- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_key_pair method

CLI Example:

```
salt myminion libcloud_compute.create_key_pair pair1 profile1
```

salt.modules.libcloud_compute.**create_volume**(*size*, *name*, *profile*, *location_id=None*, ***libcloud_kwargs*)

Create a storage volume

Parameters

- **size** (int) -- Size of volume in gigabytes (required)
- **name** (str) -- Name of the volume to be created
- **location_id** (str) -- Which data center to create a volume in. If empty, undefined behavior will be selected. (optional)
- **profile** (str) -- The profile key

- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_volumes method

CLI Example:

```
salt myminion libcloud_compute.create_volume 1000 vol1 profile1
```

salt.modules.libcloud_compute.**create_volume_snapshot**(*volume_id*, *profile*, *name=None*, ***libcloud_kwargs*)

Create a storage volume snapshot

Parameters

- **volume_id** (str) -- Volume ID from which to create the new snapshot.
- **profile** (str) -- The profile key
- **name** (str) -- Name of the snapshot to be created (optional)
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_volume_snapshot method

CLI Example:

```
salt myminion libcloud_compute.create_volume_snapshot vol1 profile1
```

salt.modules.libcloud_compute.**delete_image**(*image_id*, *profile*, ***libcloud_kwargs*)

Delete an image of a node

Parameters

- **image_id** (str) -- Image to delete
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_image method

CLI Example:

```
salt myminion libcloud_compute.delete_image image1 profile1
```

salt.modules.libcloud_compute.**delete_key_pair**(*name*, *profile*, ***libcloud_kwargs*)

Delete a key pair

Parameters

- **name** (str) -- Key pair name.
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's import_key_pair_from_xxx method

CLI Example:

```
salt myminion libcloud_compute.delete_key_pair pair1 profile1
```

salt.modules.libcloud_compute.**destroy_node**(*node_id*, *profile*, ***libcloud_kwargs*)

Destroy a node in the cloud

Parameters

- **node_id** (str) -- Unique ID of the node to destroy
- **profile** (str) -- The profile key

- **libcloud_kwargs** (dict) -- Extra arguments for the driver's destroy_node method

CLI Example:

```
salt myminion libcloud_compute.destry_node as-2346 profile1
```

salt.modules.libcloud_compute.**destroy_volume**(*volume_id*, *profile*, ***libcloud_kwargs*)

Destroy a volume.

Parameters

- **volume_id** (str) -- Volume ID from which to destroy
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's destroy_volume method

CLI Example:

```
salt myminion libcloud_compute.destroy_volume vol1 profile1
```

salt.modules.libcloud_compute.**destroy_volume_snapshot**(*volume_id*, *snapshot_id*, *profile*, ***libcloud_kwargs*)

Destroy a volume snapshot.

Parameters

- **volume_id** (str) -- Volume ID from which the snapshot belongs
- **snapshot_id** (str) -- Volume Snapshot ID from which to destroy
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's destroy_volume_snapshot method

CLI Example:

```
salt myminion libcloud_compute.destroy_volume_snapshot snap1 profile1
```

salt.modules.libcloud_compute.**detach_volume**(*volume_id*, *profile*, ***libcloud_kwargs*)

Detaches a volume from a node.

Parameters

- **volume_id** (str) -- Volume ID from which to detach
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's detach_volume method

CLI Example:

```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

salt.modules.libcloud_compute.**extra**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_compute.extra ex_get_permissions google container_
↪name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_compute.**get_image**(*image_id*, *profile*, ***libcloud_kwargs*)

Get an image of a node

Parameters

- **image_id** (str) -- Image to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_image method

CLI Example:

```
salt myminion libcloud_compute.get_image image1 profile1
```

salt.modules.libcloud_compute.**get_key_pair**(*name*, *profile*, ***libcloud_kwargs*)

Get a single key pair by name

Parameters

- **name** (str) -- Name of the key pair to retrieve.
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_key_pair method

CLI Example:

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

salt.modules.libcloud_compute.**import_key_pair**(*name*, *key*, *profile*, *key_type=None*, ***libcloud_kwargs*)

Import a new public key from string or a file path

Parameters

- **name** (str) -- Key pair name.
- **key** (str or path str) -- Public key material, the string or a path to a file
- **profile** (str) -- The profile key
- **key_type** (str) -- The key pair type, either *FILE* or *STRING*. Will detect if not provided and assume that if the string is a path to an existing path it is a FILE, else STRING.
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's import_key_pair_from_xxx method

CLI Example:

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123
↪profile1
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

salt.modules.libcloud_compute.**list_images**(*profile*, *location_id=None*, ***libcloud_kwargs*)

Return a list of images for this cloud

Parameters

- **profile** (str) -- The profile key
- **location_id** (str) -- The location key, from list_locations
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_images method

CLI Example:

```
salt myminion libcloud_compute.list_images profile1
```

salt.modules.libcloud_compute.**list_key_pairs**(*profile*, ***libcloud_kwargs*)

List all the available key pair objects.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_key_pairs method

CLI Example:

```
salt myminion libcloud_compute.list_key_pairs profile1
```

salt.modules.libcloud_compute.**list_locations**(*profile*, ***libcloud_kwargs*)

Return a list of locations for this cloud

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_locations method

CLI Example:

```
salt myminion libcloud_compute.list_locations profile1
```

salt.modules.libcloud_compute.**list_nodes**(*profile*, ***libcloud_kwargs*)

Return a list of nodes

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_nodes method

CLI Example:

```
salt myminion libcloud_compute.list_nodes profile1
```

salt.modules.libcloud_compute.**list_sizes**(*profile*, *location_id=None*, ***libcloud_kwargs*)

Return a list of node sizes

Parameters

- **profile** (str) -- The profile key
- **location_id** (str) -- The location key, from list_locations
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_sizes method

CLI Example:

```
salt myminion libcloud_compute.list_sizes profile1
salt myminion libcloud_compute.list_sizes profile1 us-east1
```

salt.modules.libcloud_compute.**list_volume_snapshots**(*volume_id*, *profile*, ***libcloud_kwargs*)

Return a list of storage volumes snapshots for this cloud

Parameters

- **volume_id** (str) -- The volume identifier
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_volume_snapshots method

CLI Example:

```
salt myminion libcloud_compute.list_volume_snapshots vol1 profile1
```

salt.modules.libcloud_compute.**list_volumes**(*profile*, ***libcloud_kwargs*)

Return a list of storage volumes for this cloud

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_volumes method

CLI Example:

```
salt myminion libcloud_compute.list_volumes profile1
```

salt.modules.libcloud_compute.**reboot_node**(*node_id*, *profile*, ***libcloud_kwargs*)

Reboot a node in the cloud

Parameters

- **node_id** (str) -- Unique ID of the node to reboot
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's reboot_node method

CLI Example:

```
salt myminion libcloud_compute.reboot_node as-2346 profile1
```

26.7.221 salt.modules.libcloud_dns

Apache Libcloud DNS Management

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

configuration

This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
    profile_test1:
      driver: cloudflare
      key: 12345
      secret: mysecret
```

(continues on next page)

(continued from previous page)

```
    profile_test2:
      driver: godaddy
      key: 12345
      secret: mysecret
      shopper_id: 12345
```

depends
apache-libcloud

`salt.modules.libcloud_dns.`**`create_record`**(*name*, *zone_id*, *type*, *data*, *profile*)

Create a new record.

Parameters

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (') for this argument.
- **zone_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2
↪profile1
```

`salt.modules.libcloud_dns.`**`create_zone`**(*domain*, *profile*, *type='master'*, *ttl=None*)

Create a new zone.

Parameters

- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.create_zone google.com profile1
```

`salt.modules.libcloud_dns.`**`delete_record`**(*zone_id*, *record_id*, *profile*)

Delete a record.

Parameters

- **zone_id** (str) -- Zone to delete.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

Return type
bool

CLI Example:

```
salt myminion libcloud_dns.delete_record google.com www profile1
```

salt.modules.libcloud_dns.**delete_zone**(*zone_id*, *profile*)

Delete a zone.

Parameters

- **zone_id** (str) -- Zone to delete.
- **profile** (str) -- The profile key

Return type

bool

CLI Example:

```
salt myminion libcloud_dns.delete_zone google.com profile1
```

salt.modules.libcloud_dns.**extra**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_container method

CLI Example:

```
salt myminion libcloud_dns.extra ex_get_permissions google container_
↪name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_dns.**get_bind_data**(*zone_id*, *profile*)

Export Zone to the BIND compatible format.

Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

Returns

Zone data in BIND compatible format.

Return type

str

CLI Example:

```
salt myminion libcloud_dns.get_bind_data google.com profile1
```

salt.modules.libcloud_dns.**get_record**(*zone_id*, *record_id*, *profile*)

Get record information for the given zone_id on the given profile

Parameters

- **zone_id** (str) -- Zone to export.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_record google.com www profile1
```

salt.modules.libcloud_dns.**get_zone**(*zone_id*, *profile*)

Get zone information for the given zone_id on the given profile

Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_zone google.com profile1
```

salt.modules.libcloud_dns.**list_record_types**(*profile*)

List available record types for the given profile, e.g. A, AAAA

Parameters

profile (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_record_types profile1
```

salt.modules.libcloud_dns.**list_records**(*zone_id*, *profile*, *type=None*)

List records for the given zone_id on the given profile

Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key
- **type** (str) -- The record type, e.g. A, NS

CLI Example:

```
salt myminion libcloud_dns.list_records google.com profile1
```

salt.modules.libcloud_dns.**list_zones**(*profile*)

List zones for the given profile

Parameters

profile (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_zones profile1
```

salt.modules.libcloud_dns.**update_zone**(*zone_id*, *domain*, *profile*, *type='master'*, *ttl=None*)

Update an existing zone.

Parameters

- **zone_id** (str) -- Zone ID to update.
- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.update_zone google.com google.com profile1
↪type=slave
```

26.7.222 salt.modules.libcloud_loadbalancer

Apache Libcloud Load Balancer Management

Connection module for Apache Libcloud Storage load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration

This module uses a configuration profile for one or multiple Storage providers

```
libcloud_loadbalancer:
    profile_test1:
      driver: gce
      key: GOOG0123456789ABCXYZ
      secret: mysecret
    profile_test2:
      driver: alb
      key: 12345
      secret: mysecret
```

depends

apache-libcloud

`salt.modules.libcloud_loadbalancer.`**`balancer_attach_member`**(*balancer_id*, *ip*, *port*, *profile*, *extra=None*, ***libcloud_kwargs*)

Add a new member to the load balancer

Parameters

- **`balancer_id`** (`str`) -- id of a load balancer you want to fetch
- **`ip`** (`str`) -- IP address for the new member
- **`port`** (`int`) -- Port for the new member
- **`profile`** (`str`) -- The profile key
- **`libcloud_kwargs`** (`dict`) -- Extra arguments for the driver's balancer_attach_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_attach_member balancer123 1.2.3.4
↪80 profile1
```

`salt.modules.libcloud_loadbalancer.`**`balancer_detach_member`**(*balancer_id*, *member_id*, *profile*, ***libcloud_kwargs*)

Add a new member to the load balancer

Parameters

- **`balancer_id`** (`str`) -- id of a load balancer you want to fetch
- **`ip`** (`str`) -- IP address for the new member
- **`port`** (`int`) -- Port for the new member
- **`profile`** (`str`) -- The profile key

- **libcloud_kwargs** (dict) -- Extra arguments for the driver's balancer_detach_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_detach_member balancer123
↪member123 profile1
```

salt.modules.libcloud_loadbalancer.**create_balancer**(*name*, *port*, *protocol*, *profile*, *algorithm=None*, *members=None*, ***libcloud_kwargs*)

Create a new load balancer instance

Parameters

- **name** (str) -- Name of the new load balancer (required)
- **port** (str) -- Port the load balancer should listen on, defaults to 80
- **protocol** (str) -- Loadbalancer protocol, defaults to http.
- **algorithm** (str) -- Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_balancer method

Returns

The details of the new balancer

CLI Example:

```
salt myminion libcloud_storage.create_balancer my_balancer 80 http
↪profile1
```

salt.modules.libcloud_loadbalancer.**destroy_balancer**(*balancer_id*, *profile*, ***libcloud_kwargs*)

Destroy a load balancer

Parameters

- **balancer_id** (str) -- LoadBalancer ID which should be used
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's destroy_balancer method

Returns

`True` if the destroy was successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt myminion libcloud_storage.destroy_balancer balancer_1 profile1
```

salt.modules.libcloud_loadbalancer.**extra**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key

- **libcloud_kwargs** (dict) -- Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_loadbalancer.extra ex_get_permissions google
↪container_name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_loadbalancer.**get_balancer**(*balancer_id*, *profile*, ***libcloud_kwargs*)

Get the details for a load balancer by ID

Parameters

- **balancer_id** (str) -- id of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_balancer method

Returns

the load balancer details

CLI Example:

```
salt myminion libcloud_storage.get_balancer balancer123 profile1
```

salt.modules.libcloud_loadbalancer.**get_balancer_by_name**(*name*, *profile*, ***libcloud_kwargs*)

Get the details for a load balancer by name

Parameters

- **name** (str) -- Name of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancers method

Returns

the load balancer details

CLI Example:

```
salt myminion libcloud_storage.get_balancer_by_name my_balancer profile1
```

salt.modules.libcloud_loadbalancer.**list_balancer_members**(*balancer_id*, *profile*, ***libcloud_kwargs*)

List the members of a load balancer

Parameters

- **balancer_id** (str) -- id of a load balancer you want to fetch
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancer_members method

CLI Example:

```
salt myminion libcloud_storage.list_balancer_members balancer123 profile1
```

salt.modules.libcloud_loadbalancer.**list_balancers**(*profile*, ***libcloud_kwargs*)

Return a list of load balancers.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancers method

CLI Example:

```
salt myminion libcloud_storage.list_balancers profile1
```

salt.modules.libcloud_loadbalancer.**list_protocols**(*profile*, ***libcloud_kwargs*)

Return a list of supported protocols.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_protocols method

Returns

a list of supported protocols

Return type

list of str

CLI Example:

```
salt myminion libcloud_storage.list_protocols profile1
```

salt.modules.libcloud_loadbalancer.**list_supported_algorithms**(*profile*, ***libcloud_kwargs*)

Get the supported algorithms for a profile

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_supported_algorithms method

Returns

The supported algorithms

CLI Example:

```
salt myminion libcloud_storage.list_supported_algorithms profile1
```

26.7.223 salt.modules.libcloud_storage

Apache Libcloud Storage Management

Connection module for Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

configuration

This module uses a configuration profile for one or multiple Storage providers

```
libcloud_storage:
    profile_test1:
```

(continues on next page)

(continued from previous page)

```
    driver: google_storage
    key: GOOG0123456789ABCXYZ
    secret: mysecret

    driver: s3
    key: 12345
    secret: mysecret
```

depends
apache-libcloud

salt.modules.libcloud_storage.**create_container**(*container_name*, *profile*, ***libcloud_kwargs*)

Create a container in the cloud

Parameters

- **container_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_container method

CLI Example:

```
salt myminion libcloud_storage.create_container MyFolder profile1
```

salt.modules.libcloud_storage.**delete_container**(*container_name*, *profile*, ***libcloud_kwargs*)

Delete an object container in the cloud

Parameters

- **container_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_container method

Returns
True if an object container has been successfully deleted, False otherwise.

Return type
bool

CLI Example:

```
salt myminion libcloud_storage.delete_container MyFolder profile1
```

salt.modules.libcloud_storage.**delete_object**(*container_name*, *object_name*, *profile*, ***libcloud_kwargs*)

Delete an object in the cloud

Parameters

- **container_name** (str) -- Container name
- **object_name** (str) -- Object name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_object method

Returns
True if an object has been successfully deleted, False otherwise.

Return type
bool

CLI Example:

```
salt myminion libcloud_storage.delete_object MyFolder me.jpg profile1
```

salt.modules.libcloud_storage.**download_object**(*container_name*, *object_name*, *destination_path*, *profile*, *overwrite_existing=False*, *delete_on_failure=True*, ***libcloud_kwargs*)

Download an object to the specified destination path.

Parameters

- **container_name** (str) -- Container name
- **object_name** (str) -- Object name
- **destination_path** (str) -- Full path to a file or a directory where the incoming file will be saved.
- **profile** (str) -- The profile key
- **overwrite_existing** (bool) -- True to overwrite an existing file, defaults to False.
- **delete_on_failure** (bool) -- True to delete a partially downloaded file if the download was not successful (hash mismatch / file size).
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's download_object method

Returns
True if an object has been successfully downloaded, False otherwise.

Return type
bool

CLI Example:

```
salt myminion libcloud_storage.download_object MyFolder me.jpg /tmp/me.
↪jpg profile1
```

salt.modules.libcloud_storage.**extra**(*method*, *profile*, ***libcloud_kwargs*)

Call an extended method on the driver

Parameters

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's delete_container method

CLI Example:

```
salt myminion libcloud_storage.extra ex_get_permissions google container_
↪name=my_container object_name=me.jpg --out=yaml
```

salt.modules.libcloud_storage.**get_container**(*container_name*, *profile*, ***libcloud_kwargs*)

List container details for the given container_name on the given profile

Parameters

- **container_name** (str) -- Container name
- **profile** (str) -- The profile key

- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_container method

CLI Example:

```
salt myminion libcloud_storage.get_container MyFolder profile1
```

salt.modules.libcloud_storage.**get_container_object**(*container_name*, *object_name*, *profile*, ***libcloud_kwargs*)

Get the details for a container object (file or object in the cloud)

Parameters

- **container_name** (str) -- Container name
- **object_name** (str) -- Object name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_container_object method

CLI Example:

```
salt myminion libcloud_storage.get_container_object MyFolder MyFile.xyz
↪profile1
```

salt.modules.libcloud_storage.**list_container_objects**(*container_name*, *profile*, ***libcloud_kwargs*)

List container objects (e.g. files) for the given container_id on the given profile

Parameters

- **container_name** (str) -- Container name
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_container_objects method

CLI Example:

```
salt myminion libcloud_storage.list_container_objects MyFolder profile1
```

salt.modules.libcloud_storage.**list_containers**(*profile*, ***libcloud_kwargs*)

Return a list of containers.

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_containers method

CLI Example:

```
salt myminion libcloud_storage.list_containers profile1
```

salt.modules.libcloud_storage.**upload_object**(*file_path*, *container_name*, *object_name*, *profile*, *extra=None*, *verify_hash=True*, *headers=None*, ***libcloud_kwargs*)

Upload an object currently located on a disk.

Parameters

- **file_path** (str) -- Path to the object on disk.

- **container_name** (str) -- Destination container.
- **object_name** (str) -- Object name.
- **profile** (str) -- The profile key
- **verify_hash** (bool) -- Verify hash
- **extra** (dict) -- Extra attributes (driver specific). (optional)
- **headers** (dict) -- (optional) Additional request headers, such as CORS headers. For example: headers = {'Access-Control-Allow-Origin': 'http://mozilla.com'}
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's upload_object method

Returns
The object name in the cloud

Return type
str

CLI Example:

```
salt myminion libcloud_storage.upload_object /file/to/me.jpg MyFolder me.
↪jpg profile1
```

26.7.224 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the *getfacl* and *setfacl* binaries.

salt.modules.linux_acl.**delfacl**(*acl_type*, *acl_name=''*, **args*, ***kwargs*)

Remove specific FACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

salt.modules.linux_acl.**getfacl**(**args*, ***kwargs*)

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
↪recursive=True
```

salt.modules.linux_acl.**modfacl**(*acl_type*, *acl_name=''*, *perms=''*, **args*, ***kwargs*)

Add or modify a FACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen raise_err=True
```

salt.modules.linux_acl.**version**()

Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

salt.modules.linux_acl.**wipefacls**(**args*, ***kwargs*)

Remove all FACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
↪recursive=True
```

26.7.225 salt.modules.linux_ip

The networking module for Non-RH/Deb Linux distros

salt.modules.linux_ip.**down**(*iface*, *iface_type=None*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.linux_ip.**get_interface**(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.linux_ip.**get_routes**(*iface=None*)

Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

salt.modules.linux_ip.**up**(*iface*, *iface_type=None*)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

26.7.226 salt.modules.linux_lvm

Support for Linux LVM2

salt.modules.linux_lvm.**fullversion**()

Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

salt.modules.linux_lvm.**lvcreate**(*lvname*, *vgname*, *size=None*, *extents=None*, *snapshot=None*, *pv=None*, *thinvolume=False*, *thinpool=False*, *force=False*, ***kwargs*)

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name     vg_name size=10G
salt '*' lvm.lvcreate new_volume_name     vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot        vg_name snapshot=volume_name
↪size=3G
```

New in version 0.12.0.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name   vg_name               size=20G
↪thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G
↪thinvolume=True
```

salt.modules.linux_lvm.**lvdisplay**(*lvname=''*, *quiet=False*)

Return information about the logical volume(s)

lvname
: logical device name

quiet
: if the logical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

salt.modules.linux_lvm.**lvextend**(*size=None*, *lvpath=None*, *extents=None*, *force=False*, *resizefs=False*)

Increase a logical volume to specific size.

CLI Examples:

```
salt '*' lvm.lvextend +12M /dev/mapper/vg1-test
salt '*' lvm.lvextend lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

salt.modules.linux_lvm.**lvremove**(*lvname*, *vgname*, *force=True*)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvremove lvname vgname force=True
```

salt.modules.linux_lvm.**lvresize**(*size=None*, *lvpath=None*, *extents=None*, *force=False*, *resizefs=False*)

Resize a logical volume to specific size.

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

salt.modules.linux_lvm.**pvcreate**(*devices*, *override=True*, *force=True*, ***kwargs*)

Set a physical device to be used as an LVM physical volume

override

Skip devices, if they are already LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

salt.modules.linux_lvm.**pvdisplay**(*pvname=''*, *real=False*, *quiet=False*)

Return information about the physical volume(s)

pvname

physical device name

real

dereference any symlinks and report the real device

New in version 2015.8.7.

quiet

if the physical volume is not present, do not show any error

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

salt.modules.linux_lvm.**pvremove**(*devices*, *override=True*, *force=True*)

Remove a physical device being used as an LVM physical volume

override

Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

salt.modules.linux_lvm.**pvresize**(*devices*, *override=True*, *force=True*)

Resize a LVM physical volume to the physical device size

override

Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvresize /dev/sdb1,/dev/sdb2
```

salt.modules.linux_lvm.**version**()

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

salt.modules.linux_lvm.**vgcreate**(*vgname*, *devices*, *force=False*, ***kwargs*)

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

salt.modules.linux_lvm.**vgdisplay**(*vgname=''*, *quiet=False*)

Return information about the volume group(s)

vgname
: volume group name

quiet
: if the volume group is not present, do not show any error

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

salt.modules.linux_lvm.**vgextend**(*vgname*, *devices*, *force=False*)

Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

salt.modules.linux_lvm.**vgremove**(*vgname*, *force=True*)

Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

26.7.227 salt.modules.linux_service

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

salt.modules.linux_service.**available**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.linux_service.**get_all**()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.linux_service.**missing**(*name*)

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.linux_service.**reload_**(*name*)

Refreshes config files by calling service reload. Does not perform a full restart.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.linux_service.**restart**(*name*)

Restart the specified service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.linux_service.**run**(*name*, *action*)

Run the specified service with an action.

New in version 2015.8.1.

name
: Service name.

action
: Action name (like start, stop, reload, restart).

CLI Example:

```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
```

salt.modules.linux_service.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.linux_service.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to PID or empty string is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check

- **sig** (*str*) -- Signature to use to find the service via ps

Returns
PID if running, empty otherwise dict: Maps service name to PID if running, empty string otherwise

Return type
string

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.linux_service.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.228 salt.modules.linux_shadow

Manage the shadow file on Linux systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

salt.modules.linux_shadow.**default_hash**()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.linux_shadow.**del_password**(*name*, *root=None*)

New in version 2014.7.0.

Delete the password from name user

name
User to delete

root
Directory to chroot into

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.linux_shadow.**gen_password**(*password*, *crypt_salt=None*, *algorithm='sha512'*)

New in version 2014.7.0.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password
Plaintext password to be hashed.
crypt_salt
Crpytographic salt. If not given, a random 8-character salt will be generated.
algorithm
The following hash algorithms are supported:
- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↪algorithm=sha256
```

`salt.modules.linux_shadow.`**`info`**(*name*, *root=None*)

Return information for the specified user
name
User to get the information for
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.linux_shadow.`**`list_users`**(*root=None*)

New in version 2018.3.0.

Return a list of all shadow users
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.list_users
```

`salt.modules.linux_shadow.`**`lock_password`**(*name*, *root=None*)

New in version 2016.11.0.

Lock the password from specified user
name
User to lock
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.lock_password username
```

`salt.modules.linux_shadow.`**`set_date`**(*name*, *date*, *root=None*)

Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man chage.
name
User to modify

date
Date the password was last changed
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_date username 0
```

salt.modules.linux_shadow.**set_expire**(*name*, *expire*, *root=None*)

Changed in version 2014.7.0.

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man chage.
name
User to modify
date
Date the account expires
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_expire username -1
```

salt.modules.linux_shadow.**set_inactdays**(*name*, *inactdays*, *root=None*)

Set the number of days of inactivity after a password has expired before the account is locked. See man chage.
name
User to modify
inactdays
Set password inactive after this number of days
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_inactdays username 7
```

salt.modules.linux_shadow.**set_maxdays**(*name*, *maxdays*, *root=None*)

Set the maximum number of days during which a password is valid. See man chage.
name
User to modify
maxdays
Maximum number of days during which a password is valid
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

salt.modules.linux_shadow.**set_mindays**(*name*, *mindays*, *root=None*)

Set the minimum number of days between password changes. See man chage.
name
User to modify
mindays
Minimum number of days between password changes

root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_mindays username 7
```

salt.modules.linux_shadow.**set_password**(*name*, *password*, *use_usermod=False*, *root=None*)

Set the password for a named user. The password must be a properly defined hash. A password hash can be generated with *gen_password()*.
name
User to set the password
password
Password already hashed
use_usermod
Use usermod command to better compatibility
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..'
```

salt.modules.linux_shadow.**set_warndays**(*name*, *warndays*, *root=None*)

Set the number of days of warning before a password change is required. See man chage.
name
User to modify
warndays
Number of days of warning before a password change is required
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.set_warndays username 7
```

salt.modules.linux_shadow.**unlock_password**(*name*, *root=None*)

New in version 2016.11.0.

Unlock the password from name user
name
User to unlock
root
Directory to chroot into
CLI Example:

```
salt '*' shadow.unlock_password username
```

26.7.229 salt.modules.linux_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.linux_sysctl.**assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

salt.modules.linux_sysctl.**default_config**()

Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

salt.modules.linux_sysctl.**get**(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

salt.modules.linux_sysctl.**persist**(*name*, *value*, *config=None*)

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using *sysctl.default_config*.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

salt.modules.linux_sysctl.**show**(*config_file=False*)

Return a list of sysctl parameters for this minion

config: **Pull the data from the system configuration file**
instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.7.230 salt.modules.localemod

Module for managing locales on POSIX-like systems.

salt.modules.localemod.**avail**(*locale*)

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

salt.modules.localemod.**gen_locale**(*locale*, ***kwargs*)

Generate a locale. Options:

New in version 2014.7.0.

Parameters

locale -- Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

verbose

Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8'    # Debian/Gentoo only
```

salt.modules.localemod.**get_locale**()

Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

salt.modules.localemod.**list_avail**()

Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

salt.modules.localemod.**set_locale**(*locale*)

Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

26.7.231 salt.modules.locate

Module for using the locate utilities

salt.modules.locate.**locate**(*pattern*, *database=''*, *limit=0*, ***kwargs*)

Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

salt.modules.locate.**stats**()

Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

salt.modules.locate.**updatedb**()

Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

salt.modules.locate.**version**()

Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

26.7.232 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

salt.modules.logadm.**list_conf**(*conf_file='/etc/logadm.conf'*, *log_file=None*, *include_unset=False*)

Show parsed configuration

New in version 2018.3.0.

conf_file
: [string] path to logadm.conf, defaults to /etc/logadm.conf

log_file
: [string] optional show only one log file

include_unset
: [boolean] include unset flags in output

CLI Example:

```
salt '*' logadm.list_conf
salt '*' logadm.list_conf log=/var/log/syslog
salt '*' logadm.list_conf include_unset=False
```

salt.modules.logadm.**remove**(*name*, *conf_file='/etc/logadm.conf'*)

Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

salt.modules.logadm.**rotate**(*name*, *pattern=None*, *conf_file='/etc/logadm.conf'*, ***kwargs*)

Set up pattern for logging.

name
: [string] alias for entryname

pattern
: [string] alias for log_file

conf_file
: [string] optional path to alternative configuration file

kwargs
: [boolean|string|int] optional additional flags and parameters

---

Note: `name` and `pattern` were kept for backwards compatibility reasons.

`name` is an alias for the `entryname` argument, `pattern` is an alias for `log_file`. These aliases will only be used if the `entryname` and `log_file` arguments are not passed.

For a full list of arguments see ``logadm.show_args``.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
salt '*' logadm.rotate myapplog log_file='/var/log/myapp/*.log' count=4
↪owner=myappd mode='0700'
```

salt.modules.logadm.**show_args**()

Show which arguments map to which flags and options.

New in version 2018.3.0.

CLI Example:

```
salt '*' logadm.show_args
```

salt.modules.logadm.**show_conf**(*conf_file='/etc/logadm.conf'*, *name=None*)

Show configuration

conf_file
: [string] path to logadm.conf, defaults to /etc/logadm.conf

name
: [string] optional show only a single entry

CLI Example:

```
salt '*' logadm.show_conf
salt '*' logadm.show_conf name=/var/log/syslog
```

26.7.233 salt.modules.logmod

On-demand logging

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{%- for var in range(10) %}
  {%- do salt["log.info"](var) -%}
{%- endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

salt.modules.logmod.**critical**(*message*)

Log message at level CRITICAL.

salt.modules.logmod.**debug**(*message*)

Log message at level DEBUG.

salt.modules.logmod.**error**(*message*)

Log message at level ERROR.

salt.modules.logmod.**exception**(*message*)

Log message at level EXCEPTION.

salt.modules.logmod.**info**(*message*)

Log message at level INFO.

salt.modules.logmod.**warning**(*message*)

Log message at level WARNING.

26.7.234 salt.modules.logrotate

Module for managing logrotate.

salt.modules.logrotate.**get**(*key*, *value=None*, *conf_file='/etc/logrotate.conf'*)

Get the value for a specific configuration line.

Parameters

- **key** (*str*) -- The command or stanza block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **conf_file** (*str*) -- The logrotate configuration file.

Returns

The value for a specific configuration line.

Return type

bool|int|str

CLI Example:

```
salt '*' logrotate.get rotate

salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

salt.modules.logrotate.**set_**(*key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*)

Set a new value for a specific configuration line.

Parameters

- **key** (*str*) -- The command or block to configure.

- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf_file** (*str*) -- The logrotate configuration file.

Returns
A boolean representing whether all changes succeeded.

Return type
bool

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

`salt.modules.logrotate.`**`show_conf`**(*conf_file='/etc/logrotate.conf'*)

Show parsed configuration

Parameters
conf_file (*str*) -- The logrotate configuration file.

Returns
The parsed configuration.

Return type
dict

CLI Example:

```
salt '*' logrotate.show_conf
```

26.7.235 salt.modules.lvs

Support for LVS (Linux Virtual Server)

`salt.modules.lvs.`**`add_server`**(*protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method='dr'*, *weight=1*, ***kwargs*)

Add a real server to a virtual service.

protocol
The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address
The LVS service address.

server_address
The real server address.
packet_forward_method
The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).
weight
The capacity of a server relative to the others in the pool.
CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

`salt.modules.lvs.`**`add_service`**(*protocol=None*, *service_address=None*, *scheduler='wlc'*)

Add a virtual service.
protocol
The service protocol(only support tcp, udp and fwmark service).
service_address
The LVS service address.
scheduler
Algorithm for allocating TCP connections and UDP datagrams to real servers.
CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

`salt.modules.lvs.`**`check_server`**(*protocol=None*, *service_address=None*, *server_address=None*, ***kwargs*)

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

`salt.modules.lvs.`**`check_service`**(*protocol=None*, *service_address=None*, ***kwargs*)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

`salt.modules.lvs.`**`clear`**()

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

`salt.modules.lvs.`**`delete_server`**(*protocol=None*, *service_address=None*, *server_address=None*)

Delete the realserver from the virtual service.
protocol
The service protocol(only support `tcp`, `udp` and `fwmark` service).
service_address
The LVS service address.
server_address
The real server address.
CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

salt.modules.lvs.**delete_service**(*protocol=None*, *service_address=None*)

Delete the virtual service.

protocol
: The service protocol(only support tcp, udp and fwmark service).

service_address
: The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

salt.modules.lvs.**edit_server**(*protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method=None*, *weight=None*, ***kwargs*)

Edit a real server to a virtual service.

protocol
: The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address
: The LVS service address.

server_address
: The real server address.

packet_forward_method
: The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

weight
: The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.**edit_service**(*protocol=None*, *service_address=None*, *scheduler=None*)

Edit the virtual service.

protocol
: The service protocol(only support tcp, udp and fwmark service).

service_address
: The LVS service address.

scheduler
: Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.**get_rules**()

Get the virtual server rules

CLI Example:

```
salt '*' lvs.get_rules
```

salt.modules.lvs.**list_**(*protocol=None*, *service_address=None*)

List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

salt.modules.lvs.**zero**(*protocol=None*, *service_address=None*)

Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

26.7.236 salt.modules.lxc

Control Linux Containers via Salt

depends
lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

salt.modules.lxc.**add_veth**(*name*, *interface_name*, *bridge=None*, *path=None*)

Add a veth to a container. Note : this function doesn't update the container config, just add the interface at runtime

name
Name of the container

interface_name
Name of the interface in the container

bridge
Name of the bridge to attach the interface to (facultative)

CLI Examples:

```
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

salt.modules.lxc.**apply_network_profile**(*name*, *network_profile*, *nic_opts=None*, *path=None*)

New in version 2015.5.0.

Apply a network profile to a container

network_profile
profile name or default values (dict)

nic_opts
values to override in defaults (dict) indexed by nic card names

path
path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
        nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
salt 'minion' lxc.apply_network_profile web1 \
        "{'eth0': {'mac': 'xx:xx:xx:xx:xx:yy'}}"
        nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
```

The special case to disable use of ethernet nics:

```
salt 'minion' lxc.apply_network_profile web1 centos \
       "{eth0: {disable: true}}"
```

salt.modules.lxc.**attachable**(*name*, *path=None*)

Return True if the named container can be attached to via the lxc-attach command

path

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt 'minion' lxc.attachable ubuntu
```

salt.modules.lxc.**bootstrap**(*name*, *config=None*, *approve_key=True*, *install=True*, *pub_key=None*, *priv_key=None*, *bootstrap_url=None*, *force_install=False*, *unconditional_install=False*, *path=None*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*)

Install and configure salt in a container.

config

Minion configuration options. By default, the `master` option is set to the target host's master.

approve_key

Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: `True`

path

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

pub_key

Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

priv_key

Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

bootstrap_delay

Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url

url, content or filepath to the salt bootstrap script

bootstrap_args

salt bootstrap script arguments

bootstrap_shell

shell to execute the script into

install

Whether to attempt a full installation of salt-minion if needed.

force_install

Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install

Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \
        [approve_key=(True|False)] [install=(True|False)]
```

salt.modules.lxc.**clone**(*name*, *orig*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container as a clone of another container

name
: Name of the container

orig
: Name of the original container to be cloned

profile
: Profile to use in container cloning (see *lxc.get_container_profile*). Values in a profile will be overridden by the **Container Cloning Arguments** listed below.

path
: path to the container parent directory default: /var/lib/lxc (system)

  New in version 2015.8.0.

Container Cloning Arguments

snapshot
: Use Copy On Write snapshots (LVM)

size
: [1G] Size of the volume to create. Only applicable if `backing=lvm`.

backing
: The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

network_profile
: Network profile to use for container

  New in version 2015.8.0.

nic_opts
: give extra opts overriding network profile values

  New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

salt.modules.lxc.**cloud_init**(*name*, *vm_=None*, ***kwargs*)

Thin wrapper to lxc.init to be used from the saltcloud lxc driver

name
: Name of the container may be None and then guessed from saltcloud mapping

vm_
: saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

salt.modules.lxc.**cloud_init_interface**(*name*, *vm_=None*, ***kwargs*)

Interface between salt.cloud.lxc driver and lxc.init `vm_` is a mapping of vm opts in the salt.cloud format as documented for the lxc driver.

This can be used either:

- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

Warning: BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

name
: name of the lxc container to create

pub_key
: public key to preseed the minion with. Can be the keycontent or a filepath

priv_key
: private key to preseed the minion with. Can be the keycontent or a filepath

path
: path to the container parent directory (default: /var/lib/lxc)

  New in version 2015.8.0.

profile
: *profile* selection

network_profile
: *network profile* selection

nic_opts
: per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

  eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
            'gateway': None, (default)
            'link': 'br0', (default)
            'gateway': None, (default)
            'netmask': '', (default)
            'ip': '22.1.4.25'}}
```

unconditional_install
: given to lxc.bootstrap (see relative doc)

force_install
: given to lxc.bootstrap (see relative doc)

config
: any extra argument for the salt minion config

dnsservers
: list of DNS servers to set inside the container

dns_via_dhcp
: do not set the dns servers, let them be set by the dhcp.

autostart
: autostart the container at boot time

password
: administrative password for the container

bootstrap_delay
: delay before launching bootstrap script at Container init

Warning: Legacy but still supported options:

from_container
: which container we use as a template when running lxc.clone

image
: which template do we use when we are using lxc.create. This is the default mode unless you specify something in from_container

backing
: which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, brtfs

fstype
: When using a blockdevice level backing store, which filesystem to use on

size
: When using a blockdevice level backing store, which size for the filesystem to use on

snapshot
: Use snapshot when cloning the container source

vgname
: if using LVM: vgname

lvname
: if using LVM: lvname

thinpool:
: if using LVM: thinpool

ip
: ip for the primary nic

mac
: mac address for the primary nic

netmask
: netmask for the primary nic (24) = `vm_.get('netmask', '24')`

bridge
: bridge for the primary nic (lxcbr0)

gateway
: network gateway for the container

additional_ips
: additional ips which will be wired on the main bridge (br0) which is connected to internet. Be aware that you may use manual virtual mac addresses providen by you provider (online, ovh, etc). This is a list of mappings {ip: '', mac: '', netmask:''} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:

```
- {'mac': '00:16:3e:01:29:40',
   'gateway': None, (default)
   'link': 'br0', (default)
   'netmask': '', (default)
   'ip': '22.1.4.25'}
```

users
: administrative users for the container default: [root] and [root, ubuntu] on ubuntu

default_nic
: name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

`salt.modules.lxc.`**`copy_to`**(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*, *path=None*)

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

name
: Container name

source
: File to be copied to the container

path
: path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

dest
: Destination on the container. Must be an absolute path.

  Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

overwrite
: [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

  New in version 2015.8.0.

makedirs : False
: Create the parent directory on the container if it does not already exist.

  New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

`salt.modules.lxc.`**`cp`**(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*, *path=None*)

This function is an alias of `copy_to`.

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

name
: Container name

source
: File to be copied to the container

path
: path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

dest
: Destination on the container. Must be an absolute path.

  Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

overwrite
: [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

  New in version 2015.8.0.

makedirs : False
: Create the parent directory on the container if it does not already exist.

  New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

salt.modules.lxc.**create**(*name*, *config=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container.

name

Name of the container

config

The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).

profile

Profile to use in container creation (see *lxc.get_container_profile*). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

network_profile

Network profile to use for container

New in version 2015.5.0.

Container Creation Arguments

template

The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the *lxc.templates* function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the *lxc.images* function.

---

options

Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options='{"dist": "centos", "release": "6", "arch": "amd64"}'
```

For available template options, refer to the lxc template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

image

A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing

The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

fstype

Filesystem type to use on LVM logical volume

size

[1G] Size of the volume to create. Only applicable if `backing=lvm`.

vgname

[lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

lvname

Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

thinpool
Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

nic_opts
give extra opts overriding network profile values

path
parent path for the container creation (default: /var/lib/lxc)

zfsroot
Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: tank/lxc)

New in version 2015.8.0.

`salt.modules.lxc.`**`destroy`**(*name*, *stop=False*, *path=None*)

Destroy the named container.

> **Warning**: Destroys all data associated with the container.

path
path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

stop
[False] If `True`, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

`salt.modules.lxc.`**`edit_conf`**(*conf_file*, *out_format='simple'*, *read_only=False*, *lxc_config=None*, ***kwargs*)

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

out_format:
Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

read_only:
return only the edited configuration without applying it to the underlying lxc configuration file

lxc_config:
List of dict containning lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatchs, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in `simple` format, meaning an unordered dict (which may not represent the actual file order). Passing in an `out_format` of `commented` will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
    out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
```

(continues on next page)

(continued from previous page)

```
    out_format=commented \
    lxc_config="[{'lxc.network.name': 'eth0', \
                  'lxc.network.ipv4': '1.2.3.4'},
                 {'lxc.network.name': 'eth2', \
                  'lxc.network.ipv4': '1.2.3.5',\
                  'lxc.network.gateway': '1.2.3.1'}]"
```

salt.modules.lxc.**exists**(*name*, *path=None*)

Returns whether the named container exists.

path

path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

salt.modules.lxc.**freeze**(*name*, ***kwargs*)

Freeze the named container

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

start

[False] If `True` and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

use_vt

run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

salt.modules.lxc.**get_container_profile**(*name=None*, ***kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using *config.get*. The key under which LXC profiles must be configured is `lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
  ubuntu:
    template: ubuntu
    backing: lvm
    vgname: lxc
    size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to *lxc.create*) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu
↪backing=overlayfs
```

`salt.modules.lxc.`**`get_network_profile`**(*name=None*, ***kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
  eth0:
    link: br0
    type: veth
    flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use network profiles.

Warning: The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.`**`get_parameter`**(*name*, *parameter*, *path=None*)

Returns the value of a cgroup parameter for a container

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

salt.modules.lxc.**get_pid**(*name*, *path=None*)

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

salt.modules.lxc.**get_root_path**(*path*)

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

salt.modules.lxc.**images**(*dist=None*)

New in version 2015.5.0.

List the available images for LXC's `download` template.

dist

[None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

salt.modules.lxc.**info**(*name*, *path=None*)

Returns information about a container

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.info name
```

salt.modules.lxc.**init**(*name*, *config=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *cpu=None*, *autostart=True*, *password=None*, *password_encrypted=None*, *users=None*, *dnsservers=None*, *searchdomains=None*, *bridge=None*, *gateway=None*, *pub_key=None*, *priv_key=None*, *force_install=False*, *unconditional_install=False*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*, *bootstrap_url=None*, ***kwargs*)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

name

Name of the container

image

A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

cpus

Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset
Explicitly define the cpus this container will be bound to

cpushare
cgroups cpu shares

autostart
autostart container on reboot

memory
cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

gateway
the ipv4 gateway to use the default does nothing more than lxcutils does

bridge
the bridge to use the default does nothing more than lxcutils does

network_profile
Network profile to use for the container

New in version 2015.5.0.

nic_opts
Extra options for network interfaces, will override

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
"2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24",
"ipv6": "2001:db8::ff00:42:8329"}}
```

users
Users for which the password defined in the `password` param should be set. Can be passed as a comma separated list or a python list. Defaults to just the `root` user.

password
Set the initial password for the users defined in the `users` parameter

password_encrypted
[False] Set to `True` to denote a password hash instead of a plaintext password

New in version 2015.5.0.

profile
A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

start
Start the newly-created container

dnsservers
list of dns servers to set in the container, default [] (no setting)

seed
Seed the container with the minion config. Default: `True`

install
If salt-minion is not already installed, install it. Default: `True`

config
Optional config parameters. By default, the id is set to the name of the container.

master
salt master (default to minion's master)

master_port
salt master port (default to minion's master port)

pub_key

Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key

priv_key
Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key

approve_key
If explicit preseeding is not used; Attempt to request key approval from the master. Default: `True`

path
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

clone_from
Original from which to use a clone operation to create the container. Default: `None`

bootstrap_delay
Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url
See lxc.bootstrap

bootstrap_shell
See lxc.bootstrap

bootstrap_args
See lxc.bootstrap

force_install
Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install
Run the script even if the container seems seeded

CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
        [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
        [nic=nic_profile] [profile=lxc_profile] \
        [nic_opts=nic_opts] [start=(True|False)] \
        [seed=(True|False)] [install=(True|False)] \
        [config=minion_config] [approve_key=(True|False) \
        [clone_from=original] [autostart=True] \
        [priv_key=/path_or_content] [pub_key=/path_or_content] \
        [bridge=lxcbr0] [gateway=10.0.3.1] \
        [dnsservers[dns1,dns2]] \
        [users=[foo]] [password='secret'] \
        [password_encrypted=(True|False)]
```

`salt.modules.lxc.`**`list_`**(*extra=False*, *limit=None*, *path=None*)

List containers classified by state

extra
Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from *`lxc.info`*.

path
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

limit
Return output matching a specific state (**frozen**, **running**, or **stopped**).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

salt.modules.lxc.**ls_**(*active=None*, *cache=True*, *path=None*)

Return a list of the containers available on the minion

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

active

If `True`, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

salt.modules.lxc.**read_conf**(*conf_file*, *out_format='simple'*)

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

out_format:

set to 'simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

salt.modules.lxc.**reboot**(*name*, *path=None*)

Reboot a container.

path

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

salt.modules.lxc.**reconfigure**(*name*, *cpu=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *bridge=None*, *gateway=None*, *autostart=None*, *utsname=None*, *rootfs=None*, *path=None*, ***kwargs*)

Reconfigure a container.

This only applies to a few property

name

Name of the container.

utsname

utsname of the container.

New in version 2016.3.0.

rootfs
rootfs of the container.

New in version 2016.3.0.

cpu
Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset
Explicitly define the cpus this container will be bound to

cpushare
cgroups cpu shares.

autostart
autostart container on reboot

memory
cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

gateway
the ipv4 gateway to use the default does nothing more than lxcutils does

bridge
the bridge to use the default does nothing more than lxcutils does

nic
Network interfaces profile (defined in config or pillar).

nic_opts
Extra options for network interfaces, will override

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
"2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6":
"2001:db8::ff00:42:8329"}}
```

path
path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{'eth1': {'mac':
↪'00:16:3e:dd:ee:44'}}" memory=4
```

`salt.modules.lxc.`**`remove`**(*name*, *stop=False*, *path=None*)

This function is an alias of `destroy`.

Destroy the named container.

> **Warning:** Destroys all data associated with the container.

path
path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

stop
[False] If `True`, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

salt.modules.lxc.**restart**(*name*, *path=None*, *lxc_config=None*, *force=False*)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

name
The name of the container

path
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config
path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

force
[False] If `True`, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

salt.modules.lxc.**retcode**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy,https_proxy,no_proxy'*)

New in version 2015.5.0.

Run *cmd.retcode* within a container

> **Warning**: Many shell builtins do not work, failing with stderr similar to the following:
>
> ```
> lxc_container: No such file or directory - failed to exec 'command'
> ```
>
> The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using *lxc.run_stderr* or *lxc.run_all*.

name
Name of the container in which to run the command

cmd
Command to run

no_start
[False] If the container is not running, don't start it

preserve_state
[True] After running the command, return the container to its previous state

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

stdin
[None] Standard input to be used for the command

output_loglevel
[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env
: [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback
: if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.retcode mycontainer 'ip addr show'
```

salt.modules.lxc.**run**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy,https_proxy,no_proxy'*)

New in version 2015.8.0.

Run *cmd.run* within a container

> **Warning**: Many shell builtins do not work, failing with stderr similar to the following:
>
> ```
> lxc_container: No such file or directory - failed to exec 'command'
> ```
>
> The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using *lxc.run_stderr* or *lxc.run_all*.

name
: Name of the container in which to run the command

cmd
: Command to run

path
: path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

chroot_fallback
: if the container is not running, try to run the command using chroot default: false

keep_env
: [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

salt.modules.lxc.**run_all**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy,https_proxy,no_proxy'*)

New in version 2015.5.0.

Run *cmd.run_all* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist.

name
: Name of the container in which to run the command

path
: path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

cmd
: Command to run

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env
: [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback
: if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

salt.modules.lxc.**run_stderr**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy,https_proxy,no_proxy'*)

New in version 2015.5.0.

Run *cmd.run_stderr* within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

name
: Name of the container in which to run the command

cmd
: Command to run

path
: path to the container parent default: /var/lib/lxc (system default)

  New in version 2015.8.0.

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env
: [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback
: if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

`salt.modules.lxc.`**`run_stdout`**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy,https_proxy,no_proxy'*)

New in version 2015.5.0.

Run *`cmd.run_stdout`* within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using *`lxc.run_stderr`* or *`lxc.run_all`*.

name
: Name of the container in which to run the command

cmd
: Command to run

path
: path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env
: [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback
: if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.lxc.`**`running_systemd`**(*name*, *cache=True*, *path=None*)

Determine if systemD is running

path
: path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

`salt.modules.lxc.`**`search_lxc_bridge`**()

Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

`salt.modules.lxc.`**`search_lxc_bridges`**()

Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_bridges
```

`salt.modules.lxc.`**`set_dns`**(*name*, *dnsservers=None*, *searchdomains=None*, *path=None*)

Changed in version 2015.5.0: The `dnsservers` and `searchdomains` parameters can now be passed as a comma-separated list.

Update /etc/resolv.confo

path
: path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

salt.modules.lxc.**set_parameter**(*name*, *parameter*, *value*, *path=None*)

Set the value of a cgroup parameter for a container.

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_parameter name parameter value
```

salt.modules.lxc.**set_pass**(*name*, *users*, *password*, *encrypted=True*, *path=None*)

This function is an alias of `set_password`.

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

users

Comma-separated list (or python list) of users to change password

password

Password to set for the specified user(s)

encrypted

[True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↪0fXtJOPcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCBOqgbfdKQSFnAo28/
↪ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.**set_password**(*name*, *users*, *password*, *encrypted=True*, *path=None*)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

users

Comma-separated list (or python list) of users to change password

password

Password to set for the specified user(s)

encrypted

[True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↪0fXtJOPcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCBOqgbfdKQSFnAo28/
↪ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.**start**(*name*, ***kwargs*)

Start the named container

path
: path to the container parent directory default: /var/lib/lxc (system)

  New in version 2015.8.0.

lxc_config
: path to a lxc config file config file will be guessed from container name otherwise

  New in version 2015.8.0.

use_vt
: run the command through VT

  New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.start name
```

salt.modules.lxc.**state**(*name*, *path=None*)

Returns the state of a container.

path
: path to the container parent directory (default: /var/lib/lxc)

  New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.state name
```

salt.modules.lxc.**stop**(*name*, *kill=False*, *path=None*, *use_vt=None*)

Stop the named container

path
: path to the container parent directory default: /var/lib/lxc (system)

  New in version 2015.8.0.

kill: **False**
: Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

  Changed in version 2015.5.0: Default value changed to `False`

use_vt
: run the command through VT

  New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

salt.modules.lxc.**systemd_running_state**(*name*, *path=None*)

Get the operational state of a systemd based container

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

salt.modules.lxc.**templates**()

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

salt.modules.lxc.**test_bare_started_state**(*name*, *path=None*)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

salt.modules.lxc.**test_sd_started_state**(*name*, *path=None*)

Test if a systemd container is fully started

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

salt.modules.lxc.**unfreeze**(*name*, *path=None*, *use_vt=None*)

Unfreeze the named container.

path
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

use_vt
run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

salt.modules.lxc.**update_lxc_conf**(*name*, *lxc_conf*, *lxc_conf_unset*, *path=None*)

Edit LXC configuration options

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \
        lxc_conf="[{'network.ipv4.ip':'10.0.3.5'}]" \
        lxc_conf_unset="['lxc.utsname']"
```

salt.modules.lxc.**version**()

Return the actual lxc client version

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

salt.modules.lxc.**wait_started**(*name*, *path=None*, *timeout=300*)

Check that the system has fully inited

This is actually very important for systemD based containers

see https://github.com/saltstack/salt/issues/23847

path

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.wait_started ubuntu
```

salt.modules.lxc.**write_conf**(*conf_file*, *conf*)

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from `lxc.read_conf()`, with `out_format` set to `commented`.

An example might look like:

```
[
    {'lxc.utsname': '$CONTAINER_NAME'},
    '# This is a commented line\n',
    '\n',
    {'lxc.mount': '$CONTAINER_FSTAB'},
    {'lxc.rootfs': {'comment': 'This is another test',
                    'value': 'This is another test'}},
    '\n',
    {'lxc.network.type': 'veth'},
    {'lxc.network.flags': 'up'},
    {'lxc.network.link': 'br0'},
    {'lxc.network.mac': '$CONTAINER_MACADDR'},
    {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
    {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:

```
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
    out_format=commented
```

26.7.237 salt.modules.lxd

Module for managing the LXD daemon and its containers.

New in version 2019.2.0.

LXD(1) is a container "hypervisor". This execution module provides several functions to help manage it and its containers.

Note:

- pylxd(2) version >=2.2.5 is required to let this work, currently only available via pip.

  To install on Ubuntu:

  $ apt-get install libssl-dev python-pip $ pip install -U pylxd

- you need lxd installed on the minion for the init() and version() methods.
- for the config_get() and config_get() methods you need to have lxd-client installed.

---

maintainer
René Jochum <rene@jochums.at>

maturity
new

depends
python-pylxd

platform
Linux

`salt.modules.lxd.`**`authenticate`**(*remote_addr*, *password*, *cert*, *key*, *verify_cert=True*)

Authenticate with a remote LXDaemon.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443

password :
The password of the remote.

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false
```

See the requests-docs for the SSL stuff.

salt.modules.lxd.**config_get**(*key*)

Get an LXD daemon config option
key :
The key of the config value to retrieve
CLI Examples:

```
salt '*' lxd.config_get core.https_address
```

salt.modules.lxd.**config_set**(*key*, *value*)

Set an LXD daemon config option

CLI Examples:

To listen on IPv4 and IPv6 port 8443, you can omit the :8443 its the default:

```
salt '*' lxd.config_set core.https_address [::]:8443
```

To set the server trust password:

```
salt '*' lxd.config_set core.trust_password blah
```

salt.modules.lxd.**container_config_delete**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a container config value
name :
Name of the container
config_key :
The config key to delete
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_config_get**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a container config value
name :
Name of the container
config_key :
The config key to retrieve

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.`**`container_config_set`**(*name*, *config_key*, *config_value*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Set a container config value
name :
Name of the container
config_key :
The config key to set
config_value :
The config value to set
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.`**`container_create`**(*name*, *source*, *profiles=None*, *config=None*, *devices=None*, *architecture='x86_64'*, *ephemeral=False*, *wait=True*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Create a container
name :
The name of the container
source :
Can be either a string containing an image alias:
"xenial/amd64"
or an dict with type "image" with alias:

{"type": "image",
"alias": "xenial/amd64"}
or image with "fingerprint":

{"type": "image",
"fingerprint": "SHA-256"}
or image with "properties":

{"type": "image",

"properties": {
"os": "ubuntu", "release": "14.04", "architecture": "x86_64"}}
or none:
{"type": "none"}
or copy:

{"type": "copy",
"source": "my-old-container"}

profiles
[['default']] List of profiles to apply on this container

config :
A config dict or None (None = unset).
Can also be a list:

[{'key': 'boot.autostart', 'value': 1},
{'key': 'security.privileged', 'value': '1'}]

devices :
A device dict or None (None = unset).

architecture
['x86_64']
Can be one of the following:

- unknown
- i686
- x86_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

ephemeral
[False] Destroy this container after stop?

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
_raw
[False] Return the raw pyxld object or a dict?
CLI Examples:

```
salt '*' lxd.container_create test xenial/amd64
```

See also the rest-api-docs.

`salt.modules.lxd.`**`container_delete`**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a container
name :
Name of the container to delete
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.`**`container_device_add`**(*name*, *device_name*, *device_type='disk'*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, ***kwargs*)

Add a container device
name :
Name of the container
device_name :
The device name to add
device_type :
Type of the device
** **kwargs** :
Additional device args
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.`**`container_device_delete`**(*name*, *device_name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a container device
name :
Name of the container
device_name :
The device name to delete
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.`**`container_device_get`**(*name*, *device_name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a container device
name :
Name of the container
device_name :
The device name to retrieve
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_execute**(*name*, *cmd*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Execute a command list on a container.

name :
: Name of the container

cmd :
: Command to be executed (as a list)

Example :
: '["ls", "-l"]'

remote_addr :
: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
: https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
: PEM Formatted SSL Certificate.

Examples:
: ~/.config/lxc/client.crt

key :
: PEM Formatted SSL Key.

Examples:
: ~/.config/lxc/client.key

verify_cert
: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.container_execute <container name> '["ls", "-l"]'
```

salt.modules.lxd.**container_file_get**(*name*, *src*, *dst*, *overwrite=False*, *mode=None*, *uid=None*, *gid=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a file from a container

name :
: Name of the container

src :
: The source file or directory

dst :
: The destination file or directory

mode :
: Set file mode to octal number

uid :
: Set file uid (owner)

gid :
: Set file gid (group)

remote_addr :
: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
: https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.container_file_put`(*name*, *src*, *dst*, *recursive=False*, *overwrite=False*, *mode=None*, *uid=None*, *gid=None*, *saltenv='base'*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Put a file into a container
name :
Name of the container
src :
The source file or directory
dst :
The destination file or directory
recursive :
Decent into src directory
overwrite :
Replace destination if it exists
mode :
Set file mode to octal number
uid :
Set file uid (owner)
gid :
Set file gid (group)
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
salt '*' lxd.container_file_put <container name> /var/tmp/foo /var/tmp/
```

`salt.modules.lxd.container_freeze`(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Freeze a container

name :
Name of the container to freeze

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

`salt.modules.lxd.`**`container_get`**(*name=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Gets a container from the LXD

name :
The name of the container to get.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_raw :
Return the pylxd object, this is internal and by states in use.

`salt.modules.lxd.`**`container_list`**(*list_names=False*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Lists containers

list_names
[False] Only return a list of names when True

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Examples:

Full dict with all available information:

```
salt '*' lxd.container_list
```

For a list of names:

```
salt '*' lxd.container_list true
```

See also container-attributes.

`salt.modules.lxd.`**`container_migrate`**(*name*, *stop_and_start=False*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *src_remote_addr=None*, *src_cert=None*, *src_key=None*, *src_verify_cert=None*)

Migrate a container.

If the container is running, it either must be shut down first (use stop_and_start=True) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate <salt.modules.lxd.authenticate` to authenticate your cert(s).
name :
Name of the container to migrate
stop_and_start :
Stop the container on the source and start it on dest
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
salt '*' lxd.container_migrate phpmyadmin stop_and_start=true remote_
↪addr=https://srv02:8443 cert=~/.config/lxc/client.crt key=~/.config/lxc/
↪client.key verify_cert=False src_remote_addr=https://srv01:8443
```

salt.modules.lxd.**container_rename**(*name*, *newname*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Rename a container

name :
Name of the container to Rename

newname :
The new name of the container

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_restart**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Restart a container

name :
Name of the container to restart

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_start**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Start a container

name :
: Name of the container to start

remote_addr :
: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
: PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
: PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_state**(*name=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get container state

remote_addr :
: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
: PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
: PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_stop**(*name*, *timeout=30*, *force=True*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Stop a container

name :
: Name of the container to stop

remote_addr :
: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**container_unfreeze**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Unfreeze a container
name :
Name of the container to unfreeze
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.**image_alias_add**(*image*, *alias*, *description=''*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Create an alias on the given image
image :
An image alias, a fingerprint or a image object
alias :
The alias to add
description :
Description of the alias
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64
↪"
```

salt.modules.lxd.**image_alias_delete**(*image*, *alias*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete an alias (this is currently not restricted to the image)

image :
An image alias, a fingerprint or a image object

alias :
The alias to delete

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64
↪"
```

salt.modules.lxd.**image_copy_lxd**(*source*, *src_remote_addr*, *src_cert*, *src_key*, *src_verify_cert*, *remote_addr*, *cert*, *key*, *verify_cert=True*, *aliases=None*, *public=None*, *auto_update=None*, *_raw=False*)

Copy an image from another LXD instance

source :
An alias or a fingerprint of the source.

src_remote_addr :
An URL to the source remote daemon
Examples:
https://mysourceserver.lan:8443

src_cert :
PEM Formatted SSL Certificate for the source
Examples:
~/.config/lxc/client.crt

src_key :
PEM Formatted SSL Key for the source

Examples:
~/.config/lxc/client.key

src_verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

remote_addr :
Address of the destination daemon
Examples:
https://mydestserver.lan:8443

cert :
PEM Formatted SSL Certificate for the destination
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key for the destination
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

aliases
[[]] List of aliases to append to the copied image

public
[None] Make this image public available, None = copy source

auto_update
[None] Wherever to auto-update from the original source, None = copy source

_raw
[False] Return the raw pylxd object or a dict of the destination image?

CLI Examples:

```
salt '*' lxd.image_copy_lxd xenial/amd64 https://srv01:8443 ~/.config/lxc/
↪client.crt ~/.config/lxc/client.key false https://srv02:8443 ~/.config/
↪lxc/client.crt ~/.config/lxc/client.key false aliases="['xenial/amd64']"
```

`salt.modules.lxd.`**`image_delete`**(*image*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete an image by an alias or fingerprint

name :
The alias or fingerprint of the image to delete, can be a obj for the states.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_delete xenial/amd64
```

salt.modules.lxd.**image_from_file**(*filename*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *aliases=None*, *public=False*, *saltenv='base'*, *_raw=False*)

Create an image from a file

filename :
The filename of the rootfs

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

aliases
[[]] List of aliases to append to the copied image

public
[False] Make this image public available

saltenv
[base] The saltenv to use for salt:// copies

_raw
[False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```
salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=[
↪"busybox-amd64"]
```

salt.modules.lxd.**image_from_simplestreams**(*server*, *alias*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *aliases=None*, *public=False*, *auto_update=False*, *_raw=False*)

Create an image from simplestreams

server :
Simplestreams server URI

alias :
The alias of the image to retrieve

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

aliases
[[]] List of aliases to append to the copied image

public
[False] Make this image public available

auto_update
[False] Should LXD auto update that image?

_raw
[False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```
salt '*' lxd.image_from_simplestreams "https://cloud-images.ubuntu.com/
↪releases" "trusty/amd64" aliases='["t", "trusty/amd64"]' auto_
↪update=True
```

salt.modules.lxd.**image_from_url**(*url*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *aliases=None*, *public=False*, *auto_update=False*, *_raw=False*)

Create an image from an url

url :
The URL from where to download the image

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

aliases
[[]] List of aliases to append to the copied image

public
[False] Make this image public available

auto_update
[False] Should LXD auto update that image?

_raw
[False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```
salt '*' lxd.image_from_url https://dl.stgraber.org/lxd aliases='[
↪"busybox-amd64"]'
```

salt.modules.lxd.**image_get**(*fingerprint*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Get an image by its fingerprint

fingerprint :
The fingerprint of the image to retrieve

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_raw
[False] Return the raw pylxd object or a dict of it?

CLI Examples:

```
salt '*' lxd.image_get <fingerprint>
```

salt.modules.lxd.**image_get_by_alias**(*alias*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Get an image by an alias

alias :
The alias of the image to retrieve

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_raw
[False] Return the raw pylxd object or a dict of it?

CLI Examples:

```
salt '*' lxd.image_get_by_alias xenial/amd64
```

salt.modules.lxd.**image_list**(*list_aliases=False*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Lists all images from the LXD.

list_aliases :
: Return a dict with the fingerprint as key and a list of aliases as value instead.

remote_addr :
: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
: PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
: PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_list true --out=json
salt '*' lxd.image_list --out=json
```

salt.modules.lxd.**init**(*storage_backend='dir'*, *trust_password=None*, *network_address=None*, *network_port=None*, *storage_create_device=None*, *storage_create_loop=None*, *storage_pool=None*)

Calls lxd init --auto -- opts

storage_backend :
: Storage backend to use (zfs or dir, default: dir)

trust_password :
: Password required to add new clients

network_address
: [None] Address to bind LXD to (default: none)

network_port
: [None] Port to bind LXD to (Default: 8443)

storage_create_device
: [None] Setup device based storage using this DEVICE

storage_create_loop
: [None] Setup loop based storage with this SIZE in GB

storage_pool
: [None] Storage pool to use or create

CLI Examples:

To listen on all IPv4/IPv6 Addresses:

```
salt '*' lxd.init dir PaSsW0rD [::]
```

To not listen on Network:

```
salt '*' lxd.init
```

salt.modules.lxd.**normalize_input_values**(*config*, *devices*)

normalize config input so returns can be put into mongodb, which doesn't like .

This is not meant to be used on the commandline.

CLI Examples:

```
salt '*' lxd.normalize_input_values config={} devices={}
```

salt.modules.lxd.**profile_config_delete**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a profile config item.

name :
The name of the profile to delete the config item.

config_key :
The config key for the value to retrieve.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_config_delete autostart boot.autostart.delay
```

salt.modules.lxd.**profile_config_get**(*name*, *config_key*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a profile config item.

name :
The name of the profile to get the config item from.

config_key :
The key for the item to retrieve.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
salt '*' lxd.profile_config_get autostart boot.autostart
```

salt.modules.lxd.**profile_config_set**(*name*, *config_key*, *config_value*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Set a profile config item.
name :
The name of the profile to set the config item to.
config_key :
The items key.
config_value :
Its items value.
remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Example:

```
salt '*' lxd.profile_config_set autostart boot.autostart 0
```

salt.modules.lxd.**profile_create**(*name*, *config=None*, *devices=None*, *description=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Creates a profile.
name :
The name of the profile to get.
config :
A config dict or None (None = unset).
Can also be a list:

[{'key': 'boot.autostart', 'value': 1},

{'key': 'security.privileged', 'value': '1'}]

devices :
A device dict or None (None = unset).

description :
A description string or None (None = unset).

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_create autostart config="{boot.autostart: 1, boot.
↪autostart.delay: 2, boot.autostart.priority: 1}"
salt '*' lxd.profile_create shared_mounts devices="{shared_mount: {type:
↪'disk', source: '/home/shared', path: '/home/shared'}}"
```

See the lxd-docs for the details about the config and devices dicts.

`salt.modules.lxd.`**`profile_delete`**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Deletes a profile.

name :
The name of the profile to delete.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_delete shared_mounts
```

salt.modules.lxd.**profile_device_delete**(*name*, *device_name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a profile device.

name :
The name of the profile to delete the device.

device_name :
The name of the device to delete.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_delete autostart eth1
```

salt.modules.lxd.**profile_device_get**(*name*, *device_name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get a profile device.

name :
The name of the profile to get the device from.

device_name :
The name of the device to retrieve.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_get default eth0
```

salt.modules.lxd.**profile_device_set**(*name*, *device_name*, *device_type='disk'*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, ***kwargs*)

Set a profile device.

name :
The name of the profile to set the device to.

device_name :
The name of the device to set.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged
↪parent=lxdbr0
```

salt.modules.lxd.**profile_get**(*name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*, *_raw=False*)

Gets a profile from the LXD

name :
The name of the profile to get.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_raw :
Return the pylxd object, this is internal and by states in use.

CLI Examples:

```
salt '*' lxd.profile_get autostart
```

salt.modules.lxd.**profile_list**(*list_names=False*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Lists all profiles from the LXD.

list_names :
Return a list of names instead of full blown dicts.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

salt.modules.lxd.**pylxd_client_get**(*remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get an pyxld client, this is not meant to be run over the CLI.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

See the requests-docs for the SSL stuff.

salt.modules.lxd.**pylxd_save_object**(*obj*)

Saves an object (profile/image/container) and
translate its execpetion on failure

obj :
The object to save
This is an internal method, no CLI Example.

salt.modules.lxd.**pylxd_version**()
Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.pylxd_version
```

salt.modules.lxd.**snapshots_all**(*container*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)
Get all snapshots for a container
container :
The name of the container to get.
remote_addr :
An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Verify the ssl certificate. Default: True
CLI Examples:

```
salt '*' lxd.snapshots_all test-container
```

salt.modules.lxd.**snapshots_create**(*container*, *name=None*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)
Create a snapshot for a container
container :
The name of the container to get.
name :
The name of the snapshot.
remote_addr :
An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt
key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key
verify_cert
[True] Verify the ssl certificate. Default: True
CLI Examples:

```
salt '*' lxd.snapshots_create test-container test-snapshot
```

salt.modules.lxd.**snapshots_delete**(*container*, *name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Delete a snapshot for a container

container :
The name of the container to get.

name :
The name of the snapshot.

remote_addr :
An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Verify the ssl certificate. Default: True

CLI Examples:

```
salt '*' lxd.snapshots_delete test-container test-snapshot
```

salt.modules.lxd.**snapshots_get**(*container*, *name*, *remote_addr=None*, *cert=None*, *key=None*, *verify_cert=True*)

Get information about snapshot for a container

container :
The name of the container to get.

name :
The name of the snapshot.

remote_addr :
An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:
~/.config/lxc/client.key

verify_cert
[True] Verify the ssl certificate. Default: True

CLI Examples:

```
salt '*' lxd.snapshots_get test-container test-snapshot
```

salt.modules.lxd.**sync_config_devices**(*obj*, *newconfig*, *newdevices*, *test=False*)

Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all changes made.

obj :
The object to sync with / or just test with.

newconfig:
The new config to check with the obj.

newdevices:
The new devices to check with the obj.

test:
Wherever to not change anything and give "Would change" message.

`salt.modules.lxd.`**`version`**`()`

Returns the actual lxd version.

CLI Example:

```
salt '*' lxd.version
```

26.7.238 salt.modules.mac_assistive

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

class `salt.modules.mac_assistive.`**`TccDB`**(*path=None*)

`disable`(*app_id*)

`enable`(*app_id*)

`enabled`(*app_id*)

`install`(*app_id*, *enable=True*)

`installed`(*app_id*)

`remove`(*app_id*)

`salt.modules.mac_assistive.`**`enable_`**(*app_id*, *enabled=True*)

Enable or disable an existing assistive access application.

app_id
The bundle ID or command to set assistive access status.

enabled
Sets enabled or disabled status. Default is `True`.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

`salt.modules.mac_assistive.`**`enabled`**(*app_id*)

Check if a bundle ID or command is listed in assistive access and enabled.

app_id
The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

salt.modules.mac_assistive.**install**(*app_id*, *enable=True*, *tries=3*, *wait=10*)

Install a bundle ID or command as being allowed to use assistive access.

app_id
The bundle ID or command to install for assistive access.

enabled
Sets enabled or disabled status. Default is `True`.

tries
How many times to try and write to a read-only tcc. Default is `True`.

wait
Number of seconds to wait between tries. Default is `10`.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

salt.modules.mac_assistive.**installed**(*app_id*)

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

app_id
The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

salt.modules.mac_assistive.**remove**(*app_id*)

Remove a bundle ID or command as being allowed to use assistive access.

app_id
The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

26.7.239 salt.modules.mac_brew_pkg

Homebrew for macOS

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

salt.modules.mac_brew_pkg.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_brew_pkg.**hold**(*name=None, pkgs=None, sources=None, **kwargs*)

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.**info_installed**(**names, **kwargs*)

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

names

The names of the packages for which to return information.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

salt.modules.mac_brew_pkg.**install**(*name=None, pkgs=None, taps=None, options=None, **kwargs*)

Install the passed package(s) with `brew install`

name

The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

taps

Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes
↪"]'
```

options

Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes
↪"]' options='["--with-fpm"]'
```

Multiple Package Installation Options:

pkgs

A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_brew_pkg.`**`latest_version`**`(`*names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_brew_pkg.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_brew_pkg.`**`list_upgrades`**`(`*refresh=True*, *include_casks=False*, ***kwargs*`)`

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_brew_pkg.`**`pin`**`(`*name=None*, *pkgs=None*, *sources=None*, ***kwargs*`)`

Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs
A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.**refresh_db**(***kwargs*)

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.mac_brew_pkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Removes packages with `brew uninstall`.

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.**unhold**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name
The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs
A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.**unpin**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name
The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs
A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.**upgrade**(*refresh=True*, ***kwargs*)

Upgrade outdated, unpinned brews.

refresh
Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.mac_brew_pkg.**upgrade_available**(*pkg*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_brew_pkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

26.7.240 salt.modules.mac_desktop

macOS implementations of various commands in the "desktop" interface

salt.modules.mac_desktop.**get_output_volume**()

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

salt.modules.mac_desktop.**lock**()

Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

salt.modules.mac_desktop.**say**(**words*)

Say some words.

words

The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

salt.modules.mac_desktop.**screensaver**()

Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

salt.modules.mac_desktop.**set_output_volume**(*volume*)

Set the volume of sound.

volume

The level of volume. Can range from 0 to 100.

CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

26.7.241 salt.modules.mac_group

Manage groups on Mac OS 10.7+

salt.modules.mac_group.**add**(*name*, *gid=None*, ***kwargs*)

Changed in version 3006.0.

Add the specified group

name

Name of the new group

gid

Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.mac_group.**adduser**(*group*, *name*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.mac_group.**chgid**(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.mac_group.**delete**(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.mac_group.**deluser**(*group*, *name*)

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.mac_group.**getent**(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.mac_group.**info**(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.mac_group.**members**(*name*, *members_list*)

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

26.7.242 salt.modules.mac_keychain

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.**get_default_keychain**(*user=None*, *domain='user'*)

Get the default keychain

user

The user to check the default keychain of

domain

The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

salt.modules.mac_keychain.**get_friendly_name**(*cert*, *password*, *legacy=False*)

Get the friendly name of the given certificate

cert
: The certificate to install

password
: The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

  Note: The password given here will show up as plaintext in the returned job info.

legacy
: Assume legacy format for certificate.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123

salt '*' keychain.get_friendly_name /tmp/test.p12 test123 legacy=True
```

salt.modules.mac_keychain.**get_hash**(*name*, *password=None*)

Returns the hash of a certificate in the keychain.

name
: The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.

password
: The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

salt.modules.mac_keychain.**install**(*cert*, *password*, *keychain='/Library/Keychains/System.keychain'*, *allow_any=False*, *keychain_password=None*)

Install a certificate

cert
: The certificate to install

password
: The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

  Note: The password given here will show up as plaintext in the job returned info.

keychain
: The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any
: Allow any application to access the imported certificate without warning

keychain_password
: If your keychain is likely to be locked pass the password and it will be unlocked before running the import

  Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.**list_certs**(*keychain='/Library/Keychains/System.keychain'*)

List all of the installed certificates

keychain
: The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

CLI Example:

```
salt '*' keychain.list_certs
```

salt.modules.mac_keychain.**set_default_keychain**(*keychain*, *domain='user'*, *user=None*)

Set the default keychain

keychain
: The location of the keychain to set as default

domain
: The domain to use valid values are user|system|common|dynamic, the default is user

user
: The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.
↪keychain
```

salt.modules.mac_keychain.**uninstall**(*cert_name*, *keychain='/Library/Keychains/System.keychain'*, *keychain_password=None*)

Uninstall a certificate from a keychain

cert_name
: The name of the certificate to remove

keychain
: The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

keychain_password
: If your keychain is likely to be locked pass the password and it will be unlocked before running the import

  Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.**unlock_keychain**(*keychain*, *password*)

Unlock the given keychain with the password

keychain
: The keychain to unlock

password
: The password to use to unlock the keychain.

  Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

26.7.243 salt.modules.mac_pkgutil

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

salt.modules.mac_pkgutil.**forget**(*package_id*)

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

> **Warning:** DO NOT use this command to fix broken package design

Parameters
package_id (*str*) -- The name of the package to forget

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.**install**(*source*, *package_id*)

Install a .pkg from an URI or an absolute path.

Parameters

- **source** (*str*) -- The path to a package.
- **package_id** (*str*) -- The package ID

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_
↪id=com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.**is_installed**(*package_id*)

Returns whether a given package id is installed.

Returns
True if installed, otherwise False

Return type
bool

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.**list_**()

List the installed packages.

Returns
A list of installed packages

Return type
list

CLI Example:

```
salt '*' pkgutil.list
```

26.7.244 salt.modules.mac_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, *refresh=True* is the default for all operations that need an up-to-date copy of available ports. Consider *refresh=False* when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where *salt mac-machine pkg./something/* won't want to return. Use

salt-run jobs.active

on the master to check for potentially long-running calls to *port*.

Finally, ports database updates are always handled with *port selfupdate* as opposed to *port sync*. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words *salt mac-machine pkg.refresh_db* is more like *apt-get update; apt-get upgrade dpkg apt-get* than simply *apt-get update*.

`salt.modules.mac_portspkg.`**`available_version`**`(`**names*, ***kwargs*`)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

refresh

Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.`**`install`**`(`*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*`)`

Install the passed package(s) with `port install`

name

The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

version

Specify a version to pkg to install. Ignored if pkgs is specified.

Note: Remember that versions that contain a single `.` will be interpreted as numbers and must be double-quoted. For example, version `3006.10` will be rendered as `3006.1`. To pass `3006.10` you'll need to use double-quotes. `version="'3006.10'"`

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant
Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
↪osxkeychain+doc+pcre'
```

Multiple Package Installation Options:
pkgs
A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_portspkg.`**`latest_version`**`(`*names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation

Options:
refresh
Update ports with `port selfupdate`
CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_portspkg.`**`list_pkgs`**`(`*versions_as_list=False*, ***kwargs*`)`

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_portspkg.`**`list_upgrades`**`(`*refresh=True*, ***kwargs*`)`

Check whether or not an upgrade is available for all packages

Options:

refresh
Update ports with `port selfupdate`
CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.mac_portspkg.`**`refresh_db`**(***kwargs*)

Update ports with `port selfupdate`

CLI Example:

```
salt mac pkg.refresh_db
```

`salt.modules.mac_portspkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Removes packages with `port uninstall`.
name
The name of the package to be deleted.
Multiple Package Options:
pkgs
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.mac_portspkg.`**`upgrade`**(*refresh=True*, ***kwargs*)

Run a full upgrade using MacPorts 'port upgrade outdated'

Options:
refresh
Update ports with `port selfupdate`
Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.mac_portspkg.`**`upgrade_available`**(*pkg*, *refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.mac_portspkg.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

26.7.245 salt.modules.mac_power

Module for editing power settings on macOS

New in version 2016.3.0.

salt.modules.mac_power.**get_computer_sleep**()

Display the amount of idle time until the computer sleeps.

Returns

A string representing the sleep settings for the computer

Return type

str

CLI Example:

```
salt '*' power.get_computer_sleep
```

salt.modules.mac_power.**get_display_sleep**()

Display the amount of idle time until the display sleeps.

Returns

A string representing the sleep settings for the displey

Return type

str

CLI Example:

```
salt '*' power.get_display_sleep
```

salt.modules.mac_power.**get_harddisk_sleep**()

Display the amount of idle time until the hard disk sleeps.

Returns

A string representing the sleep settings for the hard disk

Return type

str

CLI Example:

```
salt '*' power.get_harddisk_sleep
```

salt.modules.mac_power.**get_restart_freeze**()

Displays whether 'restart on freeze' is on or off if supported

Returns

A string value representing the "restart on freeze" settings

Return type

string

CLI Example:

```
salt '*' power.get_restart_freeze
```

salt.modules.mac_power.**get_restart_power_failure**()

Displays whether 'restart on power failure' is on or off if supported

Returns
A string value representing the "restart on power failure" settings
Return type
string
CLI Example:

```
salt '*' power.get_restart_power_failure
```

salt.modules.mac_power.**get_sleep**()

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.
Returns
A dictionary containing the sleep status for Computer, Display, and Hard Disk
Return type
dict
CLI Example:

```
salt '*' power.get_sleep
```

salt.modules.mac_power.**get_sleep_on_power_button**()

Displays whether 'allow power button to sleep computer' is on or off if supported
Returns
A string value representing the "allow power button to sleep computer" settings
Return type
string
CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

salt.modules.mac_power.**get_wake_on_modem**()

Displays whether 'wake on modem' is on or off if supported
Returns
A string value representing the "wake on modem" settings
Return type
str
CLI Example:

```
salt '*' power.get_wake_on_modem
```

salt.modules.mac_power.**get_wake_on_network**()

Displays whether 'wake on network' is on or off if supported
Returns
A string value representing the "wake on network" settings
Return type
string
CLI Example:

```
salt '*' power.get_wake_on_network
```

salt.modules.mac_power.**set_computer_sleep**(*minutes*)

Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.
Parameters
minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str
Returns
True if successful, False if not
Return type
bool

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

salt.modules.mac_power.**set_display_sleep**(*minutes*)

Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.

Parameters
minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype
int, str
Returns
True if successful, False if not
Return type
bool

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

salt.modules.mac_power.**set_harddisk_sleep**(*minutes*)

Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.

Parameters
minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype
int, str
Returns
True if successful, False if not
Return type
bool

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

salt.modules.mac_power.**set_restart_freeze**(*enabled*)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

Parameters
enabled (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively
Returns
True if successful, False if not
Return type
bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

salt.modules.mac_power.**set_restart_power_failure**(*enabled*)

Set whether or not the computer will automatically restart after a power failure.

Parameters

enabled (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

salt.modules.mac_power.**set_sleep**(*minutes*)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

Parameters

minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype

int, str

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

salt.modules.mac_power.**set_sleep_on_power_button**(*enabled*)

Set whether or not the power button can sleep the computer.

Parameters

enabled (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

salt.modules.mac_power.**set_wake_on_modem**(*enabled*)

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters

enabled (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

salt.modules.mac_power.**set_wake_on_network**(*enabled*)

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters

enabled (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' power.set_wake_on_network True
```

26.7.246 salt.modules.mac_service

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

```
/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/
```

Note: As of the 2019.2.0 release, if a service is located in a `LaunchAgent` path and a `runas` user is NOT specified, the current console user will be used to properly interact with the service.

Note: As of the 3002 release, if a service name of `salt-minion` is passed this module will convert it over to it's macOS equivalent name, in this case to `com.saltstack.salt.minion`. This is true for `salt-master` `salt-api`, and `salt-syndic` as well.

salt.modules.mac_service.**available**(*name*)

Check that the given service is available.

Parameters

name (*str*) -- The name of the service

Returns

True if the service is available, otherwise False

Return type

bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

salt.modules.mac_service.**disable**(*name*, *runas=None*)

Disable a launchd service. Raises an error if the service fails to be disabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns

`True` if successful or if the service is already disabled

Return type

bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

salt.modules.mac_service.**disabled**(*name*, *runas=None*, *domain='system'*)

Check if the specified service is not enabled. This is the opposite of `service.enabled`

Parameters

- **name** (*str*) -- The name to look up
- **runas** (*str*) -- User to run launchctl commands
- **domain** (*str*) -- domain to check for disabled services. Default is system.

Returns

True if the specified service is NOT enabled, otherwise False

Return type

bool

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

salt.modules.mac_service.**enable**(*name*, *runas=None*)

Enable a launchd service. Raises an error if the service fails to be enabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns

`True` if successful or if the service is already enabled

Return type

bool

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

salt.modules.mac_service.**enabled**(*name*, *runas=None*)

Check if the specified service is enabled (not disabled, capable of being loaded/bootstrapped).

Note: Previously this function would see if the service is loaded via `launchctl list` to determine if the service is enabled. This was not an accurate way to do so. The new behavior checks to make sure its not disabled to determine the status. Please use `service.loaded` for the previous behavior.

Parameters

- **name** (*str*) -- The name of the service to look up.
- **runas** (*str*) -- User to run launchctl commands.

Returns

True if the specified service enabled, otherwise False

Return type

bool

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

salt.modules.mac_service.**get_all**(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters

runas (*str*) -- User to run launchctl commands

Returns

A list of all the services available or enabled

Return type

list

CLI Example:

```
salt '*' service.get_all
```

salt.modules.mac_service.**get_enabled**(*runas=None*)

Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters

runas (*str*) -- User to run launchctl commands

Returns

A list of all the services enabled on the system

Return type

list

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.mac_service.**launchctl**(*sub_cmd*, **args*, ***kwargs*)

Run a launchctl command and raise an error if it fails

Parameters

- **sub_cmd** (*str*) -- Sub command supplied to launchctl
- **args** (*tuple*) -- Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) -- Dictionary containing arguments to pass to `cmd.run_all`
- **return_stdout** (*bool*) -- A keyword argument. If true return the stdout of the launchctl command

Returns

`True` if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

Return type

bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

salt.modules.mac_service.**list_**(*name=None*, *runas=None*)

Run launchctl list and return the output

Parameters

- **name** (*str*) -- The name of the service to list
- **runas** (*str*) -- User to run launchctl commands

Returns

If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type

str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

salt.modules.mac_service.**loaded**(*name*, *runas=None*)

Check if the specified service is loaded.

Parameters

- **name** (*str*) -- The name of the service to look up
- **runas** (*str*) -- User to run launchctl commands

Returns

`True` if the specified service is loaded, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' service.loaded org.cups.cupsd
```

salt.modules.mac_service.**missing**(*name*)

The inverse of service.available Check that the given service is not available.

Parameters

name (*str*) -- The name of the service

Returns

True if the service is not available, otherwise False

Return type

bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

salt.modules.mac_service.**restart**(*name*, *runas=None*)

Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns

`True` if successful

Return type
bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

salt.modules.mac_service.**show**(*name*)

Show properties of a launchctl service

Parameters
name (*str*) -- Service label, file name, or full path

Returns
The service information if the service is found

Return type
dict

CLI Example:

```
salt '*' service.show org.cups.cupsd  # service label
salt '*' service.show org.cups.cupsd.plist  # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist
↪# full path
```

salt.modules.mac_service.**start**(*name*, *runas=None*)

Start a launchd service. Raises an error if the service fails to start

---

Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if successful or if the service is already running

Return type
bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

salt.modules.mac_service.**status**(*name*, *sig=None*, *runas=None*)

Return the status for a service.

Note: Previously this function would return a PID for a running service with a PID or 'loaded' for a loaded service without a PID. This was changed to have better parity with other service modules that return True/False.

Parameters

- **name** (*str*) -- Used to find the service from launchctl. Can be the service Label, file name, or path to the service file. (normally a plist)
- **sig** (*str*) -- Find the service with status.pid instead. Note that `name` must still be provided.

- **runas** (*str*) -- User to run launchctl commands.

Returns
True if running, otherwise False.

Return type
str

CLI Example:

```
salt '*' service.status cups
```

salt.modules.mac_service.**stop**(*name*, *runas=None*)

Stop a launchd service. Raises an error if the service fails to stop

---

Note: Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

---

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns
`True` if successful or if the service is already stopped

Return type
bool

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

26.7.247 salt.modules.mac_shadow

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

salt.modules.mac_shadow.**del_password**(*name*)

Deletes the account password

Parameters
name (*str*) -- The user name of the account

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.mac_shadow.**get_account_created**(*name*)

Get the date/time the account was created

Parameters
name (*str*) -- The username of the account
Returns
The date/time the account was created (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined
Return type
str
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

salt.modules.mac_shadow.**get_change**(*name*)

Gets the date on which the password expires
Parameters
name (*str*) -- The name of the user account
Returns
The date the password will expire
Return type
str
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

salt.modules.mac_shadow.**get_expire**(*name*)

Gets the date on which the account expires
Parameters
name (*str*) -- The name of the user account
Returns
The date the account expires
Return type
str
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

salt.modules.mac_shadow.**get_last_change**(*name*)

Get the date/time the account was changed
Parameters
name (*str*) -- The username of the account
Returns
The date/time the account was modified (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined
Return type
str
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

salt.modules.mac_shadow.**get_login_failed_count**(*name*)

Get the number of failed login attempts

Parameters

name (*str*) -- The username of the account

Returns

The number of failed login attempts. 0 may mean there are no failed login attempts or the value is not defined

Return type

str

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

salt.modules.mac_shadow.**get_login_failed_last**(*name*)

Get the date/time of the last failed login attempt

Parameters

name (*str*) -- The username of the account

Returns

The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

Return type

str

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

salt.modules.mac_shadow.**get_maxdays**(*name*)

Get the maximum age of the password

Parameters

name (*str*) -- The username of the account

Returns

The maximum age of the password in days

Return type

int

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

salt.modules.mac_shadow.**info**(*name*)

Return information for the specified user

Parameters

name (*str*) -- The username

Returns

A dictionary containing the user's shadow information

Return type
dict

CLI Example:

```
salt '*' shadow.info admin
```

salt.modules.mac_shadow.**set_change**(*name*, *date*)

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters

- **name** (*str*) -- The name of the user account
- **date** (*date*) -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns
True if successful, otherwise False

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

salt.modules.mac_shadow.**set_expire**(*name*, *date*)

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- **name** (*str*) -- The name of the user account
- **date** (*datetime*) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

salt.modules.mac_shadow.**set_inactdays**(*name*, *days*)

Set the number if inactive days before the account is locked. Not available in macOS

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

salt.modules.mac_shadow.**set_maxdays**(*name*, *days*)

Set the maximum age of the password in days

Parameters

- **name** (*str*) -- The username of the account
- **days** (*int*) -- The maximum age of the account in days

Returns

True if successful, False if not

Return type

bool

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

salt.modules.mac_shadow.**set_mindays**(*name*, *days*)

Set the minimum password age in days. Not available in macOS.

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns

Will always return False until macOS supports this feature.

Return type

bool

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

salt.modules.mac_shadow.**set_password**(*name*, *password*)

Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters

- **name** (*str*) -- The name of the local user, which is assumed to be in the local directory service
- **password** (*str*) -- The plaintext password to set

Returns

True if successful, otherwise False

Return type

bool

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

salt.modules.mac_shadow.**set_warndays**(*name*, *days*)

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters

- **name** (*str*) -- The user name

- **days** (*int*) -- The number of days

Returns
Will always return False until macOS supports this feature.

Return type
bool

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

26.7.248 salt.modules.mac_softwareupdate

Support for the softwareupdate command on MacOS.

`salt.modules.mac_softwareupdate.`**`download`**`(`*name*`)`

Download a named update so that it can be installed later with the `update` or `update_all` functions

Parameters
name (*str*) -- The update to download.

Returns
True if successful, otherwise False

Return type
bool

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

`salt.modules.mac_softwareupdate.`**`download_all`**`(`*recommended=False*, *restart=True*`)`

Download all available updates so that they can be installed later with the `update` or `update_all` functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns
A list containing all downloaded updates on the system.

Return type
list

CLI Example:

```
salt '*' softwareupdate.download_all
```

`salt.modules.mac_softwareupdate.`**`get_catalog`**`()`

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns
The catalog being used for update lookups

Return type
str

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

salt.modules.mac_softwareupdate.**ignore**(*name*)

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters

name -- The name of the update to add to the ignore list.

Ptype

str

Returns

True if successful, False if not

Return type

bool

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

salt.modules.mac_softwareupdate.**list_available**(*recommended=False*, *restart=False*, *shut_down=False*)

List all available updates.

Parameters

- **recommended** (*bool*) -- Show only recommended updates.
- **restart** (*bool*) -- Show only updates that require a restart.

Returns

Returns a dictionary containing the updates

Return type

dict

CLI Example:

```
salt '*' softwareupdate.list_available
```

salt.modules.mac_softwareupdate.**list_downloads**()

Return a list of all updates that have been downloaded locally.

Returns

A list of updates that have been downloaded

Return type

list

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

salt.modules.mac_softwareupdate.**list_ignored**()

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

Returns

The list of ignored updates

Return type

list

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

salt.modules.mac_softwareupdate.**reset_catalog**()

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

salt.modules.mac_softwareupdate.**reset_ignored**()

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns
True if the list was reset, Otherwise False

Return type
bool

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

salt.modules.mac_softwareupdate.**schedule_enable**(*enable*)

Enable/disable automatic update scheduling.

Parameters
enable -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.

Type
bool str

Returns
True if scheduling is enabled, False if disabled

Return type
bool

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

salt.modules.mac_softwareupdate.**schedule_enabled**()

Check the status of automatic update scheduling.

Returns
True if scheduling is enabled, False if disabled

Return type
bool

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

salt.modules.mac_softwareupdate.**set_catalog**(*url*)

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters
url (*str*) -- The url to the update catalog
Returns
True if successful, False if not
Return type
bool

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.
↪sucatalog
```

salt.modules.mac_softwareupdate.**update**(*name*)

Install a named update.

Parameters
name (*str*) -- The name of the of the update to install.
Returns
True if successfully updated, otherwise False
Return type
bool

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

salt.modules.mac_softwareupdate.**update_all**(*recommended=False*, *restart=True*)

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns
A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.
Return type
dict

CLI Example:

```
salt '*' softwareupdate.update_all
```

salt.modules.mac_softwareupdate.**update_available**(*name*)

Check whether or not an update is available with a given name.

Parameters
name (*str*) -- The name of the update to look for
Returns
True if available, False if not
Return type
bool

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

26.7.249 salt.modules.mac_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.mac_sysctl.**assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

name

The name of the sysctl value to edit.

value

The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

salt.modules.mac_sysctl.**get**(*name*)

Return a single sysctl parameter for this minion

name

The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.mac_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*, *apply_change=False*)

Assign and persist a simple sysctl parameter for this minion

name

The name of the sysctl value to edit.

value

The sysctl value to apply.

config

The location of the sysctl configuration file.

apply_change

Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

salt.modules.mac_sysctl.**show**(*config_file=False*)

Return a list of sysctl parameters for this minion

config: **Pull the data from the system configuration file**

instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.7.250 salt.modules.mac_system

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

Warning: Using this module will enable `atrun` on the system if it is disabled.

`salt.modules.mac_system.`**`get_boot_arch`**`()`

Get the kernel architecture setting from `com.apple.Boot.plist`

Returns

A string value representing the boot architecture setting

Return type

str

CLI Example:

```
salt '*' system.get_boot_arch
```

`salt.modules.mac_system.`**`get_computer_name`**`()`

Gets the computer name

Returns

The computer name

Return type

str

CLI Example:

```
salt '*' system.get_computer_name
```

`salt.modules.mac_system.`**`get_disable_keyboard_on_lock`**`()`

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Returns

True if disable keyboard on lock is on, False if off

Return type

bool

CLI Example:

```
salt '*' system.get_disable_keyboard_on_lock
```

`salt.modules.mac_system.`**`get_remote_events`**`()`

Displays whether remote apple events are on or off.

Returns

True if remote apple events are on, False if off

Return type

bool

CLI Example:

```
salt '*' system.get_remote_events
```

`salt.modules.mac_system.`**`get_remote_login`**`()`

Displays whether remote login (SSH) is on or off.

Returns

True if remote login is on, False if off

Return type
bool

CLI Example:

```
salt '*' system.get_remote_login
```

salt.modules.mac_system.**get_restart_delay**()

Get the number of seconds after which the computer will start up after a power failure.

Returns
A string value representing the number of seconds the system will delay restart after power loss

Return type
str

CLI Example:

```
salt '*' system.get_restart_delay
```

salt.modules.mac_system.**get_startup_disk**()

Displays the current startup disk

Returns
The current startup disk

Return type
str

CLI Example:

```
salt '*' system.get_startup_disk
```

salt.modules.mac_system.**get_subnet_name**()

Gets the local subnet name

Returns
The local subnet name

Return type
str

CLI Example:

```
salt '*' system.get_subnet_name
```

salt.modules.mac_system.**halt**(*at_time=None*)

Halt a running system

Parameters
at_time (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

salt.modules.mac_system.**list_startup_disks**()

List all valid startup disks on the system.

Returns
A list of valid startup disks

Return type
list

CLI Example:

```
salt '*' system.list_startup_disks
```

salt.modules.mac_system.**restart**(*at_time=None*)

Restart the system

Parameters
at_time (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

salt.modules.mac_system.**set_boot_arch**(*arch='default'*)

Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: When this function fails with the error `changes to kernel architecture failed to save!`, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

Parameters
arch (*str*) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

- i386
- x86_64
- default

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_boot_arch i386
```

salt.modules.mac_system.**set_computer_name**(*name*)

Set the computer name

Parameters
name (*str*) -- The new computer name

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

salt.modules.mac_system.**set_disable_keyboard_on_lock**(*enable*)

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Parameters
enable (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

salt.modules.mac_system.**set_remote_events**(*enable*)

Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters
enable (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_remote_events On
```

salt.modules.mac_system.**set_remote_login**(*enable*)

Set the remote login (SSH) to either on or off.

Parameters
enable (*bool*) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_remote_login True
```

salt.modules.mac_system.**set_restart_delay**(*seconds*)

Set the number of seconds after which the computer will start up after a power failure.

Warning: This command fails with the following error:

```
Error, IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html

Parameters
seconds (*int*) -- The number of seconds. Must be a multiple of 30

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_restart_delay 180
```

salt.modules.mac_system.**set_startup_disk**(*path*)

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters
path (*str*) -- The valid startup disk path

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

salt.modules.mac_system.**set_subnet_name**(*name*)

Set the local subnet name

Parameters
name (*str*) -- The new local subnet name

Note: Spaces are changed to dashes. Other special characters are removed.

Returns
True if successful, False if not

Return type
bool

CLI Example:

```
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

salt.modules.mac_system.**shutdown**(*at_time=None*)

Shutdown the system

Parameters
at_time (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

salt.modules.mac_system.**sleep**(*at_time=None*)

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters
at_time (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: '"14:00"'

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

26.7.251 salt.modules.mac_timezone

Module for editing date/time settings on macOS

New in version 2016.3.0.

salt.modules.mac_timezone.**get_date**()

Displays the current date

Returns
the system date

Return type
str

CLI Example:

```
salt '*' timezone.get_date
```

salt.modules.mac_timezone.**get_hwclock**()

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.mac_timezone.**get_offset**()

Displays the current time zone offset

Returns
The current time zone offset

Return type
str

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.mac_timezone.**get_time**()

Get the current system time.

Returns
The current time in 24 hour format

Return type
str

CLI Example:

```
salt '*' timezone.get_time
```

salt.modules.mac_timezone.**get_time_server**()

Display the currently set network time server.

Returns
the network time server

Return type
str

CLI Example:

```
salt '*' timezone.get_time_server
```

salt.modules.mac_timezone.**get_using_network_time**()

Display whether network time is on or off

Returns

True if network time is on, False if off

Return type

bool

CLI Example:

```
salt '*' timezone.get_using_network_time
```

salt.modules.mac_timezone.**get_zone**()

Displays the current time zone

Returns

The current time zone

Return type

str

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.mac_timezone.**get_zonecode**()

Displays the current time zone abbreviated code

Returns

The current time zone code

Return type

str

CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.mac_timezone.**list_zones**()

Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

Returns

a list of time zones

Return type

list

CLI Example:

```
salt '*' timezone.list_zones
```

salt.modules.mac_timezone.**set_date**(*date*)

Set the current month, day, and year

Parameters

date (*str*) -- The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

Returns
True if successful, False if not
Return type
bool
Raises
SaltInvocationError on Invalid Date format
Raises
CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

salt.modules.mac_timezone.**set_hwclock**(*clock*)

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.mac_timezone.**set_time**(*time*)

Sets the current time. Must be in 24 hour format.

Parameters
time (*str*) -- The time to set in 24 hour format. The value must be double quoted. ie: '"17:46"'
Returns
True if successful, False if not
Return type
bool
Raises
SaltInvocationError on Invalid Time format
Raises
CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time '"17:34"'
```

salt.modules.mac_timezone.**set_time_server**(*time_server='time.apple.com'*)

Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters
time_server -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of 'time.apple.com'
Type
str
Returns
True if successful, False if not
Return type
bool
Raises
CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

salt.modules.mac_timezone.**set_using_network_time**(*enable*)

Set whether network time is on or off.

Parameters

enable -- True to enable, False to disable. Can also use 'on' or 'off'

Type

str bool

Returns

True if successful, False if not

Return type

bool

Raises

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

salt.modules.mac_timezone.**set_zone**(*time_zone*)

Set the local time zone. Use `timezone.list_zones` to list valid time_zone arguments

Parameters

time_zone (*str*) -- The time zone to apply

Returns

True if successful, False if not

Return type

bool

Raises

SaltInvocationError on Invalid Timezone

Raises

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

salt.modules.mac_timezone.**zone_compare**(*time_zone*)

Compares the given timezone name with the system timezone name.

Returns

True if they are the same, False if not

Return type

bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

26.7.252 salt.modules.mac_user

Manage users on Mac OS 10.7+

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

---

salt.modules.mac_user.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *fullname=None*, *createhome=True*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.mac_user.**chfullname**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

salt.modules.mac_user.**chgid**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.mac_user.**chgroups**(*name*, *groups*, *append=False*)

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

groups

Groups to which the user should belong, can be passed either as a python list or a comma-separated string

append

Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

salt.modules.mac_user.**chhome**(*name*, *home*, ***kwargs*)

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

salt.modules.mac_user.**chshell**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.mac_user.**chuid**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.mac_user.**delete**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.mac_user.**disable_auto_login**()

New in version 2016.3.0.

Disables auto login on the machine

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' user.disable_auto_login
```

salt.modules.mac_user.**enable_auto_login**(*name*, *password*)

New in version 2016.3.0.

Configures the machine to auto login with the specified user

Parameters

- **name** (*str*) -- The user account use for auto login
- **password** (*str*) -- The password to user for auto login

  New in version 2017.7.3.

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

salt.modules.mac_user.**get_auto_login**()

New in version 2016.3.0.

Gets the current setting for Auto Login

Returns

If enabled, returns the user name, otherwise returns False

Return type

str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

salt.modules.mac_user.**getent**(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.mac_user.**info**(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.mac_user.**list_groups**(*name*)

Return a list of groups the named user belongs to.

name
: The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

  Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.mac_user.**list_users**()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.mac_user.**primary_group**(*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

salt.modules.mac_user.**rename**(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

26.7.253 salt.modules.mac_xattr

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

salt.modules.mac_xattr.**clear**(*path*)

Causes the all attributes on the file/directory to be removed

Parameters
: **path** (*str*) -- The file(s) to get attributes from

Returns
: True if successful, otherwise False

Raises
: CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.**delete**(*path*, *attribute*)

Removes the given attribute from the file

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be deleted from the file/directory

Returns

True if successful, otherwise False

Return type

bool

Raises

CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.**list_**(*path*, ***kwargs*)

List all of the extended attributes on the given file/directory

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **hex** (*bool*) -- Return the values with forced hexadecimal values

Returns

A dictionary containing extended attributes and values for the given file

Return type

dict

Raises

CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

salt.modules.mac_xattr.**read**(*path*, *attribute*, ***kwargs*)

Read the given attributes on the given file/directory

Parameters

- **path** (*str*) -- The file to get attributes from
- **attribute** (*str*) -- The attribute to read
- **hex** (*bool*) -- Return the values with forced hexadecimal values

Returns

A string containing the value of the named attribute

Return type

str

Raises

CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

salt.modules.mac_xattr.**write**(*path*, *attribute*, *value*, ***kwargs*)

Causes the given attribute name to be assigned the given value

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be written to the file/directory
- **value** (*str*) -- The value to assign to the given attribute
- **hex** (*bool*) -- Set the values with forced hexadecimal values

Returns

True if successful, otherwise False

Return type

bool

Raises

CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

26.7.254 salt.modules.macdefaults

Set defaults on Mac OS

salt.modules.macdefaults.**delete**(*domain*, *key*, *user=None*)

Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType

salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

domain

The name of the domain to delete from

key

The key of the given domain to delete

user

The user to delete the defaults with

salt.modules.macdefaults.**read**(*domain*, *key*, *user=None*)

Read a default from the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType

salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

domain

The name of the domain to read from

key
The key of the given domain to read from

user
The user to read the defaults as

salt.modules.macdefaults.**write**(*domain*, *key*, *value*, *type='string'*, *user=None*)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server

salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain
The name of the domain to write to

key
The key of the given domain to write to

value
The value to write to the given key

type
The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user
The user to write the defaults to

26.7.255 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

salt.modules.macpackage.**get_mpkg_ids**(*mpkg*)

Attempt to get the package IDs from a mounted .mpkg file

Parameters
mpkg (*str*) -- The location of the mounted mpkg file

Returns
List of package IDs

Return type
list

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

salt.modules.macpackage.**get_pkg_id**(*pkg*)

Attempt to get the package ID from a .pkg file

Parameters
pkg (*str*) -- The location of the pkg file

Returns
List of all of the package IDs

Return type
list

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

salt.modules.macpackage.**install**(*pkg*, *target='LocalSystem'*, *store=False*, *allow_untrusted=False*)

Install a pkg file

Parameters

- **pkg** (*str*) -- The package to install
- **target** (*str*) -- The target in which to install the package to
- **store** (*bool*) -- Should the package be installed as if it was from the store?
- **allow_untrusted** (*bool*) -- Allow the installation of untrusted packages?

Returns

A dictionary containing the results of the installation

Return type

dict

CLI Example:

```
salt '*' macpackage.install test.pkg
```

salt.modules.macpackage.**install_app**(*app*, *target='/Applications/'*)

Install an app file by moving it into the specified Applications directory

Parameters

- **app** (*str*) -- The location of the .app file
- **target** (*str*) -- The target in which to install the package to Default is "/Applications/"

Returns

The results of the rsync command

Return type

str

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

salt.modules.macpackage.**installed_pkgs**()

Return the list of installed packages on the machine

Returns

List of installed packages

Return type

list

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

salt.modules.macpackage.**mount**(*dmg*)

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

Parameters

dmg (*str*) -- The location of the dmg file to mount

Returns

Tuple containing the results of the command along with the mount point

Return type

tuple

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

salt.modules.macpackage.**uninstall_app**(*app*)

Uninstall an app file by removing it from the Applications directory

Parameters

app (*str*) -- The location of the .app file

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

salt.modules.macpackage.**unmount**(*mountpoint*)

Attempt to unmount a dmg file from a temporary location

Parameters

mountpoint (*str*) -- The location of the mount point

Returns

The results of the hdutil detach command

Return type

str

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

26.7.256 salt.modules.makeconf

Support for modifying make.conf under Gentoo

salt.modules.makeconf.**append_cflags**(*value*)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

salt.modules.makeconf.**append_cxxflags**(*value*)

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cxxflags '-pipe'
```

salt.modules.makeconf.**append_emerge_default_opts**(*value*)

Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**append_features**(*value*)

Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_features 'webrsync-gpg'
```

salt.modules.makeconf.**append_gentoo_mirrors**(*value*)

Add to or create a new GENTOO_MIRRORS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**append_makeopts**(*value*)

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_makeopts '-j3'
```

salt.modules.makeconf.**append_var**(*var*, *value*)

Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**cflags_contains**(*value*)

Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cflags_contains '-pipe'
```

salt.modules.makeconf.**chost_contains**(*value*)

Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.**cxxflags_contains**(*value*)

Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cxxflags_contains '-pipe'
```

salt.modules.makeconf.**emerge_default_opts_contains**(*value*)

Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

salt.modules.makeconf.**features_contains**(*value*)

Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

salt.modules.makeconf.**gentoo_mirrors_contains**(*value*)

Verify if GENTOO_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**get_cflags**()

Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

salt.modules.makeconf.**get_chost**()

Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

salt.modules.makeconf.**get_cxxflags**()

Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

salt.modules.makeconf.**get_emerge_default_opts**()

Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

salt.modules.makeconf.**get_features**()

Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

salt.modules.makeconf.**get_gentoo_mirrors**()

Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

salt.modules.makeconf.**get_makeopts**()

Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

salt.modules.makeconf.**get_sync**()

Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

salt.modules.makeconf.**get_var**(*var*)

Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:

```
salt '*' makeconf.get_var 'LINGUAS'
```

salt.modules.makeconf.**makeopts_contains**(*value*)

Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.makeopts_contains '-j3'
```

salt.modules.makeconf.**remove_var**(*var*)

Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.remove_var 'LINGUAS'
```

salt.modules.makeconf.**set_cflags**(*value*)

Set the CFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.**set_chost**(*value*)

Set the CHOST variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.**set_cxxflags**(*value*)

Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.**set_emerge_default_opts**(*value*)

Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**set_gentoo_mirrors**(*value*)

Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**set_makeopts**(*value*)

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

salt.modules.makeconf.**set_sync**(*value*)

Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-
↪portage'
```

salt.modules.makeconf.**set_var**(*var*, *value*)

Set a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**sync_contains**(*value*)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-
↪portage'
```

salt.modules.makeconf.**trim_cflags**(*value*)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```

salt.modules.makeconf.**trim_cxxflags**(*value*)

Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cxxflags '-pipe'
```

salt.modules.makeconf.**trim_emerge_default_opts**(*value*)

Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**trim_features**(*value*)

Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

salt.modules.makeconf.**trim_gentoo_mirrors**(*value*)

Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**trim_makeopts**(*value*)

Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

salt.modules.makeconf.**trim_var**(*var*, *value*)

Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**var_contains**(*var*, *value*)

Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

26.7.257 salt.modules.mandrill

Mandrill

Send out emails using the Mandrill API.

In the minion configuration file, the following block is required:

```
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.

salt.modules.mandrill.**send**(*message*, *asynchronous=False*, *ip_pool=None*, *send_at=None*, *api_url=None*, *api_version=None*, *api_key=None*)

Send out the email using the details from the `message` argument.

message

The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

asynchronous: **`False`**

Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.

ip_pool

The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.

send_at
: When this message should be sent as a UTC timestamp in `YYYY-MM-DD HH:MM:SS` format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

Note: Fur further details please consult the API documentation.

