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

CLI Example:

```bash
salt '*'foo.bar --out=yaml
```

Example output:

```yaml
saltmine:
  foo:
    bar: baz
  dictionary:
    abc: 123
    def: 456
  list:
    - Hello
    - World
```

```python
salt.output.yaml_out.output(data, **kwargs)
    Print out YAML using the block mode
```
21.12 pillar modules

<table>

21.12.1 salt.pillar.azureblob

Use Azure Blob as a Pillar source.

New in version 3001.

maintainer  <devops@eitr.tech>
maturity  new
depends

- azure-storage-blob >= 12.0.0

The Azure Blob ext_pillar can be configured with the following parameters:

```
ext_pillar:
  - azureblob:
      container: 'test_container'
      connection_string: 'connection_string'
      multiple_env: False
      environment: 'base'
      blob_cache_expire: 30
      blob_sync_on_update: True
```

- **param container**  The name of the target Azure Blob Container.
- **param connection_string**  The connection string to use to access the specified Azure Blob Container.
- **param multiple_env**  Specifies whether the pillar should interpret top level folders as pillar environments. Defaults to false.
- **param environment**  Specifies which environment the container represents when in single environment mode. Defaults to 'base' and is ignored if multiple_env is set as True.
- **param blob_cache_expire**  Specifies expiration time of the Azure Blob metadata cache file. Defaults to 30s.
- **param blob_sync_on_update**  Specifies if the cache is synced on update. Defaults to True.
salt.pillar.azureblob.ext_pillar(minion_id, pillar, container, connection_string, multiple_env=False, environment='base', blob_cache_expire=30, blob_sync_on_update=True)

Execute a command and read the output as YAML.

Parameters
- container -- The name of the target Azure Blob Container.
- connection_string -- The connection string to use to access the specified Azure Blob Container.
- multiple_env -- Specifies whether the pillar should interpret top level folders as pillar environments. Defaults to false.
- environment -- Specifies which environment the container represents when in single environment mode. Defaults to 'base' and is ignored if multiple_env is set as True.
- blob_cache_expire -- Specifies expiration time of the Azure Blob metadata cache file. Defaults to 30s.
- blob_sync_on_update -- Specifies if the cache is synced on update. Defaults to True.

21.12.2 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

salt.pillar.cmd_json.ext_pillar(minion_id, pillar, command)

Execute a command and read the output as JSON

21.12.3 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

salt.pillar.cmd_yaml.ext_pillar(minion_id, pillar, command)

Execute a command and read the output as YAML

21.12.4 salt.pillar.cmd_yamlex

Execute a command and read the output as YAMLEX.

The YAMLEX data is then directly overlaid onto the minion's Pillar data

salt.pillar.cmd_yamlex.ext_pillar(minion_id, pillar, command)

Execute a command and read the output as YAMLEX
21.12.5 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

Configuring the Cobbler ext_pillar

The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```yaml
- cobbler:
  key: cobbler  # Nest results within this key. By default, values are not nested.
  only: [parameters]  # Add only these keys to pillar.

  cobbler.url: https://example.com/cobbler_api  # default is http://localhost/cobbler_api
  cobbler.user: username  # default is no username
  cobbler.password: password  # default is no password
```

Module Documentation

salt.pillar.cobbler.ext_pillar(minion_id, pillar, key=None, only=())

Read pillar data from Cobbler via its API.

21.12.6 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via ext_pillar in the minion config:

```yaml
ext_pillar:
  • confidant:
    profile:  # The URL of the confidant web service
    url: https://example.com/confidant  # default is http://example.com/confidant
    # The context to use for KMS authentication
    auth_context: from: example-production-iad to: example-production-iad
    # The KMS master key to use for authentication
    auth_key: "alias/authnz"
    # Cache file for KMS auth token
    token_cache_file: /run/confidant/confidant_token
    # The duration of the validity of a token, in minutes
    token_duration: 60
    # key, keyid and region can be defined in the profile, but it’s generally best to use IAM roles or environment variables for AWS
    # keyid: 98nh9h9h908h09kjjk
    # key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
    # region: us-east-1

depends confidant-common, confidant-client
```
Module Documentation

salt.pillar.confidant.ext_pillar(minion_id, pillar, profile=None)
Read pillar data from Confidant via its API.

21.12.7 salt.pillar.consul_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

depends
  • python-consul

In order to use an consul server, a profile must be created in the master configuration file:

```yaml
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consulscheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The `consul.token` requires python-consul >= 0.4.7.

If you have a multi-datacenter Consul cluster you can map your pillarenv entries to your data centers by providing a dictionary of mappings in `consul.dc` field:

```yaml
my_consul_config:
  consul.dc:
    dev: us-east-1
    prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for dev and prod Pillar environments will be fetched from us-east-1 and us-west-1 datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```yaml
my_consul_config:
  consul.dc:
    ^dev-.+: dev-datacenter
    ^(?P<region>.+)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with dev- to dev-datacenter whereas Pillar environment like eu-prod will be mapped to prod-datacenter-eu.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```yaml
my_consul_config:
  consul.dc:
    ^(?P<env>.+)$: '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.
Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
  - consul: my_consul_config
  - consul: my_other_consul_config
```

Either the minion_id, or the role, or the environment grain may be used in the root path to expose minion-specific information stored in consul:

```
ext_pillar:
  - consul: my_consul_config root=salt/%(minion_id)s
  - consul: my_consul_config root=salt/%(role)s
  - consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - consul: my_consul_config root=salt-shared
  - consul: my_other_consul_config root=salt-private/%(minion_id)s
```

If using the role or environment grain in the consul key path, be sure to define it using /etc/salt/grains, or similar:

```
role: my-minion-role
environment: dev
```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```
ext_pillar:
  - consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"
```

The data from Consul can be merged into a nested key in Pillar.

```
ext_pillar:
  - consul: my_consul_config pillar_root=consul_data
```

By default, keys containing YAML data will be deserialized before being merged into Pillar. This behavior can be disabled by setting expand_keys to false.

```
ext_pillar:
  - consul: my_consul_config expand_keys=false
```

---

**salt.pillar.consul_pillar**

- **consul_fetch**(client, path)
  
  Query consul for all keys/values within base path

- **ext_pillar**(minion_id, pillar, conf)
  
  Check consul for all data

- **fetch_tree**(client, path, expand_keys)
  
    Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.
salt.pillar.consul_pillar.get_conn(opts, profile)
    Return a client object for accessing consul

salt.pillar.consul_pillar.pillar_format(ret, keys, value, expand_keys)
    Perform data formatting to be used as pillar data and merge it with the current pillar data

## 21.12.8 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```yaml
ext_pillar:
  - csv: /path/to/file.csv

# or
ext_pillar:
  - csv:
      path: /path/to/file.csv
      namespace: 'subkey'
      fieldnames:
        - col1
        - col2
```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

<table>
<thead>
<tr>
<th>id</th>
<th>role</th>
<th>env</th>
</tr>
</thead>
<tbody>
<tr>
<td>jerry</td>
<td>web</td>
<td>prod</td>
</tr>
<tr>
<td>stuart</td>
<td>web</td>
<td>stage</td>
</tr>
<tr>
<td>dave</td>
<td>web</td>
<td>qa</td>
</tr>
<tr>
<td>phil</td>
<td>db</td>
<td>prod</td>
</tr>
<tr>
<td>kevin</td>
<td>db</td>
<td>stage</td>
</tr>
<tr>
<td>mike</td>
<td>db</td>
<td>qa</td>
</tr>
</tbody>
</table>

Will produce the following Pillar values for a minion named “jerry”:

```yaml
{       
  'role': 'web',  
  'env': 'prod',  
}
```

salt.pillar.csvpillar.ext_pillar(mid, pillar, path, idkey='id', namespace=None, fieldnames=None, restkey=None, restval=None, dialect='excel')

Read a CSV into Pillar

Parameters

- `path` *(str)* -- Absolute path to a CSV file.
- `idkey` *(str)* -- (Optional) The column name of minion IDs.
- `namespace` *(str)* -- (Optional) A pillar key to namespace the values under.
- `fieldnames` *(list)* -- (Optional) if the first row of the CSV is not column names they may be specified here instead.
21.12.9 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the digicert runner module has already been used to create certificates.

To configure this module, set digicert to True in the ext_pillar section of your master configuration file:

```yaml
ext_pillar:
  - digicert: True

salt.pillar.digicert.ext_pillar(minion_id, pillar, conf)
  Return an existing set of certificates
```

21.12.10 salt.pillar.django_orm

Generate Pillar data from Django models through the Django ORM

maintainer Micah Hausler <micah.hausler@gmail.com>
maturity new

Configuring the django_orm ext_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project’s requirements installed.

```yaml
ext_pillar:
  - django_orm:
      pillar_name: my_application
      project_path: /path/to/project/
      settings_module: my_application.settings
      env_file: /path/to/env/file.sh
      # Optional: If your project is not using the system python, add your virtualenv path below.
      env: /path/to/virtualenv/

    django_app:
      # Required: the app that is included in INSTALLED_APPS
      my_application.clients:
        # Required: the model name
        Client:
          # Required: model field to use as the key in the rendered Pillar. Must be unique; must also be included in the `fields` list below.
          name: shortname
          # Optional:
          # See Django’s QuerySet documentation for how to use .filter()
          filter: {'kw': 'args'}

          # Required: a list of field names
          # List items will be used as arguments to the .values() method.
          # See Django’s QuerySet documentation for how to use .values()
```

(continues on next page)
This would return pillar data that would look like

```
my_application:
    my_application.clients:
        Client:
            client_1:
                field_1: data_from_field_1
                field_2: data_from_field_2
            client_2:
                field_1: data_from_field_1
                field_2: data_from_field_2
```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```
ext_pillar:
    - django ORM:
        pillar_name: djangotutorial
        project_path: /path/to/mysite
        settings_module: mysite.settings

        django app:
            mysite.polls:
                Choices:
                    name: poll__question
                    fields:
                        - poll__question
                        - poll__id
                        - choice_text
                        - votes
```

Module Documentation

```
salt.pillar.django_orm.ext_pillar(minion_id, pillar, pillar_name, project_path, settings_module, django_app, env=None, env_file=None, *args, **kwargs)
```

Connect to a Django database through the ORM and retrieve model fields

**Parameters**

- `pillar_name (str)` -- The name of the pillar to be returned
- `project_path (str)` -- The full path to your Django project (the directory manage.py is in)
- `settings_module (str)` -- The settings module for your project. This can be found in your manage.py file
- `django_app (str)` -- A dictionary containing your apps, models, and fields
- `env (str)` -- The full path to the virtualenv for your Django project
- `env_file (str)` -- An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added
21.12.11 salt.pillar.ec2_pillar

Retrieve EC2 instance data for minions for ec2_tags and ec2_tags_list

The minion id must be the AWS instance-id or value in tag_match_key. For example set tag_match_key to Name to have the minion-id matched against the tag 'Name'. The tag contents must be unique. The value of tag_match_value can be 'uqdn' or 'asis'. If 'uqdn', then the domain will be stripped before comparison.

Additionally, the use_grain option can be set to True. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

**Note:** If you are using use_grain: True in the configuration for this external pillar module, the minion must have metadata_server_grains enabled in the minion config file (see also here).

It is important to also note that enabling the use_grain option allows the minion to manipulate the pillar data returned, as described above.

The optional tag_list_key indicates which keys should be added to ec2_tags_list and be split by tag_list_sep (by default ;). If a tag key is included in tag_list_key it is removed from ec2_tags. If a tag does not exist it is still included as an empty list.

..note:: As with any master configuration change, restart the salt-master daemon for changes to take effect.

```
ext_pillar:
  - ec2_pillar:
    tag_match_key: 'Name'
tag_match_value: 'asis'
tag_list_key:
    - Role
tag_list_sep: ';
use_grain: True
minion_ids:
  - trusted-minion-1
  - trusted-minion-2
  - trusted-minion-3
```

This is a very simple pillar configuration that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

salt.pillar.ec2_pillar.ext_pillar( minion_id, pillar, use_grain=False, minion_ids=None, tag_match_key=None, tag_match_value='asis', tag_list_key=None, tag_list_sep=';')

Execute a command and read the output as YAML

21.12.12 salt.pillar.etcd_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

depends

- python-etcd

In order to use an etcd server, a profile must be created in the master configuration file:

salt.pillar.etcd_pillar
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

ext_pillar:
  - etcd: my_etcd_config

ext_pillar:
  - etcd: my_etcd_config root=/salt

Using these configuration profiles, multiple etcd sources may also be used:

ext_pillar:
  - etcd: my_etcd_config
  - etcd: my_other_etcd_config

The minion_id may be used in the root path to expose minion-specific information stored in etcd.

ext_pillar:
  - etcd: my_etcd_config root=/salt/%(minion_id)s

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

ext_pillar:
  - etcd: my_etcd_config root=/salt-shared
  - etcd: my_other_etcd_config root=/salt-private/%(minion_id)s

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value

salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)
  Check etcd for all data

21.12.13 salt.pillar.extra_minion_data_in_pillar

Add all extra minion data to the pillar.

codeauthor Alexandru.Bleotu@morganstanley.ms.com

One can filter on the keys to include in the pillar by using the include parameter. For subkeys the ':' notation is supported (i.e. 'key:subkey') The keyword <all> includes all keys.
Complete example in etc/salt/master

```
ext_pillar:
  - extra_minion_data_in_pillar:
    include: *

ext_pillar:
  - extra_minion_data_in_pillar:
    include:
      - key1
      - key2: subkey2

ext_pillar:
  - extra_minion_data_in_pillar:
    include: <all>
```

salt.pillar.extra_minion_data_in_pillar.ext_pillar(minion_id, pillar, include, extra_minion_data=None)

### 21.12.14 salt.pillar.file_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

**Note:** This is an external pillar and is subject to the rules and constraints governing external pillars.

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

#### Example file_tree Pillar

**Master Configuration**

```
ext_pillar:
  - file_tree:
    root_dir: /srv/ext_pillar
    follow_dir_links: False
    keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to False. If `follow_dir_links` is set to True, this external pillar will follow symbolic links to other directories.

**Warning:** Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.
If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```yaml
ext_pillar:
  - file_tree:
      root_dir: /path/to/root/directory
      keep_newline:
        - files/testdir/*
```

**Note:** In earlier releases, this documentation incorrectly stated that binary files would not affect the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```yaml
ext_pillar:
  - file_tree:
      root_dir: /path/to/root/directory
      render_default: jinja|yaml
      renderer_blacklist:
        - gpg
      renderer_whitelist:
        - jinja
      - yaml
      template: True
```

### Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```bash
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```yaml
test-host:
  ----------
  apache:
```

(continues on next page)
config.d:

00_important.conf:
    <important_config important_setting="yes" />
20_bob_extra.conf:
    <bob_specific_cfg has_freeze_ray="yes" />

corporate_app:

settings:

common_settings:
    // This is the main settings file for the corporate
    // internal web app
    main_setting: probably

bob_settings:
    role: bob

Note: The leaf data in the example shown is the contents of the pillar files.

salt.pillar.file_tree.ext_pillar(minion_id, pillar, root_dir=None, follow_dir_links=False, debug=False, keep_newline=False, render_default=None, renderer_blacklist=None, renderer_whitelist=None, template=False)

Compile pillar data from the given root_dir specific to Nodegroup names and Minion IDs.

If a Minion’s ID is not found at <root_dir>/host/<minion_id> or if it is not included in any Nodegroups named at <root_dir>/nodegroups/<node_group>, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

template must be set to True for templating to happen.

Parameters

- minion_id -- The ID of the Minion whose pillar data is to be collected
- pillar -- Unused by the file_tree pillar module
- root_dir -- Filesystem directory used as the root for pillar data (e.g. /srv/ext_pillar)

Changed in version 2018.3.0: If root_dir is a relative path, it will be treated as relative to the pillar_roots of the environment specified by pillarenv. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.
• **follow_dir_links** -- Follow symbolic links to directories while collecting pillar files. Defaults to False.

Warning: Care should be exercised when enabling this option as it will follow links that point outside of root_dir.

Warning: Symbolic links that lead to infinite recursion are not filtered.

• **debug** -- Enable debug information at log level debug. Defaults to False. This option may be useful to help debug errors when setting up the file_tree pillar module.

• **keep_newline** -- Preserve the end-of-file newline in files. Defaults to False. This option may either be a boolean or a list of file globs (as defined by the Python fnmatch package) for which end-of-file newlines are to be kept.

keep_newline should be turned on if the pillar data is intended to be used to deploy a file using contents_pillar with a file.managed state.

Changed in version 2015.8.4: The raw_data parameter has been renamed to keep_newline. In earlier releases, raw_data must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the root_dir.