CLI Example:

```
salt '*' mandrill.send message="{'subject': 'Hi', 'from_email':
↪'test@example.com', 'to': [{'email': 'recv@example.com', 'type': 'to'}]}
↪"
```

`message` structure example (as YAML for readability):

```
message:
    text: |
        This is the body of the email.
        This is the second line.
    subject: Email subject
    from_name: Test At Example Dot Com
    from_email: test@example.com
    to:
      - email: recv@example.com
        type: to
        name: Recv At Example Dot Com
      - email: cc@example.com
        type: cc
        name: CC At Example Dot Com
    important: true
    track_clicks: true
    track_opens: true
    attachments:
      - type: text/x-yaml
        name: yaml_file.yml
        content: aV9hbV9zdXBlcl9jdXJpb3VzOiB0cnVl
```

Output example:

```
minion:
    ----------
    comment:
    out:
        |_
          ----------
          _id:
              c4353540a3c123eca112bbdd704ab6
          email:
              recv@example.com
          reject_reason:
              None
          status:
              sent
```

(continues on next page)

(continued from previous page)

```
    result:
        True
```

26.7.258 salt.modules.marathon

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

salt.modules.marathon.**app**(*id*)

Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

salt.modules.marathon.**apps**()

Return a list of the currently installed app ids.

CLI Example:

```
salt marathon-minion-id marathon.apps
```

salt.modules.marathon.**has_app**(*id*)

Return whether the given app id is currently configured.

CLI Example:

```
salt marathon-minion-id marathon.has_app my-app
```

salt.modules.marathon.**info**()

Return configuration and status information about the marathon instance.

CLI Example:

```
salt marathon-minion-id marathon.info
```

salt.modules.marathon.**restart_app**(*id*, *restart=False*, *force=True*)

Restart the current server configuration for the specified app.

Parameters

- **restart** -- Restart the app
- **force** -- Override the current deployment

CLI Example:

```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

salt.modules.marathon.**rm_app**(*id*)

Remove the specified app from the server.

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

salt.modules.marathon.**update_app**(*id*, *config*)

Update the specified app with the given configuration.

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

26.7.259 salt.modules.match

The match module allows for match routines to be run and determine target specs

salt.modules.match.**compound**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given compound target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

salt.modules.match.**data**(*tgt*)

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

salt.modules.match.**filter_by**(*lookup*, *tgt_type='compound'*, *minion_id=None*, *merge=None*, *merge_lists=False*, *default='default'*)

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, minion_id=grains['id'], default='web*') %}
```

(continues on next page)

(continued from previous page)

```
# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

salt.modules.match.**glob**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given glob target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

salt.modules.match.**grain**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.**grain_pcre**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

delimiter

Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim

Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.**ifelse**(**args*, *tgt_type='compound'*, *minion_id=None*, *merge=None*, *merge_lists=False*)

New in version 3006.0.

Evaluate each pair of arguments up to the last one as a (matcher, value) tuple, returning `value` if matched. If none match, returns the last argument.

The `ifelse` function is like a multi-level if-else statement. It was inspired by CFEngine's `ifelse` function which in turn was inspired by Oracle's `DECODE` function. It must have an odd number of arguments (from 1 to N). The last argument is the default value, like the `else` clause in standard programming languages. Every pair of arguments before the last one are evaluated as a pair. If the first one evaluates true then the second one is returned, as if you had used the first one in a compound match expression. Boolean values can also be used as the first item in a pair, as it will be translated to a match that will always match ("*") or never match ("SALT_IFELSE_MATCH_NOTHING") a target system.

This is essentially another way to express the `filter_by` functionality in way that's familiar to CFEngine or Oracle users. Consider using `filter_by` unless this function fits your workflow.

CLI Example:

```
salt '*' match.ifelse 'foo*' 'Foo!' 'bar*' 'Bar!' minion_id=bar03
```

`salt.modules.match.`**`ipcidr`**(*tgt*)

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
  - match: ipcidr
  - nodeclass: internal
```

`salt.modules.match.`**`list_`**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given list target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

`salt.modules.match.`**`pcre`**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given pcre target

minion_id

Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

`salt.modules.match.`**`pillar`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git'
↪delimiter='|'
```

delimiter
: Specify an alternate delimiter to use when traversing a nested dict

  New in version 2014.7.0.

delim
: Specify an alternate delimiter to use when traversing a nested dict

  New in version 0.16.4.

  Deprecated since version 2015.8.0.

`salt.modules.match.`**`pillar_pcre`**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git'
↪delimiter='|'
```

delimiter
: Specify an alternate delimiter to use when traversing a nested dict

  New in version 2014.7.0.

delim
: Specify an alternate delimiter to use when traversing a nested dict

  New in version 0.16.4.

  Deprecated since version 2015.8.0.

`salt.modules.match.`**`search_by`**(*lookup*, *tgt_type='compound'*, *minion_id=None*)

Search a dictionary of target strings for matching targets

This is the inverse of *`match.filter_by`* and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

26.7.260 salt.modules.mattermost

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration

This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

salt.modules.mattermost.**post_message**(*message*, *channel=None*, *username=None*, *api_url=None*, *hook=None*)

Send a message to a Mattermost channel.

Parameters

- **channel** -- The channel name, either will work.
- **username** -- The username of the poster.
- **message** -- The message to send to the Mattermost channel.
- **api_url** -- The Mattermost api url, if not specified in the configuration.
- **hook** -- The Mattermost hook, if not specified in the configuration.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' mattermost.post_message message='Build is done'
```

26.7.261 salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

salt.modules.mdadm_raid.**add**(*name*, *device*)

Add new device to RAID array.

CLI Example:

```
salt '*' raid.add /dev/md0 /dev/sda1
```

salt.modules.mdadm_raid.**assemble**(*name*, *devices*, *test_mode=False*, ***kwargs*)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

---

name
: The name of the array to assemble.

devices
: The list of devices comprising the array to assemble.

kwargs
: Optional arguments to be passed to mdadm.

returns
: **test_mode=True:**
  Prints out the full command.
  test_mode=False (Default):
  Executes command on the host(s) and prints out the mdadm output.

For more info, read the `mdadm` manpage.

`salt.modules.mdadm_raid.`**`create`**(*name*, *level*, *devices*, *metadata='default'*, *test_mode=False*, ***kwargs*)

Create a RAID device.

Changed in version 2014.7.0.

> **Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/
↪dev/xvde']" test_mode=True
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

---

name
: The name of the array to create.

level
: The RAID level to use when creating the raid.

devices
: A list of devices used to build the array.

metadata
: Version of metadata to use when creating the array.

kwargs
: Optional arguments to be passed to mdadm.

returns
: **test_mode=True:**
  Prints out the full command.
  test_mode=False (Default):
  Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the `mdadm(8)` manpage

salt.modules.mdadm_raid.**destroy**(*device*)

Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

salt.modules.mdadm_raid.**detail**(*device='/dev/md0'*)

Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

salt.modules.mdadm_raid.**examine**(*device*, *quiet=False*)

Show detail for a specified RAID component device

device
: Device to examine, that is part of the RAID

quiet
: If the device is not part of the RAID, do not show any error

CLI Example:

```
salt '*' raid.examine '/dev/sda1'
```

salt.modules.mdadm_raid.**list_**()

List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

salt.modules.mdadm_raid.**save_config**()

Save RAID configuration to config file.

Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```
salt '*' raid.save_config
```

salt.modules.mdadm_raid.**stop**()

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

26.7.262 salt.modules.mdata

Module for managaging metadata in SmartOS Zones

New in version 2016.3.0.

maintainer
Jorge Schrauwen <sjorge@blackdot.be>

maturity
new

platform
smartos

salt.modules.mdata.**delete_**(**keyname*)

Delete metadata

prop
[string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.**get_**(**keyname*)

Get metadata

keyname
[string] name of key

Note: If no keynames are specified, we get all (public) properties

---

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.**list_**()

List available metadata

CLI Example:

```
salt '*' mdata.list
```

salt.modules.mdata.**put_**(*keyname*, *val*)

Put metadata

prop
[string] name of property

val
[string] value to set

CLI Example:

```
salt '*' mdata.list
```

26.7.263 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

`salt.modules.memcached.`**`add`**(*key*, *value*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

`salt.modules.memcached.`**`decr`**(*key*, *delta=1*, *host='127.0.0.1'*, *port=11211*)

This function is an alias of `decrement`.

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

`salt.modules.memcached.`**`decrement`**(*key*, *delta=1*, *host='127.0.0.1'*, *port=11211*)

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

`salt.modules.memcached.`**`delete`**(*key*, *host='127.0.0.1'*, *port=11211*, *time=0*)

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

`salt.modules.memcached.`**`get`**(*key*, *host='127.0.0.1'*, *port=11211*)

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

`salt.modules.memcached.`**`incr`**(*key*, *delta=1*, *host='127.0.0.1'*, *port=11211*)

This function is an alias of `increment`.

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

`salt.modules.memcached.`**`increment`**(*key*, *delta=1*, *host='127.0.0.1'*, *port=11211*)

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

salt.modules.memcached.**replace**(*key*, *value*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of *memcached.add*

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

salt.modules.memcached.**set_**(*key*, *value*, *host='127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```
salt '*' memcached.set <key> <value>
```

salt.modules.memcached.**status**(*host='127.0.0.1'*, *port=11211*)

Get memcached status

CLI Example:

```
salt '*' memcached.status
```

26.7.264 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

salt.modules.mine.**delete**(*fun*)

Remove specific function contents of minion.

Parameters

fun (*str*) -- The name of the function.

Return type

bool

Returns

True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

salt.modules.mine.**flush**()

Remove all mine contents of minion.

Return type

bool

Returns

True on success

CLI Example:

```
salt '*' mine.flush
```

salt.modules.mine.**get**(*tgt*, *fun*, *tgt_type='glob'*, *exclude_minion=False*)

Get data from the mine.

Parameters

- **tgt** (*str*) -- Target whose mine data to get.
- **fun** (*str or list*) -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **tgt_type** (*str*) -- Default `glob`. Target type to use with `tgt`. See *Targeting Minions* for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **exclude_minion** (*bool*) -- Excludes the current minion from the result set.

CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs
↪compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *Mine Runner module* instead; it can be invoked from a Pillar SLS file using the *saltutil.runner* module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

`salt.modules.mine.`**`get_docker`**(*interfaces=None*, *cidrs=None*, *with_container_id=False*)

Changed in version 2017.7.8,2018.3.3: When *docker.update_mine* is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: *docker.update_mine* now defaults to `False`

Get all mine data for *docker.ps* and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

with_container_id

Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.
↪147.0/24", "172.17.42.0/24"]'
```

`salt.modules.mine.`**`send`**(*name*, **args*, ***kwargs*)

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

Parameters

name (*str*) -- Name of the function to add to the mine.

The following pameters are extracted from kwargs if present:

Parameters

- **mine_function** (*str*) -- The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to `name`.
- **allow_tgt** (*str*) -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.
- **allow_tgt_type** (*str*) -- Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

Return type

bool

Returns

Whether executing the function and storing the information was successful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See *Targeting Minions* for more information about targeting.

CLI Example:

```
salt '*' mine.send network.ip_addrs interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs
↪interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs
↪interface=eth0 allow_tgt='G@grain:value' allow_tgt_type=compound
```

`salt.modules.mine.`**`update`**(*clear=False*, *mine_functions=None*)

Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option *mine_functions*:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

This function accepts the following arguments:

Parameters

- **clear** (*bool*) -- Default: `False` Specifies whether updating will clear the existing values (`True`), or whether it will update them (`False`).
- **mine_functions** (*dict*) -- Update (or clear, see `clear`) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltproject.io/en/latest/topics/mine/index.html#mine-functions

  This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under *mine_functions* in the minion/master config or pillar. A potential use would be together with the *scheduler*, for example:

  ```
  schedule:
    lldp_mine_update:
  ```

(continues on next page)

(continued from previous page)

```
    function: mine.update
    kwargs:
        mine_functions:
          net.lldp: []
    hours: 12
```

In the example above, the mine for *net.lldp* would be refreshed every 12 hours, while *network.ip_addrs* would continue to be updated as specified in *mine_interval*.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

salt.modules.mine.**valid**()

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

26.7.265 salt.modules.minion

Module to provide information about minions and handle killing and restarting minions

salt.modules.minion.**kill**(*timeout=15*)

Kill the salt minion.

timeout

int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI Example:

```
salt minion[12] minion.kill

minion1:
    ----------
    killed:
        7874
    retcode:
        0
minion2:
    ----------
    killed:
        29071
    retcode:
        0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: `0` is success, anything else is a failure.

salt.modules.minion.**list_**()

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as *salt-key -L*

CLI Example:

```
salt 'master' minion.list
```

salt.modules.minion.**restart**(*systemd=True*, *win_service=True*, *schedule_retry=False*, *retry_delay=180*)

Restart the salt minion.

The method to restart the minion will be chosen as follows:

If `minion_restart_command` is set in the minion configuration then the command specified will be used to restart the minion.

If the minion is running as a systemd service then the minion will be restarted using the systemd_service module, unless `systemd` is set to `False`

If the minion is running as a Windows service then the minion will be restarted using the win_service module, unless `win_service` is set to `False`

If the salt-minion process is running in daemon mode (the `-d` argument is present in `argv`) then the minion will be killed and restarted using the same command line arguments, if possible.

If the salt-minion process is running in the foreground (the `-d` argument is not present in `argv`) then the minion will be killed but not restarted. This behavior is intended for minion processes that are managed by a process supervisor.

systemd
: If set to `False` then systemd will not be used to restart the minion. Defaults to `True`.

win_service
: If set to `False` then the Windows service manager will not be used to restart the minion. Defaults to `True`.

schedule_retry
: If set to `True` then a scheduled job will be added to start the minion if it has failed to restart after the retry_delay

retry_delay
: The amount of time to wait before attempting to start the minion if it has failed to restart. Defaults to 180 seconds.

CLI Examples:

```
salt minion[12] minion.restart

minion1:
----------
    comment:
        - Using systemctl to restart salt-minion
        - Service restart successful
    killed:
        None
    restart:
        ----------
    retcode:
        0
    service_restart:
        ----------
        result:
```

(continues on next page)

(continued from previous page)

```
            True
minion2:
    ----------
    comment:
        - Using windows service manager to restart salt-minion
        - Service restart successful
    killed:
        None
    restart:
        ----------
    retcode:
        0
    service_restart:
        ----------
        result:
            True
```

The result shows that `minion1` was restarted using systemd and `minion2` was restarted using the Windows service manager. The `service_restart` field indicates the result of the service restart operation. The `killed` field is `None` because the minion was restarted using the service manager and not by killing the process. The `restart` field is empty because the minion was restarted using the service manager and not by running the command line arguments of the minion process.

```
salt minion[12] minion.restart

minion1:
    ----------
    comment:
        - Restart using process argv:
        -     /home/omniture/install/bin/salt-minion
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
    killed:
        10070
    restart:
        ----------
        stderr:
        stdout:
    retcode:
        0
minion2:
    ----------
    comment:
        - Using configuration minion_restart_command:
        -     /home/omniture/install/bin/salt-minion
        -     --not-an-option
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
        - Restart failed
    killed:
```

(continues on next page)

(continued from previous page)

```
        10896
    restart:
        ----------
        stderr:
            Usage: salt-minion

            salt-minion: error: no such option: --not-an-option
        stdout:
    retcode:
        64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

26.7.266 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.`**`get_str`**(*length=20*, *chars=None*, *lowercase=True*, *uppercase=True*, *digits=True*, *punctuation=True*, *whitespace=False*, *printable=False*)

New in version 2014.7.0.

Changed in version 3004: Changed the default character set used to include symbols and implemented arguments to control the used character set.

Returns a random string of the specified length.

length
: [20] Any valid number of bytes.

chars
: [None] New in version 3004.

  String with any character that should be used to generate random string.

  This argument supersedes all other character controlling arguments.

lowercase
: [True] New in version 3004.

  Use lowercase letters in generated random string. (see `string.ascii_lowercase`)

  This argument is superseded by chars.

uppercase
: [True] New in version 3004.

  Use uppercase letters in generated random string. (see `string.ascii_uppercase`)

  This argument is superseded by chars.

digits
: [True] New in version 3004.

  Use digits in generated random string. (see `string.digits`)

  This argument is superseded by chars.

printable
[False] New in version 3004.

Use printable characters in generated random string and includes lowercase, uppercase, digits, punctuation and whitespace. (see `string.printable`)

It is disabled by default as includes whitespace characters which some systems do not handle well in passwords. This argument also supersedes all other classes because it includes them.

This argument is superseded by chars.

punctuation
[True] New in version 3004.

Use punctuation characters in generated random string. (see `string.punctuation`)

This argument is superseded by chars.

whitespace
[False] New in version 3004.

Use whitespace characters in generated random string. (see `string.whitespace`)

It is disabled by default as some systems do not handle whitespace characters in passwords well.

This argument is superseded by chars.

CLI Example:

```
salt '*' random.get_str 128
salt '*' random.get_str 128 chars='abc123.!()'
salt '*' random.get_str 128 lowercase=False whitespace=True
```

`salt.modules.mod_random.`**`hash`**`(`*value*, *algorithm='sha512'*`)`

New in version 2014.7.0.

Encodes a value with the specified encoder.

value
The value to be hashed.

algorithm
[sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

`salt.modules.mod_random.`**`rand_int`**`(`*start=1*, *end=10*, *seed=None*`)`

Returns a random integer number between the start and end number.

New in version 2015.5.3.

start
[1] Any valid integer number

end
[10] Any valid integer number

seed :
Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:

```
salt '*' random.rand_int 1 10
```

salt.modules.mod_random.**sample**(*value*, *size*, *seed=None*)

Return a given sample size from a list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

value
: A list to e used as input.

size
: The sample size to return.

seed
: Any value which will be hashed as a seed for random.

CLI Example:

```
salt '*' random.sample '["one", "two"]' 1 seed="something"
```

salt.modules.mod_random.**seed**(*range=10*, *hash=None*)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.

hash: **None**
: Any hashable object.

range: **10**
: Any valid integer number

CLI Example:

```
salt '*' random.seed 10 hash=None
```

salt.modules.mod_random.**shadow_hash**(*crypt_salt=None*, *password=None*, *algorithm='sha512'*)

Generates a salted hash suitable for /etc/shadow.

crypt_salt
: [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.

password
: [None] Value to be salted and hashed. If one is not provided, a random password will be generated.

algorithm
: [sha512] Hash algorithm to use.

CLI Example:

```
salt '*' random.shadow_hash 'My5alT' 'MyP@asswd' md5
```

salt.modules.mod_random.**shuffle**(*value*, *seed=None*)

Return a shuffled copy of an input list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

value
: A list to be used as input.

seed
: Any value which will be hashed as a seed for random.

CLI Example:

```
salt '*' random.shuffle '["one", "two"]' seed="something"
```

salt.modules.mod_random.**str_encode**(*value*, *encoder='base64'*)

New in version 2014.7.0.

value

The value to be encoded.

encoder

[base64] The encoder to use on the subsequent string.

CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

26.7.267 salt.modules.modjk

Control Modjk via the Apache Tomcat "Status" worker (http://tomcat.apache.org/connectors-doc/reference/status.html)

Below is an example of the configuration needed for this module. This configuration data can be placed either in *grains* or *pillar*.

If using grains, this can be accomplished *statically* or via a *grain module*.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

salt.modules.modjk.**bulk_activate**(*workers*, *lbn*, *profile='default'*)

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
 ↪other-profile
```

salt.modules.modjk.**bulk_disable**(*workers*, *lbn*, *profile='default'*)

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-
↪profile
```

salt.modules.modjk.**bulk_recover**(*workers, lbn, profile='default'*)

Recover all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-
↪profile
```

salt.modules.modjk.**bulk_stop**(*workers, lbn, profile='default'*)

Stop all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-
↪profile
```

salt.modules.modjk.**dump_config**(*profile='default'*)

Dump the original configuration that was loaded from disk

CLI Examples:

```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

salt.modules.modjk.**get_running**(*profile='default'*)

Get the current running config (not from disk)

CLI Examples:

```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

salt.modules.modjk.**lb_edit**(*lbn, settings, profile='default'*)

Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}"
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}" other-profile
```

salt.modules.modjk.**list_configured_members**(*lbn*, *profile='default'*)

Return a list of member workers from the configuration files

CLI Examples:

```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

salt.modules.modjk.**recover_all**(*lbn*, *profile='default'*)

Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

salt.modules.modjk.**reset_stats**(*lbn*, *profile='default'*)

Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

salt.modules.modjk.**version**(*profile='default'*)

Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

salt.modules.modjk.**worker_activate**(*worker*, *lbn*, *profile='default'*)

Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.**worker_disable**(*worker*, *lbn*, *profile='default'*)

Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

salt.modules.modjk.**worker_edit**(*worker*, *lbn*, *settings*, *profile='default'*)

Edit the worker settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}"
↪other-profile
```

salt.modules.modjk.**worker_recover**(*worker*, *lbn*, *profile='default'*)

Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

salt.modules.modjk.**worker_status**(*worker*, *profile='default'*)

Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```

salt.modules.modjk.**worker_stop**(*worker*, *lbn*, *profile='default'*)

Set the worker to stopped state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.**workers**(*profile='default'*)

Return a list of member workers and their status

CLI Examples:

```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

26.7.268 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration

This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.**collection_create**(*collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

New in version 3006.0.

Create a collection in the specified database.

collection
The name of the collection to create.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collection_create mycollection <user> <password> <host>
↪<port> <database>
```

salt.modules.mongodb.**collection_drop**(*collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

New in version 3006.0.

Drop a collection in the specified database.

collection
The name of the collection to drop.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collection_drop mycollection <user> <password> <host>
↪<port> <database>
```

salt.modules.mongodb.**collections_list**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

New in version 3006.0.

List the collections available in the specified database.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.collections_list mycollection <user> <password> <host>
↪<port> <database>
```

salt.modules.mongodb.**db_exists**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a database exists in MongoDB
name
The name of the database to check for.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

salt.modules.mongodb.**db_list**(*user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

List all MongoDB databases
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

salt.modules.mongodb.**db_remove**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Remove a MongoDB database
name
The name of the database to remove.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

salt.modules.mongodb.**find**(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Find an object or list of objects in a collection
collection
The collection to find the objects in.
query
The query to use when locating objects in the collection.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.find mycollection '[{"foo": "FOO", "bar": "BAR"}]' <user>
↪ <password> <host> <port> <database>
```

salt.modules.mongodb.**insert**(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Insert an object or list of objects into a collection
objects
The objects to insert into the collection, should be provided as a list.
collection
The collection to insert the objects into.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.insert '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ",
↪"bar": "BAM"}]' mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**remove**(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *w=1*, *authdb=None*)

Remove an object or list of objects from a collection

collection
The collection to remove objects from based on the query.

query
Query to determine which objects to remove.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

database
The database where the collection is.

w
The number of matches to remove from the collection.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.remove mycollection '[{"foo": "FOO", "bar": "BAR"}, {"foo
↪": "BAZ", "bar": "BAM"}]' <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**update_one**(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Update an object into a collection http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update_one

New in version 2016.11.0.

objects
The objects to update in the collection, should be provided as a list.

collection
The collection to insert the objects into.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}'
↪mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_create**(*name*, *passwd*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*, *roles=None*)

Create a MongoDB user

name
The name of the user to create.
passwd
The password for the user that is being created.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
database
The MongoDB database to use when checking if the user exists. Default is `admin`.
authdb
The MongoDB database to use for authentication. Default is None.
roles
The roles that should be associated with the user. Default is None.
CLI Example:

```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user>
↪<password> <host> <port> <database>
```

`salt.modules.mongodb.`**`user_exists`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Checks if a user exists in MongoDB
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
database
The MongoDB database to use when checking if the user exists. Default is `admin`.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port>
↪<database>
```

`salt.modules.mongodb.`**`user_find`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get single user from MongoDB
name
The name of the user to find.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.
database
The MongoDB database to use when looking for the user. Default is admin.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Example:

```
salt '*' mongodb.user_find <name> <user> <password> <host> <port>
↪<database> <authdb>
```

salt.modules.mongodb.**user_grant_roles**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Grant one or many roles to a MongoDB user
name
The user to grant the specified roles to.
roles
The roles to grant to the specified user.
database
The database to great the roles against for the specified user.
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
authdb
The MongoDB database to use for authentication. Default is None.
CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe '["readWrite"]' dbname admin
↪adminpwd localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe '[{"role": "readWrite", "db":
↪"dbname" }, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd
↪localhost 27017
```

salt.modules.mongodb.**user_list**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

List users of a MongoDB database
user
The user to connect to MongoDB as. Default is None.
password
The password to use to connect to MongoDB as. Default is None.
host
The host where MongoDB is running. Default is None.
port
The host where MongoDB is running. Default is None.
database
The MongoDB database to use when listing users. Default is admin.
authdb

The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_remove**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Remove a MongoDB user

name
The name of the user that should be removed.

user
The user to connect to MongoDB as. Default is None.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port>
↪<database>
```

salt.modules.mongodb.**user_revoke_roles**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Revoke one or many roles to a MongoDB user

user
The user to connect to MongoDB as. Default is None.

roles
The roles to revoke from the specified user.

database
The database to revoke the roles from for the specified user.

password
The password to use to connect to MongoDB as. Default is None.

host
The host where MongoDB is running. Default is None.

port
The host where MongoDB is running. Default is None.

authdb
The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe '["readWrite"]' dbname admin
↪adminpwd localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe '[{"role": "readWrite", "db":
↪"dbname" }, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd
↪localhost 27017
```

salt.modules.mongodb.**user_roles_exists**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a user of a MongoDB database has specified roles

name
: The name of the user to check for the specified roles.

roles
: The roles to check are associated with the specified user.

database
: The database to check has the specified roles for the specified user.

user
: The user to connect to MongoDB as. Default is None.

password
: The password to use to connect to MongoDB as. Default is None.

host
: The host where MongoDB is running. Default is None.

port
: The host where MongoDB is running. Default is None.

authdb
: The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '["readWrite"]' dbname admin
↪adminpwd localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe '[{"role": "readWrite", "db":
↪"dbname" }, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd
↪localhost 27017
```

salt.modules.mongodb.**version**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get MongoDB instance version

user
: The user to connect to MongoDB as. Default is None.

password
: The password to use to connect to MongoDB as. Default is None.

host
: The host where MongoDB is running. Default is None.

port
: The host where MongoDB is running. Default is None.

authdb
: The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

26.7.269 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.**configtest**()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

salt.modules.monit.**id_**(*reset=False*)

New in version 2016.3.0.

Return monit unique id.

reset

[False] Reset current id and generate a new id when it's True.

CLI Example:

```
salt '*' monit.id [reset=True]
```

salt.modules.monit.**monitor**(*name*)

monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

salt.modules.monit.**reload_**()

New in version 2016.3.0.

Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

salt.modules.monit.**restart**(*name*)

Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

salt.modules.monit.**start**(*name*)

CLI Example:

```
salt '*' monit.start <service name>
```

salt.modules.monit.**status**(*svc_name=''*)

Display a process status from monit

CLI Example:

```
salt '*' monit.status
salt '*' monit.status <service name>
```

salt.modules.monit.**stop**(*name*)

Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

salt.modules.monit.**summary**(*svc_name=''*)

Display a summary from monit

CLI Example:

```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

salt.modules.monit.**unmonitor**(*name*)

Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

salt.modules.monit.**validate**()

New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

salt.modules.monit.**version**()

New in version 2016.3.0.

Return version from monit -V

CLI Example:

```
salt '*' monit.version
```

26.7.270 salt.modules.moosefs

Module for gathering and managing information about MooseFS

salt.modules.moosefs.**dirinfo**(*path*, *opts=None*)

Return information on a directory located on the Moose

CLI Example:

```
salt '*' moosefs.dirinfo /path/to/dir/ [-[n][h|H]]
```

salt.modules.moosefs.**fileinfo**(*path*)

Return information on a file located on the Moose

CLI Example:

```
salt '*' moosefs.fileinfo /path/to/dir/
```

salt.modules.moosefs.**getgoal**(*path*, *opts=None*)

Return goal(s) for a file or directory

CLI Example:

```
salt '*' moosefs.getgoal /path/to/file [-[n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-[n][h|H][r]]
```

salt.modules.moosefs.**mounts**()

Return a list of current MooseFS mounts

CLI Example:

```
salt '*' moosefs.mounts
```

26.7.271 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

salt.modules.mount.**active**(*extended=False*)

List the active mounts.

CLI Example:

```
salt '*' mount.active
```

salt.modules.mount.**automaster**(*config='/etc/auto_salt'*)

List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

salt.modules.mount.**delete_mount_cache**(*real_name*)

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.delete_mount_cache /mnt/share
```

salt.modules.mount.**filesystems**(*config='/etc/filesystems'*)

New in version 2018.3.3.

List the contents of the filesystems

CLI Example:

```
salt '*' mount.filesystems
```

salt.modules.mount.**fstab**(*config='/etc/fstab'*)

Changed in version 2016.3.2.

List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

salt.modules.mount.**get_device_from_path**(*path*)

Return the underlying device for a specified path.

New in version 3006.0.

path
: The path for the function to evaluate.

CLI Example:

```
salt '*' mount.get_device_from_path /
```

salt.modules.mount.**get_mount_from_path**(*path*)

Return the mount providing a specified path.

New in version 3006.0.

path
: The path for the function to evaluate.

CLI Example:

```
salt '*' mount.get_mount_from_path /opt/some/nested/path
```

salt.modules.mount.**is_fuse_exec**(*cmd*)

Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

salt.modules.mount.**is_mounted**(*name*)

New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

salt.modules.mount.**mount**(*name*, *device=False*, *mkmnt=False*, *fstype=''*, *opts='defaults'*, *user=None*, *util='mount'*)

Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

salt.modules.mount.**read_mount_cache**(*name*)

New in version 2018.3.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.read_mount_cache /mnt/share
```

salt.modules.mount.**remount**(*name*, *device*, *mkmnt=False*, *fstype=''*, *opts='defaults'*, *user=None*)

Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

salt.modules.mount.**rm_automaster**(*name*, *device*, *config='/etc/auto_salt'*)

Remove the mount point from the auto_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

salt.modules.mount.**rm_filesystems**(*name*, *device*, *config='/etc/filesystems'*)

New in version 2018.3.3.

Remove the mount point from the filesystems

CLI Example:

```
salt '*' mount.rm_filesystems /mnt/foo /dev/sdg
```

salt.modules.mount.**rm_fstab**(*name*, *device*, *config='/etc/fstab'*)

Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

salt.modules.mount.**rm_vfstab**(*name*, *device*, *config='/etc/vfstab'*)

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

salt.modules.mount.**set_automaster**(*name*, *device*, *fstype*, *opts=''*, *config='/etc/auto_salt'*, *test=False*, *not_change=False*, ***kwargs*)

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.**set_filesystems**(*name*, *device*, *vfstype*, *opts='-'*, *mount='true'*, *config='/etc/filesystems'*, *test=False*, *match_on='auto'*, *not_change=False*, ***kwargs*)

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

Provide information if the path is mounted

Parameters

- **name** -- The name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:

```
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

salt.modules.mount.**set_fstab**(*name*, *device*, *fstype*, *opts='defaults'*, *dump=0*, *pass_num=0*, *config='/etc/fstab'*, *test=False*, *match_on='auto'*, *not_change=False*, ***kwargs*)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

CLI Example:

```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.**set_vfstab**(*name*, *device*, *fstype*, *opts='-'*, *device_fsck='-'*, *pass_fsck='-'*, *mount_at_boot='yes'*, *config='/etc/vfstab'*, *test=False*, *match_on='auto'*, *not_change=False*, ***kwargs*)

New in version 2016.3.2.

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via *match_on* and *not_change* is True, the current line will be preserved.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

salt.modules.mount.**swapoff**(*name*)

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.**swapon**(*name*, *priority=None*)

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.**swaps**()

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

salt.modules.mount.**umount**(*name*, *device=None*, *user=None*, *util='mount'*)

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

salt.modules.mount.**vfstab**(*config='/etc/vfstab'*)

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

salt.modules.mount.**write_mount_cache**(*real_name*, *device*, *mkmnt*, *fstype*, *mount_opts*)

New in version 2018.3.0.

Provide information if the path is mounted

Parameters

- **real_name** -- The real name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **mkmnt** -- Whether or not the mount point should be created.
- **fstype** -- The file system that is used.

- **mount_opts** -- Additional options used when mounting the device.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,
↪nosuid
```

26.7.272 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

- FreeTDS
- pymssql Python module

configuration

In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port:   1433
mssql.user:   'sysdba'
mssql.password:   'Some preferable complex password'
mssql.database: ''
```

The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

`salt.modules.mssql.`**`db_create`**(*database*, *containment='NONE'*, *new_database_options=None*, ***kwargs*)

Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings

CLI Example:

```
salt minion mssql.db_create DB_NAME
```

`salt.modules.mssql.`**`db_exists`**(*database_name*, ***kwargs*)

Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

`salt.modules.mssql.`**`db_list`**(***kwargs*)

Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

salt.modules.mssql.**db_remove**(*database_name*, ***kwargs*)

Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

salt.modules.mssql.**login_create**(*login*, *new_login_password=None*, *new_login_domain=''*, *new_login_roles=None*, *new_login_options=None*, ***kwargs*)

Creates a new login. Does not update password of existing logins. For Windows authentication, provide `new_login_domain`. For SQL Server authentication, prvide `new_login_password`. Since hashed passwords are *varbinary* values, if the `new_login_password` is 'int / long', it will be considered to be HASHED.

new_login_roles
: a list of SERVER roles

new_login_options
: a list of strings

CLI Example:

```
salt minion mssql.login_create LOGIN_NAME database=DBNAME [new_login_
↪password=PASSWORD]
```

salt.modules.mssql.**login_exists**(*login*, *domain=''*, ***kwargs*)

Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.**login_remove**(*login*, ***kwargs*)

Removes an login.

CLI Example:

```
salt minion mssql.login_remove LOGINNAME
```

salt.modules.mssql.**role_create**(*role*, *owner=None*, *grants=None*, ***kwargs*)

Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba grants='["SELECT
↪", "INSERT", "UPDATE", "DELETE", "EXECUTE"]'
```

salt.modules.mssql.**role_exists**(*role*, ***kwargs*)

Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

salt.modules.mssql.**role_list**(***kwargs*)

Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

salt.modules.mssql.**role_remove**(*role*, ***kwargs*)

Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

salt.modules.mssql.**tsql_query**(*query*, ***kwargs*)

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

salt.modules.mssql.**user_create**(*username*, *login=None*, *domain=''*, *database=None*, *roles=None*, *options=None*, ***kwargs*)

Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME
```

salt.modules.mssql.**user_exists**(*username*, *domain=''*, *database=None*, ***kwargs*)

Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

salt.modules.mssql.**user_list**(***kwargs*)

Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

salt.modules.mssql.**user_remove**(*username*, ***kwargs*)

Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

salt.modules.mssql.**version**(***kwargs*)

Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

26.7.273 salt.modules.msteams

Module for sending messages to MS Teams

New in version 2017.7.0.

configuration
This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

salt.modules.msteams.**post_card**(*message*, *hook_url=None*, *title=None*, *theme_color=None*)

Send a message to an MS Teams channel. :param message: The message to send to the MS Teams channel. :param hook_url: The Teams webhook URL, if not specified in the configuration. :param title: Optional title for the posted card :param theme_color: Optional hex color highlight for the posted card :return: Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```

26.7.274 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

salt.modules.munin.**list_plugins**()

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

salt.modules.munin.**run**(*plugins*)

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

salt.modules.munin.**run_all**()

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

26.7.275 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- Python module: MySQLdb, mysqlclient, or PyMYSQL

configuration

In order to connect to MySQL, certain configuration is required in either the relevant minion config (/etc/salt/minion), or pillar.

Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: 'charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined *here*. Additionally, it is now possible to setup a user with no password.

`salt.modules.mysql.`**`alter_db`**(*name*, *character_set=None*, *collate=None*, ***connection_args*)

Modify database using `ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s;` query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

`salt.modules.mysql.`**`db_check`**(*name*, *table=None*, ***connection_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

`salt.modules.mysql.`**`db_create`**(*name*, *character_set=None*, *collate=None*, ***connection_args*)

Adds a databases to the MySQL server.

name
: The name of the database to manage

character_set
: The character set, if left empty the MySQL default will be used

collate
: The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

salt.modules.mysql.**db_exists**(*name*, ***connection_args*)

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

salt.modules.mysql.**db_get**(*name*, ***connection_args*)

Return a list of databases of a MySQL server using the output from the `SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname';` query.

CLI Example:

```
salt '*' mysql.db_get test
```

salt.modules.mysql.**db_list**(***connection_args*)

Return a list of databases of a MySQL server using the output from the `SHOW DATABASES` query.

CLI Example:

```
salt '*' mysql.db_list
```

salt.modules.mysql.**db_optimize**(*name*, *table=None*, ***connection_args*)

Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

salt.modules.mysql.**db_remove**(*name*, ***connection_args*)

Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

salt.modules.mysql.**db_repair**(*name*, *table=None*, ***connection_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

salt.modules.mysql.**db_tables**(*name*, ***connection_args*)

Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

salt.modules.mysql.**file_query**(*database*, *file_name*, ***connection_args*)

Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

database
: database to run script inside

file_name
: File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

salt.modules.mysql.**free_slave**(***connection_args*)

Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

salt.modules.mysql.**get_master_status**(***connection_args*)

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                     'Binlog_Ignore_DB': '',
                     'File': 'mysql-bin.000021',
                     'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

salt.modules.mysql.**get_slave_status**(***connection_args*)

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                     'Exec_Master_Log_Pos': 107,
                     'Last_Errno': 0,
                     'Last_Error': '',
                     'Last_IO_Errno': 0,
                     'Last_IO_Error': '',
                     'Last_SQL_Errno': 0,
                     'Last_SQL_Error': '',
                     'Master_Host': 'comet.scion-eng.com',
                     'Master_Log_File': 'mysql-bin.000021',
                     'Master_Port': 3306,
```

(continues on next page)

(continued from previous page)

```
                'Master_SSL_Allowed': 'No',
                'Master_SSL_CA_File': '',
                'Master_SSL_CA_Path': '',
                'Master_SSL_Cert': '',
                'Master_SSL_Cipher': '',
                'Master_SSL_Key': '',
                'Master_SSL_Verify_Server_Cert': 'No',
                'Master_Server_Id': 1,
                'Master_User': 'replu',
                'Read_Master_Log_Pos': 107,
                'Relay_Log_File': 'klo-relay-bin.000071',
                'Relay_Log_Pos': 253,
                'Relay_Log_Space': 553,
                'Relay_Master_Log_File': 'mysql-bin.000021',
                'Replicate_Do_DB': '',
                'Replicate_Do_Table': '',
                'Replicate_Ignore_DB': '',
                'Replicate_Ignore_Server_Ids': '',
                'Replicate_Ignore_Table': '',
                'Replicate_Wild_Do_Table': '',
                'Replicate_Wild_Ignore_Table': '',
                'Seconds_Behind_Master': 0,
                'Skip_Counter': 0,
                'Slave_IO_Running': 'Yes',
                'Slave_IO_State': 'Waiting for master to send event',
                'Slave_SQL_Running': 'Yes',
                'Until_Condition': 'None',
                'Until_Log_File': '',
                'Until_Log_Pos': 0}}
```

CLI Example:

```
salt '*' mysql.get_slave_status
```

salt.modules.mysql.**grant_add**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, *ssl_option=False*, ***connection_args*)

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:

```
salt '*' mysql.grant_add            'SELECT,INSERT,UPDATE,...' 'database.
↪*' 'frank' 'localhost'
```

salt.modules.mysql.**grant_exists**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Checks to see if a grant exists in the database

CLI Example:

```
salt '*' mysql.grant_exists              'SELECT,INSERT,UPDATE,...'
↪'database.*' 'frank' 'localhost'
```

salt.modules.mysql.**grant_revoke**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Removes a grant from the MySQL server.

CLI Example:

```
salt '*' mysql.grant_revoke             'SELECT,INSERT,UPDATE' 'database.*
↪' 'frank' 'localhost'
```

salt.modules.mysql.**plugin_add**(*name*, *soname=None*, ***connection_args*)

Add a plugina.

CLI Example:

```
salt '*' mysql.plugin_add auth_socket
```

salt.modules.mysql.**plugin_remove**(*name*, ***connection_args*)

Remove a plugin.

CLI Example:

```
salt '*' mysql.plugin_remove auth_socket
```

salt.modules.mysql.**plugin_status**(*name*, ***connection_args*)

Return the status of a plugin.

CLI Example:

```
salt '*' mysql.plugin_status auth_socket
```

salt.modules.mysql.**plugins_list**(***connection_args*)

Return a list of plugins and their status from the `SHOW PLUGINS` query.

CLI Example:

```
salt '*' mysql.plugins_list
```

salt.modules.mysql.**processlist**(***connection_args*)

Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```
{'Command': 'Query',
'Host': 'localhost',
'Id': 39,
'Info': 'SHOW FULL PROCESSLIST',
'Rows_examined': 0,
'Rows_read': 1,
'Rows_sent': 0,
'State': None,
'Time': 0,
'User': 'root',
'db': 'mysql'}
```

CLI Example:

```
salt '*' mysql.processlist
```

salt.modules.mysql.**query**(*database*, *query*, ***connection_args*)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{'columns': ('id', 'name', 'cash'),
    'query time': {'human': '1.0ms', 'raw': '0.001'},
    'results': ((1L, 'User 1', Decimal('110.000000')),
                (2L, 'User 2', Decimal('215.636756')),
                (3L, 'User 3', Decimal('0.040000'))),
    'rows returned': 3L}
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on `mydb` and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')[
↪'results'][0][0] }}
```

salt.modules.mysql.**quote_identifier**(*identifier*, *for_grants=False*)

Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by "`" character and escaping this character inside. It also means doubling the '%' character for MySQLdb internal usage.

Parameters

- **identifier** -- the table, column or database identifier

- **for_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape "_" and "%" characters as requested by MySQL. Note that theses characters should only be escaped when requesting grants on the database level (*my_%db.**) but not for table level grants (*my_%db.*`foo`)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar'
```

salt.modules.mysql.**showglobal**(***connection_args*)

Retrieves the show global variables from the minion.

Returns::

show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

salt.modules.mysql.**showvariables**(***connection_args*)

Retrieves the show variables from the minion.

Returns::

show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

salt.modules.mysql.**slave_lag**(***connection_args*)

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

salt.modules.mysql.**status**(***connection_args*)

Return the status of a MySQL server using the output from the `SHOW STATUS` query.

CLI Example:

```
salt '*' mysql.status
```

salt.modules.mysql.**tokenize_grant**(*grant*)

External wrapper function :param grant: :return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant              "GRANT SELECT, INSERT ON testdb.
↪* TO 'testuser'@'localhost'"
```

salt.modules.mysql.**user_chpass**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *allow_passwordless=False*, *unix_socket=None*, *password_column=None*, ***connection_args*)

Change password for a MySQL user

host

Host for which this user/password combo applies

password
The password to set for the new user. Will take precedence over the `password_hash` option if both are specified.

password_hash
The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless
If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

salt.modules.mysql.**user_create**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *allow_passwordless=False*, *unix_socket=False*, *password_column=None*, *auth_plugin='mysql_native_password'*, ***connection_args*)

Creates a MySQL user

host
Host for which this user/password combo applies

password
The password to use for the new user. Will take precedence over the `password_hash` option if both are specified.

password_hash
The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless
If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

unix_socket
If `True` and allow_passwordless is `True` then will be used unix_socket auth plugin.

password_column
The password column to use in the user table.

auth_plugin
The authentication plugin to use, default is to use the mysql_native_password plugin.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

`salt.modules.mysql.`**`user_exists`**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *passwordless=False*, *unix_socket=False*, *password_column=None*, ***connection_args*)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting `password` and `password_hash`, and using `passwordless=True`.

New in version 0.16.2: The `passwordless` option was added.

CLI Example:

```
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_
↪string'
```

`salt.modules.mysql.`**`user_grants`**(*user*, *host='localhost'*, ***connection_args*)

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```
salt '*' mysql.user_grants 'frank' 'localhost'
```

`salt.modules.mysql.`**`user_info`**(*user*, *host='localhost'*, ***connection_args*)

Get full info on a MySQL user

CLI Example:

```
salt '*' mysql.user_info root localhost
```

`salt.modules.mysql.`**`user_list`**(***connection_args*)

Return a list of users on a MySQL server

CLI Example:

```
salt '*' mysql.user_list
```

`salt.modules.mysql.`**`user_remove`**(*user*, *host='localhost'*, ***connection_args*)

Delete MySQL user

CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

`salt.modules.mysql.`**`verify_login`**(*user*, *password=None*, ***connection_args*)

Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:

```
salt '*' mysql.verify_login root password
```

salt.modules.mysql.**version**(***connection_args*)

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

26.7.276 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends

PyNaCl, https://github.com/pyca/pynacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

configuration

The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have *pillar_opts=True*:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_
↪file`
    # also `box_type` default changed from secretbox to
↪sealedbox.
    box_type: sealedbox                     (default)
    sk_file: /etc/salt/pki/master/nacl      (default)
    pk_file: /etc/salt/pki/master/nacl.pub  (default)
    sk: None
    pk: None
```

Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/
↪etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *sk_file* and *pk_file* use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen
local:
    ----------
    pk:
        /kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
```

(continues on next page)

(continued from previous page)

```
    sk:
        SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two option, *sealedbox* or *secretbox*.

SecretBox is data encrypted using private key *pk*. Sealedbox is encrypted using public key *pk*.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-call --local nacl.enc asecretpass pk=/kfGX7PbWeu099702PBbKWLpG/
↪9p06IQRswkdWHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-call --local nacl.dec data=
↪'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58='          sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
    sk_file: /etc/salt/pki/master/nacl
    pk: 'cTIqXwnUiD1ulg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec data=
↪'tqXzeIJnTAM9Xf0mdLcpEdklMbfBGPj2oTKmlgrm3S1DTVVHNnh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl publicX
↪key
nacl.config:
    pk: '/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
    user: root
    password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6hlbWj0llUA+uaVyvou3vJ4=
↪')|json}}
    cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl
↪')|json}}
    cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl
↪')|json}}
```

Larger files like certificates can be encrypted with:

```
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
# or more advanced
cert=$(cat /tmp/cert.crt)
salt-call --out=newline_values_only nacl.enc_pub data="$cert" > /tmp/cert.nacl
```

In pillars rended with jinja be sure to include *|json* so line breaks are encoded:

```
cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')|json}}"
```

In states rendered with jinja it is also good pratice to include *|json*:

```
{{sls}} private key:
    file.managed:
        - name: /etc/ssl/private/cert.key
        - mode: 700
        - contents: "{{pillar['pillarexample']['cert_key']|json}}"
```

Optional small program to encrypt data without needing salt modules.

```
#!/bin/python3
import sys, base64, nacl.public
pk = base64.b64decode('YOURPUBKEY')
b = nacl.public.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```
echo 'apassword' | nacl_enc.py
```

salt.modules.nacl.**dec**(*data*, ***kwargs*)

Alias to *{box_type}_decrypt*

box_type: secretbox, sealedbox(default)

salt.modules.nacl.**dec_file**(*name*, *out=None*, ***kwargs*)

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-call nacl.dec_file name=salt://crt/mycert.nacl out=/tmp/id_rsa
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox
↪  sk_file=/etc/salt/pki/master/nacl.pub
```

salt.modules.nacl.**enc**(*data*, ***kwargs*)

Alias to *{box_type}_encrypt*

box_type: secretbox, sealedbox(default)

salt.modules.nacl.**enc_file**(*name*, *out=None*, ***kwargs*)

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mycert out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox              sk_
↪file=/etc/salt/pki/master/nacl.pub
```

salt.modules.nacl.**keygen**(*sk_file=None*, *pk_file=None*, ***kwargs*)

Use PyNaCl to generate a keypair.

If no *sk_file* is defined return a keypair.

If only the *sk_file* is defined *pk_file* will use the same name with a postfix *.pub*.

When the *sk_file* is already existing, but *pk_file* is not. The *pk_file* will be generated using the *sk_file*.

CLI Examples:

```
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
↪pki/master/nacl.pub
salt-call --local nacl.keygen
```

salt.modules.nacl.**sealedbox_decrypt**(*data*, ***kwargs*)

Decrypt data using a secret key that was encrypted using a public key with *nacl.sealedbox_encrypt*.

CLI Examples:

```
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/
↪etc/salt/pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk=
↪'YmFkcGFzcwo='
```

salt.modules.nacl.**sealedbox_encrypt**(*data*, ***kwargs*)

Encrypt data using a public key generated from *nacl.keygen*. The encryptd data can be decrypted using *nacl.sealedbox_decrypt* only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
salt-call --local nacl.sealedbox_encrypt datatoenc pk_file=/etc/salt/pki/
↪master/nacl.pub
salt-call --local nacl.sealedbox_encrypt datatoenc pk=
↪'vrwQF7cNiNAVQVAiS3bvcbJUnF0cN6fU9YTZD9mBfzQ='
```

salt.modules.nacl.**secretbox_decrypt**(*data*, ***kwargs*)

Decrypt data that was encrypted using *nacl.secretbox_encrypt* using the secret key that was generated from *nacl.keygen*.

CLI Examples:

```
salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/
↪etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk=
↪'YmFkcGFzcwo='
```

salt.modules.nacl.**secretbox_encrypt**(*data*, ***kwargs*)

Encrypt data using a secret key generated from *nacl.keygen*. The same secret key can be used to decrypt the data using *nacl.secretbox_decrypt*.

CLI Examples:

```
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/
↪master/nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

26.7.277 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

salt.modules.nagios.**list_plugins**()

List all the nagios plugins

CLI Example:

```
salt '*' nagios.list_plugins
```

salt.modules.nagios.**retcode**(*plugin*, *args=''*, *key_name=None*)

Run one nagios plugin and return retcode of the execution

salt.modules.nagios.**retcode_pillar**(*pillar_name*)

Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

salt.modules.nagios.**run**(*plugin*, *args=''*)

Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

salt.modules.nagios.**run_all**(*plugin*, *args=''*)

Run nagios plugin and return all the data execution with cmd.run_all

salt.modules.nagios.**run_all_pillar**(*pillar_name*)

Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

salt.modules.nagios.**run_pillar**(*pillar_name*)

Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

26.7.278 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

salt.modules.nagios_rpc.**host_status**(*hostname=None*, ***kwargs*)

Check status of a particular host By default statuses are returned in a numeric format.

Parameters:

hostname

The hostname to check the status of the service in Nagios.

numeric

Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns

status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
↪numeric=False
```

salt.modules.nagios_rpc.**service_status**(*hostname=None*, *service=None*, ***kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:

hostname

The hostname to check the status of the service in Nagios.

service

The service to check the status of in Nagios.

numeric

Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns

status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service=
↪'HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service=
↪'HTTP' numeric=False
```

26.7.279 salt.modules.namecheap_domains

Namecheap Domain Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains.`**`check`**`(`*`*domains_to_check`*`)`

Checks the availability of domains

domains_to_check
: array of strings List of domains to check

Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:

```
salt 'my-minion' namecheap_domains.check domain-to-check
```

`salt.modules.namecheap_domains.`**`create`**`(`*`domain_name, years, **kwargs`*`)`

Try to register the specified domain name

domain_name
: The domain name to be registered

years
: Number of years to register

Returns the following information:

- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

`salt.modules.namecheap_domains.`**`get_info`**`(`*`domain_name`*`)`

Returns information about the requested domain

returns a dictionary of information about the domain_name

domain_name
string Domain name to get information about
CLI Example:

```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

salt.modules.namecheap_domains.**get_list**(*list_type=None*, *search_term=None*, *page=None*, *page_size=None*, *sort_by=None*)

Returns a list of domains for the particular user as a list of objects offset by `page` length of `page_size`
list_type
[ALL] One of `ALL`, `EXPIRING`, `EXPIRED`
search_term
Keyword to look for on the domain list
page
[1] Number of result page to return
page_size
[20] Number of domains to be listed per page (minimum: `10`, maximum: `100`)
sort_by
One of `NAME`, `NAME_DESC`, `EXPIREDATE`, `EXPIREDATE_DESC`, `CREATEDATE`, or `CREATEDATE_DESC`
CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

salt.modules.namecheap_domains.**get_tld_list**()

Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

salt.modules.namecheap_domains.**reactivate**(*domain_name*)

Try to reactivate the expired domain name

Returns the following information:
- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

salt.modules.namecheap_domains.**renew**(*domain_name*, *years*, *promotion_code=None*)

Try to renew the specified expiring domain name for a specified number of years
domain_name
The domain name to be renewed
years
Number of years to renew
Returns the following information:
- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID

- The amount charged for renewal

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

26.7.280 salt.modules.namecheap_domains_dns

Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains_dns.**get_hosts**(*sld*, *tld*)

Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain

sld
: SLD of the domain name

tld
: TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

salt.modules.namecheap_domains_dns.**get_list**(*sld*, *tld*)

Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain

sld
: SLD of the domain name

tld
: TLD of the domain name

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

salt.modules.namecheap_domains_dns.**set_custom**(*sld*, *tld*, *nameservers*)

Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully

sld
SLD of the domain name

tld
TLD of the domain name

nameservers
array of strings List of nameservers to be associated with this domain

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

salt.modules.namecheap_domains_dns.**set_default**(*sld*, *tld*)

Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.

sld
SLD of the domain name

tld
TLD of the domain name

Returns `True` if the domain was successfully pointed at the default DNS servers.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

salt.modules.namecheap_domains_dns.**set_hosts**(*sld*, *tld*, *hosts*)

Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully

sld
SLD of the domain name

tld
TLD of the domain name

hosts
Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

- **hostname**
- **recordtype** - One of `A`, `AAAA`, `CNAME`, `MX`, `MXE`, `TXT`, `URL`, `URL301`, or `FRAME`
- **address** - URL or IP address
- **ttl** - An integer between 60 and 60000 (default: `1800`)

Additionally, the `mxpref` key can be present, but must be accompanied by an `emailtype` key.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

26.7.281 salt.modules.namecheap_domains_ns

Namecheap Nameserver Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains_ns.`**`create`**(*sld*, *tld*, *nameserver*, *ip*)

Creates a new nameserver. Returns `True` if the nameserver was created successfully.

sld
: SLD of the domain name

tld
: TLD of the domain name

nameserver
: Nameserver to create

ip
: Nameserver IP address

CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

`salt.modules.namecheap_domains_ns.`**`delete`**(*sld*, *tld*, *nameserver*)

Deletes a nameserver. Returns `True` if the nameserver was deleted successfully

sld
: SLD of the domain name

tld
: TLD of the domain name

nameserver
: Nameserver to delete

CLI Example:

```
salt '*' namecheap_domains_ns.delete sld tld nameserver
```

`salt.modules.namecheap_domains_ns.`**`get_info`**(*sld*, *tld*, *nameserver*)

Retrieves information about a registered nameserver. Returns the following information:

- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses

sld
SLD of the domain name
tld
TLD of the domain name
nameserver
Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

salt.modules.namecheap_domains_ns.**update**(*sld*, *tld*, *nameserver*, *old_ip*, *new_ip*)

Deletes a nameserver. Returns `True` if the nameserver was updated successfully.
sld
SLD of the domain name
tld
TLD of the domain name
nameserver
Nameserver to create
old_ip
Current ip address
new_ip
New ip address
CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

26.7.282 salt.modules.namecheap_ssl

Namecheap SSL Certificate Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_ssl.**activate**(*csr_file*, *certificate_id*, *web_server_type*, *approver_email=None*, *http_dc_validation=False*, ***kwargs*)

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

csr_file
Path to Certificate Signing Request file

certificate_id
Unique ID of the SSL certificate you wish to activate

web_server_type
The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

approver_email
The email ID which is on the approver email list.

Note: `http_dc_validation` must be set to `False` if this option is used.

---

http_dc_validation
[False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:

```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.`**`create`**(*years*, *certificate_type*, *promotion_code=None*, *sans_to_add=None*)

Creates a new SSL certificate. Returns the following information:

- Whether or not the SSL order was successful
- The certificate ID
- The order ID

- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

years
: [1] Number of years to register

certificate_type
: Type of SSL Certificate. Possible values include:
  - EV Multi Domain SSL
  - EV SSL
  - EV SSL SGC
  - EssentialSSL
  - EssentialSSL Wildcard
  - InstantSSL
  - InstantSSL Pro
  - Multi Domain SSL
  - PositiveSSL
  - PositiveSSL Multi Domain
  - PositiveSSL Wildcard
  - PremiumSSL
  - PremiumSSL Wildcard
  - QuickSSL Premium
  - RapidSSL
  - RapidSSL Wildcard
  - SGC Supercert
  - SSL Web Server
  - SSL Webserver EV
  - SSL123
  - Secure Site
  - Secure Site Pro
  - Secure Site Pro with EV
  - Secure Site with EV
  - True BusinessID
  - True BusinessID Multi Domain
  - True BusinessID Wildcard
  - True BusinessID with EV
  - True BusinessID with EV Multi Domain
  - Unified Communications

promotional_code
: An optional promo code to use when creating the certificate

sans_to_add
: [0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.

Provi	Product name	Default number of domains (domain from CSR is counted here)	Maximum number of total domains	Maximum number of domains that can be passed in sans_to_add parameter
Comodo	PositiveSSL Multi-Domain	3	100	97
Comodo	Multi-Domain SSL	3	100	97
Comodo	EV Multi- Domain SSL	3	100	97
Comodo	Unified Communications	3	100	97
GeoT	QuickSSL Premium	1	1 domain + 4 subdomains	The only supported value is 4
GeoT	True BusinessID with EV Multi-Domain	5	25	20
GeoT	True Business ID Multi- Domain	5	25	20
Thaw	SSL Web Server	1	25	24
Thaw	SSL Web Server with EV	1	25	24
Thaw	SGC Supercerts	1	25	24
Symantec	Secure Site Pro with EV	1	25	24
Symantec	Secure Site with EV	1	25	24
Symantec	Secure Site	1	25	24
Symantec	Secure Site Pro	1	25	24

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

salt.modules.namecheap_ssl.**get_info**(*certificate_id*, *returncertificate=False*, *returntype=None*)

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:

- **ssl** - Contains the metadata information
- **certificate** - Contains the details for the certificate such as the CSR, Approver, and certificate data

certificate_id
: Unique ID of the SSL certificate

returncertificate
: [False] Set to `True` to ask for the certificate in response

returntype
: Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"

> **Note:** Required if `returncertificate` is `True`

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

salt.modules.namecheap_ssl.**get_list**(***kwargs*)

Returns a list of SSL certificates for a particular user

ListType

[All] Possible values:

- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

SearchTerm

Keyword to look for on the SSL list

Page

[1] Page number to return

PageSize

[20] Total number of SSL certificates to display per page (minimum: `10`, maximum: `100`)

SoryBy

One of `PURCHASEDATE`, `PURCHASEDATE_DESC`, `SSLTYPE`, `SSLTYPE_DESC`, `EXPIREDATETIME`, `EXPIREDATETIME_DESC`, `Host_Name`, or `Host_Name_DESC`

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_list Processing
```

salt.modules.namecheap_ssl.**parse_csr**(*csr_file*, *certificate_type*, *http_dc_validation=False*)

Parses the CSR. Returns a dictionary of result values.

csr_file

Path to Certificate Signing Request file

certificate_type

Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert

- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

http_dc_validation
: [False] Set to `True` if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

`salt.modules.namecheap_ssl.`**`reissue`**(*csr_file*, *certificate_id*, *web_server_type*, *approver_email=None*, *http_dc_validation=False*, ***kwargs*)

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file
: Path to Certificate Signing Request file

certificate_id
: Unique ID of the SSL certificate you wish to activate

web_server_type
: The type of certificate format to return. Possible values include:
  - apache2
  - apacheapachessl
  - apacheopenssl
  - apacheraven
  - apachessl
  - apachessleay
  - c2net
  - cobaltseries
  - cpanel
  - domino
  - dominogo4625
  - dominogo4626
  - ensim
  - hsphere
  - ibmhttp
  - iis
  - iis4
  - iis5
  - iplanet
  - ipswitch
  - netscape
  - other
  - plesk
  - tomcat
  - weblogic

- website
- webstar
- zeusv3

approver_email
The email ID which is on the approver email list.

Note: `http_dc_validation` must be set to `False` if this option is used.

---

http_dc_validation
[False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:

```
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.`**`renew`**(*years*, *certificate_id*, *certificate_type*, *promotion_code=None*)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:

- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

years
[1] Number of years to register

certificate_id
Unique ID of the SSL certificate you wish to renew

certificate_type
Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV

- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

promotional_code
An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```

26.7.283 salt.modules.namecheap_users

Namecheap User Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname

```

`salt.modules.namecheap_users.`**`check_balances`**`(`*minimum=100*`)`

Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns `False` if the user's account balance is less than the provided minimum or `True` if greater than the minimum.

minimum
[100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

`salt.modules.namecheap_users.`**`get_balances`**`()`

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

Note: If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequiredForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

26.7.284 salt.modules.napalm_bgp

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_bgp.`**`config`**(*group=None*, *neighbor=None*, ***kwargs*)

Provides the BGP configuration on the device.

Parameters

- **`group`** -- Name of the group selected to display the configuration.
- **`neighbor`** -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

Returns

A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

- type (string)
- description (string)
- apply_groups (string list)
- multihop_ttl (int)
- multipath (True/False)
- local_address (string)
- local_as (int)
- remote_as (int)
- import_policy (string)
- export_policy (string)
- remove_private_as (True/False)

- prefix_limit (dictionary)
- neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

- description (string)
- import_policy (string)
- export_policy (string)
- local_address (string)
- local_as (int)
- remote_as (int)
- authentication_key (string)
- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP
↪group PEERS-GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only
↪about BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME
```

Output Example:

```
{
    'PEERS-GROUP-NAME':{
        'type'          : 'external',
        'description'   : 'Here we should have a nice description',
        'apply_groups'  : ['BGP-PREFIX-LIMIT'],
        'import_policy' : 'PUBLIC-PEER-IN',
        'export_policy' : 'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath'     : True,
        'multihop_ttl'  : 30,
        'neighbors'     : {
            '192.168.0.1': {
                'description'   : 'Facebook [CDN]',
                'prefix_limit'  : {
                    'inet': {
                        'unicast': {
                            'limit': 100,
                            'teardown': {
                                'threshold' : 95,
                                'timeout'   : 5
                            }
                        }
                    }
                }
                'peer-as'        : 32934,
                'route_reflector': False,
                'nhs'            : True
            },
            '172.17.17.1': {
```

(continues on next page)

(continued from previous page)

```
                'description'   : 'Twitter [CDN]',
                'prefix_limit'  : {
                    'inet': {
                        'unicast': {
                            'limit': 500,
                            'no-validate': 'IMPORT-FLOW-ROUTES'
                        }
                    }
                }
                'peer_as'        : 13414
                'route_reflector': False,
                'nhs'            : False
            }
        }
    }
}
```

salt.modules.napalm_bgp.**neighbors**(*neighbor=None*, ***kwargs*)

Provides details regarding the BGP sessions configured on the network device.

Parameters

neighbor -- IP Address of a specific neighbor.

Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)

- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- flap_count (int)

CLI Example:

```
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s)
↪172.17.17.1
```

Output Example:

```
{
    'default': {
        8121: [
            {
                'up'                        : True,
                'local_as'                  : 13335,
                'remote_as'                 : 8121,
                'local_address'             : '172.101.76.1',
                'local_address_configured'  : True,
                'local_port'                : 179,
                'remote_address'            : '192.247.78.0',
                'router_id'                 : '192.168.0.1',
                'remote_port'               : 58380,
                'multihop'                  : False,
                'import_policy'             : '4-NTT-TRANSIT-IN',
                'export_policy'             : '4-NTT-TRANSIT-OUT',
                'input_messages'            : 123,
                'output_messages'           : 13,
                'input_updates'             : 123,
                'output_updates'            : 5,
                'messages_queued_out'       : 23,
                'connection_state'          : 'Established',
```

(continues on next page)

(continued from previous page)

```
                'previous_connection_state' : 'EstabSync',
                'last_event'                : 'RecvKeepAlive',
                'suppress_4byte_as'         : False,
                'local_as_prepend'          : False,
                'holdtime'                  : 90,
                'configured_holdtime'       : 90,
                'keepalive'                 : 30,
                'configured_keepalive'      : 30,
                'active_prefix_count'       : 132808,
                'received_prefix_count'     : 566739,
                'accepted_prefix_count'     : 566479,
                'suppressed_prefix_count'   : 0,
                'advertise_prefix_count'    : 0,
                'flap_count'                : 27
            }
        ]
    }
}
```

26.7.285 salt.modules.napalm_formula

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

`salt.modules.napalm_formula.`**`container_path`**(*model*, *key=None*, *container=None*, *delim=':'*)

Return the list of all the possible paths in a container, down to the `config` container. This function can be used to verify that the `model` is a Python object correctly structured and respecting the OpenConfig hierarchy.

model

The OpenConfig-structured object to inspect.

delim: **`:`**

The key delimiter. In particular cases, it is indicated to use `//` as `:` might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path "{'interfaces': {'interface': {
↪'Ethernet1': {'config': {'name': 'Ethernet1'}}}}}"
```

The example above would return a list with the following element: `interfaces:interface:Ethernet1:config` which is the only possible path in that hierarchy.

Other output examples:

```
- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config
```

salt.modules.napalm_formula.**defaults**(*model*, *defaults_*, *delim='//'*, *flipped_merge=False*)

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

model

The OpenConfig model to apply the defaults to.

defaults

The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don't have to provide the defaults for each entity but only for the entity type. See an example below.

delim: **//**

The key delimiter to use. Generally, `//` should cover all the possible cases, and you don't need to override this value.

flipped_merge: **False**

Whether should merge the model into the defaults, or the defaults into the model. Default: `False` (merge the model into the defaults, i.e., any defaults would be overridden by the values from the `model`).

CLI Example:

```
salt '*' napalm_formula.defaults "{'interfaces': {'interface': {'Ethernet1
↪': {'config': {'name': 'Ethernet1'}}}}}" "{'interfaces': {'interface': {
↪'*': {'config': {'enabled': True}}}}}"
```

As one can notice in the example above, the `*` corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

salt.modules.napalm_formula.**dictupdate**(*dest*, *upd*, *recursive_update=True*, *merge_lists=False*)

Recursive version of the default dict.update

Merges upd recursively into dest

If recursive_update=False, will use the classic dict.update, or fall back on a manual merge (helpful for non-dict types like `FunctionWrapper`).

If `merge_lists=True`, will aggregate list object types instead of replace. The list in `upd` is added to the list in `dest`, so the resulting list is `dest[key] + upd[key]`. This behaviour is only activated when `recursive_update=True`. By default `merge_lists=False`.

salt.modules.napalm_formula.**render_field**(*dictionary*, *field*, *prepend=None*, *append=None*, *quotes=False*, ***opts*)

Render a field found under the `field` level of the hierarchy in the `dictionary` object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: `{{ interfaces.interface.Ethernet5.config.description }}` for the following object: `{'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}}` it would error, as the `Ethernet5` key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

dictionary

The dictionary to traverse.

field

The key name or part to traverse in the `dictionary`.

prepend: **None**

The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.

append: **None**

Text to append at the end.

quotes: **False**

Whether should wrap the text around quotes.

CLI Example:

```
salt '*' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the ``enabled`` leaf key
salt '*' napalm_formula.render_field "{'enabled': True}" description
# This would not error
```

Jinja usage example:

```
{%- set config = {'enabled': True, 'description': 'Interface description'}
↪ %}
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won't be accepted by Junos):

```
description "Interface description";
```

salt.modules.napalm_formula.**render_fields**(*dictionary*, **fields*, ***opts*)

This function works similarly to *render_field* but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

dictionary
: The dictionary to traverse.

fields
: A list of field names or paths in the dictionary.

indent: **0**
: The indentation to use, prepended to the rendered field.

separator: **\n**
: The separator to use between fields.

CLI Example:

```
salt '*' napalm_formula.render_fields "{'mtu': 68, 'description':
↪'Interface description'}" mtu description
```

Jinja usage example:

```
{%- set config={'mtu': 68, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description',
↪quotes=True) }}
```

The Jinja example above would generate the following configuration:

```
mtu "68"
description "Interface description"
```

salt.modules.napalm_formula.**setval**(*key*, *val*, *dict_=None*, *delim=':'*)

Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}}.

Note: Currently this doesn't work with integers, i.e. cannot build lists dynamically.

CLI Example:

```
salt '*' formula.setval foo:baz:bar True
```

salt.modules.napalm_formula.**traverse**(*data*, *key*, *default=None*, *delimiter=':'*)

Traverse a dict or list using a colon-delimited (or otherwise delimited, using the `delimiter` param) target string. The target `foo:bar:0` will return `data['foo']['bar'][0]` if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target `foo:bar:0` will return data['foo']['bar'][0] if data like `{'foo':{'bar':['baz']}}` , if data like `{'foo':{'bar':{'0':'baz'}}}` then `return data['foo']['bar']['0']`

CLI Example:

```
salt '*' napalm_formula.traverse "{'foo': {'bar': {'baz': True}}}"
↪foo:baz:bar
```

26.7.286 salt.modules.napalm_mod

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

salt.modules.napalm_mod.**alive**(***kwargs*)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
    is_alive: False
comment: ''
```

salt.modules.napalm_mod.**call**(*method*, **args*, ***kwargs*)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

Note: This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

salt.modules.napalm_mod.**compliance_report**(*filepath=None*, *string=None*, *renderer='jinja|yaml'*, ***kwargs*)

Return the compliance report.

filepath

The absolute path to the validation file.

Changed in version 2019.2.0.

Beginning with release codename `2019.2.0`, this function has been enhanced, to be able to leverage the multi-engine template rendering of Salt, besides the possibility to retrieve the file source from remote systems, the URL schemes supported being:

- `salt://`
- `http://` and `https://`
- `ftp://`
- `s3://`
- `swift:/`

Or on the local file system (on the Minion).

Note: The rendering result does not necessarily need to be YAML, instead it can be any format interpreted by Salt's rendering pipeline (including pure Python).

---

string

New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.

renderer: **`jinja|yaml`**

New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a ”she-bang” at the top of the file.

kwargs

Changed in version 2019.2.0.

Keyword args to pass to Salt's compile_template() function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
    os_version: 4.17

- get_interfaces_ip:
    Management1:
      ipv4:
        10.0.2.14:
          prefix_length: 24
        _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
    os_version: {{ grains.version }}
```

(continues on next page)

(continued from previous page)

```
- get_interfaces_ip:
    Loopback0:
      ipv4:
        {{ grains.lo0.ipv4 }}:
          prefix_length: 24
        _mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}
```

Output Example:

```
device1:
    ----------
    comment:
    out:
        ----------
        complies:
            False
        get_facts:
            ----------
            complies:
                False
            extra:
            missing:
            present:
                ----------
                os_version:
                    ----------
                    actual_value:
                        15.1F6-S1.4
                    complies:
                        False
                    nested:
                        False
        get_interfaces_ip:
            ----------
            complies:
                False
            extra:
            missing:
                - Management1
            present:
                ----------
        skipped:
    result:
        True
```

salt.modules.napalm_mod.**config_diff_text**(*source1='candidate'*, *candidate_path=None*, *source2='running'*, *running_path=None*)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.
source1: **candidate**

The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

candidate_path

Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

source2: **`running`**

The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

running_path

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`**

Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

`salt.modules.napalm_mod.`**`config_diff_tree`**(*source1='candidate'*, *candidate_path=None*, *source2='running'*, *running_path=None*)

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

source1: **`candidate`**

The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

candidate_path

Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

source2: **`running`**

The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

running_path

Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`**

Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

CLI Example:

```
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

salt.modules.napalm_mod.**config_filter_lines**(*parent_regex*, *child_regex*, *source='running'*)

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- `match`: a boolean value that tells whether `child_regex` matched any children lines.
- `parent`: the parent line (as text).
- `child`: the child line (as text). If no child line matched, this field will be `None`.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See *ciscoconfparse module* for more details.

parent_regex
The regular expression to match the parent configuration lines against.

child_regex
The regular expression to match the child configuration lines against.

source: **running**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_filter_lines '^interface' 'ip address'
salt '*' napalm.config_filter_lines '^interface' 'shutdown'
↪source=candidate
```

salt.modules.napalm_mod.**config_find_lines**(*regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `regex` argument. The configuration is read from the network device interrogated.

regex
The regular expression to match the configuration lines against.

source: **running**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

salt.modules.napalm_mod.**config_lines_w_child**(*parent_regex*, *child_regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having child lines matching `child_regex`. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See *ciscoconfparse module* for more details.

parent_regex
The regular expression to match the parent configuration lines against.

child_regex
The regular expression to match the child configuration lines against.

source: **running**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown'
↪source=candidate
```

`salt.modules.napalm_mod.`**`config_lines_wo_child`**(*parent_regex*, *child_regex*, *source='running'*)

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having the child lines *not* matching `child_regex`. The configuration is read from the network device interrogated.

Note: This function is only available only when the underlying library ciscoconfparse is installed. See *`ciscoconfparse module`* for more details.

---

parent_regex
The regular expression to match the parent configuration lines against.

child_regex
The regular expression to match the child configuration lines against.

source: **running**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

CLI Example:

```
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown'
↪source=candidate
```

`salt.modules.napalm_mod.`**`config_merge_diff`**(*source='running'*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

source: **running**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *`cp.get_url`*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.**config_merge_text**(*source='running'*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

New in version 2019.2.0.

Return the merge result of the configuration from `source` with the merge configuration, as plain text (without loading the config on the device).

source: **`running`**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.**config_merge_tree**(*source='running'*, *merge_config=None*, *merge_path=None*, *saltenv='base'*)

New in version 2019.2.0.

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

source: **`running`**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

merge_config
The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.

merge_path
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by *cp.get_url*), e.g., `salt://`, `https://`, `s3://`, `ftp:/`, etc.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

salt.modules.napalm_mod.**config_tree**(*source='running'*, *with_tags=False*)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the `with_tags` argument, this function may provide different views, valuable in different situations.

source: **`running`**
The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

with_tags: **`False`**
Whether this function should return a detailed view, with tags.

CLI Example:

```
salt '*' napalm.config_tree
```

salt.modules.napalm_mod.**junos_call**(*fun*, **args*, ***kwargs*)

New in version 2019.2.0.

Execute an arbitrary function from the `junos execution module`. To check what `args` and `kwargs` you must send to the function, please consult the appropriate documentation.

fun
: The name of the function. E.g., `set_hostname`.

args
: List of arguments to send to the `junos` function invoked.

kwargs
: Dictionary of key-value arguments to send to the `juno` function invoked.

CLI Example:

```
salt '*' napalm.junos_fun cli 'show system commit'
```

salt.modules.napalm_mod.**junos_cli**(*command*, *format=None*, *dev_timeout=None*, *dest=None*, ***kwargs*)

New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.

command
: The command to execute on the Junos CLI.

format: **`text`**
: Format in which to get the CLI output (either `text` or `xml`).

dev_timeout: **`30`**
: The NETCONF RPC timeout (in seconds).

dest
: Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use *cp.push*.

CLI Example:

```
salt '*' napalm.junos_cli 'show lldp neighbors'
```

salt.modules.napalm_mod.**junos_commit**(***kwargs*)

New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.

dev_timeout: **`30`**
: The NETCONF RPC timeout (in seconds).

comment
: Provide a comment for the commit.

confirm
: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

sync: **`False`**
: When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync: **`False`**
: When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full
: When `True`, requires all the daemons to check and evaluate the new configuration.

detail
When `True`, return commit detail.

CLI Examples:

```
salt '*' napalm.junos_commit comment='Commitiing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

`salt.modules.napalm_mod.`**`junos_copy_file`**(*src*, *dst*, ***kwargs*)

New in version 2019.2.0.

Copies the file on the remote Junos device.

src
The source file path. This argument accepts the usual Salt URIs (e.g., `salt://`, `http://`, `https://`, `s3://`, `ftp://`, etc.).

dst
The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/
↪myjunos.cfg
```

`salt.modules.napalm_mod.`**`junos_facts`**(***kwargs*)

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```
salt '*' napalm.junos_facts
```

`salt.modules.napalm_mod.`**`junos_install_os`**(*path=None*, ***kwargs*)

New in version 2019.2.0.

Installs the given image on the device.

path
The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- `salt://` to fetch from the Salt fileserver.
- `http://` and `https://`
- `ftp://`
- `swift:/`
- `s3://`

dev_timeout: **`30`**
The NETCONF RPC timeout (in seconds)

reboot: **`False`**
Whether to reboot the device after the installation is complete.

no_copy: **`False`**
If `True` the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

`salt.modules.napalm_mod.`**`junos_rpc`**(*cmd=None*, *dest=None*, *format=None*, ***kwargs*)

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

cmd
: The RPC request to the executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.

dest
: Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use *cp.push* Execution function.

format: **`xml`**
: The format in which the RPC reply is received from the device.

dev_timeout: **`30`**
: The NETCONF RPC timeout.

filter
: Used with the `get-config` RPC request to filter out the config tree.

terse: **`False`**
: Whether to return terse output.

Note: Some RPC requests may not support this argument.

---

interface_name
: Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></
↪system></configuration>
```

`salt.modules.napalm_mod.`**`netmiko_args`**`(**kwargs)`

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., `panos`, *f5*`, `mos` - either from https://github.com/napalm-automation-community or defined in user's own environment, one can specify the Netmiko device type (the `device_type` argument) via the `netmiko_device_type_map` configuration option / Pillar key, e.g.,

```
netmiko_device_type_map:
  f5: f5_ltm
  dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM `os` Grain and the Netmiko `device_type`, e.g., when the NAPALM Grain is `f5`, it would use the `f5_ltm` SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```
salt '*' napalm.netmiko_args
```

`salt.modules.napalm_mod.`**`netmiko_call`**`(method, *args, **kwargs)`

New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

method
: The name of the Netmiko method to execute.

args
List of arguments to send to the Netmiko method specified in `method`.

kwargs
Key-value arguments to send to the execution function specified in `method`.

CLI Example:

```
salt '*' napalm.netmiko_call send_command 'show version'
```

`salt.modules.napalm_mod.`**`netmiko_commands`**(**commands*, ***kwargs*)

New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

commands
A list of commands to be executed.

expect_string
Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

delay_factor: **`1`**
Multiplying factor used to adjust delays (default: `1`).

max_loops: **`500`**
Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

auto_find_prompt: **`True`**
Whether it should try to auto-detect the prompt (default: `True`).

strip_prompt: **`True`**
Remove the trailing router prompt from the output (default: `True`).

strip_command: **`True`**
Remove the echo of the command from the output (default: `True`).

normalize: **`True`**
Ensure the proper enter is sent at end of command (default: `True`).

use_textfsm: **`False`**
Process command output through TextFSM template (default: `False`).

CLI Example:

```
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```

`salt.modules.napalm_mod.`**`netmiko_config`**(**config_commands*, ***kwargs*)

New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

> **Warning**: Please remember that `netmiko` does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of `candidate` config.
>
> On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the `commit` argument to `True` to transfer the changes from the candidate into the running config before exiting.

config_commands
A list of configuration commands to be loaded on the remote device.

config_file
Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see `template_engine`).

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

exit_config_mode: **`True`**
Determines whether or not to exit config mode after complete.

delay_factor: **`1`**
Factor to adjust delays.

max_loops: **`150`**
Controls wait time in conjunction with delay_factor (default: `150`).

strip_prompt: **`False`**
Determines whether or not to strip the prompt (default: `False`).

strip_command: **`False`**
Determines whether or not to strip the command (default: `False`).

config_mode_command
The command to enter into config mode.

commit: **`False`**
Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

CLI Example:

```
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
salt '*' napalm.netmiko_config https://bit.ly/2sgljCB
```

`salt.modules.napalm_mod.`**`netmiko_conn`**(***kwargs*)

New in version 2019.2.0.

Return the connection object with the network device, over Netmiko, passing the authentication details from the existing NAPALM connection.

> **Warning**: This function is not suitable for CLI usage, more rather to be used in various Salt modules.

USAGE Example:

```
conn = __salt__['napalm.netmiko_conn']()
res = conn.send_command('show interfaces')
conn.disconnect()
```

`salt.modules.napalm_mod.`**`netmiko_fun`**(*fun*, **args*, ***kwargs*)

New in version 2019.2.0.

Call an arbitrary function from the *`Netmiko`* module, passing the authentication details from the existing NAPALM connection.

fun
The name of the function from the *`Netmiko`* to invoke.

args
List of arguments to send to the execution function specified in `fun`.

kwargs
Key-value arguments to send to the execution function specified in `fun`.

CLI Example:

```
salt '*' napalm.netmiko_fun send_command 'show version'
```

salt.modules.napalm_mod.**netmiko_multi_call**(**methods*, ***kwargs*)

New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

methods

List of dictionaries with the following keys:

- `name`: the name of the Netmiko function to invoke.
- `args`: list of arguments to send to the `name` method.
- `kwargs`: key-value arguments to send to the `name` method.

CLI Example:

```
salt '*' napalm.netmiko_multi_call "{'name': 'send_command', 'args': [
↪'show version']}" "{'name': 'send_command', 'args': ['show interfaces']}
↪"
```

salt.modules.napalm_mod.**nxos_api_config**(*commands=None*, *config_file=None*, *template_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.

commands

The list of configuration commands to load on the Nexus switch.

Note: This argument is ignored when `config_file` is specified.

---

config_file

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp:/`
- `s3:/`
- `swift://`

template_engine: **`jinja`**

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context: **`None`**

Variables to add to the template context.

defaults: **`None`**

Default values of the `context` dict.

saltenv: **`base`**

Salt fileserver environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

CLI Example:

```
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy
↪context="{'servers': ['1.2.3.4']}"
```

salt.modules.napalm_mod.**nxos_api_rpc**(*commands*, *method='cli'*, ***kwargs*)

New in version 2019.2.0.

Execute an arbitrary RPC request via the Nexus API.

commands
The RPC commands to be executed.

method: **cli**
The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

CLI Example:

```
salt '*' napalm.nxos_api_rpc 'show version'
```

salt.modules.napalm_mod.**nxos_api_show**(*commands*, *raw_text=True*, ***kwargs*)

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

commands
The commands to be executed.

raw_text: **True**
Whether to return raw text or structured data.

CLI Example:

```
salt '*' napalm.nxos_api_show 'show version'
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_
↪text=False
```

salt.modules.napalm_mod.**pyeapi_call**(*method*, **args*, ***kwargs*)

New in version 2019.2.0.

Invoke an arbitrary method from the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

method
The name of the `pyeapi` method to invoke.

kwargs
Key-value arguments to send to the `pyeapi` method.

CLI Example:

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

salt.modules.napalm_mod.**pyeapi_config**(*commands=None*, *config_file=None*, *template_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the `pyeapi` library. This function forwards the existing connection details to the `pyeapi.run_commands` execution function.

commands
The list of configuration commands to load on the Arista switch.

Note: This argument is ignored when `config_file` is specified.

---

config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- salt://
- https://
- ftp:/
- s3:/
- swift://

template_engine: **jinja**

The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

context: **None**

Variables to add to the template context.

defaults: **None**

Default values of the context dict.

saltenv: **base**

Salt fileserver environment from which to retrieve the file. Ignored if config_file is not a salt:// URL.

CLI Example:

```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

salt.modules.napalm_mod.**pyeapi_conn**(***kwargs*)

New in version 2019.2.0.

Return the connection object with the Arista switch, over pyeapi, passing the authentication details from the existing NAPALM connection.

Warning: This function is not suitable for CLI usage, more rather to be used in various Salt modules, to reusing the established connection, as in opposite to opening a new connection for each task.

Usage example:

```
conn = __salt__['napalm.pyeapi_conn']()
res1 = conn.run_commands('show version')
res2 = conn.get_config(as_string=True)
```

salt.modules.napalm_mod.**pyeapi_nxos_api_args**(***prev_kwargs*)

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the pyeapi execution module.

CLI Example:

```
salt '*' napalm.pyeapi_nxos_api_args
```

salt.modules.napalm_mod.**pyeapi_run_commands**(**commands*, ***kwargs*)

Execute a list of commands on the Arista switch, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

commands

A list of commands to execute.

encoding: **json**

The requested encoding of the command output. Valid values for encoding are json (default) or text.

CLI Example:

```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

salt.modules.napalm_mod.**reconnect**(*force=False*, ***kwargs*)

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

Note: This function can be used only when running proxy minions.

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

salt.modules.napalm_mod.**rpc**(*command*, ***kwargs*)

New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:

- *napalm.junos_rpc* for `junos`
- *napalm.pyeapi_run_commands* for `eos`
- *napalm.nxos_api_rpc* for `nxos`
- *napalm.netmiko_commands* for `ios`, `iosxr`, and `nxos_ssh`

command
: The RPC command to execute. This depends on the nature of the operating system.

kwargs
: Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```

The mapping above reads: when the NAPALM `os` Grain is `f5`, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

CLI Example:

```
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

salt.modules.napalm_mod.**scp_get**(*remote_path*, *local_path=''*, *recursive=False*, *preserve_times=False*, ***kwargs*)

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

Note: This function is only available only when the underlying library scp is installed. See *scp module* for more details.

remote_path
Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

recursive: **`False`**
Transfer files and directories recursively.

preserve_times: **`False`**
Preserve `mtime` and `atime` of transferred files and directories.

passphrase
Used for decrypting private keys.

pkey
An optional private key to use for authentication.

key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

timeout
An optional timeout (in seconds) for the TCP connect.

socket_timeout: **`10`**
The channel socket timeout in seconds.

buff_size: **`16384`**
The size of the SCP send buffer.

allow_agent: **`True`**
Set to `False` to disable connecting to the SSH agent.

look_for_keys: **`True`**
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`

banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.

auth_timeout
An optional timeout (in seconds) to wait for an authentication response.

auto_add_policy: **`False`**
Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```

`salt.modules.napalm_mod.`**`scp_put`**(*files*, *remote_path=None*, *recursive=False*, *preserve_times=False*, *saltenv='base'*, ***kwargs*)

New in version 2019.2.0.

Transfer files and directories to remote network device.

Note: This function is only available only when the underlying library scp is installed. See *scp module* for more details.

files
A single path or a list of paths to be transferred.

remote_path
The path on the remote device where to store the files.

recursive: **`True`**
Transfer files and directories recursively.

preserve_times: **`False`**
Preserve `mtime` and `atime` of transferred files and directories.
saltenv: **`base`**
The name of the Salt environment. Ignored when `files` is not a `salt://` URL.
hostname
The hostname of the remote device.
port: **`22`**
The port of the remote device.
username
The username required for SSH authentication on the device.
password
Used for password authentication. It is also used for private key decryption if `passphrase` is not given.
passphrase
Used for decrypting private keys.
pkey
An optional private key to use for authentication.
key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout
An optional timeout (in seconds) for the TCP connect.
socket_timeout: **`10`**
The channel socket timeout in seconds.
buff_size: **`16384`**
The size of the SCP send buffer.
allow_agent: **`True`**
Set to `False` to disable connecting to the SSH agent.
look_for_keys: **`True`**
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`
banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout
An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: **`False`**
Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```

26.7.287 salt.modules.napalm_netacl

NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
capirca, napalm

platform
unix

Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.modules.napalm_netacl.`**`get_filter_pillar`**(*filter_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

filter_name
The name of the filter.

pillar_key
The root key of the whole policy config.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.napalm_netacl.`**`get_term_pillar`**(*filter_name*, *term_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

filter_name
The name of the filter.

term_name
The name of the term.

pillar_key: **`acl`**
The root key of the whole policy config. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.napalm_netacl.`**`load_filter_config`**(*filter_name*, *filter_options=None*, *terms=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, ***kwargs*)

Generate and load the configuration of a policy filter.

Note: The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

filter_name
The name of the policy filter.

filter_options
Additional filter options. These options are platform-specific. See the complete list of options.

terms
List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`**
When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: **`acl`**
The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`**
Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

only_lower_merge: **`False`**
Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id
Add a comment in the filter config having the description for the changes applied.

revision_no
The revision count.

revision_date: **`True`**
Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`**
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: **`False`**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
Commit? Default: `True`.

debug: **`False`**
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as *`net.load_config`*.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
↪debug=True
```

Output Example:

```
edge01.bjm01:
    ----------
    already_configured:
        False
    comment:
    diff:
        [edit firewall]
        +    family inet {
        +        /*
        +         ** $Date: 2017/03/22 $
        +         **
        +         */
        +        filter my-filter {
        +            interface-specific;
        +            term my-term {
        +                from {
        +                    source-port [ 1234 1235 ];
        +                }
        +                then {
        +                    reject;
        +                }
        +            }
        +            term my-other-term {
        +                from {
        +                    protocol tcp;
        +                    source-port 5678-5680;
        +                }
        +                then accept;
        +            }
        +        }
        +    }
    loaded_config:
        firewall {
            family inet {
                replace:
                /*
                ** $Date: 2017/03/22 $
                **
                */
                filter my-filter {
                    interface-specific;
                    term my-term {
                        from {
                            source-port [ 1234 1235 ];
                        }
                        then {
                            reject;
                        }
                    }
                    term my-other-term {
                        from {
                            protocol tcp;
```

(continues on next page)

(continued from previous page)

```
                            source-port 5678-5680;
                        }
                        then accept;
                    }
                }
            }
        }
    result:
        True
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      terms:
        - my-term:
            source_port:
             - 1234
             - 1235
            action: reject
        - my-other-term:
            source_port:
              - - 5678
                - 5680
            protocol: tcp
            action: accept
```

salt.modules.napalm_netacl.**load_policy_config**(*filters=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, ***kwargs*)

Generate and load the configuration of the whole policy.

Note: The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the `filters` and/or inside the pillar.

When merging the `filters` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

filters
: List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`**
: When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: **`acl`**
: The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

merge_pillar: **True**
Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.

only_lower_merge: **False**
Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False. This option requires merge_pillar, otherwise it is ignored.

revision_id
Add a comment in the policy config having the description for the changes applied.

revision_no
The revision count.

revision_date: **True**
Boolean flag: display the date when the policy configuration was generated. Default: True.

revision_date_format: **%Y/%m/%d**
The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

test: **False**
Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: **True**
Commit? Default: True.

debug: **False**
Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:

            action: reject
```

salt.modules.napalm_netacl.**load_term_config**(*filter_name*, *term_name*, *filter_options=None*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, *source_service=None*, *destination_service=None*, ***term_fields*)

Generate and load the configuration of a policy term.

filter_name
The name of the policy filter.

term_name
The name of the term.

filter_options
Additional filter options. These options are platform-specific. See the complete list of options.

pillar_key: **acl**
The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: 1234
            source_address:
                - 1.2.3.4/32
                - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

pillarenv
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv
Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

merge_pillar: **True**
Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

revision_id
Add a comment in the term config having the description for the changes applied.

revision_no
The revision count.

revision_date: **True**
Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: **%Y/%m/%d**
The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: **False**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True**
Commit? Default: `True`.

debug: **False**
Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

source_service
: A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

  As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

  If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the *file state*.

destination_service
: A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields
: Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

Note: The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set

- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service

- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - - 1000
      - 2000
    - - 3000
      - 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_
↪address=1.2.3.4 destination_address=5.6.7.8 action=accept test=TrueX
↪debug=True
```

Output Example:

```
edge01.bjm01:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit firewall]
        +    family inet {
        +        /*
        +         ** $Date: 2017/03/22 $
        +         **
```

(continues on next page)

(continued from previous page)

```
        +          */
        +         filter filter-name {
        +             interface-specific;
        +             term term-name {
        +                 from {
        +                     source-address {
        +                         1.2.3.4/32;
        +                     }
        +                     destination-address {
        +                         5.6.7.8/32;
        +                     }
        +                 }
        +                 then accept;
        +             }
        +         }
        +     }
    loaded_config:
        firewall {

26.7.288 salt.modules.napalm_network

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>

maturity
new

depends
napalm

platform
unix

Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

Changed in version 2017.7.0.

`salt.modules.napalm_network.arp`(*interface=''*, *ipaddr=''*, *macaddr=''*, ***kwargs*)

NAPALM returns a list of dictionaries with details of the ARP entries.

Parameters

- **interface** -- interface name to filter on
- **ipaddr** -- IP address to filter on
- **macaddr** -- MAC address to filter on

Returns
List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
    {
        'interface' : 'MgmtEth0/RSP0/CPU0/0',
        'mac'       : '5c:5e:ab:da:3c:f0',
        'ip'        : '172.17.17.1',
        'age'       : 1454496274.84
    },
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac'       : '66:0e:94:96:e0:ff',
        'ip'        : '172.17.17.2',
        'age'       : 1435641582.49
```

salt.modules.napalm_network.**blockreplace**(*marker_start*, *marker_end*, *content=''*, *append_if_not_found=False*, *prepend_if_not_found=False*, *show_changes=True*, *append_newline=False*, *source='running'*, *path=None*, *test=False*, *commit=True*, *debug=False*, *replace=True*)

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

marker_start
: The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

marker_end
: The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

content
: The content to be used between the two lines identified by `marker_start` and `marker_stop`.

append_if_not_found: **`False`**
: If markers are not found and set to True then, the markers and content will be appended to the file.

prepend_if_not_found: **`False`**
: If markers are not found and set to True then, the markers and content will be prepended to the file.

append_newline: **`False`**
: Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will not be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

show_changes: **`True`**
: Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise False).

source: **`running`**
: The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path: **`None`**
: Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.

test: **`False`**
: Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
: Commit the configuration changes? Default: `True`.

debug: **`False`**
: Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`True`**
: Load and replace the configuration. Default: `True`.

CLI Example:

```
salt '*' net.blockreplace 'ntp' 'interface' ''
```

salt.modules.napalm_network.**cancel_commit**(*jid*)

New in version 2019.2.0.

Cancel a commit scheduled to be executed via the `commit_in` and `commit_at` arguments from the *net.load_template* or *net.load_config* execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

CLI Example:

```
salt '*' net.cancel_commit 20180726083540640360
```

salt.modules.napalm_network.**cli**(**commands*, *cli_kwargs=None*, ***kwargs*)

Returns a dictionary with the raw output of all commands passed as arguments.

commands
List of commands to be executed on the device.

cli_kwargs
Dictionary of keyword arguments to pass directly to the NAPALM driver's `cli` method. Use this for driver-specific options like `encoding`.

New in version 3006.19.

Example:

```
salt '*' net.cli "show version" cli_kwargs='{"encoding": "json"}'
```

textfsm_parse: **`False`**
Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_parse`.

---

textfsm_path
The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. `textfsm_path` can be either absolute path on the server, either specified using the following URL mschemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

New in version 2018.3.0.

Note: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

---

textfsm_template
The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`

- swift://

New in version 2018.3.0.

textfsm_template_dict

A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_template_dict`.

---

platform_grain_name: **`os`**

The name of the grain used to identify the platform name in the TextFSM index file. Default: `os`.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

---

platform_column_name: **`Platform`**

The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

New in version 2018.3.0.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

---

index_file: **`index`**

The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

---

saltenv: **`base`**

Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

New in version 2018.3.0.

include_empty: **`False`**

Include empty files under the `textfsm_path`.

New in version 2018.3.0.

include_pat

Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

exclude_pat
Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

CLI Example with TextFSM template:

```
salt '*' net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

Example output:

```
{
    'show version and haiku':  'Hostname: re0.edge01.arn01
                                  Model: mx480
                                  Junos: 13.3R6.5
                                    Help me, Obi-Wan
                                    I just saw Episode Two
                                    You're my only hope
                                ',
    'show chassis fan' :   'Item                      Status   RPM     
↪Measurement
                               Top Rear Fan               OK       3840   
↪Spinning at intermediate-speed
                               Bottom Rear Fan            OK       3840   
↪Spinning at intermediate-speed
                               Top Middle Fan             OK       3900   
↪Spinning at intermediate-speed
                               Bottom Middle Fan          OK       3840   
↪Spinning at intermediate-speed
                               Top Front Fan              OK       3810   
↪Spinning at intermediate-speed
                               Bottom Front Fan           OK       3840   
↪Spinning at intermediate-speed
                              '
}
```

Example output with TextFSM parsing:

```
{
  "comment": "",
  "result": true,
  "out": {
    "sh ver": [
      {
        "kernel": "9.1S3.5",
        "documentation": "9.1S3.5",
```

(continues on next page)

(continued from previous page)

```
        "boot": "9.1S3.5",
        "crypto": "9.1S3.5",
        "chassis": "",
        "routing": "9.1S3.5",
        "base": "9.1S3.5",
        "model": "mx960"
      }
    ]
  }
}
```

salt.modules.napalm_network.**commit**(*inherit_napalm_device=None*, ***kwargs*)

Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

salt.modules.napalm_network.**compare_config**(*inherit_napalm_device=None*, ***kwargs*)

Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

salt.modules.napalm_network.**config**(*source=None*, ***kwargs*)

New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the `source` argument.

source

Which configuration type you want to display, default is all of them.

Options:

- running
- candidate
- startup

Returns

The object returned is a dictionary with the following keys:

- running (string): Representation of the native running configuration.
- **candidate (string): Representation of the native candidate configuration.**
  If the device doesn't differentiate between running and startup configuration this will an empty string.
- **startup (string): Representation of the native startup configuration.**
  If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:

```
salt '*' net.config
salt '*' net.config source=candidate
```

salt.modules.napalm_network.**config_changed**(*inherit_napalm_device=None*, ***kwargs*)

Will prompt if the configuration has been changed.

Returns

A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

salt.modules.napalm_network.**config_control**(*inherit_napalm_device=None*, ***kwargs*)

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns

A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

salt.modules.napalm_network.**confirm_commit**(*jid*)

New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the `revert_in` and `revert_at` arguments from the *net.load_template* or *net.load_config* execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:

```
salt '*' net.confirm_commit 20180726083540640360
```

salt.modules.napalm_network.**connected**(***kwargs*)

Specifies if the connection to the device succeeded.

CLI Example:

```
salt '*' net.connected
```

salt.modules.napalm_network.**discard_config**(*inherit_napalm_device=None*, ***kwargs*)

Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

salt.modules.napalm_network.**environment**(***kwargs*)

Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```
{
    'fans': {
        'Bottom Rear Fan': {
            'status': True
        },
        'Bottom Middle Fan': {
            'status': True
        },
        'Top Middle Fan': {
            'status': True
        },
        'Bottom Front Fan': {
            'status': True
        },
        'Top Front Fan': {
            'status': True
        },
        'Top Rear Fan': {
            'status': True
        }
    },
    'memory': {
        'available_ram': 16349,
        'used_ram': 4934
    },
    'temperature': {
       'FPC 0 Exhaust A': {
            'is_alert': False,
            'temperature': 35.0,
            'is_critical': False
        }
    },
    'cpu': {
        '1': {
            '%usage': 19.0
        },
        '0': {
            '%usage': 35.0
        }
    }
}
```

`salt.modules.napalm_network.`**`facts`**`(`*`**kwargs`*`)`

Returns characteristics of the network device. :return: a dictionary with the following keys:

- uptime - Uptime of the device in seconds.
- vendor - Manufacturer of the device.
- model - Device model.
- hostname - Hostname of the device
- fqdn - Fqdn of the device
- os_version - String with the OS version running on the device.
- serial_number - Serial number of the device
- interface_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```
{
    'os_version': '13.3R6.5',
    'uptime': 10117140,
    'interface_list': [
        'lc-0/0/0',
        'pfe-0/0/0',
        'pfh-0/0/0',
        'xe-0/0/0',
        'xe-0/0/1',
        'xe-0/0/2',
        'xe-0/0/3',
        'gr-0/0/10',
        'ip-0/0/10'
    ],
    'vendor': 'Juniper',
    'serial_number': 'JN131356FBFA',
    'model': 'MX480',
    'hostname': 're0.edge05.syd01',
    'fqdn': 're0.edge05.syd01'
}
```

salt.modules.napalm_network.**interfaces**(***kwargs*)

Returns details of the interfaces on the device.

Returns

Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
    'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': '',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': 'dead:beef:dead',
    },
    'Ethernet1':{
        'is_up': True,
        'is_enabled': True,
        'description': 'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
```

(continues on next page)

(continued from previous page)

```
        'mac_address': 'beef:dead:beef',
    }
}
```

salt.modules.napalm_network.**ipaddrs**(***kwargs*)

Returns IP addresses configured on the device.

Returns

A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselvs dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
    'FastEthernet8': {
        'ipv4': {
            '10.66.43.169': {
                'prefix_length': 22
            }
        }
    },
    'Loopback555': {
        'ipv4': {
            '192.168.1.1': {
                'prefix_length': 24
            }
        },
        'ipv6': {
            '1::1': {
                'prefix_length': 64
            },
            '2001:DB8:1::1': {
                'prefix_length': 64
            },
            'FE80::3': {
                'prefix_length': 'N/A'
            }
        }
    }
}
```

salt.modules.napalm_network.**lldp**(*interface=''*, ***kwargs*)

Returns a detailed view of the LLDP neighbors.

Parameters

interface -- interface name to filter on

Returns

A dictionary with the LLDL neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```
{
    'TenGigE0/0/0/8': [
        {
            'parent_interface': 'Bundle-Ether8',
            'interface_description': 'TenGigE0/0/0/8',
            'remote_chassis_id': '8c60.4f69.e96c',
            'remote_system_name': 'switch',
            'remote_port': 'Eth2/2/1',
            'remote_port_description': 'Ethernet2/2/1',
            'remote_system_description': 'Cisco Nexus Operating System
↪(NX-OS) Software 7.1(0)N1(1a)
                  TAC support: http://www.cisco.com/tac
                  Copyright (c) 2002-2015, Cisco Systems, Inc. All rights
↪reserved.',
            'remote_system_capab': 'B, R',
            'remote_system_enable_capab': 'B'
        }
    ]
}
```

salt.modules.napalm_network.**load_config**(*filename=None*, *text=None*, *test=False*, *commit=True*, *debug=False*, *replace=False*, *commit_in=None*, *commit_at=None*, *revert_in=None*, *revert_at=None*, *commit_jid=None*, *inherit_napalm_device=None*, *saltenv='base'*, ***kwargs*)

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

filename

Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2018.3.0.

text

String containing the desired configuration. This argument is ignored when `filename` is specified.

test: **False**

Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will

commit the changes on the device.

commit: **True**

Commit? Default: `True`.

debug: **False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

replace: **False**

Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

commit_in: **`None`**

Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour)`, `5h30m` (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: **`None`**

Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *`net.cancel_commit`* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: **None**
Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour)`, `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *net.confirm_commit* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: **None**
Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *net.confirm_commit* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

saltenv: **base**
Specifies the Salt environment name.

New in version 2018.3.0.

Returns
a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the

`already_configured` flag (example below)

- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file'
↪commit=False
```

Example output:

```
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[edit interfaces xe-0/0/5]+   description "Adding a
↪description";'
}
```

`salt.modules.napalm_network.`**`load_template`**(*template_name=None*, *template_source=None*, *context=None*, *defaults=None*, *template_engine='jinja'*, *saltenv='base'*, *template_hash=None*, *template_hash_name=None*, *skip_verify=False*, *test=False*, *commit=True*, *debug=False*, *replace=False*, *commit_in=None*, *commit_at=None*, *revert_in=None*, *revert_at=None*, *inherit_napalm_device=None*, ***template_vars*)

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards he config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

template_name

Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https:/example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

template_source: **None**

Inline config template to be rendered and loaded on the device.

template_hash: **None**

Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

context: **None**

Overrides default context variables passed to the template.

New in version 2019.2.0.

template_hash_name: **None**

When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

saltenv: **`base`**

Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

template_engine: **jinja**

The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

New in version 2016.11.2.

skip_verify: **True**

If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

test: **False**

Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True**

Commit? (default: `True`)

debug: **False**

Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

replace: **False**

Load and replace the configuration.

New in version 2016.11.2.

commit_in: **`None`**

Commit the changes in a specific number of minutes / hours. Example of accepted formats: `5` (commit in 5 minutes), `2m` (commit in 2 minutes), `1h` (commit the changes in 1 hour)`, `5h30m` (commit the changes

in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *net.cancel_commit* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: **None**

Commit the changes at a specific time. Example of accepted formats: `1am` (will commit the changes at the next 1AM), `13:20` (will commit at 13:20), `1:20am`, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the `diff` is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the *net.cancel_commit* execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: **None**

Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: `5` (revert in 5 minutes), `2m` (revert in 2 minutes), `1h` (revert the changes in 1 hour)`, `5h30m` (revert the changes in 5 hours and 30 minutes).

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *net.confirm_commit* function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the

> revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.
>
> Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

revert_at: **None**

Commit and revert the changes at a specific time. Example of accepted formats: `1am` (will commit and revert the changes at the next 1AM), `13:20` (will commit and revert at 13:20), `1:20am`, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the *net.confirm_commit* function, using the commit ID returned by this function.

> **Warning**: This works on any platform, regardless if they have or don't have native capabilities to confirming a commit. However, please be *very* cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don't have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.
>
> Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

defaults: **None**

Default variables/context passed to the template.

New in version 2016.11.2.

template_vars

Dictionary with the arguments/context to be used when the template is rendered.

Note: Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

Note: It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.

Returns

a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user

- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1]  # uses
↪NAPALM default templates

# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {
↪{host_name}}; }'         host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template         template_source='system {
↪host-name {{grains.model}}.lab; }'
# if the device is a MX480, the command above will set the hostname as:
↪MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {
↪{pillar.proxy.host}}; }'

salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example  #
↪will commit
salt '*' net.load_template https://bit.ly/2OhSgqP hostname=example
↪test=True  # dry run

salt '*' net.load_template salt://templates/example.jinja debug=True  #
↪Using the salt:// URI

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_
↪engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True
↪debug=True peers=['192.168.0.1']
salt -G 'os:ios' net.load_template http://bit.ly/2gKOj20 test=True
```

(continues on next page)

(continued from previous page)

```
↪debug=True peers=['192.168.0.1']

# render multiple templates at once
salt '*' net.load_template "['https://bit.ly/2OhSgqP', 'salt://templates/
↪example.jinja']" context="{'hostname': 'example'}"
```

Example output:

```
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': '[edit system]+  host-name edge01.bjm01',
    'loaded_config': 'system { host-name edge01.bjm01; }''
}
```

`salt.modules.napalm_network.mac`(*address=''*, *interface=''*, *vlan=0*, ***kwargs*)

Returns the MAC Address Table on the device.