```
ext_pillar:
  - file_tree:
    root_dir: /srv/ext_pillar
    keep_newline:
      - apache/config.d/*
      - corporate_app/settings/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not affected by the keep_newline. However, this module does not actually distinguish between binary and text files.

• **render_default** -- Override Salt’s default global renderer for the file_tree pillar.

```
render_default: jinja
```

• **renderer_blacklist** -- Disallow renderers for pillar files.

```
renderer_blacklist:
  - json
```

• **renderer_white_list** -- Allow renderers for pillar files.

```
renderer_white_list:
  - yaml
  - jinja
```

• **template** -- Enable templating of pillar files. Defaults to False.
21.12.15 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

Configuring the Foreman ext_pillar

Set the following Salt config to setup Foreman as external pillar source:

```yaml
ext_pillar:
  - foreman:
      key: foreman  # Nest results within this key
      only: [hostgroup_name, 'parameters']  # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username  # default is admin
foreman.password: password  # default is changeme
```

The following options are optional:

```yaml
foreman.api: apiversion  # default is 2 (1 is not supported yet)
foreman.verifyssl: False  # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem  # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem  # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem  # default is None
foreman.lookup_parameters: True  # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on GitHub.

Module Documentation

salt.pillar.foreman.ext_pillar(minion_id, pillar, key=None, only=())

Read pillar data from Foreman via its API.

21.12.16 salt.pillar.git_pillar

Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since git_pillar does not have an equivalent to the pillar_roots parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```yaml
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.
**Important:** Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring States. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the qa branch is to be used for `git_pillar`, it would need to have its own top file, with the qa environment defined within it, like this:

```plaintext
qa:
  'dev-*':
    - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see here), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

### Configuring `git_pillar` for Salt

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described here.

**Important:** `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt’s `git` backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See here for documentation on the `git_pillar` configuration options and their usage.

Here is an example `git_pillar` configuration:

```plaintext
ext_pillar:
  - git:
      # Use 'prod' instead of the branch name 'production' as the environment
      - production https://gitserver/git-pillar.git:
          - env: prod
      # Use 'dev' instead of the branch name 'develop' as the environment
      - develop https://gitserver/git-pillar.git:
          - env: dev
      # No per-remote config parameters (and no trailing colon), 'qa' will
      # be used as the environment
      - qa https://gitserver/git-pillar.git
      # SSH key authentication
      - master git@other-git-server:pillardata-ssh.git:
          # Pillar SLS files will be read from the 'pillar' subdirectory in
          # this repository
          - root: pillar
          - privkey: /path/to/key
          - pubkey: /path/to/key.pub
          - passphrase: CorrectHorseBatteryStaple
      # HTTPS authentication
      - master https://other-git-server/pillardata-https.git:
          - user: git
          - password: CorrectHorseBatteryStaple
```
The main difference between this and the old way of configuring git_pillar is that multiple remotes can be configured under one git section under `ext_pillar`. More than one git section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to `gitfs`), and global versions of the git_pillar configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
  - git:
    - production https://gitserver/git-pillar.git:
      - env: prod
```

If `__env__` is specified as the branch name, then git_pillar will decide which branch to use based on the following criteria:

- If the minion has a `pillarenv` configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's `git_pillar_base` will be used.

Note: The use of `environment` to choose the pillar environment dates from a time before the `pillarenv` parameter was added. In a future release, it will be ignored and either the minion’s `pillarenv` or the master’s `git_pillar_base` will be used.

Here’s an example of using `__env__` as the git_pillar environment:

```
ext_pillar:
  - git:
    - __env__ https://gitserver/git-pillar.git:
      - root: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
  '*':
    - bar
```

With the addition of `pygit2` support, git_pillar can now interact with authenticated remotes. Authentication works just like in gitfs (as outlined in the `Git Fileserver Backend Walkthrough`), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

Note: The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.
How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git` `ext_pillar` configuration. Consider the following:

```yaml
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

ext_pillar:
  etcd: my_etcd_config
  git:
    - master https://mydomain.tld/foo.git:
      root: pillar
    - master https://mydomain.tld/bar.git
    - master https://mydomain.tld/baz.git
    - dev https://mydomain.tld/qux.git
    - git:
      - master https://mydomain.tld/abc.git
      - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each `ext_pillar` is called separately from the others. So, in the above example, the `etcd` `ext_pillar` will be evaluated first, with the first group of `git_pillar` remotes evaluated next (and merged into the `etcd` pillar data). Lastly, the second group of `git_pillar` remotes will be evaluated, and then merged into the `ext_pillar` data evaluated before it.

2. Within a single group of `git_pillar` remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

   **Note:** Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of `git_pillar` remotes, the top file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environment? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a `pillarenv` in the `minion` config file will make that minion tell the master to ignore any pillar data from environments which don't match that pillarenv. A pillarenv can also be specified for a given minion or set of minions when `running states`, by using the `pillarenv` argument. The CLI pillarenv will override one set in the `minion` config file. So, assuming that a pillarenv of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a pillarenv of `dev`, which would mean that it would then ignore any items from the `base` pillarenv. A more detailed explanation of pillar environments can be found [here](#).

Moving on to point #3, and looking at the example `ext_pillar` configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remote's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced
by the bar remote's top file will first be looked for in the bar remote, followed by foo, and baz, and when the baz remote is processed, SLS files will be looked for in baz, followed by foo and bar. This "failover" logic is called a directory overlay, and it is also used by file_roots and conf_minion pillar_roots. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of git_pillar remotes having access to files in other repos which share the same environment can be disabled by setting git_pillar_includes to False. If this is done, then all git_pillar remotes will only have access to their own SLS files. Another way of ensuring that a git_pillar remote will not have access to SLS files from other git_pillar remotes which share the same pillar environment is to put them in a separate git section under ext_pillar. Look again at the example configuration above. In the second group of git_pillar remotes, the abc remote would not have access to the SLS files from the foo, bar, and baz remotes, and vice-versa.

Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```yaml
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the web.server.nginx and web.server.appdata SLS files in separate repos. This could be done using the following ext_pillar configuration (assuming that git_pillar_includes has not been set to False):

```yaml
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git
    - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third git_pillar remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath web/server/ in the repository). This also makes it tedious to reorganize the configuration, as changing web.server.nginx to web.nginx in the top file would require you to also move the SLS files in the pillar-nginx up a directory level.

For these reasons, much like gitfs, git_pillar now supports a "mountpoint" feature. Using the following ext_pillar configuration, the SLS files in the second and third git_pillar remotes can be placed in the root of the git repository:

```yaml
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - master https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

Now, if the top file changed the SLS target from web.server.nginx, instead of reorganizing the git repository, you would just need to adjust the mountpoint to web/ (and restart the salt-master daemon).
Note:

- Leading and trailing slashes on the mountpoints are optional.
- Use of the mountpoint feature requires that `git_pillar_includes` is not disabled.
- Content from mounted git_pillar repos can only be referenced by a top file in the same pillar environment.
- Salt versions prior to 2018.3.4 ignore the root parameter when mountpoint is set.

**all_saltenvs**

New in version 2018.3.4.

When `__env__` is specified as the branch name, all_saltenvs per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. pillarenvs). This allows a single branch/tag to appear in all saltenvs. Example:

```
ext_pillar:
  - git:
      - __env__ https://mydomain.tld/top.git
      - all_saltenvs: master
      - __env__ https://mydomain.tld/pillar-nginx.git:
        - mountpoint: web/server/
      - __env__ https://mydomain.tld/pillar-appdata.git:
        - mountpoint: web/server/
```

**git_pillar_update_interval**

New in version 3000.

This option defines the default update interval (in seconds) for git_pillar remotes. The update is handled within the global loop, hence `git_pillar_update_interval` should be a multiple of `loop_interval`.

```
git_pillar_update_interval: 120
```

**fallback**

New in version 3001.

Setting fallback per-remote or global configuration parameter will map non-existing environments to a default branch. Example:

```
ext_pillar:
  - git:
      - __env__ https://mydomain.tld/top.git
      - all_saltenvs: master
      - __env__ https://mydomain.tld/pillar-nginx.git:
        - mountpoint: web/server/
        - fallback: master
      - __env__ https://mydomain.tld/pillar-appdata.git:
        - mountpoint: web/server/
        - fallback: master
```
salt.pillar.git_pillar.ext_pillar(minion_id, pillar, *repos)
    Checkout the ext_pillar sources and compile the resulting pillar SLS

21.12.17 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar
you could do something like this:

```
ext_pillar:
  - stack: /path/to/stack.cfg
  - gpg: {}
```

Set gpg_keydir in your config to adjust the homedir the renderer uses.

salt.pillar.gpg.ext_pillar(minion_id, pillar, *args, **kwargs)

21.12.18 salt.pillar.hg_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the hglib python module being available. This is the same requirement as for hgfs_ so
should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
  - hg: ssh://hg@example.co/user/repo
```

class salt.pillar.hg_pillar.Repo(repo_uri)
    Deal with remote hg (mercurial) repository for Pillar

    close()
        Cleanup mercurial command server

    pull()

    update(branch='default')
        Ensure we are using the latest revision in the hg repository

salt.pillar.hg_pillar.ext_pillar(minion_id, pillar, repo, branch='default', root=None)
    Extract pillar from an hg repository

salt.pillar.hg_pillar.update(repo_uri)
    Execute an hg pull on all the repos
21.12.19 salt.pillar.hiera

Use hiera data as a Pillar source

```python
salt.pillar.hiera.ext_pillar(minion_id, pillar, conf)
```

Execute hiera and return the data

21.12.20 salt.pillar.http_json module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_JSON ext_pillar

Set the following Salt config to setup http json result as external pillar source:

```yaml
ext_pillar:
  - http_json:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

If the with_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```yaml
ext_pillar:
  - http_json:
      url: http://example.com/api/<nodename>
      with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion_id:

```yaml
ext_pillar:
  - http_json:
      url: http://example.com/api/%s
```

Module Documentation

```python
salt.pillar.http_json.ext_pillar(minion_id, pillar, url, with_grains=False)
```

Read pillar data from HTTP response.

- **Parameters**
  - `url (str)` -- Url to request.
  - `with_grains (bool)` -- Whether to substitute strings in the url with their grain values.

- **Returns** A dictionary of the pillar data to add.
- **Return type** `dict`
21.12.21 salt.pillar.http_yaml module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_YAML ext_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
  - http_yaml:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

If the with_grains parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
  - http_yaml:
      url: http://example.com/api/<nodename>
      with_grains: True
```

Changed in version 2018.3.0: If %s is present in the url, it will be automatically replaced by the minion_id:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/%s
```

Module Documentation

salt.pillar.http_yaml.ext_pillar(minion_id, pillar, url, with_grains=False)

Read pillar data from HTTP response.

Parameters
- url (str) -- Url to request.
- with_grains (bool) -- Whether to substitute strings in the url with their grain values.

Returns A dictionary of the pillar data to add.
Return type dict

21.12.22 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

depends certtool

salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)

Read in the generated libvirt keys

salt.pillar.libvirt.gen_hyper_keys(minion_id, country='US', state='Utah', locality='Salt Lake City', organization='Salted', expiration_days='365')

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions
21.12.23 salt.pillar.makostack module

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack ext_pillar is a direct ripoff of the 'stack' ext_pillar, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for pillar, __grains__ , __salt__ , __opts__ objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for stack, pillar, __grains__ , __salt__ , __opts__ objects.
- all these rendered files are then parsed as yaml.
- then all yaml dicts are merged in order, with support for the following merging strategies: merge-first, merge-last, remove, and overwrite.
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments.

Configuration in Salt

Like any other external pillar, its configuration takes place through the ext_pillar key in the master config file.

However, you can configure MakoStack in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
  - makostack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
  - makostack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```
Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
[ext_pillar]
  makostack:
    pillar:environment:
      dev: /path/to/dev/stack.cfg
      prod: /path/to/prod/stack.cfg
    grains:custom:grain:
      value:
        - /path/to/stack1.cfg
        - /path/to/stack2.cfg
    opts:custom:opt:
      value: /path/to/stack0.cfg
```

Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
  - bar
  - baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
  fur:
    foo:
      - bar
      - baz
```

MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these yaml files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with '/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- **pillar**: the pillar data (as passed by Salt to our `ext_pillar` function)
- **minion_id**: the minion id ;-)  
- **__opts__**: a dictionary of mostly Salt configuration options 
- **__grains__**: a dictionary of the grains of the minion making this pillar call
• __salt__: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of yaml files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{__grains__['osarch']}.yml
oscodenames/%{__grains__['oscodename']}.yml
% for role in pillar.get('roles', []):
  roles/%{role}.yml
% endfor
minions/%{minion_id}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
  └── config.cfg
      ├── core.yml
      │    ├── osarchs/
      │    │    └── amd64.yml
      │    ├── oscodenames/
      │    │    └── wheezy.yml
      │    └── roles/
      │       └── db.yml
      └── minions/
          └── test-1-dev.yml
```

**Overall process**

In the above MakoStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of yaml files:

- stack: the MakoStack pillar data object that has currently been merged (data from previous yaml files in MakoStack configuration)
- pillar: the pillar data (as passed by Salt to our ext_pillar function)
- minion_id: the minion id ;-)
• __opts__: a dictionary of mostly Salt configuration options
• __grains__: a dictionary of the grains of the minion making this pillar call
• __salt__: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous yaml files in MakoStack configuration) through the stack variable.

Once a yaml file has been preprocessed by mako, we obtain a Python dict - let’s call it yml_data - then, MakoStack will merge this yml_data dict in the main stack dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge yml_data in stack (similarly to the recurse salt pillar_source_merging_strategy), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the stack dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack ext_pillar returns the stack dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new yml_data dict is merged with the existing stack data can be controlled by specifying a merging strategy. Right now this strategy can either be merge-last (the default), merge-first, remove, or overwrite.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the overwrite strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging_strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

merge-last (default) strategy

If the merge-last strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the recurse salt pillar_source_merging_strategy). This allows for extending previously defined data.

merge-first strategy

If the merge-first strategy is selected, then the content of dict or list variables are swapped between the yaml_data and stack objects before being merged recursively with the merge-last previous strategy.
remove strategy

If the remove strategy is selected, then content of dict or list variables in stack are removed only if the corresponding item is present in the yaml_data dict. This allows for removing items from previously defined data.

overwrite strategy

If the overwrite strategy is selected, then the content of dict or list variables in stack is overwritten by the content of yaml_data dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a yaml_data dict is merged in the stack dict.

When you don't specify any strategy, the default merge-last strategy is selected:

<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td>users:</td>
<td>users:</td>
<td>users:</td>
</tr>
<tr>
<td>tom:</td>
<td>tom:</td>
<td>tom:</td>
</tr>
<tr>
<td>uid: 500</td>
<td>uid: 1000</td>
<td>uid: 1000</td>
</tr>
<tr>
<td>roles:</td>
<td>roles:</td>
<td>roles:</td>
</tr>
<tr>
<td>- sysadmin</td>
<td>- developer</td>
<td>- sysadmin</td>
</tr>
<tr>
<td>root:</td>
<td>mat:</td>
<td>root:</td>
</tr>
<tr>
<td>uid: 0</td>
<td>uid: 1001</td>
<td>uid: 0</td>
</tr>
</tbody>
</table>

Then you can select a custom merging strategy using the __ key in a dict:
<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **users:**
  **tom:**
    - uid: 500
    - roles:
      - sysadmin
  **root:**
    - uid: 0

| **users:**
  **tom:**
    - uid: 500
    - roles:
      - sysadmin
  **root:**
    - uid: 0

| **users:**
  **tom:**
    - uid: 500
    - roles:
      - sysadmin
  **root:**
    - uid: 0

| **users:**
  **tom:**
    - uid: 500
    - roles:
      - sysadmin
  **root:**
    - uid: 0

You can also select a custom merging strategy using a **__** object in a list:
<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>users:</code></td>
<td><code>users:</code></td>
<td><code>users:</code></td>
</tr>
<tr>
<td><code>  - tom</code></td>
<td><code>  - __: merge-last</code></td>
<td><code>  - tom</code></td>
</tr>
<tr>
<td><code>  - root</code></td>
<td><code>  - mat</code></td>
<td><code>  - root</code></td>
</tr>
<tr>
<td><code>users:</code></td>
<td><code>users:</code></td>
<td><code>users:</code></td>
</tr>
<tr>
<td><code>  - tom</code></td>
<td><code>  - __: merge-first</code></td>
<td><code>  - mat</code></td>
</tr>
<tr>
<td><code>  - root</code></td>
<td><code>  - mat</code></td>
<td><code>  - root</code></td>
</tr>
<tr>
<td><code>users:</code></td>
<td><code>users:</code></td>
<td><code>users:</code></td>
</tr>
<tr>
<td><code>  - tom</code></td>
<td><code>  - __: remove</code></td>
<td><code>  - root</code></td>
</tr>
<tr>
<td><code>  - root</code></td>
<td><code>  - mat</code></td>
<td></td>
</tr>
<tr>
<td><code>  - tom</code></td>
<td><code>  - mat</code></td>
<td></td>
</tr>
<tr>
<td><code>users:</code></td>
<td><code>users:</code></td>
<td><code>users:</code></td>
</tr>
<tr>
<td><code>  - tom</code></td>
<td><code>  - __: overwrite</code></td>
<td><code>  - mat</code></td>
</tr>
<tr>
<td><code>  - root</code></td>
<td><code>  - mat</code></td>
<td></td>
</tr>
</tbody>
</table>