Parameters

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

Returns

A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
    {
        'mac'       : '00:1c:58:29:4a:71',
        'interface' : 'xe-3/0/2',
        'static'    : False,
        'active'    : True,
        'moves'     : 1,
        'vlan'      : 10,
        'last_move' : 1454417742.58
    },
    {
        'mac'       : '8c:60:4f:58:e1:c1',
        'interface' : 'xe-1/0/1',
        'static'    : False,
        'active'    : True,
        'moves'     : 2,
        'vlan'      : 42,
        'last_move' : 1453191948.11
    }
]
```

salt.modules.napalm_network.**optics**(***kwargs*)

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.

Returns

Returns a dictionary where the keys are as listed below:

- **intf_name (unicode)**
  - **physical_channels**
    - **channels (list of dicts)**
      - index (int)
      - **state**

        input_power

        instant (float)

        avg (float)

        min (float)

        max (float)

        output_power

        instant (float)

        avg (float)

        min (float)

        max (float)

        laser_bias_current

        instant (float)

        avg (float)

        min (float)

        max (float)

CLI Example:

```
salt '*' net.optics
```

salt.modules.napalm_network.**patch**(*patchfile*, *options=''*, *saltenv='base'*, *source_hash=None*, *show_changes=True*, *source='running'*, *path=None*, *test=False*, *commit=True*, *debug=False*, *replace=True*)

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

patchfile

A patch file to apply to the configuration source.

options

Options to pass to patch.

source_hash
If the patch file (specified via the `patchfile` argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

show_changes: **`True`**
Controls how changes are presented. If `True`, this function will return the of the changes made. If `False`, then it will return a boolean (`True` if any changes were made, otherwise False).

source: **`running`**
The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path: **`None`**
Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.

test: **`False`**
Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
Commit the configuration changes? Default: `True`.

debug: **`False`**
Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **`True`**
Load and replace the configuration. Default: `True`.

CLI Example:

```
salt '*' net.patch https://example.com/running_config.patch
```

`salt.modules.napalm_network.`**`ping`**(*destination*, *source=None*, *ttl=None*, *timeout=None*, *size=None*, *count=None*, *vrf=None*, ***kwargs*)

Executes a ping on the network device and returns a dictionary as a result.

destination
Hostname or IP address of remote host

source
Source address of echo request

ttl
IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

timeout
Maximum wait time after sending final packet (seconds)

size
Size of request packets (0..65468 bytes)

count
Number of ping requests to send (1..2000000000 packets)

vrf
VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

salt.modules.napalm_network.**replace_pattern**(*pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *search_only=False*, *show_changes=True*, *backslash_literal=False*, *source=None*, *path=None*, *test=False*, *replace=True*, *debug=False*, *commit=True*)

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made. This is a pure Python implementation that wraps Python's `sub()`.

pattern
: A regular expression, to be matched using Python's `search()`.

repl
: The replacement text.

count: **`0`**
: Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int): **`8`**
: A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

bufsize (int or str): **`1`**
: How much of the configuration to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found: **`False`**
: If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found: **`False`**
: If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content
: Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

search_only: **`False`**
: If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes: **`True`**
: If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

backslash_literal: **`False`**
: Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

source: **`running`**
: The configuration source. Choose from: `running`, `candidate`, or `startup`. Default: `running`.

path
: Save the temporary configuration to a specific path, then read from there.

test: **`False`**
: Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`**
: Commit the configuration changes? Default: `True`.

debug: **`False`**
Debug mode. Will insert a new key in the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.
replace: **`True`**
Load and replace the configuration. Default: `True`.
If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' net.replace_pattern "bind-address\s*=" "bind-address:"
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

`salt.modules.napalm_network.`**`rollback`**(*inherit_napalm_device=None*, ***kwargs*)

Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

`salt.modules.napalm_network.`**`save_config`**(*source=None*, *path=None*)

New in version 2019.2.0.

Save the configuration to a file on the local file system.
source: **`running`**
The configuration source. Choose from: `running`, `candidate`, `startup`. Default: `running`.
path
Absolute path to file where to save the configuration. To push the files to the Master, use *cp.push* Execution function.
CLI Example:

```
salt '*' net.save_config source=running
```

`salt.modules.napalm_network.`**`traceroute`**(*destination*, *source=None*, *ttl=None*, *timeout=None*, *vrf=None*, ***kwargs*)

Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.
destination
Hostname or address of remote host
source
Source address to use in outgoing traceroute packets
ttl
IP maximum time-to-live value (or IPv6 maximum hop-limit value)
timeout
Number of seconds to wait for response (seconds)
vrf
VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

26.7.289 salt.modules.napalm_ntp

NAPALM NTP

Manages NTP on network devices.

codeauthor

NTP peers management state

New in version 2016.11.0.

`salt.modules.napalm_ntp.`**`delete_peers`**`(`*peers*, ***options*`)`

Removes NTP peers configured on the device.

Parameters

- **`peers`** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **`(bool)`** (*`commit`*) -- discard loaded config. By default `test` is False (will not dicard the changes)
- **`(bool)`** -- commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For a dry run, use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False  # preserves the
↪changes, but does not commit
```

`salt.modules.napalm_ntp.`**`delete_servers`**`(`*servers*, ***options*`)`

Removes NTP servers configured on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool)** (*commit*) -- discard loaded config. By default `test` is False (will not dicard the changes)
- **(bool)** -- commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the
↪diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the
↪changes, but does not commit
```

salt.modules.napalm_ntp.**peers**(***kwargs*)

Returns a list the NTP peers configured on the network device.

Returns

configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.**servers**(***kwargs*)

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.**set_peers**(**peers*, ***options*)

Configures a list of NTP peers on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names

- **(bool)** (*test*) -- discard loaded config. By default `test` is False (will not dicard the changes)

Commit commit (bool)

commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False  # preserves the changes,
↪but does not commit
```

`salt.modules.napalm_ntp.`**`set_servers`**(**servers*, ***options*)

Configures a list of NTP servers on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names
- **(bool)** (*test*) -- discard loaded config. By default `test` is False (will not dicard the changes)

Commit commit (bool)

commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False  # preserves the
↪changes, but does not commit
```

`salt.modules.napalm_ntp.`**`stats`**(*peer=None*, ***kwargs*)

Returns a dictionary containing synchronization details of the NTP peers.

Parameters

peer -- Returns only the details of a specific NTP peer.

Returns

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
    {
        'remote'        : '188.114.101.4',
        'referenceid'   : '188.114.100.1',
        'synchronized'  : True,
        'stratum'       : 4,
        'type'          : '-',
        'when'          : '107',
        'hostpoll'      : 256,
        'reachability'  : 377,
        'delay'         : 164.228,
        'offset'        : -13.866,
        'jitter'        : 2.695
    }
]
```

26.7.290 salt.modules.napalm_probes

NAPALM Probes

Manages RPM/SLA probes on the network device.

Probes configuration management state

New in version 2016.11.0.

`salt.modules.napalm_probes.`**`config`**(***kwargs*)

Returns the configuration of the RPM probes.

Returns
A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
    'probe1':{
        'test1': {
            'probe_type'   : 'icmp-ping',
            'target'       : '192.168.0.1',
            'source'       : '192.168.0.2',
            'probe_count'  : 13,
            'test_interval': 3
        },
        'test2': {
            'probe_type'   : 'http-ping',
            'target'       : '172.17.17.1',
            'source'       : '192.17.17.2',
            'probe_count'  : 5,
            'test_interval': 60
        }
    }
}
```

salt.modules.napalm_probes.**delete_probes**(*probes*, *test=False*, *commit=True*, ***kwargs*)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Returns

A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```
probes = {
    'existing_probe':{
        'existing_test1': {},
```

(continues on next page)

(continued from previous page)

```
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.**results**(***kwargs*)

Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```
{
    'probe1':  {
        'test1': {
            'last_test_min_delay'   : 63.120,
            'global_test_min_delay' : 62.912,
            'current_test_avg_delay': 63.190,
            'global_test_max_delay' : 177.349,
            'current_test_max_delay': 63.302,
            'global_test_avg_delay' : 63.802,
            'last_test_avg_delay'   : 63.438,
            'last_test_max_delay'   : 65.356,
            'probe_type'            : 'icmp-ping',
            'rtt'                   : 63.138,
            'last_test_loss'        : 0,
            'round_trip_jitter'     : -59.0,
            'target'                : '192.168.0.1',
            'source'                : '192.168.0.2',
            'probe_count'           : 15,
            'current_test_min_delay': 63.138
        },
        'test2': {
            'last_test_min_delay'   : 176.384,
            'global_test_min_delay' : 169.226,
            'current_test_avg_delay': 177.098,
            'global_test_max_delay' : 292.628,
            'current_test_max_delay': 180.055,
            'global_test_avg_delay' : 177.959,
            'last_test_avg_delay'   : 177.178,
            'last_test_max_delay'   : 184.671,
            'probe_type'            : 'icmp-ping',
            'rtt'                   : 176.449,
            'last_test_loss'        : 0,
            'round_trip_jitter'     : -34.0,
            'target'                : '172.17.17.1',
            'source'                : '172.17.17.2',
            'probe_count'           : 15,
            'current_test_min_delay': 176.402
        }
```

(continues on next page)

(continued from previous page)

```
    }
}
```

salt.modules.napalm_probes.**schedule_probes**(*probes*, *test=False*, *commit=True*, ***kwargs*)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Returns

a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```
probes = {
    'new_probe':{
        'new_test1': {},
        'new_test2': {}
    }
}
```

salt.modules.napalm_probes.**set_probes**(*probes*, *test=False*, *commit=True*, ***kwargs*)

Configures RPM/SLA probes on the device. Calls the configuration template 'set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example - via state/script:

```
probes = {
    'new_probe':{
        'new_test1': {
            'probe_type'   : 'icmp-ping',
            'target'       : '192.168.0.1',
            'source'       : '192.168.0.2',
            'probe_count'  : 13,
            'test_interval': 3
        },
        'new_test2': {
            'probe_type'   : 'http-ping',
            'target'       : '172.17.17.1',
            'source'       : '192.17.17.2',
            'probe_count'  : 5,
            'test_interval': 60
        }
    }
}
set_probes(probes)
```

CLI Example - to push changes on the fly (not recommended):

```
salt 'junos_minion' probes.set_probes "{'new_probe':{'new_test1':{'probe_
↪type':'icmp-ping',           'target':'192.168.0.1','source':'192.168.
↪0.2','probe_count':13,'test_interval':3}}}" test=True
```

Output example - for the CLI example above:

```
junos_minion:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit services rpm]
             probe transit { ... }
        +    probe new_probe {
        +        test new_test1 {
        +            probe-type icmp-ping;
        +            target address 192.168.0.1;
        +            probe-count 13;
        +            test-interval 3;
```

(continues on next page)

(continued from previous page)

```
        +             source-address 192.168.0.2;
        +         }
        +     }
    result:
        True
```

26.7.291 salt.modules.napalm_route

NAPALM Route

Retrieves route details from network devices.

codeauthor
: Mircea Ulinic <ping@mirceaulinic.net>

maturity
: new

depends
: napalm

platform
: unix

Dependencies

- *NAPALM proxy minion*

New in version 2016.11.0.

`salt.modules.napalm_route.`**`show`**(*destination*, *protocol=None*, ***kwargs*)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

Note: This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

---

destination
: destination prefix.

protocol (optional)
: protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
    '172.16.0.0/25': [
        {
            'protocol': 'BGP',
            'last_active': True,
            'current_active': True,
            'age': 1178693,
            'routing_table': 'inet.0',
            'next_hop': '192.168.0.11',
            'outgoing_interface': 'xe-1/1/1.100',
            'preference': 170,
            'selected_next_hop': False,
            'protocol_attributes': {
                'remote_as': 65001,

maturity
new

depends
napalm

platform
unix

Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

SNMP configuration management state

New in version 2016.11.0.

salt.modules.napalm_snmp.**config**(***kwargs*)

Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

salt.modules.napalm_snmp.**remove_config**(*chassis_id=None*, *community=None*, *contact=None*, *location=None*, *test=False*, *commit=True*, ***kwargs*)

Removes a configuration element from the SNMP configuration.

Parameters
- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:

- acl (if any policy / ACL need to be set)
- mode: rw or ro. Default: ro

Parameters
- **contact** -- Contact details
- **location** -- Location

- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Returns

A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

salt.modules.napalm_snmp.**update_config**(*chassis_id=None*, *community=None*, *contact=None*, *location=None*, *test=False*, *commit=True*, ***kwargs*)

Updates the SNMP configuration.

Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:

- acl (if any policy / ACL need to be set)
- mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit snmp]
        -  location "London, UK";
        +  location "Greenwich, UK";
    result:
        True
```

26.7.293 salt.modules.napalm_users

NAPALM Users

Manages the configuration of the users on network devices.

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

depends
napalm

platform
unix

Dependencies

- *NAPALM proxy minion*

Users management state

New in version 2016.11.0.

salt.modules.napalm_users.**config**(***kwargs*)

Returns the configuration of the users on the device

CLI Example:

```
salt '*' users.config
```

Output example:

```
{
    'mircea': {
        'level': 15,
        'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/',
        'sshkeys': [
            'ssh-rsa

    }
}
```

salt.modules.napalm_users.**delete_users**(*users*, *test=False*, *commit=True*, ***kwargs*)

Removes users from the configuration of network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users "{'mircea': {}}"
```

salt.modules.napalm_users.**set_users**(*users*, *test=False*, *commit=True*, ***kwargs*)

Configures users on network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing,

can specify commit=False and will not discard the config.

Raises

MergeConfigException -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users "{'mircea': {}}"
```

26.7.294 salt.modules.napalm_yang_mod

NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

salt.modules.napalm_yang_mod.**compliance_report**(*data*, **models*, ***kwargs*)

Return the compliance report using YANG objects.

data

Dictionary structured with respect to the models referenced.

models

A list of models to be used when generating the config.

filepath

The absolute path to the validation file.

CLI Example:

```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces
↪filepath=~/validate.yml
```

Output Example:

```
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    },
    "extra": []
  }
}
```

salt.modules.napalm_yang_mod.**diff**(*candidate*, *running*, **models*)

Returns the difference between two configuration entities structured according to the YANG model.

Note: This function is recommended to be used mostly as a state helper.

---

candidate
First model to compare.

running
Second model to compare.

models
A list of models to be used when comparing.

CLI Example:

```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```
{
    "interfaces": {
        "interface": {
            "both": {
                "Port-Channel1": {
                    "config": {
                        "mtu": {
                            "first": "0",
                            "second": "9000"
                        }
                    }
                }
            },
            "first_only": [
                "Loopback0"
            ],
            "second_only": [
                "Loopback1"
            ]
        }
    }
}
```

salt.modules.napalm_yang_mod.**get_config**(*data*, **models*, ***kwargs*)

Return the native config.

data
Dictionary structured with respect to the models referenced.

models
A list of models to be used when generating the config.

profiles: **None**
Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
    ip address 192.168.1.1/24
    description Uplink1
    mtu 9000
interface et2
    ip address 192.168.2.1/24
    description Uplink2
    mtu 9000
```

salt.modules.napalm_yang_mod.**load_config**(*data*, **models*, ***kwargs*)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data
: Dictionary structured with respect to the models referenced.

models
: A list of models to be used when generating the config.

profiles: **None**
: Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: **False**
: Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True**
: Commit? Default: `True`.

debug: **False**
: Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **False**
: Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces
↪test=True debug=True
```

Output Example:

```
device1:
    ----------
    already_configured:
        False
    comment:
    diff:
        [edit interfaces ge-0/0/0]
        -   mtu 1400;
        [edit interfaces ge-0/0/0 unit 0 family inet]
        -       dhcp;
        [edit interfaces lo0]
        -    unit 0 {
        -        description lo0.0;
        -    }
        +    unit 1 {
        +        description "new loopback";
        +    }
    loaded_config:
        <configuration>
```

              </unit>
              <description>lo0</description>
            </interface>
          </interfaces>
        </configuration>
    result:
        True
```

salt.modules.napalm_yang_mod.**parse**(**models*, ***kwargs*)

Parse configuration from the device.

models

A list of models to be used when parsing.

config: **False**

Parse config.

state: **False**

Parse state.

profiles: **None**

Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse models.openconfig_interfaces
```

Output Example:

```
{
    "interfaces": {
        "interface": {
            ".local.": {
                "name": ".local.",
                "state": {
                    "admin-status": "UP",
                    "counters": {
                        "in-discards": 0,
                        "in-errors": 0,
                        "out-errors": 0
                    },
```

(continues on next page)

(continued from previous page)

```
                    "enabled": True,
                    "ifindex": 0,

```

26.7.295 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends
netaddr

`salt.modules.netaddress.`**`cidr_broadcast`**`(`*cidr*`)`

Get the broadcast address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

`salt.modules.netaddress.`**`cidr_netmask`**`(`*cidr*`)`

Get the netmask address associated with a CIDR address.

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

`salt.modules.netaddress.`**`list_cidr_ips`**`(`*cidr*`)`

Get a list of IP addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

`salt.modules.netaddress.`**`list_cidr_ips_ipv6`**`(`*cidr*`)`

Get a list of IPv6 addresses from a CIDR.

CLI Example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```

26.7.296 salt.modules.netbox

NetBox

Module to query NetBox

codeauthor
Zach Moody <zmoody@do.co>

maturity
new

depends
pynetbox

The following config should be in the minion config file. In order to work with `secrets` you should provide a token and path to your private key file:

```
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: </PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.

`salt.modules.netbox.`**`create_circuit`**(*name*, *provider_id*, *circuit_type*, *description=None*)

New in version 2019.2.0.

Create a new Netbox circuit
name
Name of the circuit
provider_id
The netbox id of the circuit provider
circuit_type
The name of the circuit type
asn
The ASN of the circuit provider
description
The description of the circuit
CLI Example:

```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299
↪"New Telia circuit"
```

`salt.modules.netbox.`**`create_circuit_provider`**(*name*, *asn=None*)

New in version 2019.2.0.

Create a new Netbox circuit provider
name
The name of the circuit provider
asn
The ASN of the circuit provider
CLI Example:

```
salt myminion netbox.create_circuit_provider Telia 1299
```

salt.modules.netbox.**create_circuit_termination**(*circuit*, *interface*, *device*, *speed*, *xconnect_id=None*, *term_side='A'*)

New in version 2019.2.0.

Terminate a circuit on an interface

circuit
: The name of the circuit

interface
: The name of the interface to terminate on

device
: The name of the device the interface belongs to

speed
: The speed of the circuit, in Kbps

xconnect_id
: The cross-connect identifier

term_side
: The side of the circuit termination

CLI Example:

```
salt myminion netbox.create_circuit_termination NEW_CIRCUIT_01 xe-0/0/1
↪myminion 10000 xconnect_id=XCON01
```

salt.modules.netbox.**create_circuit_type**(*name*)

New in version 2019.2.0.

Create a new Netbox circuit type.

name
: The name of the circuit type

CLI Example:

```
salt myminion netbox.create_circuit_type Transit
```

salt.modules.netbox.**create_device**(*name*, *role*, *model*, *manufacturer*, *site*)

New in version 2019.2.0.

Create a new device with a name, role, model, manufacturer and site. All these components need to be already in Netbox.

name
: The name of the device, e.g., `edge_router`

role
: String of device role, e.g., `router`

model
: String of device model, e.g., `MX480`

manufacturer
: String of device manufacturer, e.g., `Juniper`

site
: String of device site, e.g., `BRU`

CLI Example:

```
salt myminion netbox.create_device edge_router router MX480 Juniper BRU
```

salt.modules.netbox.**create_device_role**(*role*, *color*)

New in version 2019.2.0.

Create a device role

role
String of device role, e.g., `router`

CLI Example:

```
salt myminion netbox.create_device_role router
```

salt.modules.netbox.**create_device_type**(*model*, *manufacturer*)

New in version 2019.2.0.

Create a device type. If the manufacturer doesn't exist, create a new manufacturer.

model
String of device model, e.g., `MX480`

manufacturer
String of device manufacturer, e.g., `Juniper`

CLI Example:

```
salt myminion netbox.create_device_type MX480 Juniper
```

salt.modules.netbox.**create_interface**(*device_name*, *interface_name*, *mac_address=None*, *description=None*, *enabled=None*, *lag=None*, *lag_parent=None*, *form_factor=None*)

New in version 2019.2.0.

Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.

device_name
The name of the device, e.g., `edge_router`

interface_name
The name of the interface, e.g., `TenGigE0/0/0/0`

mac_address
String of mac address, e.g., `50:87:89:73:92:C8`

description
String of interface description, e.g., `NTT`

enabled
String of boolean interface status, e.g., `True`

lag:
Boolean of interface lag status, e.g., `True`

lag_parent
String of interface lag parent name, e.g., `ae13`

form_factor
Integer of form factor id, obtained through _choices API endpoint, e.g., `200`

CLI Example:

```
salt myminion netbox.create_interface edge_router ae13 description="Core
↪uplink"
```

salt.modules.netbox.**create_interface_connection**(*interface_a*, *interface_b*)

New in version 2019.2.0.

Create an interface connection between 2 interfaces

interface_a
Interface id for Side A

interface_b
Interface id for Side B
CLI Example:

```
salt myminion netbox.create_interface_connection 123 456
```

salt.modules.netbox.**create_inventory_item**(*device_name*, *item_name*, *manufacturer_name=None*, *serial=''*, *part_id=''*, *description=''*)

New in version 2019.2.0.

Add an inventory item to an existing device.
device_name
The name of the device, e.g., `edge_router`.
item_name
String of inventory item name, e.g., `Transceiver`.
manufacturer_name
String of inventory item manufacturer, e.g., `Fiberstore`.
serial
String of inventory item serial, e.g., `FS1238931`.
part_id
String of inventory item part id, e.g., `740-01234`.
description
String of inventory item description, e.g., `SFP+-10G-LR`.
CLI Example:

```
salt myminion netbox.create_inventory_item edge_router Transceiver part_
↪id=740-01234
```

salt.modules.netbox.**create_ipaddress**(*ip_address*, *family*, *device=None*, *interface=None*)

New in version 2019.2.0.

Add an IP address, and optionally attach it to an interface.
ip_address
The IP address and CIDR, e.g., `192.168.1.1/24`
family
Integer of IP family, e.g., `4`
device
The name of the device to attach IP to, e.g., `edge_router`
interface
The name of the interface to attach IP to, e.g., `ae13`
CLI Example:

```
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router
↪interface=ae13
```

salt.modules.netbox.**create_manufacturer**(*name*)

New in version 2019.2.0.

Create a device manufacturer.
name
The name of the manufacturer, e.g., `Juniper`
CLI Example:

```
salt myminion netbox.create_manufacturer Juniper
```

salt.modules.netbox.**create_platform**(*platform*)

New in version 2019.2.0.

Create a new device platform
platform
String of device platform, e.g., `junos`
CLI Example:

```
salt myminion netbox.create_platform junos
```

salt.modules.netbox.**create_site**(*site*)

New in version 2019.2.0.

Create a new device site
site
String of device site, e.g., `BRU`
CLI Example:

```
salt myminion netbox.create_site BRU
```

salt.modules.netbox.**delete_interface**(*device_name*, *interface_name*)

New in version 2019.2.0.

Delete an interface from a device.
device_name
The name of the device, e.g., `edge_router`.
interface_name
The name of the interface, e.g., `ae13`
CLI Example:

```
salt myminion netbox.delete_interface edge_router ae13
```

salt.modules.netbox.**delete_inventory_item**(*item_id*)

New in version 2019.2.0.

Remove an item from a devices inventory. Identified by the netbox id
item_id
Integer of item to be deleted
CLI Example:

```
salt myminion netbox.delete_inventory_item 1354
```

salt.modules.netbox.**delete_ipaddress**(*ipaddr_id*)

New in version 2019.2.0.

Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.
id
The Netbox id for the IP address.
CLI Example:

```
salt myminion netbox.delete_ipaddress 9002
```

salt.modules.netbox.**filter_**(*app*, *endpoint*, ***kwargs*)

Get a list of items from NetBox.
app
String of netbox app, e.g., `dcim`, `circuits`, `ipam`

endpoint
String of app endpoint, e.g., `sites`, `regions`, `devices`
kwargs
Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., `role=router`
Returns a list of dictionaries

```
salt myminion netbox.filter dcim devices status=1 role=router
```

salt.modules.netbox.**get_**(*app*, *endpoint*, *id=None*, ***kwargs*)

Get a single item from NetBox.
app
String of netbox app, e.g., `dcim`, `circuits`, `ipam`
endpoint
String of app endpoint, e.g., `sites`, `regions`, `devices`
Returns a single dictionary

To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

salt.modules.netbox.**get_circuit_provider**(*name*, *asn=None*)

New in version 2019.2.0.

Get a circuit provider with a given name and optional ASN.
name
The name of the circuit provider
asn
The ASN of the circuit provider
CLI Example:

```
salt myminion netbox.get_circuit_provider Telia 1299
```

salt.modules.netbox.**get_interfaces**(*device_name=None*, ***kwargs*)

New in version 2019.2.0.

Returns interfaces for a specific device using arbitrary netbox filters
device_name
The name of the device, e.g., `edge_router`
kwargs
Optional arguments to be used for filtering
CLI Example:

```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

salt.modules.netbox.**get_ipaddresses**(*device_name=None*, ***kwargs*)

New in version 2019.2.0.

Filters for an IP address using specified filters
device_name
The name of the device to check for the IP address

kwargs
Optional arguments that can be used to filter, e.g., `family=4`
CLI Example:

```
salt myminion netbox.get_ipaddresses device_name family=4
```

`salt.modules.netbox.`**`make_interface_child`**(*device_name*, *interface_name*, *parent_name*)

New in version 2019.2.0.

Set an interface as part of a LAG.
device_name
The name of the device, e.g., `edge_router`.
interface_name
The name of the interface to be attached to LAG, e.g., `xe-1/0/2`.
parent_name
The name of the LAG interface, e.g., `ae13`.
CLI Example:

```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

`salt.modules.netbox.`**`make_interface_lag`**(*device_name*, *interface_name*)

New in version 2019.2.0.

Update an interface to be a LAG.
device_name
The name of the device, e.g., `edge_router`.
interface_name
The name of the interface, e.g., `ae13`.
CLI Example:

```
salt myminion netbox.make_interface_lag edge_router ae13
```

`salt.modules.netbox.`**`openconfig_interfaces`**(*device_name=None*)

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-interfaces YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.
device_name: **`None`**
The name of the device to query the interface data for. If not provided, will use the Minion ID.
CLI Example:

```
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon
```

`salt.modules.netbox.`**`openconfig_lacp`**(*device_name=None*)

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-lacp YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

Note: The `interval` and `lacp_mode` keys have the values set as `SLOW` and `ACTIVE` respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See interval and lacp-mode for further details.

---

device_name: **None**
The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:

```
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon
```

salt.modules.netbox.**slugify**(*value*)

' Slugify given value. Credit to Djangoproject https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify

salt.modules.netbox.**update_device**(*name*, ***kwargs*)

New in version 2019.2.0.

Add attributes to an existing device, identified by name.
name
The name of the device, e.g., `edge_router`
kwargs
Arguments to change in device, e.g., `serial=JN2932930`
CLI Example:

```
salt myminion netbox.update_device edge_router serial=JN2932920
```

salt.modules.netbox.**update_interface**(*device_name*, *interface_name*, ***kwargs*)

New in version 2019.2.0.

Update an existing interface with new attributes.
device_name
The name of the device, e.g., `edge_router`
interface_name
The name of the interface, e.g., `ae13`
kwargs
Arguments to change in interface, e.g., `mac_address=50:87:69:53:32:D0`
CLI Example:

```
salt myminion netbox.update_interface edge_router ae13 mac_
↪address=50:87:69:53:32:D0
```

26.7.297 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.netbsd_sysctl.**assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.**get**(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.netbsd_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*)

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.**show**(*config_file=False*)

Return a list of sysctl parameters for this minion
config: **Pull the data from the system configuration file**
instead of the live data.
CLI Example:

```
salt '*' sysctl.show
```

26.7.298 salt.modules.netbsdservice

The service module for NetBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

---

salt.modules.netbsdservice.**available**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.netbsdservice.**disable**(*name*, ***kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.netbsdservice.**disabled**(*name*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.netbsdservice.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.netbsdservice.**enabled**(*name*, ***kwargs*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.netbsdservice.**force_reload**(*name*)

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.netbsdservice.**get_all**()

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.netbsdservice.**get_disabled**()

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.netbsdservice.**get_enabled**()

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.netbsdservice.**missing**(*name*)

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.netbsdservice.**reload_**(*name*)

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.netbsdservice.**restart**(*name*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.netbsdservice.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.netbsdservice.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.netbsdservice.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.299 salt.modules.netmiko_mod

Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., `device_type`, `ip`, `username`, `password` etc.

codeauthor

Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

depends

netmiko

platform

unix

Dependencies

The `netmiko` proxy modules requires Netmiko to be installed: `pip install netmiko`.

Usage

This module can equally be used via the *`netmiko`* Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the `netmiko` library installed.

When running outside of the *`netmiko Proxy`* (i.e., from another Proxy Minion type, or regular Minion), the netmiko connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `netmiko` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `netmiko` Proxy Module:

- `device_type` - Class selection based on device type. Supported options:
  - `a10`: A10 Networks
  - `accedian`: Accedian Networks
  - `alcatel_aos`: Alcatel AOS
  - `alcatel_sros`: Alcatel SROS
  - `apresia_aeos`: Apresia AEOS
  - `arista_eos`: Arista EOS
  - `aruba_os`: Aruba
  - `avaya_ers`: Avaya ERS
  - `avaya_vsp`: Avaya VSP
  - `brocade_fastiron`: Brocade Fastiron
  - `brocade_netiron`: Brocade Netiron
  - `brocade_nos`: Brocade NOS
  - `brocade_vdx`: Brocade NOS
  - `brocade_vyos`: VyOS
  - `checkpoint_gaia`: Check Point GAiA
  - `calix_b6`: Calix B6
  - `ciena_saos`: Ciena SAOS
  - `cisco_asa`: Cisco SA
  - `cisco_ios`: Cisco IOS
  - `cisco_nxos`: Cisco NX-oS
  - `cisco_s300`: Cisco S300
  - `cisco_tp`: Cisco TpTcCe
  - `cisco_wlc`: Cisco WLC
  - `cisco_xe`: Cisco IOS
  - `cisco_xr`: Cisco XR

- `coriant`: Coriant
- `dell_force10`: Dell Force10
- `dell_os10`: Dell OS10
- `dell_powerconnect`: Dell PowerConnect
- `eltex`: Eltex
- `enterasys`: Enterasys
- `extreme`: Extreme
- `extreme_wing`: Extreme Wing
- `f5_ltm`: F5 LTM
- `fortinet`: Fortinet
- `generic_termserver`: TerminalServer
- `hp_comware`: HP Comware
- `hp_procurve`: HP Procurve
- `huawei`: Huawei
- `huawei_vrpv8`: Huawei VRPV8
- `juniper`: Juniper Junos
- `juniper_junos`: Juniper Junos
- `linux`: Linux
- `mellanox`: Mellanox
- `mrv_optiswitch`: MrvOptiswitch
- `netapp_cdot`: NetAppcDot
- `netscaler`: Netscaler
- `ovs_linux`: OvsLinux
- `paloalto_panos`: PaloAlto Panos
- `pluribus`: Pluribus
- `quanta_mesh`: Quanta Mesh
- `ruckus_fastiron`: Ruckus Fastiron
- `ubiquiti_edge`: Ubiquiti Edge
- `ubiquiti_edgeswitch`: Ubiquiti Edge
- `vyatta_vyos`: VyOS
- `vyos`: VyOS
- `brocade_fastiron_telnet`: Brocade Fastiron over Telnet
- `brocade_netiron_telnet`: Brocade Netiron over Telnet
- `cisco_ios_telnet`: Cisco IOS over Telnet
- `apresia_aeos_telnet`: Apresia AEOS over Telnet
- `arista_eos_telnet`: Arista EOS over Telnet

  - `hp_procurve_telnet`: HP Procurve over Telnet
  - `hp_comware_telnet`: HP Comware over Telnet
  - `juniper_junos_telnet`: Juniper Junos over Telnet
  - `calix_b6_telnet`: Calix B6 over Telnet
  - `dell_powerconnect_telnet`: Dell PowerConnect over Telnet
  - `generic_termserver_telnet`: TerminalServer over Telnet
  - `extreme_telnet`: Extreme Networks over Telnet
  - `ruckus_fastiron_telnet`: Ruckus Fastiron over Telnet
  - `cisco_ios_serial`: Cisco IOS over serial port
- `ip` - IP address of target device (not required if `host` is provided)
- `host` - Hostname of target device (not required if `ip` is provided)
- `username` - Username to authenticate against target device, if required
- `password` - Password to authenticate against target device, if required
- `secret` - The enable password if target device requires one
- `port` - The destination port used to connect to the target device
- `global_delay_factor` - Multiplication factor affecting Netmiko delays (default: `1`)
- `use_keys` - Connect to target device using SSH keys (default: `False`)
- `key_file` - Filename path of the SSH key file to use
- `allow_agent` - Enable use of SSH key-agent
- `ssh_strict` - Automatically reject unknown SSH host keys (default: `False`, which means unknown SSH host keys will be accepted)
- `system_host_keys` - Load host keys from the user's "known_hosts" file (default: `False`)
- `alt_host_keys` - If `True`, host keys will be loaded from the file specified in `alt_key_file` (default: `False`)
- `alt_key_file` - SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file` - File name of OpenSSH configuration file
- `timeout` - Connection timeout, in seconds (default: `90`)
- `session_timeout` - Set a timeout for parallel requests, in seconds (default: `60`)
- `keepalive` - Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to `0`, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets).
- `default_enter` - Character(s) to send to correspond to enter key (default: `\n`)
- `response_return` - Character(s) to use in normalized return data to represent enter key (default: `\n`)

Example (when not running in a `netmiko` Proxy Minion):

```
netmiko:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `netmiko` Proxy, e.g.:

```
salt '*' netmiko.send_command 'show version' host=router1.example.com device_
↪type=juniper
salt '*' netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com
↪device_type=cisco_ios
```

Note: Remember that the above applies only when not running in a `netmiko` Proxy Minion. If you want to use the `<salt.proxy.netmiko_px>`, please follow the documentation notes for a proper setup.

`salt.modules.netmiko_mod.`**`call`**`(`*method*, **args*, ***kwargs*`)`

Invoke an arbitrary Netmiko method.

method
: The name of the Netmiko method to invoke.

args
: A list of arguments to send to the method invoked.

kwargs
: Key-value dictionary to send to the method invoked.

`salt.modules.netmiko_mod.`**`commit`**`(`***kwargs*`)`

Commit the configuration changes.

> **Warning:** This function is supported only on the platforms that support the `commit` operation.

CLI Example:

```
salt '*' netmiko.commit
```

`salt.modules.netmiko_mod.`**`enter_config_mode`**`(`***kwargs*`)`

Enter into config mode.

config_command
: Configuration command to send to the device.

pattern
: Pattern to terminate reading of channel.

CLI Example:

```
salt '*' netmiko.enter_config_mode
salt '*' netmiko.enter_config_mode device_type='juniper_junos' ip='192.
↪168.0.1' username='example'
```

`salt.modules.netmiko_mod.`**`exit_config_mode`**`(`***kwargs*`)`

Exit from configuration mode.

exit_config
: Command to exit configuration mode.

pattern
: Pattern to terminate reading of channel.

CLI Example:

```
salt '*' netmiko.exit_config_mode
salt '*' netmiko.exit_config_mode device_type='juniper' ip='192.168.0.1'
↪username='example'
```

salt.modules.netmiko_mod.**get_connection**(***kwargs*)

Return the Netmiko connection object.

Warning: This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

kwargs
Key-value dictionary with the authentication details.

USAGE Example:

```
conn = __salt__['netmiko.get_connection'](host='router1.example.com',
                                          username='example',
                                          password='example')
show_if = conn.send_command('show interfaces')
conn.disconnect()
```

salt.modules.netmiko_mod.**multi_call**(**methods*, ***kwargs*)

Invoke multiple Netmiko methods at once, and return their output, as list.

methods
A list of dictionaries with the following keys:
- `name`: the name of the Netmiko method to be executed.
- `args`: list of arguments to be sent to the Netmiko method.
- `kwargs`: dictionary of arguments to be sent to the Netmiko method.

kwargs
Key-value dictionary with the connection details (when not running under a Proxy Minion).

salt.modules.netmiko_mod.**send_command**(*command_string*, ***kwargs*)

Execute command_string on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

command_string
The command to be executed on the remote device.

expect_string
Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

delay_factor: **`1`**
Multiplying factor used to adjust delays (default: `1`).

max_loops: **`500`**
Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

auto_find_prompt: **`True`**
Whether it should try to auto-detect the prompt (default: `True`).

strip_prompt: **`True`**
Remove the trailing router prompt from the output (default: `True`).

strip_command: **`True`**
Remove the echo of the command from the output (default: `True`).

normalize: **`True`**
Ensure the proper enter is sent at end of command (default: `True`).

use_textfsm: **`False`**
Process command output through TextFSM template (default: `False`).
CLI Example:

```
salt '*' netmiko.send_command 'show version'
salt '*' netmiko.send_command 'show_version' host='router1.example.com'
↪username='example' device_type='cisco_ios'
```

`salt.modules.netmiko_mod.`**`send_command_timing`**(*command_string*, ***kwargs*)

Execute command_string on the SSH channel using a delay-based mechanism. Generally used for show commands.
command_string
The command to be executed on the remote device.
delay_factor: **`1`**
Multiplying factor used to adjust delays (default: `1`).
max_loops: **`500`**
Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
strip_prompt: **`True`**
Remove the trailing router prompt from the output (default: `True`).
strip_command: **`True`**
Remove the echo of the command from the output (default: `True`).
normalize: **`True`**
Ensure the proper enter is sent at end of command (default: `True`).
use_textfsm: **`False`**
Process command output through TextFSM template (default: `False`).
CLI Example:

```
salt '*' netmiko.send_command_timing 'show version'
salt '*' netmiko.send_command_timing 'show version' host='router1.example.
↪com' username='example' device_type='arista_eos'
```

`salt.modules.netmiko_mod.`**`send_config`**(*config_file=None*, *config_commands=None*, *template_engine='jinja'*, *commit=False*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.
config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

config_commands
Multiple configuration commands to be sent to the device.

Note: This argument is ignored when `config_file` is specified.

---

template_engine: **`jinja`**
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file

without attempting to render, set this argument to `None`.

commit: **`False`**
: Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

context
: Variables to add to the template context.

defaults
: Default values of the context_dict.

exit_config_mode: **`True`**
: Determines whether or not to exit config mode after complete.

delay_factor: **`1`**
: Factor to adjust delays.

max_loops: **`150`**
: Controls wait time in conjunction with delay_factor (default: `150`).

strip_prompt: **`False`**
: Determines whether or not to strip the prompt (default: `False`).

strip_command: **`False`**
: Determines whether or not to strip the command (default: `False`).

config_mode_command
: The command to enter into config mode.

CLI Example:

```
salt '*' netmiko.send_config config_commands="['interface GigabitEthernet3
↪', 'no ip address']"
salt '*' netmiko.send_config config_commands="['snmp-server location {{
↪grains.location }}']"
salt '*' netmiko.send_config config_file=salt://config.txt
salt '*' netmiko.send_config config_file=https://bit.ly/2sgljCB device_
↪type='cisco_ios' ip='1.2.3.4' username='example'
```

26.7.300 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

depends

- nsnitro Python module

Note: You can install nsnitro using:

```
pip install nsnitro
```

---

configuration
: This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples:

Calls relying on configuration passed using /etc/salt/minion, grains, or pillars:

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4
↪netscaler_user=username netscaler_pass=password
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.5
↪netscaler_user=username2 netscaler_pass=password2
salt-call netscaler.server_enable server_name2 netscaler_host=1.2.3.5
salt-call netscaler.server_up server_name3 netscaler_host=1.2.3.6
↪netscaler_useSSL=False
```

salt.modules.netscaler.**server_add**(*s_name*, *s_ip*, *s_state=None*, ***connection_args*)

Add a server Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

salt.modules.netscaler.**server_delete**(*s_name*, ***connection_args*)

Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

salt.modules.netscaler.**server_disable**(*s_name*, ***connection_args*)

Disable a server globally

CLI Example:

```
salt '*' netscaler.server_disable 'serverName'
```

salt.modules.netscaler.**server_enable**(*s_name*, ***connection_args*)

Enables a server globally

CLI Example:

```
salt '*' netscaler.server_enable 'serverName'
```

salt.modules.netscaler.**server_enabled**(*s_name*, ***connection_args*)

Check if a server is enabled globally

CLI Example:

```
salt '*' netscaler.server_enabled 'serverName'
```

salt.modules.netscaler.**server_exists**(*s_name*, *ip=None*, *s_state=None*, ***connection_args*)

Checks if a server exists

CLI Example:

```
salt '*' netscaler.server_exists 'serverName'
```

salt.modules.netscaler.**server_update**(*s_name*, *s_ip*, ***connection_args*)

Update a server's attributes

CLI Example:

```
salt '*' netscaler.server_update 'serverName' 'serverIP'
```

salt.modules.netscaler.**service_disable**(*s_name*, *s_delay=None*, ***connection_args*)

Disable a service

CLI Example:

```
salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'
```

salt.modules.netscaler.**service_enable**(*s_name*, ***connection_args*)

Enable a service

CLI Example:

```
salt '*' netscaler.service_enable 'serviceName'
```

salt.modules.netscaler.**service_exists**(*s_name*, ***connection_args*)

Checks if a service exists

CLI Example:

```
salt '*' netscaler.service_exists 'serviceName'
```

salt.modules.netscaler.**service_up**(*s_name*, ***connection_args*)

Checks if a service is UP

CLI Example:

```
salt '*' netscaler.service_up 'serviceName'
```

salt.modules.netscaler.**servicegroup_add**(*sg_name*, *sg_type='HTTP'*, ***connection_args*)

Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:

```
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

salt.modules.netscaler.**servicegroup_delete**(*sg_name*, ***connection_args*)

Delete a new service group

CLI Example:

```
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

salt.modules.netscaler.**servicegroup_exists**(*sg_name*, *sg_type=None*, ***connection_args*)

Checks if a service group exists

CLI Example:

```
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

salt.modules.netscaler.**servicegroup_server_add**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Add a server:port member to a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName
↪' 'serverPort'
```

salt.modules.netscaler.**servicegroup_server_delete**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Remove a server:port member from a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName'
↪'serverName' 'serverPort'
```

salt.modules.netscaler.**servicegroup_server_disable**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Disable a server:port member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_disable 'serviceGroupName'
↪'serverName' 'serverPort'
```

salt.modules.netscaler.**servicegroup_server_enable**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Enable a server:port member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName'
↪'serverName' 'serverPort'
```

salt.modules.netscaler.**servicegroup_server_exists**(*sg_name*, *s_name*, *s_port=None*, ***connection_args*)

Check if a server:port combination is a member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName'
↪'serverName' 'serverPort'
```

salt.modules.netscaler.**servicegroup_server_up**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName'
↪'serverPort'
```

salt.modules.netscaler.**vserver_add**(*v_name*, *v_ip*, *v_port*, *v_type*, ***connection_args*)

Add a new lb vserver

CLI Example:

```
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
↪'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443'
↪'SSL'
```

salt.modules.netscaler.**vserver_delete**(*v_name*, ***connection_args*)

Delete a lb vserver

CLI Example:

```
salt '*' netscaler.vserver_delete 'vserverName'
```

salt.modules.netscaler.**vserver_exists**(*v_name*, *v_ip=None*, *v_port=None*, *v_type=None*, ***connection_args*)

Checks if a vserver exists

CLI Example:

```
salt '*' netscaler.vserver_exists 'vserverName'
```

salt.modules.netscaler.**vserver_servicegroup_add**(*v_name*, *sg_name*, ***connection_args*)

Bind a servicegroup to a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_add 'vserverName'
↪'serviceGroupName'
```

salt.modules.netscaler.**vserver_servicegroup_delete**(*v_name*, *sg_name*, ***connection_args*)

Unbind a servicegroup from a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_delete 'vserverName'
↪'serviceGroupName'
```

salt.modules.netscaler.**vserver_servicegroup_exists**(*v_name*, *sg_name*, ***connection_args*)

Checks if a servicegroup is tied to a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_exists 'vserverName'
↪'serviceGroupName'
```

salt.modules.netscaler.**vserver_sslcert_add**(*v_name*, *sc_name*, ***connection_args*)

Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.**vserver_sslcert_delete**(*v_name*, *sc_name*, ***connection_args*)

Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_delete 'vserverName'
↪'sslCertificateName'
```

salt.modules.netscaler.**vserver_sslcert_exists**(*v_name*, *sc_name*, ***connection_args*)

Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_exists 'vserverName'
↪'sslCertificateName'
```

26.7.301 salt.modules.network

Module for gathering and managing network information

salt.modules.network.**active_tcp**()

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

salt.modules.network.**arp**()

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

salt.modules.network.**calc_net**(*ip_addr*, *netmask=None*)

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

salt.modules.network.**connect**(*host*, *port=None*, ***kwargs*)

Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4

salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
↪timeout=3
```

salt.modules.network.**convert_cidr**(*cidr*)

returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.**default_route**(*family=None*)

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

salt.modules.network.**dig**(*host*)

Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.network.**fqdns**()

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

CLI Example:

```
salt '*' network.fqdns
```

salt.modules.network.**get_bufsize**(*iface*)

Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

salt.modules.network.**get_fqdn**()

Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

salt.modules.network.**get_hostname**()

Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

salt.modules.network.**get_route**(*ip*)

Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.network.**hw_addr**(*iface*)

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

salt.modules.network.**hwaddr**(*iface*)

This function is an alias of hw_addr.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

salt.modules.network.**ifacestartswith**(*cidr*)

Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

salt.modules.network.**in_subnet**(*cidr*)

Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.network.**interface**(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

salt.modules.network.**interface_ip**(*iface*)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

salt.modules.network.**interfaces**()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

salt.modules.network.**ip_addrs**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.network.**ip_addrs6**(*interface=None*, *include_loopback=False*, *cidr=None*)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.network.**ip_in_subnet**(*ip_addr*, *cidr*)

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

salt.modules.network.**ip_networks**(*interface=None*, *include_loopback=False*, *verbose=False*)

New in version 3001.

Returns a list of IPv4 networks to which the minion belongs.

interface

Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks
salt '*' network.ip_networks interface=docker0
salt '*' network.ip_networks interface=docker0,enp*
salt '*' network.ip_networks interface=eth*
```

salt.modules.network.**ip_networks6**(*interface=None*, *include_loopback=False*, *verbose=False*)

New in version 3001.

Returns a list of IPv6 networks to which the minion belongs.

interface

Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_networks6
salt '*' network.ip_networks6 interface=docker0
salt '*' network.ip_networks6 interface=docker0,enp*
salt '*' network.ip_networks6 interface=eth*
```

salt.modules.network.**ipaddrs**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.network.**ipaddrs6**(*interface=None*, *include_loopback=False*, *cidr=None*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: `interface` can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.network.**iphexval**(*ip*)

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

salt.modules.network.**is_loopback**(*ip_addr*)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

salt.modules.network.**is_private**(*ip_addr*)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.**mod_bufsize**(*iface*, **args*, ***kwargs*)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=
↪<val>
```

salt.modules.network.**mod_hostname**(*hostname*)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.**netstat**()

Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

salt.modules.network.**ping**(*host*, *timeout=False*, *return_boolean=False*)

Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

salt.modules.network.**reverse_ip**(*ip_addr*)

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

salt.modules.network.**routes**(*family=None*)

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

salt.modules.network.**subnets**(*interfaces=None*)

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

salt.modules.network.**subnets6**()

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

salt.modules.network.**traceroute**(*host*)

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

salt.modules.network.**wol**(*mac*, *bcast='255.255.255.255'*, *destport=9*)

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

26.7.302 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

- neutronclient Python module

configuration

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
```

(continues on next page)

(continued from previous page)

```
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the *use_keystoneauth* option in the pillar or minion config.

Note: this is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

`salt.modules.neutron.`**`add_gateway_router`**(*router*, *ext_network*, *profile=None*)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- **`router`** -- ID or name of the router
- **`ext_network`** -- ID or name of the external network the gateway
- **`profile`** -- Profile to build on (Optional)

Returns

Added Gateway router information

`salt.modules.neutron.`**`add_interface_router`**(*router*, *subnet*, *profile=None*)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- **`router`** -- ID or name of the router

- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns

Added interface information

salt.modules.neutron.**create_firewall_rule**(*protocol*, *action*, *profile=None*, ***kwargs*)

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
        tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_
↪version=IP_VERSION
        source_ip_address=SOURCE_IP_ADDRESS destination_ip_
↪address=DESTINATION_IP_ADDRESS source_port=SOURCE_PORT
        destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

Parameters

- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None".
- **action** -- Action for the firewall rule, choose "allow" or "deny".
- **tenant_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

salt.modules.neutron.**create_floatingip**(*floating_network*, *port=None*, *profile=None*)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created floatingIP information

salt.modules.neutron.**create_ikepolicy**(*name*, *profile=None*, ***kwargs*)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
        phase1_negotiation_mode=main auth_algorithm=sha1
        encryption_algorithm=aes-128 pfs=group5
```

Parameters

- **name** -- Name of the IKE policy

- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns

Created IKE policy information

salt.modules.neutron.**create_ipsec_site_connection**(*name*, *ipsecpolicy*, *ikepolicy*, *vpnservice*, *peer_cidrs*, *peer_address*, *peer_id*, *psk*, *admin_state_up=True*, *profile=None*, ***kwargs*)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
       ipsec-policy-name ikepolicy-name vpnservice-name
       192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPSec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default:bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default:1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created IPSec site connection information

salt.modules.neutron.**create_ipsecpolicy**(*name*, *profile=None*, ***kwargs*)

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
       transform_protocol=esp auth_algorithm=sha1
```

(continues on next page)

(continued from previous page)

```
        encapsulation_mode=tunnel encryption_algorithm=aes-128
```

Parameters

- **name** -- Name of the IPSec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created IPSec policy information

salt.modules.neutron.**create_network**(*name*, *router_ext=None*, *admin_state_up=True*, *network_type=None*, *physical_network=None*, *segmentation_id=None*, *shared=None*, *profile=None*)

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** -- Name of network to create
- **admin_state_up** -- should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created network information

salt.modules.neutron.**create_port**(*name*, *network*, *device_id=None*, *admin_state_up=True*, *profile=None*)

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device_id** -- ID of device (Optional)

- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created port information

salt.modules.neutron.**create_router**(*name*, *ext_network=None*, *admin_state_up=True*, *profile=None*)

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

Parameters

- **name** -- Name of router to create (must be first)
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default:true (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created router information

salt.modules.neutron.**create_security_group**(*name=None*, *description=None*, *profile=None*)

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
↪ description='Security group for servers'
```

Parameters

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created security group information

salt.modules.neutron.**create_security_group_rule**(*security_group*, *remote_group_id=None*, *direction='ingress'*, *protocol=None*, *port_range_min=None*, *port_range_max=None*, *ethertype='IPv4'*, *profile=None*)

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- **security_group** -- Security group name or ID to add rule
- **remote_group_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** -- Starting port range (Optional)
- **port_range_max** -- Ending port range (Optional)
- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created security group rule information

salt.modules.neutron.**create_subnet**(*network*, *cidr*, *name=None*, *ip_version=4*, *profile=None*)

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

Parameters

- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- **name** -- Name of the subnet to create (Optional)
- **ip_version** -- Version to use, default is 4(IPv4) (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created subnet information

salt.modules.neutron.**create_vpnservice**(*subnet*, *router*, *name*, *admin_state_up=True*, *profile=None*)

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

Parameters

- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service
- **name** -- Set a name for the VPN service
- **admin_state_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Created VPN service information

salt.modules.neutron.**delete_firewall_rule**(*firewall_rule*, *profile=None*)

Deletes the specified firewall_rule

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_floatingip**(*floatingip_id*, *profile=None*)

Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters

- **floatingip_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_ikepolicy**(*ikepolicy*, *profile=None*)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.**delete_ipsec_site_connection**(*ipsec_site_connection*, *profile=None*)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.**delete_ipsecpolicy**(*ipsecpolicy*, *profile=None*)

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPSec policy to delete
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.**delete_network**(*network*, *profile=None*)

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to delete
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.**delete_port**(*port*, *profile=None*)

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

Parameters

- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_quota**(*tenant_id*, *profile=None*)

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters

- **tenant_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

Returns

True(Delete succeed) or False(Delete failed)

salt.modules.neutron.**delete_router**(*router*, *profile=None*)

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

Parameters

- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_security_group**(*security_group*, *profile=None*)

Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

Parameters

- **security_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_security_group_rule**(*security_group_rule_id*, *profile=None*)

Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters

- **security_group_rule_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_subnet**(*subnet*, *profile=None*)

Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters

- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**delete_vpnservice**(*vpnservice*, *profile=None*)

Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters

- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

Returns

True(Succeed) or False

salt.modules.neutron.**get_quotas_tenant**(*profile=None*)

Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters

profile -- Profile to build on (Optional)

Returns

Quotas information

salt.modules.neutron.**list_agents**(*profile=None*)

List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

Parameters

profile -- Profile to build on (Optional)

Returns

agents message.

salt.modules.neutron.**list_extensions**(*profile=None*)

Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of extensions

salt.modules.neutron.**list_firewall_rules**(*profile=None*)

Fetches a list of all firewall rules for a tenant

CLI Example:

```
salt '*' neutron.list_firewall_rules
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of firewall rules

salt.modules.neutron.**list_firewalls**(*profile=None*)

Fetches a list of all firewalls for a tenant

CLI Example:

```
salt '*' neutron.list_firewalls
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of firewalls

salt.modules.neutron.**list_floatingips**(*profile=None*)

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of floatingIP

salt.modules.neutron.**list_ikepolicies**(*profile=None*)

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of IKE policy

salt.modules.neutron.**list_ipsec_site_connections**(*profile=None*)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of IPSec site connection

salt.modules.neutron.**list_ipsecpolicies**(*profile=None*)

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of IPSec policy

salt.modules.neutron.**list_l3_agent_hosting_routers**(*router*, *profile=None*)

List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router:router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

salt.modules.neutron.**list_networks**(*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of network

salt.modules.neutron.**list_ports**(*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of port

salt.modules.neutron.**list_quotas**(*profile=None*)

Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of quotas

salt.modules.neutron.**list_routers**(*profile=None*)

Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of router

salt.modules.neutron.**list_security_group_rules**(*profile=None*)

Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of security group rule

salt.modules.neutron.**list_security_groups**(*profile=None*)

Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)

Returns
List of security group

salt.modules.neutron.**list_subnets**(*profile=None*)

Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters
profile -- Profile to build on (Optional)
Returns
List of subnet

salt.modules.neutron.**list_vpnservices**(*retrieve_all=True, profile=None, **kwargs*)

Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

Parameters
- **retrieve_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

Returns
List of VPN service

salt.modules.neutron.**remove_gateway_router**(*router, profile=None*)

Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

Parameters
- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.**remove_interface_router**(*router, subnet, profile=None*)

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters
- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns
True(Succeed) or False

salt.modules.neutron.**show_firewall**(*firewall*, *profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

Parameters
- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

Returns
firewall information

salt.modules.neutron.**show_firewall_rule**(*firewall_rule*, *profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters
- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

Returns
firewall rule information

salt.modules.neutron.**show_floatingip**(*floatingip_id*, *profile=None*)

Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

Parameters
- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns
Floating IP information

salt.modules.neutron.**show_ikepolicy**(*ikepolicy*, *profile=None*)

Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns
IKE policy information

salt.modules.neutron.**show_ipsec_site_connection**(*ipsec_site_connection*, *profile=None*)

Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns
IPSec site connection information

`salt.modules.neutron.`**`show_ipsecpolicy`**(*ipsecpolicy*, *profile=None*)

Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPSec policy to look up
- **profile** -- Profile to build on (Optional)

Returns
IPSec policy information

`salt.modules.neutron.`**`show_network`**(*network*, *profile=None*)

Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns
Network information

`salt.modules.neutron.`**`show_port`**(*port*, *profile=None*)

Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters
- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns
Port information

`salt.modules.neutron.`**`show_quota`**(*tenant_id*, *profile=None*)

Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns
Quota information

salt.modules.neutron.**show_router**(*router*, *profile=None*)

Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

Parameters
- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

Returns
Router information

salt.modules.neutron.**show_security_group**(*security_group*, *profile=None*)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

Parameters
- **security_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

Returns
Security group information

salt.modules.neutron.**show_security_group_rule**(*security_group_rule_id*, *profile=None*)

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters
- **security_group_rule_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

Returns
Security group rule information

salt.modules.neutron.**show_subnet**(*subnet*, *profile=None*)

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

Parameters
- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

Returns
Subnet information

salt.modules.neutron.**show_vpnservice**(*vpnservice*, *profile=None*, ***kwargs*)

Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

Returns

VPN service information

salt.modules.neutron.**update_firewall_rule**(*firewall_rule*, *protocol=None*, *action=None*, *name=None*, *description=None*, *ip_version=None*, *source_ip_address=None*, *destination_ip_address=None*, *source_port=None*, *destination_port=None*, *shared=None*, *enabled=None*, *profile=None*)

Update a firewall rule

CLI Example:

```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
↪action=ACTION
        name=NAME description=DESCRIPTION ip_version=IP_VERSION
        source_ip_address=SOURCE_IP_ADDRESS destination_ip_
↪address=DESTINATION_IP_ADDRESS
        source_port=SOURCE_PORT destination_port=DESTINATION_PORT
↪shared=SHARED enabled=ENABLED
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.**update_floatingip**(*floatingip_id*, *port=None*, *profile=None*)

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to *None* or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Value of updated floating IP information

salt.modules.neutron.**update_network**(*network*, *name*, *profile=None*)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns

Value of updated network information

salt.modules.neutron.**update_port**(*port*, *name*, *admin_state_up=True*, *profile=None*)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

Parameters

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns

Value of updated port information

salt.modules.neutron.**update_quota**(*tenant_id*, *subnet=None*, *router=None*, *network=None*, *floatingip=None*, *port=None*, *security_group=None*, *security_group_rule=None*, *profile=None*)

Update a tenant's quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
                              network=10 floatingip=30 port=30
```

Parameters

- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Value of updated quota

salt.modules.neutron.**update_router**(*router*, *name=None*, *admin_state_up=None*, *profile=None*, ***kwargs*)

Updates a router

CLI Example:

```
salt '*' neutron.update_router router_id name=new-router-name
        admin_state_up=True
```

Parameters
- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns
Value of updated router information

salt.modules.neutron.**update_security_group**(*security_group*, *name=None*, *description=None*, *profile=None*)

Updates a security group

CLI Example:

```
salt '*' neutron.update_security_group security-group-name
↪ new-security-group-name
```

Parameters
- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns
Value of updated security group information

salt.modules.neutron.**update_subnet**(*subnet*, *name*, *profile=None*)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters
- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

Returns
Value of updated subnet information

salt.modules.neutron.**update_vpnservice**(*vpnservice*, *desc*, *profile=None*)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

Returns

Value of updated VPN service information

26.7.303 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron

New in version 2018.3.0.

:depends:shade

Example configuration

```
neutron:
  cloud: default
```

```
neutron:
  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
  identity_api_version: 3
```

salt.modules.neutronng.**compare_changes**(*obj*, ***kwargs*)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.neutronng.**get_openstack_cloud**(*auth=None*)

Return an openstack_cloud

salt.modules.neutronng.**get_operator_cloud**(*auth=None*)

Return an operator_cloud

salt.modules.neutronng.**list_networks**(*auth=None*, ***kwargs*)

List networks

filters

A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks           filters='{"tenant_id":
↪"1dcac318a83b4610b7a7f7ba01465548"}'
```

salt.modules.neutronng.**list_subnets**(*auth=None*, ***kwargs*)

List subnets

filters
A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets           filters='{"tenant_id":
↪"1dcac318a83b4610b7a7f7ba01465548"}'
```

salt.modules.neutronng.**network_create**(*auth=None*, ***kwargs*)

Create a network
name
Name of the network being created
shared
[False] If `True`, set the network as shared
admin_state_up
[True] If `True`, Set the network administrative state to "up"
external
[False] Control whether or not this network is externally accessible
provider
An optional Python dictionary of network provider options
project_id
The project ID on which this network will be created
CLI Example:

```
salt '*' neutronng.network_create name=network2           shared=True
↪admin_state_up=True external=True

salt '*' neutronng.network_create name=network3           provider='{
↪"network_type": "vlan",                      "segmentation_id": "4010",
↪                    "physical_network": "provider"}'           project_
↪id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.**network_delete**(*auth=None*, ***kwargs*)

Delete a network
name_or_id
Name or ID of the network being deleted
CLI Example:

```
salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_
↪id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.**network_get**(*auth=None*, ***kwargs*)

Get a single network
filters
A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.network_get name=XLB4
```

salt.modules.neutronng.**security_group_create**(*auth=None*, ***kwargs*)

Create a security group. Use security_group_get to create default.
project_id
The project ID on which this security group will be created

CLI Example:

```
salt '*' neutronng.security_group_create name=secgroup1          
↪description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1          
↪description="Very secure security group"          project_
↪id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.**security_group_delete**(*auth=None*, ***kwargs*)

Delete a security group

name_or_id

The name or unique ID of the security group

CLI Example:

```
salt '*' neutronng.security_group_delete name_or_id=secgroup1
```

salt.modules.neutronng.**security_group_get**(*auth=None*, ***kwargs*)

Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

filters

A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.security_group_get          
↪name=1dcac318a83b4610b7a7f7ba01465548

salt '*' neutronng.security_group_get          name=default          
↪filters='{"tenant_id":"2e778bb64ca64a199eb526b5958d8710"}'
```

salt.modules.neutronng.**security_group_rule_create**(*auth=None*, ***kwargs*)

Create a rule in a security group

secgroup_name_or_id

The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

port_range_min

The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

port_range_max

The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

protocol

The protocol that is matched by the security group rule. Valid values are `None`, `tcp`, `udp`, and `icmp`.

remote_ip_prefix

The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

remote_group_id

The remote group ID to be associated with this security group rule

direction

Either `ingress` or `egress`; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance

ethertype
Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules
project_id
Specify the project ID this security group will be created on (admin-only)
CLI Example:

```
salt '*' neutronng.security_group_rule_create          secgroup_name_or_
↪id=secgroup1

salt '*' neutronng.security_group_rule_create          secgroup_name_or_
↪id=secgroup2 port_range_min=8080          port_range_max=8080 direction=
↪'egress'

salt '*' neutronng.security_group_rule_create          secgroup_name_or_
↪id=c0e1d1ce-7296-405e-919d-1c08217be529          protocol=icmp project_
↪id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.**security_group_rule_delete**(*auth=None*, ***kwargs*)

Delete a security group
name_or_id
The unique ID of the security group rule
CLI Example:

```
salt '*' neutronng.security_group_rule_delete name_or_
↪id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.**security_group_update**(*secgroup=None*, *auth=None*, ***kwargs*)

Update a security group
secgroup
Name, ID or Raw Object of the security group to update
name
New name for the security group
description
New description for the security group
CLI Example:

```
salt '*' neutronng.security_group_update secgroup=secgroup1          
↪description="Very secure security group"
salt '*' neutronng.security_group_update secgroup=secgroup1          
↪description="Very secure security group"          project_
↪id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.**setup_clouds**(*auth=None*)

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.neutronng.**subnet_create**(*auth=None*, ***kwargs*)

Create a subnet
network_name_or_id
The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
cidr
The CIDR
ip_version
The IP version, which is 4 or 6.

enable_dhcp
[False] Set to `True` if DHCP is enabled and `False` if disabled
subnet_name
The name of the subnet
tenant_id
The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.
allocation_pools
A list of dictionaries of the start and end addresses for the allocation pools.
gateway_ip
The gateway IP address. When you specify both `allocation_pools` and `gateway_ip`, you must ensure that the gateway IP does not overlap with the specified allocation pools.
disable_gateway_ip
[False] Set to `True` if gateway IP address is disabled and `False` if enabled. It is not allowed with `gateway_ip`.
dns_nameservers
A list of DNS name servers for the subnet
host_routes
A list of host route dictionaries for the subnet
ipv6_ra_mode
IPv6 Router Advertisement mode. Valid values are `dhcpv6-stateful`, `dhcpv6-stateless`, or `slaac`.
ipv6_address_mode
IPv6 address mode. Valid values are `dhcpv6-stateful`, `dhcpv6-stateless`, or `slaac`.
use_default_subnetpool
If `True`, use the default subnetpool for `ip_version` to obtain a CIDR. It is required to pass `None` to the `cidr` argument when enabling this option.
CLI Example:

```
salt '*' neutronng.subnet_create network_name_or_id=network1
  subnet_name=subnet1

salt '*' neutronng.subnet_create subnet_name=subnet2          network_
↪name_or_id=network2 enable_dhcp=True           allocation_pools='[{
↪"start": "192.168.199.2",                          "end": "192.168.
↪199.254"}]'          gateway_ip='192.168.199.1' cidr=192.168.199.0/24

salt '*' neutronng.subnet_create network_name_or_id=network1          
↪subnet_name=subnet1 dns_nameservers='["8.8.8.8", "8.8.8.7"]'
```

`salt.modules.neutronng.`**`subnet_delete`**(*auth=None*, ***kwargs*)

Delete a subnet
name
Name or ID of the subnet to update
CLI Example:

```
salt '*' neutronng.subnet_delete name=subnet1
salt '*' neutronng.subnet_delete          
↪name=1dcac318a83b4610b7a7f7ba01465548
```

`salt.modules.neutronng.`**`subnet_get`**(*auth=None*, ***kwargs*)

Get a single subnet
filters
A Python dictionary of filter conditions to push down

CLI Example:

```
salt '*' neutronng.subnet_get name=subnet1
```

salt.modules.neutronng.**subnet_update**(*auth=None*, ***kwargs*)

Update a subnet

name_or_id
: Name or ID of the subnet to update

subnet_name
: The new name of the subnet

enable_dhcp
: Set to `True` if DHCP is enabled and `False` if disabled

gateway_ip
: The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.

disable_gateway_ip
: [False] Set to `True` if gateway IP address is disabled and False if enabled. It is not allowed with `gateway_ip`.

allocation_pools
: A list of dictionaries of the start and end addresses for the allocation pools.

dns_nameservers
: A list of DNS name servers for the subnet

host_routes
: A list of host route dictionaries for the subnet

```
salt '*' neutronng.subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng.subnet_update name=subnet1 dns_nameservers='["8.8.8.8",
↪ "8.8.8.7"]'
```

26.7.304 salt.modules.nexus

Module for fetching artifacts from Nexus 3.x

New in version 2018.3.0.

salt.modules.nexus.**get_latest_release**(*nexus_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets the latest release of the artifact

nexus_url
: URL of nexus instance

repository
: Release repository in nexus to retrieve artifact from, for example: libs-releases

group_id
: Group Id of the artifact

artifact_id
: Artifact Id of the artifact

packaging
: Packaging type (jar,war,ear,etc)

target_dir
: Target directory to download artifact to (default: /tmp)

target_file
: Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
nexus username. Optional parameter.
password
nexus password. Optional parameter.

`salt.modules.nexus.`**`get_latest_snapshot`**(*nexus_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets latest snapshot of the given artifact
nexus_url
URL of nexus instance
repository
Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id
Group Id of the artifact
artifact_id
Artifact Id of the artifact
packaging
Packaging type (jar,war,ear,etc)
target_dir
Target directory to download artifact to (default: /tmp)
target_file
Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
nexus username. Optional parameter.
password
nexus password. Optional parameter.

`salt.modules.nexus.`**`get_release`**(*nexus_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *version*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets the specified release of the artifact
nexus_url
URL of nexus instance
repository
Release repository in nexus to retrieve artifact from, for example: libs-releases
group_id
Group Id of the artifact
artifact_id
Artifact Id of the artifact
packaging
Packaging type (jar,war,ear,etc)
version
Version of the artifact
target_dir
Target directory to download artifact to (default: /tmp)
target_file
Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
classifier
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username
nexus username. Optional parameter.
password
nexus password. Optional parameter.

salt.modules.nexus.**get_snapshot**(*nexus_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *version*, *snapshot_version=None*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets snapshot of the desired version of the artifact
nexus_url
URL of nexus instance
repository
Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id
Group Id of the artifact
artifact_id
Artifact Id of the artifact
packaging
Packaging type (jar,war,ear,etc)
version
Version of the artifact
target_dir
Target directory to download artifact to (default: /tmp)
target_file
Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
nexus username. Optional parameter.
password
nexus password. Optional parameter.

salt.modules.nexus.**get_snapshot_version_string**(*nexus_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *version*, *classifier=None*, *username=None*, *password=None*)

Gets the specific version string of a snapshot of the desired version of the artifact
nexus_url
URL of nexus instance
repository
Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id
Group Id of the artifact
artifact_id
Artifact Id of the artifact
packaging
Packaging type (jar,war,ear,etc)
version
Version of the artifact
classifier
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username
nexus username. Optional parameter.
password
nexus password. Optional parameter.

exception salt.modules.nexus.**nexusError**(*value*)

26.7.305 salt.modules.nfs3

Module for managing NFS version 3.

salt.modules.nfs3.**add_export**(*exports='/etc/exports'*, *path=None*, *hosts=None*, *options=None*)

Add an export

CLI Example:

```
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']
```

salt.modules.nfs3.**del_export**(*exports='/etc/exports'*, *path=None*)

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

salt.modules.nfs3.**list_exports**(*exports='/etc/exports'*)

List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

salt.modules.nfs3.**reload_exports**()

Trigger a reload of the exports file to apply changes

CLI Example:

```
salt '*' nfs3.reload_exports
```

26.7.306 salt.modules.nftables

Support for nftables

salt.modules.nftables.**append**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format,

starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.append filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**build_rule**(*table=None*, *chain=None*, *command=None*, *position=''*, *full=None*, *family='ipv4'*, ***kwargs*)

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is *True*, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept \
    family=ipv6
```

salt.modules.nftables.**check**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format,

starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.check filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**check_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' nftables.check_chain filter input

IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

salt.modules.nftables.**check_table**(*table=None*, *family='ipv4'*)

Check for the existence of a table

CLI Example:

```
salt '*' nftables.check_table nat
```

salt.modules.nftables.**delete**(*table*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Delete a rule from the specified table & chain, specifying either the rule
in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.delete filter input position=3

salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6

salt '*' nftables.delete filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**delete_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input

salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6
```

salt.modules.nftables.**delete_table**(*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

salt.modules.nftables.**flush**(*table='filter'*, *chain=''*, *family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input

IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.**get_policy**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 3002.

Return the current policy for the specified table/chain

table
: Name of the table containing the chain to check

chain
: Name of the chain to get the policy for

family
: Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_policy filter input

IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```

salt.modules.nftables.**get_rule_handle**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format,
: starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**get_rules**(*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules

salt '*' nftables.get_rules family=ipv6
```

salt.modules.nftables.**get_rules_json**(*family='ipv4'*)

New in version 3002.

Return a list of dictionaries comprising the current, in-memory rules

family
: Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.get_rules_json

salt '*' nftables.get_rules_json family=ipv6
```

salt.modules.nftables.**get_saved_rules**(*conf_file=None*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

salt.modules.nftables.**insert**(*table='filter'*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

This function accepts a rule in a standard nftables command format,
starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
    rule='tcp dport 22 log accept'

salt '*' nftables.insert filter input position=3 \
    rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \
    rule='tcp dport 22 log accept' \
    family=ipv6

salt '*' nftables.insert filter input position=3 \
    rule='tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**list_tables**(*family='ipv4'*)

Return a data structure of the current, in-memory tables

CLI Example:

```
salt '*' nftables.list_tables

salt '*' nftables.list_tables family=ipv6
```

salt.modules.nftables.**new_chain**(*table='filter'*, *chain=None*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input

salt '*' nftables.new_chain filter input \
        table_type=filter hook=input priority=0

salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
        table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6
```

salt.modules.nftables.**new_table**(*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter

IPv6:
salt '*' nftables.new_table filter family=ipv6
```

salt.modules.nftables.**save**(*filename=None*, *family='ipv4'*)

Changed in version 3002.

Save the current in-memory rules to disk. On systems where /etc/nftables is a directory, a file named salt-all-in-one.nft will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

salt.modules.nftables.**set_policy**(*table='filter'*, *chain=None*, *policy=None*, *family='ipv4'*)

New in version 3002.

Set the current policy for the specified table/chain. This only works on chains with an existing base chain.

table
: Name of the table containing the chain to modify

chain
: Name of the chain to set the policy for

policy
: accept or drop

family
: Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.set_policy filter input accept

IPv6:
salt '*' nftables.set_policy filter input accept family=ipv6
```

salt.modules.nftables.**version**()

Return version from nftables --version

CLI Example:

```
salt '*' nftables.version
```

26.7.307 salt.modules.nginx

Support for nginx

salt.modules.nginx.**build_info**()

Return server and build arguments

CLI Example:

```
salt '*' nginx.build_info
```

salt.modules.nginx.**configtest**()

test configuration and exit

CLI Example:

```
salt '*' nginx.configtest
```

salt.modules.nginx.**signal**(*signal=None*)

Signals nginx to start, reload, reopen or stop.

CLI Example:

```
salt '*' nginx.signal reload
```

salt.modules.nginx.**status**(*url='http://127.0.0.1/status'*)

Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule

url

The URL of the status page. Defaults to 'http://127.0.0.1/status'

CLI Example:

```
salt '*' nginx.status
```

salt.modules.nginx.**version**()

Return server version from nginx -v

CLI Example:

```
salt '*' nginx.version
```

26.7.308 salt.modules.nilrt_ip

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.**apply_network_settings**(***settings*)

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

salt.modules.nilrt_ip.**build_interface**(*iface*, *iface_type*, *enabled*, ***settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.nilrt_ip.**build_network_settings**(***settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.nilrt_ip.**disable**(*interface*)

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters

interface (*str*) -- interface label

Returns

True if the service was disabled, otherwise an exception will be thrown.

Return type

bool

CLI Example:

```
salt '*' ip.disable interface-label
```

salt.modules.nilrt_ip.**down**(*interface*, *iface_type=None*)

Disable the specified interface

Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters

interface (*str*) -- interface label

Returns

True if the service was disabled, otherwise an exception will be thrown.

Return type

bool

CLI Example:

```
salt '*' ip.down interface-label
```

salt.modules.nilrt_ip.**enable**(*interface*)

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
interface (*str*) -- interface label
Returns
True if the service was enabled, otherwise an exception will be thrown.
Return type
bool

CLI Example:

```
salt '*' ip.enable interface-label
```

salt.modules.nilrt_ip.**get_interface**(*iface*)

Returns details about given interface.

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.nilrt_ip.**get_interfaces_details**()

Get details about all the interfaces on the minion
Returns
information about all interfaces omitting loopback
Return type
dictionary
CLI Example:

```
salt '*' ip.get_interfaces_details
```

salt.modules.nilrt_ip.**get_network_settings**()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.nilrt_ip.**set_dhcp_linklocal_all**(*interface*)

Configure specified adapter to use DHCP with linklocal fallback

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
interface (*str*) -- interface label
Returns
True if the settings were applied, otherwise an exception will be thrown.
Return type
bool
CLI Example:

```
salt '*' ip.set_dhcp_linklocal_all interface-label
```

salt.modules.nilrt_ip.**set_dhcp_only_all**(*interface*)

Configure specified adapter to use DHCP only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
interface (*str*) -- interface label
Returns
True if the settings were applied, otherwise an exception will be thrown.

Return type
bool

CLI Example:

```
salt '*' ip.dhcp_only_all interface-label
```

salt.modules.nilrt_ip.**set_ethercat**(*interface*, *master_id*)

Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it doesn't already use EtherCAT adapter mode, otherwise will return true.

Parameters
- **interface** -- interface label
- **master_id** -- EtherCAT Master ID

Returns
True if the settings were applied, otherwise an exception will be thrown.

CLI Example:

```
salt '*' ip.set_ethercat interface-label master-id
```

salt.modules.nilrt_ip.**set_linklocal_only_all**(*interface*)

Configure specified adapter to use linklocal only

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
interface (*str*) -- interface label

Returns
True if the settings were applied, otherwise an exception will be thrown.

Return type
bool

CLI Example:

```
salt '*' ip.linklocal_only_all interface-label
```

salt.modules.nilrt_ip.**set_static_all**(*interface*, *address*, *netmask*, *gateway*, *nameservers=None*)

Configure specified adapter to use ipv4 manual settings

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
- **interface** (*str*) -- interface label
- **address** (*str*) -- ipv4 address
- **netmask** (*str*) -- ipv4 netmask
- **gateway** (*str*) -- ipv4 gateway
- **nameservers** (*str*) -- list of nameservers servers separated by spaces (Optional)

Returns
True if the settings were applied, otherwise an exception will be thrown.

Return type
bool

CLI Example:

```
salt '*' ip.set_static_all interface-label address netmask gateway
↪nameservers
```

salt.modules.nilrt_ip.**up**(*interface*, *iface_type=None*)

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

Parameters
interface (*str*) -- interface label
Returns
True if the service was enabled, otherwise an exception will be thrown.
Return type
bool

CLI Example:

```
salt '*' ip.up interface-label
```

26.7.309 salt.modules.nix

Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a `pkg` module, but explicitly as `nix.*`.

For more information on nix, see the nix documentation.

`salt.modules.nix.`**`collect_garbage`**`()`

Completely removed all currently 'uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.
Returns
How much space was freed and how many derivations were removed
Return type
str

> **Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

`salt.modules.nix.`**`install`**`(*pkgs, **kwargs)`

Installs a single or multiple packages via nix
Parameters
- **pkgs** (*list(str)*) -- packages to update
- **attributes** (*bool*) -- Pass the list of packages or single package as attribues, not package names. default: False

Returns
Installed packages. Example element: `gcc-3.3.2`
Return type
list(str)

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

salt.modules.nix.**list_pkgs**(*installed=True*, *attributes=True*)

Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

Parameters

- **installed** (*bool*) -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** (*bool*) -- show the attributes of the packages when listing all packages. Default: True

Returns

Packages installed or available, along with their attributes.

Return type

list(list(str))

```
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

salt.modules.nix.**uninstall**(**pkgs*)

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

Parameters

pkgs (*list(str)*) -- List, single package to uninstall

Returns

Packages that have been uninstalled

Return type

list(str)

```
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

salt.modules.nix.**upgrade**(**pkgs*)

Runs an update operation on the specified packages, or all packages if none is specified.

Parameters

pkgs (*list(str)*) -- List of packages to update

Returns

The upgraded packages. Example element: `['libxslt-1.1.0', 'libxslt-1.1.10']`

Return type

list(tuple(str, str))

```
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

26.7.310 salt.modules.nova

Module for handling OpenStack Nova calls

depends

- novaclient Python module

configuration

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the *use_keystoneauth* option in the pillar or minion config.

Note: This is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

`salt.modules.nova.`**`boot`**(*name*, *flavor_id=0*, *image_id=0*, *profile=None*, *timeout=300*)

Boot (create) a new instance

name

Name of the new instance (must be first)

flavor_id

Unique integer ID for the flavor

image_id
Unique integer ID for the image
timeout
How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.
CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The flavor_id and image_id are obtained from nova.flavor_list and nova.image_list

```
salt '*' nova.flavor_list
salt '*' nova.image_list
```

`salt.modules.nova.`**`delete`**(*instance_id*, *profile=None*)
Delete an instance
instance_id
ID of the instance to be deleted
CLI Example:

```
salt '*' nova.delete 1138
```

`salt.modules.nova.`**`flavor_create`**(*name*, *flavor_id=0*, *ram=0*, *disk=0*, *vcpus=1*, *profile=None*)
Add a flavor to nova (nova flavor-create). The following parameters are required:
name
Name of the new flavor (must be first)
flavor_id
Unique integer ID for the new flavor
ram
Memory size in MB
disk
Disk size in GB
vcpus
Number of vcpus
CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
```

`salt.modules.nova.`**`flavor_delete`**(*flavor_id*, *profile=None*)
Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

`salt.modules.nova.`**`flavor_list`**(*profile=None*)
Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

salt.modules.nova.**image_list**(*name=None*, *profile=None*)

Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

salt.modules.nova.**image_meta_delete**(*image_id=None*, *name=None*, *keys=None*, *profile=None*)

Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6
↪keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

salt.modules.nova.**image_meta_set**(*image_id=None*, *name=None*, *profile=None*, ***kwargs*)

Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6
↪cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

salt.modules.nova.**keypair_add**(*name*, *pubfile=None*, *pubkey=None*, *profile=None*)

Add a keypair to nova (nova keypair-add)

CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

salt.modules.nova.**keypair_delete**(*name*, *profile=None*)

Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

salt.modules.nova.**keypair_list**(*profile=None*)

Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

salt.modules.nova.**list_**(*profile=None*)

To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

salt.modules.nova.**lock**(*instance_id*, *profile=None*)

Lock an instance

instance_id

ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

salt.modules.nova.**resume**(*instance_id*, *profile=None*)

Resume an instance

instance_id

ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

salt.modules.nova.**secgroup_create**(*name*, *description*, *profile=None*)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

salt.modules.nova.**secgroup_delete**(*name*, *profile=None*)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

salt.modules.nova.**secgroup_list**(*profile=None*)

Return a list of available security groups (nova items-list)

CLI Example:

```
salt '*' nova.secgroup_list
```

salt.modules.nova.**server_by_name**(*name*, *profile=None*)

Return information about a server

name

Server Name

CLI Example:

```
salt '*' nova.server_by_name myserver profile=openstack
```

salt.modules.nova.**server_list**(*profile=None*)

Return list of active servers

CLI Example:

```
salt '*' nova.server_list
```

salt.modules.nova.**server_list_detailed**(*profile=None*)

Return detailed list of active servers

CLI Example:

```
salt '*' nova.server_list_detailed
```

salt.modules.nova.**server_show**(*server_id*, *profile=None*)

Return detailed information for an active server

CLI Example:

```
salt '*' nova.server_show <server_id>
```

salt.modules.nova.**show**(*server_id*, *profile=None*)

To maintain the feel of the nova command line, this function simply calls the server_show function.

CLI Example:

```
salt '*' nova.show
```

salt.modules.nova.**suspend**(*instance_id*, *profile=None*)

Suspend an instance

instance_id
: ID of the instance to be suspended

CLI Example:

```
salt '*' nova.suspend 1138
```

salt.modules.nova.**volume_attach**(*name*, *server_name*, *device='/dev/xvdb'*, *profile=None*, *timeout=300*)

Attach a block storage volume

name
: Name of the new volume to attach

server_name
: Name of the server to attach to

device
: Name of the device on the server

profile
: Profile to build on

CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/dev/xvdb'
↪profile=openstack
```

salt.modules.nova.**volume_create**(*name*, *size=100*, *snapshot=None*, *voltype=None*, *profile=None*)

Create a block storage volume

name
: Name of the new volume (must be first)

size
: Volume size

snapshot
: Block storage snapshot id

voltype
: Type of storage

profile
: Profile to build on

CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.**volume_delete**(*name*, *profile=None*)

Destroy the volume

name
: Name of the volume

profile
: Profile to build on

CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.**volume_detach**(*name*, *profile=None*, *timeout=300*)

Attach a block storage volume

name
: Name of the new volume to attach

server_name
: Name of the server to detach from

profile
: Profile to build on

CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.**volume_list**(*search_opts=None*, *profile=None*)

List storage volumes

search_opts
: Dictionary of search options

profile
: Profile to use

CLI Example:

```
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'
↪profile=openstack
```

salt.modules.nova.**volume_show**(*name*, *profile=None*)

Create a block storage volume

name
: Name of the volume

profile
: Profile to use

CLI Example:

```
salt '*' nova.volume_show myblock profile=openstack
```

26.7.311 salt.modules.npm

Manage and query NPM packages.

salt.modules.npm.**cache_clean**(*path=None*, *runas=None*, *env=None*, *force=False*)

Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.

path
: The cache subpath to delete, or None to clear the entire cache

runas
: The user to run NPM with

env
: Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

force
: Force cleaning of cache. Required for npm@5 and greater

  New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

salt.modules.npm.**cache_list**(*path=None*, *runas=None*, *env=None*)

List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.

path
: The cache subpath to list, or None to list the entire cache

runas
: The user to run NPM with

env
: Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

CLI Example:

```
salt '*' npm.cache_clean
```

salt.modules.npm.**cache_path**(*runas=None*, *env=None*)

List path of the NPM cache directory.

runas
: The user to run NPM with

env
: Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

CLI Example:

```
salt '*' npm.cache_path
```

salt.modules.npm.**install**(*pkg=None*, *pkgs=None*, *dir=None*, *runas=None*, *registry=None*, *env=None*, *dry_run=False*, *silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

pkg
A package name in any format accepted by NPM, including a version identifier

pkgs
A list of package names in the same format as the `name` parameter

New in version 2014.7.0.

dir
The target directory in which to install the package, or None for global installation

runas
The user to run NPM with

registry
The NPM registry to install the package from.

New in version 2014.7.0.

env
Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

New in version 2014.7.0.

silent
Whether or not to run NPM install with --silent flag.

New in version 2016.3.0.

dry_run
Whether or not to run NPM install with --dry-run flag.

New in version 2015.8.4.

silent
Whether or not to run NPM install with --silent flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script

salt '*' npm.install coffee-script@1.0.1
```

`salt.modules.npm.`**`list_`**(*pkg=None*, *dir=None*, *runas=None*, *env=None*, *depth=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

pkg
Limit package listing by name

dir
The directory whose packages will be listed, or None for global installation

runas
The user to run NPM with

New in version 2014.7.0.

env
Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

New in version 2014.7.0.

depth
Limit the depth of the packages listed

New in version 2016.11.6,2017.7.0.

CLI Example:

```
salt '*' npm.list
```

salt.modules.npm.**uninstall**(*pkg*, *dir=None*, *runas=None*, *env=None*)

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

pkg
: A package name in any format accepted by NPM

dir
: The target directory from which to uninstall the package, or None for global installation

runas
: The user to run NPM with

env
: Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

  New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```

26.7.312 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in `/var/lib/machines`, while those running systemd < 219 will place them in `/var/lib/container`.

salt.modules.nspawn.**bootstrap_container**(*name*, *dist=None*, *version=None*)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

salt.modules.nspawn.**bootstrap_salt**(*name*, *config=None*, *approve_key=True*, *install=True*, *pub_key=None*, *priv_key=None*, *bootstrap_url=None*, *force_install=False*, *unconditional_install=False*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

salt.modules.nspawn.**copy_to**(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*)

Copy a file from the host into a container

name
Container name
source
File to be copied to the container
dest
Destination on the container. Must be an absolute path.
overwrite
[False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.
CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.`**`cp`**(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*)

This function is an alias of `copy_to`.
Copy a file from the host into a container
name
Container name
source
File to be copied to the container
dest
Destination on the container. Must be an absolute path.
overwrite
[False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.
CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

`salt.modules.nspawn.`**`destroy`**(*name*, *stop=False*)

This function is an alias of `remove`.
Remove the named container

> **Warning**: This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (*`nspawn.pull_raw`*, *`nspawn.pull_tar`*, *`nspawn.pull_dkr`*).

stop
[False] If `True`, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.`**`disable`**(*name*)

Set the named container to *not* be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.**enable**(*name*)

Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.**exists**(*name*)

Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

salt.modules.nspawn.**info**(*name*, ***kwargs*)

Return info about a container

Note: The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

---

start

[False] If `True`, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

salt.modules.nspawn.**list_**()

This function is an alias of `list_running`.

Lists running nspawn containers

Note: `nspawn.list` also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

salt.modules.nspawn.**list_all**()

Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

salt.modules.nspawn.**list_running**()

Lists running nspawn containers

Note: `nspawn.list` also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

`salt.modules.nspawn.`**`list_stopped`**`()`

Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

`salt.modules.nspawn.`**`pid`**`(`*`name`*`)`

Returns the PID of a container

name
: Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

`salt.modules.nspawn.`**`poweroff`**`(`*`name`*`)`

Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop``(as shown in the CLI examples below) is equivalent to running ``nspawn.poweroff`.

Note: `machinectl poweroff` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

`salt.modules.nspawn.`**`pull_dkr`**`(`*`url`*`, `*`name`*`, `*`index`*`)`

Execute a `machinectl pull-dkr` to download a docker image and add it to /var/lib/machines as a new container.

Note: **Requires systemd >= 219**

url
: URL from which to download the container

name
: Name for the new container

index
: URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.
↪docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.
↪docker.com
```

salt.modules.nspawn.**pull_docker**(*url*, *name*, *index*)

This function is an alias of `pull_dkr`.

Execute a `machinectl pull-dkr` to download a docker image and add it to /var/lib/machines as a new container.

Note: **Requires systemd >= 219**

---

url
: URL from which to download the container

name
: Name for the new container

index
: URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://
↪get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6
↪index=https://get.docker.com
```

salt.modules.nspawn.**pull_raw**(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

Note: **Requires systemd >= 219**

---

url
: URL from which to download the container

name
: Name for the new container

verify
: [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/
↪linux/releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_
↪64.raw.xz fedora21
```

salt.modules.nspawn.**pull_tar**(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .tar container image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

url
URL from which to download the container

name
Name for the new container

verify
[False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-
↪2015.02.01.tar.gz arch2
```

`salt.modules.nspawn.`**`reboot`**(*name*, *kill=False*)

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

Note: `machinectl reboot` is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via `systemctl`.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

`salt.modules.nspawn.`**`remove`**(*name*, *stop=False*)

Remove the named container

Warning: This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (*`nspawn.pull_raw`*, *`nspawn.pull_tar`*, *`nspawn.pull_dkr`*).

stop
[False] If `True`, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

`salt.modules.nspawn.`**`restart`**(*name*)

This is a compatibility function which simply calls nspawn.reboot.

`salt.modules.nspawn.`**`retcode`**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.retcode* within a container

name
: Name of the container in which to run the command

cmd
: Command to run

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env
: [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

salt.modules.nspawn.**run**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run* within a container

name
: Name of the container in which to run the command

cmd
: Command to run

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console.

keep_env
: [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

salt.modules.nspawn.**run_all**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_all* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name
Name of the container in which to run the command

cmd
Command to run

no_start
[False] If the container is not running, don't start it

preserve_state
[True] After running the command, return the container to its previous state

stdin
[None] Standard input to be used for the command

output_loglevel
[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
[False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env
[None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

salt.modules.nspawn.**run_stderr**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_stderr* within a container

name
Name of the container in which to run the command

cmd
Command to run

no_start
[False] If the container is not running, don't start it

preserve_state
[True] After running the command, return the container to its previous state

stdin
[None] Standard input to be used for the command

output_loglevel
[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
[False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env
[None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

salt.modules.nspawn.**run_stdout**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_stdout* within a container

name
: Name of the container in which to run the command

cmd
: Command to run

no_start
: [False] If the container is not running, don't start it

preserve_state
: [True] After running the command, return the container to its previous state

stdin
: [None] Standard input to be used for the command

output_loglevel
: [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt
: [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env
: [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

salt.modules.nspawn.**start**(*name*)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

salt.modules.nspawn.**state**(*name*)

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

salt.modules.nspawn.**stop**(*name*, *kill=False*)

This is a compatibility function which provides the logic for nspawn.poweroff and nspawn.terminate.

salt.modules.nspawn.**terminate**(*name*)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

Note: `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

26.7.313 salt.modules.nxos

Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

This module supports execution using a Proxy Minion or Native Minion:
1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See *salt.proxy.nxos* for proxy minion setup details. 2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

maturity
new

platform
nxos

Note: To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Native minion configuration options:

```
nxos:
  cookie: 'username'
  save_config: False
```

cookie
Use the option to override the default cookie 'admin:local' when connecting over UDS and use 'username:local' instead. This is needed when running the salt-minion in the GuestShell using a non-admin user.

This option is ignored for SSH and NX-API Proxy minions.

save_config:
If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

The recommended approach is to use the *save_running_config* function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```
salt-call --local nxos.sendline 'show lldp neighbors' raw_text
```

Note: The functions in this module should be executed like so:

salt '*' nxos.<function> salt '*' nxos.get_user username=admin

For backwards compatibility, the following syntax will be supported until the 3001 release.

salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin

---

`salt.modules.nxos.`**`add_config`**(*lines*, ***kwargs*)

Add one or more config lines to the NX-OS device running config.

lines
: Configuration lines to add

save_config
: If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group
↪network-operator'
```

Note: For more than one config added per command, lines should be a list.

`salt.modules.nxos.`**`check_password`**(*username*, *password*, *encrypted=False*, ***kwargs*)

Verify user password.

username
: Username on which to perform password check

password
: Password to check

encrypted
: Whether or not the password is encrypted Default: False

`salt.modules.nxos.`**`check_role`**(*username*, *role*, ***kwargs*)

Verify role assignment for user.

```
salt '*' nxos.check_role username=admin role=network-admin
```

`salt.modules.nxos.`**`cmd`**(*command*, **args*, ***kwargs*)

NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using either of the following syntactic forms.

salt '*' nxos.cmd <function>

or

salt '*' nxos.<function>

command
: function from *salt.modules.nxos* to run

args
: positional args to pass to *command* function

kwargs
key word arguments to pass to *command* function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi
↪$blahblahblah' encrypted=True
```

salt.modules.nxos.**config**(*commands=None*, *config_file=None*, *template_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Warning: All the commands will be applied directly to the running-config.

config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

commands
The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note: This argument is ignored when `config_file` is specified.

template_engine: **`jinja`**
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context
Variables to add to the template context.

defaults
Default values of the context_dict.

save_config
If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

CLI Example:

```
salt '*' nxos.config commands="['spanning-tree mode mstp']"
salt '*' nxos.config config_file=salt://config.txt
salt '*' nxos.config config_file=https://bit.ly/2LGLcDy context="{'servers
↪': ['1.2.3.4']}"
```

salt.modules.nxos.**delete_config**(*lines*, ***kwargs*)

Delete one or more config lines to the switch running config.

lines

Configuration lines to remove.

save_config

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.delete_config 'snmp-server community TESTSTRINGHERE group
↪network-operator'
```

Note: For more than one config deleted per command, lines should be a list.

---

salt.modules.nxos.**find**(*pattern*, ***kwargs*)

Find all instances where the pattern is in the running configuration.

```
salt '*' nxos.find '^snmp-server.*$'
```

Note: This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole show_run output.

---

salt.modules.nxos.**get_roles**(*username*, ***kwargs*)

Get roles assigned to a username.

salt.modules.nxos.**get_user**(*username*, ***kwargs*)

Get username line from switch.

salt.modules.nxos.**grains**(***kwargs*)

Get grains for minion.

salt.modules.nxos.**grains_refresh**(***kwargs*)

Refresh the grains for the NX-OS device.

salt.modules.nxos.**ping**(***kwargs*)

Ping the device on the other end of the connection.

salt.modules.nxos.**remove_user**(*username*, ***kwargs*)

Remove user from switch.

username

Username to remove

save_config

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.remove_user username=daniel
```

salt.modules.nxos.**replace**(*old_value*, *new_value*, *full_match=False*, ***kwargs*)

Replace string or full line matches in switch's running config.

If full_match is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'
```

salt.modules.nxos.**save_running_config**(***kwargs*)

Save the running configuration to startup configuration.

```
salt '*' nxos.save_running_config
```

salt.modules.nxos.**sendline**(*command*, *method='cli_show_ascii'*, ***kwargs*)

Send arbitrary commands to the NX-OS device.

command
: The command or list of commands to be sent. ['cmd1', 'cmd2'] is converted to 'cmd1 ; cmd2'.

method:
: `cli_show_ascii`: Return raw test or unstructured output. `cli_show`: Return structured output. `cli_conf`: Send configuration commands to the device. Defaults to `cli_show_ascii`. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.

error_pattern
: Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

salt.modules.nxos.**set_password**(*username*, *password*, *encrypted=False*, *role=None*, *crypt_salt=None*, *algorithm='sha256'*, ***kwargs*)

Set users password on switch.

username
: Username to configure

password
: Password to configure for username

encrypted
: Whether or not to encrypt the password Default: False

role
: Configure role for the username Default: None

crypt_salt
: Configure crypt_salt setting Default: None

algorithm
: Encryption algorithm Default: sha256

save_config
: If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_password admin TestPass
salt '*' nxos.set_password admin \
    password='$5$2fWwO2vK$s7.Hr3YltMNHuhywQQ3nfOd.gAPHgs3SOBYYdGT3E.A' \
    encrypted=True
```

salt.modules.nxos.**set_role**(*username*, *role*, ***kwargs*)

Assign role to username.

username
: Username for role configuration

role
: Configure role for username

save_config
: If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.set_role username=daniel role=vdc-admin.
```

salt.modules.nxos.**show**(*commands*, *raw_text=True*, ***kwargs*)

Execute one or more show (non-configuration) commands.

commands

The commands to be executed.

raw_text: **True**

Whether to return raw text or structured data. NOTE: raw_text option is ignored for SSH proxy minion. Data is returned unstructured.

CLI Example:

```
salt-call --local nxos.show 'show version'
salt '*' nxos.show 'show bgp sessions ; show processes' raw_text=False
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com
↪username=test password=test
```

salt.modules.nxos.**show_run**(***kwargs*)

Shortcut to run *show running-config* on the NX-OS device.

```
salt '*' nxos.show_run
```

salt.modules.nxos.**show_ver**(***kwargs*)

Shortcut to run *show version* on the NX-OS device.

```
salt '*' nxos.show_ver
```

salt.modules.nxos.**system_info**(***kwargs*)

Return system information for grains of the minion.

```
salt '*' nxos.system_info
```

salt.modules.nxos.**unset_role**(*username*, *role*, ***kwargs*)

Remove role from username.

username

Username for role removal

role

Role to remove

save_config

If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

```
salt '*' nxos.unset_role username=daniel role=vdc-admin
```

26.7.314 salt.modules.nxos_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API

New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

codeauthor
Mircea Ulinic <ping@mirceaulinic.net>

maturity
new

platform
any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing `feature nxapi` in configuration mode.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to reliability reasons it is recommended to run the most recent version.

Check https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus7000/sw/programmability/guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide_chapter_0101.html for more details.

Usage

This module can equally be used via the *`nxos_api`* Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the *`nxos_api Proxy`* (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

host: **localhost**
: The IP address or DNS host name of the connection device.

username: **admin**
: The username to pass to the device to authenticate the NX-API connection.

password
: The password to pass to the device to authenticate the NX-API connection.

port
: The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

timeout: **60**
: Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: **True**
: Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

  When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (_ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (*recommended*), or bypass the checks setting this argument as `False` with all the security risks considered.

  Check https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus3000/sw/programmability/6_x/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_3000_Series_NX-OS_Programmability_Guide_chapter_01.html to see how to properly configure the certificate.

Example (when not running in a `nxos_api` Proxy Minion):

```
nxos_api:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```
salt-call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt
↪is installed

salt '*' nxos_api.show 'show version' raw_text=False
```

Note: Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the *`nxos_api Proxy`*, please follow the documentation notes for a proper setup.

`salt.modules.nxos_api.`**`config`**(*commands=None*, *config_file=None*, *template_engine='jinja'*, *context=None*, *defaults=None*, *saltenv='base'*, ***kwargs*)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Warning: All the commands will be applied directly into the running-config.

config_file
The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

commands
The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

Note: This argument is ignored when `config_file` is specified.

template_engine: **`jinja`**
The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

context
Variables to add to the template context.

defaults
Default values of the context_dict.

transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

host: **`localhost`**
The IP address or DNS host name of the connection device.

username: **`admin`**
The username to pass to the device to authenticate the NX-API connection.

password
The password to pass to the device to authenticate the NX-API connection.

port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).

timeout: **`60`**
Time in seconds to wait for the device to respond. Default: 60 seconds.

verify: **`True`**
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

CLI Example:

```
salt '*' nxos_api.config commands="['spanning-tree mode mstp']"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{
↪'servers': ['1.2.3.4']}"
```

`salt.modules.nxos_api.`**`rpc`**(*commands*, *method='cli'*, ***kwargs*)
Execute an arbitrary RPC request via the Nexus API.

commands
The commands to be executed.
method: **`cli`**
The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).
transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
host: **`localhost`**
The IP address or DNS host name of the connection device.
username: **`admin`**
The username to pass to the device to authenticate the NX-API connection.
password
The password to pass to the device to authenticate the NX-API connection.
port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).
timeout: **`60`**
Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **`True`**
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.
CLI Example:

```
salt-call --local nxos_api.rpc 'show version'
```

`salt.modules.nxos_api.`**`show`**(*commands*, *raw_text=True*, ***kwargs*)

Execute one or more show (non-configuration) commands.
commands
The commands to be executed. Multiple commands should be specified as a list.
raw_text: **`True`**
Whether to return raw text or structured data.
transport: **`https`**
Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.
host: **`localhost`**
The IP address or DNS host name of the connection device.
username: **`admin`**
The username to pass to the device to authenticate the NX-API connection.
password
The password to pass to the device to authenticate the NX-API connection.
port
The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (`80` for `http`, or `443` for `https`).
timeout: **`60`**
Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **`True`**
Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.
CLI Example:

```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show "['show bgp sessions','show processes']" raw_
↪text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.
↪com username=test password=test
```

26.7.315 salt.modules.nxos_upgrade

Execution module to upgrade Cisco NX-OS Switches.

New in version 3001.

This module supports execution using a Proxy Minion or Native Minion:

1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details.
2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the Guest-Shell running on the NX-OS device.

maturity
new

platform
nxos

codeauthor
Michael G Wiebe

Note: To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

`salt.modules.nxos_upgrade.`**`check_upgrade_impact`**(*system_image*, *kickstart_image=None*, *issu=True*, ***kwargs*)

Display upgrade impact information without actually upgrading the device.

system_image (Mandatory Option)
Path on bootflash: to system image upgrade file.

kickstart_image
Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu
In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True

timeout
Timeout in seconds for long running 'install all' impact command. Default: 900

error_pattern
Use the option to pass in a regular expression to search for in the output of the 'install all impact' com-

mand that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \
    kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

salt.modules.nxos_upgrade.**upgrade**(*system_image*, *kickstart_image=None*, *issu=True*, ***kwargs*)

Upgrade NX-OS switch.

system_image (Mandatory Option)

Path on bootflash: to system image upgrade file.

kickstart_image

Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None

issu

Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True

timeout

Timeout in seconds for long running 'install all' upgrade command. Default: 900

error_pattern

Use the option to pass in a regular expression to search for in the output of the 'install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \
    kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

26.7.316 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

depends

pypureomapi Python module

salt.modules.omapi.**add_host**(*mac*, *name=None*, *ip=None*, *ddns=False*, *group=None*, *supersede_host=False*)

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1
↪ddns=true
```

salt.modules.omapi.**delete_host**(*mac=None*, *name=None*)

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

26.7.317 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.**assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.**get**(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.openbsd_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*)

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.**show**(*config_file=False*)

Return a list of sysctl parameters for this minion

config: **Pull the data from the system configuration file**
instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.7.318 salt.modules.openbsdpkg

Package support for OpenBSD

Note: The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

```
- rsync
- vim--no_x11
- ruby%2.3
```

salt.modules.openbsdpkg.**install**(*name=None, pkgs=None, sources=None, **kwargs*)

Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]'
```

salt.modules.openbsdpkg.**latest_version**(**names, **kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

salt.modules.openbsdpkg.**list_pkgs**(*versions_as_list=False, **kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.openbsdpkg.**purge**(*name=None, pkgs=None, **kwargs*)

Remove a package and extra configuration files.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.openbsdpkg.**remove**(*name=None*, *pkgs=None*, *purge=False*, ***kwargs*)

Remove a single package with pkg_delete

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.openbsdpkg.**upgrade**(*name=None*, *pkgs=None*, ***kwargs*)

Run a full package upgrade (`pkg_add -u`), or upgrade a specific package if `name` or `pkgs` is provided. `name` is ignored when `pkgs` is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7
```

salt.modules.openbsdpkg.**upgrade_available**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.openbsdpkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.7.319 salt.modules.openbsdrcctl_service.py

The rcctl service module for OpenBSD

salt.modules.openbsdrcctl_service.**available**(*name*)

Return True if the named service is available.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.openbsdrcctl_service.**disable**(*name*, ***kwargs*)

Disable the named service to not start at boot.

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.openbsdrcctl_service.**disabled**(*name*)

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.openbsdrcctl_service.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot.

flags

[None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

salt.modules.openbsdrcctl_service.**enabled**(*name*, ***kwargs*)

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.

name

Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

salt.modules.openbsdrcctl_service.**get_all**()

Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.openbsdrcctl_service.**get_disabled**()

Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdrcctl_service.**get_enabled**()

Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.openbsdrcctl_service.**missing**(*name*)

The inverse of service.available. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.openbsdrcctl_service.**reload_**(*name*)

Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.openbsdrcctl_service.**restart**(*name*)

Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.openbsdrcctl_service.**start**(*name*)

Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.openbsdrcctl_service.**status**(*name*, *sig=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.openbsdrcctl_service.**stop**(*name*)

Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.320 salt.modules.openbsdservice

The service module for OpenBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.openbsdservice.`**`available`**`(`*name*`)`

New in version 2014.7.0.

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.openbsdservice.`**`disabled`**`(`*name*`)`

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.openbsdservice.`**`enabled`**`(`*name*, ***kwargs*`)`

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.openbsdservice.`**`get_all`**`()`

New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdservice.`**`get_disabled`**`()`

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdservice.**get_enabled**()

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.openbsdservice.**missing**(*name*)

New in version 2014.7.0.

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.openbsdservice.**reload_**(*name*)

New in version 2014.7.0.

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.openbsdservice.**restart**(*name*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.openbsdservice.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.openbsdservice.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.openbsdservice.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.321 salt.modules.openscap

Module for OpenSCAP Management

salt.modules.openscap.**xccdf**(*params*)

Run `oscap xccdf` commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

CLI Example:

```
salt '*'  openscap.xccdf "eval --profile Default /usr/share/openscap/scap-
↪yast2sec-xccdf.xml"
```

26.7.322 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

maintainer
Jeffrey C. Ollie <jeff@ocjtech.us>

maturity
new

depends
platform
linux

salt.modules.openstack_config.**delete**(*filename*, *section*, *parameter*)

Delete a value from an OpenStack configuration file.
filename
The full path to the configuration file
section
The section from which to delete the parameter
parameter
The parameter to delete
CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql
↪connection
```

salt.modules.openstack_config.**get**(*filename*, *section*, *parameter*)

Get a value from an OpenStack configuration file.
filename
The full path to the configuration file

section
The section from which to search for the parameter
parameter
The parameter to return
CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.**set_**(*filename*, *section*, *parameter*, *value*)

Set a value in an OpenStack configuration file.
filename
The full path to the configuration file
section
The section in which the parameter will be set
parameter
The parameter to change
value
The value to set
CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection␣
↪foo
```

26.7.323 salt.modules.openstack_mng

Module for OpenStack Management

codeauthor
Konrad Mosoń <mosonkonrad@gmail.com>

maturity
new

depends
openstack-utils

platform
linux

salt.modules.openstack_mng.**restart_service**(*service_name*, *minimum_running_time=None*)

Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.**start_service**(*service_name*)

Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

salt.modules.openstack_mng.**stop_service**(*service_name*)

Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

26.7.324 salt.modules.openvswitch

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

codeauthor
Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.openvswitch.**bridge_create**(*br*, *may_exist=True*, *parent=None*, *vlan=None*)

Creates a new bridge.

Parameters

- **br** -- string bridge name
- **may_exist** -- bool if False - attempting to create a bridge that exists returns False.
- **parent** -- string name of the parent bridge (if the bridge shall be created as a fake bridge). If specified, vlan must also be specified.
- **versionadded:** (..) -- 3006.0:
- **vlan** -- int VLAN ID of the bridge (if the bridge shall be created as a fake bridge). If specified, parent must also be specified.
- **versionadded:** -- 3006.0:

Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_create br0
```

salt.modules.openvswitch.**bridge_delete**(*br*, *if_exists=True*)

Deletes bridge and all of its ports.

Parameters

- **br** -- A string - bridge name
- **if_exists** -- Bool, if False - attempting to delete a bridge that does not exist returns False.

Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_delete br0
```

salt.modules.openvswitch.**bridge_exists**(*br*)

Tests whether bridge exists as a real or fake bridge.