```
salt.pillar.makostack.ext_pillar(minion_id, pillar, *args, **kwargs)
```

## 21.12.24 salt.pillar.mongo

Read Pillar data from a mongodb collection

**depends** pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node’s id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

### Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.  
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.  

---

[3204] Chapter 21. Salt Module Reference
Configuring the Mongo ext_pillar

The Mongo ext_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```yaml
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields: [customer_id, software, apache_vhosts]}
```

In the example above, we’ve decided to use the vm collection in the database to store the data. Minion ids are stored in the name field on documents in that collection. And, since minion ids are FQDNs in most cases, we’ll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the customer_id, software, and apache_vhosts fields, as that will contain the data we want for a given node. They will be available directly inside the pillar dict in your SLS templates.

Module Documentation

**salt.pillar.mongo.ext_pillar** (minion_id, pillar, collection='pillar', id_field='_id', re_pattern=None, re_replace='', fields=None)

Connect to a mongo database and read per-node pillar information.

**Parameters**

- **collection (**) --** The mongodb collection to read data from. Defaults to 'pillar'.
- **id_field (**) --** The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern (**) --** If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. re_pattern will be used to match the name, and re_replace will be used to replace it. Backrefs are supported as they are in the Python standard library. If None, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to None.
- **re_replace (**) --** Use as the replacement value in node ids matched with re_pattern. Defaults to "". Feel free to use backreferences here.
- **fields (**) --** The specific fields in the document to use for the pillar data. If None, will use the entire document. If using the entire document, the _id field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to None.

21.12.25 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the sql_base ext_pillar for MySQL.

**maturity** new

**depends** python-mysqldb

**platform** all
Configuring the mysql ext_pillar

Use the 'mysql' key under ext_pillar for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

Complete example

```python
mysql:
    user: 'salt'
    pass: 'super_secret_password'
    db: 'salt_db'
    port: 3306
    ssl:
        cert: /etc/mysql/client-cert.pem
        key: /etc/mysql/client-key.pem

ext_pillar:
    - mysql:
        fromdb:
            query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
            depth: 5
            as_list: True
            with_lists: [1,3]

class salt.pillar.mysql.MySQLExtPillar

    This class receives and processes the database rows from MySQL.

    extract_queries(args, kwargs)

        This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.ext_pillar(minion_id, pillar, *args, **kwargs)

    Execute queries against MySQL, merge and return as a dict

21.12.26 salt.pillar.nacl

Decrypt pillar data through the builtin NACL renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```python
nacl.config:
    keyfile: /root/.nacl

ext_pillar:
    - stack: /path/to/stack.cfg
    - nacl: {}
```

Set nacl.config in your config.

salt.pillar.nacl.ext_pillar(minion_id, pillar, *args, **kwargs)
21.12.27 salt.pillar.netbox

A module that adds data to the Pillar structure from a NetBox API.
New in version 2019.2.0.

Configuring the NetBox ext_pillar

```python
ext_pillar:
    - netbox:
        api_url: http://netbox_url.com/api/
        api_token: 123abc
```

Create a token in your NetBox instance at http://netbox_url.com/user/api-tokens/

The following options are optional, and determine whether or not the module will attempt to configure the proxy pillar data for use with the napalm proxy-minion:

```python
proxy_return: True
proxy_username: admin
```

By default, this module will query the NetBox API for the platform associated with the device, and use the 'NAPALM driver' field to set the napalm proxy-minion driver. (Currently only 'napalm' is supported for drivertype.)

This module currently only supports the napalm proxy minion and assumes you will use SSH keys to authenticate to the network device. If password authentication is desired, it is recommended to create another proxy key in pillar_roots (or git_pillar) with just the passwd key and use salt.renderers.gpg to encrypt the value. If any additional options for the proxy setup are needed they should also be configured in pillar_roots.

Other available options:

- **site_details**: Whether should retrieve details of the site the device belongs to.
- **site_prefixes**: Whether should retrieve the prefixes of the site the device belongs to.

salt.pillar.netbox.ext_pillar(minion_id, pillar, *args, **kwargs)
Query NetBox API for minion data

21.12.28 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.
New in version 2015.5.1.

```python
depends
    - python-neutronclient
```

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```yaml
my_openstack_config:
    keystone.user: 'admin'
    keystone.password: 'password'
    keystone.tenant: 'admin'
    keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
    keystone.region_name: 'RegionOne'
    keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.
Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
    - neutron: my_openstack_config
    - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
    - neutron: my_openstack_config
eutron_networks
```

```
salt.pillar.neutron.ext_pillar(minion_id, pillar, conf)
Check neutron for all data
```

### 21.12.29 salt.pillar.nodegroups

#### Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of `nodegroups` which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

#### Command Line

```
salt-call pillar.get nodegroups
local:
    - class_infra
    - colo_sj
    - state_active
    - country_US
    - type_saltmaster
```

#### Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
    - nodegroups:
        pillar_name: 'nodegroups'
```

```
salt.pillar.nodegroups.ext_pillar(minion_id, pillar, pillar_name=None)
```

A salt external pillar which provides the list of nodegroups of which the minion is a member.

**Parameters**

- `minion_id` -- used for compound matching nodegroups
- `pillar` -- provided by salt, but not used by nodegroups ext_pillar
- `pillar_name` -- optional name to use for the pillar, defaults to ‘nodegroups’

**Returns** a dictionary which is included by the salt master in the pillars returned to the minion
21.12.30 salt.pillar.pepa

Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

Configuring Pepa

```
extension_modules: /srv/salt/ext

ext_pillar:
  - pepa:
      resource: host
      # Name of resource directory and sub-key in pillars

    sequence:
      # Sequence used for hierarchical substitution
      - hostname:
          name: input
          base_only: True
          # Alias used for template directory
          # Only use templates from Base environment, i.e.

    no staging
    - default:
        - environment:
            - location..region:
                name: region
        - location..country:
            name: country
        - location..datacenter:
            name: datacenter
        # roles:
        - osfinger:
            name: os
        # hostname:
        - hostname:
            name: override
            base_only: True
            # Create a sub-key in pillars, named after the resource in this case [host]
        subkey: True
        subkey_only: True
        # Only create a sub-key, and leave the top level untouched

pepa_roots:
  # Base directory for each environment
  base: /srv/pepa/base
  # Path for base environment
  dev: /srv/pepa/base
  # Associate dev with base
  qa: /srv/pepa/qa
  prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since some keys may use '.' in the name
#pepa_delimiter: ..

# Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
#  # environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
# saltversion: 0.17.4
```
# Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
# salt: warning
# salt.loaded.ext.pillar.pepa: debug

Pepa can also be used in Master-less SaltStack setup.

## Command line

```

positional arguments:
  hostname  Hostname

optional arguments:
  -h, --help            show this help message and exit
  -c CONFIG, --config CONFIG
                        Configuration file
  -d, --debug           Print debug info
  -g GRAINS, --grains GRAINS
                        Input Grains as YAML
  -p PILLAR, --pillar PILLAR
                        Input Pillar as YAML
  -n, --no-color        No color output
  -v, --validate        Validate output
```

## Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

**Example File:** host/input/test_example_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
  - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

**Example File:** host/region/amer.yaml
Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

Example:

osfinger: Fedora-19

Would become:

fedora_19.yaml

### Nested dictionaries

In order to create nested dictionaries as output you can use double dot `..` as a delimiter. You can change this using "pepa_delimiter" we choose double dot since single dot is already used by key names in some modules, and using ",," requires quoting in the YAML.