Returns

True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_exists br0
```

salt.modules.openvswitch.**bridge_list**()

Lists all existing real and fake bridges.

Returns

List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.bridge_list
```

salt.modules.openvswitch.**bridge_to_parent**(*br*)

New in version 3006.0.

Returns the parent bridge of a bridge.

Parameters

br -- string bridge name

Returns

Name of the parent bridge. This is the same as the bridge name if the bridge is not a fake bridge. If the bridge does not exist, False is returned.

CLI Example:

```
salt '*' openvswitch.bridge_to_parent br0
```

salt.modules.openvswitch.**bridge_to_vlan**(*br*)

New in version 3006.0.

Returns the VLAN ID of a bridge.

Parameters

br -- string bridge name

Returns

VLAN ID of the bridge. The VLAN ID is 0 if the bridge is not a fake bridge. If the bridge does not exist, False is returned.

CLI Example:

```
salt '*' openvswitch.bridge_to_parent br0
```

salt.modules.openvswitch.**db_get**(*table*, *record*, *column*, *if_exists=False*)

New in version 3006.0.

Gets a column's value for a specific record.

Parameters

- **table** -- string name of the database table
- **record** -- string identifier of the record
- **column** -- string name of the column
- **if_exists** -- boolean if True, it is not an error if the record does not exist.

Returns

The column's value.

CLI Example:

```
salt '*' openvswitch.db_get Port br0 vlan_mode
```

salt.modules.openvswitch.**db_set**(*table*, *record*, *column*, *value*, *if_exists=False*)

New in version 3006.0.

Sets a column's value for a specific record.

Parameters

- **table** -- string name of the database table
- **record** -- string identifier of the record
- **column** -- string name of the column
- **value** -- string the value to be set
- **if_exists** -- boolean if True, it is not an error if the record does not exist.

Returns

None on success and an error message on failure.

CLI Example:

```
salt '*' openvswitch.db_set Interface br0 mac 02:03:04:05:06:07
```

salt.modules.openvswitch.**interface_get_options**(*port*)

Port's interface's optional parameters.

Parameters

port -- A string - port name.

Returns

String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.interface_get_options tap0
```

salt.modules.openvswitch.**interface_get_type**(*port*)

Type of port's interface.

Parameters

port -- A string - port name.

Returns

String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.interface_get_type tap0
```

salt.modules.openvswitch.**port_add**(*br*, *port*, *may_exist=False*, *internal=False*)

Creates on bridge a new port named port.

Returns

True on success, else False.

Parameters

- **br** -- A string - bridge name
- **port** -- A string - port name
- **may_exist** -- Bool, if False - attempting to create a port that exists returns False.
- **internal** -- A boolean to create an internal interface if one does not exist.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_add br0 8080
```

salt.modules.openvswitch.**port_create_gre**(*br*, *port*, *id*, *remote*)

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10
```

salt.modules.openvswitch.**port_create_vlan**(*br*, *port*, *id*, *internal=False*)

Isolate VM traffic using VLANs.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_vlan br0 tap0 100
```

salt.modules.openvswitch.**port_create_vxlan**(*br*, *port*, *id*, *remote*, *dst_port=None*)

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst_port** -- An integer - port to use when creating tunnelport in the switch.

Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472
```

salt.modules.openvswitch.**port_get_tag**(*port*)

Lists tags of the port.

Parameters

port -- A string - port name.

Returns

List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_get_tag tap0
```

salt.modules.openvswitch.**port_list**(*br*)

Lists all of the ports within bridge.

Parameters

br -- A string - bridge name.

Returns

List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_list br0
```

salt.modules.openvswitch.**port_remove**(*br*, *port*, *if_exists=True*)

Deletes port.

Parameters

- **br** -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** -- A string - port name.
- **if_exists** -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

Returns

True on success, else False.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.port_remove br0 8080
```

26.7.325 salt.modules.opkg

Support for Opkg

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

New in version 2016.3.0.

Note: For version comparison support on opkg < 0.3.4, the `opkg-utils` package must be installed.

---

salt.modules.opkg.**available_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.**check_extra_requirements**(*pkgname*, *pkgver*)

Check if the installed package already has the given requirements. There's nothing do to here for nipkg.py, therefore it will always return True.

salt.modules.opkg.**del_repo**(*repo*, ***kwargs*)

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo repo
```

salt.modules.opkg.**file_dict**(**packages*, ***kwargs*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.**file_list**(**packages*, ***kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.**get_repo**(*repo*, ***kwargs*)

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo repo
```

salt.modules.opkg.**hold**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package in 'hold' state, meaning it will not be upgraded.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.opkg.**info_installed**(**names*, ***kwargs*)

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

Parameters

- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  Valid attributes are:

  arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

CLI Example:

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ...
↪attr=version,packager
```

salt.modules.opkg.**install**(*name=None*, *refresh=False*, *pkgs=None*, *sources=None*, *reinstall=False*, ***kwargs*)

Install the passed package, add refresh=True to update the opkg database.

name

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh

Whether or not to refresh the package database before installing.

version

Install a specific version of the package, e.g. 1.2.3~0ubuntu0. Ignored if "pkgs" or "sources" is passed.

Note: Remember that versions that contain a single . will be interpreted as numbers and must be double-quoted. For example, version `3006.10` will be rendered as `3006.1`. To pass `3006.10` you'll need to use double-quotes. `version="'3006.10'"`

New in version 2017.7.0.

reinstall

[False] Specifying reinstall=True will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

pkgs

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

sources

A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar":
↪"salt://bar.deb"}]'
```

install_recommends

Whether to install the packages marked as recommended. Default is True.

only_upgrade

Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.opkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.opkg.`**`list_repos`**(***kwargs*)

Lists all repos on `/etc/opkg/*.conf`

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.**list_upgrades**(*refresh=True*, ***kwargs*)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.**mod_repo**(*repo*, ***kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:

repo
: alias by which opkg refers to the repo.

uri
: the URI to the repo.

compressed
: defines (True or False) if the index file is compressed

enabled
: enable or disable (True or False) repository but do not remove if disabled.

refresh
: enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

salt.modules.opkg.**owner**(**paths*, ***kwargs*)

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version <salt.modules.opkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

salt.modules.opkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported by opkg, this function is identical to *pkg.remove*.

name
: The name of the package to be deleted.

Multiple Package Options:

pkgs
: A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.opkg.**refresh_db**(*failhard=False*, ***kwargs*)

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- `True`: Database updated successfully
- `False`: Problem updating database

failhard

If False, return results of failed lines as `False` for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.opkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove packages using `opkg remove`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

remove_dependencies

Remove package and all dependencies

New in version 2019.2.0.

auto_remove_deps

Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_
↪remove_deps=True
```

salt.modules.opkg.**unhold**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package current in 'hold' state to install state, meaning it will be upgraded.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.opkg.**upgrade**(*refresh=True*, ***kwargs*)

Upgrades all packages via `opkg upgrade`

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.opkg.**upgrade_available**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.opkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.opkg.**version_clean**(*version*)

Clean the version string removing extra data. There's nothing do to here for nipkg.py, therefore it will always return the given version.

salt.modules.opkg.**version_cmp**(*pkg1*, *pkg2*, *ignore_epoch=False*, ***kwargs*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch

[False] Set to `True` to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

26.7.326 salt.modules.opsgenie

Module for sending data to OpsGenie

New in version 2018.3.0.

configuration
This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
        name: event.reactor
        api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
        reason: {{ data['data']['reason'] }}
        action_type: Create
```

salt.modules.opsgenie.**post_data**(*api_key=None*, *name='OpsGenie Execution Module'*, *reason=None*, *action_type=None*)

Post data to OpsGenie. It's designed for Salt's Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:
api_key
It's the API Key you've copied while adding integration in OpsGenie.
reason
It will be used as alert's default message in OpsGenie.
action_type
OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.
Optional parameters:
name
It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in this case.

26.7.327 salt.modules.oracle

Oracle DataBase connection module

maintainer
Vladimir Bormotov <bormotov@gmail.com>

maturity
new

depends
cx_Oracle

platform
all

configuration
module provide connections for multiple Oracle DB instances.

OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar

```
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
    user/password@host[:port]/sid[ servicename as
↪{sysdba|sysoper}]
      optional keyword servicename will determine whether it is
↪a sid or service_name
    <db>:
      uri: .....
```

salt.modules.oracle.**client_version**()

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

salt.modules.oracle.**run_query**(*db*, *query*)

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.**show_dbs**(**dbs*)

Show databases configuration from pillar. Filter by **args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.**show_env**()

Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'

salt.modules.oracle.**show_pillar**(*item=None*)

Show Pillar segment oracle.* and subitem with notation "item:subitem"

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

salt.modules.oracle.**version**(**dbs*)

Server Version (select banner from v$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

26.7.328 salt.modules.osquery

Support for OSQuery - https://osquery.io.

New in version 2015.8.0.

salt.modules.osquery.**acpi_tables**(*attrs=None, where=None*)

Return acpi_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

salt.modules.osquery.**alf**(*attrs=None, where=None*)

Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

salt.modules.osquery.**alf_exceptions**(*attrs=None, where=None*)

Return alf_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

salt.modules.osquery.**alf_explicit_auths**(*attrs=None, where=None*)

Return alf_explicit_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

salt.modules.osquery.**alf_services**(*attrs=None, where=None*)

Return alf_services information from osquery

CLI Example:

```
salt '*' osquery.alf_services
```

salt.modules.osquery.**apps**(*attrs=None*, *where=None*)

Return apps information from osquery

CLI Example:

```
salt '*' osquery.apps
```

salt.modules.osquery.**apt_sources**(*attrs=None*, *where=None*)

Return apt_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

salt.modules.osquery.**arp_cache**(*attrs=None*, *where=None*)

Return arp_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

salt.modules.osquery.**block_devices**(*attrs=None*, *where=None*)

Return block_devices information from osquery

CLI Example:

```
salt '*' osquery.block_devices
```

salt.modules.osquery.**certificates**(*attrs=None*, *where=None*)

Return certificates information from osquery

CLI Example:

```
salt '*' osquery.certificates
```

salt.modules.osquery.**chrome_extensions**(*attrs=None*, *where=None*)

Return chrome_extensions information from osquery

CLI Example:

```
salt '*' osquery.chrome_extensions
```

salt.modules.osquery.**cpuid**(*attrs=None*, *where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.cpuid
```

salt.modules.osquery.**crontab**(*attrs=None*, *where=None*)

Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

salt.modules.osquery.**deb_packages**(*attrs=None*, *where=None*)

Return deb_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

salt.modules.osquery.**etc_hosts**(*attrs=None*, *where=None*)

Return etc_hosts information from osquery

CLI Example:

```
salt '*' osquery.etc_hosts
```

salt.modules.osquery.**etc_services**(*attrs=None*, *where=None*)

Return etc_services information from osquery

CLI Example:

```
salt '*' osquery.etc_services
```

salt.modules.osquery.**file_**(*attrs=None*, *where=None*)

Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

salt.modules.osquery.**file_changes**(*attrs=None*, *where=None*)

Return file_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

salt.modules.osquery.**firefox_addons**(*attrs=None*, *where=None*)

Return firefox_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

salt.modules.osquery.**groups**(*attrs=None*, *where=None*)

Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

salt.modules.osquery.**hardware_events**(*attrs=None*, *where=None*)

Return hardware_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

salt.modules.osquery.**hash_**(*attrs=None*, *where=None*)

Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

salt.modules.osquery.**homebrew_packages**(*attrs=None*, *where=None*)

Return homebrew_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

salt.modules.osquery.**interface_addresses**(*attrs=None*, *where=None*)

Return interface_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

salt.modules.osquery.**interface_details**(*attrs=None*, *where=None*)

Return interface_details information from osquery

CLI Example:

```
salt '*' osquery.interface_details
```

salt.modules.osquery.**iokit_devicetree**(*attrs=None*, *where=None*)

Return iokit_devicetree information from osquery

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

salt.modules.osquery.**iokit_registry**(*attrs=None*, *where=None*)

Return iokit_registry information from osquery

CLI Example:

```
salt '*' osquery.iokit_registry
```

salt.modules.osquery.**kernel_extensions**(*attrs=None*, *where=None*)

Return kernel_extensions information from osquery

CLI Example:

```
salt '*' osquery.kernel_extensions
```

salt.modules.osquery.**kernel_info**(*attrs=None*, *where=None*)

Return kernel_info information from osquery

CLI Example:

```
salt '*' osquery.kernel_info
```

salt.modules.osquery.**kernel_integrity**(*attrs=None*, *where=None*)

Return kernel_integrity information from osquery

CLI Example:

```
salt '*' osquery.kernel_integrity
```

salt.modules.osquery.**kernel_modules**(*attrs=None*, *where=None*)

Return kernel_modules information from osquery

CLI Example:

```
salt '*' osquery.kernel_modules
```

salt.modules.osquery.**keychain_items**(*attrs=None*, *where=None*)

Return keychain_items information from osquery

CLI Example:

```
salt '*' osquery.keychain_items
```

salt.modules.osquery.**last**(*attrs=None*, *where=None*)

Return last information from osquery

CLI Example:

```
salt '*' osquery.last
```

salt.modules.osquery.**launchd**(*attrs=None*, *where=None*)

Return launchd information from osquery

CLI Example:

```
salt '*' osquery.launchd
```

salt.modules.osquery.**listening_ports**(*attrs=None*, *where=None*)

Return listening_ports information from osquery

CLI Example:

```
salt '*' osquery.listening_ports
```

salt.modules.osquery.**logged_in_users**(*attrs=None*, *where=None*)

Return logged_in_users information from osquery

CLI Example:

```
salt '*' osquery.logged_in_users
```

salt.modules.osquery.**memory_map**(*attrs=None*, *where=None*)

Return memory_map information from osquery

CLI Example:

```
salt '*' osquery.memory_map
```

salt.modules.osquery.**mounts**(*attrs=None*, *where=None*)

Return mounts information from osquery

CLI Example:

```
salt '*' osquery.mounts
```

salt.modules.osquery.**nfs_shares**(*attrs=None*, *where=None*)

Return nfs_shares information from osquery

CLI Example:

```
salt '*' osquery.nfs_shares
```

salt.modules.osquery.**nvram**(*attrs=None*, *where=None*)

Return nvram information from osquery

CLI Example:

```
salt '*' osquery.nvram
```

salt.modules.osquery.**os_version**(*attrs=None*, *where=None*)

Return os_version information from osquery

CLI Example:

```
salt '*' osquery.os_version
```

salt.modules.osquery.**osquery_extensions**(*attrs=None*, *where=None*)

Return osquery_extensions information from osquery

CLI Example:

```
salt '*' osquery.osquery_extensions
```

salt.modules.osquery.**osquery_flags**(*attrs=None*, *where=None*)

Return osquery_flags information from osquery

CLI Example:

```
salt '*' osquery.osquery_flags
```

salt.modules.osquery.**osquery_info**(*attrs=None*, *where=None*)

Return osquery_info information from osquery

CLI Example:

```
salt '*' osquery.osquery_info
```

salt.modules.osquery.**osquery_registry**(*attrs=None*, *where=None*)

Return osquery_registry information from osquery

CLI Example:

```
salt '*' osquery.osquery_registry
```

salt.modules.osquery.**passwd_changes**(*attrs=None*, *where=None*)

Return passwd_changes information from osquery

CLI Example:

```
salt '*' osquery.passwd_changes
```

salt.modules.osquery.**pci_devices**(*attrs=None*, *where=None*)

Return pci_devices information from osquery

CLI Example:

```
salt '*' osquery.pci_devices
```

salt.modules.osquery.**preferences**(*attrs=None*, *where=None*)

Return preferences information from osquery

CLI Example:

```
salt '*' osquery.preferences
```

salt.modules.osquery.**process_envs**(*attrs=None*, *where=None*)

Return process_envs information from osquery

CLI Example:

```
salt '*' osquery.process_envs
```

salt.modules.osquery.**process_memory_map**(*attrs=None*, *where=None*)

Return process_memory_map information from osquery

CLI Example:

```
salt '*' osquery.process_memory_map
```

salt.modules.osquery.**process_open_files**(*attrs=None*, *where=None*)

Return process_open_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

salt.modules.osquery.**process_open_sockets**(*attrs=None*, *where=None*)

Return process_open_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

salt.modules.osquery.**processes**(*attrs=None*, *where=None*)

Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

salt.modules.osquery.**quarantine**(*attrs=None*, *where=None*)

Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

salt.modules.osquery.**query**(*sql=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

salt.modules.osquery.**routes**(*attrs=None*, *where=None*)

Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

salt.modules.osquery.**rpm_packages**(*attrs=None*, *where=None*)

Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

salt.modules.osquery.**safari_extensions**(*attrs=None*, *where=None*)

Return safari_extensions information from osquery

CLI Example:

```
salt '*' osquery.safari_extensions
```

salt.modules.osquery.**shared_memory**(*attrs=None*, *where=None*)

Return shared_memory information from osquery

CLI Example:

```
salt '*' osquery.shared_memory
```

salt.modules.osquery.**shell_history**(*attrs=None*, *where=None*)

Return shell_history information from osquery

CLI Example:

```
salt '*' osquery.shell_history
```

salt.modules.osquery.**smbios_tables**(*attrs=None*, *where=None*)

Return smbios_tables information from osquery

CLI Example:

```
salt '*' osquery.smbios_tables
```

salt.modules.osquery.**startup_items**(*attrs=None*, *where=None*)

Return startup_items information from osquery

CLI Example:

```
salt '*' osquery.startup_items
```

salt.modules.osquery.**suid_bin**(*attrs=None*, *where=None*)

Return suid_bin information from osquery

CLI Example:

```
salt '*' osquery.suid_bin
```

salt.modules.osquery.**system_controls**(*attrs=None*, *where=None*)

Return system_controls information from osquery

CLI Example:

```
salt '*' osquery.system_controls
```

salt.modules.osquery.**time_**(*attrs=None*)

Return time information from osquery

CLI Example:

```
salt '*' osquery.time
```

salt.modules.osquery.**usb_devices**(*attrs=None*, *where=None*)

Return usb_devices information from osquery

CLI Example:

```
salt '*' osquery.usb_devices
```

salt.modules.osquery.**users**(*attrs=None*, *where=None*)

Return users information from osquery

CLI Example:

```
salt '*' osquery.users
```

salt.modules.osquery.**version**()

Return version of osquery

CLI Example:

```
salt '*' osquery.version
```

salt.modules.osquery.**xattr_where_from**(*attrs=None*, *where=None*)

Return xattr_where_from information from osquery

CLI Example:

```
salt '*' osquery.xattr_where_from
```

salt.modules.osquery.**xprotect_entries**(*attrs=None*, *where=None*)

Return xprotect_entries information from osquery

CLI Example:

```
salt '*' osquery.xprotect_entries
```

salt.modules.osquery.**xprotect_reports**(*attrs=None*, *where=None*)

Return xprotect_reports information from osquery

CLI Example:

```
salt '*' osquery.xprotect_reports
```

26.7.329 salt.modules.out

Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:

```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

salt.modules.out.**html_format**(*data*, *out='nested'*, *opts=None*, ***kwargs*)

Return the formatted string as HTML.

data
: The JSON serializable object.

out: **nested**
: The name of the output to use to transform the data. Default: `nested`.

opts
: Dictionary of configuration options. Default: `__opts__`.

kwargs
: Arguments to sent to the outputter module.

CLI Example:

```
salt '*' out.html_format "{'key': 'value'}" out=yaml
```

salt.modules.out.**out_format**(*data*, *out='nested'*, *opts=None*, ***kwargs*)

Return the formatted outputter string for the Python object.

data
: The JSON serializable object.

out: **nested**
: The name of the output to use to transform the data. Default: `nested`.

opts
: Dictionary of configuration options. Default: `__opts__`.

kwargs
Arguments to sent to the outputter module.
CLI Example:

```
salt '*' out.out_format "{'key': 'value'}"
```

salt.modules.out.**string_format**(*data*, *out='nested'*, *opts=None*, ***kwargs*)

Return the outputter formatted string, removing the ANSI escape sequences.
data
The JSON serializable object.
out: **nested**
The name of the output to use to transform the data. Default: `nested`.
opts
Dictionary of configuration options. Default: `__opts__`.
kwargs
Arguments to sent to the outputter module.
CLI Example:

```
salt '*' out.string_format "{'key': 'value'}" out=table
```

26.7.330 salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

---

salt.modules.pacmanpkg.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.pacmanpkg.**file_dict**(**packages*, ***kwargs*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.**file_list**(**packages*, ***kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.**group_diff**(*name*)

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacmanpkg.**group_info**(*name*)

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacmanpkg.**group_list**()

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.**install**(*name=None*, *refresh=False*, *sysupgrade=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (`pacman -S`) the specified packag(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

name

The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh

Whether or not to refresh the package database before installing.

sysupgrade
Whether or not to upgrade the system packages before installing. If refresh is set to `True` but sysupgrade is not specified, `-u` will be applied

Multiple Package Installation Options:

pkgs
A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

sources
A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install                    sources='[{"foo": "salt://foo.
↪pkg.tar.xz"},                  {"bar": "salt://bar.pkg.tar.xz"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pacmanpkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacmanpkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pacmanpkg.`**`list_repo_pkgs`**(**args*, ***kwargs*)

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a *`pkg.installed`* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level,

and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

fromrepo
: [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo
: [False] When `True`, the return data for each package will be organized by repository.

refresh
: [False] When `True`, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.pacmanpkg.`**`list_upgrades`**(*refresh=False*, *root=None*, ***kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pacmanpkg.`**`owner`**(**paths*, ***kwargs*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like *`pkg.version`*, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

salt.modules.pacmanpkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `pacman -Rsc`

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pacmanpkg.**refresh_db**(*root=None*, ***kwargs*)

Just run a `pacman -Sy`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pacmanpkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `pacman -R`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pacmanpkg.**upgrade**(*refresh=False*, *root=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a pacman -Syu

refresh

Whether or not to refresh the package database before installing.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.pacmanpkg.**upgrade_available**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.pacmanpkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.7.331 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration

This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

salt.modules.pagerduty.**create_event**(*service_key=None*, *description=None*, *details=None*, *incident_key=None*, *profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>
↪          profile=my-pagerduty-account
```

The following parameters are required:

service_key
: This key can be found by using pagerduty.list_services.

description
: This is a short description of the event.

details
: This can be a more detailed description of the event.

profile
: This refers to the configuration profile to use to connect to the PagerDuty service.

salt.modules.pagerduty.**list_escalation_policies**(*profile=None*, *api_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-
↪account
```

salt.modules.pagerduty.**list_incidents**(*profile=None*, *api_key=None*)

List incidents belonging to this account

CLI Example:

```
salt myminion pagerduty.list_incidents my-pagerduty-account
```

salt.modules.pagerduty.**list_maintenance_windows**(*profile=None*, *api_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-
↪account
```

salt.modules.pagerduty.**list_policies**(*profile=None*, *api_key=None*)

List escalation policies belonging to this account

CLI Example:

```
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

salt.modules.pagerduty.**list_schedules**(*profile=None*, *api_key=None*)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.list_schedules my-pagerduty-account
```

salt.modules.pagerduty.**list_services**(*profile=None*, *api_key=None*)

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.list_services my-pagerduty-account
```

salt.modules.pagerduty.**list_users**(*profile=None*, *api_key=None*)

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.list_users my-pagerduty-account
```

salt.modules.pagerduty.**list_windows**(*profile=None*, *api_key=None*)

List maintenance windows belonging to this account

CLI Example:

```
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-account
```

26.7.332 salt.modules.pagerduty_util

Module for manageing PagerDuty resource

configuration

This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
pagerduty:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

salt.modules.pagerduty_util.**create_or_update_resource**(*resource_name*, *identifier_fields*, *data*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavor is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

Examples

create_or_update_resource("user", ["id","name","email"]) create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)

salt.modules.pagerduty_util.**delete_resource**(*resource_name*, *key*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

delete any pagerduty resource

Helper method for absent()

Example

delete_resource("users", key, ["id","name","email"]) # delete by id or name or email

salt.modules.pagerduty_util.**get_escalation_policies**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List escalation_policies belonging to this account

CLI Example:

```
salt myminion pagerduty.get_escalation_policies
```

salt.modules.pagerduty_util.**get_resource**(*resource_name*, *key*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:

get_resource('users', key, ['name', 'email'], ...)

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

salt.modules.pagerduty_util.**get_schedules**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List schedules belonging to this account

CLI Example:

```
salt myminion pagerduty.get_schedules
```

salt.modules.pagerduty_util.**get_services**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List services belonging to this account

CLI Example:

```
salt myminion pagerduty.get_services
```

salt.modules.pagerduty_util.**get_users**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List users belonging to this account

CLI Example:

```
salt myminion pagerduty.get_users
```

salt.modules.pagerduty_util.**resource_absent**(*resource*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

Example

resource_absent("users", ["id","name","email"])

salt.modules.pagerduty_util.**resource_present**(*resource*, *identifier_fields*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

Example

resource_present("users", ["id","name","email"])

26.7.333 salt.modules.pam

Support for pam

salt.modules.pam.**read_file**(*file_name*)

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

26.7.334 salt.modules.panos

Module to provide Palo Alto compatibility to Salt

codeauthor
: Spencer Ervin <spencer_ervin@hotmail.com>

maturity
: new

depends
: none

platform
: unix

New in version 2018.3.0.

Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

Palo Alto Proxy Module

About

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

`salt.modules.panos.`**`add_config_lock`**`()`

Prevent other users from changing configuration until the lock is released.

CLI Example:

```
salt '*' panos.add_config_lock
```

`salt.modules.panos.`**`check_antivirus`**`()`

Get anti-virus information from PaloAlto Networks server

CLI Example:

```
salt '*' panos.check_antivirus
```

`salt.modules.panos.`**`check_software`**`()`

Get software information from PaloAlto Networks server.

CLI Example:

```
salt '*' panos.check_software
```

`salt.modules.panos.`**`clear_commit_tasks`**`()`

Clear all commit tasks.

CLI Example:

```
salt '*' panos.clear_commit_tasks
```

`salt.modules.panos.`**`commit`**`()`

Commits the candidate configuration to the running configuration.

CLI Example:

```
salt '*' panos.commit
```

`salt.modules.panos.`**`deactivate_license`**`(`*key_name=None*`)`

Deactivates an installed license. Required version 7.0.0 or greater.

key_name(str): The file name of the license key installed.

CLI Example:

```
salt '*' panos.deactivate_license key_name=License_File_Name.key
```

salt.modules.panos.**delete_license**(*key_name=None*)

Remove license keys on disk.

key_name(str): The file name of the license key to be deleted.

CLI Example:

```
salt '*' panos.delete_license key_name=License_File_Name.key
```

salt.modules.panos.**download_antivirus**()

Download the most recent anti-virus package.

CLI Example:

```
salt '*' panos.download_antivirus
```

salt.modules.panos.**download_software_file**(*filename=None*, *synch=False*)

Download software packages by filename.

Parameters

- **filename** (*str*) -- The filename of the PANOS file to download.
- **synch** (*bool*) -- If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True
```

salt.modules.panos.**download_software_version**(*version=None*, *synch=False*)

Download software packages by version number.

Parameters

- **version** (*str*) -- The version of the PANOS file to download.
- **synch** (*bool*) -- If true then the file will synch to the peer unit.

CLI Example:

```
salt '*' panos.download_software_version 8.0.0
salt '*' panos.download_software_version 8.0.0 True
```

salt.modules.panos.**fetch_license**(*auth_code=None*)

Get new license(s) using from the Palo Alto Network Server.

auth_code

The license authorization code.

CLI Example:

```
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar
```

salt.modules.panos.**get_address**(*address=None*, *vsys='1'*)

Get the candidate configuration for the specified get_address object. This will not return address objects that are marked as pre-defined objects.

address(str): The name of the address object.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```

salt.modules.panos.**get_address_group**(*addressgroup=None*, *vsys='1'*)

Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

addressgroup(str): The name of the address group.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

salt.modules.panos.**get_admins_active**()

Show active administrators.

CLI Example:

```
salt '*' panos.get_admins_active
```

salt.modules.panos.**get_admins_all**()

Show all administrators.

CLI Example:

```
salt '*' panos.get_admins_all
```

salt.modules.panos.**get_antivirus_info**()

Show information about available anti-virus packages.

CLI Example:

```
salt '*' panos.get_antivirus_info
```

salt.modules.panos.**get_arp**()

Show ARP information.

CLI Example:

```
salt '*' panos.get_arp
```

salt.modules.panos.**get_cli_idle_timeout**()

Show timeout information for this administrative session.

CLI Example:

```
salt '*' panos.get_cli_idle_timeout
```

salt.modules.panos.**get_cli_permissions**()

Show cli administrative permissions.

CLI Example:

```
salt '*' panos.get_cli_permissions
```

salt.modules.panos.**get_disk_usage**()

Report filesystem disk space usage.

CLI Example:

```
salt '*' panos.get_disk_usage
```

salt.modules.panos.**get_dns_server_config**()

Get the DNS server configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_dns_server_config
```

salt.modules.panos.**get_domain_config**()

Get the domain name configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_domain_config
```

salt.modules.panos.**get_dos_blocks**()

Show the DoS block-ip table.

CLI Example:

```
salt '*' panos.get_dos_blocks
```

salt.modules.panos.**get_fqdn_cache**()

Print FQDNs used in rules and their IPs.

CLI Example:

```
salt '*' panos.get_fqdn_cache
```

salt.modules.panos.**get_ha_config**()

Get the high availability configuration.

CLI Example:

```
salt '*' panos.get_ha_config
```

salt.modules.panos.**get_ha_link**()

Show high-availability link-monitoring state.

CLI Example:

```
salt '*' panos.get_ha_link
```

salt.modules.panos.**get_ha_path**()

Show high-availability path-monitoring state.

CLI Example:

```
salt '*' panos.get_ha_path
```

salt.modules.panos.**get_ha_state**()

Show high-availability state information.

CLI Example:

```
salt '*' panos.get_ha_state
```

salt.modules.panos.**get_ha_transitions**()

Show high-availability transition statistic information.

CLI Example:

```
salt '*' panos.get_ha_transitions
```

salt.modules.panos.**get_hostname**()

Get the hostname of the device.

CLI Example:

```
salt '*' panos.get_hostname
```

salt.modules.panos.**get_interface_counters**(*name='all'*)

Get the counter statistics for interfaces.

Parameters

name (*str*) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

salt.modules.panos.**get_interfaces**(*name='all'*)

Show interface information.

Parameters

name (*str*) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:

```
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

salt.modules.panos.**get_job**(*jid=None*)

List all a single job by ID.

jid

The ID of the job to retrieve.

CLI Example:

```
salt '*' panos.get_job jid=15
```

salt.modules.panos.**get_jobs**(*state='all'*)

List all jobs on the device.

state
The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:

```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

salt.modules.panos.**get_lacp**()

Show LACP state.

CLI Example:

```
salt '*' panos.get_lacp
```

salt.modules.panos.**get_license_info**()

Show information about owned license(s).

CLI Example:

```
salt '*' panos.get_license_info
```

salt.modules.panos.**get_license_tokens**()

Show license token files for manual license deactivation.

CLI Example:

```
salt '*' panos.get_license_tokens
```

salt.modules.panos.**get_lldp_config**()

Show lldp config for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_config
```

salt.modules.panos.**get_lldp_counters**()

Show lldp counters for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_counters
```

salt.modules.panos.**get_lldp_local**()

Show lldp local info for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_local
```

salt.modules.panos.**get_lldp_neighbors**()

Show lldp neighbors info for interfaces.

CLI Example:

```
salt '*' panos.get_lldp_neighbors
```

salt.modules.panos.**get_local_admins**()

Show all local administrator accounts.

CLI Example:

```
salt '*' panos.get_local_admins
```

salt.modules.panos.**get_logdb_quota**()

Report the logdb quotas.

CLI Example:

```
salt '*' panos.get_logdb_quota
```

salt.modules.panos.**get_master_key**()

Get the master key properties.

CLI Example:

```
salt '*' panos.get_master_key
```

salt.modules.panos.**get_ntp_config**()

Get the NTP configuration from the candidate configuration.

CLI Example:

```
salt '*' panos.get_ntp_config
```

salt.modules.panos.**get_ntp_servers**()

Get list of configured NTP servers.

CLI Example:

```
salt '*' panos.get_ntp_servers
```

salt.modules.panos.**get_operational_mode**()

Show device operational mode setting.

CLI Example:

```
salt '*' panos.get_operational_mode
```

salt.modules.panos.**get_panorama_status**()

Show panorama connection status.

CLI Example:

```
salt '*' panos.get_panorama_status
```

salt.modules.panos.**get_permitted_ips**()

Get the IP addresses that are permitted to establish management connections to the device.

CLI Example:

```
salt '*' panos.get_permitted_ips
```

salt.modules.panos.**get_platform**()

Get the platform model information and limitations.

CLI Example:

```
salt '*' panos.get_platform
```

salt.modules.panos.**get_predefined_application**(*application=None*)

Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.

application(str): The name of the pre-defined application object.

CLI Example:

```
salt '*' panos.get_predefined_application saltstack
```

salt.modules.panos.**get_security_rule**(*rulename=None*, *vsys='1'*)

Get the candidate configuration for the specified security rule.

rulename(str): The name of the security rule.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

salt.modules.panos.**get_service**(*service=None*, *vsys='1'*)

Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

service(str): The name of the service object.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

salt.modules.panos.**get_service_group**(*servicegroup=None*, *vsys='1'*)

Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

servicegroup(str): The name of the service group.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

salt.modules.panos.**get_session_info**()

Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

salt.modules.panos.**get_snmp_config**()

Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```

salt.modules.panos.**get_software_info**()

Show information about available software packages.

CLI Example:

```
salt '*' panos.get_software_info
```

salt.modules.panos.**get_system_date_time**()

Get the system date/time.

CLI Example:

```
salt '*' panos.get_system_date_time
```

salt.modules.panos.**get_system_files**()

List important files in the system.

CLI Example:

```
salt '*' panos.get_system_files
```

salt.modules.panos.**get_system_info**()

Get the system information.

CLI Example:

```
salt '*' panos.get_system_info
```

salt.modules.panos.**get_system_services**()

Show system services.

CLI Example:

```
salt '*' panos.get_system_services
```

salt.modules.panos.**get_system_state**(*mask=None*)

Show the system state variables.

mask

Filters by a subtree or a wildcard.

CLI Example:

```
salt '*' panos.get_system_state
salt '*' panos.get_system_state mask=cfg.ha.config.enabled
salt '*' panos.get_system_state mask=cfg.ha.*
```

salt.modules.panos.**get_uncommitted_changes**()

Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.

CLI Example:

```
salt '*' panos.get_uncommitted_changes
```

salt.modules.panos.**get_users_config**()

Get the local administrative user account configuration.

CLI Example:

```
salt '*' panos.get_users_config
```

salt.modules.panos.**get_vlans**()

Show all VLAN information.

CLI Example:

```
salt '*' panos.get_vlans
```

salt.modules.panos.**get_xpath**(*xpath=''*)

Retrieve a specified xpath from the candidate configuration.

xpath(str): The specified xpath in the candidate configuration.

CLI Example:

```
salt '*' panos.get_xpath /config/shared/service
```

salt.modules.panos.**get_zone**(*zone=''*, *vsys='1'*)

Get the candidate configuration for the specified zone.

zone(str): The name of the zone.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_zone trust
salt '*' panos.get_zone trust 2
```

salt.modules.panos.**get_zones**(*vsys='1'*)

Get all the zones in the candidate configuration.

vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_zones
salt '*' panos.get_zones 2
```

salt.modules.panos.**install_antivirus**(*version=None*, *latest=False*, *synch=False*, *skip_commit=False*)

Install anti-virus packages.

Parameters

- **version** (*str*) -- The version of the PANOS file to install.
- **latest** (*bool*) -- If true, the latest anti-virus file will be installed. The specified version option will be ignored.

- **synch** (*bool*) -- If true, the anti-virus will synch to the peer unit.
- **skip_commit** (*bool*) -- If true, the install will skip committing to the device.

CLI Example:

```
salt '*' panos.install_antivirus 8.0.0
```

salt.modules.panos.**install_license**()

Install the license key(s).

CLI Example:

```
salt '*' panos.install_license
```

salt.modules.panos.**install_software**(*version=None*)

Upgrade to a software package by version.

Parameters

version (*str*) -- The version of the PANOS file to install.

CLI Example:

```
salt '*' panos.install_license 8.0.0
```

salt.modules.panos.**reboot**()

Reboot a running system.

CLI Example:

```
salt '*' panos.reboot
```

salt.modules.panos.**refresh_fqdn_cache**(*force=False*)

Force refreshes all FQDNs used in rules.

force

Forces all fqdn refresh

CLI Example:

```
salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True
```

salt.modules.panos.**remove_config_lock**()

Release config lock previously held.

CLI Example:

```
salt '*' panos.remove_config_lock
```

salt.modules.panos.**resolve_address**(*address=None, vsys=None*)

Resolve address to ip address. Required version 7.0.0 or greater.

address

Address name you want to resolve.

vsys

The vsys name.

CLI Example:

```
salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2
```

salt.modules.panos.**save_device_config**(*filename=None*)

Save device configuration to a named file.

filename

The filename to save the configuration to.

CLI Example:

```
salt '*' panos.save_device_config foo.xml
```

salt.modules.panos.**save_device_state**()

Save files needed to restore device to local disk.

CLI Example:

```
salt '*' panos.save_device_state
```

salt.modules.panos.**set_authentication_profile**(*profile=None*, *deploy=False*)

Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **profile** (*str*) -- The name of the authentication profile to set.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True
```

salt.modules.panos.**set_hostname**(*hostname=None*, *deploy=False*)

Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **hostname** (*str*) -- The hostname to set
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_hostname newhostname
salt '*' panos.set_hostname newhostname deploy=True
```

salt.modules.panos.**set_management_http**(*enabled=True*, *deploy=False*)

Enables or disables the HTTP management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_http
salt '*' panos.set_management_http enabled=False deploy=True
```

salt.modules.panos.**set_management_https**(*enabled=True*, *deploy=False*)

Enables or disables the HTTPS management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_https
salt '*' panos.set_management_https enabled=False deploy=True
```

salt.modules.panos.**set_management_icmp**(*enabled=True*, *deploy=False*)

Enables or disables the ICMP management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_icmp
salt '*' panos.set_management_icmp enabled=False deploy=True
```

salt.modules.panos.**set_management_ocsp**(*enabled=True*, *deploy=False*)

Enables or disables the HTTP OCSP management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ocsp
salt '*' panos.set_management_ocsp enabled=False deploy=True
```

salt.modules.panos.**set_management_snmp**(*enabled=True*, *deploy=False*)

Enables or disables the SNMP management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

salt.modules.panos.**set_management_ssh**(*enabled=True*, *deploy=False*)

Enables or disables the SSH management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.

- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

salt.modules.panos.**set_management_telnet**(*enabled=True*, *deploy=False*)

Enables or disables the Telnet management service on the device.

CLI Example:

Parameters

- **enabled** (*bool*) -- If true the service will be enabled. If false the service will be disabled.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

salt.modules.panos.**set_ntp_authentication**(*target=None*, *authentication_type=None*, *key_id=None*, *authentication_key=None*, *algorithm=None*, *deploy=False*)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **target** (*str*) -- Determines the target of the authentication. Valid options are primary, secondary, or both.
- **authentication_type** (*str*) -- The authentication type to be used. Valid options are symmetric, autokey, and none.
- **key_id** (*int*) -- The NTP authentication key ID.
- **authentication_key** (*str*) -- The authentication key.
- **algorithm** (*str*) -- The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
salt '*' ntp.set_authentication target=both authentication_type=symmetric
↪key_id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric
↪key_id=15 authentication_key=mykey algorithm=md5 deploy=True
```

salt.modules.panos.**set_ntp_servers**(*primary_server=None*, *secondary_server=None*, *deploy=False*)

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **primary_server** (*str*) -- The primary NTP server IP address or FQDN.
- **secondary_server** (*str*) -- The secondary NTP server IP address or FQDN.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.
↪pool.ntp.org
salt '*' ntp.ser_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

salt.modules.panos.**set_permitted_ip**(*address=None*, *deploy=False*)

Add an IPv4 address or network to the permitted IP list.

CLI Example:

Parameters

- **address** (*str*) -- The IPv4 address or network to allow access to add to the Palo Alto device.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

salt.modules.panos.**set_timezone**(*tz=None*, *deploy=False*)

Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **tz** (*str*) -- The name of the timezone to set.
- **deploy** (*bool*) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```

salt.modules.panos.**shutdown**()

Shutdown a running system.

CLI Example:

```
salt '*' panos.shutdown
```

salt.modules.panos.**test_fib_route**(*ip=None*, *vr='vr1'*)

Perform a route lookup within active route table (fib).

ip (str): The destination IP address to test.

vr (str): The name of the virtual router to test.

CLI Example:

```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```

salt.modules.panos.**test_security_policy**(*sourcezone=None*, *destinationzone=None*, *source=None*, *destination=None*, *protocol=None*, *port=None*, *application=None*, *category=None*, *vsys='1'*, *allrules=False*)

Checks which security policy as connection will match on the device.

sourcezone (str): The source zone matched against the connection.

destinationzone (str): The destination zone matched against the connection.

source (str): The source address. This must be a single IP address.

destination (str): The destination address. This must be a single IP address.

protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.

port (int): The port number for the connection.

application (str): The application that should be matched.

category (str): The category that should be matched.

vsys (int): The numerical representation of the VSYS ID.

allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust
 ↪destinationzone=untrust protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust
 ↪destinationzone=untrust protocol=6 port=22 vsys=2
```

`salt.modules.panos.`**`unlock_admin`**(*username=None*)

Unlocks a locked administrator account.

username

Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```

26.7.335 salt.modules.parallels

Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

This module requires the prlctl binary to be installed to run most functions. To run parallels.prlsrvctl, the prlsrvctl binary is required.

What has not been implemented yet can be accessed through `parallels.prlctl` and `parallels.prlsrvctl` (note the preceding double dash `--` as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png'
 ↪runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

`salt.modules.parallels.`**`clone`**(*name*, *new_name*, *linked=False*, *template=False*, *runas=None*)

Clone a VM

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **new_name** (*str*) -- Name of the new VM
- **linked** (*bool*) -- Create a linked virtual machine.
- **template** (*bool*) -- Create a virtual machine template instead of a real virtual machine.
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

salt.modules.parallels.**delete**(*name*, *runas=None*)

Delete a VM

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM to clone
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.**delete_snapshot**(*name*, *snap_name*, *runas=None*, *all=False*)

Delete a snapshot

Note: Deleting a snapshot from which other snapshots are dervied will not delete the derived snapshots

---

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshot will be deleted
- **snap_name** (*str*) -- Name/ID of snapshot to delete
- **runas** (*str*) -- The user that the prlctl command will be run as
- **all** (*bool*) -- Delete all snapshots having the name given

  New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone'
↪all=True runas=macdev
```

salt.modules.parallels.**exec_**(*name*, *command*, *runas=None*)

Run a command on a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose exec will be returned
- **command** (*str*) -- Command to run on the VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.**exists**(*name*, *runas=None*)

Query whether a VM exists

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

salt.modules.parallels.**list_snapshots**(*name*, *snap_name=None*, *tree=False*, *names=False*, *runas=None*)

List the snapshots

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots will be listed
- **snap_id** (*str*) -- Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (*bool*) -- List snapshots in tree format rather than tabular format
- **names** (*bool*) -- List snapshots as ID, name pairs
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

salt.modules.parallels.**list_vms**(*name=None*, *info=False*, *all=False*, *args=None*, *runas=None*, *template=False*)

List information about the VMs

Parameters

- **name** (*str*) -- Name/ID of VM to list

  Changed in version 2016.11.0: No longer implies `info=True`
- **info** (*str*) -- List extra information
- **all** (*bool*) -- List all non-template VMs
- **args** (*tuple*) -- Additional arguments given to `prctl list`
- **runas** (*str*) -- The user that the prlctl command will be run as
- **template** (*bool*) -- List the available virtual machine templates. The real virtual machines will not be included in the output

  New in version 2016.11.0.

Example:

```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```

salt.modules.parallels.**prlctl**(*sub_cmd*, *args=None*, *runas=None*)

Execute a prlctl command

Parameters

- **sub_cmd** (*str*) -- prlctl subcommand to execute
- **args** (*str*) -- The arguments supplied to `prlctl <sub_cmd>`
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png'
↪runas=macdev
```

salt.modules.parallels.**prlsrvctl**(*sub_cmd*, *args=None*, *runas=None*)

Execute a prlsrvctl command

New in version 2016.11.0.

Parameters

- **sub_cmd** (*str*) -- prlsrvctl subcommand to execute
- **args** (*str*) -- The arguments supplied to `prlsrvctl <sub_cmd>`
- **runas** (*str*) -- The user that the prlsrvctl command will be run as

Example:

```
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

salt.modules.parallels.**reset**(*name*, *runas=None*)

Reset a VM by performing a hard shutdown and then a restart

Parameters

- **name** (*str*) -- Name/ID of VM to reset
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

salt.modules.parallels.**restart**(*name*, *runas=None*)

Restart a VM by gracefully shutting it down and then restarting it

Parameters

- **name** (*str*) -- Name/ID of VM to restart
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

salt.modules.parallels.**revert_snapshot**(*name*, *snap_name*, *runas=None*)

Revert a VM to a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to revert to a snapshot
- **snap_name** (*str*) -- Name/ID of snapshot to revert to
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

salt.modules.parallels.**snapshot**(*name*, *snap_name=None*, *desc=None*, *runas=None*)

Create a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to take a snapshot of
- **snap_name** (*str*) -- Name of snapshot
- **desc** (*str*) -- Description of snapshot

- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.create_snapshot macvm snap_name=macvm-original
↪runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc=
↪'clean install with updates' runas=macdev
```

salt.modules.parallels.**snapshot_id_to_name**(*name*, *snap_id*, *strict=False*, *runas=None*)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap_id** (*str*) -- ID of the snapshot
- **strict** (*bool*) -- Raise an exception if a name cannot be found for the given snap_id
- **runas** (*str*) -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-
↪e515b0101b66 runas=macdev
```

salt.modules.parallels.**snapshot_name_to_id**(*name*, *snap_name*, *strict=False*, *runas=None*)

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap_name** (*str*) -- Name of the snapshot
- **strict** (*bool*) -- Raise an exception if multiple snapshot IDs are found
- **runas** (*str*) -- The user that the prlctl command will be run as

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

salt.modules.parallels.**start**(*name*, *runas=None*)

Start a VM

Parameters

- **name** (*str*) -- Name/ID of VM to start
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.start macvm runas=macdev
```

salt.modules.parallels.**status**(*name*, *runas=None*)

Status of a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose status will be returned
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.status macvm runas=macdev
```

salt.modules.parallels.**stop**(*name*, *kill=False*, *runas=None*)

Stop a VM

Parameters

- **name** (*str*) -- Name/ID of VM to stop
- **kill** (*bool*) -- Perform a hard shutdown
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

26.7.336 salt.modules.parted_partition

Module for managing partitions on POSIX-like systems.

depends

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for `parted(8)` for more information, or the online docs at:

http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for `sfdisk(8)`.

salt.modules.parted_partition.**align_check**(*device*, *part_type*, *partition*)

Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

salt.modules.parted_partition.**check**(*device*, *minor*)

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

salt.modules.parted_partition.**cp**(*device*, *from_minor*, *to_minor*)

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

salt.modules.parted_partition.**disk_set**(*device*, *flag*, *state*)

Changes a flag on selected device.

A flag can be either "on" or "off" (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- cylinder_alignment
- pmbr_boot
- implicit_partition_table

CLI Example:

```
salt '*' partition.disk_set /dev/sda pmbr_boot '"on"'
```

salt.modules.parted_partition.**disk_toggle**(*device*, *flag*)

Toggle the state of <flag> on <device>. Valid flags are the same as the disk_set command.

CLI Example:

```
salt '*' partition.disk_toggle /dev/sda pmbr_boot
```

salt.modules.parted_partition.**exists**(*device=''*)

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

salt.modules.parted_partition.**get_block_device**()

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

salt.modules.parted_partition.**get_id**(*device*, *minor*)

Prints the system ID for the partition. Some typical values are:

```
 b: FAT32 (vfat)
 7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted_partition.**list_**(*device*, *unit=None*)

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

salt.modules.parted_partition.**mkfs**(*device*, *fs_type*)

Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted_partition.**mklabel**(*device*, *label_type*)

Create a new disklabel (partition table) of label_type.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted_partition.**mkpart**(*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)

Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.**mkpartfs**(*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)

The mkpartfs actually is an alias to mkpart and is kept for compatibility. To know the valid options and usage syntax read mkpart documentation.

CLI Examples:

```
salt '*' partition.mkpartfs /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpartfs /dev/sda primary start=0 end=639
```

salt.modules.parted_partition.**name**(*device*, *partition*, *name*)

Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

salt.modules.parted_partition.**probe**(**devices*)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

salt.modules.parted_partition.**rescue**(*device*, *start*, *end*)

Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

salt.modules.parted_partition.**resize**(*device*, *minor*, *start*, *end*)

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

salt.modules.parted_partition.**rm**(*device*, *minor*)

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

salt.modules.parted_partition.**set_**(*device*, *minor*, *flag*, *state*)

Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios_grub
- atvrecv
- diag
- legacy_boot
- msftdata
- irst
- esp
- type

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot '"on"'
```

salt.modules.parted_partition.**set_id**(*device*, *minor*, *system_id*)

Sets the system ID for the partition. Some typical values are:

```
 b: FAT32 (vfat)
 7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

salt.modules.parted_partition.**system_types**()

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

salt.modules.parted_partition.**toggle**(*device*, *partition*, *flag*)

Toggle the state of <flag> on <partition>. Valid flags are the same as
the set command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

26.7.337 salt.modules.pcs

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Cororsync clusters with the Pacemaker/Cororsync conifguration system (PCS)

depends
pcs

New in version 2016.3.0.

salt.modules.pcs.**auth**(*nodes*, *pcsuser='hacluster'*, *pcspasswd='hacluster'*, *extra_args=None*)

Authorize nodes to the cluster

nodes
a list of nodes which should be authorized to the cluster

pcsuser
user for communitcation with PCS (default: hacluster)

pcspasswd
password for pcsuser (default: hacluster)

extra_args
list of extra option for the 'pcs cluster auth' command. The newer cluster host command has no extra args and so will ignore it.

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org, node2.example.org ]'
↪pcsuser=hacluster pcspasswd=hoonetorg extra_args=[ '--force' ]
```

salt.modules.pcs.**cib_create**(*cibfile*, *scope='configuration'*, *extra_args=None*)

Create a CIB-file from the current CIB of the cluster

cibfile
: name/path of the file containing the CIB

scope
: specific section of the CIB (default: configuration)

extra_args
: additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

salt.modules.pcs.**cib_push**(*cibfile*, *scope='configuration'*, *extra_args=None*)

Push a CIB-file as the new CIB to the cluster

cibfile
: name/path of the file containing the CIB

scope
: specific section of the CIB (default: configuration)

extra_args
: additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

salt.modules.pcs.**cluster_destroy**(*extra_args=None*)

Destroy corosync cluster using the pcs command

extra_args
: list of extra option for the 'pcs cluster destroy' command (only really --all)

CLI Example:

```
salt '*' pcs.cluster_destroy extra_args=--all
```

salt.modules.pcs.**cluster_node_add**(*node*, *extra_args=None*)

Add a node to the pacemaker cluster via pcs command

node
: node that should be added

extra_args
: list of extra option for the 'pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

salt.modules.pcs.**cluster_setup**(*nodes*, *pcsclustername='pcscluster'*, *extra_args=None*)

Setup pacemaker cluster via pcs command

nodes
: a list of nodes which should be set up

pcsclustername
: Name of the Pacemaker cluster (default: pcscluster)

extra_args
list of extra option for the 'pcs cluster setup' command
CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org, node2.example.org ]
↪' pcsclustername=pcscluster
```

salt.modules.pcs.**config_show**(*cibfile=None*)

Show config of cluster
cibfile
name/path of the file containing the CIB
CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

salt.modules.pcs.**is_auth**(*nodes*, *pcsuser='hacluster'*, *pcspasswd='hacluster'*)

Check if nodes are already authorized
nodes
a list of nodes to be checked for authorization to the cluster
pcsuser
user for communitcation with PCS (default: hacluster)
pcspasswd
password for pcsuser (default: hacluster)
CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org, node2.example.org]'
↪pcsuser=hacluster pcspasswd=hoonetorg
```

salt.modules.pcs.**item_create**(*item*, *item_id*, *item_type*, *create='create'*, *extra_args=None*, *cibfile=None*)

Create an item via pcs command (mainly for use with the pcs state module)
item
config, property, resource, constraint etc.
item_id
id of the item
item_type
item type
create
create command (create or set f.e., default: create)
extra_args
additional options for the pcs command
cibfile
use cibfile instead of the live CIB

salt.modules.pcs.**item_show**(*item*, *item_id=None*, *item_type=None*, *show='show'*, *extra_args=None*, *cibfile=None*)

Show an item via pcs command (mainly for use with the pcs state module)
item
config, property, resource, constraint etc.
item_id
id of the item
item_type
item type
show
show command (probably None, default: show or status for newer implementation)

extra_args
additional options for the pcs command
cibfile
use cibfile instead of the live CIB

salt.modules.pcs.**prop_set**(*prop*, *value*, *extra_args=None*, *cibfile=None*)

Set the value of a cluster property
prop
name of the property
value
value of the property prop
extra_args
additional options for the pcs property command
cibfile
use cibfile instead of the live CIB
CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/
↪tmp/2_node_cluster.cib'
```

salt.modules.pcs.**prop_show**(*prop*, *extra_args=None*, *cibfile=None*)

Show the value of a cluster property
prop
name of the property
extra_args
additional options for the pcs property command
cibfile
use cibfile instead of the live CIB
CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-
↪policy' cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.**resource_create**(*resource_id*, *resource_type*, *resource_options=None*, *cibfile=None*)

Create a resource via pcs command
resource_id
name for the resource
resource_type
resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
resource_options
additional options for creating the resource
cibfile
use cibfile instead of the live CIB for manipulation
CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' resource_type=
↪'ocf:heartbeat:galera' resource_options="['wsrep_cluster_address=gcomm:/
↪/node1.example.org,node2.example.org,node3.example.org', '--master']"
↪cibfile='/tmp/cib_for_galera.cib'
```

salt.modules.pcs.**resource_show**(*resource_id*, *extra_args=None*, *cibfile=None*)

Show a resource via pcs command
resource_id
name of the resource

extra_args
additional options for the pcs command
cibfile
use cibfile instead of the live CIB
CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_
↪galera.cib'
```

salt.modules.pcs.**stonith_create**(*stonith_id*, *stonith_device_type*, *stonith_device_options=None*, *cibfile=None*)

Create a stonith resource via pcs command
stonith_id
name for the stonith resource
stonith_device_type
name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options
additional options for creating the stonith resource
cibfile
use cibfile instead of the live CIB for manipulation
CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type=
↪'fence_eps'
                            stonith_device_options="['pcmk_host_map=node1.
↪example.org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org',
↪'action=reboot', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_
↪fence.log', 'login=hidden', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_
↪stonith.cib'
```

salt.modules.pcs.**stonith_show**(*stonith_id*, *extra_args=None*, *cibfile=None*)

Show the value of a cluster stonith
stonith_id
name for the stonith resource
extra_args
additional options for the pcs stonith command
cibfile
use cibfile instead of the live CIB
CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_
↪cluster.cib'
```

26.7.338 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer
Jorge Schrauwen <sjorge@blackdot.be>

maturity
new

platform
posix

New in version 2017.7.0.

salt.modules.pdbedit.**create**(*login*, *password*, *password_hashed=False*, *machine_account=False*)

Create user account
login
[string] login name
password
[string] password
password_hashed
[boolean] set if password is a nt hash instead of plain text
machine_account
[boolean] set to create a machine trust account instead
CLI Example:

```
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '*' pdbedit.create river  1sw4ll0w3d4bug
```

salt.modules.pdbedit.**delete**(*login*)

Delete user account
login
[string] login name
CLI Example:

```
salt '*' pdbedit.delete wash
```

salt.modules.pdbedit.**generate_nt_hash**(*password*)

Generate a NT HASH

CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

salt.modules.pdbedit.**get_user**(*login*, *hashes=False*)

Get user account details
login
[string] login name
hashes
[boolean] include NTHASH and LMHASH in verbose output
CLI Example:

```
salt '*' pdbedit.get kaylee
```

salt.modules.pdbedit.**list_users**(*verbose=True*, *hashes=False*)

List user accounts
verbose
[boolean] return all information
hashes
[boolean] include NT HASH and LM HASH in verbose output
CLI Example:

```
salt '*' pdbedit.list
```

salt.modules.pdbedit.**modify**(*login*, *password=None*, *password_hashed=False*, *domain=None*, *profile=None*, *script=None*, *drive=None*, *homedir=None*, *fullname=None*, *account_desc=None*, *account_control=None*, *machine_sid=None*, *user_sid=None*, *reset_login_hours=False*, *reset_bad_password_count=False*)

Modify user account

login
: [string] login name

password
: [string] password

password_hashed
: [boolean] set if password is a nt hash instead of plain text

domain
: [string] users domain

profile
: [string] profile path

script
: [string] logon script

drive
: [string] home drive

homedir
: [string] home directory

fullname
: [string] full name

account_desc
: [string] account description

machine_sid
: [string] specify the machines new primary group SID or rid

user_sid
: [string] specify the users new primary group SID or rid

account_control
: [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

---

reset_login_hours
: [boolean] reset the users allowed logon hours

reset_bad_password_count
: [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

---

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
```

26.7.339 salt.modules.pecl

Manage PHP pecl extensions.

salt.modules.pecl.**install**(*pecls*, *defaults=False*, *force=False*, *preferred_state='stable'*)

New in version 0.17.0.

Installs one or several pecl extensions.

pecls
: The pecl extensions to install.

defaults
: Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force
: Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

salt.modules.pecl.**list_**(*channel=None*)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

salt.modules.pecl.**uninstall**(*pecls*)

Uninstall one or several pecl extensions.

pecls
: The pecl extensions to uninstall.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

salt.modules.pecl.**update**(*pecls*)

Update one or several pecl extensions.

pecls
: The pecl extensions to update.

CLI Example:

```
salt '*' pecl.update fuse
```

26.7.340 salt.modules.peeringdb

PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by `get_`) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to https://www.peeringdb.com/apidocs/.

Configuration (in the opts or Pillar):

```
peeringdb:
  username: salt
  password: 5@1t
```

salt.modules.peeringdb.**get_fac**(***kwargs*)

Return the details of the facility identified using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

---

CLI Example:

```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

salt.modules.peeringdb.**get_ix**(***kwargs*)

Return the details of an IX (Internet Exchange) using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ix/ix_list

---

CLI Example:

```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

salt.modules.peeringdb.**get_ixfac**(***kwargs*)

Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list

---

CLI Example:

```
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```

salt.modules.peeringdb.**get_ixlan**(***kwargs*)

Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list

CLI Example:

```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

salt.modules.peeringdb.**get_ixpfx**(***kwargs*)

Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list

CLI Example:

```
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

salt.modules.peeringdb.**get_net**(***kwargs*)

Return the details of a network identified using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/net/net_list

CLI Example:

```
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

salt.modules.peeringdb.**get_netfac**(***kwargs*)

Return the list of facilities used by a particular network, given the `id` or other filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

CLI Example:

```
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

salt.modules.peeringdb.**get_netixlan**(***kwargs*)

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the `id` argument or the other filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list

CLI Example:

```
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```

`salt.modules.peeringdb.`**`get_org`**`(**kwargs)`

Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/org/org_list

CLI Example:

```
salt '*' peeringdb.get_org id=2
salt '*' peeringdb.get_org city=Duesseldorf
```

`salt.modules.peeringdb.`**`get_poc`**`(**kwargs)`

Return the details of a person of contact together using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/poc/poc_list

CLI Example:

```
salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'
```

26.7.341 salt.modules.pf

Control the OpenBSD packet filter (PF).

codeauthor
Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.

`salt.modules.pf.`**`disable`**`()`

Disable the Packet Filter.

CLI Example:

```
salt '*' pf.disable
```

salt.modules.pf.**enable**()

Enable the Packet Filter.

CLI Example:

```
salt '*' pf.enable
```

salt.modules.pf.**flush**(*modifier*)

Flush the specified packet filter parameters.

modifier:

Should be one of the following:

- all
- info
- osfp
- rules
- sources
- states
- tables

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI Example:

```
salt '*' pf.flush states
```

salt.modules.pf.**load**(*file='/etc/pf.conf'*, *noop=False*)

Load a ruleset from the specific file, overwriting the currently loaded ruleset.

file:

Full path to the file containing the ruleset.

noop:

Don't actually load the rules, just parse them.

CLI Example:

```
salt '*' pf.load /etc/pf.conf.d/lockdown.conf
```

salt.modules.pf.**loglevel**(*level*)

Set the debug level which limits the severity of log messages printed by `pf(4)`.

level:

Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug (OpenBSD); or none, urgent, misc, loud (FreeBSD).

CLI Example:

```
salt '*' pf.loglevel emerg
```

salt.modules.pf.**show**(*modifier*)

Show filter parameters.

modifier:

Modifier to apply for filtering. Only a useful subset of what pfctl supports can be used with Salt.

- rules
- states
- tables

CLI Example:

```
salt '*' pf.show rules
```

`salt.modules.pf.table`(*command*, *table*, ***kwargs*)

Apply a command on the specified table.

table:

Name of the table.

command:

Command to apply to the table. Supported commands are:

- add
- delete
- expire
- flush
- kill
- replace
- show
- test
- zero

Please refer to the OpenBSD pfctl(8) documentation for a detailed explanation of each command.

CLI Example:

```
salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", "::1"]'
```

26.7.342 salt.modules.philips_hue

Philips HUE lamps module for proxy.

New in version 2015.8.3.

26.7.343 salt.modules.pillar

Extract the pillar data for this minion

`salt.modules.pillar.data`(**args*, ***kwargs*)

This function is an alias of `items`.

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with *`raw()`* which returns the pillar data that is currently loaded into the minion.

pillar

If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

pillar_enc

If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

pillarenv

Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's *pillarenv* option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

saltenv

Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

salt.modules.pillar.**ext**(*external*, *pillar=None*)

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext_pillar types are now tunable using the *on_demand_ext_pillar* config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

external

A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated `ext_pillar` configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load("""
... ext_pillar:
...   - git:
...     - issue38440 https://github.com/terminalmage/git_pillar:
...       - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo
↪': [{'env': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base
↪'}]}]}
```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar

[None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext "{'git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext "{'git': [{'mybranch https://github.com/myuser/myrepo
↪': [{'env': 'base'}]}]}"
```

salt.modules.pillar.**fetch**(*key*, *default=<Constant.NOT_SET>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.0.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

key
: The pillar key to get value from

default
: The value specified by this option will be returned if the desired pillar key does not exist.

  If a default value is not specified, then it will be an empty string, unless *pillar_raise_on_missing* is set to `True`, in which case an error will be raised.

merge
: [`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

  New in version 2014.7.0.

  Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists
: If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

  Note: This option is ignored when `merge` is set to `False`.

  New in version 2016.11.6.

delimiter
: Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

pillarenv
: If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

  Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

  New in version 2017.7.0.

saltenv
: Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.**file_exists**(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

path
: The path to the file in question. Will be treated as a relative path

saltenv
: Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

salt.modules.pillar.**filter_by**(*lookup_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

Parameters

- **lookup_dict** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

  ```
  # this will render 'got some salt' if ``role`` begins
  ↪with 'salt'
  salt '*' pillar.filter_by '{salt*: got some salt,
  ↪default: salt is not here}' role
  ```

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the `lookup_dict` dictionary.

  The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.

- **default** -- default lookup_dict's key used if the pillar does not exist or if the pillar value has no match on lookup_dict. If unspecified the value is "default".

- **base** -- A lookup_dict key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}'
↪role
```

salt.modules.pillar.**get**(*key*, *default=<Constant.NOT_SET>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.0.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

key
: The pillar key to get value from

default
: The value specified by this option will be returned if the desired pillar key does not exist.

  If a default value is not specified, then it will be an empty string, unless *`pillar_raise_on_missing`* is set to `True`, in which case an error will be raised.

merge
: [`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

  New in version 2014.7.0.

  Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists
: If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

  Note: This option is ignored when `merge` is set to `False`.

  New in version 2016.11.6.

delimiter
: Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

pillarenv
: If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv

Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.**item**(**args*, ***kwargs*)

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

delimiter

Delimiter used to traverse nested dictionaries.

Note: This is different from *pillar.get* in that no default value can be specified. *pillar.get* should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of *pillar.get* however is when it is desirable to retrieve the values of more than one key, since *pillar.get* can only retrieve one key at a time.

New in version 2015.8.0.

pillarenv

If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

saltenv

Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

salt.modules.pillar.**items**(**args*, ***kwargs*)

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with *raw()* which returns the pillar data that is currently loaded into the minion.

pillar
If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

pillar_enc
If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

pillarenv
Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's *`pillarenv`* option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

saltenv
Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

`salt.modules.pillar.`**`keys`**(*key*, *delimiter=':'*)

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.

delimiter
Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

`salt.modules.pillar.`**`ls`**(**args*)

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as *`items()`*), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

`salt.modules.pillar.`**`obfuscate`**(**args*, ***kwargs*)

New in version 2015.8.0.

Same as *`items()`*, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `'<str>'`
- `['secret', 1]` becomes `['<str>', '<int>']`
- `{'login': 'somelogin', 'pwd': 'secret'}` becomes `{'login': '<str>', 'pwd': '<str>'}`

CLI Examples:

```
salt '*' pillar.obfuscate
```

`salt.modules.pillar.`**`raw`**(*key=None*)

Return the raw pillar data that is currently loaded into the minion.

Contrast with *`items()`* which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

26.7.344 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\
↪pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, cwd: 'C:\salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.* and Salt <=2018.3.0. The issue is described here: https://github.com/saltstack/salt/issues/46163

`salt.modules.pip.`**`freeze`**(*bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*, *env_vars=None*, ***kwargs*)

Return a list of installed packages either globally or in the specified virtualenv

bin_env

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

user

The user under which to run pip

cwd

Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

`salt.modules.pip.`**`install`**(*pkgs=None*, *requirements=None*, *bin_env=None*, *use_wheel=False*, *no_use_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *editable=None*, *find_links=None*, *index_url=None*, *extra_index_url=None*, *no_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download_cache=None*, *source=None*, *upgrade=False*, *force_reinstall=False*, *ignore_installed=False*, *exists_action=None*, *no_deps=False*, *no_install=False*, *no_download=False*, *global_options=None*, *install_options=None*, *user=None*, *cwd=None*, *pre_releases=False*, *cert=None*, *allow_all_external=False*, *allow_external=None*, *allow_unverified=None*, *process_dependency_links=False*, *saltenv='base'*, *env_vars=None*, *use_vt=False*, *trusted_host=None*, *no_cache_dir=False*, *extra_args=None*, *cache_dir=None*, *no_binary=None*, *disable_version_check=False*, ***kwargs*)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs
: Comma separated list of packages to install

requirements
: Path to requirements

bin_env
: Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

  Note: For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

use_wheel
: Prefer wheel archives (requires pip>=1.4)

no_use_wheel
: Force to not use wheel archives (requires pip>=1.4,<10.0.0)

no_binary
: Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them

log
: Log file where a complete (maximum verbosity) record will be kept. If this file doesn't exist and the parent directory is writeable, it will be created.

proxy
: Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

  Note: If the Minion has a globaly configured proxy - it will be used even if no proxy was set here. To

explicitly disable proxy for pip you should pass `False` as a value.

---

timeout
Set the socket timeout (default 15 seconds)
editable
install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)
find_links
URL to search for packages
index_url
Base URL of Python Package Index
extra_index_url
Extra URLs of package indexes to use in addition to `index_url`
no_index
Ignore package index
mirrors
Specific mirror URL(s) to query (automatically adds --use-mirrors)

> **Warning**: This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

build
Unpack packages into `build` dir
target
Install packages into `target` dir
download
Download packages into `download` instead of installing them
download_cache | cache_dir
Cache downloaded packages in `download_cache` or `cache_dir` dir
source
Check out `editable` packages into `source` dir
upgrade
Upgrade all packages to the newest available version
force_reinstall
When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed
Ignore the installed packages (reinstalling instead)
exists_action
Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps
Ignore package dependencies
no_install
Download and unpack all packages, but don't actually install them
no_download
Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)
install_options
Extra arguments to be supplied to the setup.py install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
global_options
Extra global options to be supplied to the setup.py call before the install command.

user
The user under which to run pip

cwd
Directory from which to run pip

pre_releases
Include pre-releases in the available versions

cert
Provide a path to an alternate CA bundle

allow_all_external
Allow the installation of all externally hosted files

allow_external
Allow the installation of externally hosted files (comma separated list)

allow_unverified
Allow the installation of insecure and unverifiable files (comma separated list)

process_dependency_links
Enable the processing of dependency links

env_vars
Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/
↪django_app'}"
```

trusted_host
Mark this host as trusted, even though it does not have valid or any HTTPS.

use_vt
Use VT terminal emulation (see output while installing)

no_cache_dir
Disable the cache.

extra_args
pip keyword and positional arguments not yet implemented in salt

```
salt '*' pip.install pandas extra_args="[{'--latest-pip-kwarg':'param
↪'}, '--latest-pip-arg']"
```

> **Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a *No such option error* will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

disable_version_check
Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
```

(continues on next page)

(continued from previous page)

```
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI Example:

```
salt '*' pip.install markdown,django                    editable=git+https://
↪github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_
↪deps=True
```

salt.modules.pip.**is_installed**(*pkgname*, *bin_env=None*, *user=None*, *cwd=None*)

New in version 2018.3.0.

Changed in version 3006.0.

Filter list of installed modules and return True if `pkgname` exists in the list of packages installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

salt.modules.pip.**list_**(*prefix=None*, *bin_env=None*, *user=None*, *cwd=None*, *env_vars=None*, ***kwargs*)

Changed in version 3006.0.

Output list of installed apps from `pip list` in JSON format and check to see if `prefix` exists in the list of packages installed.

Note: If the version of pip available is older than 9.0.0, parsing the `freeze` function output will be used to determine the name and version of installed modules.

CLI Example:

```
salt '*' pip.list salt
```

salt.modules.pip.**list_all_versions**(*pkg*, *bin_env=None*, *include_alpha=False*, *include_beta=False*, *include_rc=False*, *user=None*, *cwd=None*, *index_url=None*, *extra_index_url=None*)

New in version 2017.7.3.

List all available versions of a pip package

pkg
: The package to check

bin_env
: Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

include_alpha
: Include alpha versions in the list

include_beta
: Include beta versions in the list

include_rc
: Include release candidates versions in the list

user
: The user under which to run pip

cwd
Directory from which to run pip
index_url
Base URL of Python Package Index .. versionadded:: 2019.2.0
extra_index_url
Additional URL of Python Package Index .. versionadded:: 2019.2.0
CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

salt.modules.pip.**list_freeze_parse**(*prefix=None*, *bin_env=None*, *user=None*, *cwd=None*, *env_vars=None*, ***kwargs*)

New in version 3006.0.

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

Note: If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike *pip.freeze*, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list_freeze_parse salt
```

salt.modules.pip.**list_upgrades**(*bin_env=None*, *user=None*, *cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

salt.modules.pip.**uninstall**(*pkgs=None*, *requirements=None*, *bin_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *saltenv='base'*, *use_vt=False*)

Uninstall packages individually or from a pip requirements file
pkgs
comma separated list of packages to install
requirements
Path to requirements file
bin_env
Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.
log
Log file where a complete (maximum verbosity) record will be kept
proxy
Specify a proxy in the format `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

Note: If the Minion has a globaly configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass `False` as a value.

---

timeout
Set the socket timeout (default 15 seconds)
user
The user under which to run pip
cwd
Directory from which to run pip
use_vt
Use VT terminal emulation (see output while installing)
CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

`salt.modules.pip.`**`upgrade`**(*bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages.

Note: On Windows you can't update salt from pip using salt, so salt will be skipped

---

Returns a dict containing the changes.
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}
CLI Example:

```
salt '*' pip.upgrade
```

`salt.modules.pip.`**`upgrade_available`**(*pkg*, *bin_env=None*, *user=None*, *cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

`salt.modules.pip.`**`version`**(*bin_env=None*, *cwd=None*, *user=None*)

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns `None`.

Changed in version 3001.1: The `user` parameter was added, to allow specifying the user who runs the version command.

CLI Example:

```
salt '*' pip.version
```

26.7.345 salt.modules.pkg_resource

Resources needed by pkg providers

salt.modules.pkg_resource.**add_pkg**(*pkgs*, *name*, *pkgver*)

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{}' bind 9
```

salt.modules.pkg_resource.**check_extra_requirements**(*pkgname*, *pkgver*)

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_
↪requirements>
```

salt.modules.pkg_resource.**format_pkg_list**(*packages*, *versions_as_list*, *attr*)

Formats packages according to parameters for list_pkgs.

salt.modules.pkg_resource.**format_version**(*epoch*, *version*, *release*)

Formats a version string for list_pkgs.

salt.modules.pkg_resource.**pack_sources**(*sources*, *normalize=True*)

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

`'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]'` would become `{"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}`

normalize

[True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar":
↪"salt://bar.rpm"}]'
```

salt.modules.pkg_resource.**parse_targets**(*name=None*, *pkgs=None*, *sources=None*, *saltenv='base'*, *normalize=True*, ***kwargs*)

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

salt.modules.pkg_resource.**sort_pkglist**(*pkgs*)

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

salt.modules.pkg_resource.**stringify**(*pkgs*)

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

salt.modules.pkg_resource.**version**(**names*, ***kwargs*)

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

salt.modules.pkg_resource.**version_clean**(*verstr*)

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

salt.modules.pkg_resource.**version_compare**(*ver1*, *oper*, *ver2*, *ignore_epoch=False*)

New in version 3001.

Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

ver1
: The first version to be compared

oper
: One of ==, *!=*, >=, <=, >, <

ver2
: The second version to be compared

Note: To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

---

ignore_epoch
: [False] If `True`, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:

```
{%- set postfix_version = salt.pkg.version('postfix') %}
{%- if postfix_version and salt.pkg_resource.version_compare(postfix_
↪version, '>=', '3.3', ignore_epoch=True) %}
  {#- do stuff #}
{%- endif %}
```

CLI Examples:

```
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '<=' '2.4' ignore_
↪epoch=True
```

26.7.346 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

---

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

`salt.modules.pkgin.`**`available_version`**`(*names, **kwargs)`

This function is an alias of `latest_version`.

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.`**`file_dict`**`(*packages, **kwargs)`

Changed in version 2016.3.0.

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.`**`file_list`**`(package, **kwargs)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.`**`install`**`(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

name

The name of the package to be installed.

refresh

Whether or not to refresh the package database before installing.

fromrepo

Specify a package repository to install from.

Multiple Package Installation Options:

pkgs
A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources
A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar":
↪"salt://bar.deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.`**`latest_version`**(**names*, ***kwargs*)

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

Changed in version 2016.3.0.

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

List all available package upgrades.

New in version 2018.3.0.
refresh
Whether or not to refresh the package database before installing.
CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pkgin.**normalize_name**(*pkgs*, ***kwargs*)

Normalize package names

Note: Nothing special to do to normalize, just return the original. (We do need it to be compatible with the pkg_resource provider.)

---

salt.modules.pkgin.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgin.**refresh_db**(*force=False*, ***kwargs*)

Use pkg update to get latest pkg_summary

force

Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pkgin.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgin.**search**(*pkg_name*, ***kwargs*)

Searches for an exact match using pkgin ^package$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

salt.modules.pkgin.**upgrade**(*refresh=True*, *pkgs=None*, ***kwargs*)

Run pkg upgrade, if pkgin used. Otherwise do nothing

refresh

Whether or not to refresh the package database before installing.

Multiple Package Upgrade Options:

pkgs

A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs='["foo","bar"]'
```

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.pkgin.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.7.347 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the *providers* parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

salt.modules.pkgng.**audit**(*jail=None, chroot=None, root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

jail

Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

chroot

Audit packages within the specified chroot (ignored if `jail` is specified)

root

Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

salt.modules.pkgng.**autoremove**(*jail=None, chroot=None, root=None, dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

dryrun

Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

salt.modules.pkgng.**available_version**(**names, **kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

salt.modules.pkgng.**backup**(*file_name, jail=None, chroot=None, root=None*)

Export installed packages into yaml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

jail
Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot
Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

root
Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`check`**(*jail=None*, *chroot=None*, *root=None*, *depends=False*, *recompute=False*, *checksum=False*, *checklibs=False*)

Sanity checks installed packages

jail
Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

chroot
Perform the sanity check in the specified chroot (ignored if `jail` is specified)

root
Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

depends
Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check depends=True
```

recompute
Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check recompute=True
```

checksum
Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

checklibs

Regenerates the library dependency metadata for a package.

CLI Example:

```
salt '*' pkg.check checklibs=True
```

salt.modules.pkgng.**clean**(*jail=None*, *chroot=None*, *root=None*, *clean_all=False*, *dryrun=False*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
```

jail

Cleans the package cache in the specified jail

CLI Example:

```
salt '*' pkg.clean jail=<jail name or id>
```

chroot

Cleans the package cache in the specified chroot (ignored if `jail` is specified)

root

Cleans the package cache in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.clean chroot=/path/to/chroot
```

clean_all

Clean all packages from the local cache (not just those that have been superseded by newer versions).

CLI Example:

```

```

salt '*' pkg.clean clean_all=True

dryrun

Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.clean dryrun=True
```

salt.modules.pkgng.**delete**(*name=None*, *pkgs=None*, *jail=None*, *chroot=None*, *root=None*, *all_installed=False*, *force=False*, *glob=False*, *dryrun=False*, *recurse=False*, *regex=False*, *pcre=False*, ***kwargs*)

This function is an alias of `remove`.

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name
The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail
Delete the package from the specified jail

chroot
Delete the package from the specified chroot (ignored if `jail` is specified)

root
Delete the package from the specified root (ignored if `jail` is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgng.**fetch**(*name*, *jail=None*, *chroot=None*, *root=None*, *fetch_all=False*, *quiet=False*, *fromrepo=None*, *glob=True*, *regex=False*, *pcre=False*, *local=False*, *depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

jail

Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot

Fetch package in the specified chroot (ignored if `jail` is specified)

root

Fetch package in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all

Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet

Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo

Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob

Treat pkg_name as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex

Treat pkg_name as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre
Treat pkg_name is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local
Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

depends
Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

`salt.modules.pkgng.`**`hold`**(*name=None, pkgs=None, **kwargs*)

Version-lock packages

Note: This function is provided primarily for compatibility with some parts of *states.pkg*. Consider using Consider using *pkg.lock* instead. instead.

---

name
The name of the package to be held.

Multiple Package Options:

pkgs
A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.pkgng.`**`info`**(**names, **kwargs*)

This function is an alias of `version`.

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

jail
Get package version information for the specified jail

chroot
Get package version information for the specified chroot (ignored if `jail` is specified)

root
Get package version information for the specified root (ignored if `jail` is specified)

with_origin
[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.pkgng.**install**(*name=None*, *fromrepo=None*, *pkgs=None*, *sources=None*, *jail=None*, *chroot=None*, *root=None*, *orphan=False*, *force=False*, *glob=False*, *local=False*, *dryrun=False*, *quiet=False*, *reinstall_requires=False*, *regex=False*, *pcre=False*, *batch=False*, ***kwargs*)

Install package(s) from a repository

name
The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail
Install the package into the specified jail

chroot
Install the package into the specified chroot (ignored if `jail` is specified)

root
Install the package into the specified root (ignored if `jail` is specified)

orphan
Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force
Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local
Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun
Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet
Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires
When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True
↪force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

fromrepo
In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

regex
Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:

```
```

batch
Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

`salt.modules.pkgng.`**`latest_version`**`(`*names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

salt.modules.pkgng.**list_locked**(***kwargs*)

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

jail
: List locked packages within the specified jail

  CLI Example:

  ```
  salt '*' pkg.list_locked jail=<jail name or id>
  ```

chroot
: List locked packages within the specified chroot (ignored if `jail` is specified)

  CLI Example:

  ```
  salt '*' pkg.list_locked chroot=/path/to/chroot
  ```

root
: List locked packages within the specified root (ignored if `jail` is specified)

  CLI Example:

  ```
  salt '*' pkg.list_locked root=/path/to/chroot
  ```

salt.modules.pkgng.**list_pkgs**(*versions_as_list=False*, *jail=None*, *chroot=None*, *root=None*, *with_origin=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

jail
: List the packages in the specified jail

chroot
: List the packages in the specified chroot (ignored if `jail` is specified)

root
: List the packages in the specified root (ignored if `jail` is specified)

with_origin
: [False] Return a nested dictionary containing both the origin name and version for each installed package.

  New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

salt.modules.pkgng.**list_upgrades**(*refresh=True*, ***kwargs*)

List those packages for which an upgrade is available

The `fromrepo` argument is also supported, as used in pkg states.

CLI Example:

```
salt '*' pkg.list_upgrades
```

jail

List upgrades within the specified jail

CLI Example:

```
salt '*' pkg.list_upgrades jail=<jail name or id>
```

chroot

List upgrades within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

root

List upgrades within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.list_upgrades root=/path/to/chroot
```

salt.modules.pkgng.**lock**(*name*, ***kwargs*)

Lock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully locked.

CLI Example:

```
salt '*' pkg.lock <package name>
```

jail

Lock packages within the specified jail

CLI Example:

```
salt '*' pkg.lock <package name> jail=<jail name or id>
```

chroot

Lock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

root

Lock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.lock <package name> root=/path/to/chroot
```

salt.modules.pkgng.**locked**(*name*, ***kwargs*)

Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```
salt '*' pkg.locked <package name>
```

jail

Test if a package is locked within the specified jail

CLI Example:

```
salt '*' pkg.locked <package name> jail=<jail name or id>
```

chroot

Test if a package is locked within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

root

Test if a package is locked within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.locked <package name> root=/path/to/chroot
```

salt.modules.pkgng.**parse_config**(*file_name='/usr/local/etc/pkg.conf'*)

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

`NOTE:` not working properly right now

salt.modules.pkgng.**purge**(*name=None*, *pkgs=None*, *jail=None*, *chroot=None*, *root=None*, *all_installed=False*, *force=False*, *glob=False*, *dryrun=False*, *recurse=False*, *regex=False*, *pcre=False*, ***kwargs*)

This function is an alias of `remove`.

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name

The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail

Delete the package from the specified jail

chroot
Delete the package from the specified chroot (ignored if `jail` is specified)

root
Delete the package from the specified root (ignored if `jail` is specified)

all_installed
Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force
Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob
Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun
Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse
Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex
Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre
Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.`**`refresh_db`**(*jail=None*, *chroot=None*, *root=None*, *force=False*, ***kwargs*)
Refresh PACKAGESITE contents

Note: This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail
: Refresh the pkg database within the specified jail

chroot
: Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

root
: Refresh the pkg database within the specified root (ignored if `jail` is specified)

force
: Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

  CLI Example:

  ```
  salt '*' pkg.refresh_db force=True
  ```

`salt.modules.pkgng.`**`remove`**(*name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs*)

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name
: The package to remove

  CLI Example:

  ```
  salt '*' pkg.remove <package name>
  ```

jail
: Delete the package from the specified jail

chroot
: Delete the package from the specified chroot (ignored if `jail` is specified)

root
: Delete the package from the specified root (ignored if `jail` is specified)

all_installed
: Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

  CLI Example:

  ```
  salt '*' pkg.remove all all_installed=True force=True
  ```

force
: Forces packages to be removed despite leaving unresolved dependencies.

  CLI Example:

  ```
  salt '*' pkg.remove <package name> force=True
  ```

glob
: Treat the package names as shell glob patterns.

  CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun

Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse

Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex

Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre

Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

salt.modules.pkgng.**restore**(*file_name*, *jail=None*, *chroot=None*, *root=None*)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

jail

Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

chroot

Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

root

Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.**search**(*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcre=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

jail
Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

chroot
Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

root
Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

exact
Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

glob
Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

regex
Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

pcre
Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

comment
Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

desc
Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

full

Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

depends

Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

size

Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

quiet

Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

origin

Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

prefix

Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

`salt.modules.pkgng.`**`stats`**(*local=False*, *remote=False*, *jail=None*, *chroot=None*, *root=None*, *bytes=False*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

local

Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

remote

Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

bytes
Display disk space usage in bytes only.

CLI Example:

```
salt '*' pkg.stats bytes=True
```

jail
Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

chroot
Retrieve stats from the specified chroot (ignored if `jail` is specified).

root
Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

`salt.modules.pkgng.`**`unhold`**(*name=None*, *pkgs=None*, ***kwargs*)

Remove version locks

Note: This function is provided primarily for compatibility with some parts of *`states.pkg`*. Consider using *`pkg.unlock`* instead.

---

name
The name of the package to be unheld

Multiple Package Options:

pkgs
A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.pkgng.`**`unlock`**(*name*, ***kwargs*)

Unlock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully unlocked.

CLI Example:

```
salt '*' pkg.unlock <package name>
```

jail
Unlock packages within the specified jail

CLI Example:

```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

chroot
Unlock packages within the specified chroot (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

root
Unlock packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

`salt.modules.pkgng.`**`update`**(*jail=None*, *chroot=None*, *root=None*, *force=False*, ***kwargs*)

This function is an alias of `refresh_db`.
Refresh PACKAGESITE contents

Note: This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail
Refresh the pkg database within the specified jail

chroot
Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

root
Refresh the pkg database within the specified root (ignored if `jail` is specified)

force
Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.`**`update_package_site`**(*new_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

salt.modules.pkgng.**updating**(*name*, *jail=None*, *chroot=None*, *root=None*, *filedate=None*, *filename=None*)

' Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

jail

Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

chroot

Perform the action in the specified chroot (ignored if `jail` is specified)

root

Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

filedate

Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.updating foo filedate=20130101
```

filename

Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

salt.modules.pkgng.**upgrade**(**names*, ***kwargs*)

Upgrade named or all packages (run a `pkg upgrade`). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

jail

Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

chroot
Audit packages within the specified chroot (ignored if `jail` is specified)

root
Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

force
Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

local
Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

dryrun
Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

fromrepo
In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

CLI Example:

```
salt '*' pkg.upgrade <package name> fromrepo=repo
```

fetchonly
Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:

```
salt '*' pkg.upgrade <package name> fetchonly=True
```

`salt.modules.pkgng.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

jail
Get package version information for the specified jail

chroot
Get package version information for the specified chroot (ignored if `jail` is specified)

root
Get package version information for the specified root (ignored if `jail` is specified)

with_origin
[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.`**`version_cmp`**(*pkg1*, *pkg2*, *ignore_epoch=False*, ***kwargs*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.`**`which`**(*path*, *jail=None*, *chroot=None*, *root=None*, *origin=False*, *quiet=False*)

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

jail
Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot
Perform the check in the specified chroot (ignored if `jail` is specified)

root
Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin
Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

quiet
Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

26.7.348 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

---

salt.modules.pkgutil.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3>
↪...
```

salt.modules.pkgutil.**install**(*name=None*, *refresh=False*, *version=None*, *pkgs=None*, ***kwargs*)

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

pkgs

A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

salt.modules.pkgutil.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.**list_upgrades**(*refresh=True*, ***kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

salt.modules.pkgutil.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.**refresh_db**()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

salt.modules.pkgutil.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove a package and all its dependencies which are not in use by other packages.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.**upgrade**(*refresh=True*)

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

salt.modules.pkgutil.**upgrade_available**(*name*)

Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

salt.modules.pkgutil.**version**(**names*, ***kwargs*)

Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

26.7.349 salt.modules.portage_config

Configure `portage(5)`

salt.modules.portage_config.**append_to_package_conf**(*conf*, *atom=''*, *flags=None*, *string=''*, *overwrite=False*)

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt
↪ldap -libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/
↪salt-0.14.1" flags="['ldap', '-libvirt']"
```

salt.modules.portage_config.**append_use_flags**(*atom*, *uses=None*, *overwrite=False*)

Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "['ldap
↪', '-libvirt']"
```

salt.modules.portage_config.**enforce_nice_config**()

Enforce a nice tree structure for /etc/portage/package.* configuration files.

See also:

salt.modules.ebuild.ex_mod_init()
for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

salt.modules.portage_config.**filter_flags**(*use*, *use_expand_hidden*, *usemasked*, *useforced*)

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

salt.modules.portage_config.**get_all_cpv_use**(*cp*)

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

salt.modules.portage_config.**get_cleared_flags**(*cp*)

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

salt.modules.portage_config.**get_flags_from_package_conf**(*conf*, *atom*)

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

salt.modules.portage_config.**get_installed_use**(*cp*, *use='USE'*)

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.**get_iuse**(*cp*)

New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.**get_missing_flags**(*conf*, *atom*, *flags*)

Find out which of the given flags are currently not set.

CLI Example:

```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt',
↪'openssl']"
```

salt.modules.portage_config.**has_flag**(*conf*, *atom*, *flag*)

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.**has_use**(*atom*, *use*)

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

salt.modules.portage_config.**is_changed_uses**(*cp*)

New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.**is_present**(*conf*, *atom*)

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

26.7.350 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.**delete**(*queue_id*)

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA

salt '*' postfix.delete ALL
```

salt.modules.postfix.**hold**(*queue_id*)

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA

salt '*' postfix.hold ALL
```

salt.modules.postfix.**requeue**(*queue_id*)

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA

salt '*' postfix.requeue ALL
```

salt.modules.postfix.**set_main**(*key*, *value*, *path='/etc/postfix/main.cf'*)

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

salt.modules.postfix.**set_master**(*service*, *conn_type*, *private='y'*, *unpriv='y'*, *chroot='y'*, *wakeup='n'*, *maxproc='100'*, *command=''*, *write_conf=True*, *path='/etc/postfix/master.cf'*)

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

salt.modules.postfix.**show_main**(*path='/etc/postfix/main.cf'*)

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the

data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main
salt <minion> postfix.show_main path=/path/to/main.cf
```

salt.modules.postfix.**show_master**(*path='/etc/postfix/master.cf'*)

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master
salt <minion> postfix.show_master path=/path/to/master.cf
```

salt.modules.postfix.**show_queue**()

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

salt.modules.postfix.**unhold**(*queue_id*)

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA

salt '*' postfix.unhold ALL
```

26.7.351 salt.modules.postgres

Module to provide Postgres compatibility to salt.

configuration

In order to connect to Postgres, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the maintenance_db is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar

To prevent Postgres commands from running arbitrarily long, a timeout (in seconds) can be set

```
postgres.timeout: 60
```

New in version 3006.0.

note

This module uses MD5 hashing which may not be compliant with certain security audits.

note

When installing postgres from the official postgres repos, on certain linux distributions, either the psql or the initdb binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

salt.modules.postgres.**available_extensions**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

salt.modules.postgres.**create_extension**(*name*, *if_not_exists=None*, *schema=None*, *ext_version=None*, *from_version=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

salt.modules.postgres.**create_metadata**(*name*, *ext_version=None*, *schema=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

salt.modules.postgres.**datadir_exists**(*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name

Name of the directory to check

salt.modules.postgres.**datadir_init**(*name*, *auth='password'*, *user=None*, *password=None*, *encoding='UTF8'*, *locale=None*, *waldir=None*, *checksums=False*, *runas=None*)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name
The name of the directory to initialize

auth
The default authentication method for local connections

password
The password to set for the postgres user

user
The database superuser name

encoding
The default encoding for new databases

locale
The default locale for new databases

waldir
The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.

checksums
If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas
The system user the operation should be performed on behalf of

salt.modules.postgres.**db_alter**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *tablespace=None*, *owner=None*, *owner_recurse=False*, *runas=None*)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

salt.modules.postgres.**db_create**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *tablespace=None*, *encoding=None*, *lc_collate=None*, *lc_ctype=None*, *owner=None*, *template=None*, *runas=None*)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'

salt '*' postgres.db_create 'dbname' template=template_postgis
```

salt.modules.postgres.**db_exists**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

salt.modules.postgres.**db_list**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

salt.modules.postgres.**db_remove**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

salt.modules.postgres.**drop_extension**(*name*, *if_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

salt.modules.postgres.**get_available_extension**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

salt.modules.postgres.**get_installed_extension**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

salt.modules.postgres.**group_create**(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
       host='hostname' port='port' password='password' \
       rolepassword='rolepassword'
```

salt.modules.postgres.**group_remove**(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

salt.modules.postgres.**group_update**(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
       host='hostname' port='port' password='password' \
       rolepassword='rolepassword'
```

salt.modules.postgres.**has_privileges**(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
SELECT,INSERT maintenance_db=db_name
```

name
: Name of the role whose privileges should be checked on object_type

object_name
: Name of the object on which the check is to be performed

object_type
: The object type, which can be one of the following:
  - table
  - sequence
  - schema
  - tablespace
  - language
  - database
  - group

- function

privileges
Comma separated list of privileges to check, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option
If grant_option is set to True, the grant option check is performed

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`installed_extensions`**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

`salt.modules.postgres.`**`is_available_extension`**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

`salt.modules.postgres.`**`is_installed_extension`**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

salt.modules.postgres.**language_create**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

name
Language to install
maintenance_db
The database to install the language in
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

salt.modules.postgres.**language_exists**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name
Language to check for
maintenance_db
The database to check in
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

salt.modules.postgres.**language_list**(*maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db
The database to check
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

salt.modules.postgres.**language_remove**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

name
Language to remove
maintenance_db
The database to install the language in
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

salt.modules.postgres.**owner_to**(*dbname*, *ownername*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

salt.modules.postgres.**privileges_grant**(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name
Name of the role to which privileges should be granted

object_name
Name of the object on which the grant is to be performed

object_type
The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges
Comma separated list of privileges to grant, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option
If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

salt.modules.postgres.**privileges_list**(*name*, *object_type*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name
Name of the object for which the permissions should be returned

object_type
The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

prepend
Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db
The database to connect to

user
database username if different from config or default

password
user password if any password for a specified user

host
Database host if different from config or default

port
Database port if different from config or default

runas
System user all operations should be performed on behalf of

salt.modules.postgres.**privileges_revoke**(*name*, *object_name*, *object_type*, *privileges=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name
Name of the role whose privileges should be revoked
object_name
Name of the object on which the revoke is to be performed
object_type
The object type, which can be one of the following:
- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges
Comma separated list of privileges to revoke, from the list below:
- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

maintenance_db
The database to connect to
user
database username if different from config or default
password
user password if any password for a specified user
host
Database host if different from config or default
port
Database port if different from config or default
runas
System user all operations should be performed on behalf of

`salt.modules.postgres.`**`psql_query`**(*query*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *write=False*)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
query
The query string.
user
Database username, if different from config or default.
host
Database host, if different from config or default.

port
Database port, if different from the config or default.
maintenance_db
The database to run the query against.
password
User password, if different from the config or default.
runas
User to run the command as.
write
Mark query as READ WRITE transaction.
CLI Example:

```
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```

salt.modules.postgres.**role_get**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *return_password=False*)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

salt.modules.postgres.**schema_create**(*dbname*, *name*, *owner=None*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
        user='user' \
        db_user='user' db_password='password'
        db_host='hostname' db_port='port'
```

salt.modules.postgres.**schema_exists**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname
Database name we query on
name
Schema name we look for
user
The system user the operation should be performed on behalf of
db_user
database username if different from config or default
db_password
user password if any password for a specified user
db_host
Database host if different from config or default

db_port
Database port if different from config or default

salt.modules.postgres.**schema_get**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname
Database name we query on
name
Schema name we look for
user
The system user the operation should be performed on behalf of
db_user
database username if different from config or default
db_password
user password if any password for a specified user
db_host
Database host if different from config or default
db_port
Database port if different from config or default

salt.modules.postgres.**schema_list**(*dbname*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname
Database name we query on
user
The system user the operation should be performed on behalf of
db_user
database username if different from config or default
db_password
user password if any password for a specified user
db_host
Database host if different from config or default
db_port
Database port if different from config or default

salt.modules.postgres.**schema_remove**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

dbname
Database name we work on

schemaname
The schema's name we'll remove
user
System user all operations should be performed on behalf of
db_user
database username if different from config or default
db_password
user password if any password for a specified user
db_host
Database host if different from config or default
db_port
Database port if different from config or default

salt.modules.postgres.**tablespace_alter**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *new_name=None*, *new_owner=None*, *set_option=None*, *reset_option=None*, *runas=None*)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1
↪'}"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_create**(*name*, *location*, *options=None*, *owner=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_exists**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_list**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_remove**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

salt.modules.postgres.**user_create**(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *inherit=None*, *login=None*, *connlimit=None*, *encrypted=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *valid_until=None*, *groups=None*, *runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
       host='hostname' port='port' password='password' \
       rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.**user_exists**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

salt.modules.postgres.**user_list**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *return_password=False*)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

salt.modules.postgres.**user_remove**(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

salt.modules.postgres.**user_update**(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *encrypted=None*, *superuser=None*, *inherit=None*, *login=None*, *connlimit=None*, *replication=None*, *rolepassword=None*, *valid_until=None*, *groups=None*, *runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
       host='hostname' port='port' password='password' \
       rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.**version**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

26.7.352 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.**bulk_build**(*jail*, *pkg_file*, *keep=False*)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

salt.modules.poudriere.**create_jail**(*name*, *arch*, *version='9.0-RELEASE'*)

Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.**create_ports_tree**()

Not working need to run portfetch non interactive

salt.modules.poudriere.**delete_jail**(*name*)

Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.**info_jail**(*name*)

Show information on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.info_jail head-amd64
```

salt.modules.poudriere.**is_jail**(*name*)

Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

salt.modules.poudriere.**list_jails**()

Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

salt.modules.poudriere.**list_ports**()

Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

salt.modules.poudriere.**make_pkgng_aware**(*jname*)

Make jail `jname` pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

salt.modules.poudriere.**parse_config**(*config_file=None*)

Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

salt.modules.poudriere.**update_jail**(*name*)

Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

salt.modules.poudriere.**update_ports_tree**(*ports_tree*)

Updates the ports tree, either the default or the *ports_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

salt.modules.poudriere.**version**()

Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

26.7.353 salt.modules.powerpath

powerpath support.

Assumes RedHat

salt.modules.powerpath.**add_license**(*key*)

Add a license

salt.modules.powerpath.**has_powerpath**()

salt.modules.powerpath.**list_licenses**()

returns a list of applied powerpath license keys

salt.modules.powerpath.**remove_license**(*key*)

Remove a license

26.7.354 salt.modules.proxy

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

salt.modules.proxy.**get_ftp_proxy**(*network_service='Ethernet'*)

Returns the current ftp proxy settings

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

salt.modules.proxy.**get_http_proxy**(*network_service='Ethernet'*)

Returns the current http proxy settings

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

salt.modules.proxy.**get_https_proxy**(*network_service='Ethernet'*)

Returns the current https proxy settings

network_service

The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

salt.modules.proxy.**get_proxy_bypass**(*network_service='Ethernet'*)

Returns the current domains that can bypass the proxy

network_service

The network service to get the bypass domains from, this is only necessary on macOS

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

salt.modules.proxy.**get_proxy_win**()

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

salt.modules.proxy.**set_ftp_proxy**(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the ftp proxy settings

server
: The proxy server to use

port
: The port used by the proxy server

user
: The username to use for the proxy server if required

password
: The password to use if required by the server

network_service
: The network service to apply the changes to, this only necessary on macOS

bypass_hosts
: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user
↪password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.**set_http_proxy**(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server
: The proxy server to use

port
: The port used by the proxy server

user
: The username to use for the proxy server if required

password
: The password to use if required by the server

network_service
: The network service to apply the changes to, this only necessary on macOS

bypass_hosts
: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user
↪password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.**set_https_proxy**(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server
The proxy server to use

port
The port used by the proxy server

user
The username to use for the proxy server if required

password
The password to use if required by the server

network_service
The network service to apply the changes to, this only necessary on macOS

bypass_hosts
The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user
↪password=proxy_pass network_service=Ethernet
```

salt.modules.proxy.**set_proxy_bypass**(*domains*, *network_service='Ethernet'*)

Sets the domains that can bypass the proxy

domains
An array of domains allowed to bypass the proxy

network_service
The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

salt.modules.proxy.**set_proxy_win**(*server*, *port*, *types=None*, *bypass_hosts=None*)

Sets the http proxy settings, only works with Windows.

server
The proxy server to use

password
The password to use if required by the server

types
The types of proxy connections should be setup with this server. Valid types are:
- `http`
- `https`
- `ftp`

bypass_hosts
The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

26.7.355 salt.modules.ps

A salt interface to psutil, a system and process library. See http://code.google.com/p/psutil.

depends

- python-utmp package (optional)

salt.modules.ps.**boot_time**(*time_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

time_format

Optionally specify a strftime format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. `Fri May 2 19:08:32 2014`).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

salt.modules.ps.**cpu_percent**(*interval=0.1*, *per_cpu=False*)

Return the percent of time the CPU is busy.

interval

the number of seconds to sample CPU usage over

per_cpu

if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

salt.modules.ps.**cpu_times**(*per_cpu=False*)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

per_cpu

if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

salt.modules.ps.**disk_io_counters**(*device=None*)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters

salt '*' ps.disk_io_counters device=sda1
```

salt.modules.ps.**disk_partition_usage**(*all=False*)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

salt.modules.ps.**disk_partitions**(*all=False*)

Return a list of disk partitions and their device, mount point, and filesystem type.

all

if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

salt.modules.ps.**disk_usage**(*path*)

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

salt.modules.ps.**get_pid_list**()

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

salt.modules.ps.**get_users**()

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

salt.modules.ps.**kill_pid**(*pid*, *signal=15*)

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid

PID of process to kill.

signal

Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

salt.modules.ps.**lsof**(*name*)

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

salt.modules.ps.**netstat**(*name*)

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

salt.modules.ps.**network_io_counters**(*interface=None*)

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters

salt '*' ps.network_io_counters interface=eth0
```

salt.modules.ps.**num_cpus**()

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

salt.modules.ps.**pgrep**(*pattern*, *user=None*, *full=False*, *pattern_is_regex=False*)

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

pattern
: Pattern to search for in the process list.

user
: Limit matches to the given username. Default: All users.

full
: A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

pattern_is_regex
: This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.

  New in version 3001.

Examples:

Find all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user 'tom':

```
salt '*' ps.pgrep bash user=tom
```

salt.modules.ps.**pkill**(*pattern*, *user=None*, *signal=15*, *full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
        [full=(true|false)]
```

pattern
Pattern to search for in the process list.

user
Limit matches to the given username. Default: All users.

signal
Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

full
A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Send SIGHUP to all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user 'tom':

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.`**`proc_info`**(*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

pid
PID of process to query.

attrs
Optional list of desired process attributes. The list of possible attributes can be found here: https://psutil.readthedocs.io/en/latest/#processes

`salt.modules.ps.`**`psaux`**(*name*)

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.`**`ss`**(*name*)

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

`salt.modules.ps.`**`status`**(*status*)

New in version 3006.0.

Returns a list of processes according to their state.

CLI Example:

```
salt '*' ps.status STATUS
```

where STATUS is one of

- running
- sleeping
- disk_sleep
- stopped
- tracing_stop
- zombie
- dead
- wake_kill
- waking
- parked (Linux)
- idle (Linux, macOS, FreeBSD)
- locked (FreeBSD)
- waiting (FreeBSD)
- suspended (NetBSD)

See https://psutil.readthedocs.io/en/latest/index.html?highlight=status#process-status-constants

salt.modules.ps.**swap_memory**()

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.swap_memory
```

salt.modules.ps.**top**(*num_processes=5*, *interval=3*)

Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top

salt '*' ps.top 5 10
```

salt.modules.ps.**total_physical_memory**()

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

salt.modules.ps.**virtual_memory**()

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

26.7.356 salt.modules.publish

Publish a command from a minion to a target

salt.modules.publish.**full_data**(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=''*, *timeout=5*)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

---

salt.modules.publish.**publish**(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=''*, *timeout=5*, *via_master=None*)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces ''
↪grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam','spam=cheese']"
```

When running via salt-call, the *via_master* flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.`**`runner`**(*fun*, *arg=None*, *timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

26.7.357 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.`**`disable`**(*message=None*)

New in version 2014.7.0.

Disable the puppet agent

message

New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

`salt.modules.puppet.`**`enable`**()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

salt.modules.puppet.**fact**(*name*, *puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

salt.modules.puppet.**facts**(*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

salt.modules.puppet.**noop**(**args*, ***kwargs*)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
↪tags=basefiles::edit,apache::server
```

salt.modules.puppet.**plugin_sync**()

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

salt.modules.puppet.**run**(**args*, ***kwargs*)

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-
↪splay ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
↪tags=basefiles::edit,apache::server
```

salt.modules.puppet.**status**()

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

salt.modules.puppet.**summary**()

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

26.7.358 salt.modules.purefa

Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the `purestorage` python package in your python installation path that is running salt.

```
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

  1) From the minion config

```
pure_tags:
  fa:
    san_ip: management vip or hostname for the FlashArray
    api_token: A valid api token for the FlashArray being managed
```

  2) From environment (PUREFA_IP and PUREFA_API)

  3) From the pillar (PUREFA_IP and PUREFA_API)

maintainer
Simon Dodsley (simon@purestorage.com)

maturity
new

requires
purestorage

platform
all

New in version 2018.3.0.

salt.modules.purefa.**hg_create**(*name*, *host=None*, *volume=None*)

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

name
[string] name of hostgroup (truncated to 63 characters)

host
[string] name of host to add to hostgroup
volume
[string] name of volume to add to hostgroup
CLI Example:

```
salt '*' purefa.hg_create foo host=bar volume=vol
```

salt.modules.purefa.**hg_delete**(*name*)

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False is hostgroup is already in a deleted state.

New in version 2018.3.0.
name
[string] name of hostgroup
CLI Example:

```
salt '*' purefa.hg_delete foo
```

salt.modules.purefa.**hg_remove**(*name*, *volume=None*, *host=None*)

Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.
name
[string] name of hostgroup
volume
[string] name of volume to remove from hostgroup
host
[string] name of host to remove from hostgroup
CLI Example:

```
salt '*' purefa.hg_remove foo volume=test host=bar
```

salt.modules.purefa.**hg_update**(*name*, *host=None*, *volume=None*)

Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn't exist, or host or volume do not exist.

New in version 2018.3.0.
name
[string] name of hostgroup
host
[string] name of host to add to hostgroup
volume
[string] name of volume to add to hostgroup
CLI Example:

```
salt '*' purefa.hg_update foo host=bar volume=vol
```

salt.modules.purefa.**host_create**(*name*, *iqn=None*, *wwn=None*, *nqn=None*)

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name
: [string] name of host (truncated to 63 characters)

iqn
: [string] iSCSI IQN of host

nqn
: [string] NVMeF NQN of host .. versionadded:: 3006.0

wwn
: [string] Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
↪nqn='<Valid NQN>'
```

`salt.modules.purefa.`**`host_delete`**(*name*)

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn't exist.

New in version 2018.3.0.

name
: [string] name of host

CLI Example:

```
salt '*' purefa.host_delete foo
```

`salt.modules.purefa.`**`host_update`**(*name*, *iqn=None*, *wwn=None*, *nqn=None*)

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name
: [string] name of host

nqn
: [string] Additional NVMeF NQN of host .. versionadded:: 3006.0

iqn
: [string] Additional iSCSI IQN of host

wwn
: [string] Additional Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
↪nqn='<Valid NQN>'
```

`salt.modules.purefa.`**`pg_create`**(*name*, *hostgroup=None*, *host=None*, *volume=None*, *enabled=True*)

Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:

- Protection Grop already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

name
: [string] name of protection group

hostgroup
: [string] name of hostgroup to add to protection group

host
: [string] name of host to add to protection group

volume
: [string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]
↪enabled=[true | false]
```

salt.modules.purefa.**pg_delete**(*name*, *eradicate=False*)

Delete a protecton group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

name
: [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_delete foo
```

salt.modules.purefa.**pg_eradicate**(*name*)

Eradicate a deleted protecton group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

name
: [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_eradicate foo
```

salt.modules.purefa.**pg_remove**(*name*, *hostgroup=None*, *host=None*, *volume=None*)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

Will return False in the following cases:

- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

name
: [string] name of hostgroup

hostgroup
: [string] name of hostgroup to remove from protection group

host
: [string] name of host to remove from hostgroup

volume
: [string] name of volume to remove from hostgroup

CLI Example:

```
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

salt.modules.purefa.**pg_update**(*name*, *hostgroup=None*, *host=None*, *volume=None*)

Update a protection group on a Pure Storage FlashArray.

Will return False in the following cases:

- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

name
[string] name of protection group

hostgroup
[string] name of hostgroup to add to protection group

host
[string] name of host to add to protection group

volume
[string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]
```

`salt.modules.purefa.`**`snap_create`**(*name*, *suffix=None*)

Create a volume snapshot on a Pure Storage FlashArray.

Will return False is volume selected to snap does not exist.

New in version 2018.3.0.

name
[string] name of volume to snapshot

suffix
[string] if specificed forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
```

`salt.modules.purefa.`**`snap_delete`**(*name*, *suffix=None*, *eradicate=False*)

Delete a volume snapshot on a Pure Storage FlashArray.

Will return False if selected snapshot does not exist.

New in version 2018.3.0.

name
[string] name of volume

suffix
[string] name of snapshot

eradicate
[boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.snap_delete foo suffix=snap eradicate=True
```

`salt.modules.purefa.`**`snap_eradicate`**(*name*, *suffix=None*)

Eradicate a deleted volume snapshot on a Pure Storage FlashArray.

Will return False if snapshot is not in a deleted state.

New in version 2018.3.0.

name
[string] name of volume

suffix
[string] name of snapshot

CLI Example:

```
salt '*' purefa.snap_eradicate foo suffix=snap
```

salt.modules.purefa.**snap_volume_create**(*name*, *target*, *overwrite=False*)

Create R/W volume from snapshot on a Pure Storage FlashArray.

Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.

New in version 2018.3.0.

name
: [string] name of volume snapshot

target
: [string] name of clone volume

overwrite
: [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

salt.modules.purefa.**volume_attach**(*name*, *host*)

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

name
: [string] name of volume

host
: [string] name of host

CLI Example:

```
salt '*' purefa.volume_attach foo bar
```

salt.modules.purefa.**volume_clone**(*name*, *target*, *overwrite=False*)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

name
: [string] name of volume

target
: [string] name of clone volume

overwrite
: [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.volume_clone foo bar overwrite=True
```

salt.modules.purefa.**volume_create**(*name*, *size=None*)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

name
[string] name of volume (truncated to 63 characters)
size
[string] if specificed capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.
CLI Example:

```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

salt.modules.purefa.**volume_delete**(*name*, *eradicate=False*)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist is already in a deleted state.

New in version 2018.3.0.
name
[string] name of volume
eradicate
[boolean] Eradicate volume after deletion if True. Default is False
CLI Example:

```
salt '*' purefa.volume_delete foo eradicate=True
```

salt.modules.purefa.**volume_detach**(*name*, *host*)

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.
name
[string] name of volume
host
[string] name of host
CLI Example:

```
salt '*' purefa.volume_detach foo bar
```

salt.modules.purefa.**volume_eradicate**(*name*)

Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False is volume is not in a deleted state.

New in version 2018.3.0.
name
[string] name of volume
CLI Example:

```
salt '*' purefa.volume_eradicate foo
```

salt.modules.purefa.**volume_extend**(*name*, *size*)

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.
name
[string] name of volume

size
: [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_extend foo 10T
```

26.7.359 salt.modules.purefb

Management of Pure Storage FlashBlade

Installation Prerequisites

- You will need the `purity_fb` python package in your python installation path that is running salt.

```
pip install purity_fb
```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.

  1) From the minion config

```
pure_tags:
  fb:
    san_ip: management vip or hostname for the FlashBlade
    api_token: A valid api token for the FlashBlade being managed
```

  2) From environment (PUREFB_IP and PUREFB_API)

  3) From the pillar (PUREFB_IP and PUREFB_API)

maintainer
: Simon Dodsley (simon@purestorage.com)

maturity
: new

requires
: purity_fb

platform
: all

New in version 2019.2.0.

`salt.modules.purefb.`**`fs_create`**(*name*, *size=None*, *proto='NFS'*, *nfs_rules='*(rw,no_root_squash)'*, *snapshot=False*)

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.

name
: [string] name of filesystem (truncated to 63 characters)

proto
: [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS

snapshot: **boolean**
: (Optional) Are snapshots enabled on the filesystem. Default is False

nfs_rules
: [string] (Optional) export rules for NFS. If not specified default is `*(rw,no_root_squash)`. Refer to Pure Storage documentation for formatting rules.

size
: [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

`salt.modules.purefb.`**`fs_delete`**(*name*, *eradicate=False*)

Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn't exist or is already in a deleted state.

New in version 2019.2.0.

name
: [string] name of filesystem

eradicate
: [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.fs_delete foo eradicate=True
```

`salt.modules.purefb.`**`fs_eradicate`**(*name*)

Eradicate a deleted filesystem on a Pure Storage FlashBlade.

Will return False is filesystem is not in a deleted state.

New in version 2019.2.0.

name
: [string] name of filesystem

CLI Example:

```
salt '*' purefb.fs_eradicate foo
```

`salt.modules.purefb.`**`fs_extend`**(*name*, *size*)

Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

name
: [string] name of filesystem

size
: [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefb.fs_extend foo 10T
```

`salt.modules.purefb.`**`fs_update`**(*name*, *rules*, *snapshot=False*)

Update filesystem on a Pure Storage FlashBlade.

Allows for change of NFS export rules and enabling/disabled of snapshotting capability.

New in version 2019.2.0.

name
: [string] name of filesystem

rules
: [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.

snapshot: boolean
: (Optional) Enable/Disable snapshots on the filesystem. Default is False

CLI Example:

```
salt '*' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.
↪24(rw)' snapshot=True
```

salt.modules.purefb.**snap_create**(*name*, *suffix=None*)

Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.

name
: [string] name of filesystem to snapshot

suffix
: [string] if specificed forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```
salt '*' purefb.snap_create foo
salt '*' purefb.snap_create foo suffix=bar
```

salt.modules.purefb.**snap_delete**(*name*, *suffix=None*, *eradicate=False*)

Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.

name
: [string] name of filesystem

suffix
: [string] name of snapshot

eradicate
: [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefb.snap_delete foo suffix=snap eradicate=True
```

salt.modules.purefb.**snap_eradicate**(*name*, *suffix=None*)

Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.

name
: [string] name of filesystem

suffix
: [string] name of snapshot

CLI Example:

```
salt '*' purefb.snap_eradicate foo suffix=snap
```

26.7.360 salt.modules.pushbullet

Module for sending messages to Pushbullet (https://www.pushbullet.com)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
pushbullet:
  api_key: 'ABC123abc123ABC123abc123ABC123ab'
```

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

`salt.modules.pushbullet.`**`push_note`**(*device=None*, *title=None*, *body=None*)

Pushing a text note.

Parameters

- **`device`** -- Pushbullet target device
- **`title`** -- Note title
- **`body`** -- Note body

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body=
↪"Example body."
```

26.7.361 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)

New in version 2016.3.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

`salt.modules.pushover_notify.`**`post_message`**(*user=None*, *device=None*, *message=None*, *title=None*, *priority=None*, *expire=None*, *retry=None*, *sound=None*, *api_version=1*, *token=None*)

Send a message to a Pushover user or group.

Parameters

- **`user`** -- The user or group to send to, must be key of user or group not email address.
- **`message`** -- The message to send to the PushOver user or group.
- **`title`** -- Specify who the message is from.
- **`priority`** -- The priority of the message, defaults to 0.

- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
↪title='Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
↪title='Message from Salt' message='Build is done' priority='2' expire=
↪'720' retry='5'
```

26.7.362 salt.modules.pw_group

Manage groups on FreeBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.pw_group.`**`add`**`(`*name*, *gid=None*, ***kwargs*`)`

Changed in version 3006.0.

Add the specified group

name

Name of the new group

gid

Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.`**`adduser`**`(`*name*, *username*`)`

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.pw_group.`**`chgid`**`(`*name*, *gid*`)`

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.pw_group.**delete**(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.pw_group.**deluser**(*name*, *username*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.pw_group.**getent**(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.pw_group.**info**(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.pw_group.**members**(*name*, *members_list*)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

foo:x:1234:user1,user2,user3,...

26.7.363 salt.modules.pw_user

Manage users with the pw command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

---

salt.modules.pw_user.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, *loginclass=None*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.pw_user.**chfullname**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.pw_user.**chgid**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.pw_user.**chgroups**(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name
: Username to modify

groups
: List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append
: [False] Set to `True` to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.pw_user.**chhome**(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name
: Username to modify

home
: New home directory to set

persist
: [False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.pw_user.**chhomephone**(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.pw_user.**chloginclass**(*name*, *loginclass*, *root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

salt.modules.pw_user.**chroomnumber**(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.pw_user.**chshell**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.pw_user.**chuid**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.pw_user.**chworkphone**(*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

salt.modules.pw_user.**delete**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.pw_user.**get_loginclass**(*name*)

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

salt.modules.pw_user.**getent**(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.pw_user.**info**(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.pw_user.**list_groups**(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.pw_user.**list_users**()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.pw_user.**rename**(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

26.7.364 salt.modules.pyenv

Manage python installations with pyenv.

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version 2014.4.0.

salt.modules.pyenv.**default**(*python=None*, *runas=None*)

Returns or sets the currently defined default python.

python=None

The version to set as the default. Should match one of the versions listed by *pyenv.versions*. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

salt.modules.pyenv.**do**(*cmdline=None*, *runas=None*)

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

salt.modules.pyenv.**do_with_python**(*python*, *cmdline*, *runas=None*)

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

salt.modules.pyenv.**install**(*runas=None*, *path=None*)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

salt.modules.pyenv.**install_python**(*python*, *runas=None*)

Install a python implementation.

python

The version of python to install, should match one of the versions listed by pyenv.list

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

salt.modules.pyenv.**is_installed**(*runas=None*)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

salt.modules.pyenv.**list_**(*runas=None*)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

salt.modules.pyenv.**rehash**(*runas=None*)

Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

salt.modules.pyenv.**uninstall_python**(*python*, *runas=None*)

Uninstall a python implementation.

python

The version of python to uninstall. Should match one of the versions listed by *pyenv.versions*

CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

salt.modules.pyenv.**update**(*runas=None*, *path=None*)

Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

salt.modules.pyenv.**versions**(*runas=None*)

List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

26.7.365 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

depends
qemu-img

salt.modules.qemu_img.**convert**(*orig, dest, fmt*)

Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

salt.modules.qemu_img.**make_image**(*location, size, fmt*)

Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

26.7.366 salt.modules.qemu_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

salt.modules.qemu_nbd.**clear**(*mnt*)

Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}'
```

salt.modules.qemu_nbd.**connect**(*image*)

Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

salt.modules.qemu_nbd.**init**(*image*, *root=None*)

Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

salt.modules.qemu_nbd.**mount**(*nbd*, *root=None*)

Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

26.7.367 salt.modules.quota

Module for managing quotas on POSIX-like systems.

salt.modules.quota.**get_mode**(*device*)

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

salt.modules.quota.**off**(*device*)

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

salt.modules.quota.**on**(*device*)

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

salt.modules.quota.**report**(*mount*)

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

salt.modules.quota.**set_**(*device*, ***kwargs*)

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

salt.modules.quota.**stats**()

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

salt.modules.quota.**warn**()

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

26.7.368 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.**add_user**(*name*, *password=None*, *runas=None*)

Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

salt.modules.rabbitmq.**add_vhost**(*vhost*, *runas=None*)

Adds a vhost via rabbitmqctl add_vhost.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

salt.modules.rabbitmq.**change_password**(*name*, *password*, *runas=None*)

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

salt.modules.rabbitmq.**check_password**(*name*, *password*, *runas=None*)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

salt.modules.rabbitmq.**clear_password**(*name*, *runas=None*)

Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

salt.modules.rabbitmq.**cluster_status**(*runas=None*)

return rabbitmq cluster_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

salt.modules.rabbitmq.**delete_policy**(*vhost*, *name*, *runas=None*)

Delete a policy based on rabbitmqctl clear_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA
```

salt.modules.rabbitmq.**delete_upstream**(*name*, *runas=None*)

Deletes an upstream via rabbitmqctl clear_parameter.

Parameters

- **name** (*str*) -- The name of the upstream to delete.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.delete_upstream upstream_name
```

New in version 3000.

salt.modules.rabbitmq.**delete_user**(*name*, *runas=None*)

Deletes a user via rabbitmqctl delete_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

salt.modules.rabbitmq.**delete_vhost**(*vhost*, *runas=None*)

Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

salt.modules.rabbitmq.**disable_plugin**(*name*, *runas=None*)

Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

salt.modules.rabbitmq.**enable_plugin**(*name*, *runas=None*)

Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

salt.modules.rabbitmq.**force_reset**(*runas=None*)

Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

salt.modules.rabbitmq.**join_cluster**(*host*, *user='rabbit'*, *ram_node=None*, *runas=None*)

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

salt.modules.rabbitmq.**list_available_plugins**(*runas=None*)

Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

salt.modules.rabbitmq.**list_enabled_plugins**(*runas=None*)

Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

salt.modules.rabbitmq.**list_permissions**(*vhost*, *runas=None*)

Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions /myvhost
```

salt.modules.rabbitmq.**list_policies**(*vhost='/'*, *runas=None*)

Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.list_policies
```

salt.modules.rabbitmq.**list_queues**(*runas=None*, **args*)

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.**list_queues_vhost**(*vhost*, *runas=None*, **args*)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost `/`, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.**list_upstreams**(*runas=None*)

Returns a dict of upstreams based on rabbitmqctl list_parameters.

Parameters

runas (*str*) -- The name of the user to run this command as.

CLI Example:

```
salt '*' rabbitmq.list_upstreams
```

New in version 3000.

salt.modules.rabbitmq.**list_user_permissions**(*name*, *runas=None*)

List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions user
```

salt.modules.rabbitmq.**list_users**(*runas=None*)

Return a list of users based off of rabbitmqctl user_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

salt.modules.rabbitmq.**list_vhosts**(*runas=None*)

Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

salt.modules.rabbitmq.**plugin_is_enabled**(*name*, *runas=None*)

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

salt.modules.rabbitmq.**policy_exists**(*vhost*, *name*, *runas=None*)

Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

salt.modules.rabbitmq.**reset**(*runas=None*)

Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

salt.modules.rabbitmq.**set_permissions**(*vhost*, *user*, *conf='.*'*, *write='.*'*, *read='.*'*, *runas=None*)

Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions myvhost myuser
```

salt.modules.rabbitmq.**set_policy**(*vhost*, *name*, *pattern*, *definition*, *priority=None*, *runas=None*, *apply_to=None*)

Set a policy based on rabbitmqctl set_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

salt.modules.rabbitmq.**set_upstream**(*name*, *uri*, *prefetch_count=None*, *reconnect_delay=None*, *ack_mode=None*, *trust_user_id=None*, *exchange=None*, *max_hops=None*, *expires=None*, *message_ttl=None*, *ha_policy=None*, *queue=None*, *runas=None*)

Configures an upstream via rabbitmqctl set_parameter. This can be an exchange-upstream, a queue-upstream or both.

Parameters

name (*str*) -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

Parameters

- **uri** (*str*) -- The AMQP URI(s) for the upstream.
- **prefetch_count** (*int*) -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect_delay** (*int*) -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- **ack_mode** (*str*) -- Determines how the link should acknowledge messages. If set to `on-confirm` (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to `on-publish`, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to `no-ack`, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.
- **trust_user_id** (*bool*) -- Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

Parameters

- **exchange** (*str*) -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max_hops** (*int*) -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the

same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.

- **expires** (*int*) -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.
- **message_ttl** (*int*) -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is None, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.
- **ha_policy** (*str*) -- Determines the "x-ha-policy" argument for the upstream queue for a federated exchange (see expires). This is only of interest when connecting to old brokers which determine queue HA mode using this argument. Default is None, meaning the queue is not HA.

The following parameter applies to federated queues only:

Parameters

- **queue** (*str*) -- The name of the upstream queue. Default is to use the same name as the federated queue.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_
↪hops=1             trust_user_id=True uri=amqp://hostname
```

New in version 3000.

salt.modules.rabbitmq.**set_user_tags**(*name*, *tags*, *runas=None*)

Add user tags via rabbitmqctl set_user_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

salt.modules.rabbitmq.**start_app**(*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

salt.modules.rabbitmq.**status**(*runas=None*)

return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

salt.modules.rabbitmq.**stop_app**(*runas=None*)

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

salt.modules.rabbitmq.**upstream_exists**(*name*, *runas=None*)

Return whether the upstreamexists based on rabbitmqctl list_parameters.

Parameters

- **name** (*str*) -- The name of the upstream to check for.
- **runas** (*str*) -- The name of the user to run the command as.

CLI Example:

```
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

salt.modules.rabbitmq.**user_exists**(*name*, *runas=None*)

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

salt.modules.rabbitmq.**vhost_exists**(*name*, *runas=None*)

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

26.7.369 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a `username` and a `password` in `/etc/salt/minion`:

```
rallydev:
  username: myuser@example.com
  password: 123pass
```

salt.modules.rallydev.**list_items**(*name*)

List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

salt.modules.rallydev.**list_users**()

List the users

CLI Example:

```
salt myminion rallydev.list_users
```

salt.modules.rallydev.**query_item**(*name*, *query_string*, *order='Rank'*)

Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

salt.modules.rallydev.**query_user**(*query_string*, *order='UserName'*)

Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

salt.modules.rallydev.**show_artifact**(*id_*)

Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

salt.modules.rallydev.**show_item**(*name*, *id_*)

Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

salt.modules.rallydev.**show_user**(*id_*)

Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

salt.modules.rallydev.**update_item**(*name*, *id_*, *field=None*, *value=None*, *postdata=None*)

Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=
↪<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

salt.modules.rallydev.**update_user**(*id_*, *field*, *value*)

Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

26.7.370 salt.modules.random_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

salt.modules.random_org.**generateBlobs**(*api_key=None*, *api_version=None*, ***kwargs*)

List all Slack users.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **format** -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

Returns

The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6

salt '*' get_integers number=5 min=1 max=6
```

salt.modules.random_org.**generateDecimalFractions**(*api_key=None*, *api_version=None*, ***kwargs*)

Generates true random decimal fractions

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns

A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4

salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
↪replacement=True
```

salt.modules.random_org.**generateGaussians**(*api_key=None*, *api_version=None*, ***kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

Returns

The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0
↪standardDeviation=1.0 significantDigits=8
```

salt.modules.random_org.**generateIntegers**(*api_key=None*, *api_version=None*, ***kwargs*)

Generate random integers

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns

A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6

salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

salt.modules.random_org.**generateStrings**(*api_key=None*, *api_version=None*, ***kwargs*)

Generate random strings.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length

- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns

A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=
↪'abcdefghijklmnopqrstuvwxyz'

salt '*' random_org.generateStrings number=10 length=16 characters
↪'abcdefghijklmnopqrstuvwxyz'
```

salt.modules.random_org.**generateUUIDs**(*api_key=None*, *api_version=None*, ***kwargs*)

Generate a list of random UUIDs

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

Returns

A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

salt.modules.random_org.**getUsage**(*api_key=None*, *api_version=None*)

Show current usages statistics

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.

Returns

The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage

salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=1
```

26.7.371 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

salt.modules.rbac_solaris.**auth_add**(*user*, *auth*)

Add authorization to user

user

[string] username

auth

[string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.**auth_get**(*user*, *computed=True*)

List authorization for user

user
: [string] username

computed
: [boolean] merge results from *auths* command into data from user_attr

CLI Example:

```
salt '*' rbac.auth_get leo
```

salt.modules.rbac_solaris.**auth_list**()

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

salt.modules.rbac_solaris.**auth_rm**(*user*, *auth*)

Remove authorization from user

user
: [string] username

auth
: [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.**profile_add**(*user*, *profile*)

Add profile to user

user
: [string] username

profile
: [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

salt.modules.rbac_solaris.**profile_get**(*user*, *default_hidden=True*)

List profiles for user

user
: [string] username

default_hidden
: [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

salt.modules.rbac_solaris.**profile_list**(*default_only=False*)

List all available profiles

default_only

[boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

salt.modules.rbac_solaris.**profile_rm**(*user, profile*)

Remove profile from user

user

[string] username

profile

[string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

salt.modules.rbac_solaris.**role_add**(*user, role*)

Add role to user

user

[string] username

role

[string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

salt.modules.rbac_solaris.**role_get**(*user*)

List roles for user

user

[string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.**role_list**()

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.**role_rm**(*user, role*)

Remove role from user

user

[string] username

role

[string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

26.7.372 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

`salt.modules.rbenv.`**`default`**(*ruby=None*, *runas=None*)

Returns or sets the currently defined default ruby

ruby

The version to set as the default. Should match one of the versions listed by *`rbenv.versions`*. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

`salt.modules.rbenv.`**`do`**(*cmdline*, *runas=None*, *env=None*)

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

`salt.modules.rbenv.`**`do_with_ruby`**(*ruby*, *cmdline*, *runas=None*)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

`salt.modules.rbenv.`**`install`**(*runas=None*, *path=None*)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

`salt.modules.rbenv.`**`install_ruby`**(*ruby*, *runas=None*)

Install a ruby implementation.

ruby

The version of Ruby to install, should match one of the versions listed by `rbenv.list`

runas

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

salt.modules.rbenv.**is_installed**(*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

salt.modules.rbenv.**list_**(*runas=None*)

List the installable versions of ruby

runas

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

salt.modules.rbenv.**rehash**(*runas=None*)

Run `rbenv rehash` to update the installed shims

runas

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

salt.modules.rbenv.**uninstall_ruby**(*ruby*, *runas=None*)

Uninstall a ruby implementation.

ruby

The version of ruby to uninstall. Should match one of the versions listed by *rbenv.versions*.

runas

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

salt.modules.rbenv.**update**(*runas=None*, *path=None*)

Updates the current versions of rbenv and ruby-build

runas

The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

salt.modules.rbenv.**versions**(*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

26.7.373 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.**disable**()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

salt.modules.rdp.**disconnect_session**(*session_id*)

Disconnect a session.

New in version 2016.11.0.

Parameters

session_id -- The numeric Id of the session.

Returns

A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id

salt '*' rdp.disconnect_session 99
```

salt.modules.rdp.**enable**()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

salt.modules.rdp.**get_session**(*session_id*)

Get information about a session.

New in version 2016.11.0.

Parameters

session_id -- The numeric Id of the session.

Returns

A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id

salt '*' rdp.get_session 99
```

salt.modules.rdp.**list_sessions**(*logged_in_users_only=False*)

List information about the sessions.

New in version 2016.11.0.

Parameters

logged_in_users_only -- If True, only return sessions with users logged in.

Returns

A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

salt.modules.rdp.**logoff_session**(*session_id*)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters

session_id -- The numeric Id of the session.

Returns

A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id

salt '*' rdp.logoff_session 99
```

salt.modules.rdp.**status**()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

26.7.374 salt.modules.rebootmgr module

Module for rebootmgr :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

New in version 3004.

salt.modules.rebootmgr.**cancel**()

Cancels an already running reboot.

CLI Example:

```
salt microos rebootmgr cancel
```

salt.modules.rebootmgr.**get_group**()

The currently set lock group for etcd.

CLI Example:

```
salt microos rebootmgr get_group
```

salt.modules.rebootmgr.**get_strategy**()

The currently used reboot strategy of rebootmgrd will be printed.

CLI Example:

```
salt microos rebootmgr get_strategy
```

salt.modules.rebootmgr.**get_window**()

The currently set maintenance window will be printed.

CLI Example:

```
salt microos rebootmgr get_window
```

salt.modules.rebootmgr.**is_active**()

Check if the rebootmgrd is running and active or not.

CLI Example:

```
salt microos rebootmgr is_active
```

salt.modules.rebootmgr.**lock**(*machine_id=None*, *group=None*)

Lock a machine. If no group is specified, the local default group
will be used. If no machine-id is specified, the local machine will be locked.

machine_id
The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

group
Group name

CLI Example:

```
salt microos rebootmgr lock group=group1
```

salt.modules.rebootmgr.**reboot**(*order=None*)

Tells rebootmgr to schedule a reboot.

With the [now] option, a forced reboot is done, no lock from etcd is requested and a set maintenance window is ignored. With the [fast] option, a lock from etcd is requested if needed, but a defined maintenance window is ignored.

order
If specified, can be "now" or "fast"

CLI Example:

```
salt microos rebootmgr reboot
salt microos rebootmgt reboot order=now
```

salt.modules.rebootmgr.**set_group**(*group*)

Set the group, to which this machine belongs to get a reboot lock
from etcd.

group
Group name

CLI Example:

```
salt microos rebootmgr set_group group=group_1
```

salt.modules.rebootmgr.**set_max**(*max_locks*, *group=None*)

Set the maximal number of hosts in a group, which are allowed to
reboot at the same time.

number
Maximal number of hosts in a group

group
Group name

CLI Example:

```
salt microos rebootmgr set_max 4
```

salt.modules.rebootmgr.**set_strategy**(*strategy=None*)

A new strategy to reboot the machine is set and written into /etc/rebootmgr.conf.

strategy
If specified, must be one of those options:

best-effort - This is the default strategy. If etcd is
running, etcd-lock is used. If no etcd is running, but a maintenance window is specified, the strategy will be maint-window. If no maintenance window is specified, the machine is immediately rebooted (instantly).

etcd-lock - A lock at etcd for the specified lock-group will
be acquired before reboot. If a maintenance window is specified, the lock is only acquired during this window.

maint-window - Reboot does happen only during a specified
maintenance window. If no window is specified, the instantly strategy is followed.

instantly - Other services will be informed that a reboot will
happen. Reboot will be done without getting any locks or waiting for a maintenance window.

off - Reboot requests are temporary
ignored. /etc/rebootmgr.conf is not modified.

CLI Example:

```
salt microos rebootmgr set_strategy stragegy=off
```

salt.modules.rebootmgr.**set_window**(*time*, *duration*)

Set's the maintenance window.

time
The format of time is the same as described in systemd.time(7).

duration
The format of duration is "[XXh][YYm]".

CLI Example:

```
salt microos rebootmgr set_window time="Thu,Fri 2020-*-1,5 11:12:13" duration=1h
```

salt.modules.rebootmgr.**status**()

Returns the current status of rebootmgrd.

Valid returned values are:
0 - No reboot requested 1 - Reboot requested 2 - Reboot requested, waiting for maintenance window 3 - Reboot requested, waiting for etcd lock.

CLI Example:

```
salt microos rebootmgr status
```

salt.modules.rebootmgr.**unlock**(*machine_id=None*, *group=None*)

Unlock a machine. If no group is specified, the local default group
will be used. If no machine-id is specified, the local machine will be locked.

machine_id
The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.

group
Group name

CLI Example:

```
salt microos rebootmgr unlock group=group1
```

salt.modules.rebootmgr.**version**()

Return the version of rebootmgrd

CLI Example:

```
salt microos rebootmgr version
```

26.7.375 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

configuration
This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

salt.modules.redismod.**bgrewriteaof**(*host=None*, *port=None*, *db=None*, *password=None*)

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

salt.modules.redismod.**bgsave**(*host=None*, *port=None*, *db=None*, *password=None*)

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

salt.modules.redismod.**config_get**(*pattern='*'*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

salt.modules.redismod.**config_set**(*name*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.**dbsize**(*host=None*, *port=None*, *db=None*, *password=None*)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

salt.modules.redismod.**delete**(**keys*, ***connection_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

salt.modules.redismod.**exists**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

salt.modules.redismod.**expire**(*key*, *seconds*, *host=None*, *port=None*, *db=None*, *password=None*)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

salt.modules.redismod.**expireat**(*key*, *timestamp*, *host=None*, *port=None*, *db=None*, *password=None*)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

salt.modules.redismod.**flushall**(*host=None*, *port=None*, *db=None*, *password=None*)

Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

salt.modules.redismod.**flushdb**(*host=None*, *port=None*, *db=None*, *password=None*)

Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

salt.modules.redismod.**get_key**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

salt.modules.redismod.**get_master_ip**(*host=None*, *port=None*, *password=None*)

Get host information about slave

New in version 2016.3.0.

CLI Example:

```
salt '*' redis.get_master_ip
```

salt.modules.redismod.**hdel**(*key*, **fields*, ***options*)

Delete one of more hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

salt.modules.redismod.**hexists**(*key*, *field*, *host=None*, *port=None*, *db=None*, *password=None*)

Determine if a hash fields exists.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

salt.modules.redismod.**hget**(*key*, *field*, *host=None*, *port=None*, *db=None*, *password=None*)

Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

salt.modules.redismod.**hgetall**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

salt.modules.redismod.**hincrby**(*key*, *field*, *increment=1*, *host=None*, *port=None*, *db=None*, *password=None*)

Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

salt.modules.redismod.**hincrbyfloat**(*key*, *field*, *increment=1.0*, *host=None*, *port=None*, *db=None*, *password=None*)

Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

salt.modules.redismod.**hlen**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

salt.modules.redismod.**hmget**(*key*, **fields*, ***options*)

Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

salt.modules.redismod.**hmset**(*key*, ***fieldsvals*)

Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

salt.modules.redismod.**hscan**(*key*, *cursor=0*, *match=None*, *count=None*, *host=None*, *port=None*, *db=None*, *password=None*)

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

salt.modules.redismod.**hset**(*key*, *field*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

salt.modules.redismod.**hsetnx**(*key*, *field*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

salt.modules.redismod.**hvals**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

salt.modules.redismod.**info**(*host=None*, *port=None*, *db=None*, *password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

salt.modules.redismod.**key_type**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

salt.modules.redismod.**keys**(*pattern='*'*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

salt.modules.redismod.**lastsave**(*host=None*, *port=None*, *db=None*, *password=None*)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

salt.modules.redismod.**llen**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

salt.modules.redismod.**lrange**(*key*, *start*, *stop*, *host=None*, *port=None*, *db=None*, *password=None*)

Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

salt.modules.redismod.**ping**(*host=None*, *port=None*, *db=None*, *password=None*)

Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

salt.modules.redismod.**save**(*host=None*, *port=None*, *db=None*, *password=None*)

Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

salt.modules.redismod.**sentinel_get_master_ip**(*master*, *host=None*, *port=None*, *password=None*)

Get ip for sentinel master

New in version 2016.3.0.

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

salt.modules.redismod.**set_key**(*key*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

salt.modules.redismod.**shutdown**(*host=None*, *port=None*, *db=None*, *password=None*)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

salt.modules.redismod.**slaveof**(*master_host=None*, *master_port=None*, *host=None*, *port=None*, *db=None*, *password=None*)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

salt.modules.redismod.**smembers**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

salt.modules.redismod.**time**(*host=None*, *port=None*, *db=None*, *password=None*)

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

salt.modules.redismod.**zcard**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

salt.modules.redismod.**zrange**(*key*, *start*, *stop*, *host=None*, *port=None*, *db=None*, *password=None*)

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

26.7.376 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\). The following are valid methods of passing the key on the CLI:

Using single backslashes:
`"SOFTWARE\Python"` `'SOFTWARE\Python'` (will not work on a Windows Master)

Using double backslashes:
`SOFTWARE\\Python`

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is `(Default)` with a displayed value of `(value not set)`. The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\
↪NvBackend.exe\""
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\
↪btmshellex.dll\",TrayApp"
```

In this example these are the values for each:

Hive:
`HKEY_LOCAL_MACHINE`

Key and subkeys:
`SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run`

Value:

- **There are 3 value names**:
  - *RTHDVCPL*
  - *NvBackend*
  - *BTMTrayAgent*
- Each value name has a corresponding value

depends

- salt.utils.win_reg

`salt.modules.reg.`**`broadcast_change`**`()`

Refresh the Windows environment.

Note: This will only effect new processes and windows. Services will not see the change until the system restarts.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' reg.broadcast_change
```

salt.modules.reg.**delete_key_recursive**(*hive*, *key*, *use_32bit_registry=False*)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

Parameters

hive (*str*) -- The name of the hive. Can be one of the following

- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU
- HKEY_CLASSES_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC

key (str):
The key to remove (looks like a path)

use_32bit_registry (bool, optional):
Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Default is `False`.

Returns

A dictionary listing the keys that deleted successfully as well as
those that failed to delete.

Return type
dict

CLI Example:

The following example will remove `delete_me` and all its subkeys from the `SOFTWARE` key in `HKEY_LOCAL_MACHINE`:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

salt.modules.reg.**delete_value**(*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Delete a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*, optional) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.

  Default is `None`.
- **use_32bit_registry** (*bool*, optional) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

  Default is `False`.

Returns

`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\\Salt'
↪'version'
```

salt.modules.reg.**import_file**(*source*, *use_32bit_registry=False*)

Import registry settings from a Windows REG file by invoking REG.EXE.

New in version 2018.3.0.

Parameters

- **source** (*str*) -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)
- **use_32bit_registry** (bool, optional) -- If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

  Default is False.

Returns

True if successful, otherwise an error is raised

Return type

bool

Raises

- **ValueError** -- If the value of source is an invalid path or otherwise causes cp.cache_file to return False
- ***CommandExecutionError*** -- If reg.exe exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import_file salt://win/printer_config/110_
↪Canon/postinstall_config.reg
```

salt.modules.reg.**key_exists**(*hive*, *key*, *use_32bit_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters

- **hive** (*str*) -- The hive to connect to.
- **key** (*str*) -- The key to check.
- **use_32bit_registry** (bool, optional) -- Look in the 32bit portion of the registry.

  Default is False.

Returns

True if exists, otherwise False.

Return type

bool

CLI Example:

```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

salt.modules.reg.**list_keys**(*hive*, *key=None*, *use_32bit_registry=False*)

Enumerates the subkeys in a registry key or hive.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (str, optional) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.

  Default is None.

- **use_32bit_registry** (bool, optional) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

  Default is False.

Returns
A list of keys/subkeys under the hive or key.

Return type
list

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

salt.modules.reg.**list_values**(*hive*, *key=None*, *use_32bit_registry=False*)

Enumerates the values in a registry key or hive.

Note: The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of values.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (str, optional) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.

  Default is None.
- **use_32bit_registry** (bool, optional) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

  Default is False.

Returns
A list of values under the hive or key.

Return type
list

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\\CurrentControlSet\\
↪Services\\Tcpip'
```

salt.modules.reg.**read_value**(*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Reads a registry value entry or the default value for a key. To read the default value, don't pass vname.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following:
- **HKLM** (*- HKEY_LOCAL_MACHINE or*) --
- **HKCU** (*- HKEY_CURRENT_USER or*) --
- **HKU** (*- HKEY_USER or*) --
- **HKCR** (*- HKEY_CLASSES_ROOT or*) --
- **HKCC** (*- HKEY_CURRENT_CONFIG or*) --
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (str, optional) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.

Default is None.

- **use_32bit_registry** (bool, optional) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

  Default is False.

Returns

A dictionary containing the passed settings as well as the
value_data if successful. If unsuccessful, sets success to False.

bool: Returns False if the key is not found

If vname is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns none if first unnamed value is empty.

Return type

dict

CLI Example:

The following will get the value of the version value name in the HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
↪'version'
```

CLI Example:

The following will get the default value of the HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

salt.modules.reg.**set_value**(*hive*, *key*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*, *volatile=False*)

Sets a value in the registry. If vname is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (str, optional) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.

  Default is None.
- **vdata** (Union[str, int, list, bytes], optional) -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

  The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:
  - REG_BINARY: Binary data (str in Py2, bytes in Py3)
  - REG_DWORD: int
  - REG_EXPAND_SZ: str
  - REG_MULTI_SZ: list of str
  - REG_QWORD: int
  - REG_SZ: str

Default is None.

Note: When setting REG_BINARY, string data will be converted to binary.

Note: The type for the (Default) value is always REG_SZ and cannot be changed.

Note: This parameter is optional. If vdata is not passed, the Key will be created with no associated item/value pairs.

- **vtype** (str, optional) -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.

  Default is REG_SZ.
- **use_32bit_registry** (bool, optional) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

  Default is False.
- **volatile** (bool, optional) -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

  Default is False.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

This will set the version value to 2015.5.2 in the SOFTWARESalt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
↪'version' '2015.5.2'
```

CLI Example:

This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_
↪data' 1.2
```

CLI Example:

In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_
↪data' vtype=REG_SZ vdata='"1.2"'
```

CLI Example:

This is an example of using vtype REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_
↪data' vtype=REG_BINARY vdata='Salty Data'
```

CLI Example:

An example of using vtype REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_
↪data' vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

salt.modules.reg.**value_exists**(*hive*, *key*, *vname*, *use_32bit_registry=False*)

Check that the value/data pair is found in the registry.

New in version 3000.

Parameters

- **hive** (*str*) -- The hive to connect to.
- **key** (*str*) -- The key to check in.
- **vname** (*str*) -- The name of the value/data pair you're checking.
- **use_32bit_registry** (bool, optional) -- Look in the 32bit portion of the registry.

  Default is False.

Returns

True if exists, otherwise False.

Return type

bool

CLI Example:

```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\
↪CurrentVersion CommonFilesDir
```

26.7.377 salt.modules.rest_pkg

Package support for the REST example

salt.modules.rest_pkg.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*)

salt.modules.rest_pkg.**installed**(*name*, *version=None*, *refresh=False*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *sources=None*, ***kwargs*)

salt.modules.rest_pkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

salt.modules.rest_pkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

salt.modules.rest_pkg.**upgrade**(*refresh=True*, *skip_verify=True*, ***kwargs*)

salt.modules.rest_pkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.7.378 salt.modules.rest_sample_utils

Utility functions for the rest_sample

salt.modules.rest_sample_utils.**fix_outage**()

”Fix” the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

salt.modules.rest_sample_utils.**get_test_string**()

Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

26.7.379 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.**enabled**(*name*, *sig=None*)

Only the 'redbull' service is 'enabled' in the test

New in version 2015.8.1.

salt.modules.rest_service.**get_all**()

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.rest_service.**list_**()

Return a list of all available services.

New in version 2015.8.1.

CLI Example:

```
salt '*' service.list
```

salt.modules.rest_service.**restart**(*name*, *sig=None*)

Restart the specified service with rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rest_service.**running**(*name*, *sig=None*)

Return whether this service is running.

New in version 2015.8.0.

salt.modules.rest_service.**start**(*name*, *sig=None*)

Start the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rest_service.**status**(*name*, *sig=None*)

Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.rest_service.**stop**(*name*, *sig=None*)

Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.380 salt.modules.restartcheck

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

codeauthor

Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.restartcheck.**restartcheck**(*ignorelist=None*, *blacklist=None*, *excludepid=None*, ***kwargs*)

Analyzes files openeded by running processes and seeks for packages which need to be restarted.

Parameters

- **ignorelist** -- string or list of packages to be ignored.
- **blacklist** -- string or list of file paths to be ignored.
- **excludepid** -- string or list of process IDs to be ignored.
- **verbose** -- boolean, enables extensive output.

- **timeout** -- int, timeout in minute.

Returns
{ 'result': False, 'comment': '<reason>' }. String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

Return type
Dict on error

New in version 2015.8.3.

CLI Example:

```
salt '*' restartcheck.restartcheck
```

26.7.381 salt.modules.restconf

Execution module for RESTCONF Proxy minions

codeauthor
Jamie (Bear) Murphy <jamiemurphyit@gmail.com>

maturity
new

platform
any

salt.modules.restconf.**get_data**(*path*)

Returns an object containing the content of the request path with a GET request. Data returned will contain a dict with at minimum a key of "status" containing the http status code Other keys that should be available error (if http error), body, dict (parsed json to dict)

CLI Example:

```
salt '*' restconf.get_data restconf/yang-library-version
```

salt.modules.restconf.**info**()

Returns the RESTCONF capabilities PATH

CLI Example:

```
salt '*' restconf.info
```

salt.modules.restconf.**path_check**(*primary_path*, *init_path*)

Used to check which path responds with a 200 status Returns an array of True/False and a dict with keys path + path_method + response data, used in states code.

CLI Example:

```
salt '*' restconf.path_check restconf/yang-library-version/specifc_item
↪restconf/yang-library-version
```

salt.modules.restconf.**set_data**(*path*, *method*, *dict_payload*)

Sends a post/patch/other type of rest method to a specified path with the specified method with specified payload

CLI Example:

```
salt '*' restconf.set_data restconf/yang-library-version method=PATCH
↪dict_payload=""
```

26.7.382 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.**get_fun**(*returner*, *fun*)

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

salt.modules.ret.**get_jid**(*returner*, *jid*)

Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

salt.modules.ret.**get_jids**(*returner*)

Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

salt.modules.ret.**get_minions**(*returner*)

Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

26.7.383 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.**apply_network_settings**(***settings*)

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

salt.modules.rh_ip.**build_interface**(*iface*, *iface_type*, *enabled*, ***settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.rh_ip.**build_network_settings**(***settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.rh_ip.**build_routes**(*iface*, ***settings*)

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.rh_ip.**down**(*iface*, *iface_type*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.rh_ip.**get_interface**(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.rh_ip.**get_network_settings**()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.rh_ip.**get_routes**(*iface*)

Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.rh_ip.**up**(*iface*, *iface_type*)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

26.7.384 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

salt.modules.rh_service.**available**(*name*, *limit=''*)

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

salt.modules.rh_service.**delete**(*name*, ***kwargs*)

Delete the named service

New in version 2016.3.0.

CLI Example:

```
salt '*' service.delete <service name>
```

salt.modules.rh_service.**disable**(*name*, ***kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.rh_service.**disabled**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.rh_service.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.rh_service.**enabled**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.rh_service.**get_all**(*limit=''*)

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

salt.modules.rh_service.**get_disabled**(*limit=''*)

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

salt.modules.rh_service.**get_enabled**(*limit=''*)

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

salt.modules.rh_service.**missing**(*name*, *limit=''*)

The inverse of service.available. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.**reload_**(*name*)

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.rh_service.**restart**(*name*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rh_service.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rh_service.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.rh_service.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.385 salt.modules.riak

Riak Salt Module

salt.modules.riak.**cluster_commit**()

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

salt.modules.riak.**cluster_join**(*username*, *hostname*)

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

salt.modules.riak.**cluster_leave**(*username*, *hostname*)

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

salt.modules.riak.**cluster_plan**()

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

salt.modules.riak.**member_status**()

Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

salt.modules.riak.**services**()

List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

salt.modules.riak.**start**()

Start Riak

CLI Example:

```
salt '*' riak.start
```

salt.modules.riak.**status**()

Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

salt.modules.riak.**stop**()

Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

salt.modules.riak.**test**()

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

26.7.386 salt.modules.rpm_lowpkg

Support for rpm

salt.modules.rpm_lowpkg.**bin_pkg_info**(*path*, *saltenv='base'*)

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path
: Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv
: [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

salt.modules.rpm_lowpkg.**checksum**(**paths*, ***kwargs*)

Return if the signature of a RPM file is valid.

root
: use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

salt.modules.rpm_lowpkg.**diff**(*package_path*, *path*)

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters
- **package** -- Full pack of the RPM file
- **path** -- Full path to the installed file

Returns
: Difference or empty string. For binary files only a notification.

CLI Example:

```
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf
```

salt.modules.rpm_lowpkg.**file_dict**(**packages*, ***kwargs*)

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root
use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

salt.modules.rpm_lowpkg.**file_list**(**packages*, ***kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

root
use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

salt.modules.rpm_lowpkg.**info**(**packages*, ***kwargs*)

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters

- **packages** --
- **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

  Valid attributes are:
  version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **all_versions** -- Return information for all installed versions of the packages
- **root** -- use root as top level directory (default: "/")

Returns

CLI Example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_
↪versions=True
```

salt.modules.rpm_lowpkg.**list_pkgs**(**packages*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

root
use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm_lowpkg.**modified**(**packages*, ***flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

root

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm_lowpkg.**owner**(**paths*, ***kwargs*)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

root

use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm_lowpkg.**verify**(**packages*, ***kwargs*)

Runs an rpm -Va on a system, and returns the results in a dict

root

use root as top level directory (default: "/")

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

salt.modules.rpm_lowpkg.**version_cmp**(*ver1*, *ver2*, *ignore_epoch=False*)

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch

[False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

26.7.387 salt.modules.rpmbuild_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

salt.modules.rpmbuild_pkgbuild.**build**(*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
            https://raw.githubusercontent.com/saltstack/libnacl/master/
↪pkg/rpm/python-libnacl.spec
            https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.
↪5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

salt.modules.rpmbuild_pkgbuild.**make_repo**(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign packages present

Given the repodir, create a `yum` repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir

The directory to find packages that will be in the repository.

keyid

Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQO+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R5OmgHqvydEnO4pWbn8JzQO9YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----
```

(continues on next page)

(continued from previous page)

```
gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vlZcN4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making `yum` repositories.

---

use_passphrase

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter.

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

New in version 3001.1.

RHEL 8 and above leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

gnupghome

[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas

[root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

---

timeout

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_pkgbuild.**make_src_pkg**(*dest_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*, *runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
       https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
↪rpm/python-libnacl.spec
       https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.
↪tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

Changed in version 2017.7.0.

dest_dir
: The directory on the minion to place the built package(s)

spec
: The location of the spec file (used for rpms)

sources
: The list of package sources

env
: A dictionary of environment variables to be set prior to execution.

template
: Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

saltenv
: The saltenv to use for files downloaded from the salt filesever

runas
: The user to run the build process as

  New in version 2018.3.3.

Note: using SHA256 as digest and minimum level dist el6

26.7.388 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into opts will overwrite options passed into pillar.

salt.modules.rsync.**config**(*conf_path='/etc/rsyncd.conf'*)

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

conf_path
: [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

salt.modules.rsync.**rsync**(*src*, *dst*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *dryrun=False*, *rsh=None*, *additional_opts=None*, *saltenv='base'*)

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from *cmd.run_all*.

Rsync files from src to dst

src
: The source location where files will be rsynced from.

dst
: The destination location where files will be rsynced to.

delete
: [False] Whether to enable the rsync *--delete* flag, which will delete extraneous files from dest dirs

force
: [False] Whether to enable the rsync *--force* flag, which will force deletion of dirs even if not empty.

update
: [False] Whether to enable the rsync *--update* flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.

passwordfile
: A file that contains a password for accessing an rsync daemon. The file should contain just the password.

exclude
: Whether to enable the rsync *--exclude* flag, which will exclude files matching a PATTERN.

excludefrom
: Whether to enable the rsync *--excludefrom* flag, which will read exclude patterns from a file.

dryrun
: [False] Whether to enable the rsync *--dry-run* flag, which will perform a trial run with no changes made.

rsh
: Whether to enable the rsync *--rsh* flag, to specify the remote shell to use.

additional_opts
: Any additional rsync options, should be specified as a list.

saltenv
: Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True
↪passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,
↪exclude2/dir]' additional_opts='["--partial", "--bwlimit=5000"]'
```

salt.modules.rsync.**version**()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from *cmd.run_all*.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

26.7.389 salt.modules.runit

runit service module (http://smarden.org/runit)

This module is compatible with the `service` states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual *service* module on systems using runit as init.

Service management rules (*sv* command):

> service $n is ENABLED if file SERVICE_DIR/$n/run exists service $n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/$n/run exists service $n is DISABLED if AVAILABLE but not ENABLED
>
> SERVICE_DIR/$n is normally a symlink to a AVAIL_SVR_DIR/$n folder

Service auto-start/stop mechanism:

> *sv* (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.
>
> autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

> Service *sva* is an alias of service *svc* when *AVAIL_SVR_DIR/sva* symlinks to folder *AVAIL_SVR_DIR/svc*. *svc* can't be enabled if it is already enabled through an alias already enabled, since *sv* files are stored in folder *SERVICE_DIR/svc/*.
>
> XBPS package management uses a service's alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

`salt.modules.runit.`**`add_svc_avail_path`**(*path*)

> Add a path that may contain available services. Return `True` if added (or already present), `False` on error.
>
> **path**
>
> directory to add to AVAIL_SVR_DIRS

`salt.modules.runit.`**`available`**(*name*)

> Returns `True` if the specified service is available, otherwise returns `False`.
>
> **name**
>
> the service's name
>
> CLI Example:

```
salt '*' runit.available <service name>
```

`salt.modules.runit.`**`disable`**(*name*, *stop=False*, ***kwargs*)

> Don't start service `name` at boot Returns `True` if operation is successful
>
> **name**
>
> the service's name
>
> **stop**
>
> if True, also stops the service
>
> CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

salt.modules.runit.**disabled**(*name*)

Return `True` if the named service is disabled, `False` otherwise

name

the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.runit.**enable**(*name*, *start=False*, ***kwargs*)

Start service `name` at boot. Returns `True` if operation is successful

name

the service's name

start

[False] If `True`, start the service once enabled.

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

salt.modules.runit.**enabled**(*name*)

Return `True` if the named service is enabled, `False` otherwise

name

the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.runit.**full_restart**(*name*)

Calls runit.restart()

name

the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

salt.modules.runit.**get_all**()

Return a list of all available services

CLI Example:

```
salt '*' runit.get_all
```

salt.modules.runit.**get_disabled**()

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.runit.**get_enabled**()

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.runit.**get_svc_alias**()

Returns the list of service's name that are aliased and their alias path(s)

salt.modules.runit.**get_svc_avail_path**()

Return list of paths that may contain available services

salt.modules.runit.**get_svc_broken_path**(*name='*'*)

Return list of broken path(s) in SERVICE_DIR that match `name`

A path is broken if it is a broken symlink or can not be a runit service

name

a glob for service name. default is '*'

CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

salt.modules.runit.**missing**(*name*)

The inverse of runit.available. Returns `True` if the specified service is not available, otherwise returns `False`.

name

the service's name

CLI Example:

```
salt '*' runit.missing <service name>
```

salt.modules.runit.**reload_**(*name*)

Reload service

name

the service's name

CLI Example:

```
salt '*' runit.reload <service name>
```

salt.modules.runit.**remove**(*name*)

Remove the service <name> from system. Returns `True` if operation is successful. The service will be also stopped.

name

the service's name

CLI Example:

```
salt '*' service.remove <name>
```

salt.modules.runit.**restart**(*name*)

Restart service

name

the service's name

CLI Example:

```
salt '*' runit.restart <service name>
```

salt.modules.runit.**show**(*name*)

Show properties of one or more units/jobs or the manager

name
the service's name
CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.runit.**start**(*name*)

Start service
name
the service's name
CLI Example:

```
salt '*' runit.start <service name>
```

salt.modules.runit.**status**(*name*, *sig=None*)

Return `True` if service is running
name
the service's name
sig
signature to identify with ps
CLI Example:

```
salt '*' runit.status <service name>
```

salt.modules.runit.**status_autostart**(*name*)

Return `True` if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return `False` if the service is not enabled.
name
the service's name
CLI Example:

```
salt '*' runit.status_autostart <service name>
```

salt.modules.runit.**stop**(*name*)

Stop service
name
the service's name
CLI Example:

```
salt '*' runit.stop <service name>
```

26.7.390 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

salt.modules.rvm.**do**(*ruby*, *command*, *runas=None*, *cwd=None*, *env=None*)

Execute a command in an RVM controlled environment.
ruby
Which ruby to use
command
The rvm command to execute

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

cwd
The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

salt.modules.rvm.**gemset_copy**(*source*, *destination*, *runas=None*)

Copy all gems from one gemset to another.

source
The name of the gemset to copy, complete with ruby version

destination
The destination gemset

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

salt.modules.rvm.**gemset_create**(*ruby*, *gemset*, *runas=None*)

Creates a gemset.

ruby
The ruby version for which to create the gemset

gemset
The name of the gemset to create

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

salt.modules.rvm.**gemset_delete**(*ruby*, *gemset*, *runas=None*)

Delete a gemset

ruby
The ruby version to which the gemset belongs

gemset
The gemset to delete

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

salt.modules.rvm.**gemset_empty**(*ruby*, *gemset*, *runas=None*)

Remove all gems from a gemset.

ruby
The ruby version to which the gemset belongs

gemset
The gemset to empty

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

salt.modules.rvm.**gemset_list**(*ruby='default'*, *runas=None*)

List all gemsets for the given ruby.

ruby
[default] The ruby version for which to list the gemsets

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

salt.modules.rvm.**gemset_list_all**(*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

salt.modules.rvm.**get**(*version='stable'*, *runas=None*)

Update RVM

version
[stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

salt.modules.rvm.**install**(*runas=None*)

Install RVM system-wide

runas
The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

salt.modules.rvm.**install_ruby**(*ruby*, *runas=None*, *opts=None*, *env=None*)

Install a ruby implementation.

ruby
The version of ruby to install

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

env
Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS

opts
List of options to pass to the RVM installer (ie -C, --patch, etc)

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

salt.modules.rvm.**is_installed**(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

salt.modules.rvm.**list_**(*runas=None*)

List all rvm-installed rubies

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

salt.modules.rvm.**reinstall_ruby**(*ruby*, *runas=None*, *env=None*)

Reinstall a ruby implementation

ruby
The version of ruby to reinstall

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

salt.modules.rvm.**rubygems**(*ruby*, *version*, *runas=None*)

Installs a specific rubygems version in the given ruby

ruby
The ruby for which to install rubygems

version
The version of rubygems to install, or 'remove' to use the version that ships with 1.9

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

salt.modules.rvm.**set_default**(*ruby*, *runas=None*)

Set the default ruby

ruby
The version of ruby to make the default

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

salt.modules.rvm.**wrapper**(*ruby_string*, *wrapper_prefix*, *runas=None*, **binaries*)

Install RVM wrapper scripts

ruby_string
Ruby/gemset to install wrappers for

wrapper_prefix
What to prepend to the name of the generated wrapper binaries

runas
The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

binaries
[None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

26.7.391 salt.modules.s3

Connection module for Amazon S3

configuration
This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

> http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

> **Warning**: This is literally the pillar key `s3.keyid` or the config option `s3.keyid`, not:
>
> ```
> s3:
>   keyid: blah
> ```

A `service_url` may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use Salt with a proxy for a S3 compatible storage.

You can use either HTTPS protocol or HTTP protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

depends
: requests

`salt.modules.s3.`**`delete`**(*bucket*, *path=None*, *action=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

`salt.modules.s3.`**`get`**(*bucket=''*, *path=''*, *return_bin=False*, *action=None*, *local_file=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:
: salt myminion s3.get

CLI Example to list the contents of a bucket:
: salt myminion s3.get mybucket

CLI Example to return the binary contents of an object:

salt myminion s3.get mybucket myfile.png return_bin=True

CLI Example to save the binary contents of an object to a local file:

salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

salt myminion s3.get mybucket myfile.png action=acl

salt.modules.s3.**head**(*bucket*, *path=''*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

salt.modules.s3.**put**(*bucket*, *path=None*, *return_bin=False*, *action=None*, *local_file=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

salt myminion s3.put mybucket

CLI Example to upload an object to a bucket:

salt myminion s3.put mybucket remotepath local_file=/path/to/file

26.7.392 salt.modules.s6

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the `enabled` argument is not available with this provider.

codeauthor
Marek Skrobacki <skrobul@skrobul.com>

salt.modules.s6.**available**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' s6.available foo
```

salt.modules.s6.**full_restart**(*name*)

Calls s6.restart() function

CLI Example:

```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.**get_all**()

Return a list of all available services

CLI Example:

```
salt '*' s6.get_all
```

salt.modules.s6.**missing**(*name*)

The inverse of s6.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' s6.missing foo
```

salt.modules.s6.**reload_**(*name*)

Send a HUP to service via s6

CLI Example:

```
salt '*' s6.reload <service name>
```

salt.modules.s6.**restart**(*name*)

Restart service via s6. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

salt.modules.s6.**start**(*name*)

Starts service via s6

CLI Example:

```
salt '*' s6.start <service name>
```

salt.modules.s6.**status**(*name*, *sig=None*)

Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

salt.modules.s6.**stop**(*name*)

Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

salt.modules.s6.**term**(*name*)

Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

26.7.393 salt.modules.salt_proxy

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

salt.modules.salt_proxy.**configure_proxy**(*proxyname*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

salt.modules.salt_proxy.**is_running**(*proxyname*)

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters

proxyname -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

26.7.394 salt.modules.salt_version

Access Salt's elemental release code-names.

New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```
{# a boolean check #}
{% set option_deprecated = salt['salt_version.less_than']("Sodium") %}

{% if option_deprecated %}
  <use old syntax>
{% else %}
  <use new syntax>
{% endif %}
```

salt.modules.salt_version.**equal**(*name*)

Returns a boolean (True) if the minion's current version code name matches the named version.

name

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.equal 'Oxygen'
```

salt.modules.salt_version.**get_release_number**(*name*)

Returns the release number of a given release code name in a `MAJOR.PATCH` format (for Salt versions < 3000) or `MAJOR` for newer Salt versions.

If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns `None`.

name

The release code name for which to find a release number.

CLI Example:

```
salt '*' salt_version.get_release_number 'Oxygen'
```

salt.modules.salt_version.**greater_than**(*name*)

Returns a boolean (True) if the minion's current version code name is greater than the named version.

name

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.greater_than 'Oxygen'
```

salt.modules.salt_version.**less_than**(*name*)

Returns a boolean (True) if the minion's current version code name is less than the named version.

name

The release code name to check the version against.

CLI Example:

```
salt '*' salt_version.less_than 'Oxygen'
```

26.7.395 salt.modules.saltcheck

A module for testing the logic of states and highstates on salt minions

codeauthor
William Cannon <william.cannon@gmail.com>

maturity
new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named `saltcheck-tests`. Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder. `tst` files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a `tst` file. Multiple `tst` files can be created in the `saltcheck-tests` folder, and should be named the same as the associated state. The `id` of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The `saltcheck-tests` folder can be customized using the `saltcheck_test_location` minion configuration setting. This setting is a relative path from the formula's `salt://` path to the test files.

Usage

Example Default file system layout:

```
/srv/salt/apache/
    init.sls
    config.sls
    saltcheck-tests/
        init.tst
        config.tst
        deployment_validation.tst
```

Alternative example file system layout with custom saltcheck_test_location:

Minion configuration:

```
saltcheck_test_location: tests/integration/saltcheck
```

Filesystem layout:

```
/srv/salt/apache/
    init.sls
    config.sls
    tests/integration/saltcheck/
        init.tst
        config.tst
        deployment_validation.tst
```

Tests can be run for each state by name, for all `apache/saltcheck/*.tst` files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Saltcheck Keywords

module_and_function:
(str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

args:
(list) Optional arguments passed to the salt module

kwargs:
(dict) Optional keyword arguments to be passed to the salt module

assertion:
(str) One of the supported assertions and required except for `saltcheck.state_apply` Tests which fail the assertion and expected_return, cause saltcheck to exit which a non-zero exit code.

expected_return:
(str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of module_and_function is compared to this value in the assertion.

assertion_section:
(str) Optional keyword used to parse the module_and_function return. If a salt module returns a dictionary as a result, the `assertion_section` value is used to lookup a specific value in that return for the assertion comparison.

assertion_section_delimiter:
(str) Optional delimiter to use when splitting a nested structure. Defaults to ':'

print_result:
(bool) Optional keyword to show results in the `assertEqual`, `assertNotEqual`, `assertIn`, and `assertNotIn` output. Defaults to True.

output_details:
(bool) Optional keyword to display `module_and_function`, `args`, `assertion_section`, and assertion results text in the output. If print_result is False, assertion results will be hidden. This is a per test setting,

but can be set globally for all tests by adding `saltcheck_output_details: True` in the minion configuration file. Defaults to False

pillar_data:
(dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the `saltcheck.state_apply` function.

skip:
(bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single `module_and_function` call. The `assertion`, `expected_return`, `assertion_section`, and `assertion_section_delimiter` keys can be placed in a list under an `assertions` key. See the multiple assertions example below.

Sample Cases/Examples

Basic Example

```
echo_test_hello:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
  assertion: assertEqual
  expected_return:  'hello'
```

Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
```

(continues on next page)

(continued from previous page)

```
  args:
    - vim
  assertion: assertNotEmpty
```

Example with jinja

```
{% for package in ["apache2", "openssh"] %}
{# or another example #}
{# for package in salt['pillar.get']("packages") #}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```

Example with setup state including pillar

```
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar-data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```

Example with skip

```
package_latest:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True
```

Example with assertion_section

```
validate_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected_return: /bin/bash
  assertion_section: shell
```

Example with a nested assertion_section

```
validate_smb_signing:
  module_and_function: lgpo.get
  args:
    - 'Machine'
  kwargs:
    return_full_policy_names: True
  assertion: assertEqual
  expected_return: Enabled
  assertion_section: 'Computer Configuration|Microsoft network client:
↪Digitally sign communications (always)'
  assertion_section_delimiter: '|'
```

Example suppressing print results

```
validate_env_nameNode:
  module_and_function: hadoop.dfs
  args:
    - text
    - /oozie/common/env.properties
  expected_return: nameNode = hdfs://nameservice2
  assertion: assertNotIn
  print_result: False
```

Example with multiple assertions and output_details

```
multiple_validations:
  module_and_function: network.netstat
  assertions:
    - assertion: assertEqual
      assertion_section: "0:program"
      expected_return: "systemd-resolve"
    - assertion: assertEqual
      assertion_section: "0:proto"
      expected_return: "udp"
  output_details: True
```

Supported assertions

- assertEqual
- assertNotEqual
- assertTrue
- assertFalse
- assertIn
- assertNotIn
- assertGreater
- assertGreaterEqual
- assertLess
- assertLessEqual
- assertEmpty
- assertNotEmpty

Warning: The saltcheck.state_apply function is an alias for `state.apply`. If using the *ACL system* `saltcheck.*` might provide more capability than intended if only `saltcheck.run_state_tests` and `saltcheck.run_highstate_tests` are needed.

class salt.modules.saltcheck.**SaltCheck**(*saltenv='base'*)

This class validates and runs the saltchecks

run_test(*test_dict*)

Run a single saltcheck test

class salt.modules.saltcheck.**StateTestLoader**(*saltenv='base'*)

Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

add_test_files_for_sls(*sls_name*, *check_all=False*)

Detects states used, caches needed files, and adds to test list

load_test_suite()

Load tests either from one file, or a set of files

salt.modules.saltcheck.**parallel_scheck**(*data*)

triggers salt-call in parallel

salt.modules.saltcheck.**report_highstate_tests**(*saltenv=None*)

Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:

```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

salt.modules.saltcheck.**run_highstate_tests**(*saltenv=None*, *only_fails=False*)

Execute all tests for states assigned to the minion through highstate and return results

Parameters

- **saltenv** (*str*) -- optional saltenv. Defaults to base
- **only_fails** (*bool*) -- boolean to only print failure results

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

salt.modules.saltcheck.**run_state_tests**(*state*, *saltenv=None*, *check_all=False*, *only_fails=False*)

Execute tests for a salt state and return results Nested states will also be tested

Parameters

- **state** (*str*) -- state name for which to run associated .tst test files
- **saltenv** (*str*) -- optional saltenv. Defaults to base
- **check_all** (*bool*) -- boolean to run all tests in state/saltcheck-tests directory
- **only_fails** (*bool*) -- boolean to only print failure results

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

salt.modules.saltcheck.**run_state_tests_ssh**(*state*, *saltenv=None*, *check_all=False*, *only_fails=False*)

This function is an alias of `run_state_tests`.

Execute tests for a salt state and return results Nested states will also be tested

param str state
: state name for which to run associated .tst test files

param str saltenv
: optional saltenv. Defaults to base

param bool check_all
: boolean to run all tests in state/saltcheck-tests directory

param bool only_fails
: boolean to only print failure results

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

salt.modules.saltcheck.**run_test**(***kwargs*)

Execute one saltcheck test and return result

Parameters

test (*keyword arg*) --

CLI Example:

```
salt '*' saltcheck.run_test
    test='{"module_and_function": "test.echo",
           "assertion": "assertEqual",
```

(continues on next page)

(continued from previous page)

```
            "expected_return": "This works!",
            "args":["This works!"] }'
```

salt.modules.saltcheck.**state_apply**(*state_name*, ***kwargs*)

Runs `state.apply` with given options to set up test data. Intended to be used for optional test setup or teardown

Reference the `state.apply` module documentation for arguments and usage options

CLI Example:

```
salt '*' saltcheck.state_apply postfix
```

26.7.396 salt.modules.saltcloudmod

Control a salt cloud system

salt.modules.saltcloudmod.**create**(*name*, *profile*)

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

26.7.397 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

salt.modules.saltutil.**clear_cache**()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

salt.modules.saltutil.**clear_job_cache**(*hours=24*)

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

salt.modules.saltutil.**cmd**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *ssh=False*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

salt.modules.saltutil.**cmd_iter**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *ssh=False*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

salt.modules.saltutil.**find_cached_job**(*jid*)

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

salt.modules.saltutil.**find_job**(*jid*)

Return the data for a specific job id that is currently running.

jid

The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    ----------
    arg:
        - 30
    fun:
        test.sleep
    jid:
        20160503150049487736
    pid:
        9601
```

(continues on next page)

(continued from previous page)

```
    ret:
    tgt:
        my-minion
    tgt_type:
        glob
    user:
        root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    ----------
```

salt.modules.saltutil.**is_running**(*fun*)

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

salt.modules.saltutil.**kill_all_jobs**()

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

salt.modules.saltutil.**kill_job**(*jid*)

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

salt.modules.saltutil.**list_extmods**()

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

salt.modules.saltutil.**mmodule**(*saltenv*, *fun*, **args*, ***kwargs*)

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

salt.modules.saltutil.**pillar_refresh**(*wait=False*, *timeout=30*, *clean_cache=True*)

This function is an alias of `refresh_pillar`.

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

param wait
Wait for pillar refresh to complete, defaults to False.

type wait
bool, optional

param timeout
How long to wait in seconds, only used when wait is True, defaults to 30.

type timeout
int, optional

param clean_cache
Clean the pillar cache, only used when *pillar_cache* is True. Defaults to True

type clean_cache
bool, optional .. versionadded:: 3005

return
Boolean status, True when the pillar_refresh event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

`salt.modules.saltutil.`**`refresh_beacons`**`()`

Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

`salt.modules.saltutil.`**`refresh_grains`**`(`*`**kwargs`*`)`

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

Note: The available execution modules will be reloaded as part of this proceess, as grains can affect which modules are available.

---

refresh_pillar
[True] Set to `False` to keep pillar data from being refreshed.

clean_pillar_cache
[False] Set to `True` to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

`salt.modules.saltutil.`**`refresh_matchers`**`()`

Signal the minion to refresh its matchers.

CLI Example:

```
salt '*' saltutil.refresh_matchers
```

`salt.modules.saltutil.`**`refresh_modules`**`(`*`**kwargs`*`)`

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

salt.modules.saltutil.**refresh_pillar**(*wait=False*, *timeout=30*, *clean_cache=True*)

Signal the minion to refresh the in-memory pillar data. See *In-Memory Pillar Data vs. On-Demand Pillar Data*.

Parameters

- **wait** (*bool, optional*) -- Wait for pillar refresh to complete, defaults to False.
- **timeout** (*int, optional*) -- How long to wait in seconds, only used when wait is True, defaults to 30.
- **clean_cache** (*bool, optional .. versionadded:: 3005*) -- Clean the pillar cache, only used when *pillar_cache* is True. Defaults to True

Returns

Boolean status, True when the pillar_refresh event was fired successfully.

CLI Example:

```
salt '*' saltutil.refresh_pillar
salt '*' saltutil.refresh_pillar wait=True timeout=60
```

salt.modules.saltutil.**regen_keys**()

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

salt.modules.saltutil.**revoke_auth**(*preserve_minion_cache=False*)

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

salt.modules.saltutil.**runner**(*name*, *arg=None*, *kwarg=None*, *full_return=False*, *saltenv='base'*, *jid=None*, ***kwargs*)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name

The name of the function to run

kwargs

Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{'foo':
↪'bar'}"
```

salt.modules.saltutil.**running**()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.**signal_job**(*jid*, *sig*)

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.**sync_all**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*, *clean_pillar_cache=False*)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh
: [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a *`module.run`* state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See *here* for a more detailed explanation of why this is necessary.

---

extmod_whitelist
: [None] dictionary of modules to sync based on type

extmod_blacklist
: [None] dictionary of modules to blacklist based on type

clean_pillar_cache
: [False] Set to `True` to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

salt.modules.saltutil.**sync_beacons**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_clouds`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_cloud` to the minion

saltenv
[base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_engines`**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

salt.modules.saltutil.**sync_executors**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 3000.

Sync executors from `salt://_executors` to the minion
saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.
refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.
extmod_whitelist
[None] comma-seperated list of modules to sync
extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev
```

salt.modules.saltutil.**sync_grains**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*, *clean_pillar_cache=False*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion
saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.
refresh
[True] If `True`, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to `False` to prevent this refresh.
extmod_whitelist
[None] comma-separated list of modules to sync
extmod_blacklist
[None] comma-separated list of modules to blacklist based on type
clean_pillar_cache
[False] Set to `True` to refresh pillar cache.
CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

salt.modules.saltutil.**sync_log_handlers**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

salt.modules.saltutil.**sync_matchers**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2019.2.0.

Sync engine modules from `salt://_matchers` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

salt.modules.saltutil.**sync_modules**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a *`module.run`* state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See *here* for a more detailed explanation of why this is necessary.

---

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_output`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync outputters from `salt://_output` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_outputters`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_pillar`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*, *clean_pillar_cache=False*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

refresh
: [True] Also refresh the execution modules available to the minion, and refresh pillar data.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

clean_pillar_cache
: [False] Set to `True` to refresh pillar cache.

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

`salt.modules.saltutil.`**`sync_proxymodules`**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

refresh

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist

[None] comma-separated list of modules to sync

extmod_blacklist

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_renderers`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

saltenv

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

refresh

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to `False` to prevent this refresh. Set to `False` to prevent this refresh.

extmod_whitelist

[None] comma-separated list of modules to sync

extmod_blacklist

[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_returners`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

saltenv

The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.

refresh

[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to `False` to prevent this refresh.

extmod_whitelist

[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.**sync_sdb**(*saltenv=None, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion
saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync. If no top files are found, then the `base` environment will be synced.
refresh
[False] This argument has no affect and is included for consistency with the other sync functions.
extmod_whitelist
[None] comma-separated list of modules to sync
extmod_blacklist
[None] comma-separated list of modules to blacklist based on type
CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.**sync_serializers**(*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2019.2.0.

Sync serializers from `salt://_serializers` to the minion
saltenv
The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for serializer modules to sync. If no top files are found, then the `base` environment will be synced.
refresh
[True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new serializer modules are synced. Set to `False` to prevent this refresh.
extmod_whitelist
[None] comma-seperated list of modules to sync
extmod_blacklist
[None] comma-seperated list of modules to blacklist based on type
CLI Examples:

```
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev
```

salt.modules.saltutil.**sync_states**(*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for state modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: [None] comma-separated list of modules to sync

extmod_blacklist
: [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_thorium`**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh: **`True`**
: If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
: comma-separated list of modules to sync

extmod_blacklist
: comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_utils`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

saltenv
: The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

  If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the `base` environment will be synced.

refresh
: [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed

even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist
[None] comma-separated list of modules to sync

extmod_blacklist
[None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

`salt.modules.saltutil.`**`term_all_jobs`**`()`

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

`salt.modules.saltutil.`**`term_job`**`(`*jid*`)`

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

`salt.modules.saltutil.`**`update`**`(`*version=None*`)`

Update the salt minion from the URL defined in opts['update_url'] Broadcom, Inc provides the latest builds here: update_url: https://packages.broadcom.com/artifactory/saltproject-generic/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

`salt.modules.saltutil.`**`wheel`**`(`*name*, **args*, ***kwargs*`)`

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

name
The name of the function to run

args
Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version 2015.8.11.

kwargs
Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

26.7.398 salt.modules.schedule

Module for managing the Salt schedule on a minion

Requires that python-dateutil is installed on the minion.

New in version 2014.7.0.

`salt.modules.schedule.`**`add`**(*name*, ***kwargs*)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/
↪date.log']" seconds=60

# Add job to Salt minion when the Salt minion is not running
salt '*' schedule.add job1 function='test.ping' seconds=3600 offline=True
```

`salt.modules.schedule.`**`build_schedule_item`**(*name*, ***kwargs*)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping'
↪seconds=3600
```

`salt.modules.schedule.`**`copy`**(*name*, *target*, ***kwargs*)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

`salt.modules.schedule.`**`delete`**(*name*, ***kwargs*)

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1

# Delete job on Salt minion when the Salt minion is not running
salt '*' schedule.delete job1
```

salt.modules.schedule.**disable**(***kwargs*)

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

salt.modules.schedule.**disable_job**(*name*, ***kwargs*)

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

salt.modules.schedule.**enable**(***kwargs*)

Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

salt.modules.schedule.**enable_job**(*name*, ***kwargs*)

Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

salt.modules.schedule.**is_enabled**(*name=None*)

List a Job only if its enabled

If job is not specified, indicate if the scheduler is enabled or disabled.

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
salt '*' schedule.is_enabled
```

salt.modules.schedule.**job_status**(*name*, *time_fmt='%Y-%m-%dT%H:%M:%S'*)

Show the information for a particular job.

CLI Example:

```
salt '*' schedule.job_status job_name
```

salt.modules.schedule.**list_**(*show_all=False*, *show_disabled=True*, *where=None*, *return_yaml=True*, *offline=False*)

List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True
```

(continues on next page)

(continued from previous page)

```
# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

salt.modules.schedule.**modify**(*name*, ***kwargs*)

Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600

# Modify job on Salt minion when the Salt minion is not running
salt '*' schedule.modify job1 function='test.ping' seconds=3600
↪offline=True
```

salt.modules.schedule.**move**(*name*, *target*, ***kwargs*)

Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

salt.modules.schedule.**postpone_job**(*name*, *current_time*, *new_time*, ***kwargs*)

Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.postpone_job job current_time new_time

salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-
↪%dT%H:%M:%S'
```

salt.modules.schedule.**purge**(***kwargs*)

Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge

# Purge jobs on Salt minion
salt '*' schedule.purge
```

salt.modules.schedule.**reload_**()

Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

salt.modules.schedule.**run_job**(*name*, *force=False*)

Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1

salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

salt.modules.schedule.**save**(***kwargs*)

Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

salt.modules.schedule.**show_next_fire_time**(*name*, ***kwargs*)

Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.show_next_fire_time job_name
```

salt.modules.schedule.**skip_job**(*name*, *current_time*, ***kwargs*)

Skip a job in the minion's schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

26.7.399 salt.modules.scp

SCP Module

New in version 2019.2.0.

Module to copy files via SCP

salt.modules.scp_mod.**get**(*remote_path*, *local_path=''*, *recursive=False*, *preserve_times=False*, ***kwargs*)

Transfer files and directories from remote host to the localhost of the Minion.

remote_path
: Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

recursive: **False**
: Transfer files and directories recursively.

preserve_times: **False**
: Preserve `mtime` and `atime` of transferred files and directories.

hostname
: The hostname of the remote device.

port: **22**
The port of the remote device.
username
The username required for SSH authentication on the device.
password
Used for password authentication. It is also used for private key decryption if `passphrase` is not given.
passphrase
Used for decrypting private keys.
pkey
An optional private key to use for authentication.
key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout
An optional timeout (in seconds) for the TCP connect.
socket_timeout: **10**
The channel socket timeout in seconds.
buff_size: **16384**
The size of the SCP send buffer.
allow_agent: **True**
Set to `False` to disable connecting to the SSH agent.
look_for_keys: **True**
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`
banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout
An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: **False**
Automatically add the host to the `known_hosts`.
CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_
↪policy=True
```

`salt.modules.scp_mod.`**`put`**(*files*, *remote_path=None*, *recursive=False*, *preserve_times=False*, *saltenv='base'*, ***kwargs*)

Transfer files and directories to remote host.
files
A single path or a list of paths to be transferred.
remote_path
The path on the remote device where to store the files.
recursive: **True**
Transfer files and directories recursively.
preserve_times: **False**
Preserve `mtime` and `atime` of transferred files and directories.
hostname
The hostname of the remote device.
port: **22**
The port of the remote device.
username
The username required for SSH authentication on the device.
password
Used for password authentication. It is also used for private key decryption if `passphrase` is not given.

passphrase
Used for decrypting private keys.
pkey
An optional private key to use for authentication.
key_filename
The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
timeout
An optional timeout (in seconds) for the TCP connect.
socket_timeout: **`10`**
The channel socket timeout in seconds.
buff_size: **`16384`**
The size of the SCP send buffer.
allow_agent: **`True`**
Set to `False` to disable connecting to the SSH agent.
look_for_keys: **`True`**
Set to `False` to disable searching for discoverable private key files in `~/.ssh/`
banner_timeout
An optional timeout (in seconds) to wait for the SSH banner to be presented.
auth_timeout
An optional timeout (in seconds) to wait for an authentication response.
auto_add_policy: **`False`**
Automatically add the host to the `known_hosts`.
CLI Example:

```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_
↪policy=True
```

26.7.400 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.`**`ls_`**(*get_size=True*)

List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size
[True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the '-s' option in lsscsi.

New in version 2015.5.10.

`salt.modules.scsi.`**`rescan_all`**(*host*)

List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

26.7.401 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.**delete**(*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

salt.modules.sdb.**get**(*uri*, *strict=False*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided is not valid, then it will be returned as-is, unless `strict=True` was passed.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo strict=True
```

salt.modules.sdb.**get_or_set_hash**(*uri*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'*)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt["sdb.get_or_set_hash"]("sdb://mymemcached/some_
↪user_pass") }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'sdb://mymemcached/SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.sdb.**set_**(*uri*, *value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

26.7.402 salt.modules.seed

Virtual machine image management tools

salt.modules.seed.**apply_**(*path*, *id_=None*, *config=None*, *approve_key=True*, *install=True*, *prep_install=False*, *pub_key=None*, *priv_key=None*, *mount_point=None*)

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
        [gen_key=(true|false)] [approve_key=(true|false)] \
        [install=(true|false)]
```

path
: Full path to the directory, device, or disk image on the target minion's file system.

id
: Minion id with which to seed the path.

config
: Minion configuration options. By default, the 'master' option is set to the target host's 'master'.

approve_key
: Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

install
: Install salt-minion, if absent. Default: true.

prep_install
: Prepare the bootstrap script, but don't run it. Default: false

salt.modules.seed.**mkconfig**(*config=None*, *tmp=None*, *id_=None*, *approve_key=True*, *pub_key=None*, *priv_key=None*)

Generate keys and config and put them in a tmp directory.

pub_key
: absolute path or file content of an optional preseeded salt key

priv_key
: absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
        [id_=minion_id] [approve_key=(true|false)]
```

salt.modules.seed.**prep_bootstrap**(*mpt*)

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

26.7.403 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

`salt.modules.selinux.`**`fcontext_add_policy`**(*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name
: filespec of the file or directory. Regex syntax is allowed.

file_type
: The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

sel_type
: SELinux context type. There are many.

sel_user
: SELinux user. Use `semanage login -l` to determine which ones are available to you.

sel_level
: The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_policy my-policy
```

`salt.modules.selinux.`**`fcontext_apply_policy`**(*name*, *recursive=False*)

New in version 2017.7.0.

Applies SElinux policies to filespec using *restorecon [-R] filespec*. Returns dict with changes if successful, the output of the restorecon command otherwise.

name
: filespec of the file or directory. Regex syntax is allowed.

recursive
: Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

`salt.modules.selinux.`**`fcontext_delete_policy`**(*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name
: filespec of the file or directory. Regex syntax is allowed.

file_type
: The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

sel_type
: SELinux context type. There are many.

sel_user
: SELinux user. Use `semanage login -l` to determine which ones are available to you.

sel_level
: The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_delete_policy my-policy
```

salt.modules.selinux.**fcontext_get_policy**(*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

For a more in-depth explanation of the selinux context, go to https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html

name
: filespec of the file or directory. Regex syntax is allowed.

filetype
: The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

salt.modules.selinux.**fcontext_policy_is_applied**(*name*, *recursive=False*)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

name
: filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

salt.modules.selinux.**filetype_id_to_string**(*filetype='a'*)

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in *semanage fcontext -l*).

salt.modules.selinux.**getconfig**()

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

salt.modules.selinux.**getenforce**()

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

salt.modules.selinux.**getsebool**(*boolean*)

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

salt.modules.selinux.**getsemod**(*module*)

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

salt.modules.selinux.**install_semod**(*module_path*)

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

salt.modules.selinux.**list_sebool**()

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

salt.modules.selinux.**list_semod**()

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

salt.modules.selinux.**port_add_policy**(*name*, *sel_type=None*, *protocol=None*, *port=None*, *sel_range=None*)

New in version 2019.2.0.

Adds the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type. Required.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

sel_range
The SELinux MLS/MCS Security Range.

CLI Example:

```
salt '*' selinux.port_add_policy add tcp/8080 http_port_t
salt '*' selinux.port_add_policy add foobar http_port_t protocol=tcp
↪port=8091
```

salt.modules.selinux.**port_delete_policy**(*name*, *protocol=None*, *port=None*)

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

salt.modules.selinux.**port_get_policy**(*name*, *sel_type=None*, *protocol=None*, *port=None*)

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- sel_type (the selinux type)
- proto (the protocol)
- port (the port(s) and/or port range(s))

name
The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.

sel_type
The SELinux Type.

protocol
The protocol for the port, `tcp` or `udp`. Required if name is not formatted.

port
The port or port range. Required if name is not formatted.

CLI Example:

```
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

salt.modules.selinux.**remove_semod**(*module*)

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.**selinux_fs_path**()

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.**setenforce**(*mode*)

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.**setsebool**(*boolean*, *value*, *persist=False*)

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

salt.modules.selinux.**setsebools**(*pairs*, *persist=False*)

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

salt.modules.selinux.**setsemod**(*module*, *state*)

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

26.7.404 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

maintainer
Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

maturity
new

depends
sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
    rotation: 90
```

`salt.modules.sensehat.clear(color=None)`

Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'
```

`salt.modules.sensehat.get_humidity()`

Get the percentage of relative humidity from the humidity sensor.

`salt.modules.sensehat.get_pixel(x, y)`

Returns the color of a single pixel on the LED matrix.

x
The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

y
The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

Note: Please read the note for `get_pixels`

`salt.modules.sensehat.get_pixels()`

Returns a list of 64 smaller lists of `[R, G, B]` pixels representing the the currently displayed image on the LED matrix.

Note: When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

---

salt.modules.sensehat.**get_pressure**()

Gets the current pressure in Millibars from the pressure sensor.

salt.modules.sensehat.**get_temperature**()

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.

salt.modules.sensehat.**get_temperature_from_humidity**()

Gets the temperature in degrees Celsius from the humidity sensor.

salt.modules.sensehat.**get_temperature_from_pressure**()

Gets the temperature in degrees Celsius from the pressure sensor.

salt.modules.sensehat.**low_light**(*low_light=True*)

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False
```

salt.modules.sensehat.**set_pixel**(*x*, *y*, *color*)

Sets a single pixel on the LED matrix to a specified color.

x
: The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

y
: The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

color
: The new color of the pixel as a list of `[R, G, B]` values.

CLI Example:

```
salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

salt.modules.sensehat.**set_pixels**(*pixels*)

Sets the entire LED matrix based on a list of 64 pixel values

pixels
: A list of 64 `[R, G, B]` color values.

salt.modules.sensehat.**show_image**(*image*)

Displays an 8 x 8 image on the LED matrix.

image
: The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```
salt 'raspberry' sensehat.show_image /tmp/my_image.png
```

salt.modules.sensehat.**show_letter**(*letter*, *text_color=None*, *back_color=None*)

Displays a single letter on the LED matrix.

letter
: The letter to display

text_color
: The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).

back_color
: The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

salt.modules.sensehat.**show_message**(*message*, *msg_type=None*, *text_color=None*, *back_color=None*, *scroll_speed=0.1*)

Displays a message on the LED matrix.

message
The message to display

msg_type
The type of the message. Changes the appearance of the message.

Available types are:

```
error:      red text
warning:    orange text
success:    green text
info:       blue text
```

scroll_speed
The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

text_color
The color in which the message is shown. Defaults to '[255, 255, 255]' (white).

back_color
The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]'
↪'[255, 255, 0]' 0.2
```

26.7.405 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

salt.modules.sensors.**sense**(*chip*, *fahrenheit=False*)

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:

/usr/bin/sensors

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0℃ (high = +87.0℃, crit = +105.0℃) Core 0: +52.0℃ (high = +87.0℃, crit = +105.0℃) Core 1: +50.0℃ (high = +87.0℃, crit = +105.0℃) Core 2: +56.0℃ (high = +87.0℃, crit = +105.0℃) Core 3: +53.0℃ (high = +87.0℃, crit = +105.0℃)

Given the above, the chip is 'coretemp-isa-0000'.

26.7.406 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

salt.modules.serverdensity_device.**create**(*name*, ***params*)

Function to create device in Server Density. For more info, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band
↪installedRAM=32768
```

salt.modules.serverdensity_device.**delete**(*device_id*)

Delete a device from Server Density. For more information, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

salt.modules.serverdensity_device.**get_sd_auth**(*val*, *sd_auth_pillar_name='serverdensity'*)

Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

salt.modules.serverdensity_device.**install_agent**(*agent_key*, *agent_version=1*)

Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent
↪c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent
↪c2bbdd6689ff46282bdaa07555641498 2
```

salt.modules.serverdensity_device.**ls**(***params*)

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band
↪installedRAM=32768
```

salt.modules.serverdensity_device.**update**(*device_id*, ***params*)

Updates device information in Server Density. For more information see the API docs.

CLI Example:

```
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
↪group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_
↪lama group=rock_lamas swapSpace=512
```

26.7.407 salt.modules.servicenow

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

depends
servicenow_rest python module

configuration
Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

`salt.modules.servicenow.`**`delete_record`**(*table*, *sys_id*)

Delete an existing record

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

`salt.modules.servicenow.`**`non_structured_query`**(*table*, *query=None*, ***kwargs*)

Run a non-structed (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

Parameters
- **table** (str) -- The table name, e.g. sys_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web
↪type=computer
```

`salt.modules.servicenow.`**`set_change_request_state`**(*change_id*, *state='approved'*)

Set the approval state of a change request/record

Parameters
- **change_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

salt.modules.servicenow.**update_record_field**(*table*, *sys_id*, *field*, *value*)

Update the value of a record's field in a servicenow table

Parameters

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name
↪jimmy
```

26.7.408 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**call_hook**(*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon_emoji=None*)

Send message to Slack incoming webhook.

Parameters

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.**find_room**(*name*, *api_key=None*)

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_key** -- The Slack admin api key.

Returns

The room object.

CLI Example:

```
salt '*' slack.find_room name="random"

salt '*' slack.find_room name="random" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**find_user**(*name*, *api_key=None*)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

Returns

The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"

salt '*' slack.find_user name="ThomasHatch" api_
↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**list_rooms**(*api_key=None*)

List all Slack rooms.

Parameters

api_key -- The Slack admin api key.

Returns

The room list.

CLI Example:

```
salt '*' slack.list_rooms

salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**list_users**(*api_key=None*)

List all Slack users.

Parameters

api_key -- The Slack admin api key.

Returns

The user list.

CLI Example:

```
salt '*' slack.list_users

salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**post_message**(*channel*, *message*, *from_name*, *api_key=None*, *icon=None*, *attachments=None*, *blocks=None*)

Send a message to a Slack channel.

Changed in version 3003: Added *attachments* and *blocks* kwargs

Parameters

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from_name** -- Specify who the message is from.
- **api_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message
- **attachments** -- Any attachments to be sent with the message.
- **blocks** -- Any blocks to be sent with the message.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is
↪done" from_name="Build Server"
```

26.7.409 salt.modules.slackware_service

The service module for Slackware

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.slackware_service.`**`available`**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

New in version 3002.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.slackware_service.`**`disable`**(*name*, ***kwargs*)

Disable the named service to start at boot

New in version 3002.

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.slackware_service.`**`disabled`**(*name*)

Return True if the named service is enabled, false otherwise

New in version 3002.

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.slackware_service.`**`enable`**(*name*, ***kwargs*)

Enable the named service to start at boot

New in version 3002.

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.slackware_service.**enabled**(*name*, ***kwargs*)

Return True if the named service is enabled, false otherwise

New in version 3002.

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.slackware_service.**force_reload**(*name*)

Force-reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.slackware_service.**get_all**()

Return all available boot services

New in version 3002.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.slackware_service.**get_disabled**()

Return a set of services that are installed but disabled

New in version 3002.

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.slackware_service.**get_enabled**()

Return a list of service that are enabled on boot

New in version 3002.

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.slackware_service.**missing**(*name*)

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

New in version 3002.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.slackware_service.**reload_**(*name*)

Reload the named service

New in version 3002.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.slackware_service.**restart**(*name*)

Restart the named service

New in version 3002.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.slackware_service.**start**(*name*)

Start the specified service

New in version 3002.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.slackware_service.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 3002.

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.slackware_service.**stop**(*name*)

Stop the specified service

New in version 3002.

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.410 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.banner`(*width=72*, *commentchar='#'*, *borderchar='#'*, *blockstart=None*, *blockend=None*, *title=None*, *text=None*, *newline=False*)

Create a standardized comment block to include in a templated file.

A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

Parameters

- **`width`** -- The width, in characters, of the banner. Default is 72.
- **`commentchar`** -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like '//' are supported. If the file's syntax does not support line comments (such as XML), use the `blockstart` and `blockend` options.
- **`borderchar`** -- The character to use in the top and bottom border of the comment box. Must be a single character.
- **`blockstart`** -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with `blockend`
- **`blockend`** -- The character sequence to use at the end of a block comment. Should be used in conjunction with `blockstart`
- **`title`** -- The first field of the comment block. This field appears centered at the top of the box.
- **`text`** -- The second filed of the comment block. This field appears left-justified at the bottom of the box.
- **`newline`** -- Boolean value to indicate whether the comment block should end with a newline. Default is `False`.

Example 1 - the default banner:

```
{{ salt['slsutil.banner']() }}
```

```
###############################################################################
#                                                                             #
#              THIS FILE IS MANAGED BY SALT - DO NOT EDIT                     #
#                                                                             #
# The contents of this file are managed by Salt. Any changes to this          #
# file may be overwritten automatically and without warning.                  #
###############################################################################
```

Example 2 - a Javadoc-style banner:

```
{{ salt['slsutil.banner'](commentchar=' *', borderchar='*', blockstart='/
↪**', blockend=' */') }}
```

```
/**
 *******************************************************************************
 *                                                                             *
 *              THIS FILE IS MANAGED BY SALT - DO NOT EDIT                     *
 *                                                                             *
 * The contents of this file are managed by Salt. Any changes to this          *
 * file may be overwritten automatically and without warning.                  *
```

(continues on next page)

(continued from previous page)

```
 ************************************************************************
 */
```

Example 3 - custom text:

```
{{ set copyright='This file may not be copied or distributed without
 ↪permission of VMware, Inc.' }}
{{ salt['slsutil.banner'](title='Copyright 2019 VMware, Inc.',
 ↪text=copyright, width=60) }}
```

```
############################################################
#                                                          #
#              Copyright 2019 VMware, Inc.                 #
#                                                          #
# This file may not be copied or distributed without       #
# permission of VMware, Inc.                               #
############################################################
```

`salt.modules.slsutil.`**`boolstr`**(*value*, *true='true'*, *false='false'*)

Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.

Parameters

- **`value`** -- The boolean value to be converted
- **`true`** -- The value to return if `value` is `True`
- **`false`** -- The value to return if `value` is `False`

In this example, a pillar named `smtp:encrypted` stores a boolean value, but the template that uses that value needs `yes` or `no` to be written, based on the boolean value.

Note: this is written on two lines for clarity. The same result could be achieved in one line.

```
{% set encrypted = salt[pillar.get]('smtp:encrypted', false) %}
use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}
```

Result (assuming the value is `True`):

```
use_tls: yes
```

`salt.modules.slsutil.`**`deserialize`**(*serializer*, *stream_or_string*, ***mod_kwargs*)

Deserialize a Python object using one of the available *serializer modules*.

CLI Example:

```
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:

```
{% set python_object = salt.slsutil.deserialize('json',
    '{"foo": "Foo!"}') %}
```

salt.modules.slsutil.**dir_exists**(*path*, *saltenv='base'*)

Return `True` if a directory exists in the state tree, `False` otherwise.

Parameters

- **path** (*str*) -- The fully qualified path to a directory in the state tree.
- **saltenv** (*str*) -- The fileserver environment to search. Default: `base`

New in version 3004.

CLI Example:

```
salt '*' slsutil.dir_exists nginx/files
```

salt.modules.slsutil.**file_exists**(*path*, *saltenv='base'*)

Return `True` if a file exists in the state tree, `False` otherwise.

New in version 3004.

Parameters

- **path** (*str*) -- The fully qualified path to a file in the state tree.
- **saltenv** (*str*) -- The fileserver environment to search. Default: `base`

CLI Example:

```
salt '*' slsutil.file_exists nginx/defaults.yaml
```

salt.modules.slsutil.**findup**(*startpath*, *filenames*, *saltenv='base'*)

Find the first path matching a filename or list of filenames in a specified directory or the nearest ancestor directory. Returns the full path to the first file found.

New in version 3004.

Parameters

- **startpath** (*str*) -- The fileserver path from which to begin the search. An empty string refers to the state tree root.
- **filenames** -- A filename or list of filenames to search for. Searching for directory names is also supported.
- **saltenv** (*str*) -- The fileserver environment to search. Default: `base`

Example: return the path to `defaults.yaml`, walking up the tree from the state file currently being processed.

```
{{ salt["slsutil.findup"](tplfile, "defaults.yaml") }}
```

CLI Example:

```
salt '*' slsutil.findup formulas/shared/nginx map.jinja
```

salt.modules.slsutil.**merge**(*obj_a*, *obj_b*, *strategy='smart'*, *renderer='yaml'*, *merge_lists=False*)

Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

salt.modules.slsutil.**merge_all**(*lst*, *strategy='smart'*, *renderer='yaml'*, *merge_lists=False*)

New in version 2019.2.0.

Merge a list of objects into each other in order

Parameters

- **lst** (*Iterable*) -- List of objects to be merged.
- **strategy** (*String*) -- Merge strategy. See utils.dictupdate.
- **renderer** (*String*) -- Renderer type. Used to determine strategy when strategy is 'smart'.
- **merge_lists** (*Bool*) -- Defines whether to merge embedded object lists.

CLI Example:

```
$ salt-call --output=txt slsutil.merge_all '[{foo: Foo}, {foo: Bar}]'
local: {u'foo': u'Bar'}
```

salt.modules.slsutil.**path_exists**(*path*, *saltenv='base'*)

Return `True` if a path exists in the state tree, `False` otherwise. The path could refer to a file or directory.

New in version 3004.

Parameters

- **path** (*str*) -- The fully qualified path to a file or directory in the state tree.
- **saltenv** (*str*) -- The fileserver environment to search. Default: `base`

CLI Example:

```
salt '*' slsutil.path_exists nginx/defaults.yaml
```

salt.modules.slsutil.**renderer**(*path=None*, *string=None*, *default_renderer='jinja|yaml'*, ***kwargs*)

Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** -- The path to a file on Salt's fileserver (any URIs supported by *cp.get_url*) or on the local file system.
- **string** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- **default_renderer** -- The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```
#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
```

(continues on next page)

(continued from previous page)

```
}, merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

salt.modules.slsutil.**serialize**(*serializer*, *obj*, ***mod_kwargs*)

Serialize a Python object using one of the available *serializer modules*.

CLI Example:

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}
```

Jinja Example:

```
{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'}) %}
```

salt.modules.slsutil.**update**(*dest*, *upd*, *recursive_update=True*, *merge_lists=False*)

Merge `upd` recursively into `dest`

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

26.7.411 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadm.**avail**(*search=None*, *verbose=False*)

Return a list of available images

search

[string] search keyword

verbose

[boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

salt.modules.smartos_imgadm.**delete**(*uuid*)

Remove an installed image

uuid

[string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.**docker_to_uuid**(*uuid*)

Get the image uuid from an imported docker image

New in version 2019.2.0.

salt.modules.smartos_imgadm.**get**(*uuid*)

Return info on an installed image

uuid

[string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.get plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.**import_image**(*uuid*, *verbose=False*)

Import an image from the repository

uuid

[string] uuid to import

verbose

[boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.**list_installed**(*verbose=False*)

Return a list of installed images

verbose

[boolean (False)] toggle verbose output

Changed in version 2019.2.0: Docker images are now also listed

CLI Example:

```
salt '*' imgadm.list
salt '*' imgadm.list docker=True
salt '*' imgadm.list verbose=True
```

salt.modules.smartos_imgadm.**show**(*uuid*)

Show manifest of a given image

uuid

[string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.**source_add**(*source, source_type='imgapi'*)

Add a new source

source

[string] source url to add

source_trype

[string (imgapi)] source type, either imgapi or docker

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```

salt.modules.smartos_imgadm.**source_delete**(*source*)

Delete a source

source

[string] source url to delete

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.source_delete https://updates.joyent.com
```

salt.modules.smartos_imgadm.**sources**(*verbose=False*)

Return a list of available sources

verbose

[boolean (False)] toggle verbose output

New in version 2019.2.0.

CLI Example:

```
salt '*' imgadm.sources
```

salt.modules.smartos_imgadm.**update_installed**(*uuid=''*)

Gather info on unknown image(s) (locally installed)

uuid

[string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

salt.modules.smartos_imgadm.**vacuum**(*verbose=False*)

Remove unused images

verbose

[boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

salt.modules.smartos_imgadm.**version**()

Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```

26.7.412 salt.modules.smartos_nictagadm

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

New in version 2016.11.0.

salt.modules.smartos_nictagadm.**add**(*name*, *mac*, *mtu=1500*)

Add a new nictag

name

[string] name of new nictag

mac

[string] mac of parent interface or 'etherstub' to create a ether stub

mtu

[int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:OO:OO:BE:EF' 9000
```

salt.modules.smartos_nictagadm.**delete**(*name*, *force=False*)

Delete nictag

name

[string] nictag to delete

force

[boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.**exists**(**nictag*, ***kwargs*)

Check if nictags exists

nictag

[string] one or more nictags to check

verbose

[boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.**list_nictags**(*include_etherstubs=True*)

List all nictags

include_etherstubs
: [boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

salt.modules.smartos_nictagadm.**update**(*name*, *mac=None*, *mtu=None*)

Update a nictag

name
: [string] name of nictag

mac
: [string] optional new mac for nictag

mtu
: [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.**vms**(*nictag*)

List all vms connect to nictag

nictag
: [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```

26.7.413 salt.modules.smartos_virt

virst compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.**get_macs**(*domain*)

Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.smartos_virt.**init**(***kwargs*)

Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

salt.modules.smartos_virt.**list_active_vms**()

Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.smartos_virt.**list_domains**()

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.smartos_virt.**list_inactive_vms**()

Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.smartos_virt.**reboot**(*domain*)

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

salt.modules.smartos_virt.**setmem**(*domain*, *memory*)

Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

salt.modules.smartos_virt.**shutdown**(*domain*)

Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

salt.modules.smartos_virt.**start**(*domain*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

salt.modules.smartos_virt.**stop**(*domain*)

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

salt.modules.smartos_virt.**vm_info**(*domain*)

Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

salt.modules.smartos_virt.**vm_virt_type**(*domain*)

Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

26.7.414 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

salt.modules.smartos_vmadm.**create**(*from_file=None*, ***kwargs*)

Create a new vm

from_file

[string] json file to create the vm from -- if present, all other options will be ignored

kwargs

[string|int|...] options to set for the vm

CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{ "nic_tag":
↪"admin", "ip": "198.51.100.123", ...}, {...}]' [...]
```

salt.modules.smartos_vmadm.**create_snapshot**(*vm*, *name*, *key='uuid'*)

Create snapshot of a vm

vm

[string] vm to be targeted

name

[string]

snapshot name

The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
↪baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.**delete**(*vm*, *key='uuid'*)

Delete a vm

vm

[string] vm to be deleted

key

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

salt.modules.smartos_vmadm.**delete_snapshot**(*vm*, *name*, *key='uuid'*)

Delete snapshot of a vm

vm

[string] vm to be targeted

name

[string]

snapshot name

The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
↪baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.**get**(*vm*, *key='uuid'*)

Output the JSON object describing a VM

vm

[string] vm to be targeted

key

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

salt.modules.smartos_vmadm.**info**(*vm*, *info_type='all'*, *key='uuid'*)

Lookup info on running kvm

vm

[string] vm to be targeted

info_type

[string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return

key

[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

salt.modules.smartos_vmadm.**list_vms**(*search=None*, *sort=None*, *order='uuid,type,ram,state,alias'*, *keyed=True*)

Return a list of VMs

search

[string] vmadm filter property

sort

[string] vmadm sort (-s) property

order

[string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias

keyed

[boolean]

specified if the output should be an array (False) or dict (True)
For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

salt.modules.smartos_vmadm.**lookup**(*search=None, order=None, one=False*)

Return a list of VMs using lookup

search
[string] vmadm filter property

order
[string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias

one
[boolean] return only one result (vmadm's -1)

CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.**reboot**(*vm, force=False, key='uuid'*)

Reboot a vm

vm
[string] vm to be rebooted

force
[boolean] force reboot of vm if true

key
[string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.**receive**(*uuid, source*)

Receive a vm from a directory

uuid
[string] uuid of vm to be received

source
[string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.**reprovision**(*vm, image, key='uuid'*)

Reprovision a vm

vm
[string] vm to be reprovisioned

image
[string] uuid of new image

key
[string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-
↪c1bd-11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
↪key=alias
```

salt.modules.smartos_vmadm.**rollback_snapshot**(*vm*, *name*, *key='uuid'*)

Rollback snapshot of a vm
vm
[string] vm to be targeted
name
[string]
snapshot name
The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.
key
[string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543
↪baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.**send**(*vm*, *target*, *key='uuid'*)

Send a vm to a directory
vm
[string] vm to be sent
target
[string] target directory
key
[string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.**start**(*vm*, *options=None*, *key='uuid'*)

Start a vm
vm
[string] vm to be started
options
[string] optional additional options
key
[string [uuid|alias|hostname]] value type of 'vm' parameter
CLI Example:

```
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d
↪cdrom=/path/to/image.iso,ide'
```

(continues on next page)

(continued from previous page)

```
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.**stop**(*vm*, *force=False*, *key='uuid'*)

Stop a vm

vm
: [string] vm to be stopped

force
: [boolean] force stop of vm if true

key
: [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.**sysrq**(*vm*, *action='nmi'*, *key='uuid'*)

Send non-maskable interrupt to vm or capture a screenshot

vm
: [string] vm to be targeted

action
: [string] nmi or screenshot -- Default: nmi

key
: [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

salt.modules.smartos_vmadm.**update**(*vm*, *from_file=None*, *key='uuid'*, ***kwargs*)

Update a new vm

vm
: [string] vm to be updated

from_file
: [string] json file to update the vm with -- if present, all other options will be ignored

key
: [string [uuid|alias|hostname]] value type of 'vm' parameter

kwargs
: [string|int|...] options to update for the vm

CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/
↪tmp/new_vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_
↪physical_memory=1024
```

26.7.415 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMIdecode

salt.modules.smbios.**get**(*string*, *clean=True*)

Get an individual DMI string from SMBIOS info

string

The string to fetch. DMIdecode supports:

- `bios-vendor`
- `bios-version`
- `bios-release-date`
- `system-manufacturer`
- `system-product-name`
- `system-version`
- `system-serial-number`
- `system-uuid`
- `baseboard-manufacturer`
- `baseboard-product-name`
- `baseboard-version`
- `baseboard-serial-number`
- `baseboard-asset-tag`
- `chassis-manufacturer`
- `chassis-type`
- `chassis-version`
- `chassis-serial-number`
- `chassis-asset-tag`
- `processor-family`
- `processor-manufacturer`
- `processor-version`
- `processor-frequency`

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to `True`

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

salt.modules.smbios.**records**(*rec_type=None*, *fields=None*, *clean=True*)

Return DMI records from SMBIOS

type

Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to `True`

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

26.7.416 salt.modules.smf_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

`salt.modules.smf_service.`**`available`**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

`salt.modules.smf_service.`**`disable`**(*name*, ***kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf_service.`**`disabled`**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf_service.`**`enable`**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.smf_service.`**`enabled`**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.smf_service.`**`get_all`**()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.smf_service.**get_disabled**()

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.smf_service.**get_enabled**()

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.smf_service.**get_running**()

Return the running services

CLI Example:

```
salt '*' service.get_running
```

salt.modules.smf_service.**get_stopped**()

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

salt.modules.smf_service.**missing**(*name*)

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing net-snmp
```

salt.modules.smf_service.**reload_**(*name*)

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.smf_service.**restart**(*name*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.smf_service.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.smf_service.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.smf_service.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.417 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

depends

- smtplib python module

configuration

This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
```

(continues on next page)

(continued from previous page)

```
    smtp.username: myuser
    smtp.password: verybadpass

another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

salt.modules.smtp.**send_msg**(*recipient*, *message*, *subject='Message from Salt'*, *sender=None*, *server=None*, *use_ssl='True'*, *username=None*, *password=None*, *profile=None*, *attachments=None*)

Send a message to an SMTP recipient. To send a message to multiple recipients, the recipients should be in a comma-seperated Python string. Designed for use in states.