Example:

```yaml
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2

network..dns..options:
  - timeout:2
  - attempts:1
  - ndots:1

network..dns..search:
  - example.com
```

Would become:

```yaml
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```
Operators

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can’t be changed.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>merge()</td>
<td>Merge list or hash</td>
</tr>
<tr>
<td>unset()</td>
<td>Unset key</td>
</tr>
<tr>
<td>immutable()</td>
<td>Set the key as immutable, so it can’t be changed</td>
</tr>
<tr>
<td>merge()</td>
<td>Set immutable and merge</td>
</tr>
<tr>
<td>iunset()</td>
<td>Set immutable and unset</td>
</tr>
</tbody>
</table>

Example:

```yaml
network..dns..search..merge():
  - foobar.com
  - dummy.nl
owner..immutable(): Operations
host..printers..unset():
```

Validation

Since it’s very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus &lt;https://github.com/nicolaiarocci/cerberus&gt;.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```yaml
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
    regex: ^([0-9]{1,3}.){3}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}.){3}[0-9]{1,3}$
```

(continues on next page)
{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network.interfaces.{{ interface }}.dhcp:
  type: boolean

network.interfaces.{{ interface }}.fqdn:
  type: string
  regex: ^([a-z0-9][a-z0-9-]{0,61}[a-z0-9])\.+[a-zA-Z]{2,6}$

network.interfaces.{{ interface }}.hwaddr:
  type: string
  regex: ^([0-9a-f]{1,2}:)\{5\}[0-9a-f]{1,2}$

network.interfaces.{{ interface }}.ipv4:
  type: string
  regex: ^([0-9]{1,3})\{3\}[0-9]{1,3}$

network.interfaces.{{ interface }}.netmask:
  type: string
  regex: ^([0-9]{1,3})\{3\}[0-9]{1,3}$

{% endfor %}
{% endif %}

21.12.31 salt.pillar.pillar_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.
Configuring the LDAP ext_pillar

The basic configuration is part of the master configuration.

```
ext_pillar:
    - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

**Note:** When placing the file in the master.d directory, make sure its name doesn't end in .conf, otherwise the salt-master process will attempt to parse its content.

**Warning:** Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is pillar_ldap pointing to a file containing the actual configuration.

Configuring the LDAP searches

The file is processed using Salt’s Renderers <renderers> which makes it possible to reference grains within the configuration.

**Warning:** When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the ‘id’ grain which is verified through the minion’s key/cert.

Map Mode

The it-admins configuration below returns the Pillar it-admins by:

- filtering for: members of the group it-admins - objects with objectclass=user
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

**Configuration**

```
salt-users:
    server: ldap.company.tld
    port: 389
    tls: true
    dn: 'dc=company,dc=tld'
    binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
    bindpw: bi7ieBai5Ano
    referrals: false
    anonymous: false
    mode: map
    dn: 'ou=users,dc=company,dc=tld'
    filter: '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
```

(continues on next page)
attrs:
- cn
- displayName
- givenName
- sn
lists:
- memberOf

search_order:
- salt-users

Result

```
{  
  'salt-users': [  
    {  
      'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',  
      'displayName': 'John Doe'  
    },  
    {  
      'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',  
      'displayName': 'John'  
    },  
    {  
      'cn': 'cn=it-admins,ou=groups,dc=company,dc=tld',  
      'cn=team01,ou=groups,dc=company'  
    },  
  ],  
  {  
    'cn': 'cn=janedoe,ou=users,dc=company,dc=tld',  
    'displayName': 'Jane Doe',  
    'givenName': 'Jane',  
    'sn': 'Doe',  
    'memberOf': [  
      'cn=it-admins,ou=groups,dc=company,dc=tld',  
      'cn=team02,ou=groups,dc=company'  
    ]  
  }  
}
```

salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)

Execute LDAP searches and return the aggregated data

### 21.12.32 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

- maturity new
- depends psycopg2
- platform all
Complete Example

```
postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: |
          SELECT col1,col2,col3,col4,col5,col6,col7
          FROM some_random_table
          WHERE minion_pattern LIKE %s
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.postgres.POSTGRESExtPillar

This class receives and processes the database rows from POSTGRES.

```
extract_queries(args, kwargs)
```

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

```
salt.pillar.postgres.ext_pillar(minion_id, pillar, *args, **kwargs)
```

Execute queries against POSTGRES, merge and return as a dict.

21.12.33 salt.pillar.puppet

Execute an unmodified puppet_node_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion’s Pillar data.

```
salt.pillar.puppet.ext_pillar(minion_id, pillar, command)
```

Execute an unmodified puppet_node_classifier and read the output as YAML.

21.12.34 salt.pillar.reclass_adapter

Use the "reclass" database as a Pillar source.

This `ext_pillar` plugin provides access to the `reclass` database, such that Pillar data for a specific minion are fetched using `reclass`.

You can find more information about `reclass` at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell `reclass` by way of a few options how and where to find the inventory:

```
ext_pillar:
  - reclass:
      storage_type: yaml_fs
      inventory_base_uri: /srv/salt
```

This would cause `reclass` to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using `reclass` as `master_tops` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):
Salt Documentation, Release 3002.6

reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

    salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)

    Obtain the Pillar data from reclass for the given minion_id.

21.12.35 salt.pillar.redismod

Read pillar data from a Redis backend

New in version 2014.7.0.

depends
  - redis Python module (on master)

Salt Master Redis Configuration

The module shares the same base Redis connection variables as salt.returners.redis_return. These variables go in your master config file.

  - redis.db - The Redis database to use. Defaults to 0.
  - redis.host - The Redis host to connect to. Defaults to 'salt'.
  - redis.port - The port that the Redis database is listening on. Defaults to 6379.
  - redis.password - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

Configuring the Redis ext_pillar

    ext_pillar:
      - redis: {function: key_value}

    salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)

    Grabs external pillar data based on configured function

    salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=\None)

    Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar_key is not set.
    pillar_key Pillar key to return data into
salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')

Looks for key in redis matching minion_id, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

pillar_key Pillar key to return data into

21.12.36 salt.pillar.rethinkdb_pillar

Provide external pillar data from RethinkDB

New in version 2018.3.0.

depends rethinkdb (on the salt-master)

text

salt master rethinkdb configuration

These variables must be configured in your master configuration file.

- rethinkdb.host - The RethinkDB server. Defaults to 'salt'
- rethinkdb.port - The port the RethinkDB server listens on. Defaults to '28015'
- rethinkdb.database - The database to connect to. Defaults to 'salt'
- rethinkdb.username - The username for connecting to RethinkDB. Defaults to ''
- rethinkdb.password - The password for connecting to RethinkDB. Defaults to ''

salt-master ext_pillar configuration

The ext_pillar function arguments are given in single line dictionary notation.

```
ext_pillar:
  - rethinkdb: {table: ext_pillar, id_field: minion_id, field: pillar_root, pillar_key: external_pillar}
```

In the example above the following happens.

- The salt-master will look for external pillars in the 'ext_pillar' table on the RethinkDB host
- The minion id will be matched against the 'minion_id' field
- Pillars will be retrieved from the nested field 'pillar_root'
- Found pillars will be merged inside a key called 'external_pillar'

Module Documentation

salt.pillar.rethinkdb_pillar.ext_pillar(minion_id, pillar, table='pillar', id_field=None, field=None, pillar_key=None)

Collect minion external pillars from a RethinkDB database

Arguments:

- table: The RethinkDB table containing external pillar information. Defaults to 'pillar'
- id_field: Field in document containing the minion id. If blank then we assume the table index matches minion ids
- field: Specific field in the document used for pillar data, if blank then the entire document will be used
- pillar_key: The salt-master will nest found external pillars under this key before merging into the minion pillars. If blank, external pillars will be merged at top level
21.12.37 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```python
ext_pillar:
  s3:
    bucket: my.fancy.pillar.bucket
    keyid: KASKFJWAKJASJKDAJKSD
    key: ksldadfLKDALSFKSD93q032sdDasdfasdfslasdfk
    multiple_env: False
    environment: base
    prefix: somewhere/overthere
    verify_ssl: True
    service_url: s3.amazonaws.com
    kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
    s3_cache_expire: 30
    s3_sync_on_update: True
    path_style: False
    https_enable: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to False. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to 'base'. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if multiple_env is True.