CLI Examples:

```
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
↪profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com,admin2@example.com' 'This is a
↪salt module test for multiple recipients' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
↪username='myuser' password='verybadpass' sender='admin@example.com'
↪server='smtp.domain.com'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test'
↪username='myuser' password='verybadpass' sender='admin@example.com'
↪server='smtp.domain.com' attachments="['/var/log/messages']"
```

26.7.418 salt.modules.snapper

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor
: Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor
: Pablo Suárez Hernández <psuarezhernandez@suse.de>

depends
: `dbus` Python module.

depends
: `snapper` http://snapper.io, available in most distros

maturity
: new

platform
: Linux

salt.modules.snapper.**changed_files**(*config='root'*, *num_pre=None*, *num_post=None*)

Returns the files changed between two snapshots

config
Configuration name.
num_pre
first snapshot ID to compare. Default is last snapshot
num_post
last snapshot ID to compare. Default is 0 (current state)
CLI Example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.**create_baseline**(*tag='baseline'*, *config='root'*)

Creates a snapshot marked as baseline
tag
Tag name for the baseline
config
Configuration name.
CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.**create_config**(*name=None*, *subvolume=None*, *fstype=None*, *template=None*, *extra_opts=None*)

Creates a new Snapper configuration
name
Name of the new Snapper configuration.
subvolume
Path to the related subvolume.
fstype
Filesystem type of the subvolume.
template
Configuration template to use. (Default: default)
extra_opts
Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).
CLI Example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/⌧
↪fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/⌧
↪fstype=btrfs template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/⌧
↪fstype=btrfs extra_opts='{"NUMBER_CLEANUP": False}'
```

salt.modules.snapper.**create_snapshot**(*config='root'*, *snapshot_type='single'*, *pre_number=None*, *description=None*, *cleanup_algorithm='number'*, *userdata=None*, ***kwargs*)

Creates an snapshot
config
Configuration name.
snapshot_type
Specifies the type of the new snapshot. Possible values are single, pre and post.

pre_number
: For post snapshots the number of the pre snapshot must be provided.

description
: Description for the snapshot. If not given, the salt job will be used.

cleanup_algorithm
: Set the cleanup algorithm for the snapshot.

number
: Deletes old snapshots when a certain number of snapshots is reached.

timeline
: Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.

empty-pre-post
: Deletes pre/post snapshot pairs with empty diffs.

userdata
: Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI Example:

```
salt '*' snapper.create_snapshot
```

salt.modules.snapper.**delete_snapshot**(*snapshots_ids=None*, *config='root'*)

Deletes an snapshot

config
: Configuration name. (Default: root)

snapshots_ids
: List of the snapshots IDs to be deleted.

CLI Example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

salt.modules.snapper.**diff**(*config='root'*, *filename=None*, *num_pre=None*, *num_post=None*)

Returns the differences between two snapshots

config
: Configuration name.

filename
: if not provided the showing differences between snapshots for all "text" files

num_pre
: first snapshot ID to compare. Default is last snapshot

num_post
: last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

salt.modules.snapper.**diff_jid**(*jid*, *config='root'*)

Returns the changes applied by a *jid*

jid
: The job id to lookup

config
: Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.**get_config**(*name='root'*)

Retrieves all values from a given configuration

CLI Example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.**get_snapshot**(*number=0*, *config='root'*)

Get detailed information about a given snapshot

CLI Example:

```
salt '*' snapper.get_snapshot 1
```

salt.modules.snapper.**list_configs**()

List all available configs

CLI Example:

```
salt '*' snapper.list_configs
```

salt.modules.snapper.**list_snapshots**(*config='root'*)

List available snapshots

CLI Example:

```
salt '*' snapper.list_snapshots config=myconfig
```

salt.modules.snapper.**modify_snapshot**(*snapshot_id=None*, *description=None*, *userdata=None*, *cleanup=None*, *config='root'*)

Modify attributes of an existing snapshot.

config
: Configuration name. (Default: root)

snapshot_id
: ID of the snapshot to be modified.

cleanup
: Change the cleanup method of the snapshot. (str)

description
: Change the description of the snapshot. (str)

userdata
: Change the userdata dictionary of the snapshot. (dict)

CLI Example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

salt.modules.snapper.**run**(*function*, **args*, ***kwargs*)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function
: Salt function to call.

config
Configuration name. (default: "root")
description
A description for the snapshots. (default: None)
userdata
Data to include in the snapshot metadata. (default: None)
cleanup_algorithm
Snapper cleanup algorithm. (default: "number")
***args**
args for the function to call. (default: None)
****kwargs**
kwargs for the function to call (default: None)
This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='["/etc/motd", "some text"]'
```

salt.modules.snapper.**set_config**(*name='root'*, ***kwargs*)

Set configuration values

CLI Example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.**status**(*config='root'*, *num_pre=None*, *num_post=None*)

Returns a comparison between two snapshots
config
Configuration name.
num_pre
first snapshot ID to compare. Default is last snapshot
num_post
last snapshot ID to compare. Default is 0 (current state)
CLI Example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.**status_to_string**(*dbus_status*)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

salt.modules.snapper.**undo**(*config='root'*, *files=None*, *num_pre=None*, *num_post=None*)

Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

> **Warning:** If one of the files has changes after num_post, they will be overwritten The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.
>
> You to undo changes between num_pre and the current version of the files use num_post=0.

CLI Example:

```
salt '*' snapper.undo
```

salt.modules.snapper.**undo_jid**(*jid*, *config='root'*)

Undo the changes applied by a salt job

jid
: The job id to lookup

config
: Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

26.7.419 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer
: Jorge Schrauwen <sjorge@blackdot.be>

maturity
: new

platform
: solaris,illumos

New in version 2016.3.0.

salt.modules.solaris_fmadm.**acquit**(*fmri*)

Acquit resource or acquit case

fmri: **string**
: fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

salt.modules.solaris_fmadm.**config**()

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

salt.modules.solaris_fmadm.**faulty**()

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

salt.modules.solaris_fmadm.**flush**(*fmri*)

Flush cached state for resource
fmri: **string**
fmri
CLI Example:

```
salt '*' fmadm.flush fmri
```

salt.modules.solaris_fmadm.**healthy**()

Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

salt.modules.solaris_fmadm.**list_records**(*after=None*, *before=None*)

Display fault management logs
after
[string] filter events after time, see man fmdump for format
before
[string] filter events before time, see man fmdump for format
CLI Example:

```
salt '*' fmadm.list
```

salt.modules.solaris_fmadm.**load**(*path*)

Load specified fault manager module
path: **string**
path of fault manager module
CLI Example:

```
salt '*' fmadm.load /module/path
```

salt.modules.solaris_fmadm.**repaired**(*fmri*)

Notify fault manager that resource has been repaired
fmri: **string**
fmri
CLI Example:

```
salt '*' fmadm.repaired fmri
```

salt.modules.solaris_fmadm.**replaced**(*fmri*)

Notify fault manager that resource has been replaced
fmri: **string**
fmri
CLI Example:

```
salt '*' fmadm.repaired fmri
```

salt.modules.solaris_fmadm.**reset**(*module*, *serd=None*)

Reset module or sub-component

module: **string**
module to unload
serd
[string] serd sub module
CLI Example:

```
salt '*' fmadm.reset software-response
```

salt.modules.solaris_fmadm.**show**(*uuid*)

Display log details
uuid: **string**
uuid of fault
CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

salt.modules.solaris_fmadm.**unload**(*module*)

Unload specified fault manager module
module: **string**
module to unload
CLI Example:

```
salt '*' fmadm.unload software-response
```

26.7.420 salt.modules.solaris_group

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

---

salt.modules.solaris_group.**add**(*name*, *gid=None*, ***kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.solaris_group.**chgid**(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.solaris_group.**delete**(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.solaris_group.**getent**(*refresh=False*)

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.solaris_group.**info**(*name*)

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

26.7.421 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

---

salt.modules.solaris_shadow.**default_hash**()

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.**del_password**(*name*)

New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.solaris_shadow.**gen_password**(*password, crypt_salt=None, algorithm='sha512'*)

New in version 2015.8.8.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

---

password
Plaintext password to be hashed.

crypt_salt
Crpytographic salt. If not given, a random 8-character salt will be generated.

algorithm
The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)

- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt' algorithm=sha256
```

salt.modules.solaris_shadow.**info**(*name*)

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.solaris_shadow.**set_maxdays**(*name*, *maxdays*)

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

salt.modules.solaris_shadow.**set_mindays**(*name*, *mindays*)

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

salt.modules.solaris_shadow.**set_password**(*name*, *password*)

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

salt.modules.solaris_shadow.**set_warndays**(*name*, *warndays*)

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

26.7.422 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.**halt**()

Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.solaris_system.**init**(*state*)

Change the system runlevel on sysV compatible systems

CLI Example:

state

[string] Init state

```
salt '*' system.init 3
```

salt.modules.solaris_system.**poweroff**()

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

salt.modules.solaris_system.**reboot**(*delay=0*, *message=None*)

Reboot the system

delay

[int] Optional wait time in seconds before the system will be rebooted.

message

[string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

salt.modules.solaris_system.**shutdown**(*delay=0*, *message=None*)

Shutdown a running system

delay

[int] Optional wait time in seconds before the system will be shutdown.

message

[string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

26.7.423 salt.modules.solaris_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

salt.modules.solaris_user.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.solaris_user.**chfullname**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.solaris_user.**chgid**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.solaris_user.**chgroups**(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name
: Username to modify

groups
: List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append
: [False] Set to `True` to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.solaris_user.**chhome**(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name
: Username to modify

home
: New home directory to set

persist
: [False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.solaris_user.**chhomephone**(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.solaris_user.**chroomnumber**(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.solaris_user.**chshell**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.solaris_user.**chuid**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.solaris_user.**chworkphone**(*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

salt.modules.solaris_user.**delete**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.solaris_user.**getent**(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.solaris_user.**info**(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.solaris_user.**list_groups**(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.solaris_user.**list_users**()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.solaris_user.**rename**(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

26.7.424 salt.modules.solarisipspkg

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the `pkg` provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

salt.modules.solarisipspkg.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

salt.modules.solarisipspkg.**get_fmri**(*name*, ***kwargs*)

Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

salt.modules.solarisipspkg.**install**(*name=None*, *refresh=False*, *pkgs=None*, *version=None*, *test=False*, ***kwargs*)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Multiple Package Installation Options:

pkgs

A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'
```

salt.modules.solarisipspkg.**is_installed**(*name*, ***kwargs*)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

salt.modules.solarisipspkg.**latest_version**(**names*, ***kwargs*)

The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```

salt.modules.solarisipspkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.solarisipspkg.**list_upgrades**(*refresh=True*, ***kwargs*)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

refresh

[True] Runs a full package database refresh before listing. Set to `False` to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to `False`. This was changed to default to `True` in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to `True`.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

salt.modules.solarisipspkg.**normalize_name**(*name*, ***kwargs*)

Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

salt.modules.solarisipspkg.**purge**(*name*, ***kwargs*)

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

salt.modules.solarisipspkg.**refresh_db**(*full=False*, ***kwargs*)

Updates the remote repos database.

full : False

Set to `True` to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

salt.modules.solarisipspkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.solarisipspkg.`**`search`**(*name*, *versions_as_list=False*, ***kwargs*)

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisipspkg.`**`upgrade`**(*refresh=False*, ***kwargs*)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisipspkg.`**`upgrade_available`**(*name*, ***kwargs*)

Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisipspkg.`**`version`**(**names*, ***kwargs*)

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

26.7.425 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

salt.modules.solarispkg.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

salt.modules.solarispkg.**install**(*name=None*, *sources=None*, *saltenv='base'*, ***kwargs*)

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion

salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg
↪filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
↪sol10-sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-
↪sol10-sparc-local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/
```

(continues on next page)

(continued from previous page)

```
↪<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/
↪gcc-3.4.6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass 'current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/
↪gcc-3.4.6-sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module
↪directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]' instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state

SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>
↪"}]' admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states

<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
    - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

`salt.modules.solarispkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.`**`purge`**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name

The name of the package to be deleted

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.solarispkg.**remove**(*name=None, pkgs=None, saltenv='base', **kwargs*)

Remove packages with pkgrm

name

The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.solarispkg.**upgrade_available**(*name, **kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.solarispkg.**version**(**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.7.426 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

Override these in the minion config

solr.cores
A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.

solr.baseurl
The root level URL to access solr via HTTP

solr.request_timeout
The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

solr.type
Possible values are 'master' or 'slave'

solr.backup_path
The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

solr.num_backups
For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

solr.init_script
The full path to your init script with start/stop options

solr.dih.options
A list of options to pass to the DIH.

Required Options for DIH

clean
[False] Clear the index before importing

commit
[True] Commit the documents to the index upon completion

optimize
[True] Optimize the index after commit is complete

verbose
[True] Get verbose output

`salt.modules.solr.`**`abort_import`**(*handler*, *host=None*, *core_name=None*, *verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

handler
[str] The name of the data import handler.

host
[str (None)] The solr host to query. __opts__['host'] is default.

core
[str (None)] The core the handler belongs to.

verbose
[boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

`salt.modules.solr.`**`backup`**(*host=None*, *core_name=None*, *append_core_to_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

host
[str (None)] The solr host to query. __opts__['host'] is default.

core_name
[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

append_core_to_path
[boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

`salt.modules.solr.`**`core_status`**(*host=None*, *core_name=None*)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

host
[str (None)] The solr host to query. __opts__['host'] is default.
core_name
[str] The name of the core to reload
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

salt.modules.solr.**delta_import**(*handler*, *host=None*, *core_name=None*, *options=None*, *extra=None*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master
handler
[str] The name of the data import handler.
host
[str (None)] The solr host to query. __opts__['host'] is default.
core
[str (None)] The core the handler belongs to.
options
[dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
extra
[dict ([])] Extra name value pairs to pass to the handler. e.g. ["name=value"]
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

salt.modules.solr.**full_import**(*handler*, *host=None*, *core_name=None*, *options=None*, *extra=None*)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master
handler
[str] The name of the data import handler.
host
[str (None)] The solr host to query. __opts__['host'] is default.
core
[str (None)] The core the handler belongs to.
options
[dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__
extra
[dict ([])] Extra name value pairs to pass to the handler. e.g. ["name=value"]
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

salt.modules.solr.**import_status**(*handler*, *host=None*, *core_name=None*, *verbose=False*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: 'master'

handler
: [str] The name of the data import handler.

host
: [str (None)] The solr host to query. __opts__['host'] is default.

core
: [str (None)] The core the handler belongs to.

verbose
: [boolean (False)] Specifies verbose output

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

salt.modules.solr.**is_replication_enabled**(*host=None*, *core_name=None*)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

host
: [str (None)] The solr host to query. __opts__['host'] is default.

core_name
: [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

salt.modules.solr.**lucene_version**(*core_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

core_name
: [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

salt.modules.solr.**match_index_versions**(*host=None*, *core_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to

this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

host
: [str (None)] The solr host to query. __opts__['host'] is default.

core_name
: [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

`salt.modules.solr.`**`optimize`**(*host=None*, *core_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

host
: [str (None)] The solr host to query. __opts__['host'] is default.

core_name
: [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

`salt.modules.solr.`**`ping`**(*host=None*, *core_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

host
: [str (None)] The solr host to query. __opts__['host'] is default.

core_name
: [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

`salt.modules.solr.`**`reload_core`**(*host=None*, *core_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

host
[str (None)] The solr host to query. __opts__['host'] is default.
core_name
[str] The name of the core to reload
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

salt.modules.solr.**reload_import_config**(*handler*, *host=None*, *core_name=None*, *verbose=False*)
MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type
handler
[str] The name of the data import handler.
host
[str (None)] The solr host to query. __opts__['host'] is default.
core
[str (None)] The core the handler belongs to.
verbose
[boolean (False)] Run the command with verbose output.
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

salt.modules.solr.**replication_details**(*host=None*, *core_name=None*)
Get the full replication details.
host
[str (None)] The solr host to query. __opts__['host'] is default.
core_name
[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

salt.modules.solr.**set_is_polling**(*polling*, *host=None*, *core_name=None*)
SLAVE CALL Prevent the slaves from polling the master for updates.
polling
[boolean] True will enable polling. False will disable it.

host
[str (None)] The solr host to query. __opts__['host'] is default.
core_name
[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

salt.modules.solr.**set_replication_enabled**(*status*, *host=None*, *core_name=None*)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.
status
[boolean] Sets the replication status to the specified state.
host
[str (None)] The solr host to query. __opts__['host'] is default.
core_name
[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

salt.modules.solr.**signal**(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.
signal
[str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'
CLI Example:

```
salt '*' solr.signal restart
```

salt.modules.solr.**version**(*core_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.
core_name
[str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

26.7.427 salt.modules.solrcloud

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

salt.modules.solrcloud.**BOOL_PROPS_LIST = ['transient', 'loadOnStartup']**

Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1

salt.modules.solrcloud.**DICT_OPTIONS_LIST = ['properties']**

Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll

salt.modules.solrcloud.**alias_exists**(*alias_name*, ***kwargs*)

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

salt.modules.solrcloud.**alias_get_collections**(*alias_name*, ***kwargs*)

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

salt.modules.solrcloud.**alias_set_collections**(*alias_name*, *collections=None*, ***kwargs*)

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1,
↪colletion2]
```

salt.modules.solrcloud.**cluster_status**(***kwargs*)

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.cluster_status
```

salt.modules.solrcloud.**collection_backup**(*collection_name*, *location*, *backup_name=None*, ***kwargs*)

Create a backup for a collection.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

salt.modules.solrcloud.**collection_backup_all**(*location*, *backup_name=None*, ***kwargs*)

Create a backup for all collection present on the server.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

salt.modules.solrcloud.**collection_check_options**(*options*)

Check collections options

CLI Example:

```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'
```

salt.modules.solrcloud.**collection_create**(*collection_name*, *options=None*, ***kwargs*)

Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"

```
salt '*' solrcloud.collection_create collection_name options={
↪"replicationFactor":2, "numShards":3}
```

Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '*' solrcloud.collection_create collection_name options={
↪"replicationFactor":2, "numShards":3,            "properties":{"dataDir
↪":"/srv/solr/hugePartitionSollection"}}
```

salt.modules.solrcloud.**collection_creation_options**()

Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

salt.modules.solrcloud.**collection_exists**(*collection_name*, ***kwargs*)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

salt.modules.solrcloud.**collection_get_options**(*collection_name*, ***kwargs*)

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

salt.modules.solrcloud.**collection_list**(***kwargs*)

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

salt.modules.solrcloud.**collection_reload**(*collection*, ***kwargs*)

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

salt.modules.solrcloud.**collection_set_options**(*collection_name*, *options*, ***kwargs*)

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={
↪"replicationFactor":4}
```

salt.modules.solrcloud.**log = <SaltLoggingClass salt.modules.solrcloud (GARBAGE)>**

Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

26.7.428 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0.

depends

- splunk-sdk python module

configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

salt.modules.splunk.**create_user**(*email*, *profile='splunk'*, ***kwargs*)

create a splunk user by name/email

CLI Example:

```
salt myminion splunk.create_user user@example.com roles=['user'] realname=
↪"Test User" name=testuser
```

salt.modules.splunk.**delete_user**(*email*, *profile='splunk'*)

Delete a splunk user by email

CLI Example:

```
salt myminion splunk_user.delete 'user@example.com'
```

salt.modules.splunk.**get_user**(*email*, *profile='splunk'*, ***kwargs*)

Get a splunk user by name/email

CLI Example:

```
salt myminion splunk.get_user 'user@example.com' user_details=false
salt myminion splunk.get_user 'user@example.com' user_details=true
```

salt.modules.splunk.**list_users**(*profile='splunk'*)

List all users in the splunk DB

CLI Example:

```
salt myminion splunk.list_users
```

salt.modules.splunk.**update_user**(*email*, *profile='splunk'*, ***kwargs*)

Create a splunk user by email

CLI Example:

```
salt myminion splunk.update_user example@domain.com roles=['user']
↪realname="Test User"
```

26.7.429 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

- splunk-sdk python module

configuration
Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

salt.modules.splunk_search.**create**(*name*, *profile='splunk'*, ***kwargs*)

Create a splunk search

CLI Example:
splunk_search.create 'my search name' search='error msg'

salt.modules.splunk_search.**delete**(*name*, *profile='splunk'*)

Delete a splunk search

CLI Example:
splunk_search.delete 'my search name'

salt.modules.splunk_search.**get**(*name*, *profile='splunk'*)

Get a splunk search

CLI Example:
splunk_search.get 'my search name'

salt.modules.splunk_search.**list_**(*profile='splunk'*)

List splunk searches (names only)

CLI Example:
splunk_search.list

salt.modules.splunk_search.**list_all**(*prefix=None*, *app=None*, *owner=None*, *description_contains=None*, *name_not_contains=None*, *profile='splunk'*)

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where "description_contains in description" is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI Example:

1. **Make a "backup" of all existing searches**
   $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > legacy_searches.sls
2. **Get all searches with new prefixed names**
   $ salt-call splunk_search.list_all "prefix=**MANAGED BY SALT** " --out=txt | sed "s/local: //" > managed_searches.sls
3. **Insert the managed searches into splunk**
   $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right

5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls $ salt-call state.sls remove_legacy_searches.sls
6. Get all searches again, verify no changes $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > final_searches.sls $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.**update**(*name*, *profile='splunk'*, ***kwargs*)

Update a splunk search

CLI Example:

splunk_search.update 'my search name' sharing=app

26.7.430 salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.**fetch**(*db=None*, *sql=None*)

Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

salt.modules.sqlite3.**indexes**(*db=None*)

Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

salt.modules.sqlite3.**indices**(*db=None*)

Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

salt.modules.sqlite3.**modify**(*db=None*, *sql=None*)

Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata
↪TEXT);'
```

salt.modules.sqlite3.**sqlite_version**()

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

salt.modules.sqlite3.**tables**(*db=None*)

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

salt.modules.sqlite3.**version**()

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

26.7.431 salt.modules.ssh

Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

---

salt.modules.ssh.**auth_keys**(*user=None*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*)

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

salt.modules.ssh.**check_key**(*user*, *key*, *enc*, *comment*, *options*, *config='.ssh/authorized_keys'*, *cache_keys=None*, *fingerprint_hash_type=None*)

Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

salt.modules.ssh.**check_key_file**(*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fingerprint_hash_type=None*)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

salt.modules.ssh.**check_known_host**(*user=None*, *hostname=None*, *key=None*, *fingerprint=None*, *config=None*, *port=None*, *fingerprint_hash_type=None*)

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

salt.modules.ssh.**get_known_host_entries**(*user*, *hostname*, *config=None*, *port=None*, *fingerprint_hash_type=None*)

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:

```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

salt.modules.ssh.**hash_known_hosts**(*user=None*, *config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user
: hash known hosts of this user

config
: path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

salt.modules.ssh.**host_keys**(*keydir=None*, *private=True*, *certs=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

salt.modules.ssh.**key_is_encrypted**(*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a `Proc-Type` header with `ENCRYPTED` in the value. If found, returns `True`, otherwise returns `False`.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

salt.modules.ssh.**recv_known_host_entries**(*hostname*, *enc=None*, *port=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

hostname
: The name of the remote host (e.g. "github.com")

enc
Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

port
Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

hash_known_hosts
[True] Hash all hostnames and addresses in the known hosts file.

timeout
[int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

fingerprint_hash_type
The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.`**`rm_auth_key`**(*user*, *key*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`salt.modules.ssh.`**`rm_auth_key_from_file`**(*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
↪pub
```

`salt.modules.ssh.`**`rm_known_host`**(*user=None*, *hostname=None*, *config=None*, *port=None*)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`salt.modules.ssh.`**`set_auth_key`**(*user*, *key*, *enc='ssh-rsa'*, *comment=''*, *options=None*, *config='.ssh/authorized_keys'*, *cache_keys=None*, *fingerprint_hash_type=None*)

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

salt.modules.ssh.**set_auth_key_from_file**(*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fingerprint_hash_type=None*, ***kwargs*)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.
↪pub
```

salt.modules.ssh.**set_known_host**(*user=None*, *hostname=None*, *fingerprint=None*, *key=None*, *port=None*, *enc=None*, *config=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

user
: The user who owns the ssh authorized keys file to modify

hostname
: The name of the remote host (e.g. "github.com")

fingerprint
: The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key
: The public key which must be presented in the known_hosts file (optional if fingerprint specified)

port
: optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

enc
: Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.

config
: The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

hash_known_hosts
: [True] Hash all hostnames and addresses in the known hosts file.

timeout
: [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

  New in version 2016.3.0.

fingerprint_hash_type
: The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

  New in version 2016.11.4.

  Changed in version 2017.7.0: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa
↪' config='.ssh/known_hosts'
```

salt.modules.ssh.**user_keys**(*user=None*, *pubfile=None*, *prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub
 ↪prvfile=/home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user="['user1','user2'] pubfile=id_rsa.pub
 ↪prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

26.7.432 salt.modules.ssh_pkg

Service support for the REST example

salt.modules.ssh_pkg.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*)

salt.modules.ssh_pkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

salt.modules.ssh_pkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

26.7.433 salt.modules.ssh_service

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

salt.modules.ssh_service.**enabled**(*name*, *sig=None*)

Only the 'redbull' service is 'enabled' in the test

salt.modules.ssh_service.**get_all**()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.ssh_service.**list_**()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

salt.modules.ssh_service.**restart**(*name*, *sig=None*)

Restart the specified service with rest_sample

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.ssh_service.**running**(*name*, *sig=None*)

Return whether this service is running.

salt.modules.ssh_service.**start**(*name*, *sig=None*)

Start the specified service on the ssh_sample

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.ssh_service.**status**(*name*, *sig=None*)

Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not implemented

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.ssh_service.**stop**(*name*, *sig=None*)

Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.434 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

salt.modules.state.**apply_**(*mods=None*, ***kwargs*)

New in version 2015.5.0.

This function will call *state.highstate* or *state.sls* based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply` with no SLS targets, like so:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in top.sls:

test
: Run states in test-only (dry-run) mode

mock
: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

  New in version 2015.8.4.

pillar
: Custom Pillar values, passed as a dictionary of key-value pairs

  ```
  salt '*' state.apply stuff pillar='{"foo": "bar"}'
  ```

  Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

  ---

exclude
: Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

  ```
  salt '*' state.apply exclude=bar,baz
  salt '*' state.apply exclude=foo*
  salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
  ↪to_exclude'}]"
  ```

queue
: [False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

  The queue is implemented as a disk-based FIFO queue, minimizing memory usage regardless of queue depth. Jobs in the state queue are processed by a background thread and will bypass `process_count_max` limits when they are ready to execute, ensuring they are not starved by other workloads.

  Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

localconfig
: Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

  ```
  salt '*' state.apply localconfig=/path/to/minion.yml
  ```

state_events
: The state_events option sends progress events as each function in a state run completes execution.

  New in version 3006.0.

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff

# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

# Run the states configured in a more deeply nested directory such as
↪salt://my/organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

test
: Run states in test-only (dry-run) mode

mock
: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

  New in version 2015.8.4.

pillar
: Custom Pillar values, passed as a dictionary of key-value pairs

  ```
  salt '*' state.apply stuff pillar='{"foo": "bar"}'
  ```

  Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

  ---

queue
: [False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

  The queue is implemented as a disk-based FIFO queue, minimizing memory usage regardless of queue depth. Jobs in the state queue are processed by a background thread and will bypass `process_count_max` limits when they are ready to execute, ensuring they are not starved by other workloads.

  Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent
: [False] Execute state runs concurrently instead of serially

  Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv
: Specify a salt fileserver environment to be used when applying states

  Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

sync_mods

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

Note: This option is ignored when no SLS files are specified, as a *highstate* automatically syncs all custom module types.

New in version 2017.7.8,2018.3.3,2019.2.0.

state_events

The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

`salt.modules.state.`**`check_request`**`(`*name=None*`)`

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.`**`clear_cache`**`()`

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.`**`clear_request`**`(`*name=None*`)`

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

salt.modules.state.**disable**(*states*)

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate

salt '*' state.disable highstate,test.succeed_without_changes
```

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.

salt '*' state.disable bind.config

---

salt.modules.state.**enable**(*states*)

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate

salt '*' state.enable test.succeed_without_changes
```

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.

salt '*' state.disable bind.config

---

salt.modules.state.**event**(*tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

Changed in version 2019.2.0: `tagmatch` can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

salt.modules.state.**get_pauses**(*jid=None*)

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

salt.modules.state.**high**(*data*, *test=None*, *queue=None*, ***kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

salt.modules.state.**highstate**(*test=None*, *queue=None*, *state_events=None*, ***kwargs*)

Retrieve the state data from the salt master for this minion and execute it

test

Run states in test-only (dry-run) mode

pillar

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.highstate stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See *here* for details.

pillar_enc

Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude

Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls':
↪'sls_to_exclude'}]"
```

saltenv

Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

queue
: [False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

  The queue is implemented as a disk-based FIFO queue, minimizing memory usage regardless of queue depth. Jobs in the state queue are processed by a background thread and will bypass `process_count_max` limits when they are ready to execute, ensuring they are not starved by other workloads.

  Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent
: [False] Execute state runs concurrently instead of serially

  Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

localconfig
: Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock
: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

  New in version 2015.8.4.

state_events
: The state_events option sends progress events as each function in a state run completes execution.

  New in version 3006.0.

CLI Examples:

```
salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
↪to_exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.`**`id_exists`**(*ids*, *mods*, *test=None*, *queue=None*, ***kwargs*)

Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to *state.sls_exists*, returns True or False. The default environment is base``, use `saltenv` to specify a different environment.

New in version 2019.2.0.

saltenv
: Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.id_exists create_myfile,update_template filestate
↪saltenv=dev
```

salt.modules.state.**list_disabled**()

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

salt.modules.state.**low**(*data*, *queue=None*, ***kwargs*)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.**orchestrate**(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- Docs for the salt state module *salt.states.saltmod*

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

salt.modules.state.**pause**(*jid*, *state_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to *pause* is *vim*

CLI Examples:

```
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

salt.modules.state.**pkg**(*pkg_path*, *pkg_sum*, *hash_type*, *test=None*, ***kwargs*)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc
↪md5
```

salt.modules.state.**request**(*mods=None*, ***kwargs*)

New in version 2015.5.0.

Request that the local admin execute a state run via *salt-call state.run_request*. All arguments match those of state.apply.

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

salt.modules.state.**resume**(*jid*, *state_id=None*)

Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to *rm_pause* is *vim*

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

salt.modules.state.**run_request**(*name='default'*, ***kwargs*)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

salt.modules.state.**running**(*concurrent=False*)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

salt.modules.state.**show_highstate**(*queue=None*, ***kwargs*)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

salt.modules.state.**show_low_sls**(*mods*, *test=None*, *queue=None*, ***kwargs*)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

saltenv
Specify a salt fileserver environment to be used when applying states

pillar
Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

salt.modules.state.**show_lowstate**(*queue=None*, ***kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

salt.modules.state.**show_sls**(*mods*, *test=None*, *queue=None*, ***kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

saltenv
Specify a salt fileserver environment to be used when applying states

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

salt.modules.state.**show_state_usage**(*queue=None*, ***kwargs*)

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

salt.modules.state.**show_states**(*queue=None*, ***kwargs*)

Returns the list of states that will be applied on highstate.

CLI Example:

```
salt '*' state.show_states
```

New in version 2019.2.0.

salt.modules.state.**show_top**(*queue=None*, ***kwargs*)

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

salt.modules.state.**single**(*fun*, *name*, *test=None*, *queue=None*, ***kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

salt.modules.state.**sls**(*mods*, *test=None*, *exclude=None*, *queue=None*, *sync_mods=None*, *state_events=None*, ***kwargs*)

Execute the states in one or more SLS files

test

Run states in test-only (dry-run) mode

pillar

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See *here* for details.

pillar_enc

Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude

Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
```

(continues on next page)

(continued from previous page)

```
salt '*' state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {
↪'sls': 'sls_to_exclude'}]"
```

queue

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

The queue is implemented as a disk-based FIFO queue, minimizing memory usage regardless of queue depth. Jobs in the state queue are processed by a background thread and will bypass `process_count_max` limits when they are ready to execute, ensuring they are not starved by other workloads.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent

[False] Execute state runs concurrently instead of serially

> **Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv

Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock

The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

sync_mods

If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,2019.2.0.

state_events

The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Example:

```
# Run the states configured in salt://example.sls (or salt://example/init.
↪sls)
salt '*' state.apply example

# Run the states configured in salt://core.sls (or salt://core/init.sls)
# and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

# Run the states configured in a more deeply nested directory such as
↪salt://my/nested/state.sls (or salt://my/nested/state/init.sls)
salt '*' state.sls my.nested.state

salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_
↪to_exclude'}]"
salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.`**`sls_exists`**(*mods*, *test=None*, *queue=None*, ***kwargs*)

Tests for the existence the of a specific SLS or list of SLS files on the master. Similar to *state.show_sls*, rather than returning state details, returns True or False. The default environment is `base`, use `saltenv` to specify a different environment.

New in version 2019.2.0.

saltenv

Specify a salt fileserver environment from which to look for the SLS files specified in the `mods` argument

CLI Example:

```
salt '*' state.sls_exists core,edit.vim saltenv=dev
```

`salt.modules.state.`**`sls_id`**(*id_*, *mods*, *test=None*, *queue=None*, *state_events=None*, ***kwargs*)

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

id

ID to call

mods

Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

saltenv

[base] Specify a salt fileserver environment to be used when applying states

pillarenv

Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

pillar

Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls_id my_state my_module pillar='{"foo": "bar"}'
```

Note: Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.

CLI Example:

```
salt '*' state.sls_id my_state my_module

salt '*' state.sls_id my_state my_module,a_common_module
```

salt.modules.state.**soft_kill**(*jid*, *state_id=None*)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to *soft_kill* is *vim*

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

salt.modules.state.**template**(*tem*, *queue=None*, ***kwargs*)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

salt.modules.state.**template_str**(*tem*, *queue=None*, ***kwargs*)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

salt.modules.state.**test**(**args*, ***kwargs*)

New in version 3001.

Alias for *state.apply* with the kwarg *test* forced to *True*.

This is a nicety to avoid the need to type out *test=True* and the possibility of a typo causing changes you do not intend.

salt.modules.state.**top**(*topfn*, *test=None*, *queue=None*, ***kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue

[False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

The queue is implemented as a disk-based FIFO queue, minimizing memory usage regardless of queue depth. Jobs in the state queue are processed by a background thread and will bypass

`process_count_max` limits when they are ready to execute, ensuring they are not starved by other workloads.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

saltenv
Specify a salt fileserver environment to be used when applying states

pillarenv
Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="[{'id': 'id_to_exclude'}, {'sls':
↪'sls_to_exclude'}]"
```

26.7.435 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.`**`all_status`**`()`

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

`salt.modules.status.`**`cpuinfo`**`()`

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

`salt.modules.status.`**`cpustats`**`()`

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cpustats
```

salt.modules.status.**custom**()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

salt.modules.status.**diskstats**()

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

salt.modules.status.**diskusage**(**args*)

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage         # usage for all filesystems
salt '*' status.diskusage / /tmp  # usage for / and /tmp
salt '*' status.diskusage ext?    # usage for ext[234] filesystems
salt '*' status.diskusage / ext?  # usage for / and all ext filesystems
```

salt.modules.status.**loadavg**()

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages
↪to Python
```

salt.modules.status.**master**(*master=None*, *connected=True*)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

salt.modules.status.**meminfo**()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.meminfo
```

salt.modules.status.**netdev**()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

salt.modules.status.**netstats**()

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

salt.modules.status.**nproc**()

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

salt.modules.status.**pid**(*sig*)

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

salt.modules.status.**ping_master**(*master*)

New in version 2016.3.0.

Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

salt.modules.status.**procs**()

Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

salt.modules.status.**proxy_reconnect**(*proxy_name*, *opts=None*)

Forces proxy minion reconnection when not alive.

proxy_name
: The virtual name of the proxy module.

opts: **None**
: Opts dictionary. Not intended for CLI usage.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

salt.modules.status.**time_**(*format='%A, %d. %B %Y %I:%M%p'*)

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time

salt '*' status.time '%s'
```

salt.modules.status.**uptime**()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

salt.modules.status.**version**()

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.version
```

salt.modules.status.**vmstats**()

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

salt.modules.status.**w**()

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```

26.7.436 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

salt.modules.statuspage.**create**(*endpoint='incidents'*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*)

Insert a new entry under a specific endpoint.

endpoint: **incidents**
: Insert under this specific endpoint.

page_id
: Page ID. Can also be specified in the config file.

api_key
: API key. Can also be specified in the config file.

api_version: **1**
: API version. Can also be specified in the config file.

api_url
: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component'␣
↪group_id='993vgplshj12'
```

Example output:

```
minion:
    ----------
    comment:
    out:
        ----------
        created_at:
            2017-01-05T19:35:27.135Z
        description:
            None
        group_id:
            993vgplshj12
        id:
            mjkmtt5lhdgc
        name:
            my component
        page_id:
            ksdhgfyiuhaa
        position:
            7
        status:
            operational
        updated_at:
            2017-01-05T19:35:27.135Z
    result:
        True
```

salt.modules.statuspage.**delete**(*endpoint='incidents'*, *id=None*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*)

Remove an entry from an endpoint.

endpoint: **incidents**
: Request a specific endpoint.

page_id
: Page ID. Can also be specified in the config file.

api_key
: API key. Can also be specified in the config file.

api_version: **1**
: API version. Can also be specified in the config file.

api_url
: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```
minion:
    ----------
    comment:
```

(continues on next page)

(continued from previous page)

```
    out:
        None
    result:
        True
```

salt.modules.statuspage.**retrieve**(*endpoint='incidents'*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*)

Retrieve a specific endpoint from the Statuspage API.

endpoint: **incidents**
: Request a specific endpoint.

page_id
: Page ID. Can also be specified in the config file.

api_key
: API key. Can also be specified in the config file.

api_version: **1**
: API version. Can also be specified in the config file.

api_url
: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion:
    ----------
    comment:
    out:
        |_
          ----------
          backfilled:
              False
          created_at:
              2015-01-26T20:25:02.702Z
          id:
              kh2qwjbheqdc36
          impact:
              major
          impact_override:
              None
          incident_updates:
              |_
                ----------
                affected_components:
                    None
                body:
                    We are currently investigating this issue.
                created_at:
                    2015-01-26T20:25:02.849Z
                display_at:

                None
            scheduled_auto_completed:
                False
            scheduled_auto_in_progress:
                False
            scheduled_for:
                None
            scheduled_remind_prior:
                False
            scheduled_reminded_at:
                None
            scheduled_until:
                None
            shortlink:
                http://stspg.io/voY
            status:
                investigating
            updated_at:
                2015-01-26T20:25:13.379Z
    result:
        True
```

salt.modules.statuspage.**update**(*endpoint='incidents'*, *id=None*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*)

Update attribute(s) of a specific endpoint.

id
: The unique ID of the endpoint entry.

endpoint: **incidents**
: Endpoint name.

page_id
: Page ID. Can also be specified in the config file.

api_key
: API key. Can also be specified in the config file.

api_version: **1**
: API version. Can also be specified in the config file.

api_url
: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```
minion:
    ----------
    comment:
    out:
        ----------
        created_at:
            2017-01-03T15:25:30.718Z
        description:
            None
        group_id:
            993vgplshj12
        id:
            dz959yz2nd4l
        name:
            Management Portal
        page_id:
            xzwjjdw87vpf
        position:
            11
        status:
            resolved
        updated_at:
            2017-01-05T15:34:27.676Z
    result:
        True
```

26.7.437 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.**add**(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Activates any updates in config for process/group.

user
: user to run supervisorctl as

conf_file
: path to supervisord config file

bin_env
: path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

salt.modules.supervisord.**custom**(*command*, *user=None*, *conf_file=None*, *bin_env=None*)

Run any custom supervisord command

user
: user to run supervisorctl as

conf_file
: path to supervisord config file

bin_env
: path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

salt.modules.supervisord.**options**(*name*, *conf_file=None*)

New in version 2014.1.0.

Read the config file and return the config options for a given process

name
: Name of the configured process

conf_file
: path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

salt.modules.supervisord.**remove**(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Removes process/group from active config

user
: user to run supervisorctl as

conf_file
: path to supervisord config file

bin_env
: path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

salt.modules.supervisord.**reread**(*user=None*, *conf_file=None*, *bin_env=None*)

Reload the daemon's configuration files

user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.reread
```

salt.modules.supervisord.**restart**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Restart the named service. Process group names should not include a trailing asterisk.
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

salt.modules.supervisord.**start**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Start the named service. Process group names should not include a trailing asterisk.
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

salt.modules.supervisord.**status**(*name=None*, *user=None*, *conf_file=None*, *bin_env=None*)

List programs and its state
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.status
```

salt.modules.supervisord.**status_bool**(*name*, *expected_state=None*, *user=None*, *conf_file=None*, *bin_env=None*)

Check for status of a specific supervisord process and return boolean result.
name
name of the process to check

expected_state
search for a specific process state. If set to `None` - any process state will match.
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.status_bool nginx expected_state='RUNNING'
```

`salt.modules.supervisord.`**`status_raw`**(*name=None*, *user=None*, *conf_file=None*, *bin_env=None*)

Display the raw output of status
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.status_raw
```

`salt.modules.supervisord.`**`stop`**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

`salt.modules.supervisord.`**`update`**(*user=None*, *conf_file=None*, *bin_env=None*, *name=None*)

Reload config and add/remove/update as necessary
user
user to run supervisorctl as
conf_file
path to supervisord config file
bin_env
path to supervisorctl bin or path to virtualenv with supervisor installed
name
name of the process group to update. if none then update any process group that has changes
CLI Example:

```
salt '*' supervisord.update
```

26.7.438 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the `apache` namespace.

`salt.modules.suse_apache.`**`a2dismod`**(*mod*)

Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.suse_apache.`**`a2enmod`**(*mod*)

Runs a2enmod for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.suse_apache.`**`check_mod_enabled`**(*mod*)

Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support *a2enmod -l* to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

26.7.439 salt.modules.suse_ip

The networking module for SUSE based distros

New in version 3005.

`salt.modules.suse_ip.`**`apply_network_settings`**(***settings*)

Apply global network configuration.

:param

[param settings:] The network settings to apply

Returns

The result of `service.reload` for `network` service

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.suse_ip.`**`build_interface`**(*iface*, *iface_type*, *enabled*, ***settings*)

Build an interface script for a network interface.

:param

[param iface:] The name of the interface to build the configuration for

:param

[param iface_type:]

The type of the interface. The following types are possible:

- eth
- bond

- alias
- clone
- ipsec
- dialup
- bridge
- slave
- vlan
- ipip
- ib

:**param**
[param enabled:] Build the interface enabled or disabled
:**param**
[param settings:] The settings for the interface

Returns
A dictionary of file/content
Return type
dict

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.suse_ip.**build_network_settings**(***settings*)

Build the global network script.
:**param**
[param settings:] The network settings

Returns
A dictionary of file/content
Return type
dict

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.suse_ip.**build_routes**(*iface*, ***settings*)

Build a route script for a network interface.
:**param**
[param iface:] The name of the interface to build the routes for
:**param**
[param settings:] The settings for the routes

Returns
A dictionary of file/content
Return type
dict

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.suse_ip.**down**(*iface*, *iface_type=None*)

Shutdown a network interface
:**param**
[param iface:] The name of the interface to shutdown

:**param**
[param iface_type:] The type of the interface If `slave` is specified, no any action is performing Default is `None`

Returns
The result of `ifdown` command or `None` if `slave` iface_type was specified

Return type
str

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.suse_ip.`**`get_interface`**`(`*iface*`)`

Return the contents of an interface script

:**param**
[param iface:] The name of the interface to get settings for

Returns
A dictionary of file/content

Return type
dict

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.suse_ip.`**`get_network_settings`**`()`

Return the contents of the global network script.

:**param**
[param iface:] The name of the interface to start up

:**param**
[param iface_type:] The type of the interface If `slave` is specified, no any action is performing Default is `None`

Returns
A dictionary of file/content

Return type
dict

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.suse_ip.`**`get_routes`**`(`*iface*`)`

Return the contents of the interface routes script.

:**param**
[param iface:] The name of the interface to get the routes for

Returns
A dictionary of file/content

Return type
dict

CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.suse_ip.**up**(*iface*, *iface_type=None*)

Start up a network interface

:**param**

[param iface:] The name of the interface to start up

:**param**

[param iface_type:] The type of the interface If `slave` is specified, no any action is performing Default is `None`

Returns

The result of `ifup` command or `None` if `slave` iface_type was specified

Return type

str

CLI Example:

```
salt '*' ip.up eth0
```

26.7.440 salt.modules.svn

Subversion SCM

salt.modules.svn.**add**(*cwd*, *targets*, *user=None*, *username=None*, *password=None*, **opts*)

Add files to be tracked by the Subversion working-copy checkout

cwd

The path to the Subversion repository

targets

[None] files and directories to pass to the command as arguments

user

[None] Run svn as a user other than what the minion runs as

username

[None] Connect to the Subversion server as another user

password

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

salt.modules.svn.**checkout**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

Download a working copy of the remote Subversion repository directory or file

cwd

The path to the Subversion repository

remote

[None] URL to checkout

target

[None] The name to give the file or directory working copy Default: svn uses the remote basename

user

[None] Run svn as a user other than what the minion runs as

username

[None] Connect to the Subversion server as another user

password

[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

salt.modules.svn.**commit**(*cwd*, *targets=None*, *msg=None*, *user=None*, *username=None*, *password=None*, **opts*)

Commit the current directory, files, or directories to the remote Subversion repository

cwd
The path to the Subversion repository

targets
[None] files and directories to pass to the command as arguments Default: svn uses '.'

msg
[None] Message to attach to the commit log

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

salt.modules.svn.**diff**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

cwd
The path to the Subversion repository

targets
[None] files and directories to pass to the command as arguments Default: svn uses '.'

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user

password
[None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

salt.modules.svn.**export**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *revision='HEAD'*, **opts*)

Create an unversioned copy of a tree.

cwd
The path to the Subversion repository

remote
[None] URL and path to file or directory checkout

target
[None] The name to give the file or directory working copy Default: svn uses the remote basename

user
[None] Run svn as a user other than what the minion runs as

username
[None] Connect to the Subversion server as another user
password
[None] Connect to the Subversion server with this password

New in version 0.17.0.
CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

`salt.modules.svn.`**`info`**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *fmt='str'*)

Display the Subversion information from the checkout.
cwd
The path to the Subversion repository
targets
[None] files, directories, and URLs to pass to the command as arguments svn uses '.' by default
user
[None] Run svn as a user other than what the minion runs as
username
[None] Connect to the Subversion server as another user
password
[None] Connect to the Subversion server with this password

New in version 0.17.0.
fmt
[str] How to fmt the output from info. (str, xml, list, dict)
CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

`salt.modules.svn.`**`remove`**(*cwd*, *targets*, *msg=None*, *user=None*, *username=None*, *password=None*, **opts*)

Remove files and directories from the Subversion repository
cwd
The path to the Subversion repository
targets
[None] files, directories, and URLs to pass to the command as arguments
msg
[None] Message to attach to the commit log
user
[None] Run svn as a user other than what the minion runs as
username
[None] Connect to the Subversion server as another user
password
[None] Connect to the Subversion server with this password

New in version 0.17.0.
CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

`salt.modules.svn.`**`status`**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Display the status of the current directory, files, or directories in the Subversion repository
cwd
The path to the Subversion repository

targets
[None] files, directories, and URLs to pass to the command as arguments Default: svn uses '.'
user
[None] Run svn as a user other than what the minion runs as
username
[None] Connect to the Subversion server as another user
password
[None] Connect to the Subversion server with this password

New in version 0.17.0.
CLI Example:

```
salt '*' svn.status /path/to/repo
```

salt.modules.svn.**switch**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory
cwd
The path to the Subversion repository
remote
[None] URL to switch
target
[None] The name to give the file or directory working copy Default: svn uses the remote basename
user
[None] Run svn as a user other than what the minion runs as
username
[None] Connect to the Subversion server as another user
password
[None] Connect to the Subversion server with this password
CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

salt.modules.svn.**update**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Update the current directory, files, or directories from the remote Subversion repository
cwd
The path to the Subversion repository
targets
[None] files and directories to pass to the command as arguments Default: svn uses '.'
user
[None] Run svn as a user other than what the minion runs as
password
[None] Connect to the Subversion server with this password

New in version 0.17.0.
username
[None] Connect to the Subversion server as another user
CLI Example:

```
salt '*' svn.update /path/to/repo
```

26.7.441 salt.modules.swarm

Docker Swarm Module using Docker's Python SDK

codeauthor
Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

Docker Python SDK

```
pip install -U docker
```

More information: https://docker-py.readthedocs.io/en/stable/

`salt.modules.swarm.`**`joinswarm`**(*remote_addr=<class 'int'>*, *listen_addr=<class 'int'>*, *token=<class 'str'>*)

Join a Swarm Worker to the cluster

remote_addr
The manager node you want to connect to for the swarm

listen_addr
Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)

token
Either the manager join token or the worker join token. You can get the worker or manager token via `salt '*' swarm.swarm_tokens`

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0' ␣
↪           token='SWMTKN-1-
↪64tux2g0701r84ofq93zppcih0pe081akq45owe9ts61f30x4t-
↪06trjugdu7x2z47j938s54il'
```

`salt.modules.swarm.`**`leave_swarm`**(*force=<class 'bool'>*)

Force the minion to leave the swarm

force
Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

`salt.modules.swarm.`**`node_ls`**(*server=<class 'str'>*)

Displays Information about Swarm Nodes with passing in the server

server
The minion/server name

CLI Example:

```
salt '*' swarm.node_ls server=minion1
```

salt.modules.swarm.**remove_node**(*node_id=<class 'str'>*, *force=<class 'bool'>*)

Remove a node from a swarm and the target needs to be a swarm manager

node_id
: The node id from the return of swarm.node_ls

force
: Forcefully remove the node/minion from the service

CLI Example:

```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

salt.modules.swarm.**remove_service**(*service=<class 'str'>*)

Remove Swarm Service

service
: The name of the service

CLI Example:

```
salt '*' swarm.remove_service service=Test_Service
```

salt.modules.swarm.**service_create**(*image=<class 'str'>*, *name=<class 'str'>*, *command=<class 'str'>*, *hostname=<class 'str'>*, *replicas=<class 'int'>*, *target_port=<class 'int'>*, *published_port=<class 'int'>*)

Create Docker Swarm Service Create

image
: The docker image

name
: Is the service name

command
: The docker command to run in the container at launch

hostname
: The hostname of the containers

replicas
: How many replicas you want running in the swarm

target_port
: The target port on the container

published_port
: port that's published on the host/os

CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service
↪command=None hostname=salthttpd replicas=6 target_port=80 published_
↪port=80
```

salt.modules.swarm.**swarm_init**(*advertise_addr=<class 'str'>*, *listen_addr=<class 'int'>*, *force_new_cluster=<class 'bool'>*)

Initialize Docker on Minion as a Swarm Manager

advertise_addr
: The ip of the manager

listen_addr
: Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567

force_new_cluster
Force a new cluster if True is passed
CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.
↪0.0' force_new_cluster=False
```

salt.modules.swarm.**swarm_service_info**(*service_name=<class 'str'>*)

Swarm Service Information
service_name
The name of the service that you want information on about the service
CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```

salt.modules.swarm.**swarm_tokens**()

Get the Docker Swarm Manager or Worker join tokens

CLI Example:

```
salt '*' swarm.swarm_tokens
```

salt.modules.swarm.**update_node**(*availability=<class 'str'>*, *node_name=<class 'str'>*, *role=<class 'str'>*, *node_id=<class 'str'>*, *version=<class 'int'>*)

Updates docker swarm nodes/needs to target a manager node/minion
availability
Drain or Active
node_name
minion/node
role
role of manager or worker
node_id
The Id and that can be obtained via swarm.node_ls
version
Is obtained by swarm.node_ls
CLI Example:

```
salt '*' swarm.update_node availability=drain node_name=minion2
↪  role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

26.7.442 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

depends

- swiftclient Python module

configuration
This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file
 ↪profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

`salt.modules.swift.`**`delete`**(*cont*, *path=None*, *profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.`**`get`**(*cont=None*, *path=None*, *local_file=None*, *return_bin=False*, *profile=None*)

List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

salt.modules.swift.**head**()

salt.modules.swift.**put**(*cont*, *path=None*, *local_file=None*, *profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

26.7.443 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

salt.modules.sysbench.**cpu**()

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

salt.modules.sysbench.**fileio**()

This tests for the file read and write operations Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

salt.modules.sysbench.**memory**()

This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

salt.modules.sysbench.**mutex**()

Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

salt.modules.sysbench.**ping**()

salt.modules.sysbench.**threads**()

This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

26.7.444 salt.modules.sysfs

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

salt.modules.sysfs.**attr**(*key*, *value=None*)

Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned

Returns

value or bool

CLI Example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

salt.modules.sysfs.**interfaces**(*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI Example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
   "r": [
     "state",
     "partial_stripes_expensive",
     "writeback_rate_debug",
     "stripe_size",
     "dirty_data",
     "stats_total/cache_hits",
     "stats_total/cache_bypass_misses",
```

(continues on next page)

(continued from previous page)

```
      "stats_total/bypassed",
      "stats_total/cache_readaheads",
      "stats_total/cache_hit_ratio",
      "stats_total/cache_miss_collisions",
      "stats_total/cache_misses",
      "stats_total/cache_bypass_hits",
    ],
    "rw": [
      "writeback_rate",
      "writeback_rate_update_seconds",
      "cache_mode",
      "writeback_delay",
      "label",
      "writeback_running",
      "writeback_metadata",
      "running",
      "writeback_rate_p_term_inverse",
      "sequential_cutoff",
      "writeback_percent",
      "writeback_rate_d_term",
      "readahead"
    ],
    "w": [
      "stop",
      "clear_stats",
      "attach",
      "detach"
    ]
}
```

Note:

- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

`salt.modules.sysfs.`**`read`**(*key*, *root=''*)

Read from SysFS

Parameters

`key` -- file or path in SysFS; if key is a list then root will be prefixed on each key

Returns

the full (tree of) SysFS attributes under key

CLI Example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.`**`target`**(*key*, *full=True*)

Return the basename of a SysFS key path

Parameters

- **`key`** -- the location to resolve within SysFS
- **`full`** -- full path instead of basename

Returns
fullpath or basename of path

CLI Example:

```
salt '*' sysfs.read class/ttyS0
```

salt.modules.sysfs.**write**(*key*, *value*)

Write a SysFS attribute/action

CLI Example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_
↪governor 'performance'
```

26.7.445 salt.modules.syslog_ng

Module for getting information about syslog-ng

maintainer
Tibor Benke <btibi@sch.bme.hu>

maturity
new

depends
cmd

platform
all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with *syslog_ng.set_binary_path*.

Similarly, users can specify the location of the configuration file with *syslog_ng.set_config_file*, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

class salt.modules.syslog_ng.**Argument**(*value=''*)

A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

Does not need examples.

build()

class salt.modules.syslog_ng.**Buildable**(*iterable*, *join_body_on=''*, *append_extra_newline=True*)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with its children.

build_body()

Builds the body of a syslog-ng configuration object.

build_header()

Builds the header of a syslog-ng configuration object.

build_tail()

Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.**GivenStatement**(*value*, *add_newline=True*)

This statement returns a string without modification. It can be used to
use existing configuration snippets.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**NamedStatement**(*type*, *id=''*, *options=None*)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

class salt.modules.syslog_ng.**Option**(*type=''*, *params=None*)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

add_parameter(*param*)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**Parameter**(*iterable=None*, *join_body_on=''*)

An Option has one or more Parameter instances.

Does not need examples.

class salt.modules.syslog_ng.**ParameterValue**(*iterable=None*, *join_body_on=''*)

A TypedParameter can have one or more values.

Does not need examples.

class salt.modules.syslog_ng.**SimpleParameter**(*value=''*)

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
};
```

`/var/log/messages` is a SimpleParameter.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**SimpleParameterValue**(*value=''*)

A ParameterValuem which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**Statement**(*type*, *id=''*, *options=None*, *has_name=True*)

It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child(*option*)

build_header()

Builds the header of a syslog-ng configuration object.

build_tail()

Builds the tail of a syslog-ng configuration object.

exception salt.modules.syslog_ng.**SyslogNgError**

class salt.modules.syslog_ng.**TypedParameter**(*type=''*, *values=None*)

A Parameter, which has a type:

```
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};
```

`ip(127.0.0.1)` is a TypedParameter.

Does not need examples.

add_value(*value*)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**TypedParameterValue**(*type=''*, *arguments=None*)

We have to go deeper...

A TypedParameter can have a 'parameter', which also have a type. For example key_file and cert_file:

```
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert
```

(continues on next page)

(continued from previous page)

```
↪')
        )
    );
};
```

Does not need examples.

add_argument(*arg*)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.**UnnamedStatement**(*type*, *options=None*)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog_ng.**config**(*name*, *config*, *write=True*)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{'tcp':[{'ip':'127.0.0.1
↪'},{'port':1233}]}]"
```

salt.modules.syslog_ng.**config_test**(*syslog_ng_sbin_dir=None*, *cfgfile=None*)

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/
↪syslog-ng/syslog-ng.conf
```

salt.modules.syslog_ng.**get_config_file**()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

salt.modules.syslog_ng.**modules**(*syslog_ng_sbin_dir=None*)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**reload_**(*name*)

Reloads syslog-ng. This function is intended to be used from states.

If *syslog_ng.set_config_file*, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

salt.modules.syslog_ng.**set_binary_path**(*name*)

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

salt.modules.syslog_ng.**set_config_file**(*name*)

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

salt.modules.syslog_ng.**set_parameters**(*version=None*, *binary_path=None*, *config_file=None*, **args*, ***kwargs*)

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters  binary_path=/home/user/install/syslog-
↪ng/sbin config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

salt.modules.syslog_ng.**start**(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no_caps=False*, *pidfile=None*, *enable_core=False*, *fd_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist_file=None*, *control=None*, *worker_threads=None*)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If *syslog_ng.set_config_file*, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

salt.modules.syslog_ng.**stats**(*syslog_ng_sbin_dir=None*)

Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**stop**(*name=None*)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If *syslog_ng.set_config_file* is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

salt.modules.syslog_ng.**version**(*syslog_ng_sbin_dir=None*)

Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**write_config**(*config*, *newlines=2*)

Writes the given parameter config into the config file. This function is intended to be used from states.

If *syslog_ng.set_config_file*, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

salt.modules.syslog_ng.**write_version**(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If *syslog_ng.set_config_file*, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

26.7.446 salt.modules.sysmod

The sys module provides information about the available functions on the minion

salt.modules.sysmod.**argspec**(*module=''*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

salt.modules.sysmod.**doc**(**args*)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

salt.modules.sysmod.**list_functions**(**args*, ***kwargs*)

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

New in version 0.12.0.

```
salt '*' sys.list_functions 'module.specific_function'
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

salt.modules.sysmod.**list_modules**(**args*)

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

salt.modules.sysmod.**list_renderers**(**args*)

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

salt.modules.sysmod.**list_returner_functions**(**args*, ***kwargs*)

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

salt.modules.sysmod.**list_returners**(**args*)

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

salt.modules.sysmod.**list_runner_functions**(**args*, ***kwargs*)

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

salt.modules.sysmod.**list_runners**(**args*)

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

salt.modules.sysmod.**list_state_functions**(**args*, ***kwargs*)

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version 2016.9.0.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

salt.modules.sysmod.**list_state_modules**(**args*)

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

salt.modules.sysmod.**reload_modules**()

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

salt.modules.sysmod.**renderer_doc**(**args*)

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

salt.modules.sysmod.**returner_argspec**(*module=''*)

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

salt.modules.sysmod.**returner_doc**(**args*)

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returner_doc 'sqlite3.get_*'
```

salt.modules.sysmod.**runner_argspec**(*module=''*)

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

salt.modules.sysmod.**runner_doc**(**args*)

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

salt.modules.sysmod.**state_argspec**(*module=''*)

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

salt.modules.sysmod.**state_doc**(**args*)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

salt.modules.sysmod.**state_schema**(*module=''*)

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

26.7.447 salt.modules.sysrc

sysrc module for FreeBSD

salt.modules.sysrc.**get**(***kwargs*)

Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

salt.modules.sysrc.**remove**(*name*, ***kwargs*)

Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

salt.modules.sysrc.**set_**(*name*, *value*, ***kwargs*)

Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

26.7.448 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

Note: If you have configured a wrapper such as `molly-guard` to intercept *interactive* shutdown commands, be aware that calling `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` with `salt-call` will hang indefinitely while the wrapper script waits for user input. Calling them with `salt` will work as expected.

`salt.modules.system.`**`get_computer_desc`**`()`

Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

Returns
Value of PRETTY_HOSTNAME if this does not exist False.

Return type
str

CLI Example:

```
salt '*' system.get_computer_desc
```

`salt.modules.system.`**`get_computer_name`**`()`

Get hostname.

CLI Example:

```
salt '*' system.get_computer_name
```

`salt.modules.system.`**`get_reboot_required_witnessed`**`()`

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

Returns
`True` if the a reboot request was witnessed, `False` otherwise

Return type
bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

`salt.modules.system.`**`get_system_date`**`(`*utc_offset=None*`)`

Get the system date

Parameters
`utc_offset` (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns
Returns the system date.

Return type
str

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.system.**get_system_date_time**(*utc_offset=None*)

Get the system date/time.

Parameters

utc_offset (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns

Returns the system time in YYYY-MM-DD hh:mm:ss format.

Return type

str

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

salt.modules.system.**get_system_time**(*utc_offset=None*)

Get the system time.

Parameters

utc_offset (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns

Returns the system time in HH:MM:SS AM/PM format.

Return type

str

CLI Example:

```
salt '*' system.get_system_time
```

salt.modules.system.**halt**()

Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.system.**has_settable_hwclock**()

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

salt.modules.system.**init**(*runlevel*)

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

salt.modules.system.**poweroff**()

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

salt.modules.system.**reboot**(*at_time=None*)

Reboot the system

at_time

The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

salt.modules.system.**set_computer_desc**(*desc*)

Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

Parameters

desc (*str*) -- The computer description

Returns

False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

salt.modules.system.**set_computer_name**(*hostname*)

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

salt.modules.system.**set_reboot_required_witnessed**()

This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

Returns

`True` if successful, otherwise `False`

Return type

bool

```
salt '*' system.set_reboot_required_witnessed
```

salt.modules.system.**set_system_date**(*newdate*, *utc_offset=None*)

Set the system date. Use <mm-dd-yy> format for the date.

Parameters

newdate (*str*) -- The date to set. Can be any of the following formats:

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.system.**set_system_date_time**(*years=None*, *months=None*, *days=None*, *hours=None*, *minutes=None*, *seconds=None*, *utc_offset=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Updates hardware clock, if present, in addition to software (kernel) clock.

Parameters

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31
- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59
- **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns

True if successful. Otherwise False.

Return type

bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

salt.modules.system.**set_system_time**(*newtime*, *utc_offset=None*)

Set the system time.

Parameters

- **newtime** (*str*) -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

  Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.
- **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns

Returns True if successful. Otherwise False.

Return type

bool

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

salt.modules.system.**shutdown**(*at_time=None*)

Shutdown a running system

at_time

The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

26.7.449 salt.modules.system_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

salt.modules.system_profiler.**applications**()

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

salt.modules.system_profiler.**receipts**()

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

26.7.450 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

Important: This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

---

salt.modules.systemd_service.**available**(*name*)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd_service.**disable**(*name*, *no_block=False*, *root=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

no_block

[False] Set to `True` to disable the service using `--no-block`.

New in version 2017.7.0.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd_service.**disabled**(*name*, *root=None*)

Return if the named service is disabled from starting on boot

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.systemd_service.**enable**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*, *root=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

no_block

[False] Set to `True` to enable the service using `--no-block`.

New in version 2017.7.0.

unmask

[False] Set to `True` to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime

[False] Set to `True` to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.systemd_service.**enabled**(*name*, *root=None*, ***kwargs*)

Return if the named service is enabled to start on boot

root
: Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.systemd_service.**execs**(*root=None*)

New in version 2014.7.0.

Return a list of all files specified as `ExecStart` for all services.

root
: Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.execs
```

salt.modules.systemd_service.**firstboot**(*locale=None*, *locale_message=None*, *keymap=None*, *timezone=None*, *hostname=None*, *machine_id=None*, *root=None*)

New in version 3001.

Call systemd-firstboot to configure basic settings of the system

locale
: Set primary locale (LANG=)

locale_message
: Set message locale (LC_MESSAGES=)

keymap
: Set keymap

timezone
: Set timezone

hostname
: Set host name

machine_id
: Set machine ID

root
: Operate on an alternative filesystem root

CLI Example:

```
salt '*' service.firstboot keymap=jp locale=en_US.UTF-8
```

salt.modules.systemd_service.**force_reload**(*name*, *no_block=True*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block
[False] Set to `True` to force_reload the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd_service.`**`get_all`**`(`*root=None*`)`

Return a list of all available services

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd_service.`**`get_disabled`**`(`*root=None*`)`

Return a list of all disabled services

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd_service.`**`get_enabled`**`(`*root=None*`)`

Return a list of all enabled services

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd_service.`**`get_running`**`()`

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd_service.`**`get_static`**`(`*root=None*`)`

New in version 2015.8.5.

Return a list of all static services

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.get_static
```

salt.modules.systemd_service.**mask**(*name*, *runtime=False*, *root=None*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

runtime

[False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

root

Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

salt.modules.systemd_service.**masked**(*name*, *runtime=False*, *root=None*)

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

runtime

[False] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

root

Enable/disable/mask unit files in the specified root directory

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

salt.modules.systemd_service.**missing**(*name*)

New in version 2014.1.0.

The inverse of `service.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.systemd_service.**offline**()

New in version 3004.

Check if systemd is working in offline mode, where is not possible to talk with PID 1.

CLI Example:

```
salt '*' service.offline
```

salt.modules.systemd_service.**reload_**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with systemd

no_block

[False] Set to `True` to reload the service using `--no-block`.

New in version 2017.7.0.

unmask

[False] Set to `True` to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime

[False] Set to `True` to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.systemd_service.**restart**(*name*, *no_block=None*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with systemd

no_block

[False] Set to `True` to restart the service using `--no-block`. Defaults to `True` for the salt-minion service.

New in version 2017.7.0.

Changed in version 3006.15: The default value for this argument has changed if the service is the salt-minion service, where it now defaults to `True` to prevent a deadlock with the minion waiting for the service to stop before exiting.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.systemd_service.`**`show`**(*name*, *root=None*)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.show <service name>
```

`salt.modules.systemd_service.`**`start`**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with systemd

no_block
[False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask
[False] Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

unmask_runtime
[False] Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.systemd_service.`**`status`**(*name*, *sig=None*)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters
- **`name`** (*`str`*) -- The name of the service to check
- **`sig`** (*`str`*) -- Not implemented

Returns
True if running, False otherwise dict: Maps service name to True if running, False otherwise
Return type
bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.systemd_service.**stop**(*name*, *no_block=None*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with systemd
no_block
[False] Set to `True` to stop the service using `--no-block`. Defaults to `True` for the salt-minion service.

New in version 2017.7.0.

Changed in version 3006.15: The default value for this argument has changed if the service is the salt-minion service, where it now defaults to `True` to prevent a deadlock with the minion waiting for the service to stop before exiting.

CLI Example:

```
salt '*' service.stop <service name>
```

salt.modules.systemd_service.**systemctl_reload**()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

salt.modules.systemd_service.**unmask_**(*name*, *runtime=False*, *root=None*)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with systemd
runtime
[False] Set to `True` to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to `True`, and otherwise removes an indefinite mask.

root
Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

26.7.451 salt.modules.telegram

Module for sending messages via Telegram.

configuration

In order to send a message via the Telegram, certain configuration is required in /etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxx'
```

`salt.modules.telegram.`**`post_message`**(*message*, *chat_id=None*, *token=None*)

Send a message to a Telegram chat.

Parameters

- **`message`** -- The message to send to the Telegram chat.
- **`chat_id`** -- (optional) The Telegram chat id.
- **`token`** -- (optional) The Telegram API token.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

26.7.452 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

configuration

This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available here.

In the minion's config file:

```
telemetry.telemetry_api_keys:
  - abc123  # Key 1
  - efg321  # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends

requests

`salt.modules.telemetry.`**`create_alarm`**(*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*)

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

salt.modules.telemetry.**delete_alarms**(*deployment_id*, *alert_id=None*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

delete an alert specified by alert_id or if not specified blows away all the alerts
in the current deployment.
Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

salt.modules.telemetry.**get_alarms**(*deployment_id*, *profile='telemetry'*)

get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

salt.modules.telemetry.**get_alert_config**(*deployment_id*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections
↪profile=telemetry
salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

salt.modules.telemetry.**get_notification_channel_id**(*notify_channel*, *profile='telemetry'*)

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.
notify_channel
Email escalation policy
profile
A dict of telemetry config information.
CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com
↪profile=telemetry
```

salt.modules.telemetry.**update_alarm**(*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*)

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

26.7.453 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Pythons tempfile module

New in version 2015.8.0.

salt.modules.temp.**dir**(*suffix=''*, *prefix='tmp'*, *parent=None*)

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

salt.modules.temp.**file**(*suffix=''*, *prefix='tmp'*, *parent=None*)

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

26.7.454 salt.modules.test

Module for running arbitrary tests

salt.modules.test.**arg**(**args*, ***kwargs*)

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns

```
{"args": args, "kwargs": kwargs}
```

Return type

dict

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.**arg_clean**(**args*, ***kwargs*)

Like *test.arg* but cleans `kwargs` of the `__pub*` items

CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.**arg_repr**(**args*, ***kwargs*)

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns

```
{"args": repr(args), "kwargs": repr(kwargs)}
```

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.**arg_type**(**args*, ***kwargs*)

Print out the types of the `args` and `kwargs`. This is used to test the types of the `args` and `kwargs` passed down to the Minion

Return type

dict

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

salt.modules.test.**assertion**(*assertion*)

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

salt.modules.test.**attr_call**()

Call grains.items via the attribute

CLI Example:

```
salt '*' test.attr_call
```

salt.modules.test.**collatz**(*start*)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

salt.modules.test.**conf_test**()

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

salt.modules.test.**cross_test**(*func*, *args=None*)

Execute a minion function via the `__salt__` object in the test module, used to verify that the Minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

salt.modules.test.**deprecation_warning**()

Return True, but also produce two DeprecationWarnings. One by date, the other by the codename - release Oganesson, which should correspond to Salt 3108.

CLI Example:

```
salt \* test.deprecation_warning
```

salt.modules.test.**echo**(*text*)

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

salt.modules.test.**exception**(*message='Test Exception'*)

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

salt.modules.test.**false_**()

Always return `False`

CLI Example:

```
salt '*' test.false
```

salt.modules.test.**fib**(*num*)

Return the `num`-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

salt.modules.test.**get_opts**()

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

salt.modules.test.**kwarg**(***kwargs*)

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and CLI `kwarg` passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

salt.modules.test.**missing_func**()

salt.modules.test.**module_report**()

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

salt.modules.test.**not_loaded**()

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

salt.modules.test.**opts_pkg**()

Return an `opts` package with the `grains` and `opts` for this Minion. This is primarily used to create the options used for Master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

salt.modules.test.**outputter**(*data*)

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

salt.modules.test.**ping**()

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns `True`.

CLI Example:

```
salt '*' test.ping
```

salt.modules.test.**provider**(*module*)

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

salt.modules.test.**providers**()

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

salt.modules.test.**raise_exception**(*name*, **args*, ***kwargs*)

Raise an exception. Built-in exceptions and those in `salt.exceptions` can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return `False`.

This function is designed to test Salt's exception and return code handling.

CLI Example:

```
salt '*' test.raise_exception TypeError "An integer is required"
salt '*' test.raise_exception salt.exceptions.CommandExecutionError
↪"Something went wrong"
```

salt.modules.test.**rand_sleep**(*max=60*)

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

salt.modules.test.**rand_str**(*size=9999999999*, *hash_type=None*)

This function has been renamed to *test.random_hash*. This function will stay to ensure backwards compatibility, but please switch to using the preferred name *test.random_hash*.

salt.modules.test.**random_hash**(*size=9999999999*, *hash_type=None*)

New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from `test.rand_str` to `test.random_hash`

Generates a random number between 1 and `size`, then returns a hash of that number. If no `hash_type` is passed, the `hash_type` specified by the Minion's *hash_type* config option is used.

CLI Example:

```
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512
```

salt.modules.test.**retcode**(*code=42*)

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

salt.modules.test.**sleep**(*length*)

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

salt.modules.test.**stack**()

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

salt.modules.test.**true_**()

Always return `True`

CLI Example:

```
salt '*' test.true
```

salt.modules.test.**try_**(*module*, *return_try_exception=False*, ***kwargs*)

Try to run a module command. On an exception return None. If return_try_exception is set to True, return the exception. This can be helpful in templates where running a module might fail as expected.

Jinja Example:

```
{% for i in range(0,230) %}
    {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
↪'+i)|yaml(False) }}
{% endfor %}
```

salt.modules.test.**tty**(**args*, ***kwargs*)

Deprecated! Moved to *cmd.tty*

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.**version**()

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

salt.modules.test.**versions**()

This function is an alias of versions_report.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

salt.modules.test.**versions_information**()

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

salt.modules.test.**versions_report**()

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

26.7.455 salt.modules.test_virtual

Module for testing that a __virtual__ function returning False will not be available via the Salt Loader.

salt.modules.test_virtual.**ping**()

26.7.456 salt.modules.testinframod

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the testinfra.modules namespace.

exception salt.modules.testinframod.**InvalidArgumentError**

salt.modules.testinframod.**camel_to_snake_case**(*camel_input*)

Converts camelCase (or CamelCase) to snake_case. From https://codereview.stackexchange.com/questions/185966/functions-to-convert-camelcase-strings-to-snake-case

Parameters

camel_input (*str*) -- The camelcase or CamelCase string to convert to snake_case

:return str

salt.modules.testinframod.**snake_to_camel_case**(*snake_input*, *uppercamel=False*)

Converts snake_case to camelCase (or CamelCase if uppercamel is `True`). Inspired by https://codereview.stackexchange.com/questions/85311/transform-snake-case-to-camelcase

Parameters

- **snake_input** (*str*) -- The input snake_case string to convert to camelCase
- **uppercamel** (*bool*) -- Whether or not to convert to CamelCase instead

:return str

26.7.457 salt.modules.textfsm_mod

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

depends

- textfsm Python library

Note: Install `textfsm` library: `pip install textfsm`.

---

salt.modules.textfsm_mod.**extract**(*template_path*, *raw_text=None*, *raw_text_file=None*, *saltenv='base'*)

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

template_path

The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.

- http:// or https://
- ftp://
- s3://
- swift://

raw_text: **None**
The unstructured text to be parsed.

raw_text_file: **None**
Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

CLI Example:

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
↪file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_
↪template raw_text='Hostname: router.abc ... snip ...'
```

Jinja template example:

```
{%- set raw_text = 'Hostname: router.abc ... snip ...' -%}
{%- set textfsm_extract = salt.textfsm.extract('https://some-server/
↪textfsm/juniper_version_template', raw_text) -%}
```

Raw text example:

```
Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]
```

TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*)

Start
# Support multiple chassis systems.
  ^\S+:$$ -> Continue.Record
  ^${Chassis}:$$
  ^Model: ${Model}
```

(continues on next page)

(continued from previous page)

```
  ^JUNOS Base OS boot \[${Boot}\]
  ^JUNOS Software Release \[${Base}\]
  ^JUNOS Base OS Software Suite \[${Base}\]
  ^JUNOS Kernel Software Suite \[${Kernel}\]
  ^JUNOS Crypto Software Suite \[${Crypto}\]
  ^JUNOS Online Documentation \[${Documentation}\]
  ^JUNOS Routing Software Suite \[${Routing}\]
```

Output example:

```
{
    "comment": "",
    "result": true,
    "out": [
        {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
            "crypto": "9.1S3.5",
            "chassis": "",
            "routing": "9.1S3.5",
            "base": "9.1S3.5",
            "model": "mx960"
        }
    ]
}
```

salt.modules.textfsm_mod.**index**(*command*, *platform=None*, *platform_grain_name=None*, *platform_column_name=None*, *output=None*, *output_file=None*, *textfsm_path=None*, *index_file=None*, *saltenv='base'*, *include_empty=False*, *include_pat=None*, *exclude_pat=None*)

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

command

The command executed on the device, to get the output.

platform

The platform name, as defined in the TextFSM index file.

Note: For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

---

platform_grain_name

The name of the grain used to identify the platform name in the TextFSM index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

Note: This option is ignored when `platform` is specified.

platform_column_name: **`Platform`**
The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

output
The raw output from the device, to be parsed and extract the structured data.

output_file
The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

textfsm_path
The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: `file://`, `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://`.

Note: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

index_file: **`index`**
The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

saltenv: **`base`**
Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

include_empty: **`False`**
Include empty files under the `textfsm_path`.

include_pat
Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

exclude_pat
Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files

defined by `include_pat`.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://
↪textfsm/juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
↪version_example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
↪version_example textfsm_path=https://some-server/textfsm/ platform_
↪column_name=Vendor platform_grain_name=vendor
```

TextFSM index file example:

`salt://textfsm/index`

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_
↪version_example
```

Usgae inside a Jinja template:

```
{%- set command = 'sh ver' -%}
{%- set output = salt.net.cli(command) -%}
{%- set textfsm_extract = salt.textfsm.index(command, output=output) -%}
```

26.7.458 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

`salt.modules.timezone.`**`get_hwclock`**`()`

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.`**`get_offset`**`()`

Get current numeric timezone offset from UTC (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.timezone.**get_zone**()

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.timezone.**get_zonecode**()

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.timezone.**set_hwclock**(*clock*)

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.timezone.**set_zone**(*timezone*)

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

salt.modules.timezone.**zone_compare**(*timezone*)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-like operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

26.7.459 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends
PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

configuration
Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \
days=5 \
CN='My Little CA' \
C=US \
ST=Utah \
L=Salt Lake City \
O=Saltstack \
emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.
↪csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.
↪example.com.crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr
↪"

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_
↪No.1.crt"
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2  \
    cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_
↪No.2.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_
↪No.1.crt"

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_
↪client.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↪MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.
↪key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.
↪ing_server.csr"

# salt-call tls_create_ca_signed_cert my_little CN=www.anothersometh.ing \
    cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/
↪something_completely_different.crt
```

salt.modules.tls.**ca_exists**(*ca_name*, *cacert_path=None*, *ca_filename=None*)

Verify whether a Certificate Authority (CA) already exists

ca_name

name of the CA

cacert_path

absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

salt.modules.tls.**cert_base_path**(*cacert_path=None*)

Return the base path for certs from CLI or from options

cacert_path
absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

salt.modules.tls.**cert_info**(*cert*, *digest='sha256'*)

Return information for a particular certificate

cert
path to the certifiate PEM file or string

Changed in version 2018.3.4.

digest
what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

salt.modules.tls.**create_ca**(*ca_name*, *bits=2048*, *days=365*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress=None*, *fixmode=False*, *cacert_path=None*, *ca_filename=None*, *digest='sha256'*, *onlyif=None*, *unless=None*, *replace=False*)

Create a Certificate Authority (CA)

ca_name
name of the CA

bits
number of RSA key bits, default is 2048

days
number of days the CA will be valid, default is 365

CN
common name in the request, default is "localhost"

C
country, default is "US"

ST
state, default is "Utah"

L
locality, default is "Centerville", the city where SaltStack originated

O
organization, default is "SaltStack"

OU
organizational unit, default is None

emailAddress
email address for the CA owner, default is None

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

salt.modules.tls.**create_ca_signed_cert**(*ca_name*, *CN*, *days=365*, *cacert_path=None*, *ca_filename=None*, *cert_path=None*, *cert_filename=None*, *digest='sha256'*, *cert_type=None*, *type_ext=False*, *replace=False*)

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by create_csr. If it does not, this method does nothing.

ca_name
name of the CA

CN
common name matching the certificate signing request

days
number of days certificate is valid, default is 365 (1 year)

cacert_path
absolute path to ca certificates root directory

ca_filename
alternative filename for the CA

New in version 2015.5.3.

cert_path
full path to the certificates directory

cert_filename
alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of `cert_type`. `type_ext` will be completely overridden.

New in version 2015.5.3.

digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
Replace this certificate even if it exists

New in version 2015.5.1.

cert_type
string. Either 'server' or 'client' (see create_csr() for details).

If create_csr(type_ext=True) this function **must** be called with the same cert_type so it can find the CSR file.

Note: create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

---

type_ext
bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

`salt.modules.tls.`**`create_csr`**(*ca_name*, *bits=2048*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress=None*, *subjectAltName=None*, *cacert_path=None*, *ca_filename=None*, *csr_path=None*, *csr_filename=None*, *digest='sha256'*, *type_ext=False*, *cert_type='server'*, *replace=False*)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

ca_name
name of the CA

bits
number of RSA key bits, default is 2048

CN
common name in the request, default is "localhost"

C
country, default is "US"

ST
state, default is "Utah"

L
locality, default is "Centerville", the city where SaltStack originated

O
organization, default is ”SaltStack” NOTE: Must the same as CA certificate or an error will be raised
OU
organizational unit, default is None
emailAddress
email address for the request, default is None
subjectAltName
valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:
examples: **[**'DNS:somednsname.com',
'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to https://1.2.3.4 will fail from python's requests library w/out the second entry in the above list

---

New in version 2015.8.0.
cert_type
Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
   'basicConstraints': 'CA:FALSE',
   'extendedKeyUsage': 'serverAuth',
   'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
   'basicConstraints': 'CA:FALSE',
   'extendedKeyUsage': 'clientAuth',
   'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

type_ext
boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved
replace
Replace this signing request even if it exists

New in version 2015.5.1.
Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

salt.modules.tls.**create_empty_crl**(*ca_name*, *cacert_path=None*, *ca_filename=None*, *crl_file=None*, *digest='sha256'*)

Create an empty Certificate Revocation List.

New in version 2015.8.0.

ca_name
: name of the CA

cacert_path
: absolute path to ca certificates root directory

ca_filename
: alternative filename for the CA

  New in version 2015.5.3.

crl_file
: full path to the CRL file

digest
: The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji'                 ca_filename=
↪'ca'                 crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.**create_pkcs12**(*ca_name*, *CN*, *passphrase=''*, *cacert_path=None*, *replace=False*)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

ca_name
: name of the CA

CN
: common name matching the certificate signing request

passphrase
: used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path
: absolute path to ca certificates root directory

replace
: Replace this certificate even if it exists

  New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.**create_self_signed_cert**(*tls_dir='tls'*, *bits=2048*, *days=365*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress=None*, *cacert_path=None*, *cert_filename=None*, *digest='sha256'*, *replace=False*)

Create a Self-Signed Certificate (CERT)

tls_dir
: location appended to the ca.cert_base_path, default is 'tls'

bits
: number of RSA key bits, default is 2048

CN
: common name in the request, default is "localhost"

C
: country, default is "US"

ST
: state, default is "Utah"

L
: locality, default is "Centerville", the city where SaltStack originated

O
: organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU
: organizational unit, default is None

emailAddress
: email address for the request, default is None

cacert_path
: absolute path to ca certificates root directory

digest
: The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace
: Replace this certificate even if it exists

  New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

salt.modules.tls.**get_ca**(*ca_name*, *as_text=False*, *cacert_path=None*)

Get the certificate path or content

ca_name
: name of the CA

as_text
: if true, return the certificate content instead of the path

cacert_path
: absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

salt.modules.tls.**get_ca_signed_cert**(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *cert_filename=None*)

Get the certificate path or content

ca_name
: name of the CA

CN
: common name of the certificate

as_text
: if true, return the certificate content instead of the path

cacert_path
: absolute path to certificates root directory

cert_filename
: alternative filename for the certificate, useful when using special characters in the CN

  New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_
↪path=/etc/certs
```

salt.modules.tls.**get_ca_signed_key**(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *key_filename=None*)

Get the certificate path or content

ca_name
: name of the CA

CN
: common name of the certificate

as_text
: if true, return the certificate content instead of the path

cacert_path
: absolute path to certificates root directory

key_filename
: alternative filename for the key, useful when using special characters

  New in version 2015.5.3.

  in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key                    test_ca CN=localhost      ⏎
↪          as_text=False                  cacert_path=/etc/certs
```

salt.modules.tls.**get_expiration_date**(*cert*, *date_format='%Y-%m-%d'*)

New in version 2019.2.0.

Get a certificate's expiration date

cert
: Full path to the certificate

date_format
: By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.

CLI Examples:

```
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='%d/%m/%Y'
```

salt.modules.tls.**get_extensions**(*cert_type*)

Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.

New in version 2015.8.0.

cert_type:
: The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

salt.modules.tls.**maybe_fix_ssl_version**(*ca_name*, *cacert_path=None*, *ca_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

ca_name
: ca authority name

cacert_path
: absolute path to ca certificates root directory

ca_filename
: alternative filename for the CA

  New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

salt.modules.tls.**revoke_cert**(*ca_name*, *CN*, *cacert_path=None*, *ca_filename=None*, *cert_path=None*, *cert_filename=None*, *crl_file=None*, *digest='sha256'*)

Revoke a certificate.

New in version 2015.8.0.

ca_name
: Name of the CA.

CN
: Common name matching the certificate signing request.

cacert_path
: Absolute path to ca certificates root directory.

ca_filename
Alternative filename for the CA.
cert_path
Path to the cert file.
cert_filename
Alternative filename for the certificate, useful when using special characters in the CN.
crl_file
Full path to the CRL file.
digest
The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji'                ca_filename='ca' ␣
↪               crl_file='/etc/openvpn/team1/crl.pem'
```

`salt.modules.tls.`**`set_ca_path`**(*cacert_path*)

If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

`salt.modules.tls.`**`validate`**(*cert*, *ca_name*, *crl_file*)

New in version 3000.

Validate a certificate against a given CA/CRL.
cert
path to the certifiate PEM file or string
ca_name
name of the CA
crl_file
full path to the CRL file

26.7.460 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under `/opt`, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
  user: <username>
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:

- More information about tomcat manager: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html
- if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:

  JVM Vendor:
  Sun Microsystems Inc.

  JVM Version:
  1.6.0_43-b01

  OS Architecture:
  amd64

  OS Name:
  Linux

  OS Version:
  2.6.32-358.el6.x86_64

  Tomcat Version:
  Apache Tomcat/7.0.37

`salt.modules.tomcat.`**`deploy_war`**(*war*, *context*, *force='no'*, *url='http://localhost:8080/manager'*, *saltenv='base'*, *timeout=180*, *temp_war_location=None*, *version=True*)

Deploy a WAR file

war
: absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function

context
: the context path to deploy

force
: [False] set True to deploy the webapp even one is deployed in the context

url
: [http://localhost:8080/manager] the URL of the server manager webapp

saltenv
: [base] the environment for WAR file in used by salt.modules.cp.get_url function

timeout
: [180] timeout for HTTP request

temp_war_location
[None] use another location to temporarily copy to war file by default the system's temp directory is used

version
['] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.
↪r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://
↪localhost:8080/manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://
↪localhost:8080/manager
```

salt.modules.tomcat.**extract_war_version**(*war*)

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

salt.modules.tomcat.**fullversion**()

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.**leaks**(*url='http://localhost:8080/manager'*, *timeout=180*)

Find memory leaks in tomcat

url
[http://localhost:8080/manager] the URL of the server manager webapp

timeout
[180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

salt.modules.tomcat.**ls**(*url='http://localhost:8080/manager'*, *timeout=180*)

list all the deployed webapps

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

salt.modules.tomcat.**passwd**(*passwd*, *user=''*, *alg='sha1'*, *realm=None*)

This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the $CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

salt.modules.tomcat.**reload_**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Reload the webapp

app
: the webapp context path

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**serverinfo**(*url='http://localhost:8080/manager'*, *timeout=180*)

return details about the server

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

salt.modules.tomcat.**sessions**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

return the status of the webapp sessions

app
: the webapp context path

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**signal**(*signal=None*)

Signals catalina to start, stop, securestart, forcestop.

CLI Example:

```
salt '*' tomcat.signal start
```

salt.modules.tomcat.**start**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Start the webapp

app
: the webapp context path

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**status**(*url='http://localhost:8080/manager'*, *timeout=180*)

Used to test if the tomcat manager is up

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

salt.modules.tomcat.**status_webapp**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

return the status of the webapp (stopped | running | missing)

app
: the webapp context path

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
: [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**stop**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Stop the webapp

app
: the webapp context path

url
: [http://localhost:8080/manager] the URL of the server manager webapp

timeout
[180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**undeploy**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Undeploy a webapp
app
the webapp context path
url
[http://localhost:8080/manager] the URL of the server manager webapp
timeout
[180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**version**()

Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```

26.7.461 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

`traffic_ctl` is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.**alarms**()

List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

salt.modules.trafficserver.**bounce_cluster**()

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

salt.modules.trafficserver.**bounce_local**(*drain=False*)

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.
drain
This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

salt.modules.trafficserver.**clear_alarms**(*alarm*)

Clear (acknowledge) an alarm event. The arguments are "all" for all current alarms, a specific alarm number (e.g. ''1''), or an alarm string identifier (e.g. ''MGMT_ALARM_PROXY_CONFIG_ERROR'').

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

salt.modules.trafficserver.**clear_cluster**()

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

salt.modules.trafficserver.**clear_node**()

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

salt.modules.trafficserver.**match_config**(*regex*)

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

salt.modules.trafficserver.**match_metric**(*regex*)

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

salt.modules.trafficserver.**offline**(*path*)

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```
salt '*' trafficserver.offline /path/to/cache
```

salt.modules.trafficserver.**read_config**(**args*)

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

salt.modules.trafficserver.**read_metric**(**args*)

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

salt.modules.trafficserver.**refresh**()

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```
salt '*' trafficserver.refresh
```

salt.modules.trafficserver.**restart_cluster**()

Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

salt.modules.trafficserver.**restart_local**(*drain=False*)

Restart the traffic_manager and traffic_server processes on the local node.

drain

This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

salt.modules.trafficserver.**set_config**(*variable*, *value*)

Set the value of a Traffic Server configuration variable.

variable

Name of a Traffic Server configuration variable.

value

The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

salt.modules.trafficserver.**shutdown**()

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

salt.modules.trafficserver.**startup**()

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

salt.modules.trafficserver.**status**()

Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

salt.modules.trafficserver.**zero_cluster**()

Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

salt.modules.trafficserver.**zero_node**()

Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

26.7.462 salt.modules.transactional_update module

Transactional update

New in version 3004.

A transactional system, like MicroOS, can present some challenges when the user decided to manage it via Salt.

MicroOS provides a read-only rootfs and a tool, `transactional-update`, that takes care of the management of the system (updating, upgrading, installation or reboot, among others) in an atomic way.

Atomicity is the main feature of MicroOS, and to guarantee this property, this model leverages `snapper`, `zypper`, `btrfs` and `overlayfs` to create snapshots that will be updated independently of the currently running system, and that are activated after the reboot. This implies, for example, that some changes made on the system are not visible until the next reboot, as those changes are living in a different snapshot of the file system.

This model presents a lot of problems with the traditional Salt model, where the inspections (like 'is this package installed?') are executed in order to determine if a subsequent action is required (like 'install this package').

Lets consider this use case, to see how it works on a traditional system, and in a transactional system:

1) Check if `apache` is installed
2) If it is not installed, install it
3) Check that a `vhost` is configured for `apache`
4) Make sure that `apache2.service` is enabled
5) If the configuration changes, restart `apache2.service`

In the traditional system everything will work as expected. The system can see if the package is present or not, install it if it isn't, and a re-check will shows that is already present. The same will happen to the configuration file in `/etc/apache2`, that will be available as soon the package gets installed. Salt can inspect the current form of this file, and add the missing bits if required. Salt can annotate that a change is present, and restart the service.

In a transactional system we will have multiple issues. The first one is that Salt can only see the content of the snapshot where the system booted from. Later snapshots may contain different content, including the presence of `apache`. If Salt decides to install `apache` calling `zypper`, it will fail, as this will try to write into the read-only rootfs. Even if Salt would call `transactional-update pkg install`, the package would only be present in the new transaction (snapshot), and will not be found in the currently running system when later Salt tries to validate the presence of the package in the current one.

Any change in `/etc` alone will have also problems, as the changes will be alive in a different overlay, only visible after the reboot. And, finally, the service can only be enabled and restarted if the service file is already present in the current `/etc`.

General strategy

`transactional-update` is the reference tool used for the administration of transactional systems. Newer versions of this tool support the execution of random commands in the new transaction, the continuation of a transaction, the automatic detection of changes in new transactions and the merge of `/etc` overlays.

Continue a transaction

One prerequisite already present is the support for branching from a different snapshot than the current one in snapper.

With this feature we can represent in `transactional-update` the action of creating a transaction snapshot based on one that is planned to be the active one after the reboot. This feature removes a lot of user complains (like, for example, losing changes that are stored in a transaction not yet activated), but also provide a more simple model to work with.

So, for example, if the user have this scenario:

```
  +-----+  *=====*  +--V--+
--| T.1 |--| T.2 |--| T.3 |
  +-----+  *=====*  +--A--+
```

where T.2 is the current active one, and T.3 is an snapshot generated from T.2 with a new package (`apache2`), and is marked to be the active after the reboot.

Previously, if the user (that is still on T.2) created a new transaction, maybe for adding a new package (`tomcat`, for example), the new T.4 will be based on the content of T.2 again, and not T.3, so the new T.4 will have lost the changes of T.3 (i.e. *apache2* will not be present in T.4).

With the `--continue` parameter, `transactional-update` will create T.4 based on T.3, and nothing will be lost.

Command execution inside a new transaction

With `transactional-update run` we will create a new transaction based on the current one (T.2), where we can send interactive commands that can modify the new transaction, and as commented, with `transactional-update --continue run`, we will create a new transaction based on the last created (T.3)

The `run` command can execute any application inside the new transaction namespace. This module uses this feature to execute the different Salt execution modules, via `call()`. Or even the full `salt-thin` or `salt-call` via `sls()`, `apply()`, `single()` or `highstate`.

`transactional-update` will drop empty snapshots

The option `--drop-if-no-change` is used to detect whether there is any change in the file system on the read-only subvolume of the new transaction will be added. If a change is present, the new transaction will remain, if not it will be discarded.

For example:

```
transactional-update --continue --drop-if-no-change run zypper in apache2
```

If we are in the scenario described before, `apache2` is already present in T.3. In this case a new transaction, T.4, will be created based on T.3, `zypper` will detect that the package is already present and no change will be produced on T.4. At the end of the execution, `transactional-update` will validate that T.3 and T.4 are equivalent and T.4 will be discarded.

If the command is:

```
transactional-update --continue --drop-if-no-change run zypper in tomcat
```

the new T.4 will be indeed different from T.3, and will remain after the transaction is closed.

With this feature, every time that we call any function of this execution module, we will minimize the amount of transaction, while maintaining the idempotence so some operations.

Report for pending transaction

A change in the system will create a new transaction, that needs to be activated via a reboot. With `pending_transaction()` we can check if a reboot is needed. We can execute the reboot using the `reboot()` function, that will follow the plan established by the functions of the `rebootmgr` execution module.

`/etc` overlay merge when no new transaction is created

In a transactional model, `/etc` is an overlay file system. Changes done during the update are only present in the new transaction, and so will only be available after the reboot. Or worse, if the transaction gets dropped, because there is no change in the `rootfs`, the changes in `/etc` will be dropped too!. This is designed like that in order to make the configuration files for the new package available only when new package is also available to the user. So, after the reboot.

This makes sense for the case when, for example, `apache2` is not present in the current transaction, but we installed it. The new snapshot contains the `apache2` service, and the configuration files in `/etc` will be accessible only after the reboot.

But this model presents an issue. If we use `transactional-update --continue --drop-if-no-change run <command>`, where `<command>` does not make any change in the read-only subvolume, but only in `/etc` (which is also read-write in the running system), the new overlay with the changes in `/etc` will be dropped together with the transaction.

To fix this, `transactional-update` will detect that when no change has been made on the read-only subvolume, but done in the overlay, the transaction will be dropped and the changes in the overlay will be merged back into `/etc` overlay of the current transaction.

Using the execution module

With this module we can create states that leverage Salt into this kind of systems:

```
# Install apache (low-level API)
salt-call transactional_update.pkg_install apache2

# We can call any execution module
salt-call transactional_update.call pkg.install apache2

# Or via a state
salt-call transactional_update.single pkg.installed name=apache2
```

(continues on next page)

(continued from previous page)

```
# We can also execute a zypper directly
salt-call transactional_update run "zypper in apache2" snapshot="continue"

# We can reuse SLS states
salt-call transactional_update.apply install_and_configure_apache

# Or apply the full highstate
salt-call transactional_update.highstate

# Is there any change done in the system?
salt-call transactional_update pending_transaction

# If so, reboot via rebootmgr
salt-call transactional_update reboot

# We can enable the service
salt-call service.enable apache2

# If apache2 is available, this will work too
salt-call service.restart apache2
```

Fixing some expectations

This module alone is an improvement over the current state, but is easy to see some limitations and problems:

Is not a fully transparent approach

The user needs to know if the system is transactional or not, as not everything can be expressed inside a transaction (for example, restarting a service inside transaction is not allowed).

Two step for service restart

In the `apache2` example from the beginning we can observe the biggest drawback. If the package `apache2` is missing, the new module will create a new transaction, will execute `pkg.install` inside the transaction (creating the salt-thin, moving it inside and delegating the execution to `transactional-update` CLI as part of the full state). Inside the transaction we can do too the required changes in `/etc` for adding the new `vhost`, and we can enable the service via systemctl inside the same transaction.

At this point we will not merge the `/etc` overlay into the current one, and we expect from the user call the `reboot` function inside this module, in order to activate the new transaction and start the `apache2` service.

In the case that the package is already there, but the configuration for the `vhost` is required, the new transaction will be dropped and the `/etc` overlay will be visible in the live system. Then from outside the transaction, via a different call to Salt, we can command a restart of the `apache2` service.

We can see that in both cases we break the user expectation, where a change on the configuration will trigger automatically the restart of the associated service. In a transactional scenario we need two different steps: or a reboot, or a restart from outside of the transaction.

depends
None

platform
Linux

salt.modules.transactional_update.**apply_**(*mods=None*, ***kwargs*)

Apply an state inside a transaction.

This function will call *transactional_update.highstate* or *transactional_update.sls* based on the arguments passed to this function. It exists as a more intuitive way of applying states.

For a formal description of the possible parameters accepted in this function, check *state.apply_* documentation.

activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.apply
salt microos transactional_update.apply stuff
salt microos transactional_update.apply stuff pillar='{"foo": "bar"}'
salt microos transactional_update.apply stuff activate_transaction=True
```

salt.modules.transactional_update.**bootloader**(*self_update=False*, *snapshot=None*)

Reinstall the bootloader

Same as grub.cfg, but will also rewrite the bootloader itself.

self_update
Check for newer transactional-update versions.

snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update bootloader snapshot="continue"
```

salt.modules.transactional_update.**call**(*function*, **args*, ***kwargs*)

Executes a Salt function inside a transaction.

The chroot does not need to have Salt installed, but Python is required.

function
Salt execution module function

activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.call test.ping
salt microos transactional_update.call ssh.set_auth_key user key=mykey
salt microos transactional_update.call pkg.install emacs activate_
↪transaction=True
```

salt.modules.transactional_update.**cleanup**(*self_update=False*)

Run both cleanup-snapshots and cleanup-overlays.

Identical to calling both cleanup-snapshots and cleanup-overlays.

self_update
: Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup
```

salt.modules.transactional_update.**cleanup_overlays**(*self_update=False*)

Remove unused overlay layers.

Removes all unreferenced (and thus unused) /etc overlay directories in /var/lib/overlay.

self_update
: Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup_overlays
```

salt.modules.transactional_update.**cleanup_snapshots**(*self_update=False*)

Mark unused snapshots for snapper removal.

If the current root filesystem is identical to the active root filesystem (means after a reboot, before transactional-update creates a new snapshot with updates), all old snapshots without a cleanup algorithm get a cleanup algorithm set. This is to make sure, that old snapshots will be deleted by snapper. See the section about cleanup algorithms in snapper(8).

self_update
: Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup_snapshots
```

salt.modules.transactional_update.**dup**(*self_update=False*, *snapshot=None*)

Call 'zypper dup'

If new updates are available, a new snapshot is created and zypper dup --no-allow-vendor-change is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use ”continue” to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update dup snapshot="continue"
```

salt.modules.transactional_update.**grub_cfg**(*self_update=False*, *snapshot=None*)

Regenerate grub.cfg

grub2-mkconfig(8) is called to create a new /boot/grub2/grub.cfg configuration file for the bootloader.

self_update
: Check for newer transactional-update versions.

snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update grub_cfg snapshot="continue"
```

salt.modules.transactional_update.**highstate**(*activate_transaction=False*, *queue=False*, ***kwargs*)

Retrieve the state data from the salt master for this minion and execute it inside a transaction.

For a formal description of the possible parameters accepted in this function, check *state.highstate* documentation.

activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

queue
Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

CLI Example:

```
salt microos transactional_update.highstate
salt microos transactional_update.highstate pillar='{"foo": "bar"}'
salt microos transactional_update.highstate activate_transaction=True
```

salt.modules.transactional_update.**in_transaction**()

Check if Salt is executing while in a transaction

CLI Example:

```
salt microos transactional_update in_transaction
```

salt.modules.transactional_update.**initrd**(*self_update=False*, *snapshot=None*)

Regenerate initrd

A new initrd is created in a snapshot.

self_update
Check for newer transactional-update versions.

snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update initrd snapshot="continue"
```

salt.modules.transactional_update.**kdump**(*self_update=False*, *snapshot=None*)

Regenerate kdump initrd

A new initrd for kdump is created in a snapshot.

self_update
Check for newer transactional-update versions.

snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update kdump snapshot="continue"
```

salt.modules.transactional_update.**migration**(*self_update=False*, *snapshot=None*)

Updates systems registered via SCC / SMT

On systems which are registered against the SUSE Customer Center (SCC) or SMT, a migration to a new version of the installed products can be made with this option.

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update migration snapshot="continue"
```

salt.modules.transactional_update.**patch**(*self_update=False*, *snapshot=None*)

Call 'zypper patch'

If new updates are available, a new snapshot is created and zypper patch is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update patch snapshot="continue"
```

salt.modules.transactional_update.**pending_transaction**()

Check if there is a pending transaction

CLI Example:

```
salt microos transactional_update pending_transaction
```

salt.modules.transactional_update.**pkg_install**(*pkg=None*, *pkgs=None*, *args=None*, *self_update=False*, *snapshot=None*)

Install individual packages

Installs additional software. See the install description in the "Package Management Commands" section of zypper's man page for all available arguments.

pkg
: Package name to install

pkgs
: List of packages names to install

args
: String or list of extra parameters for zypper

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_install pkg=emacs snapshot="continue
↪"
```

salt.modules.transactional_update.**pkg_remove**(*pkg=None*, *pkgs=None*, *args=None*, *self_update=False*, *snapshot=None*)

Remove individual packages

Removes installed software. See the remove description in the "Package Management Commands" section of zypper's man page for all available arguments.

pkg
: Package name to install

pkgs
: List of packages names to install

args
: String or list of extra parameters for zypper

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_remove pkg=vim snapshot="continue"
```

salt.modules.transactional_update.**pkg_update**(*pkg=None*, *pkgs=None*, *args=None*, *self_update=False*, *snapshot=None*)

Updates individual packages

Update selected software. See the update description in the "Update Management Commands" section of zypper's man page for all available arguments.

pkg
: Package name to install

pkgs
: List of packages names to install

args
: String or list of extra parameters for zypper

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_update pkg=emacs snapshot="continue"
```

salt.modules.transactional_update.**reboot**(*self_update=False*)

Reboot after update

Trigger a reboot after updating the system.

Several different reboot methods are supported, configurable via the REBOOT_METHOD configuration option in transactional-update.conf(5). By default rebootmgrd(8) will be used to reboot the system according to the configured policies if the service is running, otherwise systemctl reboot will be called.

self_update
Check for newer transactional-update versions.
CLI Example:

```
salt microos transactional_update reboot
```

salt.modules.transactional_update.**rollback**(*snapshot=None*)

Set the current, given or last working snapshot as default snapshot

Sets the default root file system. On a read-only system the root file system is set directly using btrfs. On read-write systems snapper(8) rollback is called.

If no snapshot number is given, the current root file system is set as the new default root file system. Otherwise number can either be a snapshot number (as displayed by snapper list) or the word last. last will try to reset to the latest working snapshot.
snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "last" to indicate the last working snapshot done.
CLI Example:

```
salt microos transactional_update rollback
```

salt.modules.transactional_update.**run**(*command*, *self_update=False*, *snapshot=None*)

Run a command in a new snapshot

Execute the command inside a new snapshot. By default this snapshot will remain, but if --drop-if-no-change is set, the new snapshot will be dropped if there is no change in the file system.
command
Command with parameters that will be executed (as string or array)
self_update
Check for newer transactional-update versions.
snapshot
Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:

```
salt microos transactional_update run "mkdir /tmp/dir" snapshot="continue"
```

salt.modules.transactional_update.**single**(*fun*, *name*, *activate_transaction=False*, *queue=False*, ***kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.
activate_transaction
If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).
queue
Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly (Default: False).
CLI Example:

```
salt microos transactional_update.single pkg.installed name=emacs
salt microos transactional_update.single pkg.installed name=emacs
↪activate_transaction=True
```

salt.modules.transactional_update.**sls**(*mods*, *activate_transaction=False*, *queue=False*, ***kwargs*)

Execute the states in one or more SLS files inside a transaction.

saltenv
: Specify a salt fileserver environment to be used when applying states

mods
: List of states to execute

test
: Run states in test-only (dry-run) mode

exclude
: Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

activate_transaction
: If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (Default: False).

queue
: Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly (Default: False).

For a formal description of the possible parameters accepted in this function, check *state.sls* documentation.

CLI Example:

```
salt microos transactional_update.sls stuff pillar='{"foo": "bar"}'
salt microos transactional_update.sls stuff activate_transaction=True
```

salt.modules.transactional_update.**transactional**()

Check if the system is a transactional system

CLI Example:

```
salt microos transactional_update transactional
```

salt.modules.transactional_update.**up**(*self_update=False*, *snapshot=None*)

Call 'zypper up'

If new updates are available, a new snapshot is created and zypper up is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

self_update
: Check for newer transactional-update versions.

snapshot
: Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update up snapshot="continue"
```

26.7.463 salt.modules.travisci

Commands for working with travisci.

depends
pyOpenSSL >= 16.0.0

`salt.modules.travisci.`**`verify_webhook`**(*signature*, *body*)

Verify the webhook signature from travisci

signature
The signature header from the webhook header

body
The full payload body from the webhook post

Note: The body needs to be the urlencoded version of the body.

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B
↪%22id%22%3A183791261%2C%22repository...'
```

26.7.464 salt.modules.tuned

Interface to Red Hat tuned-adm module

maintainer
Syed Ali <alicsyed@gmail.com>

maturity
new

depends
tuned-adm

platform
Linux

`salt.modules.tuned.`**`active`**()

Return current active profile

CLI Example:

```
salt '*' tuned.active
```

`salt.modules.tuned.`**`list_`**()

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

`salt.modules.tuned.`**`off`**()

Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

salt.modules.tuned.**profile**(*profile_name*)

Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

26.7.465 salt.modules.twilio_notify

Module for notifications via Twilio

New in version 2014.7.0.

depends

- twilio python module

configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with `pillar_opts` set to True).

For example:

```
my-twilio-account:
    twilio.account_sid: AC32a3c83990934481addd5ce1659f04d2
    twilio.auth_token: mytoken
```

salt.modules.twilio_notify.**send_sms**(*profile*, *body*, *to*, *from_*)

Send an sms

CLI Example:

twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'

26.7.466 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

salt.modules.udev.**env**(*dev*)

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

salt.modules.udev.**exportdb**()

Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

salt.modules.udev.**info**(*dev*)

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.**links**(*dev*)

Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

salt.modules.udev.**name**(*dev*)

Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

salt.modules.udev.**path**(*dev*)

Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

26.7.467 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *'service.start' is not available*), see *here*.

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of "initctl show-config" to determine if all service dependencies are enabled to start on boot. For example, see the "start on" condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on ((((filesystem and runlevel [!06]) and started dbus) and (drm-device-
 ↪added card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-
 ↪graphics)) or runlevel PREVLEVEL=S)
stop on runlevel [016]
```

Warning: This module should not be used on Red Hat systems. For these, the *rh_service* module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

salt.modules.upstart_service.**available**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.upstart_service.**disable**(*name*, ***kwargs*)

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.upstart_service.**disabled**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.upstart_service.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.upstart_service.**enabled**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.upstart_service.**force_reload**(*name*)

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.upstart_service.**full_restart**(*name*)

Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

salt.modules.upstart_service.**get_all**()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.upstart_service.**get_disabled**()

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.upstart_service.**get_enabled**()

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.upstart_service.**missing**(*name*)

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.upstart_service.**reload_**(*name*)

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.upstart_service.**restart**(*name*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.upstart_service.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.upstart_service.**status**(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.upstart_service.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.468 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.**check_exists**(*name*)

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.**checks_list**()

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

salt.modules.uptime.**create**(*name*, ***params*)

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation https://github.com/fzaninotto/uptime for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.**delete**(*name*)

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

26.7.469 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

---

salt.modules.useradd.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *system=False*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *other=''*, *createhome=True*, *loginclass=None*, *nologinit=False*, *root=None*, *usergroup=None*)

Add a user to the minion

name
: Username LOGIN to add

uid
: User ID of the new account

gid
: Name or ID of the primary group of the new account

groups
: List of supplementary groups of the new account

home
: Home directory of the new account

shell
: Login shell of the new account

unique
: If not True, the user account can have a non-unique UID

system
: Create a system account

fullname
: GECOS field for the full name

roomnumber
: GECOS field for the room number

workphone
: GECOS field for the work phone

homephone
: GECOS field for the home phone

other
: GECOS field for other information

createhome
: Create the user's home directory

loginclass
: Login class for the new account (OpenBSD)

nologinit
: Do not add the user to the lastlog and faillog databases

root
Directory to chroot into
usergroup
Create and add the user to a new primary group of the same name
CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.useradd.**chfullname**(*name*, *fullname*, *root=None*)

Change the user's Full Name
name
User to modify
fullname
GECOS field for the full name
root
Directory to chroot into
CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.useradd.**chgid**(*name*, *gid*, *root=None*)

Change the default group of the user
name
User to modify
gid
Force use GID as new primary group
root
Directory to chroot into
CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.useradd.**chgroups**(*name*, *groups*, *append=False*, *root=None*)

Change the groups to which this user belongs
name
User to modify
groups
Groups to set for the user
append
[False] If `True`, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).
root
Directory to chroot into
CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

salt.modules.useradd.**chhome**(*name*, *home*, *persist=False*, *root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.
name
User to modify

home
New home directory for the user account
persist
Move contents of the home directory to the new location
root
Directory to chroot into
CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.`**`chhomephone`**(*name*, *homephone*, *root=None*)

Change the user's Home Phone
name
User to modify
homephone
GECOS field for the home phone
root
Directory to chroot into
CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.`**`chloginclass`**(*name*, *loginclass*, *root=None*)

Change the default login class of the user
name
User to modify
loginclass
Login class for the new account
root
Directory to chroot into

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.useradd.`**`chother`**(*name*, *other*, *root=None*)

Change the user's other GECOS attribute
name
User to modify
other
GECOS field for other information
root
Directory to chroot into
CLI Example:

```
salt '*' user.chother foobar
```

`salt.modules.useradd.`**`chroomnumber`**(*name*, *roomnumber*, *root=None*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.useradd.**chshell**(*name*, *shell*, *root=None*)

Change the default shell of the user

name
: User to modify

shell
: New login shell for the user account

root
: Directory to chroot into

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.useradd.**chuid**(*name*, *uid*, *root=None*)

Change the uid for a named user

name
: User to modify

uid
: New UID for the user account

root
: Directory to chroot into

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.useradd.**chworkphone**(*name*, *workphone*, *root=None*)

Change the user's Work Phone

name
: User to modify

workphone
: GECOS field for the work phone

root
: Directory to chroot into

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

salt.modules.useradd.**delete**(*name*, *remove=False*, *force=False*, *root=None*)

Remove a user from the minion

name
: Username to delete

remove
: Remove home directory and mail spool

force
: Force some actions that would fail otherwise

root
: Directory to chroot into

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.useradd.**get_loginclass**(*name*)

Get the login class of the user

name

User to get the information

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.get_loginclass foo
```

salt.modules.useradd.**getent**(*refresh=False*, *root=None*)

Return the list of all info for all users

refresh

Force a refresh of user information

root

Directory to chroot into

CLI Example:

```
salt '*' user.getent
```

salt.modules.useradd.**info**(*name*, *root=None*)

Return user information

name

User to get the information

root

Directory to chroot into

CLI Example:

```
salt '*' user.info root
```

salt.modules.useradd.**list_groups**(*name*)

Return a list of groups the named user belongs to

name

User to get the information

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.useradd.**list_users**(*root=None*)

Return a list of all users

root

Directory to chroot into

CLI Example:

```
salt '*' user.list_users
```

salt.modules.useradd.**primary_group**(*name*)

Return the primary group of the named user

New in version 2016.3.0.

name

User to get the information

CLI Example:

```
salt '*' user.primary_group saltadmin
```

salt.modules.useradd.**rename**(*name*, *new_name*, *root=None*)

Change the username for a named user

name
User to modify

new_name
New value of the login name

root
Directory to chroot into

CLI Example:

```
salt '*' user.rename name new_name
```

26.7.470 salt.modules.uwsgi

uWSGI stats server https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html

maintainer
Peter Baumgartner <pete@lincolnloop.com>

maturity
new

platform
all

salt.modules.uwsgi.**stats**(*socket*)

Return the data from *uwsgi --connect-and-read* as a dictionary.

socket
The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatsserver.sock

salt '*' uwsgi.stats 127.0.0.1:5050
```

26.7.471 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for *sdb://vagrant_sdb_data*

Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

salt.modules.vagrant.**destroy**(*name*)

Destroy and delete a virtual machine. (vagrant destroy -f)

This also removes the salt_id name defined by vagrant.init.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

salt.modules.vagrant.**get_machine_id**(*machine*, *cwd*)

returns the salt_id name of the Vagrant VM

Parameters

- **machine** -- the Vagrant machine name
- **cwd** -- the path to Vagrantfile

Returns

salt_id name

salt.modules.vagrant.**get_ssh_config**(*name*, *network_mask=''*, *get_private_key=False*)

Retrieve hints of how you might connect to a Vagrant VM.

Parameters

- **name** -- the salt_id of the machine
- **network_mask** -- a CIDR mask to search for the VM's address
- **get_private_key** -- (default: False) return the key used for ssh login

Returns

a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_
↪private_key=True
```

The returned dictionary contains:

- key_filename: the name of the private key file on the VM host computer
- ssh_username: the username to be used to log in to the VM
- ssh_host: the IP address used to log in to the VM. (This will usually be *127.0.0.1*)
- ssh_port: the TCP port used to log in to the VM. (This will often be *2222*)
- [ip_address:] (if *network_mask* is defined. see below)
- [private_key:] (if *get_private_key* is True) the private key for ssh_username

About *network_mask*:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a *config.vm.network "public_network"* statement in your *Vagrantfile*.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should

be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ifconfig" command to the VM (using ssh to *ssh_host*:*ssh_port*) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.**get_vm_info**(*name*)

get the information for a VM.

Parameters

name -- salt_id name

Returns

dictionary of {'machine': x, 'cwd': y, ...}.

salt.modules.vagrant.**init**(*name*, *cwd=None*, *machine=''*, *runas=None*, *start=False*, *vagrant_provider=''*, *vm=None*)

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters

- **name** -- The salt_id name you will use to control this VM
- **cwd** -- The path to the directory where the Vagrantfile is located
- **machine** -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** -- The username on the host who owns the Vagrant work files.
- **start** -- (default: False) Start the virtual machine now.
- **vagrant_provider** -- The name of a Vagrant VM provider (if not the default).
- **vm** -- Optionally, all the above information may be supplied in this dictionary.

Returns

A string indicating success, or False.

CLI Example:

```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

salt.modules.vagrant.**list_active_vms**(*cwd=None*)

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' vagrant.list_active_vms  cwd=/projects/project_1
```

salt.modules.vagrant.**list_domains**()

Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

salt.modules.vagrant.**list_inactive_vms**(*cwd=None*)

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

salt.modules.vagrant.**pause**(*name*)

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

salt.modules.vagrant.**reboot**(*name*, *provision=False*)

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

Parameters

- **name** -- The salt_id name you will use to control this VM
- **provision** -- (False) also re-run the Vagrant provisioning scripts.

salt.modules.vagrant.**shutdown**(*name*)

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use ”stop” and ”shutdown” to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

salt.modules.vagrant.**start**(*name*)

Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using ”vagrant.init”.

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

salt.modules.vagrant.**stop**(*name*)

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```

salt.modules.vagrant.**version**()

Return the version of Vagrant on the minion

CLI Example:

```
salt '*' vagrant.version
```

salt.modules.vagrant.**vm_state**(*name=''*, *cwd=None*)

Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the *cwd* directory.

CLI Example:

```
salt '*' vagrant.vm_state <name>  cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': _, # Vagrant machine name,
         'state': _, # string indicating machine state, like 'running'
         'provider': _, # the Vagrant VM provider
         'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the `primary` machine, which you defined by leaving the `machine` parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

26.7.472 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.**ban**(*ban_expression*)

Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

salt.modules.varnish.**ban_list**()

List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

salt.modules.varnish.**param_set**(*param*, *value*)

Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

salt.modules.varnish.**param_show**(*param=None*)

Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

salt.modules.varnish.**purge**()

Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

salt.modules.varnish.**version**()

Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

26.7.473 salt.modules.vault

Functions to interact with Hashicorp Vault.

maintainer
SaltStack

maturity
new

platform
all

note
If you see the following error, you'll need to upgrade `requests` to at least 2.4.2

```
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to
↪load ext_pillar vault: {'error': "request() got an unexpected keyword
↪argument 'json'"}
```

configuration
The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

```
vault:
    url: https://vault.service.domain:8200
    verify: /etc/ssl/certs/ca-certificates.crt
    role_name: minion_role
    namespace:  vault_enterprice_namespace
    auth:
        method: approle
        role_id: 11111111-2222-3333-4444-1111111111111
        secret_id: 11111111-1111-1111-1111-1111111111111
```

(continues on next page)

(continued from previous page)

```
    policies:
        - saltstack/minions
        - saltstack/minion/{minion}
        .. more policies
    keys:
        - n63/TbrQuL3xaIW7ZZpuXj/tIfnK1/MbVxO4vT3wYD2A
        - S9OwCvMRhErEA4NVVELYBs6w/Me6+urgUr24xGK44Uy3
        - F1j4b7JKq850NS6Kboiy5laJ0xY8dWJvB3fcwA+SraYl
        - 1cYtvjKJNDVam9c7HNqJUfINk4PYyAXIpjkpN/sIuzPv
        - 3pPK5X6vGtwLhNOFv1U2elahECz3HpRUfNXJFYLw6lid
```

url
: Url to your Vault installation. Required.

verify
: For details please see https://requests.readthedocs.io/en/master/user/advanced/#ssl-cert-verification

  New in version 2018.3.0.

namespaces
: Optional Vault Namespace. Used with Vault enterprice

  For detail please see: https://www.vaultproject.io/docs/enterprise/namespaces

  New in version 3004.

role_name
: Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

  For details please see: https://www.vaultproject.io/api/auth/token/index.html#create-token

  Example configuration: https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration

auth
: Currently only token and approle auth types are supported. Required.

  Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: https://www.vaultproject.io/docs/auth/approle.html

  The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

```
vault:
  url: https://vault.service.domain:8200
  auth:
    method: token
    token: sdb://osenv/VAULT_TOKEN
osenv:
  driver: env
```

  And then export the VAULT_TOKEN variable in your OS:

```
export VAULT_TOKEN=11111111-1111-1111-1111-111111111111
```

Configuration keys `uses` or `ttl` may also be specified under `auth` to configure the tokens generated on behalf of minions to be reused for the defined number of uses or length of time in seconds. These settings may also be configured on the minion when `allow_minion_override` is set to `True` in the master config.

Defining `uses` will cause the salt master to generate a token with that number of uses rather than a single use token. This multi-use token will be cached on the minion. The type of minion cache can be specified with `token_backend: session` or `token_backend: disk`. The value of `session` is the default, and will store the vault information in memory only for that session. The value of `disk` will write to an on disk file, and persist between state runs (most helpful for multi-use tokens).

```
vault:
  auth:
    method: token
    token: xxxxxx
    uses: 10
    ttl: 43200
    allow_minion_override: True
    token_backend: disk

  .. versionchanged:: 3001
```

policies

Policies that are assigned to minions when requesting a token. These can either be static, eg `saltstack/minions`, or templated with grain values, eg `my-policies/{grains[os]}`. `{minion}` is shorthand for `grains[id]`, eg `saltstack/minion/{minion}`.

New in version 3006.0: Policies can be templated with pillar values as well: `salt_role_{pillar[roles]}` Make sure to only reference pillars that are not sourced from Vault since the latter ones might be unavailable during policy rendering.

Important: See *Is Targeting using Grain Data Secure?* for important security information. In short, everything except `grains[id]` is minion-controlled.

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template `saltstack/by-role/{grains[roles]}`, and a minion having these grains:

```
grains:
    roles:
        - web
        - database
```

The minion will have the policies `saltstack/by-role/web` and `saltstack/by-role/database`.

Note: List members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of

types which work well.

Optional. If policies is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

policies_refresh_pillar
Whether to refresh the pillar data when rendering templated policies. When unset (=null/None), will only refresh when the cached data is unavailable, boolean values force one behavior always.

Note: Using cached pillar data only (policies_refresh_pillar=False) might cause the policies to be out of sync. If there is no cached pillar data available for the minion, pillar templates will fail to render at all.

If you use pillar values for templating policies and do not disable refreshing pillar data, make sure the relevant values are not sourced from Vault (ext_pillar, sdb) or from a pillar sls file that uses the vault execution module. Although this will often work when cached pillar data is available, if the master needs to compile the pillar data during policy rendering, all Vault modules will be broken to prevent an infinite loop.

---

policies_cache_time
Policy computation can be heavy in case pillar data is used in templated policies and it has not been cached. Therefore, a short-lived cache specifically for rendered policies is used. This specifies the expiration timeout in seconds. Defaults to 60.

keys
List of keys to use to unseal vault server with the vault.unseal runner.

config_location
Where to get the connection details for calling vault. By default, vault will try to determine if it needs to request the connection details from the master or from the local config. This optional option will force vault to use the connection details from the master or the local config. Can only be either `master` or `local`.

New in version 3006.0.

Add this segment to the master configuration file, or /etc/salt/master.d/peer_run.conf:

```
peer_run:
    .*:
        - vault.generate_token
```

`salt.modules.vault.`**`clear_token_cache`**`()`

Changed in version 3001.

Delete minion Vault token cache file

CLI Example:

```
salt '*' vault.clear_token_cache
```

`salt.modules.vault.`**`delete_secret`**`(`*`path`*`)`

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

salt.modules.vault.**destroy_secret**(*path*, **args*)

New in version 3001.

Destroy specified secret version at the path in vault. The vault policy used must allow this. Only supported on Vault KV version 2

CLI Example:

```
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```

salt.modules.vault.**list_secrets**(*path*, *default=<Constant.NOT_SET>*)

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

salt.modules.vault.**read_secret**(*path*, *key=None*, *metadata=False*, *default=<Constant.NOT_SET>*)

Changed in version 3001: The `default` argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

Return the value of key at path in vault, or entire secret

Parameters

metadata -- Optional - If using KV v2 backend, display full results, including metadata

New in version 3001.

Jinja Example:

```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}

{{ salt['vault'].read_secret('/secret/my/secret', 'some-key',
↪metadata=True)['data'] }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
    first: {{ supersecret.first }}
    second: {{ supersecret.second }}
```

salt.modules.vault.**write_raw**(*path*, *raw*)

Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password":
↪"bar"}'
```

salt.modules.vault.**write_secret**(*path*, ***kwargs*)

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

26.7.474 salt.modules.vbox_guest

VirtualBox Guest Additions installer

salt.modules.vbox_guest.**additions_install**(***kwargs*)

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters

- **reboot** (*bool*) -- reboot computer to complete installation
- **upgrade_os** (*bool*) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns

version of VirtualBox Guest Additions or string with error

salt.modules.vbox_guest.**additions_mount**()

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

Returns

True or OSError exception

salt.modules.vbox_guest.**additions_remove**(***kwargs*)

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it failes.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters

force (*bool*) -- force VirtualBox Guest Additions removing

Returns

True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.**additions_umount**(*mount_point*)

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

Parameters
mount_point -- directory VirtualBox Guest Additions is mounted to

Returns
True or an string with error

salt.modules.vbox_guest.**additions_version**()

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

Returns
version of VirtualBox Guest Additions or False if they are not installed

salt.modules.vbox_guest.**grant_access_to_shared_folders_to**(*name*, *users=None*)

Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument *users*. Access will be denied to the users not listed in *users* argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred',
↪'roman']
```

Parameters
- **name** (*str*) -- name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) -- list of names of users to grant access to auto-mounted shared folders to (if specified, *name* will not be taken into account)

Returns
list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.**list_shared_folders_users**()

List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

Returns
list of users who have access to auto-mounted shared folders

26.7.475 salt.modules.vboxmanage

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

```
autoload_vboxdrv: True
```

The default for this setting is `False`.

depends
virtualbox

`salt.modules.vboxmanage.`**`clonemedium`**(*medium*, *uuid_in=None*, *file_in=None*, *uuid_out=None*, *file_out=None*, *mformat=None*, *variant=None*, *existing=False*, ***kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

`salt.modules.vboxmanage.`**`clonevm`**(*name=None*, *uuid=None*, *new_name=None*, *snapshot_uuid=None*, *snapshot_name=None*, *mode='machine'*, *options=None*, *basefolder=None*, *new_uuid=None*, *register=False*, *groups=None*, ***kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

`salt.modules.vboxmanage.`**`create`**(*name*, *groups=None*, *ostype=None*, *register=True*, *basefolder=None*, *new_uuid=None*, ***kwargs*)

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

`salt.modules.vboxmanage.`**`destroy`**(*name*)

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

`salt.modules.vboxmanage.`**`list_items`**(*item*, *details=False*, *group_by='UUID'*)

Return a list of a specific type of item. The following items are available:
vms runningvms ostypes hostdvds hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks groups webcams screenshotformats

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the `UUID` field, but not all items contain that field. In those cases, another field must be specified.

`salt.modules.vboxmanage.`**`list_nodes`**`()`

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

`salt.modules.vboxmanage.`**`list_nodes_full`**`()`

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

`salt.modules.vboxmanage.`**`list_nodes_min`**`()`

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

`salt.modules.vboxmanage.`**`list_ostypes`**`()`

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

`salt.modules.vboxmanage.`**`register`**`(`*`filename`*`)`

Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

`salt.modules.vboxmanage.`**`start`**`(`*`name`*`)`

Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

`salt.modules.vboxmanage.`**`stop`**`(`*`name`*`)`

Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

salt.modules.vboxmanage.**unregister**(*name*, *delete=False*)

Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

salt.modules.vboxmanage.**vboxcmd**()

Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

26.7.476 salt.modules.vcenter

Module used to access the vcenter proxy connection methods

Warning: This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the vCenter module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

salt.modules.vcenter.**get_details**()

26.7.477 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

```
victorops:
  api_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

salt.modules.victorops.**create_event**(*message_type=None*, *routing_key='everybody'*, ***kwargs*)

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

Parameters

message_type -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

Parameters

- **routing_key** -- The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp_fmt The date format for the timestamp parameter.

Parameters

- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.
- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

Returns

A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key=
↪'everyone'                  entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT'
↪routing_key='everyone'                  entity_id='hostname/diskspace'
↪ack_message='Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key=
↪'everyone'                  entity_id='hostname/diskspace'
```

The following parameters are required:

message_type

26.7.478 salt.modules.virt

Work with virtual machines managed by libvirt

depends

- libvirt Python module
- libvirt client
- qemu-img
- grep

Connection

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
  connection:
    uri: lxc:///
```

If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```
virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
    auth:
      username: user
      password: secret
```

Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the `ssh`, `libssh` and `libssh2` transports. Note that `libssh2` is likely to fail as it doesn't read the `known_hosts` file. Libvirt may also have been built without `libssh` or `libssh2` support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using `connection`, `username` and `password` parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the `virt:connection` is.

```
salt 'hypervisor' virt.list_domains connection=lxc:///
```

The calls not using the libvirt connection setup are:

- `seed_non_shared_migrate`
- `virt_type`
- `is_*hyper`
- all migration functions
- libvirt ESX URI format
- libvirt URI format
- libvirt authentication configuration

Units

Units specification

New in version 3002.

The string should contain a number optionally followed by a unit. The number may have a decimal fraction. If the unit is not given then MiB are set by default. Units can optionally be given in IEC style (such as MiB), although the standard single letter style (such as M) is more convenient.

Valid units include:

Standard Unit	IEC Unit	Standard Name	IEC Name	Factor
B		Bytes		1
K	KiB	Kilobytes	Kibibytes	2**10
M	MiB	Megabytes	Mebibytes	2**20
G	GiB	Gigabytes	Gibibytes	2**30
T	TiB	Terabytes	Tebibytes	2**40
P	PiB	Petabytes	Pebibytes	2**50
E	EiB	Exabytes	Exbibytes	2**60
Z	ZiB	Zettabytes	Zebibytes	2**70
Y	YiB	Yottabytes	Yobibytes	2**80

Additional decimal based units:

Unit	Factor
KB	10**3
MB	10**6
GB	10**9
TB	10**12
PB	10**15
EB	10**18
ZB	10**21
YB	10**24

salt.modules.virt.**all_capabilities**(***kwargs*)

Return the host and domain capabilities in a single call.

New in version 3001.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.all_capabilities
```

salt.modules.virt.**capabilities**(***kwargs*)

Return the hypervisor connection capabilities.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.capabilities
```

salt.modules.virt.**cpu_baseline**(*full=False*, *migratable=False*, *out='libvirt'*, ***kwargs*)

Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.cpu_baseline
```

`salt.modules.virt.`**`create_xml_path`**(*path*, ***kwargs*)

Start a transient domain based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

`salt.modules.virt.`**`create_xml_str`**(*xml*, ***kwargs*)

Start a transient domain based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

`salt.modules.virt.`**`ctrl_alt_del`**(*vm_*, ***kwargs*)

Sends CTRL+ALT+DEL to a VM

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

salt.modules.virt.**define_vol_xml_path**(*path*, *pool=None*, ***kwargs*)

Define a volume based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the volume
- **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.

  New in version 3001.
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

salt.modules.virt.**define_vol_xml_str**(*xml*, *pool=None*, ***kwargs*)

Define a volume based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the storage volume
- **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.

  New in version 3001.
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

The storage pool where the disk image will be defined is `default` unless changed with the pool parameter or a configuration like this:

```
virt:
    storagepool: mine
```

salt.modules.virt.**define_xml_path**(*path*, ***kwargs*)

Define a persistent domain based on the XML-file path passed to the function

Parameters

- **path** -- path to a file containing the libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

salt.modules.virt.**define_xml_str**(*xml*, ***kwargs*)

Define a persistent domain based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

salt.modules.virt.**delete_snapshots**(*name*, **names*, ***kwargs*)

Delete one or more snapshots of the given VM.

Parameters

- **name** -- domain name
- **names** -- names of the snapshots to remove
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

salt.modules.virt.**domain_capabilities**(*emulator=None*, *arch=None*, *machine=None*, *domain=None*, ***kwargs*)

Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

Parameters

- **emulator** -- return the capabilities for the given emulator binary
- **arch** -- return the capabilities for the given CPU architecture
- **machine** -- return the capabilities for the given emulated machine type
- **domain** -- return the capabilities for the given virtualization type.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided, the libvirt default one is returned.

CLI Example:

```
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```

salt.modules.virt.**freecpu**(***kwargs*)

Return an int representing the number of unallocated cpus on this hypervisor

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.virt.**freemem**(***kwargs*)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.virt.**full_info**(***kwargs*)

Return the node_info, vm_info and freemem

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.virt.**get_disks**(*vm_*, ***kwargs*)

Return the disks of a named vm

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_disks <domain>
```

salt.modules.virt.**get_graphics**(*vm_*, ***kwargs*)

Returns the information on vnc for a given vm

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

salt.modules.virt.**get_hypervisor**()

Returns the name of the hypervisor running on this node or `None`.

Detected hypervisors:

- kvm
- xen
- bhyve

CLI Example:

```
salt '*' virt.get_hypervisor
```

New in version 2019.2.0: the function and the `kvm`, `xen` and `bhyve` hypervisors support

salt.modules.virt.**get_loader**(*vm_*, ***kwargs*)

Returns the information on the loader for a given vm

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.get_loader <domain>
```

New in version 2019.2.0.

salt.modules.virt.**get_macs**(*vm_*, ***kwargs*)

Return a list off MAC addresses from the named vm

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.virt.**get_nics**(*vm_*, ***kwargs*)

Return info about the network interfaces of a named vm

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_nics <domain>
```

salt.modules.virt.**get_profiles**(*hypervisor=None*, ***kwargs*)

Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic
- disk

Parameters

- **hypervisor** -- override the default machine type.
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=vmware
```

salt.modules.virt.**get_xml**(*vm_*, ***kwargs*)

Returns the XML for a given vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.get_xml <domain>
```

salt.modules.virt.**init**(*name*, *cpu*, *mem*, *nic='default'*, *interfaces=None*, *hypervisor=None*, *start=True*, *disk='default'*, *disks=None*, *saltenv='base'*, *seed=True*, *install=True*, *pub_key=None*, *priv_key=None*, *seed_cmd='seed.apply'*, *graphics=None*, *os_type=None*, *arch=None*, *boot=None*, *boot_dev=None*, *numatune=None*, *hypervisor_features=None*, *clock=None*, *serials=None*, *consoles=None*, *stop_on_reboot=False*, *host_devices=None*, ***kwargs*)

Initialize a new vm

Parameters

- **name** -- name of the virtual machine to create
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iothreads allocation. The structure of the dictionary is documented in *cpu parameters definition*.

```
cpu:
  placement: static
  cpuset: 0-11
  current: 5
  maximum: 12
  vcpus:
    0:
      enabled: True
      hotpluggable: False
      order: 1
    1:

New in version 3003.

- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are `boot`, `current`, `max`, `slots`, `hard_limit`, `soft_limit`, `swap_hard_limit`, `min_guarantee`, `hugepages` , `nosharepages`, `locked`, `source`, `access`, `allocation` and `discard`. The structure of the dictionary is documented in *Memory parameter definition*. Both decimal and binary base are supported. Detail unit specification is documented in *Units specification*. Please note that the value for `slots` must be an integer.

```
{
    'boot': 1g,
```

(continues on next page)

(continued from previous page)

```
    'current': 1g,
    'max': 1g,
    'slots': 10,
    'hard_limit': '1024',
    'soft_limit': '512m',
    'swap_hard_limit': '1g',
    'min_guarantee': '512mib',
    'hugepages': [{'nodeset': '0-3,^2', 'size': '1g'}, {
↪'nodeset': '2', 'size': '2m'}],
    'nosharepages': True,
    'locked': True,
    'source': 'file',
    'access': 'shared',
    'allocation': 'immediate',
    'discard': True
}
```

Changed in version 3002.

- **nic** -- NIC profile to use (Default: `'default'`). The profile interfaces can be customized / extended with the interfaces parameter. If set to `None`, no profile will be used.
- **interfaces** -- List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in *Network Interfaces Definitions*.

  New in version 2019.2.0.
- **hypervisor** -- the virtual machine type. By default the value will be computed according to the virtual host capabilities.
- **start** -- `True` to start the virtual machine after having defined it (Default: `True`)
- **disk** -- Disk profile to use (Default: `'default'`). If set to `None`, no profile will be used.
- **disks** -- List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in *Disks Definitions*.

  New in version 2019.2.0.
- **saltenv** -- Fileserver environment (Default: `'base'`). See *cp module for more details*
- **seed** -- `True` to seed the disk image. Only used when the `image` parameter is provided. (Default: `True`)
- **install** -- install salt minion if absent (Default: `True`)
- **pub_key** -- public key to seed with (Default: `None`)
- **priv_key** -- public key to seed with (Default: `None`)
- **seed_cmd** -- Salt command to execute to seed the image. (Default: `'seed.apply'`)
- **graphics** -- Dictionary providing details on the graphics device to create. (Default: `None`) See *Graphics Definition* for more details on the possible values.

  New in version 2019.2.0.
- **os_type** -- type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for `hvm`.

  New in version 2019.2.0.

- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but `x86_64` is prefed over `i686`.

  New in version 2019.2.0.
- **config** -- minion configuration to use when seeding. See *seed module for more details*
- **boot_dev** -- String of space-separated devices to boot from (Default: `'hd'`)
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.
- **stop_on_reboot** -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

  New in version 3003.
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary. The structure of the dictionary is documented in *Boot parameters definition*. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file and modify the XML accordingly. To boot VM with UEFI, specify loader and nvram path or specify 'efi': `True` if your libvirtd version is >= 5.2.0 and QEMU >= 3.0.0.

  New in version 3000.

  ```
  {
      'kernel': '/root/f8-i386-vmlinuz',
      'initrd': '/root/f8-i386-initrd',
      'cmdline': 'console=ttyS0 ks=http://example.com/f8-
  ↪i386/os/',
      'loader': '/usr/share/OVMF/OVMF_CODE.fd',
      'nvram': '/usr/share/OVMF/OVMF_VARS.ms.fd'
  }
  ```
- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

  By default, the value will `"hd"`.
- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional `memory` element specifies how to allocate memory for the domain process on a NUMA host. `memnode` elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at *cpu parameters definition*.

  New in version 3003.

  ```
  {
      'memory': {'mode': 'strict', 'nodeset': '0-11'},
      'memnodes': {0: {'mode': 'strict', 'nodeset': 1}, 1:
  ↪{'mode': 'preferred', 'nodeset': 2}}
  }
  ```

- **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

  New in version 3003.

```
hypervisor_features:
  kvm-hint-dedicated: True
```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:

  adjustment
  : time adjustment in seconds or `reset`

  utc
  : set to `False` to use the host local time as the guest clock. Defaults to `True`.

  timezone
  : synchronize the guest to the correspding timezone

  timers
  : a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties `track`, `tickpolicy`, `catchup`, `frequency`, `mode`, `present`, `slew`, `threshold` and `limit`. See libvirt time keeping documentation for the possible values.

  New in version 3003.

  Set the clock to local time using an offset in seconds .. code-block:: yaml
  : **clock**:
    adjustment: 3600 utc: False

  Set the clock to a specific time zone:

```
clock:
  timezone: CEST
```

  Tweak guest timers:

```
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False
```

- **serials** -- Dictionary providing details on the serials connection to create. (Default: `None`) See *Serials and Consoles Definitions* for more details on the possible values.

  New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: `None`) See *Serials and Consoles Definitions* for more details on the possible values.

  New in version 3003.

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the *node_devices()* function. (Default: `None`)

New in version 3003.

cpu parameters definition

The cpu parameters dictionary can contain the following properties:

cpuset
: a comma-separated list of physical CPU numbers that domain process and virtual CPUs can be pinned to by default. eg. `1-4,^3` cpuset 3 is excluded.

current
: the number of virtual cpus available at startup

placement
: indicate the CPU placement mode for domain process. the value can be either `static` or `auto`

vcpus
: specify the state of individual vcpu. Possible attribute for each individual vcpu include: `id`, `enabled`, `hotpluggable` and `order`. Valid `ids` are from 0 to the maximum vCPU count minus 1. `enabled` takes boolean values which controls the state of the vcpu. `hotpluggable` take boolean value which controls whether given vCPU can be hotplugged and hotunplugged. `order` takes an integer value which specifies the order to add the online vCPUs.

match
: The cpu attribute `match` attribute specifies how strictly the virtual CPU provided to the guest matches the CPU requirements, possible values are `minimum`, `exact` or `strict`.

check
: Optional cpu attribute `check` attribute can be used to request a specific way of checking whether the virtual CPU matches the specification, possible values are `none`, `partial` and `full`.

mode
: Optional cpu attribute `mode` attribute may be used to make it easier to configure a guest CPU to be as close to host CPU as possible, possible values are `custom`, `host-model` and `host-passthrough`.

model
: specifies CPU model requested by the guest. An optional `fallback` attribute can be used to forbid libvirt falls back to the closest model supported by the hypervisor, possible values are `allow` or `forbid`. `vendor_id` attribute can be used to set the vendor id seen by the guest, the length must be exactly 12 characters long.

vendor
: specifies CPU vendor requested by the guest.

topology
: specifies requested topology of virtual CPU provided to the guest. Four possible attributes , `sockets`, `dies`, `cores`, and `threads`, accept non-zero positive integer values. They refer to the number of CPU sockets per NUMA node, number of dies per socket, number of cores per die, and number of threads per core, respectively.

features
: A dictionary contains a set of cpu features to fine-tune features provided by the selected CPU model. Use cpu feature `name` as the key and the `policy` as the value. `policy` Attribute takes `force`, `require`, `optional`, `disable` or `forbid`.

cache
: describes the virtual CPU cache. Optional attribute `level` takes an integer value which describes cache level `mode` attribute supported three possible values: `emulate`, `passthrough`, `disable`

numa
: specify the guest numa topology. `cell` element specifies a NUMA cell or a NUMA node, `cpus` specifies the CPU or range of CPUs that are part of the node, `memory` specifies the size of the node memory. All cells should have `id` attribute in case referring to some cell is necessary in the code. optional attribute `memAccess` control whether the memory is to be mapped as `shared` or `private`, `discard` attribute which fine tunes the discard feature for given numa node, possible values are `True` or `False`. `distances` element define the distance between NUMA cells and `sibling` sub-element is used to specify the distance value between sibling NUMA cells.

vcpupin
The optional vcpupin element specifies which of host's physical CPUs the domain vCPU will be pinned to.

emulatorpin
The optional emulatorpin element specifies which of host physical CPUs the "emulator", a subset of a domain not including vCPU or iothreads will be pinned to.

iothreadpin
The optional iothreadpin element specifies which of host physical CPUs the IOThreads will be pinned to.

shares
The optional shares element specifies the proportional weighted share for the domain.

period
The optional period element specifies the enforcement interval (unit: microseconds).

quota
The optional quota element specifies the maximum allowed bandwidth (unit: microseconds).

global_period
The optional global_period element specifies the enforcement CFS scheduler interval (unit: microseconds) for the whole domain in contrast with period which enforces the interval per vCPU.

global_quota
The optional global_quota element specifies the maximum allowed bandwidth (unit: microseconds) within a period for the whole domain.

emulator_period
The optional emulator_period element specifies the enforcement interval (unit: microseconds).

emulator_quota
The optional emulator_quota element specifies the maximum allowed bandwidth (unit: microseconds) for domain's emulator threads (those excluding vCPUs).

iothread_period
The optional iothread_period element specifies the enforcement interval (unit: microseconds) for IOThreads.

iothread_quota
The optional iothread_quota element specifies the maximum allowed bandwidth (unit: microseconds) for IOThreads.

vcpusched
specify the scheduler type for vCPUs. The value is a list of dictionaries with the `scheduler` key (values `batch`, `idle`, `fifo`, `rr`) and the optional `priority` and `vcpus` keys. The `priority` value usually is a positive integer and the `vcpus` value is a cpu set like `1-4,^3,6` or simply the vcpu id.

iothreadsched
specify the scheduler type for IO threads. The value is a list of dictionaries with the `scheduler` key (values `batch`, `idle`, `fifo`, `rr`) and the optional `priority` and `vcpus` keys. The `priority` value usually is a positive integer and the `vcpus` value is a cpu set like `1-4,^3,6` or simply the vcpu id.

emulatorsched
specify the scheduler type (values batch, idle, fifo, rr) for particular the emulator. The value is a dictionary with the `scheduler` key (values `batch`, `idle`, `fifo`, `rr`) and the optional `priority` and `vcpus` keys. The `priority` value usually is a positive integer.

cachetune
Optional cachetune element can control allocations for CPU caches using the resctrl on the host.

monitor
The optional element monitor creates the cache monitor(s) for current cache allocation.

memorytune
Optional memorytune element can control allocations for memory bandwidth using the resctrl on the host.

iothreads
Number of threads for supported disk devices to perform I/O requests. iothread id will be numbered from 1 to the provided number (Default: None).

Boot parameters definition

The boot parameters dictionary can contains the following properties:

kernel
: The URL or path to the kernel to run the virtual machine with.

initrd
: The URL or path to the initrd file to run the virtual machine with.

cmdline
: The parameters to pass to the kernel provided in the *kernel* property.

loader
: The path to the UEFI binary loader to use.

  New in version 3001.

nvram
: The path to the UEFI data template. The file will be copied when creating the virtual machine.

  New in version 3001.

efi
: A boolean value.

  New in version 3001.

Memory parameter definition

Memory parameter can contain the following properties:

boot
: The maximum allocation of memory for the guest at boot time

current
: The actual allocation of memory for the guest

max
: The run time maximum memory allocation of the guest

slots
: specifies the number of slots available for adding memory to the guest

hard_limit
: the maximum memory the guest can use

soft_limit
: memory limit to enforce during memory contention

swap_hard_limit
: the maximum memory plus swap the guest can use

min_guarantee
: the guaranteed minimum memory allocation for the guest

hugepages
: memory allocated using `hugepages` instead of the normal native page size. It takes a list of dictionaries with `nodeset` and `size` keys. For example `"hugepages": [{"nodeset": "1-4,^3", "size": "2m"}, {"nodeset": "3", "size": "1g"}]`.

nosharepages
: boolean value to instruct hypervisor to disable shared pages (memory merge, KSM) for this domain

locked
: boolean value that allows memory pages belonging to the domain will be locked in host's memory and the host will not be allowed to swap them out, which might be required for some workloads such as real-time.

source
: possible values are `file` which utilizes file memorybacking, `anonymous` by default and `memfd` backing. (QEMU/KVM only)

access
specify if the memory is to be `shared` or `private`. This can be overridden per numa node by memAccess.
allocation
specify when to allocate the memory by supplying either `immediate` or `ondemand`.
discard
boolean value to ensure the memory content is discarded just before guest shuts down (or when DIMM module is unplugged). Please note that this is just an optimization and is not guaranteed to work in all cases (e.g. when hypervisor crashes). (QEMU/KVM only)

Network Interfaces Definitions

Network interfaces dictionaries can contain the following properties:
name
Name of the network interface. This is only used as a key to merge with the profile data
type
Network type. One of `'bridge'`, `'network'`
source
The network source, typically the bridge or network name
mac
The desired mac address, computed if `None` (Default: `None`).
model
The network card model (Default: depends on the hypervisor)

Disks Definitions

Disk dictionaries can contain the following properties:
name
Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.
format
Format of the disk image, like `'qcow2'`, `'raw'`, `'vmdk'`. (Default: depends on the hypervisor)
size
Disk size in MiB
pool
Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor and the virt:storagepool configuration)

Changed in version 3001.

If the value contains no '/', it is considered a pool name where to create a volume. Using volumes will be mandatory for some pools types like rdb, iscsi, etc.
model
One of the disk busses allowed by libvirt (Default: depends on hypervisor)

See the libvirt disk element documentation for the allowed bus types.
image
Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: `None`)

Note that some pool types do not support uploading an image. This list can evolve with libvirt versions.
overlay_image
`True` to create a QCOW2 disk image with `image` as backing file. If `False` the file pointed to by the `image` property will simply be copied. (Default: `False`)

Changed in version 3001.

This property is only valid on path-based disks, not on volumes. To create a volume with a backing store, set the `backing_store_path` and `backing_store_format` properties.

backing_store_path
Path to the backing store image to use. This can also be the name of a volume to use as backing store within the same pool.

New in version 3001.

backing_store_format
Image format of the disk or volume to use as backing store. This property is mandatory when using `backing_store_path` to avoid problems

New in version 3001.

source_file
Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be `None` for devices that have no associated image like cdroms.

Changed in version 3001.

For volume disks, this can be the name of a volume already existing in the storage pool.

device
Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: `'disk'`)

hostname_property
When using ZFS volumes, setting this value to a ZFS property ID will make Salt store the name of the virtual machine inside this property. (Default: `None`)

sparse_volume
Boolean to specify whether to use a thin provisioned ZFS volume.

Example profile for a bhyve VM with two ZFS disks. The first is cloned from the specified image. The second disk is a thin provisioned volume.

```
virt:
  disk:
    two_zvols:
      - system:
          image: zroot/bhyve/CentOS-7-x86_64-v1@v1.0.5
          hostname_property: virt:hostname
          pool: zroot/bhyve/guests
      - data:
          pool: tank/disks
          size: 20G
          hostname_property: virt:hostname
          sparse_volume: True
```

io
I/O control policy. String value amongst `native`, `threads` and `io_uring`. (Default: `native`)

New in version 3003.

iothread_id
I/O thread id to assign the disk to. (Default: none assigned)

New in version 3003.

Graphics Definition

The graphics dictionary can have the following properties:

type
: Graphics type. The possible values are `none`, `'spice'`, `'vnc'` and other values allowed as a libvirt graphics type (Default: `None`)

  See the libvirt graphics element documentation for more details on the possible types.

port
: Port to export the graphics on for `vnc`, `spice` and `rdp` types.

tls_port
: Port to export the graphics over a secured connection for `spice` type.

listen
: Dictionary defining on what address to listen on for `vnc`, `spice` and `rdp`. It has a `type` property with `address` and `None` as possible values, and an `address` property holding the IP or hostname to listen on.

  By default, not setting the `listen` part of the dictionary will default to listen on all addresses.

Serials and Consoles Definitions

Serial dictionaries can contain the following properties:

type
: Type of the serial connection, like `'tcp'`, `'pty'`, `'file'`, `'udp'`, `'dev'`, `'pipe'`, `'unix'`.

path
: Path to the source device. Can be a log file, a host character device to pass through, a unix socket, a named pipe path.

host
: The serial UDP or TCP host name. (Default: 23023)

port
: The serial UDP or TCP port number. (Default: 23023)

protocol
: Name of the TCP connection protocol. (Default: telnet)

tls
: Boolean value indicating whether to use hypervisor TLS certificates environment for TCP devices.

target_port
: The guest device port number starting from 0

target_type
: The guest device type. Common values are `serial`, `virtio` or `usb-serial`, but more are documented in the libvirt documentation.

CLI Example

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

The disk images will be created in an image folder within the directory defined by the `virt:images` option. Its default value is `/srv/salt-images/` but this can changed with such a configuration:

```
virt:
    images: /data/my/vm/images/
```

salt.modules.virt.**is_hyper**()

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

salt.modules.virt.**list_active_vms**(***kwargs*)

Return a list of names for active virtual machine on the minion

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.virt.**list_domains**(***kwargs*)

Return a list of available domains.

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.virt.**list_inactive_vms**(***kwargs*)

Return a list of names for inactive virtual machine on the minion

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.virt.**list_networks**(***kwargs*)

List all virtual networks.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_networks
```

salt.modules.virt.**list_pools**(***kwargs*)

List all storage pools.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_pools
```

salt.modules.virt.**list_snapshots**(*domain=None*, ***kwargs*)

List available snapshots for certain vm or for all.

Parameters

- **domain** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

salt.modules.virt.**migrate**(*vm_*, *target*, ***kwargs*)

Shared storage migration

Parameters

- **vm** -- domain name
- **target** -- target libvirt URI or host name
- **kwargs** --
  - live: Use live migration. Default value is True.
  - **persistent: Leave the domain persistent on destination host.**
    Default value is True.
  - **undefinesource: Undefine the domain on the source host.**
    Default value is True.
  - **offline: If set to True it will migrate the domain definition**
    without starting the domain on destination and without stopping it on source host. Default value is False.
  - max_bandwidth: The maximum bandwidth (in MiB/s) that will be used.

- **max_downtime: Set maximum tolerable downtime for live-migration.**
  The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
- **parallel_connections: Specify a number of parallel network connections**
  to be used to send memory pages to the destination host.
- compressed: Activate compression.
- **comp_methods: A comma-separated list of compression methods.**
  Supported
  methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
- **comp_mt_level: Set compression level. Values are in range from 0 to 9,**
  where 1 is maximum speed and 9 is maximum compression.
- comp_mt_threads: Set number of compress threads on source host.
- comp_mt_dthreads: Set number of decompress threads on target host.
- comp_xbzrle_cache: Set the size of page cache for xbzrle compression in bytes.
- **copy_storage: Migrate non-shared storage. It must be one of the following**
  values: all (full disk copy) or incremental (Incremental copy)
- postcopy: Enable the use of post-copy migration.
- postcopy_bandwidth: The maximum bandwidth allowed in post-copy phase. (MiB/s)
- username: Username to connect with target host
- password: Password to connect with target host

New in version 3002.

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor URI>
salt src virt.migrate guest qemu+ssh://dst/system
salt src virt.migrate guest qemu+tls://dst/system
salt src virt.migrate guest qemu+tcp://dst/system
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
    tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporttunnel

salt.modules.virt.**migrate_start_postcopy**(*vm_*)

Starts post-copy migration. This function has to be called while live migration is in progress and it has been initiated with the *postcopy=True* option.

CLI Example:

```
salt '*' virt.migrate_start_postcopy <domain>
```

salt.modules.virt.**nesthash**(*value=None*)

create default dict that allows arbitrary level of nesting

salt.modules.virt.**network_define**(*name*, *bridge*, *forward*, *ipv4_config=None*, *ipv6_config=None*, *vport=None*, *tag=None*, *autostart=True*, *start=True*, *mtu=None*, *domain=None*, *nat=None*, *interfaces=None*, *addresses=None*, *physical_function=None*, *dns=None*, ***kwargs*)

Create libvirt network.

Parameters

- **name** -- Network name.

- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat).

  Changed in version 3003: a `None` value creates an isolated network with no forwarding at all
- **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

```
- vport:
    type: openvswitch
    parameters:
      interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aaa4f
```

  Changed in version 3003: possible dictionary value
- **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

```
- tag:
    trunk: True
    tags:
      - id: 42
        nativeMode: untagged
      - id: 47
```

  Changed in version 3003: possible dictionary value
- **autostart** -- Network autostart (default True).
- **start** -- Network start (default True).
- **ipv4_config** (*dict or None*) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.

  New in version 3000.
- **ipv6_config** (*dict or None*) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.

  New in version 3000.
- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default `None`)

  New in version 3003.
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default `None`)

```
- domain:
    name: lab.acme.org
    localOnly: True
```

  New in version 3003.
- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start`

and end values. (default None)

```
- forward: nat
- nat:
    address:
      start: 1.2.3.4
      end: 1.2.3.10
    port:
      start: 500
      end: 1000
```

New in version 3003.

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

```
- forward: passthrough
- interfaces: "eth10 eth11 eth12"
```

New in version 3003.

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in *hostdev* forward mode. (default None)

```
- forward: hostdev
- interfaces: "0000:04:00.1 0000:e3:01.2"
```

New in version 3003.

- **physical_function** -- device name of the physical interface to use in hostdev forward mode. (default None)

```
- forward: hostdev
- physical_function: "eth0"
```

New in version 3003.

- **dns** -- virtual network DNS configuration. The value is a dictionary described in *net-define-dns*. (default None)

```
- dns:
    forwarders:
      - domain: example.com
        addr: 192.168.1.1
      - addr: 8.8.8.8
      - domain: www.example.com
    txt:
      example.com: "v=spf1 a -all"
      _http.tcp.example.com: "name=value,paper=A4"
    hosts:
      192.168.1.2:
        - mirror.acme.lab
        - test.acme.lab
    srvs:
      - name: ldap
        protocol: tcp
        domain: ldapserver.example.com
        target: .
```

(continues on next page)

(continued from previous page)

```
        port: 389
        priority: 1
        weight: 10
```

New in version 3003.

IP configuration definition

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

cidr
: CIDR notation for the network. For example '192.168.124.0/24'

dhcp_ranges
: A list of dictionaries with `'start'` and `'end'` properties.

hosts
: A list of dictionaries with `ip` property and optional `name`, `mac` and `id` properties.

  New in version 3003.

bootp
: A dictionary with a `file` property and an optional `server` one.

  New in version 3003.

tftp
: The path to the TFTP root directory to serve.

  New in version 3003.

DNS configuration definition

The DNS configuration dictionary contains the following optional properties:

forwarders
: List of alternate DNS forwarders to use. Each item is a dictionary with the optional `domain` and `addr` keys. If both are provided, the requests to the domain are forwarded to the server at the `addr`. If only `domain` is provided the requests matching this domain will be resolved locally. If only `addr` is provided all requests will be forwarded to this DNS server.

txt:
: Dictionary of TXT fields to set.

hosts:
: Dictionary of host DNS entries. The key is the IP of the host, and the value is a list of hostnames for it.

srvs:
: List of SRV DNS entries. Each entry is a dictionary with the mandatory `name` and `protocol` keys. Entries can also have `target`, `port`, `priority`, `domain` and `weight` optional properties.

CLI Example:

```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

`salt.modules.virt.`**`network_get_xml`**(*name*, ***kwargs*)

Return the XML definition of a virtual network

Parameters

- **`name`** -- libvirt network name
- **`connection`** -- libvirt connection URI, overriding defaults
- **`username`** -- username to connect with, overriding defaults
- **`password`** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.network_get_xml default
```

salt.modules.virt.**network_info**(*name=None*, ***kwargs*)

Return information on a virtual network provided its name.

Parameters

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_info default
```

salt.modules.virt.**network_set_autostart**(*name*, *state='on'*, ***kwargs*)

Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

Parameters

- **name** -- virtual network name
- **state** -- 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.network_set_autostart <pool> <on | off>
```

salt.modules.virt.**network_start**(*name*, ***kwargs*)

Start a defined virtual network.

Parameters

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_start default
```

salt.modules.virt.**network_stop**(*name*, ***kwargs*)

Stop a defined virtual network.

Parameters

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_stop default
```

salt.modules.virt.**network_undefine**(*name*, ***kwargs*)

Remove a defined virtual network. This does not stop the virtual network.

Parameters

- **name** -- virtual network name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.network_undefine default
```

salt.modules.virt.**network_update**(*name*, *bridge*, *forward*, *ipv4_config=None*, *ipv6_config=None*, *vport=None*, *tag=None*, *mtu=None*, *domain=None*, *nat=None*, *interfaces=None*, *addresses=None*, *physical_function=None*, *dns=None*, *test=False*, ***kwargs*)

Update a virtual network if needed.

Parameters

- **name** -- Network name.
- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat). A `None` value creates an isolated network with no forwarding at all.
- **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

```
- vport:
    type: openvswitch
    parameters:
      interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aaa4f
```

- **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

```
- tag:
    trunk: True
    tags:
      - id: 42
        nativeMode: untagged
      - id: 47
```

- **ipv4_config** (*dict or None*) -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.
- **ipv6_config** (*dict or None*) -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.

- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default None)
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default None)

```
- domain:
    name: lab.acme.org
    localOnly: True
```

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default None)

```
- forward: nat
- nat:
    address:
      start: 1.2.3.4
      end: 1.2.3.10
    port:
      start: 500
      end: 1000
```

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

```
- forward: passthrough
- interfaces: "eth10 eth11 eth12"
```

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in *hostdev* forward mode. (default None)

```
- forward: hostdev
- interfaces: "0000:04:00.1 0000:e3:01.2"
```

- **physical_function** -- device name of the physical interface to use in `hostdev` forward mode. (default None)

```
- forward: hostdev
- physical_function: "eth0"
```

- **dns** -- virtual network DNS configuration. The value is a dictionary described in *net-define-dns*. (default None)

```
- dns:
    forwarders:
      - domain: example.com
        addr: 192.168.1.1
      - addr: 8.8.8.8
      - domain: www.example.com
    txt:
      example.com: "v=spf1 a -all"
      _http.tcp.example.com: "name=value,paper=A4"
    hosts:
      192.168.1.2:
        - mirror.acme.lab
```

(continues on next page)

(continued from previous page)

```
        - test.acme.lab
    srvs:
      - name: ldap
        protocol: tcp
        domain: ldapserver.example.com
        target: .
        port: 389
        priority: 1
        weight: 10
```

New in version 3003.

salt.modules.virt.**node_devices**(***kwargs*)

List the host available devices.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3003.

salt.modules.virt.**node_info**(***kwargs*)

Return a dict with information about this node

Parameters

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.node_info
```

salt.modules.virt.**pause**(*vm_*, ***kwargs*)

Pause the named vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pause <domain>
```

salt.modules.virt.**pool_build**(*name*, ***kwargs*)

Build a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_build default
```

salt.modules.virt.**pool_capabilities**(***kwargs*)

Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types could be listed as supported while they are not. To distinguish between the two cases, check the value of the `computed` property.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.pool_capabilities
```

salt.modules.virt.**pool_define**(*name*, *ptype*, *target=None*, *permissions=None*, *source_devices=None*, *source_dir=None*, *source_initiator=None*, *source_adapter=None*, *source_hosts=None*, *source_auth=None*, *source_name=None*, *source_format=None*, *transient=False*, *start=True*, ***kwargs*)

Create libvirt pool.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See *Permissions definition* for more details on this structure.
- **source_devices** -- List of source devices for pools backed by physical devices. (Default: `None`)

  Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

  Report to this libvirt page for more information on the use of `part_separator`
- **source_dir** -- Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: `None`)
- **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: `None`)

  New in version 3000.
- **source_adapter** -- SCSI source definition. The value is a dictionary with `type`, `name`, `parent`, `managed`, `parent_wwnn`, `parent_wwpn`, `parent_fabric_wwn`, `wwnn`, `wwpn` and `parent_address` keys.

  The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`,

`slot` and `function` properties. Report to this libvirt page for the meaning and possible values of these properties.

- **`source_hosts`** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: `None`)
- **`source_auth`** -- Source authentication details. (Default: `None`)

  The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

  The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

  Examples:

```
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

```
source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'usage',
        'value': 'mycluster_myname'
    }
}
```

  Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.
- **`source_name`** -- Identifier of name-based sources.
- **`source_format`** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **`start`** -- Pool start (default True)
- **`transient`** -- When `True`, the pool will be automatically undefined after being stopped. Note that a transient pool will force `start` to `True`. (Default: `False`)
- **`connection`** -- libvirt connection URI, overriding defaults
- **`username`** -- username to connect with, overriding defaults
- **`password`** -- password to connect with, overriding defaults

Permissions definition

The permissions are described by a dictionary containing the following keys:

mode
: The octal representation of the permissions. (Default: *0711*)

owner
: the numeric user ID of the owner. (Default: from the parent folder)

group
: the numeric ID of the group. (Default: from the parent folder)

label
: the SELinux label. (Default: *None*)

CLI Example:

Local folder pool:

```
salt '*' virt.pool_define somepool dir target=/srv/mypool                 
↪                  permissions="{'mode': '0744' 'ower': 107, 'group':
↪107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_define myshare netfs source_format=cifs                
↪                   source_dir=samba_share source_hosts="['example.com']
↪" target=/mnt/cifs
```

New in version 2019.2.0.

`salt.modules.virt.`**`pool_delete`**(*name*, ***kwargs*)

Delete the resources of a defined libvirt storage pool.

Parameters

- **`name`** -- libvirt storage pool name
- **`connection`** -- libvirt connection URI, overriding defaults
- **`username`** -- username to connect with, overriding defaults
- **`password`** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_delete default
```

`salt.modules.virt.`**`pool_get_xml`**(*name*, ***kwargs*)

Return the XML definition of a virtual storage pool

Parameters

- **`name`** -- libvirt storage pool name
- **`connection`** -- libvirt connection URI, overriding defaults
- **`username`** -- username to connect with, overriding defaults
- **`password`** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.pool_get_xml default
```

salt.modules.virt.**pool_info**(*name=None*, ***kwargs*)

Return information on a storage pool provided its name.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_info default
```

salt.modules.virt.**pool_list_volumes**(*name*, ***kwargs*)

List the volumes contained in a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_list_volumes <pool>
```

salt.modules.virt.**pool_refresh**(*name*, ***kwargs*)

Refresh a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_refresh default
```

salt.modules.virt.**pool_set_autostart**(*name*, *state='on'*, ***kwargs*)

Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters

- **name** -- libvirt storage pool name
- **state** -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt "*" virt.pool_set_autostart <pool> <on | off>
```

salt.modules.virt.**pool_start**(*name*, ***kwargs*)

Start a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_start default
```

salt.modules.virt.**pool_stop**(*name*, ***kwargs*)

Stop a defined libvirt storage pool.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_stop default
```

salt.modules.virt.**pool_undefine**(*name*, ***kwargs*)

Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.pool_undefine default
```

salt.modules.virt.**pool_update**(*name*, *ptype*, *target=None*, *permissions=None*, *source_devices=None*, *source_dir=None*, *source_initiator=None*, *source_adapter=None*, *source_hosts=None*, *source_auth=None*, *source_name=None*, *source_format=None*, *test=False*, ***kwargs*)

Update a libvirt storage pool if needed. If called with test=True, this is also reporting whether an update would be performed.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See *Permissions definition* for more details on this structure.
- **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of `part_separator`

- **`source_dir`** -- Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: `None`)
- **`source_initiator`** -- Initiator IQN for libiscsi-direct pool types. (Default: `None`)

New in version 3000.

- **`source_adapter`** -- SCSI source definition. The value is a dictionary with `type`, `name`, `parent`, `managed`, `parent_wwnn`, `parent_wwpn`, `parent_fabric_wwn`, `wwnn`, `wwpn` and `parent_address` keys.

The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`, `slot` and `function` properties. Report to this libvirt page for the meaning and possible values of these properties.

- **`source_hosts`** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: `None`)
- **`source_auth`** -- Source authentication details. (Default: `None`)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

```
source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'usage',
        'uuid': 'mycluster_myname'
    }
}
```

Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **`source_name`** -- Identifier of name-based sources.
- **`source_format`** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **`test`** -- run in dry-run mode if set to True
- **`connection`** -- libvirt connection URI, overriding defaults
- **`username`** -- username to connect with, overriding defaults

- **password** -- password to connect with, overriding defaults

Example:

Local folder pool:

```
salt '*' virt.pool_update somepool dir target=/srv/mypool
↪                  permissions="{'mode': '0744' 'ower': 107, 'group':
↪107 }"
```

CIFS backed pool:

```
salt '*' virt.pool_update myshare netfs source_format=cifs
↪                   source_dir=samba_share source_hosts="['example.com']
↪" target=/mnt/cifs
```

New in version 3000.

`salt.modules.virt.`**`purge`**(*vm_*, *dirs=False*, *removables=False*, ***kwargs*)

Recursively destroy and delete a persistent virtual machine, pass True for dir's to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

Parameters

- **vm** -- domain name
- **dirs** -- pass True to remove containing directories
- **removables** -- pass True to remove removable devices

  New in version 2019.2.0.
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.purge <domain>
```

`salt.modules.virt.`**`reboot`**(*name*, ***kwargs*)

Reboot a domain via ACPI request

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reboot <domain>
```

salt.modules.virt.**reset**(*vm_*, ***kwargs*)

Reset a VM by emulating the reset button on a physical machine

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reset <domain>
```

salt.modules.virt.**resume**(*vm_*, ***kwargs*)

Resume the named vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.resume <domain>
```

salt.modules.virt.**revert_snapshot**(*name*, *vm_snapshot=None*, *cleanup=False*, ***kwargs*)

Revert snapshot to the previous from current (if available) or to the specific.

Parameters

- **name** -- domain name
- **vm_snapshot** -- name of the snapshot to revert
- **cleanup** -- Remove all newer than reverted snapshots. Values: True or False (default False).
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

salt.modules.virt.**seed_non_shared_migrate**(*disks*, *force=False*)

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters

- **disks** -- the list of disk data as provided by virt.get_disks
- **force** -- skip checking the compatibility of source and target disk images if True. (default: False)

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.**set_autostart**(*vm_*, *state='on'*, ***kwargs*)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters

- **vm** -- domain name
- **state** -- 'on' to auto start the VM, 'off' to mark the VM not to be started when the host boots
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

salt.modules.virt.**setmem**(*vm_*, *memory*, *config=False*, ***kwargs*)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

Parameters

- **vm** -- name of the domain
- **memory** -- memory amount to set in MB
- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

salt.modules.virt.**setvcpus**(*vm_*, *vcpus*, *config=False*, ***kwargs*)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

If config is True then we ask libvirt to modify the config as well

Parameters

- **vm** -- name of the domain
- **vcpus** -- integer representing the number of CPUs to be assigned

- **config** -- if True then libvirt will be asked to modify the config as well
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

salt.modules.virt.**shutdown**(*vm_*, ***kwargs*)

Send a soft shutdown signal to the named vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.shutdown <domain>
```

salt.modules.virt.**snapshot**(*domain*, *name=None*, *suffix=None*, ***kwargs*)

Create a snapshot of a VM.

Parameters

- **domain** -- domain name
- **name** -- Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- **suffix** -- Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

salt.modules.virt.**start**(*name*, ***kwargs*)

Start a defined domain

Parameters

- **vm** -- domain name

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.start <domain>
```

salt.modules.virt.**stop**(*name*, ***kwargs*)

Hard power down the virtual machine, this is equivalent to pulling the power.

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.stop <domain>
```

salt.modules.virt.**undefine**(*vm_*, ***kwargs*)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.undefine <domain>
```

salt.modules.virt.**update**(*name*, *cpu=0*, *mem=0*, *disk_profile=None*, *disks=None*, *nic_profile=None*, *interfaces=None*, *graphics=None*, *live=True*, *boot=None*, *numatune=None*, *test=False*, *boot_dev=None*, *hypervisor_features=None*, *clock=None*, *serials=None*, *consoles=None*, *stop_on_reboot=False*, *host_devices=None*, *autostart=False*, ***kwargs*)

Update the definition of an existing domain.

Parameters

- **name** -- Name of the domain to update
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu

tuning and iothreads allocation. The structure of the dictionary is documented in *cpu parameters definition*.

To update any cpu parameters specify the new values to the corresponding tag. To remove any element or attribute, specify `None` object. Please note that `None` object is mapped to `null` in yaml, use `null` in sls file instead.

- **`mem`** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are `boot`, `current`, `max`, `slots`, `hard_limit`, `soft_limit`, `swap_hard_limit`, `min_guarantee`, `hugepages` , `nosharepages`, `locked`, `source`, `access`, `allocation` and `discard`. The structure of the dictionary is documented in *Memory parameter definition*. Both decimal and binary base are supported. Detail unit specification is documented in *Units specification*. Please note that the value for `slots` must be an integer.

  To remove any parameters, pass a None object, for instance: 'soft_limit': `None`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

```
- mem:
    hard_limit: null
    soft_limit: null
```

  Changed in version 3002.
- **`disk_profile`** -- disk profile to use
- **`disks`** -- Disk definitions as documented in the *`init()`* function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **`nic_profile`** -- network interfaces profile to use
- **`interfaces`** -- Network interface definitions as documented in the *`init()`* function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **`graphics`** -- The new graphics definition as defined in *Graphics Definition*. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to `{'type': 'none'}`.
- **`live`** -- `False` to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If `True`, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: `True`)
- **`connection`** -- libvirt connection URI, overriding defaults
- **`username`** -- username to connect with, overriding defaults
- **`password`** -- password to connect with, overriding defaults
- **`boot`** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

  Refer to *Boot parameters definition* for the complete boot parameter description.

  To update any boot parameters, specify the new path for each. To remove any boot parameters, pass `None` object, for instance: 'kernel': `None`. To switch back to BIOS boot, specify ('loader': `None` and 'nvram': `None`) or 'efi': `False`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

  SLS file Example:

```
- boot:
    loader: null
```

(continues on next page)

(continued from previous page)

```
    nvram: null
```

New in version 3000.

- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

  By default, the value will `"hd"`.

  New in version 3002.
- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional `memory` element specifies how to allocate memory for the domain process on a NUMA host. `memnode` elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at *cpu parameters definition*.

  To update any numatune parameters, specify the new value. To remove any `numatune` parameters, pass a None object, for instance: 'numatune': `None`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

  New in version 3003.
- **serials** -- Dictionary providing details on the serials connection to create. (Default: `None`) See *Serials and Consoles Definitions* for more details on the possible values.

  New in version 3003.
- **consoles** -- Dictionary providing details on the consoles device to create. (Default: `None`) See *Serials and Consoles Definitions* for more details on the possible values.

  New in version 3003.
- **stop_on_reboot** -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

  New in version 3003.
- **test** -- run in dry-run mode if set to True

  New in version 3001.
- **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

  New in version 3003.

```
hypervisor_features:
  kvm-hint-dedicated: True
```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:

  adjustment
  : time adjustment in seconds or `reset`

  utc
  : set to `False` to use the host local time as the guest clock. Defaults to `True`.

  timezone
  : synchronize the guest to the correspding timezone

  timers
  : a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties `track`, `tickpolicy`, `catchup`, `frequency`, `mode`, `present`, `slew`, `threshold` and `limit`. See libvirt time keeping documentation for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds .. code-block:: yaml

clock:

adjustment: 3600 utc: False

Set the clock to a specific time zone:

```
clock:
  timezone: CEST
```

Tweak guest timers:

```
clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False
```

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the *node_devices()* function. (Default: None)

  New in version 3003.
- **autostart** -- If set to True the host will start the guest after boot. (Default: False)

Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

```
{
  'definition': True,
  'cpu': True,
  'mem': True,
  'disks': {'attached': [list of actually attached disks],
            'detached': [list of actually detached disks]},
  'nics': {'attached': [list of actually attached nics],
           'detached': [list of actually detached nics]},
  'errors': ['error messages for failures']
}
```

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.update domain cpu=2 mem=1024
```

salt.modules.virt.**virt_type**()

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

salt.modules.virt.**vm_cputime**(*vm_=None*, ***kwargs*)

Return cputime used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

```
[
    'your-vm': {
        'cputime' <int>
        'cputime_percent' <int>
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

salt.modules.virt.**vm_diskstats**(*vm_=None*, ***kwargs*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

```
[
    'your-vm': {
        'rd_req'   : 0,
        'rd_bytes' : 0,
        'wr_req'   : 0,
        'wr_bytes' : 0,
        'errs'     : 0
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_blockstats
```

salt.modules.virt.**vm_info**(*vm_=None*, ***kwargs*)

Return detailed information about the vms on this hyper in a list of dicts:

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

```
[
    'your-vm': {
        'cpu': <int>,
        'maxMem': <int>,
        'mem': <int>,
        'state': '<state>',
        'cputime' <int>
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.virt.**vm_netstats**(*vm_=None*, ***kwargs*)

Return combined network counters used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

```
[
    'your-vm': {
        'rx_bytes'   : 0,
        'rx_packets' : 0,
```

(continues on next page)

(continued from previous page)

```
        'rx_errs'    : 0,
        'rx_drop'    : 0,
        'tx_bytes'   : 0,
        'tx_packets' : 0,
        'tx_errs'    : 0,
        'tx_drop'    : 0
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.virt.**vm_state**(*vm_=None*, ***kwargs*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

salt.modules.virt.**volume_define**(*pool*, *name*, *size*, *allocation=0*, *format=None*, *type=None*, *permissions=None*, *backing_store=None*, *nocow=False*, ***kwargs*)

Create libvirt volume.

Parameters

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **size** -- capacity of the volume to define in MiB
- **allocation** -- allocated size of the volume in MiB. Defaults to 0.
- **format** -- volume format. The allowed values are depending on the pool type. Check the virt.pool_capabilities output for the possible values and the default.
- **type** -- type of the volume. One of file, block, dir, network, netdiri, ploop or None. By default, the type is guessed by libvirt from the pool type.
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See *Permissions definition* for more details on this structure.
- **backing_store** -- dictionary describing a backing file for the volume. It must contain a `path` property pointing to the base volume and a `format` property defining the format of the base volume.

The base volume format will not be guessed for security reasons and is thus mandatory.
- **nocow** -- disable COW for the volume.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

Volume on ESX:

```
salt '*' virt.volume_define "[local-storage]" myvm/myvm.vmdk vmdk 8192
```

QCow2 volume with backing file:

```
salt '*' virt.volume_define default myvm.qcow2 qcow2 8192                 ␣
↪            permissions="{'mode': '0775', 'owner': '123', 'group': '345'
↪"}"                              backing_store="{'path': '/path/to/base.
↪img', 'format': 'raw'}"                                 nocow=True
```

New in version 3001.

`salt.modules.virt.`**`volume_delete`**(*pool*, *volume*, ***kwargs*)

Delete a libvirt managed volume.

Parameters
- **pool** -- libvirt storage pool name
- **volume** -- name of the volume to delete
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_delete <pool> <volume>
```

`salt.modules.virt.`**`volume_infos`**(*pool=None*, *volume=None*, ***kwargs*)

Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

Parameters
- **pool** -- libvirt storage pool name (default: `None`)
- **volume** -- name of the volume to get infos from (default: `None`)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt "*" virt.volume_infos <pool> <volume>
```

`salt.modules.virt.`**`volume_upload`**(*pool*, *volume*, *file*, *offset=0*, *length=0*, *sparse=False*, ***kwargs*)

Create libvirt volume.

Parameters
- **pool** -- name of the pool to create the volume in

- **name** -- name of the volume to define
- **file** -- the file to upload to the volume
- **offset** -- where to start writing the data in the volume
- **length** -- amount of bytes to transfer to the volume
- **sparse** -- set to True to preserve data sparsiness.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.volume_upload default myvm.qcow2 /path/to/disk.qcow2
```

New in version 3001.

26.7.479 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

salt.modules.virtualenv_mod.**create**(*path*, *venv_bin=None*, *system_site_packages=False*, *distribute=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *pip=False*, *symlinks=None*, *upgrade=None*, *user=None*, *use_vt=False*, *saltenv='base'*, ***kwargs*)

Create a virtualenv

path
: The path to the virtualenv to be created

venv_bin
: The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

system_site_packages
: [False] Passthrough argument given to virtualenv or venv

distribute
: [False] Passthrough argument given to virtualenv

pip
: [False] Install pip after creating a virtual environment. Implies `distribute=True`

clear
: [False] Passthrough argument given to virtualenv or venv

python
: [None (default)] Passthrough argument given to virtualenv

extra_search_dir
: [None (default)] Passthrough argument given to virtualenv

never_download
: [None (default)] Passthrough argument given to virtualenv if True

prompt
: [None (default)] Passthrough argument given to virtualenv if not None

symlinks
: [None] Passthrough argument given to venv if True

upgrade
: [None] Passthrough argument given to venv if True

user
[None] Set ownership for the virtualenv

Note: On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

---

runas
[None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

use_vt
[False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

saltenv
['base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

Note: The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

CLI Example:

```
   salt '*' virtualenv.create /path/to/new/virtualenv

Example of using --always-copy environment variable (in case your fs doesn
↪'t support symlinks).
This will copy files into the virtualenv instead of symlinking them.

.. code-block:: yaml

    - env:
      - VIRTUALENV_ALWAYS_COPY: 1
```

`salt.modules.virtualenv_mod.`**`get_distribution_path`**(*venv*, *distribution*)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv
Path to the virtualenv.

distribution
Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

`salt.modules.virtualenv_mod.`**`get_resource_content`**(*venv*, *package=None*, *resource=None*)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

venv
Path to the virtualenv

package
Name of the package in which the resource resides

New in version 2016.3.0.

resource
Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/
↪resource.xml
```

salt.modules.virtualenv_mod.**get_resource_path**(*venv*, *package=None*, *resource=None*)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv
Path to the virtualenv

package
Name of the package in which the resource resides

New in version 2016.3.0.

resource
Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/
↪resource.xml
```

salt.modules.virtualenv_mod.**get_site_packages**(*venv*)

Return the path to the site-packages directory of a virtualenv

venv
Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

salt.modules.virtualenv_mod.**virtualenv_ver**(*venv_bin*, *user=None*, ***kwargs*)

return virtualenv version if exists

26.7.480 salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).

New in version 2019.2.0.

codeauthor
Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the *vmd* service to be running on the OpenBSD target machine.

---

salt.modules.vmctl.**create_disk**(*name*, *size*)

Create a VMM disk with the specified *name* and *size*.

size:
Size in megabytes, or use a specifier such as M, G, T.

CLI Example:

```
salt '*' vmctl.create_disk /path/to/disk.img size=10G
```

salt.modules.vmctl.**load**(*path*)

Load additional configuration from the specified file.

path
: Path to the configuration file.

CLI Example:

```
salt '*' vmctl.load path=/etc/vm.switches.conf
```

salt.modules.vmctl.**reload**()

Remove all stopped VMs and reload configuration from the default configuration file.

CLI Example:

```
salt '*' vmctl.reload
```

salt.modules.vmctl.**reset**(*all=False*, *vms=False*, *switches=False*)

Reset the running state of VMM or a subsystem.

all:
: Reset the running state.

switches:
: Reset the configured switches.

vms:
: Reset and terminate all VMs.

CLI Example:

```
salt '*' vmctl.reset all=True
```

salt.modules.vmctl.**start**(*name=None*, *id=None*, *bootpath=None*, *disk=None*, *disks=None*, *local_iface=False*, *memory=None*, *nics=0*, *switch=None*)

Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.

name:
: Name of the defined VM.

id:
: VM id.

bootpath:
: Path to a kernel or BIOS image to load.

disk:
: Path to a single disk to use.

disks:
: List of multiple disks to use.

local_iface:
: Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.

memory:
: Memory size of the VM specified in megabytes.

switch:
: Add a network interface that is attached to the specified virtual switch on the host.

CLI Example:

```
salt '*' vmctl.start 2   # start VM with id 2
salt '*' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk=
↪'/disk.img'
```

salt.modules.vmctl.**status**(*name=None*, *id=None*)

List VMs running on the host, or only the VM specified by `id`. When both a name and id are provided, the id is ignored.

name:
Name of the defined VM.

id:
VM id.

CLI Example:

```
salt '*' vmctl.status           # to list all VMs
salt '*' vmctl.status name=web1 # to get a single VM
```

salt.modules.vmctl.**stop**(*name=None*, *id=None*)

Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.

name:
Name of the defined VM.

id:
VM id.

CLI Example:

```
salt '*' vmctl.stop name=alpine
```

26.7.481 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

codeauthor
Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi

6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

vSphere Automation SDK

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-
↪python.git
```

Note: The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

The module is currently in version 1.0.3 (as of 8/26/2019)

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-
↪password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-
↪user>         <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.
↪example.com]'
my-minion:
----------
    esxi-1.example.com:
        ----------
        Coredump Config:
            ----------
            enabled:
                False
    esxi-2.example.com:
        ----------
        Coredump Config:
            ----------
            enabled:
                True
            host_vnic:
                vmk0
            ip:
                coredump-location.example.com
            port:
                6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root
↪<host-password>
local:
```

(continues on next page)

(continued from previous page)

```
----------
    10.4.28.150:
        ----------
        Coredump Config:
            ----------
            enabled:
                True
            host_vnic:
                vmk0
            ip:
                coredump-location.example.com
            port:
                6500
```

salt.modules.vsphere.**add_capacity_to_diskgroup**(*cache_disk_id*, *capacity_disk_ids*, *safety_checks=True*, *service_instance=None*)

Adds capacity disks to the disk group with the specified cache disk.

cache_disk_id
: The canonical name of the cache disk.

capacity_disk_ids
: A list containing canonical names of the capacity disks to add.

safety_checks
: Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.add_capacity_to_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

salt.modules.vsphere.**add_host_to_dvs**(*host*, *username*, *password*, *vmknic_name*, *vmnic_name*, *dvs_name*, *target_portgroup_name*, *uplink_portgroup_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.

host
: The location of the vCenter server.

username
: The username used to login to the vCenter server.

password
: The password used to login to the vCenter server.

vmknic_name
: The name of the virtual NIC to migrate.

vmnic_name
: The name of the physical NIC to migrate.

dvs_name
: The name of the Distributed Virtual Switch.

target_portgroup_name
: The name of the distributed portgroup in which to migrate the virtual NIC.

uplink_portgroup_name
The name of the uplink portgroup in which to migrate the physical NIC.

protocol
Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

host_names:
An array of VMware host names to migrate

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
    username='administrator@vsphere.corp.com' password='vsphere_password'
    vmknic_name='vmk0' vmnic_name='vnmic0' dvs_name='DSwitch'
    target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-
↪DVUplinks-181'
    protocol='https' port='443', host_names="['esxi1.corp.com','esxi2.
↪corp.com','esxi3.corp.com']"
```

Return Example:

```
somehost:
    ----------
    esxi1.corp.com:
        ----------
        dvs:
            DSwitch
        portgroup:
            DPortGroup
        status:
            True
        uplink:
            DSwitch-DVUplinks-181
        vmknic:
            vmk0
        vmnic:
            vmnic0
    esxi2.corp.com:
        ----------
        dvs:
            DSwitch
        portgroup:
            DPortGroup
        status:
            True
        uplink:
            DSwitch-DVUplinks-181
        vmknic:
            vmk0
        vmnic:
```

(continues on next page)

(continued from previous page)

```
            vmnic0
    esxi3.corp.com:
        ----------
        dvs:
            DSwitch
        portgroup:
            DPortGroup
        status:
            True
        uplink:
            DSwitch-DVUplinks-181
        vmknic:
            vmk0
        vmnic:
            vmnic0
    message:
    success:
        True
```

This was very difficult to figure out. VMware's PyVmomi documentation at

https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst (which is a copy of the official documentation here: https://www.vmware.com/support/developer/converter-sdk/conv60_apireference/vim.DistributedVirtualSwitch.html)

says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```
<UpdateNetworkConfig xmlns="urn:vim25">
  <_this type="HostNetworkSystem">networkSystem-187</_this>

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.`**`add_license`**(*key*, *description*, *safety_checks=True*, *service_instance=None*)

Adds a license to the vCenter or ESXi host

key
: License key.

description
: License description added in as a label.

safety_checks
: Specify whether to perform safety check or to skip the checks and try performing the required task

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.add_license key=<license_key> desc='License desc'
```

`salt.modules.vsphere.`**`assign_default_storage_policy_to_datastore`**(*policy*, *datastore*, *service_instance=None*)

Assigns a storage policy as the default policy to a datastore.

policy
: Name of the policy to assign.

datastore
: Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.assign_storage_policy_to_datastore
    policy='policy name' datastore=ds1
```

salt.modules.vsphere.**assign_license**(*license_key*, *license_name*, *entity*, *entity_display_name*, *safety_checks=True*, *service_instance=None*)

Assigns a license to an entity

license_key
: Key of the license to assign See `_get_entity` docstrings for format.

license_name
: Display name of license

entity
: Dictionary representation of an entity

entity_display_name
: Entity name used in logging

safety_checks
: Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.assign_license license_key=AAAAA-11111-AAAAA-11111-AAAAA
    license_name=test entity={type:cluster,datacenter:dc,cluster:cl}
```

salt.modules.vsphere.**attach_tag**(*object_id*, *tag_id*, *managed_obj='ClusterComputeResource'*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (*CategoryModel.cardinality*) and associability (*CategoryModel.associable_types*) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:

```
salt vm_minion vsphere.attach_tag domain-c2283
↪urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-
↪38865467cfbe:GLOBAL
```

Parameters

- **object_id** (*str*) -- The identifier of the input object.
- **tag_id** (*str*) -- The identifier of the tag object.
- **managed_obj** (*str*) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns

The list of all tag identifiers that correspond to the tags attached to the given object.

Return type
list of tags
Raise
Unauthorized if you do not have the privilege to read the object.
Raise
Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.**compare_vm_configs**(*new_config*, *current_config*)

Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference
new_config:
New config dictionary with every available parameter
current_config
Currently deployed configuration

salt.modules.vsphere.**configure_host_cache**(*enabled*, *datastore=None*, *swap_size_MiB=None*, *service_instance=None*)

Configures the host cache on the selected host.
enabled
Boolean flag specifying whether the host cache is enabled.
datastore
Name of the datastore that contains the host cache. Must be set if enabled is `true`.
swap_size_MiB
Swap size in Mibibytes. Needs to be set if enabled is `true`. Must be smaller than the datastore size.
service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
CLI Example:

```
salt '*' vsphere.configure_host_cache enabled=False

salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
    swap_size_MiB=1024
```

salt.modules.vsphere.**coredump_network_enable**(*host*, *username*, *password*, *enabled*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.
host
The location of the host.
username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
enabled
Python True or False to enable or disable coredumps.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi

machines.

credstore
Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password
↪True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-
↪password True             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]
↪'
```

salt.modules.vsphere.**create_cluster**(*cluster_dict*, *datacenter=None*, *cluster=None*, *service_instance=None*)

Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value

config_dict
Dictionary with the config values of the new cluster.

datacenter
Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster
Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

salt.modules.vsphere.**create_datacenter**(*datacenter_name*, *service_instance=None*)

Creates a datacenter.

Supported proxies: esxdatacenter

datacenter_name
The datacenter name

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_datacenter dc1
```

salt.modules.vsphere.**create_diskgroup**(*cache_disk_id*, *capacity_disk_ids*, *safety_checks=True*, *service_instance=None*)

Creates disk group on an ESXi host with the specified cache and capacity disks.

cache_disk_id
The canonical name of the disk to be used as a cache. The disk must be ssd.

capacity_disk_ids
A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
CLI Example:

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

salt.modules.vsphere.**create_dvportgroup**(*portgroup_dict*, *portgroup_name*, *dvs*, *service_instance=None*)

Creates a distributed virtual portgroup.

Note: The `portgroup_name` param will override any name already set in `portgroup_dict`.
portgroup_dict
Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).
portgroup_name
Name of the portgroup to be created.
dvs
Name of the DVS that will contain the portgroup.
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
    portgroup_name=pg1 dvs=dvs1
```

salt.modules.vsphere.**create_dvs**(*dvs_dict*, *dvs_name*, *service_instance=None*)

Creates a distributed virtual switch (DVS).

Note: The `dvs_name` param will override any name set in `dvs_dict`.
dvs_dict
Dict representation of the new DVS (example in salt.states.dvs)
dvs_name
Name of the DVS to be created.
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

salt.modules.vsphere.**create_storage_policy**(*policy_name*, *policy_dict*, *service_instance=None*)

Creates a storage policy.

Supported capability types: scalar, set, range.
policy_name
Name of the policy to create. The value of the argument will override any existing name in `policy_dict`.
policy_dict
Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
    policy_dict="$policy_dict"
```

salt.modules.vsphere.**create_tag**(*name*, *description*, *category_id*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

Create a tag under a category with given description.

CLI Example:

```
salt vm_minion vsphere.create_tag
```

Parameters

- **server** (*basestring*) -- Target DNS or IP of vCenter client.
- **username** (*basestring*) -- Username associated with the vCenter client.
- **password** (*basestring*) -- Password associated with the vCenter client.
- **name** (*str*) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) -- Given description of tag category.
- **category_id** (*str*) -- Value of category_id representative of the category created previously.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns

The identifier of the created tag.

Return type

str

Raise

AlreadyExists if the name provided in the create_spec is the name of an already existing tag in the input category.

Raise

InvalidArgument if any of the input information in the create_spec is invalid.

Raise

NotFound if the category for in the given create_spec does not exist in the system.

Raise

Unauthorized if you do not have the privilege to create tag.

salt.modules.vsphere.**create_tag_category**(*name*, *description*, *cardinality*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

Create a category with given cardinality.

CLI Example:

```
salt vm_minion vsphere.create_tag_category
```

Parameters

- **name** (*str*) -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** (*str*) -- Given description of tag category.
- **cardinality** (*str*) -- The associated cardinality (SINGLE, MULTIPLE) of the category.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.

- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
Identifier of the created category.

Return type
str

Raise
AlreadyExists if the name` provided in the create_spec is the name of an already existing category.

Raise
InvalidArgument if any of the information in the create_spec is invalid.

Raise
Unauthorized if you do not have the privilege to create a category.

salt.modules.vsphere.**create_vm**(*vm_name*, *cpu*, *memory*, *image*, *version*, *datacenter*, *datastore*, *placement*, *interfaces*, *disks*, *scsi_devices*, *serial_ports=None*, *ide_controllers=None*, *sata_controllers=None*, *cd_drives=None*, *advanced_configs=None*, *service_instance=None*)

Creates a virtual machine container.

CLI Example:

```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested:
↪True}' ...
```

vm_name
Name of the virtual machine

cpu
Properties of CPUs for freshly created machines

memory
Memory size for freshly created machines

image
Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

version
Virtual machine container hardware version

datacenter
Datacenter where the virtual machine will be deployed (mandatory)

datastore
Datastore where the virtual machine files will be placed

placement
Resource pool or cluster or host or folder where the virtual machine will be deployed

devices
interfaces

```
interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable:
    allow_guest_control: True
```

(continues on next page)

(continued from previous page)

```
    connected: True
    start_connected: True
```

disks

```
disks:
  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'
```

scsi_devices

```
scsi_devices:
  controller: 'SCSI controller 0'
  type: paravirtual
  bus_sharing: no_sharing
```

serial_ports

```
serial_ports:
  adapter: 'Serial port 1'
  type: network
  backing:
    uri: 'telnet://something:port'
    direction: <client|server>
    filename: 'service_uri'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
  yield: False
```

cd_drives

```
cd_drives:
  adapter: 'CD/DVD drive 0'
  controller: 'IDE 0'
  device_type: datastore_iso_file
  datastore_iso_file:
    path: path_to_iso
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

advanced_config
Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.**create_vmfs_datastore**(*datastore_name*, *disk_id*, *vmfs_major_version*, *safety_checks=True*, *service_instance=None*)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name
The name of the datastore to be created.

disk_id
The disk id (canonical name) on which the datastore is created.

vmfs_major_version
The VMFS major version.

safety_checks
Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
    vmfs_major_version=5
```

salt.modules.vsphere.**delete_advanced_configs**(*vm_name*, *datacenter*, *advanced_configs*, *service_instance=None*)

Removes extra config parameters from a virtual machine

vm_name
Virtual machine name

datacenter
Datacenter name where the virtual machine is available

advanced_configs
List of advanced config values to be removed

service_instance
vCenter service instance for connection and configuration

salt.modules.vsphere.**delete_tag**(*tag_id*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

Parameters

- **tag_id** (*str*) -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Tag`.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Raise
AlreadyExists if the name provided in the create_spec is the name of an already existing category.

Raise
InvalidArgument if any of the information in the create_spec is invalid.

Raise
Unauthorized if you do not have the privilege to create a category.

salt.modules.vsphere.**delete_tag_category**(*category_id*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

Parameters
- **category_id** (*str*) -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: `com.vmware.cis.tagging.Category`.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Raise
NotFound if the tag for the given tag_id does not exist in the system.
Raise
Unauthorized if you do not have the privilege to delete the tag.
Raise
Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.**delete_vm**(*name*, *datacenter*, *placement=None*, *power_off=False*, *service_instance=None*)

Deletes a virtual machine defined by name and placement
name
Name of the virtual machine
datacenter
Datacenter of the virtual machine
placement
Placement information of the virtual machine
service_instance
vCenter service instance for connection and configuration
CLI Example:

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.**disconnect**(*service_instance*)

Disconnects from a vCenter or ESXi host

Note: Should be used by state functions, not invoked directly.

---

service_instance
Service instance (vim.ServiceInstance)

CLI Example:
See note above.

salt.modules.vsphere.**enable_firewall_ruleset**(*host*, *username*, *password*, *ruleset_enable*, *ruleset_name*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Enable or disable an ESXi firewall rule set.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

ruleset_enable
True to enable the ruleset, false to disable.

ruleset_name
Name of ruleset to target.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
A standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password
↪True 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-
↪password True 'syslog'              esxi_hosts='[esxi-1.host.com, esxi-2.
↪host.com]'
```

salt.modules.vsphere.**erase_disk_partitions**(*disk_id=None*, *scsi_address=None*, *service_instance=None*)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id
Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

scsi_address
Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.erase_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'
```

salt.modules.vsphere.**esxcli_cmd**(*cmd_str*, *host=None*, *username=None*, *password=None*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

cmd_str
: The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
: If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
: Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
↪'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
↪    'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.
↪host.com]'
```

salt.modules.vsphere.**get_advanced_configs**(*vm_name*, *datacenter*, *service_instance=None*)

Returns extra config parameters from a virtual machine advanced config list

vm_name
: Virtual machine name

datacenter
: Datacenter name where the virtual machine is available

service_instance
: vCenter service instance for connection and configuration

salt.modules.vsphere.**get_coredump_network_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore
Optionally set to path to the credential store file.

Returns
A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-
↪password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↪password             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_firewall_status`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Show status of all firewall rule sets.
host
The location of the host.
username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore
Optionally set to path to the credential store file.

Returns
Nested dictionary with two toplevel keys `rulesets` and `success` `success` will be True or False depending on query success `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-
↪password             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_host_cache**(*service_instance=None*)

Returns the host cache configuration on the proxy host.

service_instance

Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.get_host_cache
```

salt.modules.vsphere.**get_host_datetime**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the date/time information for a given host or list of host_names.

host

The location of the host.

username

The username used to login to the host, such as `root`.

password

The password used to login to the host.

protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get date/time information.

If host_names is not provided, the date/time information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
↪       host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_ntp_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the NTP configuration information for a given host or list of host_names.

host

The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.

If host_names is not provided, the NTP configuration will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
 ↪    host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_proxy_type`**`()`

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns `<undefined>` otherwise.

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

`salt.modules.vsphere.`**`get_service_instance_via_proxy`**`(`*service_instance=None*`)`

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

Note: Should be used by state functions not invoked directly.

CLI Example:
See note above

`salt.modules.vsphere.`**`get_service_policy`**`(`*host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True*`)`

Get the service name's policy for a given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
: **The name of the service for which to retrieve the policy. Supported service names are:**
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd
  - lwiod
  - netlogond
  - ntpd
  - sfcbd-watchdog
  - snmpd
  - vprobed
  - vpxa
  - xorg

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.

  If host_names is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
: Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password
↪'ntpd'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_service_running`**(*host*, *username*, *password*, *service_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the service name's running state for a given host or list of hosts.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

service_name
: **The name of the service for which to retrieve the policy. Supported service names are:**
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd

- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host_names is not provided, the service's running state will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-
↪password 'ntpd'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_ssh_key`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *certificate_verify=None*)

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

Parameters

- **`host`** -- The location of the ESXi Host
- **`username`** -- Username to connect as
- **`password`** -- Password for the ESXi web endpoint
- **`protocol`** -- defaults to https, can be http if ssl is disabled on ESXi
- **`port`** -- defaults to 443 for https
- **`certificate_verify`** -- If true require that the SSL connection present a valid certificate. Default: True

Returns
True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_
↪verify=True
```

`salt.modules.vsphere.`**`get_syslog_config`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Retrieve the syslog configuration.

host
The location of the host.

username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore
Optionally set to path to the credential store file.

Returns
Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
↪           esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_vm`**(*name*, *datacenter=None*, *vm_properties=None*, *traversal_spec=None*, *parent_ref=None*, *service_instance=None*)

Returns vm object properties.
name
Name of the virtual machine.
datacenter
Datacenter name
vm_properties
List of vm properties.
traversal_spec
Traversal Spec object(s) for searching.
parent_ref
Container Reference object for searching under a given object.
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

`salt.modules.vsphere.`**`get_vm_config`**(*name*, *datacenter=None*, *objects=True*, *service_instance=None*)

Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.
name
Name of the virtual machine
datacenter
Datacenter's name where the virtual machine is available
objects
Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set

service_instance
vCenter service instance for connection and configuration

salt.modules.vsphere.**get_vm_config_file**(*name*, *datacenter*, *placement*, *datastore*, *service_instance=None*)

Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure

name
Name of the virtual machine

datacenter
Datacenter name

datastore
Datastore where the virtual machine files are stored

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.**get_vmotion_enabled**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the VMotion enabled status for a given host or a list of host_names. Returns `True` if VMotion is enabled, `False` if it is not enabled.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-
↪password         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_vsan_eligible_disks**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Returns a list of VSAN-eligible disks for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-
↪password         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`get_vsan_enabled`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Get the VSAN enabled status for a given host or a list of host_names. Returns `True` if VSAN is enabled, `False` if it is not enabled, and `None` if a VSAN Host Config is unset, per host.
host
The location of the host.
username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

If host_names is not provided, the VSAN status will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
↪      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**list_assigned_licenses**(*entity*, *entity_display_name*, *license_keys=None*, *service_instance=None*)

Lists the licenses assigned to an entity

entity
: Dictionary representation of an entity. See `_get_entity` docstrings for format.

entity_display_name
: Entity name used in logging

license_keys:
: List of license keys to be retrieved. Default is None.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_assigned_licenses
    entity={type:cluster,datacenter:dc,cluster:cl}
    entiy_display_name=cl
```

salt.modules.vsphere.**list_attached_tags**(*object_id*, *managed_obj='ClusterComputeResource'*, *server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

Parameters

- **object_id** (*str*) -- The identifier of the input object.
- **managed_obj** (*str*) -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
: The list of all tag identifiers that correspond to the tags attached to the given object.

Return type
: list of tags

Raise
: Unauthorized if you do not have the privilege to read the object.

Raise
: Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.**list_capability_definitions**(*service_instance=None*)

Returns a list of the metadata of all capabilities in the vCenter.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.list_capabilities
```

salt.modules.vsphere.**list_cluster**(*datacenter=None*, *cluster=None*, *service_instance=None*)

Returns a dict representation of an ESX cluster.
datacenter
Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster
Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt '*' vsphere.list_cluster
```

salt.modules.vsphere.**list_clusters**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of clusters for the specified host.
host
The location of the host.
username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_datacenters**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of datacenters for the specified host.
host
The location of the host.
username
The username used to login to the host, such as `root`.

password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_datacenters_via_proxy**(*datacenter_names=None*, *service_instance=None*)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter
datacenter_names
List of datacenter names. Default is None.
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.list_datacenters_via_proxy

salt '*' vsphere.list_datacenters_via_proxy dc1

salt '*' vsphere.list_datacenters_via_proxy dc1,dc2

salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

salt.modules.vsphere.**list_datastore_clusters**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of datastore clusters for the specified host.
host
The location of the host.
username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_datastores**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of datastores for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_datastores_via_proxy**(*datastore_names=None*, *backing_disk_ids=None*, *backing_disk_scsi_addresses=None*, *service_instance=None*)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datastore_names
List of the names of datastores to filter on

backing_disk_ids
List of canonical names of the backing disks of the datastores to filer. Default is None.

backing_disk_scsi_addresses
List of scsi addresses of the backing disks of the datastores to filter. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_datastores_via_proxy

salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

salt.modules.vsphere.**list_default_storage_policy_of_datastore**(*datastore*, *service_instance=None*)

Returns a list of datastores assign the storage policies.

datastore
Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

salt.modules.vsphere.**list_default_vsan_policy**(*service_instance=None*)

Returns the default vsan storage policy.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_default_vsan_policy
```

salt.modules.vsphere.**list_disk_partitions**(*disk_id=None, scsi_address=None, service_instance=None*)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

disk_id
Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

scsi_address`
Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhaba0:C0:T0:L0'

salt '*' vsphere.list_disk_partitions disk_id='naa.000000000000001'
```

salt.modules.vsphere.**list_diskgroups**(*cache_disk_ids=None, service_instance=None*)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

cache_disk_ids:
List of cache disk canonical names of the disk groups to be retrieved. Default is None.

use_proxy_details
Specify whether to use the proxy minion's details instead of the arguments

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_diskgroups

salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'
```

salt.modules.vsphere.**list_disks**(*disk_ids=None, scsi_addresses=None, service_instance=None*)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

disk_ids:
List of disk canonical names to be retrieved. Default is None.

scsi_addresses
List of scsi addresses of disks to be retrieved. Default is None

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_disks
```

(continues on next page)

(continued from previous page)

```
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'

salt '*' vsphere.list_disks
    scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

salt.modules.vsphere.**list_dvportgroups**(*dvs=None*, *portgroup_names=None*, *service_instance=None*)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

dvs
: Name of the DVS containing the portgroups. Default value is None.

portgroup_names
: List of portgroup names to look for. If None, all portgroups are returned. Default value is None

service_instance
: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_dvportgroups

salt '*' vsphere.list_dvportgroups dvs=dvs1

salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]

salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]
```

salt.modules.vsphere.**list_dvs**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of distributed virtual switches for the specified host.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
: Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_dvss**(*datacenter=None*, *dvs_names=None*, *service_instance=None*)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

datacenter
: The datacenter to look for DVSs in. Default value is None.

dvs_names
: List of DVS names to look for. If None, all DVSs are returned. Default value is None.

CLI Example:

```
salt '*' vsphere.list_dvss

salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

salt.modules.vsphere.**list_folders**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of folders for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_folders 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_hosts**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of hosts for the specified VMware environment.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_hosts_via_proxy**(*hostnames=None*, *datacenter=None*, *cluster=None*, *service_instance=None*)

Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

hostnames
Hostnames to filter on.

datacenter_name
Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.

cluster_name
Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considerred. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_hosts_via_proxy

salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]

salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1
```

`salt.modules.vsphere.`**`list_licenses`**(*service_instance=None*)

Lists all licenses on a vCenter.

service_instance
Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_licenses
```

`salt.modules.vsphere.`**`list_networks`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of networks for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_networks 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_non_ssds`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Returns a list of Non-SSD disks for the given host or list of host_names.

Note: In the pyVmomi StorageSystem, ScsiDisks may, or may not have an `ssd` attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have `ssd = true`, it will end up in the `non_ssds` list here.

---

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If host_names is not provided, Non-SSD disks will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password
↪   host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`list_resourcepools`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of resource pools for the specified host.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`list_ssds`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Returns a list of SSDs for the given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve SSDs.

If host_names is not provided, SSDs will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password
↪host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`list_storage_policies`**(*policy_names=None*, *service_instance=None*)

Returns a list of storage policies.

policy_names
Names of policies to list. If None, all policies are listed. Default is None.

service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policies policy_names=[policy_name]
```

`salt.modules.vsphere.`**`list_tag_categories`**(*server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

List existing categories a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tag_categories
```

Parameters
- **`server`** (*basestring*) -- Target DNS or IP of vCenter center.
- **`username`** (*basestring*) -- Username associated with the vCenter center.
- **`password`** (*basestring*) -- Password associated with the vCenter center.
- **`verify_ssl`** (*boolean*) -- Verify the SSL certificate. Default: True
- **`ca_bundle`** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns
Value(s) of category_id.

Return type
list of str

salt.modules.vsphere.**list_tags**(*server=None*, *username=None*, *password=None*, *service_instance=None*, *verify_ssl=None*, *ca_bundle=None*)

List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_tags
```

Parameters

- **server** (*basestring*) -- Target DNS or IP of vCenter center.
- **username** (*basestring*) -- Username associated with the vCenter center.
- **password** (*basestring*) -- Password associated with the vCenter center.
- **verify_ssl** (*boolean*) -- Verify the SSL certificate. Default: True
- **ca_bundle** (*basestring*) -- Path to the ca bundle to use when verifying SSL certificates.

Returns

Value(s) of tag_id.

Return type

list of str

salt.modules.vsphere.**list_uplink_dvportgroup**(*dvs*, *service_instance=None*)

Returns the uplink portgroup of a distributed virtual switch.

dvs

Name of the DVS containing the portgroup.

service_instance

Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

salt.modules.vsphere.**list_vapps**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of vApps for the specified host.

host

The location of the host.

username

The username used to login to the host, such as `root`.

password

The password used to login to the host.

protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```

salt.modules.vsphere.**list_vms**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Returns a list of VMs for the specified host.

host

The location of the host.

username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`power_off_vm`**(*name*, *datacenter=None*, *service_instance=None*)

Powers off a virtual machine specified by its name.
name
Name of the virtual machine
datacenter
Datacenter of the virtual machine
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.power_off_vm name=my_vm
```

`salt.modules.vsphere.`**`power_on_vm`**(*name*, *datacenter=None*, *service_instance=None*)

Powers on a virtual machine specified by its name.
name
Name of the virtual machine
datacenter
Datacenter of the virtual machine
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.power_on_vm name=my_vm
```

`salt.modules.vsphere.`**`register_vm`**(*name*, *datacenter*, *placement*, *vmx_path*, *service_instance=None*)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list
name
Name of the virtual machine
datacenter
Datacenter of the virtual machine
placement
Placement dictionary of the virtual machine, host or cluster
vmx_path:
Full path to the vmx file, datastore name should be included
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.**remove_capacity_from_diskgroup**(*cache_disk_id*, *capacity_disk_ids*, *data_evacuation=True*, *safety_checks=True*, *service_instance=None*)

Remove capacity disks from the disk group with the specified cache disk.

cache_disk_id
: The canonical name of the cache disk.

capacity_disk_ids
: A list containing canonical names of the capacity disks to add.

data_evacuation
: Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.

safety_checks
: Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_capacity_from_diskgroup
    cache_disk_id='naa.000000000000001'
    capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

salt.modules.vsphere.**remove_datastore**(*datastore*, *service_instance=None*)

Removes a datastore. If multiple datastores an error is raised.

datastore
: Datastore name

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_datastore ds_name
```

salt.modules.vsphere.**remove_diskgroup**(*cache_disk_id*, *data_accessibility=True*, *service_instance=None*)

Remove the diskgroup with the specified cache disk.

cache_disk_id
: The canonical name of the cache disk.

data_accessibility
: Specifies whether to ensure data accessibility. Default value is True.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'
```

salt.modules.vsphere.**remove_dvportgroup**(*portgroup*, *dvs*, *service_instance=None*)

Removes a distributed virtual portgroup.

portgroup
: Name of the portgroup to be removed.

dvs
: Name of the DVS containing the portgroups.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.**rename_datastore**(*datastore_name*, *new_datastore_name*, *service_instance=None*)

Renames a datastore. The datastore needs to be visible to the proxy.

datastore_name
: Current datastore name.

new_datastore_name
: New datastore name.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.rename_datastore old_name new_name
```

salt.modules.vsphere.**reset_syslog_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *syslog_config=None*, *esxi_hosts=None*, *credstore=None*)

Reset the syslog service to its default settings.

Valid syslog_config values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

syslog_config
: List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.

esxi_hosts
: If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
: Optionally set to path to the credential store file.

Returns
: Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

Note: `syslog_config` can be passed as a quoted, comma-separated string. See CLI Example for details.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
```

(continues on next page)

(continued from previous page)

```
↪      syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-
↪password             syslog_config='logdir,loghost' esxi_hosts='[esxi-1.
↪host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**service_restart**(*host*, *username*, *password*, *service_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Restart the named service for the given host or list of hosts.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

service_name
: **The name of the service for which to set the policy. Supported service names are:**
  - DCUI
  - TSM
  - SSH
  - lbtd
  - lsassd
  - lwiod
  - netlogond
  - ntpd
  - sfcbd-watchdog
  - snmpd
  - vprobed
  - vpxa
  - xorg

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

  If host_names is not provided, the service will be restarted for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
: Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password
↪'ntpd'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**service_start**(*host*, *username*, *password*, *service_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Start the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd
↪'         host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**service_stop**(*host*, *username*, *password*, *service_name*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Stop the named service for the given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password

The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port

Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names

List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to stop the service.

If host_names is not provided, the service will be stopped for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'
↪        host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`set_advanced_configs`**(*vm_name*, *datacenter*, *advanced_configs*, *service_instance=None*)

Appends extra config parameters to a virtual machine advanced config list

vm_name

Virtual machine name

datacenter

Datacenter name where the virtual machine is available

advanced_configs

Dictionary with advanced parameter key value pairs

service_instance

vCenter service instance for connection and configuration

`salt.modules.vsphere.`**`set_coredump_network_config`**(*host*, *username*, *password*, *dump_ip*, *protocol=None*, *port=None*, *host_vnic='vmk0'*, *dump_port=6500*, *esxi_hosts=None*, *credstore=None*)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first

be enabled (see *coredump_network_enable*) before these parameters may be set.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

dump_ip
: IP address of host that will accept the dump.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
: If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

host_vnic
: Host VNic port through which to communicate. Defaults to `vmk0`.

dump_port
: TCP port to use for the dump, defaults to `6500`.

credstore
: Optionally set to path to the credential store file.

Returns
: A standard cmd.run_all dictionary with a *success* key added, per host. *success* will be True if the set succeeded, False otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-
↪password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-
↪password 'dump_ip.host.com'             esxi_hosts='[esxi-1.host.com,
↪esxi-2.host.com]'
```

salt.modules.vsphere.**set_ntp_config**(*host*, *username*, *password*, *ntp_servers*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Set NTP configuration for a given host of list of host_names.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

ntp_servers
: A list of servers that should be added to and configured for the specified host's NTP configuration.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.
↪100, 192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password
↪'[192.174.1.100, 192.174.1.200]'         host_names='[esxi-1.host.com,
↪esxi-2.host.com]'
```

`salt.modules.vsphere.`**`set_service_policy`**(*host*, *username*, *password*, *service_name*, *service_policy*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Set the service name's policy for a given host or list of hosts.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

service_name
The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

service_policy
The policy to set for the service. For example, 'automatic'.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd'
↪'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password
↪'ntpd' 'automatic'         host_names='[esxi-1.host.com, esxi-2.host.
↪com]'
```

salt.modules.vsphere.**set_syslog_config**(*host*, *username*, *password*, *syslog_config*, *config_value*, *protocol=None*, *port=None*, *firewall=True*, *reset_service=True*, *esxi_hosts=None*, *credstore=None*)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

host
ESXi or vCenter host to connect to.

username
User to connect as, usually root.

password
Password to connect with.

syslog_config
Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are `logdir`, `loghost`, `default-rotate`, ``default-size`, `default-timeout`, and `logdir-unique`.

config_value
Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

firewall
Enable the firewall rule set for syslog. Defaults to `True`.

reset_service
After a successful parameter set, reset the service. Defaults to `True`.

esxi_hosts
If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
Optionally set to path to the credential store file.

Returns
Dictionary with a top-level key of 'success' which indicates if all the parameters were reset,

and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
    loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
          loghost ssl://localhost:5432,tcp://10.1.0.1:1514
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**syslog_service_reload**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Reload the syslog service so it will pick up any changes.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts
: If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore
: Optionally set to path to the credential store file.

Returns
: A standard cmd.run_all dictionary. This dictionary will at least have a *retcode* key. If *retcode* is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-
password             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**system_info**(*host*, *username*, *password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Return system information about a VMware environment.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

`salt.modules.vsphere.`**`test_vcenter_connection`**(*service_instance=None*)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

`salt.modules.vsphere.`**`unregister_vm`**(*name*, *datacenter*, *placement=None*, *power_off=False*, *service_instance=None*)

Unregisters a virtual machine defined by name and placement
name
Name of the virtual machine
datacenter
Datacenter of the virtual machine
placement
Placement information of the virtual machine
service_instance
vCenter service instance for connection and configuration
CLI Example:

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.`**`update_cluster`**(*cluster_dict*, *datacenter=None*, *cluster=None*, *service_instance=None*)

Updates a cluster.
config_dict
Dictionary with the config values of the new cluster.
datacenter
Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster
Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict
```

salt.modules.vsphere.**update_dvportgroup**(*portgroup_dict*, *portgroup*, *dvs*, *service_instance=True*)

Updates a distributed virtual portgroup.

portgroup_dict
: Dictionary with the values the portgroup should be update with (example in salt.states.dvs).

portgroup
: Name of the portgroup to be updated.

dvs
: Name of the DVS containing the portgroups.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.**update_dvs**(*dvs_dict*, *dvs*, *service_instance=None*)

Updates a distributed virtual switch (DVS).

Note: Updating the product info, capability, uplinks of a DVS is not
: supported so the corresponding entries in `dvs_dict` will be ignored.

dvs_dict
: Dictionary with the values the DVS should be update with (example in salt.states.dvs)

dvs
: Name of the DVS to be updated.

service_instance
: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1
```

salt.modules.vsphere.**update_host_datetime**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

host
: The location of the host.

username
: The username used to login to the host, such as `root`.

password
: The password used to login to the host.

protocol
: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
: Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

  If host_names is not provided, the date/time will be updated for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
↪      host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**update_host_password**(*host*, *username*, *password*, *new_password*, *protocol=None*, *port=None*, *verify_ssl=True*)

Update the password for a given host.

Note: Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

---

host
The location of the ESXi host.
username
The username used to login to the ESXi host, such as `root`.
password
The password used to login to the ESXi host.
new_password
The new password that will be updated for the provided username on the ESXi host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.update_host_password my.esxi.host root original-bad-
↪password new-bad-password
```

salt.modules.vsphere.**update_storage_policy**(*policy*, *policy_dict*, *service_instance=None*)

Updates a storage policy.

Supported capability types: scalar, set, range.
policy
Name of the policy to update.
policy_dict
Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
service_instance
Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:

```
salt '*' vsphere.update_storage_policy policy='policy name'
    policy_dict="$policy_dict"
```

salt.modules.vsphere.**update_vm**(*vm_name*, *cpu=None*, *memory=None*, *image=None*, *version=None*, *interfaces=None*, *disks=None*, *scsi_devices=None*, *serial_ports=None*, *datacenter=None*, *datastore=None*, *cd_dvd_drives=None*, *sata_controllers=None*, *advanced_configs=None*, *service_instance=None*)

Updates the configuration of the virtual machine if the config differs

vm_name
: Virtual Machine name to be updated

cpu
: CPU configuration options

memory
: Memory configuration options

version
: Virtual machine container hardware version

image
: Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

interfaces
: Network interfaces configuration options

disks
: Disks configuration options

scsi_devices
: SCSI devices configuration options

serial_ports
: Serial ports configuration options

datacenter
: Datacenter where the virtual machine is available

datastore
: Datastore where the virtual machine config files are available

cd_dvd_drives
: CD/DVD drives configuration options

advanced_config
: Advanced config parameters to be set for the virtual machine

service_instance
: vCenter service instance for connection and configuration

salt.modules.vsphere.**upload_ssh_key**(*host*, *username*, *password*, *ssh_key=None*, *ssh_key_file=None*, *protocol=None*, *port=None*, *certificate_verify=None*)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **ssh_key** -- Public SSH key, will be added to authorized_keys on ESXi
- **ssh_key_file** -- File containing the SSH key. Use 'ssh_key' or ssh_key_file, but not both.
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate. Default: True

Returns

Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:

```
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_
↪file='/etc/salt/my_keys/my_key.pub'
```

salt.modules.vsphere.**vmotion_disable**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Disable vMotion for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VMotion.

If host_names is not provided, VMotion will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password
↪     host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**vmotion_enable**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *device='vmk0'*, *verify_ssl=True*)

Enable vMotion for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

If host_names is not provided, VMotion will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

device
The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults to `vmk0`.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password
 ↪    host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vsan_add_disks`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.

protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.

host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any VSAN-eligible disks to the host's VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the hosts's VSAN system for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl
Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
 ↪    host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vsan_disable`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Disable VSAN for a given host or list of host_names.

host
The location of the host.

username
The username used to login to the host, such as `root`.

password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN.

If host_names is not provided, VSAN will be disabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password
↪  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`vsan_enable`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *host_names=None*, *verify_ssl=True*)

Enable VSAN for a given host or list of host_names.
host
The location of the host.
username
The username used to login to the host, such as `root`.
password
The password used to login to the host.
protocol
Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
port
Optionally set to alternate port if the host is not using the default port. Default port is `443`.
host_names
List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN.

If host_names is not provided, VSAN will be enabled for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.
verify_ssl
Verify the SSL certificate. Default: True
CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password
↪ host_names='[esxi-1.host.com, esxi-2.host.com]'
```

26.7.482 salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don't use htpasswd to use the webutil module name.