The `prefix` defaults to ''. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when multiple_env is True or False. Essentially it tells ext_pillar to look for your pillar data in a 'subdirectory' of your S3 bucket

The `verify_ssl` parameter defaults to True. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to False else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to 's3.amazonaws.com'. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to True. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to False. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to True. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/]<prefix>/files
```
Multiple environment mode must have this bucket structure:

`s3://<bucket name>/<prefix>/<environment>/<files>`

If you wish to define your pillar data entirely within S3 it's recommended that you use the `prefix=` parameter and specify one entry in ext_pillar for each environment rather than specifying `multiple_env`. This is due to issue #22471 (https://github.com/saltstack/salt/issues/22471)

```python
class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True, kms_keyid=None, location=None, path_style=False, https_enable=True)
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True, location=None, multiple_env=False, environment='base', prefix='', service_url=None, kms_keyid=None, s3_cache_expire=30, s3_sync_on_update=True, path_style=False, https_enable=True)
```

Execute a command and read the output as YAML

21.12.38 salt.pillar.saltclass

SaltClass Pillar Module

```yaml
ext_pillar:
  - saltclass:
    - path: /srv/saltclass
```

For additional configuration instructions, see the saltclass module

```python
salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)
```

Compile pillar data

21.12.39 salt.pillar.sql_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

```
maturity new
platform all
```

Theory of sql_base ext_pillar

Ok, here’s the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it’s backward compatible with older configs. Keyword arguments are sorted before being appended, so that they’re predictable, but they will always be applied last so overall it’s moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
A mapping uses the keys "query" and "depth" as the tuple.

You can retrieve as many fields as you like, how they get used depends on the exact settings.

### Configuring a sql_base ext_pillar

The sql_base ext_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```yaml
ext_pillar:
  - sql_base:
    - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```yaml
ext_pillar:
  - sql_base:
    main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```yaml
ext_pillar:
  - sql_base:
    - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    2
```

Or as a mapping

```yaml
ext_pillar:
  - sql_base:
    query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
    depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: `{a: {"b": b, "c": c, "d": d}}`
- With depth 2: `{a: {b: {"c": c, "d": d}}}
- With depth 3: `{a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The ignore_null option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.
If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string ’1,3’ will result in:

```
a,b,c,d,e,1  # field 1 same, field 3 differs
a,b,c,f,g,2  # ^^^^   
a,z,h,y,j,3  # field 1 same, field 3 same
a,z,h,y,k,4  # ^^^^
```

These columns define list grouping

```
{a: [
  {c: [
    {e: 1},
    {g: 2}
  ]},
  {h: [
    {j: 3, k: 4}
  ]}
]}
```

The range for `with_lists` is 1 to number_of_fields, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your minion_id is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

More complete example for MySQL (to also show configuration)

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7 FROM some_random_table WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```
class salt.pillar.sql_base.SqlBaseExtPillar
This class receives and processes the database rows in a database agnostic way.

  as_list = False
  depth = 0
  enter_root(root)
    Set self.focus for kwarg queries
  extract_queries(args, kwargs)
    This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.
  fetch(minion_id, pillar, *args, **kwargs)
    Execute queries, merge and return as a dict.
  field_names = None
  focus = None
  ignore_null = False
  num_fields = 0
  process_fields(field_names, depth)
    The primary purpose of this function is to store the sql field list and the depth to which we process.
  process_results(rows)
    This function takes a list of database results and iterates over, merging them into a dict form.
  result = None
  with_lists = None

21.12.40 salt.pillar.sqlcipher module
Retrieve Pillar data by running a SQLCipher query
New in version 2016.3.0.
Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.
This module is a concrete implementation of the sql_base ext_pillar for SQLCipher.

  maturity new
  depends pysqlcipher (for py2) or pysqlcipher3 (for py3)
  platform all
Configuring the sqlcipher ext_pillar

Use the 'sqlcipher' key under ext_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- **sqlcipher.database** - The SQLCipher database to connect to. Defaults to '/var/lib/salt/pillar-sqlcipher.db'.
- **sqlcipher.pass** - The SQLCipher database decryption password.
- **sqlcipher.timeout** - The connection timeout in seconds.

Example configuration

```python
sqlcipher:
    database: /var/lib/salt/pillar-sqlcipher.db
    pass: strong_pass_phrase
    timeout: 5.0
```

Complete Example

```python
sqlcipher:
    database: '/var/lib/salt/pillar-sqlcipher.db'
    pass: strong_pass_phrase
    timeout: 5.0

ext_pillar:
    sqlcipher:
        fromdb: True
        query:
            SELECT col1,col2,col3,col4,col5,col6,col7
            FROM some_random_table
            WHERE minion_pattern LIKE ?
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.sqlcipher.SQLCipherExtPillar

This class receives and processes the database rows from SQLCipher.

salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)

Execute queries against SQLCipher, merge and return as a dict

21.12.41 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

sqlite3 is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql_base ext_pillar for SQLite3.

    platform  all
Configuring the sqlite3 ext_pillar

Use the ‘sqlite3’ key under ext_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

| sqlite3.database: /var/lib/salt/pillar.db |
| sqlite3.timeout: 5.0 |

Complete Example

```yaml
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1, col2, col3, col4, col5, col6, col7
                   FROM some_random_table
                   WHERE minion_pattern LIKE ?'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)

Execute queries against SQLite3, merge and return as a dict

21.12.42 salt.pillar.stack

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

PillarStack is a custom saltstack ext_pillar which was inspired by varstack but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: https://github.com/bbinet/pillarstack/issues

It supports the following features:

- multiple config files that are jinja2 templates with support for pillar, __grains__, __salt__, __opts__ objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for stack, pillar, __grains__, __salt__, __opts__ objects
- all these rendered files are then parsed as yaml
- then all yaml dicts are merged in order with support for the following merging strategies: merge-first, merge-last, remove, and overwrite
- stack config files can be matched based on pillar, grains, or opts values, which make it possible to support kind of self-contained environments

Installation

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0. If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.

Installing the PillarStack ext_pillar is as simple as dropping the stack.py file in the <extension_modules>/pillar directory (no external python module required), given that extension_modules is set in your salt-master configuration, see: http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules

Configuration in Salt

Like any other external pillar, its configuration takes place through the ext_pillar key in the master config file. However, you can configure PillarStack in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
  - stack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
  - stack:
    - /path/to/stack1.cfg
    - /path/to/stack2.cfg
```

Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
  - stack:
    pillar:environment:
      dev: /path/to/dev/stack.cfg
      prod: /path/to/prod/stack.cfg
    grains:custom:grain:
      value:
```

(continues on next page)
PillarStack configuration files

The config files that are referenced in the above ext_pillar configuration are jinja2 templates which must render as a simple ordered list of yaml files that will then be merged to build pillar data.

The path of these yaml files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the Python glob module <https://docs.python.org/2/library/glob.html>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- pillar: the pillar data (as passed by Salt to our ext_pillar function)
- minion_id: the minion id :-)  
- __opts__: a dictionary of mostly Salt configuration options
- __grains__: a dictionary of the grains of the minion making this pillar call
- __salt__: a dictionary of Salt module functions, useful so you don’t have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of yaml files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```bash
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{% for role in pillar.get('roles', []) %}
    roles/{{ role }}.yml
{% endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```bash
$ tree /path/to/stack/
/path/to/stack/
    config.cfg
    core.yml
    common/
        xxx.yml
        yyy.yml
    osarchs/
        amd64.yml
        armhf.yml
    oscodenames/
        wheezy.yml
        jessie.yml
    roles/
```

(continues on next page)
Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- stack: the PillarStack pillar data object that has currently been merged (data from previous yaml files in PillarStack configuration)
- pillar: the pillar data (as passed by Salt to our ext_pillar function)
- minion_id: the minion id ;-)  
- __opts__: a dictionary of mostly Salt configuration options
- __grains__: a dictionary of the grains of the minion making this pillar call
- __salt__: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous yaml files in PillarStack configuration) through the stack variable.

Once a yaml file has been preprocessed by Jinja2, we obtain a Python dict - let's call it yml_data - then, PillarStack will merge this yml_data dict in the main stack dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge yml_data in stack (similarly to the recurse salt pillar_source_merging_strategy), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the stack dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack ext_pillar returns the stack dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.
Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```python
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

**merge-last (default) strategy**

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse` salt pillar source merging strategy). This allows for extending previously defined data.

**merge-first strategy**

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

**remove strategy**

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

**overwrite strategy**

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:
<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>users:</code></td>
<td><code>users:</code></td>
<td><code>users:</code></td>
</tr>
<tr>
<td><code>tom:</code></td>
<td><code>tom:</code></td>
<td><code>tom:</code></td>
</tr>
<tr>
<td><code>uid</code>: 500</td>
<td><code>uid</code>: 1000</td>
<td><code>uid</code>: 1000</td>
</tr>
<tr>
<td><code>roles:</code></td>
<td><code>roles:</code></td>
<td><code>roles:</code></td>
</tr>
<tr>
<td><code>- sysadmin</code></td>
<td><code>- developer</code></td>
<td><code>- developer</code></td>
</tr>
<tr>
<td><code>root:</code></td>
<td><code>mat:</code></td>
<td><code>root:</code></td>
</tr>
<tr>
<td><code>uid</code>: 0</td>
<td><code>uid</code>: 1001</td>
<td><code>uid</code>: 0</td>
</tr>
</tbody>
</table>

Then you can select a custom merging strategy using the `__` key in a dict:
You can also select a custom merging strategy using a `__` object in a list:
<table>
<thead>
<tr>
<th>stack</th>
<th>yaml_data</th>
<th>stack (after merge)</th>
</tr>
</thead>
</table>
| **users:**  
  - tom  
  - root | **users:**  
  - **__**: merge-last  
  - mat | **users:**  
  - tom  
  - root  
  - mat |
| **users:**  
  - tom  
  - root | **users:**  
  - **__**: merge-first  
  - mat | **users:**  
  - mat  
  - tom  
  - root |
| **users:**  
  - tom  
  - root | **users:**  
  - **__**: remove  
  - mat  
  - tom | **users:**  
  - root |
| **users:**  
  - tom  
  - root | **users:**  
  - **__**: overwrite  
  - mat | **users:**  
  - mat |

salt.pillar.stack.ext_pillar(minion_id, pillar, *args, **kwargs)

21.12.43 salt.pillar.svn_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source.

This external Pillar source can be configured in the master config file like so:

```yaml
ext_pillar:
  - **svn**: trunk svn://svnserver/repo root=subdirectory
```

The **root** parameter is optional and used to set the subdirectory from where to look for Pillar files (such as top.sls).

Changed in version 2014.7.0: The optional **root** parameter will be added.

Note that this is not the same thing as configuring pillar data using the **pillar_roots** parameter. The branch referenced in the **ext_pillar** entry above (**master**), would evaluate to the **base** environment, so this branch needs to contain a **top.sls** with a **base** section in it, like this:

```yaml
base:
  '*x*':
    - foo
```

To use other environments from the same SVN repo as **svn_pillar** sources, just add additional lines, like so:

```yaml
ext_pillar:
  - **svn**: trunk svn://svnserver/repo
  - **svn**: dev svn://svnserver/repo
```

In this case, the **dev** branch would need its own **top.sls** with a **dev** section in it, like this:
```python
dev:
  "*":
    - bar

class salt.pillar.svn_pillar.SvnPillar(branch, repo_location, root, opts):
    Deal with the remote SVN repository for Pillar

    pillar_dir()
    Returns the directory of the pillars (repo cache + branch + root)

    update()

salt.pillar.svn_pillar.ext_pillar(minion_id, pillar, repo_string)
    Execute a command and read the output as YAML

21.12.44 salt.pillar.varstack_pillar

Use Varstack data as a Pillar source

Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
  - varstack: /etc/varstack.yaml
```

Varstack will then use /etc/varstack.yaml to determine which configuration data to return as pillar information. From there you can take a look at the README of varstack on how this file is evaluated.

salt.pillar.varstack_pillar.ext_pillar(minion_id, pillar, conf)
    Parse varstack data and return the result

21.12.45 salt.pillar.vault module

Vault Pillar Module

    maintainer SaltStack
    maturity New
    platform all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext_pillar section in the Salt master configuration.

```
ext_pillar:
  - vault: path=secret/salt
```
Each key needs to have all the key-value pairs with the names you require. Avoid naming every key 'password' as you they will collide:

If you want to nest results under a nesting_key name use the following format:

```yaml
ext_pillar:
  - vault: conf: path=secret/salt nesting_key: vault_key_name
```

```bash
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, auth and master.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```bash
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

```yaml
ext_pillar:
  - vault: path=secret/salt
  - vault: path=secret/root
  - vault: path=secret/minions/{minion}/pass
```

You can also use nesting here as well. Identical nesting keys will get merged.

```yaml
ext_pillar:
  - vault:
    conf: path=secret/salt
    nesting_key: keyname1
  - vault:
    conf: path=secret/root
    nesting_key: keyname1
  - vault:
    conf: path=secret/minions/{minion}/pass
    nesting_key: keyname2
```

The difference between the return with and without the nesting key is shown below. This example takes the key value pairs returned from vault as follows:

- path=secret/salt
  Key Value --- -----  salt-passwd badpasswd
- path=secret/root
  Key Value --- -----  root-passwd rootbadpasswd
- path=secret/minions/{minion}/pass
  Key Value --- -----  minion-passwd minionbadpasswd

#Nesting Key not defined

local:  
----------
 salt-passwd:  
   badpasswd
 root-passwd:  
   rootbadpasswd
 minion-passwd:  
(continues on next page)
minionbadpasswd1

# Nesting Key defined

local:
    ------------
    keyname1:
        ------------
        salt-passwd:
            badpasswd1
        root-passwd:
            rootbadpasswd1
    keyname2:
        ------------
        minion-passwd:
            minionbadpasswd1

salt.pillar.vault.ext_pillar(minion_id, pillar, conf, nesting_key=None)
Get pillar data from Vault for the configuration conf.

21.12.46 salt.pillar.venafi module

Venafi Pillar Certificates

This module will only return pillar data if the venafi runner module has already been used to create certificates.

To configure this module, set venafi to True in the ext_pillar section of your master configuration file:

```
salt.pillar.venafi.ext_pillar(minion_id, pillar, conf)
```

Return an existing set of certificates

21.12.47 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

```
salt.pillar.virtkey.ext_pillar(hyper_id, pillar, name, key)
```
Accept the key for the VM on the hyper, if authorized.

21.12.48 salt.pillar.vmware_pillar module

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

depends
    • pyVmomi

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the 'os' or 'virtual' grain are not 'VMWare', 'ESXi', or 'VMWare ESXi'.

21.12. pillar modules
Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the `vmware` pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

Configuring the VMWare pillar

The required minimal configuration in the salt master `ext_pillar` setup:

```yaml
ext_pillar:
  - vmware:
    host: <vcenter/esx host>
    username: <user to connect with>
    password: <password>
```

Optionally, the following keyword arguments can be passed to the `ext_pillar` for customized configuration:

- `pillar_key` Optionally set the pillar key to return the data into. Default is `vmware`.
- `protocol` Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.
- `port` Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
- `property_name` Property name to match the minion id against. Defaults to `name`.
- `property_types` Optionally specify a list of pyVmomi vim types to search for the minion id in `property_name`. Default is `['VirtualMachine']`.

For example, to search both vim.VirtualMachine and vim.HostSystem object types:

```yaml
ext_pillar:
  - vmware:
    host: myesx
    username: root
    password: complex_password
    property_types:
    - VirtualMachine
    - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

**Note:** Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.
The above ext_pillar example would return a pillar like the following for a VirtualMachine object that's name matched the minion id:

```python
vmware:
    config:
        bootOptions:
            bootDelay: 1000
            bootRetryDelay: 1000
```

If you were to retrieve these virtual machine attributes via pyVmomi directly, this would be the same as

```python
vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptionis.bootRetryDelay
```

The above ext_pillar example would return a pillar like the following for a HostySystem object that's name matched the minion id:

```python
vmware:
    datastore:
        - name: Datastore1
        - name: Datastore2
```

The 'datastore' property of a HostSystem object is a list of datastores, thus a list is returned.

**replace_default_attributes** If custom attributes are specified by the property_types parameter, replace_default_attributes determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

**Note:** vCenter "Custom Attributes" (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

```python
salt.pillar.vmware_pillar.ext_pillar(minion_id, pillar, **kwargs)
```

Check vmware/vcenter for all data
## 21.13 proxy modules

<table>