`salt.modules.webutil.`**`useradd`**(*pwfile*, *user*, *password*, *opts=''*, *runas=None*)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.

pwfile
: Path to htpasswd file

user
: User name

password
: User password

opts
: Valid options that can be passed are:
  - *n* Don't update file; display results on stdout.
  - *m* Force MD5 encryption of the password (default).
  - *d* Force CRYPT encryption of the password.
  - *p* Do not encrypt the password (plaintext).
  - *s* Force SHA encryption of the password.

runas
: The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.webutil.`**`userdel`**(*pwfile*, *user*, *runas=None*, *all_results=False*)

Delete a user from the specified htpasswd file.

pwfile
: Path to htpasswd file

user
: User name

runas
: The system user to run htpasswd command with

all_results
: Return stdout, stderr, and retcode, not just stdout

CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

`salt.modules.webutil.`**`verify`**(*pwfile*, *user*, *password*, *opts=''*, *runas=None*)

Return True if the htpasswd file exists, the user has an entry, and their password matches.

pwfile
: Fully qualified path to htpasswd file

user
: User name

password
: User password

opts
: Valid options that can be passed are:

- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas
The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

26.7.483 salt.modules.win_auditpol

A salt module for modifying the audit policies on the machine

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings are broken down into nine categories:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System

The `get_settings` function will return the subcategories for all nine of the above categories in one dictionary along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

- No Auditing
- Success
- Failure
- Success and Failure

CLI Example:

```
# Get current state of all audit settings
salt '*' auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon"
```

(continues on next page)

(continued from previous page)

```
# category
salt '*' auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt '*' auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and
# Failure
salt '*' auditpol.set_setting name="Credential Validation" value="Success and
↪Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt '*' auditpol.set_setting name="Credential Validation" value="No Auditing"
```

salt.modules.win_auditpol.**get_setting**(*name*)

Get the current configuration for the named audit setting

Parameters

name (*str*) -- The name of the setting to retrieve

Returns

The current configuration for the named setting

Return type

str

Raises

- **KeyError** -- On invalid setting name
- ***CommandExecutionError*** -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of the "Credential Validation" setting
salt '*' auditpol.get_setting 'Credential Validation'
```

salt.modules.win_auditpol.**get_settings**(*category='All'*)

Get the current configuration for all audit settings specified in the category

Parameters

category (*str*, optional) -- One of the nine categories to return. Can also be `All` to return the settings for all categories. Valid options are:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System
- All

Default is `All`.

Returns

A dictionary containing all subcategories for the specified category along with their current configuration

Return type

dict

Raises

- **KeyError** -- On invalid category
- ***CommandExecutionError*** -- If an error is encountered retrieving the settings

CLI Example:

```
# Get current state of all audit settings
salt '*' auditipol.get_settings

# Get the current state of all audit settings in the "Account Logon"
# category
salt '*' auditpol.get_settings 'Account Logon'
```

salt.modules.win_auditpol.**set_setting**(*name*, *value*)

Set the configuration for the named audit setting

Parameters

- **name** (*str*) -- The name of the setting to configure
- **value** (*str*) -- The configuration for the named value. Valid options are:
  - No Auditing
  - Success
  - Failure
  - Success and Failure

Returns

`True` if successful

Return type

bool

Raises

- **KeyError** -- On invalid `name` or `value`
- ***CommandExecutionError*** -- If an error is encountered modifying the setting

CLI Example:

```
# Set the state of the "Credential Validation" setting to Success and
# Failure
salt '*' auditpol.set_setting 'Credential Validation' 'Success and Failure
↪'

# Set the state of the "Credential Validation" setting to No Auditing
salt '*' auditpol.set_setting 'Credential Validation' 'No Auditing'
```

26.7.484 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

salt.modules.win_autoruns.**list_**()

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

26.7.485 salt.modules.win_certutil

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer 'TrustedPublisher'
```

salt.modules.win_certutil.**add_store**(*source*, *store*, *retcode=False*, *saltenv='base'*)

Add the cert to the given Certificate Store

Parameters

- **source** (*str*) -- The source certificate file. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`
- **store** (*str*) -- The certificate store to add the certificate to
- **retcode** (`bool`, optional) -- If `True`, return the retcode instead of stdout. Default is `False`.
- **saltenv** (`str`, optional) -- The salt environment to use. This is ignored if the path is local. Default is `base`.

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
salt '*' certutil.add_store C:\path\to\local.cer TrustedPublisher
```

salt.modules.win_certutil.**del_store**(*source*, *store*, *retcode=False*, *saltenv='base'*)

Delete the cert from the given Certificate Store

Parameters

- **source** (*str*) -- The source certificate file. This is either the path to a local file or a file from the file server in the form of `salt://path/to/file`
- **store** (*str*) -- The certificate store to delete the certificate from
- **retcode** (`bool`, optional) -- If `True`, return the retcode instead of stdout. Default is `False`
- **saltenv** (`str`, optional) -- The salt environment to use. This is ignored if the path is local. Default is `base`.

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
salt '*' certutil.del_store 'C:\path\to\local.cer' TrustedPublisher
```

salt.modules.win_certutil.**get_cert_serial**(*cert_file*, *saltenv='base'*)

Get the serial number of a certificate file

Parameters

- **cert_file** (*str*) -- The certificate file to find the serial for. Can be a local file or a file on the file server (`salt://`)
- **saltenv** (`str`, optional) -- The environment on the fileserver to use for the certificate. Default is `base`.

Returns

The serial number of the certificate if found, otherwise `None`.

Return type

str

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

salt.modules.win_certutil.**get_stored_cert_serials**(*store*)

Get all of the certificate serials in the specified store

store (str):
The store to get all the certificate serials from

Returns
A list of serial numbers found, or an empty list if none found

Return type
list

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

26.7.486 salt.modules.win_dacl

Manage DACLs on Windows

depends

- winreg Python module

`salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)`

Add an ace to an object

Parameters

- **path** (*str*) -- Path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
- **user** (*str*) -- User to add
- **permission** (*str*) -- Permissions for the user
- **acetype** (*str*) -- Either allow/deny for each user/permission (ALLOW, DENY)
- **propagation** (*str*) -- How the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
# allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey,
↪propagate to this key and subkeys
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\\SOFTWARE\\somekey'
↪'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

`salt.modules.win_dacl.check_ace(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)`

Checks a path to verify the ACE (access control entry) specified exists

Parameters

- **path** (*str*) -- Path to the file/reg key
- **objectType** (*str*) -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** (*str*) -- User that the ACL is for
- **permission** (str, optional) -- Permission to test for (READ, FULLCONTROL, etc). Default is None.
- **acetype** (str, optional) -- The type of ACE (ALLOW or DENY). Default is None.
- **propagation** (str, optional) -- The propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc). Default is None.
- **exactPermissionMatch** (bool, optional) -- The ACL must match exactly, ie: if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace 'c:\temp' directory <username>
↪fullcontrol
```

salt.modules.win_dacl.**check_inheritance**(*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

Parameters

- **path** (*str*) -- path of the registry key or file system object to check
- **objectType** (*str*) -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** (*str*, optional) -- If provided, will consider only the ACEs for that user. Default is None.

Returns (bool): 'Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance 'c:\temp' directory <username>
```

class salt.modules.win_dacl.**daclConstants**

DACL constants used throughout the module

getAceTypeBit(*t*)

returns the acetype bit of a text value

getAceTypeText(*t*)

returns the textual representation of a acetype bit

getObjectTypeBit(*t*)

returns the bit value of the string object type

getPermissionBit(*t*, *m*)

returns a permission bit of the string permission value for the specified object type

getPermissionText(*t*, *m*)

returns the permission textual representation of a specified permission bit/object type

getPropagationBit(*t*, *p*)

returns the propagation bit of a text value

getPropagationText(*t*, *p*)

returns the textual representation of a propagation bit

getSecurityHkey(*s*)

returns the necessary string value for an HKEY for the win32security module

processPath(*path*, *objectType*)

processes a path/object type combo and returns:

registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.**disable_inheritance**(*path*, *objectType*, *copy=True*)

Disable inheritance on an object

Parameters

- **path** (*str*) -- The path to the object
- **objectType** (*str*) -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** (*bool*, optional) -- True will copy the Inherited ACEs to the DACL before disabling inheritance. Default is True.

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance 'c:\temp' directory
```

salt.modules.win_dacl.**enable_inheritance**(*path*, *objectType*, *clear=False*)

Enable/disable inheritance on an object

Parameters

- **path** (*str*) -- The path to the object
- **objectType** (*str*) -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** (bool, optional) -- `True` will remove non-Inherited ACEs from the ACL. Default is `False`.

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance 'c:\temp' directory
```

salt.modules.win_dacl.**get**(*path*, *objectType*, *user=None*)

Get the ACL of an object. Will filter by user if one is provided.

Parameters

- **path** (*str*) -- The path to the object
- **objectType** (*str*) -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** (str, optional) -- A username to filter by. Default is `None`.

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get 'c:\temp' directory
```

salt.modules.win_dacl.**rm_ace**(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*)

remove an ace to an object

Parameters

- **path** (*str*) -- Path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc)
- **user** (*str*) -- User to remove
- **permission** (str, optional) -- Permission for the user. Default is `None`.
- **acetype** (str, optional) -- Either allow/deny for each user/permission (ALLOW, DENY). Default is `None`.
- **propagation** (str, optional) -- How the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS). Default is `None`.

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
# Remove allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey
↪propagated to this key and subkeys
salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\\SOFTWARE\\
↪somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

26.7.487 salt.modules.win_disk

Module for gathering disk information on Windows

depends

- win32api Python module

salt.modules.win_disk.**usage**()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

26.7.488 salt.modules.win_dism

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.**add_capability**(*capability*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)

Install a capability

Parameters

- **capability** (*str*) -- The capability to install
- **source** (str, optional) -- The optional source of the capability. Default is set by group policy and can be Windows Update. Default is None.
- **limit_access** (bool, optional) -- Prevent DISM from contacting Windows Update for the source package. Default is False.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the install. Default is False.

Raises

NotImplementedError -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.add_capability 'Tools.Graphics.DirectX~~~~0.0.1.0'
```

salt.modules.win_dism.**add_feature**(*feature*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a feature using DISM

Parameters

- **feature** (*str*) -- The feature to install
- **package** (str, optional) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature. Default is None.
- **source** (str, optional) -- The optional source of the capability. Default is set by group policy and can be Windows Update. Default is None.

- **limit_access** (bool, optional) -- Prevent DISM from contacting Windows Update for the source package. Default is False.
- **enable_parent** (bool, optional) -- True will enable all parent features of the specified feature. Default is False.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the install. Default is False.

Returns
A dictionary containing the results of the command

Return type
dict

CLI Example:

```
salt '*' dism.add_feature 'NetFx3'
```

salt.modules.win_dism.**add_package**(*package*, *ignore_check=False*, *prevent_pending=False*, *image=None*, *restart=False*)

Install a package using DISM

Parameters

- **package** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder.

  Note: An *.msu* package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** (bool, optional) -- Skip installation of the package if the applicability checks fail. Default is False.
- **prevent_pending** (bool, optional) -- Skip the installation of the package if there are pending online actions. Default is False.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the install. Default is False.

Returns
A dictionary containing the results of the command

Return type
dict

CLI Example:

```
salt '*' dism.add_package 'C:\Packages\package.cab'
```

salt.modules.win_dism.**available_capabilities**(*image=None*)

List the capabilities available on the system

Parameters
image (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

Returns
A list of available capabilities

Return type

list

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.**available_features**(*image=None*)

List the features available on the system

Parameters

image (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns

A list of available features

Return type

list

CLI Example:

```
salt '*' dism.available_features
```

salt.modules.win_dism.**get_capabilities**(*image=None*)

List all capabilities on the system

Parameters

image (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

Returns

A list of capabilities

Return type

list

CLI Example:

```
salt '*' dism.get_capabilities
```

salt.modules.win_dism.**get_features**(*package=None*, *image=None*)

List features on the system or in a package

Parameters

- **package** (str, optional) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

  This can also be the name of a package as listed in dism.installed_packages

  Default is None.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns

A list of features

Return type

list

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features 'C:\packages\package.cab'

# Return all features in the calc package
salt '*' dism.get_features 'Microsoft.Windows.Calc.Demo~
↪6595b6144ccf1df~x86~en~1.0.0.0'
```

salt.modules.win_dism.**get_kb_package_name**(*kb*, *image=None*)

Get the actual package name on the system based on the KB name.

New in version 3006.0.

Parameters

- **kb** (*str*) -- The name of the KB to remove. Can also be just the KB number.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns

The name of the package found on the system None: If the package is not installed on the system

Return type

str

CLI Example:

```
# Get the package name for KB1231231
salt '*' dism.get_kb_package_name KB1231231

# Get the package name for KB1231231 using just the number
salt '*' dism.get_kb_package_name 1231231
```

salt.modules.win_dism.**installed_capabilities**(*image=None*)

List the capabilities installed on the system

Parameters

image (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Raises

- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

Returns

A list of installed capabilities

Return type

list

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.**installed_features**(*image=None*)

List the features installed on the system

Parameters

image (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns
A list of installed features
Return type
list
CLI Example:

```
salt '*' dism.installed_features
```

salt.modules.win_dism.**installed_packages**(*image=None*)

List the packages installed on the system
Parameters
image (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
Returns
A list of installed packages
Return type
list
CLI Example:

```
salt '*' dism.installed_packages
```

salt.modules.win_dism.**package_info**(*package*, *image=None*)

Display information about a package
Parameters
- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns
A dictionary containing the results of the command
Return type
dict
CLI Example:

```
salt '*' dism. package_info 'C:\packages\package.cab'
```

salt.modules.win_dism.**remove_capability**(*capability*, *image=None*, *restart=False*)

Uninstall a capability
Parameters
- **capability** (*str*) -- The capability to be removed
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the install. Default is False.

Raises
- **NotImplementedError** -- For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** --

Returns
A dictionary containing the results of the command
Return type
dict
CLI Example:

```
salt '*' dism.remove_capability 'Tools.Graphics.DirectX~~~~0.0.1.0'
```

salt.modules.win_dism.**remove_feature**(*feature*, *remove_payload=False*, *image=None*, *restart=False*)

Disables the feature.

Parameters

- **feature** (*str*) -- The feature to uninstall.
- **remove_payload** (bool, optional) -- Remove the feature's payload. Must supply source when enabling in the future. Default is False.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the install. Default is False.

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
salt '*' dism.remove_feature 'NetFx3'
```

salt.modules.win_dism.**remove_kb**(*kb*, *image=None*, *restart=False*)

Remove a package by passing a KB number. This searches the installed packages to get the full package name of the KB. It then calls the dism.remove_package function to remove the package.

New in version 3006.0.

Parameters

- **kb** (*str*) -- The name of the KB to remove. Can also be just the KB number.
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the uninstall. Default is False.

Returns

A dictionary containing the results of the command

Return type

dict

CLI Example:

```
# Remove the KB5007575 just passing the number
salt '*' dism.remove_kb 5007575

# Remove the KB5007575 just passing the full name
salt '*' dism.remove_kb KB5007575
```

salt.modules.win_dism.**remove_package**(*package*, *image=None*, *restart=False*)

Uninstall a package

Parameters

- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages
- **image** (str, optional) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (bool, optional) -- Reboot the machine if required by the uninstall. Default is False.

Returns
A dictionary containing the results of the command

Return type
dict

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package 'Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
↪x86~en~1.0.0.0'

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package 'C:\packages\package.cab'
```

26.7.489 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

`salt.modules.win_dns_client.`**`add_dns`**(*ip*, *interface='Local Area Connection'*, *index=1*)

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

Parameters
- **ip** (*str*) -- The IP address of the DNS server to remove.
- **interface** (str, optional) -- The name of the network interface. This is the name as it appears in the Control Panel under Network Connections. Default is `Local Area Connection`.
- **index** (int, optional) -- The index to add the DNS server to. Default is 1.

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

`salt.modules.win_dns_client.`**`dns_dhcp`**(*interface='Local Area Connection'*)

Configure the interface to get its DNS servers from the DHCP server

Parameters
interface (str, optional) -- The name of the network interface. This is the name as it appears in the Control Panel under Network Connections. Default is `Local Area Connection`.

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

`salt.modules.win_dns_client.`**`get_dns_config`**(*interface='Local Area Connection'*)

Get the type of DNS configuration (dhcp / static).

Parameters
interface (str, optional) -- The name of the network interface. This is the name as it appears in the Control Panel under Network Connections. Default is `Local Area Connection`.

Returns
`True` if DNS is configured, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

salt.modules.win_dns_client.**get_dns_servers**(*interface='Local Area Connection'*)

Return a list of the configured DNS servers of the specified interface

Parameters

interface (str, optional) -- The name of the network interface. This is the name as it appears in the Control Panel under Network Connections. Default is `Local Area Connection`.

Returns

A list of dns servers

Return type

list

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

salt.modules.win_dns_client.**rm_dns**(*ip*, *interface='Local Area Connection'*)

Remove the DNS server from the network interface

Parameters

- **ip** (*str*) -- The IP address of the DNS server to remove.
- **interface** (str, optional) -- The name of the network interface. This is the name as it appears in the Control Panel under Network Connections. Default is `Local Area Connection`.

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

26.7.490 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

depends

- PowerShell 5.0

salt.modules.win_dsc.**apply_config**(*path*, *source=None*, *salt_env='base'*)

Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

Parameters

- **path** (*str*) -- Local path to the directory that contains the .mof configuration file to apply.
- **source** (str, optional) -- Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at `path` will be applied. Default is `None`.

- **salt_env** (str, optional) -- The salt environment to use when copying your source. Default is base.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
# To apply a config that already exists on the system
salt '*' dsc.apply_config 'C:\\DSC\\WebSiteConfiguration'
```

```
# To cache a configuration from the master and apply it
salt '*' dsc.apply_config 'C:\\DSC\\WebSiteConfiguration' salt://dsc/
↪configs/WebSiteConfiguration
```

salt.modules.win_dsc.**compile_config**(*path*, *source=None*, *config_name=None*, *config_data=None*, *config_data_source=None*, *script_parameters=None*, *salt_env='base'*)

Compile a config from a PowerShell script (.ps1)

Parameters

- **path** (*str*) -- Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally.
- **source** (str, optional) -- Path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Default is None.
- **config_name** (str, optional) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Default is None.
- **config_data** (str, optional) -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table. Default is None.

  New in version 2017.7.0.
- **config_data_source** (str, optional) -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table. Default is None.

  New in version 2017.7.0.
- **script_parameters** (str, optional) -- Any additional parameters expected by the configuration script. These must be defined in the script itself. Default is None.

  New in version 2017.7.0.
- **salt_env** (*Optional[str]*) --
- **salt_env** -- The salt environment to use when copying the source. Default is base.

Returns

A dictionary containing the results of the compilation

Return type

dict

CLI Example:

```
# To compile a config from a script that already exists on the system
salt '*' dsc.compile_config 'C:\\DSC\\WebsiteConfig.ps1'
```

```
# To cache a config script to the system from the master and compile it:
salt '*' dsc.compile_config 'C:\\DSC\\WebsiteConfig.ps1' salt://dsc/
↪configs/WebsiteConfig.ps1
```

salt.modules.win_dsc.**get_config**()

Get the current DSC Configuration

Returns

A dictionary representing the DSC Configuration on the machine

Return type

dict

Raises

CommandExecutionError -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

salt.modules.win_dsc.**get_config_status**()

Get the status of the current DSC Configuration

Returns

A dictionary representing the status of the current DSC
Configuration on the machine

Return type

dict

CLI Example:

```
salt '*' dsc.get_config_status
```

salt.modules.win_dsc.**get_lcm_config**()

Get the current Local Configuration Manager settings

Returns

A dictionary representing the Local Configuration Manager settings
on the machine

Return type

dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

salt.modules.win_dsc.**remove_config**(*reset=False*)

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters

reset (bool, optional) -- Attempts to reset the DSC configuration by removing the following from `C:\Windows\System32\Configuration`:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is `False`.

> **Warning:** `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory are in use. If you wait a few minutes and run again, it may complete successfully.

Returns
`True` if successful
Return type
bool
Raises
CommandExecutionError -- On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

salt.modules.win_dsc.**restore_config**()

Reapplies the previous configuration.

New in version 2017.7.5.

Note: The current configuration will become the previous configuration. If run a second time back-to-back it is like toggling between two configs.

Returns
`True` if successfully restored, otherwise `False`
Return type
bool
Raises
CommandExecutionError -- On failure

CLI Example:

```
salt '*' dsc.restore_config
```

salt.modules.win_dsc.**run_config**(*path*, *source=None*, *config_name=None*, *config_data=None*, *config_data_source=None*, *script_parameters=None*, *salt_env='base'*)

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

Parameters
- **path** (*str*) -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (`str`, optional) -- The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Default is `None`.
- **config_name** (`str`, optional) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Default is `None`.

- **config_data** (str, optional) -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table. Default is None.

  New in version 2017.7.0.
- **config_data_source** (str, optional) -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table. Default is None.

  New in version 2017.7.0.
- **script_parameters** (str, optional) -- Any additional parameters expected by the configuration script. These must be defined in the script itself. Note that these are passed to the script (the outermost scope), and not to the dsc configuration inside the script (the inner scope). Default is None.

  New in version 2017.7.0.
- **salt_env** (str, optional) -- The salt environment to use when copying the source. Default is base.

Returns

True if successfully compiled and applied, otherwise False

Return type

bool

CLI Example:

```
# To compile a config from a script that already exists on the system
salt '*' dsc.run_config 'C:\\DSC\\WebsiteConfig.ps1'
```

```
# To cache a config script to the system from the master and compile it
salt '*' dsc.run_config 'C:\\DSC\\WebsiteConfig.ps1' salt://dsc/configs/
↪WebsiteConfig.ps1
```

```
# To cache a config script to the system from the master and compile it,
↪passing in `script_parameters`:
salt '*' dsc.run_config path='C:\\DSC\\WebsiteConfig.ps1' source=salt://
↪dsc/configs/WebsiteConfig.ps1 script_parameters='-hostname "my-computer
↪" -ip "192.168.1.10" -DnsArray "192.168.1.3","192.168.1.4","1.1.1.1"'
```

salt.modules.win_dsc.**set_lcm_config**(*config_mode=None*, *config_mode_freq=None*, *refresh_freq=None*, *reboot_if_needed=None*, *action_after_reboot=None*, *refresh_mode=None*, *certificate_id=None*, *configuration_id=None*, *allow_module_overwrite=None*, *debug_mode=None*, *status_retention_days=None*)

For detailed descriptions of the parameters see: https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig

Parameters

- **config_mode** (str, optional) -- How the LCM applies the configuration. Valid values are:
  - ApplyOnly
  - ApplyAndMonitor
  - ApplyAndAutoCorrect

  Default is None.
- **config_mode_freq** (int, optional) -- How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default

is 15.

- **refresh_mode** (str, optional) -- How the LCM gets configurations. Valid values are:
  - Disabled
  - Push
  - Pull

  Default is None.
- **refresh_freq** (int, optional) -- How often, in minutes, the LCM checks for updated configurations (pull mode only). Default is 30.
- **reboot_if_needed** (bool, optional) -- Reboot the machine if needed after a configuration is applied. Default is False.
- **action_after_reboot** (str, optional) -- Action to take after reboot. Valid values are:
  - ContinueConfiguration
  - StopConfiguration

  Default is None.
- **certificate_id** (guid, optional) -- A GUID that specifies a certificate used to access the configuration (pull mode). Default is None.
- **configuration_id** (guid, optional) -- A GUID that identifies the config file to get from a pull server (pull mode). Default is None.
- **allow_module_overwrite** (bool, optional) -- New configs are allowed to overwrite old ones on the target node. Default is False.
- **debug_mode** (str, optional) -- Sets the debug level. Valid values are:
  - None
  - ForceModuleImport
  - All

  Default is None.
- **status_retention_days** (int, optional) -- Number of days to keep status of the current config. Default is 10
- **note::** (..) -- Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documentation on MSDN for more details.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

salt.modules.win_dsc.**test_config**()

Tests the current applied DSC Configuration

Returns

True if successfully applied, otherwise False

Return type

bool

CLI Example:

```
salt '*' dsc.test_config
```

26.7.491 salt.modules.win_event

A module for working with the Windows Event log system. .. versionadded:: 3006.0

salt.modules.win_event.**add**(*log_name*, *event_id*, *event_category=0*, *event_type=None*, *event_strings=None*, *event_data=None*, *event_sid=None*)

Adds an event to the application event log.

Parameters

- **log_name** (*str*) -- The name of the application or source
- **event_id** (*int*) -- The event ID
- **event_category** (int, optional) -- The event category. Default is 0
- **event_type** (str, optional) -- The event category. Must be one of:
  - Success
  - Error
  - Warning
  - Information
  - AuditSuccess
  - AuditFailure

  Default is None.
- **event_strings** (list, optional) -- A list of strings. Default is None.
- **event_data** (bytes, optional) -- Event data. Strings will be converted to bytes. Default is None.
- **event_sid** (sid, optional) -- The SID for the event. Default is None.

Raises

- ***CommandExecutionError*** -- event_id is not an integer
- ***CommandExecutionError*** -- event_category is not an integer
- ***CommandExecutionError*** -- event_type is not one of the valid event types
- ***CommandExecutionError*** -- event_strings is not a list or string

CLI Example:

```
# A simple Application event log warning entry
salt '*' win_event.add Application 1234 12 Warning

# A more complex System event log information entry
salt '*' win_event.add System 1234 12 Information '["Event string data 1",
↪ "Event string data 2"]' 'Some event data'

# Log to the System Event log with the source "Service Control Manager"
salt '*' win_event.add 'Service Control Manager' 1234 12 Warning '["Event
↪string data 1", "Event string data 2"]' 'Some event data'
```

```
# Log to the PowerShell event log with the source "PowerShell (PowerShell)
↪"
salt-call --local win_event.add "PowerShell" 6969 12 Warning
```

salt.modules.win_event.**clear**(*log_name*, *backup=None*)

Clears the specified event log.

Note: A clear log event will be added to the log after it is cleared.

Parameters

- **log_name** (*str*) -- The name of the log to clear
- **backup** (str, optional) -- Path to backup file. Default is None.

CLI Example:

```
salt "*" win_event.clear Application
```

salt.modules.win_event.**count**(*log_name*)

Gets the number of events in the specified.

Parameters

log_name (*str*) -- The name of the log

Returns

The number of events the log contains

Return type

int

CLI Example:

```
salt "*" win_event.count Application
```

salt.modules.win_event.**get**(*log_name*)

Get events from the specified log. Get a list of available logs using the *win_event.get_log_names* function.

Warning: Running this command on a log with thousands of events, such as the `Applications` log, can take a long time.

Parameters

log_name (*str*) -- The name of the log to retrieve.

Returns

tuple: A tuple of events as dictionaries

CLI Example:

```
salt '*' win_event.get Application
```

salt.modules.win_event.**get_filtered**(*log_name*, *all_requirements=True*, ***kwargs*)

Will find events that match the fields and values specified in the kwargs. Kwargs can be any item in the return for the event.

Warning: Running this command on a log with thousands of events, such as the `Applications` log, can take a long time.

Parameters

- **log_name** (*str*) -- The name of the log to retrieve
- **all_requirements** (`bool`, optional) -- `True` matches all requirements. `False` matches any requirement. Default is `True`.

Kwargs:

eventID (int): The event ID number

eventType (int): The event type number. Valid options and their

corresponding meaning are:

- 0 : Success
- 1 : Error
- 2 : Warning
- 4 : Information

- 8 : Audit Success
- 10 : Audit Failure

year (int): The year

month (int): The month

day (int): The day of the month

hour (int): The hour

minute (int): The minute

second (int): The second

eventCategory (int): The event category number

sid (sid): The SID of the user that created the event

sourceName (str): The name of the event source

Returns
A tuple of dicts of each filtered event

Return type
tuple

CLI Example:

```
# Return all events from the Security log with an ID of 1100
salt '*' win_event.get_filtered Security eventID=1100

# Return all events from the System log with an Error (1) event type
salt '*' win_event.get_filtered System eventType=1

# Return all events from System log with an Error (1) type, source is
↪Service Control Manager, and data is netprofm
salt '*' win_event.get_filtered System eventType=1 sourceName='Service
↪Control Manager' data='netprofm'

# Return events from the System log that match any of the kwargs below
salt '*' win_event.get_filtered System eventType=1 sourceName='Service
↪Control Manager' data='netprofm' all_requirements=False
```

salt.modules.win_event.**get_log_names**()

Get a list of event logs available on the system

Returns
A list of event logs available on the system

Return type
list

CLI Example:

```
salt '*' win_event.get_log_names
```

salt.modules.win_event.**query**(*log_name*, *query_text=None*, *records=20*, *latest=True*, *raw=False*)

Query a log for a specific event_id. Return the top number of records specified. Use the *win_event.get_log_names* to see a list of available logs on the system.

Note: You can use the Windows Event Viewer to create the XPath query for the `query_text` parameter. Click on `Filter Current Log`, configure the filter, then click on the XML tab. Copy the text between

the two <Select> tags. This will be the contents of the query_text parameter. You will have to convert some codes. For example, > becomes >, < becomes <. Additionally, you'll need to put spaces between comparison operators. For example: this >= that.

Parameters

- **log_name** (*str*) -- The name of the log to query
- **query_text** (str, optional) -- The filter to apply to the log. Default is None.
- **records** (int, optional) -- The number of records to return. Default is 20
- **latest** (bool, optional) -- True will return the newest events. False will return the oldest events. Default is True.
- **raw** (bool, optional) -- True will return the raw xml results. False will return the xml converted to a dictionary. Default is False.

Returns

A list of dict objects that contain information about the event

Return type

list

CLI Example:

```
# Return the 20 most recent events from the Application log with an event
 ↪ID of 22
salt '*' win_event.query Application '*[System[(EventID=22)]]'

# Return the 20 most recent events from the Application log with an event
 ↪ID of 22
# Return raw xml
salt '*' win_event.query Application '*[System[(EventID=22)]]' raw=True

# Return the 20 oldest events from the Application log with an event ID
 ↪of 22
salt '*' win_event.query Application '*[System[(EventID=22)]]'
 ↪latest=False

# Return the 20 most recent Critical (1) events from the Application log
 ↪in the last 12 hours
salt '*' win_event.query Application '*[System[(Level=1) and
 ↪TimeCreated[timediff(@SystemTime) <= 43200000]]]'

# Return the 5 most recent Error (2) events from the application log
salt '*' win_event.query Application '*[System[(Level=2)]]' records=5

# Return the 20 most recent Warning (3) events from the Windows
 ↪PowerShell log where the Event Source is PowerShell
salt '*' win_event.query 'Windows PowerShell' '*[System[Provider[@Name=
 ↪"PowerShell"] and (Level=3)]]'

# Return the 20 most recent Information (0 or 4) events from the
 ↪Microsoft-Windows-PowerShell/Operational on 2022-08-24 with an Event ID
 ↪of 4103
salt '*' win_event.query 'Microsoft-Windows-PowerShell/Operational'
 ↪'*[System[(Level=4 or Level=0) and (EventID=4103) and
 ↪TimeCreated[@SystemTime >= "2022-08-24T06:00:00.000Z"]]]'
```

(continues on next page)

(continued from previous page)

```
# Return the 20 most recent Information (0 or 4) events from the
↪Microsoft-Windows-PowerShell/Operational within the last hour
salt '*' win_event.query 'Microsoft-Windows-PowerShell/Operational'
↪'*[System[(Level=4 or Level=0) and TimeCreated[timediff(@SystemTime) <=
↪3600000]]]'
```

26.7.492 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends

- win32api
- win32file
- win32con
- salt.utils.win_dacl

salt.modules.win_file.**check_perms**(*path*, *ret=None*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters

- **path** (*str*) -- The full path to the directory.
- **ret** (dict, optional) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return. Default is None.
- **owner** (str, optional) -- The owner to set for the directory. Default is None.
- **grant_perms** (dict, optional) -- A dictionary containing the user/group and the basic permissions to check/grant, ie: `{'user': {'perms': 'basic_permission'}}`. Default is None.
- **deny_perms** (dict, optional) -- A dictionary containing the user/group and permissions to check/deny. Default is None.
- **inheritance** (bool, optional) -- True will check if inheritance is enabled and enable it. False will check if inheritance is disabled and disable it. Default is True.
- **reset** (bool, optional) -- True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

Returns

A dictionary of changes that have been made

Return type

dict

CLI Example:

```
# To see changes to C:\Temp if the 'Users' group is given 'read & execute
↪' permissions.
salt '*' file.check_perms 'C:\Temp\' '{}' Administrators '{"Users": {
↪"perms": "read_execute"}}'

# Specify advanced attributes with a list
salt '*' file.check_perms 'C:\Temp\' '{}' Administrators '{"jsnuffy": {
↪"perms": ["read_attributes", "read_ea"], "applies_to": "files_only"}}'
```

```
# Locally using salt call
salt-call file.check_perms "C:\Temp\" {} Administrators "{'Users': {'perms
↪': 'read_execute', 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.**chgrp**(*path*, *group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chpgrp`.

To set group permissions use `file.set_perms`.

Parameters

- **path** (*str*) -- The path to the file or directory
- **group** (*str*) -- The group (unused)

Returns

None

CLI Example:

```
salt '*' file.chgrp 'c:\temp\test.txt' administrators
```

salt.modules.win_file.**chown**(*path*, *user*, *group=None*, *pgroup=None*, *follow_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (`str`, optional) -- The group (not used). Default is `None`.
- **pgroup** (`str`, optional) -- The primary group to assign. Default is `None`.
- **follow_symlinks** (`bool`, optional) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is `True`.

Returns

`True` if successful

Return type

bool

Raises

- ***CommandExecutionError*** -- Path not found
- ***CommandExecutionError*** -- Failed to change ownership

CLI Example:

```
salt '*' file.chown 'c:\temp\test.txt' 'myusername'
salt '*' file.chown 'c:\temp\test.txt' 'myusername' pgroup=Administrators
salt '*' file.chown 'c:\temp\test.txt' 'myusername' pgroup=None
```

salt.modules.win_file.**chpgrp**(*path*, *group*)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (*str*) -- The path to the file or directory
- **pgroup** (*str*) -- The primary group to assign

Returns

`True` if successful

Return type

bool

Raises

CommandExecutionError -- Failed to change group

CLI Example:

```
salt '*' file.chpgrp 'c:\temp\test.txt' Administrators
salt '*' file.chpgrp 'c:\temp\test.txt' None
```

salt.modules.win_file.**get_attributes**(*path*)

Return a dictionary object with the Windows file attributes for a file.

Parameters

path (*str*) -- The path to the file or directory

Returns

A dictionary of file attributes

Return type

dict

CLI Example:

```
salt '*' file.get_attributes 'c:\temp\a.txt'
```

salt.modules.win_file.**get_gid**(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use *file.get_pgid*.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (`bool`, optional) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is `True`.

Returns
The gid of the owner
Return type
str

CLI Example:

```
salt '*' file.get_gid 'c:\temp\test.txt'
```

salt.modules.win_file.**get_group**(*path*, *follow_symlinks=True*)

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use *file.get_pgroup*.

Parameters
- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (bool, optional) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True.

Returns
The name of the owner
Return type
str

CLI Example:

```
salt '*' file.get_group 'c:\temp\test.txt'
```

salt.modules.win_file.**get_mode**(*path*)

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

Parameters
path (*str*) -- The path to the file or directory
Returns
None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

salt.modules.win_file.**get_pgid**(*path*, *follow_symlinks=True*)

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters
- **path** (*str*) -- The path to the file or directory

- **follow_symlinks** (bool, optional) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True.

Returns
The gid of the primary group

Return type
str

CLI Example:

```
salt '*' file.get_pgid 'c:\temp\test.txt'
```

salt.modules.win_file.**get_pgroup**(*path*, *follow_symlinks=True*)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the *get_pgid* function which will return the SID, including for the system 'None' group.

Parameters
- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (bool, optional) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True.

Returns
The name of the primary group

Return type
str

CLI Example:

```
salt '*' file.get_pgroup 'c:\temp\test.txt'
```

salt.modules.win_file.**get_uid**(*path*, *follow_symlinks=True*)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify *follow_symlinks=False* to turn off this behavior.

Parameters
- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (bool, optional) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True.

Returns
The uid of the owner

Return type
str

CLI Example:

```
salt '*' file.get_uid 'c:\temp\test.txt'
salt '*' file.get_uid 'c:\temp\test.txt' follow_symlinks=False
```

salt.modules.win_file.**get_user**(*path*, *follow_symlinks=True*)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify *follow_symlinks=False* to turn off this behavior.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (bool, optional) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True.

Returns

The name of the owner

Return type

str

CLI Example:

```
salt '*' file.get_user 'c:\temp\test.txt'
salt '*' file.get_user 'c:\temp\test.txt' follow_symlinks=False
```

salt.modules.win_file.**gid_to_group**(*gid*)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

Parameters

gid (*str*) -- The gid of the group

Returns

The name of the group

Return type

str

CLI Example:

```
salt '*' file.gid_to_group 'S-1-5-21-626487655-2533044672-482107328-1010'
```

salt.modules.win_file.**group_to_gid**(*group*)

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, '' is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

Parameters

group (*str*) -- The name of the group

Returns

The gid of the group

Return type

str

CLI Example:

```
salt '*' file.group_to_gid 'administrators'
```

salt.modules.win_file.**is_link**(*path*)

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters

path (*str*) -- The path to a file or directory

Returns

`True` if path is a symlink, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.win_file.`**`lchown`**(*path*, *user*, *group=None*, *pgroup=None*)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise, Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*, optional) -- The group (not used). Default is `None`.
- **pgroup** (*str*, optional) -- The primary group to assign. Default is `None`.

Returns

True if successful, otherwise error

Return type

bool

CLI Example:

```
salt '*' file.lchown 'c:\temp\test.txt' myusername
salt '*' file.lchown 'c:\temp\test.txt' myusername pgroup=Administrators
salt '*' file.lchown 'c:\temp\test.txt' myusername "pgroup='None'"
```

`salt.modules.win_file.`**`makedirs_`**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the parent directory containing this path is available.

Parameters

- **path** (*str*) -- The full path to the directory.

  Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

- **owner** (*str*, optional) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM. Default is `None`.

- **grant_perms** (dict, optional) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

  Default is `None`.
- **deny_perms** (dict, optional) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions. Default is `None`.
- **inheritance** (bool, optional) -- If `True`, the object will inherit permissions from the parent. If `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `True`.
- **reset** (bool, optional) -- If `True`, the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

  New in version 2018.3.0.

Returns
`True` if successful

Return type
bool

Raises
CommandExecutionError -- Failed to create directories

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs 'C:\Temp\' Administrators '{"Users": {"perms":
↪"read_execute"}}'

# Locally using salt call
salt-call file.makedirs 'C:\Temp\' Administrators '{"Users": {"perms":
↪"read_execute", "applies_to": "this_folder_only"}}'

# Specify advanced attributes with a list
salt '*' file.makedirs 'C:\Temp\' Administrators '{"jsnuffy": {"perms": [
↪"read_attributes", "read_ea"], "applies_to": "this_folder_only"}}'
```

salt.modules.win_file.**makedirs_perms**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=True*)

Set owner and permissions for each directory created.

Parameters
- **path** (*str*) -- The full path to the directory.
- **owner** (str, optional) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM. Default is `None`.

- **grant_perms** (dict, optional) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

  Default is `None`.
- **deny_perms** (dict, optional) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions. Default is `None`.
- **inheritance** (bool, optional) -- If `True`, the object will inherit permissions from the parent. If `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `True`.
- **reset** (bool, optional) -- If `True`, the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

  New in version 2018.3.0.

Returns
`True` if successful

Return type
bool

Raises
OSError -- Failed to create dirs and set perms

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms 'C:\Temp\' Administrators '{"Users": {"perms
↪": "read_execute"}}'

# Specify advanced attributes with a list
salt '*' file.makedirs_perms 'C:\Temp\' Administrators '{"jsnuffy": {
↪"perms": ["read_attributes", "read_ea"], "applies_to": "this_folder_
↪files"}}'
```

```
# Locally using salt call
salt-call file.makedirs_perms "C:\Temp\" Administrators "{'Users': {'perms
↪': 'read_execute', 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.**mkdir**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the directory is available and permissions are set.

Parameters
- **path** (*str*) -- The full path to the directory.

- **owner** (str, optional) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM. Default is None.
- **grant_perms** (dict, optional) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

  Default is None.
- **deny_perms** (dict, optional) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions. Default is None.
- **inheritance** (bool, optional) -- If True, the object will inherit permissions from the parent. If False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is True.
- **reset** (bool, optional) -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

  New in version 2018.3.0.

Returns
True if successful

Return type
bool

Raises
CommandExecutionError -- Failed to create directory

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir 'C:\Temp\' Administrators '{"Users": {"perms": "read_
↪execute"}}'

# Locally using salt call
salt-call file.mkdir 'C:\Temp\' Administrators '{"Users": {"perms": "read_
↪execute", "applies_to": "this_folder_only"}}'

# Specify advanced attributes with a list
salt '*' file.mkdir 'C:\Temp\' Administrators '{"jsnuffy": {"perms": [
↪"read_attributes", "read_ea"], "applies_to": "this_folder_only"}}'
```

salt.modules.win_file.**remove**(*path*, *force=False*)

Remove the named file or directory

Parameters
- **path** (*str*) -- The path to the file or directory to remove.
- **force** (bool, optional) -- Remove even if marked Read-Only. Default is False.

Returns
`True` if successful, otherwise `False`
Return type
bool

CLI Example:

```
salt '*' file.remove 'C:\Temp'
```

salt.modules.win_file.**set_attributes**(*path*, *archive=None*, *hidden=None*, *normal=None*, *notIndexed=None*, *readonly=None*, *system=None*, *temporary=None*)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters
- **path** (*str*) -- The path to the file or directory
- **archive** (bool, optional) -- Sets the archive attribute. Default is None.
- **hidden** (bool, optional) -- Sets the hidden attribute. Default is None.
- **normal** (bool, optional) -- Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None.
- **notIndexed** (bool, optional) -- Sets the indexed attribute. Default is None.
- **readonly** (bool, optional) -- Sets the readonly attribute. Default is None.
- **system** (bool, optional) -- Sets the system attribute. Default is None.
- **temporary** (bool, optional) -- Sets the temporary attribute. Default is None.

Returns
`True` if successful, otherwise `False`
Return type
bool

CLI Example:

```
salt '*' file.set_attributes 'c:\temp\a.txt' normal=True
salt '*' file.set_attributes 'c:\temp\a.txt' readonly=True hidden=True
```

salt.modules.win_file.**set_mode**(*path*, *mode*)

Set the mode of a file

This just calls get_mode, which returns None because we don't use mode on Windows

Parameters
- **path** (*str*) -- The path to the file or directory
- **mode** (*str*) -- The mode (not used)

Returns
None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

salt.modules.win_file.**set_perms**(*path*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Set permissions for the given path

Parameters
- **path** (*str*) -- The full path to the directory.
- **grant_perms** (dict, optional) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here for directories. The default for `applies_to` is `this_folder_subfolders_files`.

Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_
↪folder'}}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'],
↪'applies_to': 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for salt.utils.win_dacl.

A value of `None` will make no changes to the `grant` portion of the DACL.

Default is `None`.

- **`deny_perms`** (`dict`, optional) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

  A value of `None` will make no changes to the `deny` portion of the DACL.

  Default is `None`.
- **`inheritance`** (`bool`, optional) -- If `True`, the object will inherit permissions from the parent. If `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `True`.
- **`reset`** (`bool`, optional) -- If `True`, the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

  New in version 2018.3.0.

Returns
: `True` if successful

Return type
: bool

Raises
: ***`CommandExecutionError`*** -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms 'C:\Temp\' '{"Users": {"perms": "read_execute"}}'

# Specify advanced attributes with a list
salt '*' file.set_perms 'C:\Temp\' '{"jsnuffy": {"perms": ["read_
↪attributes", "read_ea"], "applies_to": "this_folder_only"}}'
```

```
# Locally using salt call
salt-call file.set_perms "C:\Temp\" "{'Users': {'perms': 'read_execute',
↪'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.`**`stats`**(*path*, *hash_type='sha256'*, *follow_symlinks=True*)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

Parameters

- **path** (*str*) -- The path to the file or directory
- **hash_type** (str, optional) -- The type of hash to return. Default is``sha256``.
- **follow_symlinks** (bool, optional) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is `True`.

Returns

A dictionary of file/directory stats

Return type

dict

CLI Example:

```
salt '*' file.stats /etc/passwd
```

salt.modules.win_file.**symlink**(*src*, *link*, *force=False*, *atomic=False*)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

Parameters

- **src** (*str*) -- The path to a file or directory
- **link** (*str*) -- The path to the link. Must be an absolute path
- **force** (bool, optional) -- Overwrite an existing symlink with the same name. Default is `False`.

  New in version 3005.
- **atomic** (bool, optional) -- Use atomic file operations to create the symlink. Default is `False`.

  New in version 3006.0.

Returns

`True` if successful

Return type

bool

Raises

- ***SaltInvocationError*** -- Unsupported version of Windows
- ***SaltInvocationError*** -- Link path must be absolute
- ***CommandExecutionError*** -- Existing symlink and force is False
- ***CommandExecutionError*** -- Existing path is not a symlink
- ***CommandExecutionError*** -- Failed to create symlink

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.win_file.**uid_to_user**(*uid*)

Convert a User ID (uid) to a username

Parameters

uid (*str*) -- The user id to lookup

Returns
The name of the user. The **uid** will be returned if there is no corresponding username

Return type
str

CLI Example:

```
salt '*' file.uid_to_user 'S-1-5-21-626487655-2533044672-482107328-1010'
```

salt.modules.win_file.**user_to_uid**(*user*)

Convert user name to a uid

Parameters
user (*str*) -- The user to lookup

Returns
The user id of the user

Return type
str

CLI Example:

```
salt '*' file.user_to_uid 'myusername'
```

salt.modules.win_file.**version**(*path*)

New in version 3005.

Get the version of a file.

Note: Not all files have version information. The following are common file types that contain version information:

- .exe
- .dll
- .sys

Parameters
path (*str*) -- The path to the file.

Returns
The version of the file if the file contains it. Otherwise, an empty string will be returned.

Return type
str

Raises
- ***CommandExecutionError*** -- If the file does not exist
- ***CommandExecutionError*** -- If the path is not a file

CLI Example:

```
salt '*' file.version 'C:\Windows\notepad.exe'
```

salt.modules.win_file.**version_details**(*path*)

New in version 3005.

Get file details for a file. Similar to what's in the details tab on the file properties.

Note: Not all files have version information. The following are common file types that contain version information:

- .exe
- .dll
- .sys

Parameters
path (*str*) -- The path to the file.
Returns
A dictionary containing details about the file related to version.
An empty dictionary if the file contains no version information.
Return type
dict
Raises
- ***CommandExecutionError*** -- If the file does not exist
- ***CommandExecutionError*** -- If the path is not a file

CLI Example:

```
salt '*' file.version_details 'C:\Windows\notepad.exe'
```

26.7.493 salt.modules.win_firewall

Module for configuring Windows Firewall using `netsh`

`salt.modules.win_firewall.`**`add_rule`**(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy
Parameters
- **name** (*str*) -- The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (`str`, optional) -- The protocol. Default is `tcp`. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (`str`, optional) -- The action the rule performs. Default is `allow`. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (`str`, optional) -- The direction. Can be `in` or `out`. Default is `in`.
- **remoteip** (`str`, optional) -- The remote IP. Default is `any`. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins

- defaultgateway
- Any valid IPv4 address (192.168.0.12)
- Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
- Any valid subnet (192.168.1.0/24)
- Any valid range of IP addresses (192.168.0.1-192.168.0.12)
- A list of valid IP addresses

Can be combinations of the above separated by commas.

Returns
`True` if successful

Return type
bool

Raises
CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in'
↪'192.168.0.1'
```

`salt.modules.win_firewall.`**`delete_rule`**(*name=None*, *localport=None*, *protocol=None*, *dir=None*, *remoteip=None*)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters
- **`name`** (*str*) -- The name of the rule to delete. If the name `all` is used, you must specify additional parameters.
- **`localport`** (`str`, optional) -- The port of the rule. If protocol is not specified, protocol will be set to `tcp`. Default is `None`.
- **`protocol`** (`str`, optional) -- The protocol of the rule. Default is `tcp` when `localport` is specified. Default is `None`.
- **`dir`** (`str`, optional) -- The direction of the rule. Default is `None`.
- **`remoteip`** (`str`, optional) -- The remote IP of the rule. Default is `None`.

Returns
`True` if successful

Return type
bool

Raises
CommandExecutionError -- If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.
↪0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
```

(continues on next page)

(continued from previous page)

```
salt '*' firewall.delete_rule allow80
```

salt.modules.win_firewall.**disable**(*profile='allprofiles'*)

Disable firewall profile

Parameters

profile (str, optional) -- The name of the profile to disable. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Default is `allprofiles`.

Returns

`True` if successful

Return type

bool

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.disable
```

salt.modules.win_firewall.**enable**(*profile='allprofiles'*)

New in version 2015.5.0.

Enable firewall profile

Parameters

profile (str, optional) -- The name of the profile to enable. Default is `allprofiles`. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns

`True` if successful

Return type

bool

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.enable
```

salt.modules.win_firewall.**get_all_profiles**(*store='local'*)

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

store (str, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- lgpo
- local

Default is `local`.

Returns
A dictionary containing the specified settings for each profile
Return type
dict

CLI Example:

```
# Get all firewall settings for all profiles
salt * firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group
# policy

salt * firewall.get_all_settings lgpo
```

salt.modules.win_firewall.**get_all_settings**(*domain*, *store='local'*)

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
- **domain** (*str*) -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private

  Required.
- **store** (*str*, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`.

Returns
A dictionary containing the specified settings
Return type
dict

CLI Example:

```
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as
# defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

salt.modules.win_firewall.**get_config**()

Get the status of all the firewall profiles

Returns
A dictionary of all profiles on the system
Return type
dict
Raises
CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

salt.modules.win_firewall.**get_rule**(*name='all'*)

New in version 2015.5.0.

Display all matching rules as specified by name

Parameters

name (str, optional) -- The full name of the rule. `all` will return all rules. Default is `all`.

Returns

A dictionary of all rules or rules that match the name exactly

Return type

dict

Raises

CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

salt.modules.win_firewall.**get_settings**(*profile*, *section*, *store='local'*)

Get the firewall property from the specified profile in the specified store as returned by `netsh advfirewall`.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private

  Required.
- **section** (*str*) -- The property to query within the selected profile. Valid options are:
  - firewallpolicy : inbound/outbound behavior
  - logging : firewall logging settings
  - settings : firewall properties
  - state : firewalls state (on | off)

  Required.
- **store** (str, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`.

Returns

A dictionary containing the properties for the specified profile

Return type

dict

Raises

- ***CommandExecutionError*** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
```

(continues on next page)

(continued from previous page)

```
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

salt.modules.win_firewall.**rule_exists**(*name*)

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

Parameters

name (*str*) -- The name of the rule

Returns

`True` if exists, otherwise `False`.

Return type

bool

CLI Example:

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

salt.modules.win_firewall.**set_firewall_settings**(*profile*, *inbound=None*, *outbound=None*, *store='local'*)

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **inbound** (*str*, optional) -- The inbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured

  Default is `None`.
- **outbound** (*str*, optional) -- The outbound setting. If `None` is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured

  Default is `None`.
- **store** (*str*, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`.

Returns

`True` if successful

Return type
bool

Raises
- ***CommandExecutionError*** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Set the inbound setting for the domain profile to block inbound
# connections
salt * firewall.set_firewall_settings domain='domain' inbound=
↪'blockinbound'

# Set the outbound setting for the domain profile to allow outbound
# connections
salt * firewall.set_firewall_settings domain='domain' outbound=
↪'allowoutbound'

# Set inbound/outbound settings for the domain profile in the group
# policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound=
↪'blockinbound' outbound='allowoutbound' store='lgpo'
```

salt.modules.win_firewall.**set_logging_settings**(*profile*, *setting*, *value*, *store='local'*)

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
- **profile** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** (*str*) -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize
- **value** (*str*) -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

  allowedconnections:
  - enable
  - disable
  - notconfigured

  droppedconnections:
  - enable
  - disable
  - notconfigured

  filename:
  - Full path and name of the firewall log file
  - notconfigured

  maxfilesize:
  - 1 - 32767
  - notconfigured

Note: `notconfigured` can only be used when using the lgpo store

- **store** (*str*, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`.

Returns
`True` if successful

Return type
bool

Raises
- ***CommandExecutionError*** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private
↪setting=droppedconnections value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\
↪firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\
↪system32\LogFiles\Firewall\pfirewall.log

# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

`salt.modules.win_firewall.`**`set_settings`**(*profile*, *setting*, *value*, *store='local'*)

Configure firewall settings.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters
- **profile** (*str*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** (*str*) -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
  - unicastresponsetomulticast
- **value** (*str*) -- The value to apply to the setting. Valid options are
  - enable
  - disable

- notconfigured

Note: `notconfigured` can only be used when using the lgpo store

- **`store`** (`str`, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`.

Returns

`True` if successful

Return type

bool

Raises

- ***`CommandExecutionError`*** -- If an error occurs
- **`ValueError`** -- If the parameters are incorrect

CLI Example:

```
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

`salt.modules.win_firewall.`**`set_state`**(*profile*, *state*, *store='local'*)

Configure the firewall state.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **`profile`** (*`str`*) -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **`state`** (*`str`*) -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

Note: `notconfigured` can only be used when using the lgpo store

- **`store`** (`str`, optional) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

  Default is `local`.

Returns

`True` if successful

Return type

bool

Raises

- ***`CommandExecutionError`*** -- If an error occurs
- **`ValueError`** -- If the parameters are incorrect

CLI Example:

```
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo
```

26.7.494 salt.modules.win_groupadd

Manage groups on Windows

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see *here*.

`salt.modules.win_groupadd.`**`add`**(*name*, ***kwargs*)

Add the specified group

Parameters

name (*str*) -- The name of the group to add

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.`**`adduser`**(*name*, *username*, ***kwargs*)

Add a user to a group

Parameters

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to add to the group

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.`**`delete`**(*name*, ***kwargs*)

Remove the named group

Parameters

name (*str*) -- The name of the group to remove

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.win_groupadd.**deluser**(*name*, *username*, ***kwargs*)

Remove a user from a group

Parameters

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to remove from the group

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.deluser foo username
```

salt.modules.win_groupadd.**getent**(*refresh=False*)

Return info on all groups

Parameters

refresh (`bool`, optional) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is `False`.

Returns

A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

salt.modules.win_groupadd.**info**(*name*)

Return information about a group

Parameters

name (*str*) -- The name of the group for which to get information

Returns

A dictionary of information about the group

Return type

dict

CLI Example:

```
salt '*' group.info foo
```

salt.modules.win_groupadd.**list_groups**(*refresh=False*)

Return a list of groups

Parameters

refresh (`bool`, optional) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is `False`.

Returns

A list of groups on the machine

Return type

list

CLI Example:

```
salt '*' group.list_groups
```

salt.modules.win_groupadd.**members**(*name*, *members_list*, ***kwargs*)

Ensure a group contains only the members in the list

Parameters

- **name** (*str*) -- The name of the group to modify
- **members_list** (*str*) -- A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

26.7.495 salt.modules.win_iis

Microsoft IIS site management via WebAdministration powershell module

maintainer

Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

platform

Windows

depends

PowerShell

depends

WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

`salt.modules.win_iis.`**`create_app`**`(`*name, site, sourcepath, apppool=None*`)`

Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (`str`, optional) -- The name of the IIS application pool. Default is `None`.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0
↪' apppool='site0'
```

`salt.modules.win_iis.`**`create_apppool`**`(`*name*`)`

Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

Parameters
name (*str*) -- The name of the IIS application pool.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

`salt.modules.win_iis.`**`create_backup`**(*name*)

Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Parameters
name (*str*) -- The name to give the backup

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

`salt.modules.win_iis.`**`create_binding`**(*site*, *hostheader=''*, *ipaddress='*'*, *port=80*, *protocol='http'*, *sslflags=None*)

Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters
- **site** (*str*) -- The IIS site name.
- **hostheader** (`str`, optional) -- The host header of the binding. Usually a hostname. Default is ""
- **ipaddress** (`str`, optional) -- The IP address of the binding. Default is "*"
- **port** (`int`, optional) -- The TCP port of the binding. Default is 80
- **protocol** (`str`, optional) -- The application protocol of the binding. Default is "http
- **sslflags** (`str`, optional) -- The flags representing certificate type and storage of the binding. Default is `None`.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com'
↪ipaddress='*' port='80'
```

salt.modules.win_iis.**create_cert_binding**(*name*, *site*, *hostheader=''*, *ipaddress='*'*, *port=443*, *sslflags=0*)

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters
- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (str, optional) -- The host header of the binding. Default is ""
- **ipaddress** (str, optional) -- The IP address of the binding. Default is "*"
- **port** (int, optional) -- The TCP port of the binding. Default is 443
- **sslflags** (int, optional) -- Flags representing certificate type and certificate storage of the binding. Default is 0

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0'
↪hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.**create_site**(*name*, *sourcepath*, *apppool=''*, *hostheader=''*, *ipaddress='*'*, *port=80*, *protocol='http'*)

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters
- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (str, optional) -- The name of the IIS application pool. Default is ""
- **hostheader** (str, optional) -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com Default is ""
- **ipaddress** (str, optional) -- The IP address of the binding. Default is "*"
- **port** (int, optional) -- The TCP port of the binding. Default is 80
- **protocol** (str, optional) -- The application protocol of the binding. (http, https, etc.) Default is "http"

Returns
`True` if successful, otherwise `False`.

Return type
bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage'
↪apppool='TestPool'
```

`salt.modules.win_iis.`**`create_vdir`**(*name*, *site*, *sourcepath*, *app='/'*)

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters
- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (str, optional) -- The IIS application. Default is _DEFAULT_APP ("/")

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\
↪inetpub\vdirs\vd0'
```

`salt.modules.win_iis.`**`get_container_setting`**(*name*, *container*, *settings*)

Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters
- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

Returns
A dictionary of the provided settings and their values.

Return type
dict

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container=
↪'AppPools'
    settings="['processModel.identityType']"
```

`salt.modules.win_iis.`**`get_webapp_settings`**(*name*, *site*, *settings*)

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

Note: Params are case sensitive

Parameters

- **name** (*str*) -- The name of the IIS web application.
- **site** (*site*) -- The site name contains the web application. Example: Default Web Site
- **settings** (*str*) -- A dictionary of the setting names and their values. Available settings:
  - physicalPath
  - applicationPool
  - userName
  - password

Returns

A dictionary of the provided settings and their values.

Return type

dict

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
    settings='["physicalPath","applicationPool"]'
```

salt.modules.win_iis.**get_webconfiguration_settings**(*name*, *settings*)

Get the webconfiguration settings for the IIS PSPath.

Parameters

- **name** (*str*) -- The PSPath of the IIS webconfiguration settings.
- **settings** (*list*) -- A list of dictionaries containing setting name and filter.

Returns

A list of dictionaries containing setting name, filter and value.

Return type

dict

CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:\' settings='[{
↪"name": "enabled", "filter": "system.webServer/security/authentication/
↪anonymousAuthentication"}]'
```

salt.modules.win_iis.**list_apppools**()

List all configured IIS application pools.

Returns

A dictionary of IIS application pools and their details.

Return type

dict

CLI Example:

```
salt '*' win_iis.list_apppools
```

salt.modules.win_iis.**list_apps**(*site*)

Get all configured IIS applications for the specified site.

Parameters

site (*str*) -- The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

salt.modules.win_iis.**list_backups**()

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Returns
A dictionary of IIS Configurations backed up on the system.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_backups
```

salt.modules.win_iis.**list_bindings**(*site*)

Get all configured IIS bindings for the specified site.

Parameters
site (*str*) -- The name if the IIS Site

Returns
A dictionary of the binding names and properties.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

salt.modules.win_iis.**list_cert_bindings**(*site*)

List certificate bindings for an IIS site.

New in version 2016.11.0.

Parameters
site (*str*) -- The IIS site name.

Returns
A dictionary of the binding names and properties.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

salt.modules.win_iis.**list_sites**()

List all the currently deployed websites.

Returns
A dictionary of the IIS sites and their properties.

Return type
dict

CLI Example:

```
salt '*' win_iis.list_sites
```

salt.modules.win_iis.**list_vdirs**(*site*, *app='/'*)

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters

- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Returns

A dictionary of the virtual directory names and properties.

Return type

dict

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

salt.modules.win_iis.**list_worker_processes**(*apppool*)

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

Parameters

apppool (*str*) -- The application pool to query

Returns

A dictionary of worker processes with their process IDs

Return type

dict

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

salt.modules.win_iis.**modify_binding**(*site*, *binding*, *hostheader=None*, *ipaddress=None*, *port=None*, *sslflags=None*)

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

Parameters

- **site** (*str*) -- The IIS site name.
- **binding** (*str*) -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, `*:80:` or `*:80:salt.com`
- **hostheader** (`str`, optional) -- The host header of the binding. Usually the hostname. Default is `None`.
- **ipaddress** (`str`, optional) -- The IP address of the binding. Default is `None`.
- **port** (`int`, optional) -- The TCP port of the binding. Default is `None`.
- **sslflags** (`str`, optional) -- The flags representing certificate type and storage of the binding. Default is `None`.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

The following will seat the host header of binding `*:80:` for `site0` to `example.com`

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader=
↪'example.com'
```

salt.modules.win_iis.**modify_site**(*name*, *sourcepath=None*, *apppool=None*)

Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (str, optional) -- The physical path of the IIS site. Default is None.
- **apppool** (str, optional) -- The name of the IIS application pool. Default is None.

Returns

True if successful, otherwise False.

Return type

bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path'
↪apppool='NewTestPool'
```

salt.modules.win_iis.**remove_app**(*name*, *site*)

Remove an IIS application.

Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.**remove_apppool**(*name*)

Remove an IIS application pool.

Parameters

name (*str*) -- The name of the IIS application pool.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

salt.modules.win_iis.**remove_backup**(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the backup to remove

Returns
True if successful, otherwise False.
Return type
bool

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

salt.modules.win_iis.**remove_binding**(*site*, *hostheader=''*, *ipaddress='*'*, *port=80*)

Remove an IIS binding.

Parameters
- **site** (*str*) -- The IIS site name.
- **hostheader** (str, optional) -- The host header of the binding. Default is "".
- **ipaddress** (str, optional) -- The IP address of the binding. Default is "*"
- **port** (int, optional) -- The TCP port of the binding. Default is 80

Returns
True if successful, otherwise False.
Return type
bool

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com'
↪ipaddress='*' port='80'
```

salt.modules.win_iis.**remove_cert_binding**(*name*, *site*, *hostheader=''*, *ipaddress='*'*, *port=443*)

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters
- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (str, optional) -- The host header of the binding. Default is ""
- **ipaddress** (str, optional) -- The IP address of the binding. Default is "*"
- **port** (int, optional) -- The TCP port of the binding. Default is 443

Returns
True if successful, otherwise False.
Return type
bool

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0'
↪hostheader='example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.**remove_site**(*name*)

Delete a website from IIS.

Parameters
name (*str*) -- The IIS site name.
Returns
True if successful, otherwise False.

Return type
bool

Note: This will not remove the application pool used by the site.

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

salt.modules.win_iis.**remove_vdir**(*name*, *site*, *app='/'*)

Remove an IIS virtual directory.

Parameters
- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (str, optional) -- The IIS application. Default is _DEFAULT_APP ("/")

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

salt.modules.win_iis.**restart_apppool**(*name*)

Restart an IIS application pool.

New in version 2016.11.0.

Parameters
name (*str*) -- The name of the IIS application pool.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.restart_apppool name='MyTestPool'
```

salt.modules.win_iis.**restart_site**(*name*)

Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters
name (*str*) -- The name of the website to restart.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

salt.modules.win_iis.**set_container_setting**(*name*, *container*, *settings*)

Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container=
↪'AppPools'
    settings="{'managedPipeLineMode': 'Integrated'}"
```

`salt.modules.win_iis.`**`set_webapp_settings`**(*name*, *site*, *settings*)

New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case-sensitive.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values.
  - physicalPath: The physical path of the webapp.
  - applicationPool: The application pool for the webapp.
  - userName: "connectAs" user
  - password: "connectAs" password for user

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings='{
↪"physicalPath": "C:\site0", "apppool": "site0"}'
```

`salt.modules.win_iis.`**`set_webconfiguration_settings`**(*name*, *settings*)

Set the value of the setting for an IIS container.

Parameters

- **name** (*str*) -- The PSPath of the IIS webconfiguration settings.
- **settings** (*list*) -- A list of dictionaries containing setting name, filter and value.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.set_webconfiguration_settings name='IIS:\' settings='[{
↪"name": "enabled", "filter": "system.webServer/security/authentication/
↪anonymousAuthentication", "value": False}]'
```

salt.modules.win_iis.**start_apppool**(*name*)

Start an IIS application pool.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the App Pool to start.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.**start_site**(*name*)

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the website to start.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.**stop_apppool**(*name*)

Stop an IIS application pool.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the App Pool to stop.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.**stop_site**(*name*)

Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters

name (*str*) -- The name of the website to stop.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

26.7.496 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.**disable**(*iface*)

Disable an interface

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.**enable**(*iface*)

Enable an interface

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_ip.**get_all_interfaces**()

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_ip.**get_default_gateway**()

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

salt.modules.win_ip.**get_interface**(*iface*)

Return the configuration of a network interface

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

salt.modules.win_ip.**get_subnet_length**(*mask*)

Convenience function to convert the netmask to the CIDR subnet length

Parameters

mask (*str*) -- A netmask

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

salt.modules.win_ip.**is_disabled**(*iface*)

Returns `True` if interface is disabled, otherwise `False`

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

salt.modules.win_ip.**is_enabled**(*iface*)

Returns `True` if interface is enabled, otherwise `False`

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

salt.modules.win_ip.**raw_interface_configs**()

Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

salt.modules.win_ip.**set_dhcp_all**(*iface*)

Set both IP Address and DNS to DHCP

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

salt.modules.win_ip.**set_dhcp_dns**(*iface*)

Set DNS source to DHCP on Windows

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

salt.modules.win_ip.**set_dhcp_ip**(*iface*)

Set Windows NIC to get IP from DHCP

Parameters

iface (*str*) -- The name of the interface to manage

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

salt.modules.win_ip.**set_static_dns**(*iface*, **addrs*)

Set static DNS configuration on a Windows NIC

Parameters

- **iface** (*str*) -- The name of the interface to manage
- **addrs** (*list*) -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list (`[]`). If undefined or `None` no changes will be made.

Returns
A dictionary containing the new DNS settings

Return type
dict

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection'
↪'192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection'
↪'192.168.1.252' '192.168.1.253'
```

salt.modules.win_ip.**set_static_ip**(*iface*, *addr*, *gateway=None*, *append=False*)

Set static IP configuration on a Windows NIC

Parameters

- **iface** (*str*) -- The name of the interface to manage
- **addr** (*str*) -- IP address with subnet length (ex. `10.1.2.3/24`). The *ip.get_subnet_length* function can be used to calculate the subnet length from a netmask.
- **gateway** (`str`, optional) -- If specified, the default gateway will be set to this value. Default is `None`.
- **append** (`bool`, optional) -- If `True`, this IP address will be added to the interface. Default is `False`, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface. Default is `False`.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.
↪2.3/24 gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.
↪2.4/24 append=True
```

26.7.497 salt.modules.win_lgpo

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows machine.

New in version 2016.11.0.

Warning: Local Group Policy will always be superseded by Domain Group policy. If policies are configured with Local Group Policy that are also configured with Domain Group policy, the Domain Group policy will take precedence.

Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's _policy_info class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the _policy_info class

  depends

  - pywin32 Python module
  - lxml
  - uuid
  - struct
  - salt.utils.win_reg

`salt.modules.win_lgpo.`**`clear_policy_cache`**`()`

Clears the policy definitions and resource stored in `__context__`. They will be rebuilt the next time a policy is applied.

CLI Example:

```
salt '*' lgpo.clear_policy_cache
```

`salt.modules.win_lgpo.`**`get`**`(`*policy_class=None*, *return_full_policy_names=True*, *hierarchical_return=False*, *adml_language='en-US'*, *return_not_configured=False*`)`

Get a policy value

Parameters

- **`policy_class`** (`str`, optional) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies.

  Default is `None`.
- **`return_full_policy_names`** (`bool`, optional) -- `True`/`False` to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.

  Default is `True`.
- **`hierarchical_return`** (`bool`, optional) -- `True`/`False` to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections.

  Default is `False`.

- **adml_language** (str, optional) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data.

  Default is en-US.
- **return_not_configured** (bool, optional) -- Include Administrative Template policies that are 'Not Configured' in the return data.

  Default is False.

Returns
A dictionary containing the policy values for the specified class

Return type
dict

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

salt.modules.win_lgpo.**get_policy**(*policy_name*, *policy_class*, *adml_language='en-US'*, *return_value_only=True*, *return_full_policy_names=True*, *hierarchical_return=False*)

Get the current settings for a single policy on the machine

Parameters

- **policy_name** (*str*) -- The name of the policy to retrieve. Can be the any of the names or alieses returned by lgpo.get_policy_info
- **policy_class** (*str*) -- The policy class. Must be one of machine or user
- **adml_language** (str, optional) -- The language code for the adml file to use for localization.

  Default is en-US.
- **return_value_only** (bool, optional) -- True will return only the value for the policy, without the name of the policy. return_full_policy_names and hierarchical_return will be ignored.

  Default is True
- **return_full_policy_names** (bool, optional) -- Returns the full policy name regardless of what was passed in policy_name.

  Note: This setting applies to sub-elements of the policy if they exist. The value passed in policy_name will always be used as the policy name when this setting is False

  Default is True.
- **hierarchical_return** (bool, optional) -- Returns a hierarchical view of the policy showing its parents.

  Default is False.

Returns
A dictionary containing the policy settings

Return type
dict

CLI Example:

```
# Using the policy id
salt * lgpo.get_policy LockoutDuration machine
salt * lgpo.get_policy AutoUpdateCfg machine

# Using the full name
```

(continues on next page)

(continued from previous page)

```
salt * lgpo.get_policy "Account lockout duration" machine
salt * lgpo.get_policy "Configure Automatic Updates" machine

# Using full path and name
salt * lgpo.get_policy "Windows Components\Windows Update\Configure
↪Automatic Updates" machine
```

salt.modules.win_lgpo.**get_policy_info**(*policy_name*, *policy_class*, *adml_language='en-US'*)

Returns information about a specified policy

Parameters

- **policy_name** (*str*) -- The name of the policy to lookup
- **policy_class** (*str*) -- The class of policy, i.e. machine, user, both
- **adml_language** (str, optional) -- The ADML language to use for Administrative Template data lookup.

  Default is en-US.

Returns

Information about the specified policy

Return type

dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use `lgpo.get_policy_info` to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the `gpedit.msc` gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, `Access data sources across domains` exists in ~10 different paths. If you put that through `get_policy_info` you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine

local:
    ----------
    message:
    policy_aliases:
        - Turn off the "Order Prints" picture task
        - ShellRemoveOrderPrints_2
        - System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task
    policy_class:
        machine
    policy_elements:
    policy_found:
        True
    policy_name:
        ShellRemoveOrderPrints_2
    rights_assignment:
        False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using

backquotes:

```
PS>salt-call --local lgpo.get_policy_info "Turn off the `\`"Order Prints`\
↪`" picture task" machine

local:
    ----------
    message:
    policy_aliases:
        - Turn off the "Order Prints" picture task
        - ShellRemoveOrderPrints_2
        - System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task
    policy_class:
        machine
    policy_elements:
    policy_found:
        True
    policy_name:
        Turn off the "Order Prints" picture task
    rights_assignment:
        False
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        Turn off the "Order Prints" picture task: Enabled
```

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        ShellRemoveOrderPrints_2: Enabled
```

When using the full path, it might be a good idea to use single quotes around the path:

```
internet_communications_settings:
  lgpo.set:
    - computer_policy:
        'System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task': 'Enabled'
```

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the `.admx` files. If you know nothing about `.admx`/`.adml` relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.
↪adml | Select-String "Order Prints"

C:\windows\PolicyDefinitions\en-US\ICM.adml:152:      <string id=
```

(continues on next page)

(continued from previous page)

```
 ↪"ShellRemoveOrderPrints">Turn off the "Order Prints" picture task</
 ↪string>
C:\windows\PolicyDefinitions\en-US\ICM.adml:153:      <string id=
 ↪"ShellRemoveOrderPrints_Help">This policy setting specifies whether the
 ↪"Order Prints Online" task is available from Picture Tasks in Windows
 ↪folders.
C:\windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online
 ↪Wizard is used to download a list of providers and allow users to order
 ↪prints online.
C:\windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy
 ↪setting, the task "Order Prints Online" is removed from Picture Tasks
 ↪in File Explorer folders.
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.
 ↪admx | Select-String "ShellRemoveOrderPrints"

C:\windows\PolicyDefinitions\ICM.admx:661:    <policy name=
 ↪"ShellRemoveOrderPrints_1" class="User" displayName="$(string.
 ↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_
 ↪Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer
 ↪" valueName="NoOnlinePrintsWizard">
C:\windows\PolicyDefinitions\ICM.admx:671:    <policy name=
 ↪"ShellRemoveOrderPrints_2" class="Machine" displayName="$(string.
 ↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_
 ↪Help)" key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer
 ↪" valueName="NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the `class="Machine"` and `class="User"` (which details if it is a computer policy or user policy respectively) the `ShellRemoveOrderPrints_2` is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.

`salt.modules.win_lgpo.`**`set_`**`(`*computer_policy=None*, *user_policy=None*, *cumulative_rights_assignments=True*, *adml_language='en-US'*`)`

Set a local server policy.

Parameters

- **`computer_policy`** (`dict`, optional) -- A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed.

  Administrative Template data may require dicts within dicts to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

  Policy names can be specified in a number of ways based on the type of policy:

  Windows Settings Policies:

  These policies can be specified using the GUI display name or the key name from the _policy_info class in this module. The GUI display name is also contained in the _policy_info class in this module.

  Administrative Template Policies:

  These can be specified using the policy name as displayed in

the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears lbefore the policy element in the GUI.

Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.

Default is `None`.

- **`user_policy`** (`dict`, optional) -- The same setup as the computer_policy, except with data to configure the local user policy.

  Default is `None`.
- **`cumulative_rights_assignments`** (`bool`, optional) -- Determine how user rights assignment policies are configured.

  If `True`, user right assignment specifications are simply added to the existing policy

  If `False`, only the users specified will get the right (any existing will have the right revoked)

  Default is `True`.
- **`adml_language`** (`str`, optional) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI).

  Default is `en-US`.

Returns

`True` is successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' lgpo.set computer_policy='{"LockoutDuration": 2,
↪"RestrictAnonymous": "Enabled", "AuditProcessTracking": "Succes, Failure
↪"}'
```

`salt.modules.win_lgpo.`**`set_computer_policy`**(*name*, *setting*, *cumulative_rights_assignments=True*, *adml_language='en-US'*)

Set a single computer policy

Parameters

- **`name`** (*`str`*) -- The name of the policy to configure
- **`setting`** (*`str`*) -- The setting to configure the named policy with
- **`cumulative_rights_assignments`** (`bool`, optional) -- Determine how user rights assignment policies are configured. If `True`, user right assignment specifications are simply added to the existing policy. If `False`, only the users specified will get the right (any existing will have the right revoked)

Default is `True`.

- **adml_language** (`str`, optional) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI).

  Default is `en-US`.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

`salt.modules.win_lgpo.`**`set_user_policy`**(*name*, *setting*, *adml_language='en-US'*)

Set a single user policy

Parameters

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **adml_language** (`str`, optional) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI).

  Default is `en-US`.

Returns
True if successful, Otherwise False

Return type
bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display
↪Control Panel" Enabled
```

26.7.498 salt.modules.win_lgpo_reg

LGPO - Registry.pol

New in version 3006.0.

A module for working with registry based policies in Windows Local Group Policy (LGPO). This module contains functions for working with the `Registry.pol` file. The `Registry.pol` file is the source of truth for registry settings and LGPO.

Group Policy is refreshed every 90 seconds by default. During that refresh the contents of the `Registry.pol` file are applied to the Registry. If the setting is changed outside of Group Policy to something other than what is contained in the `Registry.pol` file, it will be changed back during the next refresh.

In the Group Policy Editor (`gpedit.msc`) these policies can be set to three states:

- Not Configured
- Enabled
- Disabled

A policy that is "Not Configured" does not have an entry in the `Registry.pol` file. A Group Policy refresh will not make any changes to key/value pairs in the registry that are not specified in the `Registry.pol` file.

An ”Enabled” policy will have an entry in the `Registry.pol` files that contains its key path, value name, value type, value size, and value data. When Group Policy is refreshed, existing values will be overwritten with those contained in the `Registry.pol` file.

A ”Disabled” policy will have an entry in the `Registry.pol` file with the key path and the value name, but the value name will be prepended with `**del.`. When Group Policy is refreshed the key/value will be deleted from the registry. If the key contains no values, it will also be deleted.

Working with LGPO Reg

The easiest way to figure out the values needed for this module is to set the policy using the Group Policy Editor (`gpedit.msc`) and then run the `lgpo_reg.read_reg_pol` function. This function will display a dictionary of all registry-based policies in the `Registry.pol` file. From its return you can get the `key`, `v_name`, `v_type`, and `v_data` required to ”enable” that policy. Use those values to set/disable/delete policies using this module. The same values can also be used to create states for setting these policies.

Note: Not all policies in the Group Policy Editor (`gpedit.msc`) that write to the registry make that change in the `Registry.pol` file. Those policies could still be enforced via the `Registry.pol` file... theoretically. But you will have to find the values needed to set them with this module using a different method.

`salt.modules.win_lgpo_reg.`**`delete_value`**(*key*, *v_name*, *policy_class='Machine'*)

Delete a key/value pair from the Registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to `Not Configured`.

Parameters

- **`key`** (*`str`*) -- The registry key path
- **`v_name`** (*`str`*) -- The registry value name within the key
- **`policy_class`** (`str`, optional) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`.

Raises

- ***`SaltInvocationError`*** -- Invalid policy_class
- ***`CommandExecutionError`*** -- On failure

Returns

`True` if successful, otherwise `False` None: Key/value not present

Return type

bool

CLI Example:

```
# Delete all values under a key
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.`**`disable_value`**(*key*, *v_name*, *policy_class='machine'*)

Mark a registry value for deletion in the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to `Disabled` in the Group Policy editor (`gpedit.msc`)

Parameters

- **`key`** (*`str`*) -- The registry key path
- **`v_name`** (*`str`*) -- The registry value name within the key
- **`policy_class`** (`str`, optional) -- The registry class to write to. Can be one of the following:

- Computer
- Machine
- User

Default is `Machine`.

Raises

- ***SaltInvocationError*** -- Invalid policy_class
- ***CommandExecutionError*** -- On failure

Returns

`True` if successful, otherwise `False` None: If already disabled

Return type

bool

CLI Example:

```
# Delete a value
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

`salt.modules.win_lgpo_reg.`**`get_key`**(*key*, *policy_class='Machine'*)

Get all the values set in a key in the `Registry.pol` file.

Parameters

- **key** (*str*) -- The registry key where the values reside
- **policy_class** (*str*, optional) -- The registry class to read from. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`.

Raises

SaltInvocationError -- Invalid policy class

Returns

A dictionary containing the value data and the value type

Return type

dict

CLI Example:

```
# Get all values from a key
salt '*' lgpo_reg.get_key "SOFTWARE\MyKey"
```

`salt.modules.win_lgpo_reg.`**`get_value`**(*key*, *v_name*, *policy_class='Machine'*)

Get the value of a single value pair as set in the `Registry.pol` file.

Parameters

- **key** (*str*) -- The registry key where the value name resides
- **v_name** (*str*) -- The value name to retrieve
- **policy_class** (*str*, optional) -- The registry class to read from. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is `Machine`.

Raises

SaltInvocationError -- Invalid policy class

Returns

A dictionary containing the value data and the value type found

Return type

dict

CLI Example:

```
# Get a value
salt '*' lgpo_reg.get_value "SOFTWARE\MyKey" "MyValue"
```

salt.modules.win_lgpo_reg.**read_reg_pol**(*policy_class='Machine'*)

Read the contents of the Registry.pol file. Display the contents as a human-readable dictionary.

Parameters

policy_class (str, optional) -- The registry class to retrieve. Can be one of the following:

- Computer
- Machine
- User

Default is Machine.

Raises

SaltInvocationError -- Invalid policy class

Returns

A dictionary representing the contents of the Registry.pol file

Return type

dict

CLI Example:

```
# Read the machine Registry.pol
salt '*' lgpo_reg.read_reg_pol
```

salt.modules.win_lgpo_reg.**set_value**(*key*, *v_name*, *v_data*, *v_type='REG_DWORD'*, *policy_class='Machine'*)

Add a key/value pair to the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting a policy to Enabled

Parameters

- **key** (*str*) -- The registry key path
- **v_name** (*str*) -- The registry value name within the key
- **v_data** (*str*) -- The registry value
- **v_type** (str, optional) -- The registry value type. Must be one of the following:
  - REG_BINARY
  - REG_DWORD
  - REG_EXPAND_SZ
  - REG_MULTI_SZ
  - REG_QWORD
  - REG_SZ

  Default is REG_DWORD.
- **policy_class** (str, optional) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is Machine.

Raises

- ***SaltInvocationError*** -- Invalid policy_class
- ***SaltInvocationError*** -- Invalid v_type
- ***SaltInvocationError*** -- v_data doesn't match v_type

Returns

True if successful, otherwise False.

Return type
bool

CLI Example:

```
# Set REG_DWORD value (default)
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" 1

# Set REG_SZ value
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" "string value"
↪"REG_SZ"
```

salt.modules.win_lgpo_reg.**write_reg_pol**(*data*, *policy_class='Machine'*)

Write data to the Registry.pol file. The data is a dictionary that is then converted to the appropriate bytes format expected by Registry.pol

Parameters

- **data** (*dict*) -- A dictionary containing Registry.pol data
- **policy_class** (str, optional) -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User

  Default is Machine.

Raises

- ***SaltInvocationError*** -- Invalid policy class
- ***CommandExecutionError*** -- On failure

Returns
True if successful

Return type
bool

CLI Example:

```
# Write to Machine Registry.pol
salt '*' lgpo_reg.write_reg_pol "{'SOFTWARE\MyKey': {'MyValue': 'data': 1,
↪ 'type': 'REG_DWORD'}}"
```

26.7.499 salt.modules.win_license

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**activate**()

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

salt.modules.win_license.**info**()

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

salt.modules.win_license.**install**(*product_key*)

Install the given product key

Parameters

product_key (*str*) -- The product key to install.

Returns

The output of the `slmgr.vbs` script

Return type

str

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**installed**(*product_key*)

Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last
5 digits of the license.

Parameters

product_key (*str*) -- The product key to check.

Returns

True if the last 5 digits match the current product key,
otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**licensed**()

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

salt.modules.win_license.**uninstall**()

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

26.7.500 salt.modules.win_network

Module for gathering and managing network information

salt.modules.win_network.**connect**(*host*, *port=None*, ***kwargs*)

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

Parameters

- **host** (*str*) -- The host to connect to
- **port** (*int*, optional) -- The port to connect to

  Default is None.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4

salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
↪timeout=3
```

salt.modules.win_network.**dig**(*host*)

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

Parameters

host (*str*) -- The host to lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.win_network.**get_route**(*ip*)

Return routing information for given destination ip

New in version 2016.11.5.

Parameters

ip (*str*) -- The to find routing information for

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.win_network.**hw_addr**(*iface*)

Return the hardware address (a.k.a. MAC address) for a given interface

Parameters

iface (*str*) -- The interface name

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.**hwaddr**(*iface*)

This function is an alias of hw_addr.

Return the hardware address (a.k.a. MAC address) for a given interface

Args:

iface (str): The interface name

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.**in_subnet**(*cidr*)

Determine if a host is within a subnet

Parameters

cidr (*str*) -- The CIDR to check

Returns

`True` if host is within specified subnet, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.win_network.**interfaces**()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

salt.modules.win_network.**interfaces_names**()

Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

salt.modules.win_network.**ip_addrs**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

Returns a list of IPv4 addresses assigned to the host.

Parameters

- **interface** (*str*, optional) -- Only IP addresses from that interface will be returned.

  Default is `None`.
- **include_loopback** (*bool*, optional) -- Include loopback 127.0.0.1 IPv4 address.

  Default is `False`.
- **cidr** (*str*, optional) --
  Describes subnet using CIDR notation and only IPv4 addresses that belong
  to this subnet will be returned.

  Default is `None`.

  Changed in version 2019.2.0.
- **type** (*str*, optional) -- If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

  Default is `None`.

  Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

salt.modules.win_network.**ip_addrs6**(*interface=None*, *include_loopback=False*, *cidr=None*)

Returns a list of IPv6 addresses assigned to the host.

Parameters

- **interface** (str, optional) -- Only IP addresses from that interface will be returned.

  Default is None.
- **include_loopback** (bool, optional) -- Include loopback ::1 IPv6 address.

  Default is False.
- **cidr** (str, optional) -- Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

  Default is None.

  Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.**ipaddrs**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)

This function is an alias of ip_addrs.

Returns a list of IPv4 addresses assigned to the host.

Args:

interface (str, optional):
Only IP addresses from that interface will be returned.

Default is None.

include_loopback (bool, optional):
Include loopback 127.0.0.1 IPv4 address.

Default is False.

cidr (str, optional):
Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

Default is None.

Changed in version 2019.2.0.

type (str, optional):
If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

Default is None.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
```

salt.modules.win_network.**ipaddrs6**(*interface=None*, *include_loopback=False*, *cidr=None*)

This function is an alias of ip_addrs6.

Returns a list of IPv6 addresses assigned to the host.

Args:

interface (str, optional):
Only IP addresses from that interface will be returned.

Default is None.

include_loopback (bool, optional):
Include loopback ::1 IPv6 address.

Default is False.

cidr (str, optional):
Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Default is None.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.**is_private**(*ip_addr*)

Check if the given IP address is a private address

New in version 2019.2.0.

Parameters
ip_addr (*str*) -- The IP address to check

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.win_network.**netstat**()

Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

salt.modules.win_network.**nslookup**(*host*)

Query DNS for information about a domain or ip address

Parameters
host (*str*) -- The domain or ip address to lookup

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

salt.modules.win_network.**ping**(*host*, *timeout=False*, *return_boolean=False*)

Performs a ping to a host

Parameters
- **host** (*str*) -- The host to ping
- **timeout** (bool, optional) -- Timeout in seconds. Defaults is False.
- **return_boolean** (bool, optional) -- Return boolean.

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

salt.modules.win_network.**subnets**()

Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

salt.modules.win_network.**traceroute**(*host*)

Performs a traceroute to a 3rd party host

Parameters

host (*str*) -- The host to target with traceroute

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

26.7.501 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

salt.modules.win_ntp.**get_servers**()

Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

salt.modules.win_ntp.**set_servers**(**servers*)

Set Windows to use a list of NTP servers

Parameters

servers (*list*) -- List of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

26.7.502 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message http://support.microsoft.com/kb/104011

salt.modules.win_path.**add**(*path*, *index=None*, ***kwargs*)

Add the directory to the SYSTEM path in the index location.

Parameters

- **path** (*str*) -- Directory to add to path

- **index** (int, optional) -- Optionally specify an index at which to insert the directory

  Default is None.

Kwargs:

rehash (bool, optional):
If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

Returns
True if path was added, otherwise False.

Return type
bool

CLI Examples:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

salt.modules.win_path.**exists**(*path*)

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Parameters
path (str) -- Path to the directory to check

Returns
True if path exists, otherwise False.

Return type
bool

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

salt.modules.win_path.**get_path**()

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

salt.modules.win_path.**rehash**()

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

Note: This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation

---

CLI Example:

```
salt '*' win_path.rehash
```

`salt.modules.win_path.`**`remove`**(*path*, ***kwargs*)

Remove the directory from the SYSTEM path

Parameters

path (*str*) -- Directory to remove from path

Kwargs:

rehash

[True] If the registry was updated, and this value is set to `True`, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to `False` to skip this broadcast.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

26.7.503 salt.modules.win_pkg

A module to manage software on Windows

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see *here*.

The following functions require the existence of a *windows repository* metadata DB, typically created by running *pkg.refresh_db*:

- *pkg.get_repo_data*
- *pkg.install*
- *pkg.latest_version*
- *pkg.list_available*
- *pkg.list_pkgs*
- *pkg.list_upgrades*
- *pkg.remove*

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the *winrepo_cache_expire_min* minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

Note: Version numbers can be `version number string`, `latest` and `Not Found`, where `Not Found` means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, `Not Found`, `order version numbers`, ..., `latest`.

salt.modules.win_pkg.**compare_versions**(*ver1=''*, *oper='=='*, *ver2=''*)

Compare software package versions. Made public for use with Jinja

Parameters

- **ver1** (str, optional) -- A software version to compare.

  Default is "".
- **oper** (str, optional) -- The operand to use to compare.

  Default is "==".
- **ver2** (str, optional) -- A software version to compare. Default is ""

Returns

True if the comparison is valid, otherwise False.

Return type

bool

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

salt.modules.win_pkg.**genrepo**(***kwargs*)

Generate package metadata db based on files within the winrepo_source_dir

Kwargs:

saltenv (str): Salt environment.

Default is base.

verbose (bool):

Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within.

Default is False.

failhard (bool):

If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

Default is True.

Note:

- Hidden directories (directories beginning with '.', such as '*.git*') will be ignored.

Returns

A dictionary of the results of the command

Return type

dict

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

salt.modules.win_pkg.**get_package_info**(*name*, *saltenv='base'*)

Get information about the package as found in the winrepo database

Parameters

- **name** (*str*) -- The name of the package
- **saltenv** (str, optional) -- The salt environment to use.

  Default is base.

Returns
A dictionary of package info, empty if package not available

Return type
dict

CLI Example:

```
salt '*' pkg.get_package_info chrome
```

salt.modules.win_pkg.**get_repo_data**(*saltenv='base'*)

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters
saltenv (str, optional) -- Salt environment.

Default is base.

Returns
A dict containing contents of metadata db.

Return type
dict

CLI Example:

```
salt '*' pkg.get_repo_data
```

salt.modules.win_pkg.**install**(*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*)

Install the passed package(s) on the system using winrepo

Parameters
- **name** (*str*) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (bool, optional) -- Boolean value representing whether or not to refresh the winrepo db.

  Default is False.
- **pkgs** (list, optional) -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

  You can specify a version by passing the item as a dict:

  CLI Example:

  ```
  # will install the latest version of foo and bar
  salt '*' pkg.install pkgs='["foo", "bar"]'

  # will install the latest version of foo and version 1.2.
  ↪3 of bar
  salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
  ```

  Default is None.

Kwargs:

version (str):
The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the pkgs parameter, the version will be ignored.

Note: Remember that versions that contain a single . will be interpreted as numbers and must be double-quoted. For example, version 3006.10 will be rendered as 3006.1. To

pass `3006.10` you'll need to use double-quotes. `version="'3006.10'"`

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.
↪2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

extra_install_flags (str):
Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

saltenv (str):
Salt environment. Default 'base'

report_reboot_exit_codes (bool):
If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

force (bool):
If `True`, the installation will run whether the package is already installed or not. If `False`, the installation will not run if the correct version of the package is already installed. Default is `False`.

New in version 3006.15.

Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Return type
dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\
↪repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\
↪repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

`salt.modules.win_pkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Note: Since this is looking for the latest version available, a refresh_db will be triggered by default. This can take some time. To avoid this set `refresh` to `False`.

Parameters

names (*str, list*) -- A single name or a list of names to lookup

Kwargs:

saltenv (str): Salt environment. Default `base`

refresh (bool): Refresh package metadata. Default `True`

Returns

A dictionary of packages with the latest version available

Return type
dict

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.win_pkg.**list_available**(**names*, ***kwargs*)

Return a list of available versions of the specified package.

Parameters
names (*str*, *list*) -- A single name or a list of names to check

Kwargs:

saltenv (str): The salt environment to use. Default is `base`.

refresh (bool): Refresh package metadata.
Default is `False`.

return_dict_always (bool):
Return a dict when a single package name is queried. Default is `False`.

Returns
The package name with its available versions

Return type
dict

```
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

salt.modules.win_pkg.**list_pkgs**(*versions_as_list=False*, *include_components=True*, *include_updates=True*, ***kwargs*)

List the packages currently installed.

Note: To view installed software as displayed in the Add/Remove Programs, set `include_components` and `include_updates` to False.

Parameters

- **versions_as_list** (`bool`, optional) -- Returns the versions as a list.

  Default is `False`.
- **include_components** (`bool`, optional) -- Include sub components of installed software.

  Default is `True`.
- **include_updates** (`bool`, optional) -- Include software updates and Windows updates.

  Default is `True`

Kwargs:

saltenv (str):
The salt environment to use.

Default is `base`.

refresh (bool):
Refresh package metadata.

Default is `False`

Returns
A dictionary of installed software with versions installed

Return type
dict

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

List all available package upgrades on this system

Parameters
`refresh` (`bool`, optional) -- Refresh package metadata. Default is `True`.

Kwargs:
saltenv (str): Salt environment. Default is `base`

Returns
A dictionary of packages with available upgrades

Return type
dict

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.`**`normalize_name`**(*name*)

Nothing to do on Windows. We need this function so that Salt doesn't go through every module looking for `pkg.normalize_name`.

New in version 3006.0.

Parameters
`name` (*`str`*) -- The name of the package

Returns
The name of the package

Return type
str

CLI Example:

```
salt '*' pkg.normalize_name git
```

`salt.modules.win_pkg.`**`purge`**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported on Windows, this function is identical to `remove()`.

Note: At some point in the future, `pkg.purge` may direct the installer to remove all configs and settings for software packages that support that option.

New in version 0.16.0.

Parameters

- **name** (str, optional) -- The name of the package to be deleted.

  Default is None.
- **pkgs** (list, optional) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

  Default is None.

Kwargs:

version (str):
The version of the package to be deleted. If this option is used in combination with the pkgs option below, then this version will be applied to all targeted packages.

saltenv (str): Salt environment.
Default is base.

refresh (bool): Refresh package metadata.
Default is False.

Returns
A dict containing the changes.

Return type
dict

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.**refresh_db**(***kwargs*)

Generates the local software metadata database (*winrepo.p*) on the minion. The database is stored in a serialized format located by default at the following location:

```
C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\
repo-ng\winrepo.p
```

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from *winrepo_source_dir* (default *salt://win/repo-ng*) and cache them in *<cachedir>files<saltenv><winrepo_source_dir>* (default: C:\ProgramData\Salt Project\Salt\var\cache\salt\minion\files\base\win\repo-ng)
- Call *pkg.genrepo* to parse the package definition files and generate the repository metadata database file (*winrepo.p*)
- Return the report received from *pkg.genrepo*

The default winrepo directory on the master is */srv/salt/win/repo-ng*. All files that end with *.sls* in this and all subdirectories will be used to generate the repository metadata database (*winrepo.p*).

Note:

- Hidden directories (directories beginning with '.', such as '*.git*') will be ignored.

Note: There is no need to call *pkg.refresh_db* every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

- *winrepo_cache_expire_min*
- *winrepo_cache_expire_max*

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

Warning: Directories and files fetched from <winrepo_source_dir> (*/srv/salt/win/repo-ng*) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see *Windows Software Repository*

Kwargs:

saltenv (str): Salt environment.
Default is `base`.

verbose (bool):
Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within.

Default is `False`.

failhard (bool):
If `True`, an error will be raised if any repo SLS files fail to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

Default is `True`.

Returns
A dictionary containing the results of the database refresh.

Return type
dict

Note: A result with a *total: 0* generally means that the files are in the wrong location on the master. Try running the following command on the minion: *salt-call -l debug pkg.refresh saltenv=base*

Warning: When calling this command from a state using *module.run* be sure to pass *failhard: False*. Otherwise, the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **`name`** (`str`, optional) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma-delimited list of packages, no spaces.

  Default is `None`.
- **`pkgs`** (`list`, optional) -- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Default is None.

Kwargs:

version (str):
The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

saltenv (str): Salt environment.
Default is base.
refresh (bool): Refresh package metadata.
Default is False.

Returns

Returns a dict containing the changes.

If the package is removed by pkg.remove:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}
If the package is already uninstalled:
{'<package>': {'current': 'not installed'}}

Return type
dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.**upgrade**(***kwargs*)

Upgrade all software. Currently not implemented

Kwargs:
saltenv (str): The salt environment to use.
Default is base.
refresh (bool): Refresh package metadata.
Default is True.

Note: This feature is not yet implemented for Windows.

Returns
Empty dict, until implemented
Return type
dict

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.win_pkg.**upgrade_available**(*name*, ***kwargs*)

Check whether an upgrade is available for a given package

Parameters
name (*str*) -- The name of a single package

Kwargs:

refresh (bool): Refresh package metadata. Default `True`

saltenv (str): The salt environment. Default `base`

Returns
`True` if new version available, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.win_pkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters
name (*str, list*) -- A single name or a list of package names to check

Kwargs:

saltenv (str): The salt environment to use. Default `base`.

refresh (bool): Refresh package metadata. Default `False`.

Returns
version string when a single package is specified. dict: The package name(s) with the installed versions.

Return type
str

```
{['<version>', '<version>', ]} OR
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

26.7.504 salt.modules.win_pki

Microsoft certificate management via the PKI Client PowerShell module. https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx

platform
Windows

depends

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

salt.modules.win_pki.**export_cert**(*name*, *thumbprint*, *cert_format='cer'*, *context='LocalMachine'*, *store='My'*, *password=''*)

Export the certificate to a file from the given certificate store.

Parameters

- **name** (*str*) -- The destination path for the exported certificate file.
- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **cert_format** (str, optional) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.

  Default is "cer"
- **context** (str, optional) -- The name of the certificate store location context.

  Default is "LocalMachine"
- **store** (str, optional) -- The name of the certificate store.

  Default is "My"
- **password** (str, optional) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

  Default is "".

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint=
↪'AAA000'
```

salt.modules.win_pki.**get_cert_file**(*name*, *cert_format='cer'*, *password=''*)

Get the details of the certificate file.

Parameters

- **name** (*str*) -- The filesystem path of the certificate file.
- **cert_format** (str, optional) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.

  Default is "cer"
- **password** (str, optional) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

  Default is "".

Returns

A dictionary of the certificate thumbprints and properties.

Return type

dict

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.**get_certs**(*context='LocalMachine'*, *store='My'*)

Get the available certificates in the given store.

Parameters

- **context** (str, optional) -- The name of the certificate store location context.

  Default is "LocalMachine"
- **store** (str, optional) -- The name of the certificate store.

Default is "My"

Returns
A dictionary of the certificate thumbprints and properties.

Return type
dict

CLI Example:

```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.**get_stores**()

Get the certificate location contexts and their corresponding stores.

Returns
A dictionary of the certificate location contexts and stores.

Return type
dict

CLI Example:

```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.**import_cert**(*name*, *cert_format='cer'*, *context='LocalMachine'*, *store='My'*, *exportable=True*, *password=''*, *saltenv='base'*)

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) -- The path of the certificate file to import.
- **cert_format** (str, optional) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.

  Default is "cer"
- **context** (str, optional) -- The name of the certificate store location context.

  Default is "LocalMachine"
- **store** (*str*) -- The name of the certificate store.

  Default is "My"
- **exportable** (bool, optional) -- Mark the certificate as exportable. Only applicable to pfx format.

  Default is True.
- **password** (str, optional) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

  Default is "".
- **saltenv** (str, optional) -- The environment the file resides in.

  Default is "base".

Returns
A boolean representing whether all changes succeeded.

Return type
bool

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

salt.modules.win_pki.**remove_cert**(*thumbprint*, *context='LocalMachine'*, *store='My'*)

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (str, optional) -- The name of the certificate store location context.

  Default is "LocalMachine".
- **store** (str, optional) -- The name of the certificate store.

  Default is "My"

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

salt.modules.win_pki.**test_cert**(*thumbprint*, *context='LocalMachine'*, *store='My'*, *untrusted_root=False*, *dns_name=''*, *eku=''*)

Check the certificate for validity.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (str, optional) -- The name of the certificate store location context.

  Default is "LocalMachine"
- **store** (str, optional) -- The name of the certificate store.

  Default is "My"
- **untrusted_root** (bool, optional) -- Whether the root certificate is required to be trusted in chain building.

  Default is False.
- **dns_name** (str, optional) -- The DNS name to verify as valid for the certificate.

  Default is "".
- **eku** (str, optional) -- The enhanced key usage object identifiers to verify for the certificate chain.

  Default is "".

Returns

A boolean representing whether the certificate was considered valid.

Return type

bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

26.7.505 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

salt.modules.win_powercfg.**get_disk_timeout**(*scheme=None*)

Get the current disk timeout of the given scheme

Parameters

scheme (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Default is None.

Returns

A dictionary of both the AC and DC settings

Return type

dict

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

salt.modules.win_powercfg.**get_hibernate_timeout**(*scheme=None*)

Get the current hibernate timeout of the given scheme

Args

scheme (str, optional):

The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Default is None.

Returns

A dictionary of both the AC and DC settings

Return type

dict

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

salt.modules.win_powercfg.**get_monitor_timeout**(*scheme=None*)

Get the current monitor timeout of the given scheme

Parameters

scheme (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Default is None.

Returns

A dictionary of both the AC and DC settings

Return type

dict

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

salt.modules.win_powercfg.**get_standby_timeout**(*scheme=None*)

Get the current standby timeout of the given scheme

Parameters

scheme (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Default is None.

Returns

A dictionary of both the AC and DC settings

Return type

dict

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

salt.modules.win_powercfg.**set_disk_timeout**(*timeout*, *power='ac'*, *scheme=None*)

Set the disk timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) -- The amount of time in minutes before the disk will timeout
- **power** (str, optional) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)

  Default is "ac"
- **scheme** (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

  Default is None.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

salt.modules.win_powercfg.**set_hibernate_timeout**(*timeout*, *power='ac'*, *scheme=None*)

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) -- The amount of time in minutes before the computer hibernates
- **power** (str, optional) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)

  Default is "ac".
- **scheme** (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Default is None.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

salt.modules.win_powercfg.**set_monitor_timeout**(*timeout*, *power='ac'*, *scheme=None*)

Set the monitor timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) -- The amount of time in minutes before the monitor will timeout
- **power** (str, optional) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)

  Default is "ac".
- **scheme** (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

  Default is None.

Returns

True if successful, otherwise False

Return type

bool

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

salt.modules.win_powercfg.**set_standby_timeout**(*timeout*, *power='ac'*, *scheme=None*)

Set the standby timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) -- The amount of time in minutes before the computer sleeps
- **power** (str, optional) -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)

  Default is "ac".
- **scheme** (str, optional) -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

  Default is None.

Returns
`True` if successful, otherwise `False`
Return type
bool

CLI Example:

```
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

26.7.506 salt.modules.win_psget

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0
- PSGet

Support for PowerShell

`salt.modules.win_psget.`**`avail_modules`**(*desc=False*)

List available modules in registered Powershell module repositories.

Parameters
`desc` (`bool`, optional) -- If `True`, the verbose description will be returned.

Default is `False`.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

`salt.modules.win_psget.`**`bootstrap`**()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

`salt.modules.win_psget.`**`get_repository`**(*name*)

Get the details of a local PSGet repository

Parameters
`name` (*str*) -- Name of the repository.

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

`salt.modules.win_psget.`**`install`**(*name*, *minimum_version=None*, *required_version=None*, *scope=None*, *repository=None*)

Install a Powershell module from powershell gallery on the system.

Parameters
- **`name`** (*str*) -- Name of a Powershell module.
- **`minimum_version`** (`str`, optional) -- The maximum version to install, e.g. 1.23.2.

  Default is `None`.

- **required_version** (str, optional) -- Install a specific version.

  Default is None.
- **scope** (str, optional) -- The scope to install the module to, e.g. CurrentUser, Computer.

  Default is None.
- **repository** (str, optional) -- The friendly name of a private repository, e.g. MyREpo.

  Default is None.

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

salt.modules.win_psget.**list_modules**(*desc=False*)

List currently installed PSGet Modules on the system.

Parameters

desc (bool, optional) -- If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

salt.modules.win_psget.**register_repository**(*name*, *location*, *installation_policy=None*)

Register a PSGet repository on the local machine

Parameters

- **name** (*str*) -- The name for the repository.
- **location** (*str*) -- The URI for the repository.
- **installation_policy** (str, optional) -- The installation policy for packages, e.g. Trusted, Untrusted.

  Default is None.

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.
↪com/packages
```

salt.modules.win_psget.**remove**(*name*)

Remove a Powershell DSC module from the system.

Parameters

name (*str*) -- Name of a Powershell DSC module.

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

salt.modules.win_psget.**update**(*name*, *maximum_version=None*, *required_version=None*)

Update a PowerShell module to a specific version, or the newest

Parameters

- **name** (*str*) -- Name of a Powershell module.
- **maximum_version** (str, optional) -- The maximum version to install, e.g. 1.23.2.

  Default is None.
- **required_version** (str, optional) -- Install a specific version.

  Default is None.

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

26.7.507 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

maintainer
Shane Lee <slee@saltstack.com>

platform
Windows Server 2008R2 or greater

depends
PowerShell module `ServerManager`

`salt.modules.win_servermanager.`**`install`**(*feature, recurse=False, restart=False, source=None, exclude=None*)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

---

Parameters

- **`feature`** (*`str, list`*) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  New in version 2018.3.0: Added the ability to pass a list of features to be installed.
- **`recurse`** (`bool`, optional) -- Install all sub-features.

  Default is `False`.
- **`restart`** (`bool`, optional) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in `exclude` requires a reboot to be properly removed.

  Default is `False`.
- **`source`** (`str`, optional) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files.

  Default is `None`.
- **`exclude`** (`str`, optional) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  Warning: As there is no exclude option for the `Add-WindowsFeature` or `Install-WindowsFeature` PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If**

the feature named in ``exclude`` is not a sub-feature of one of the installed items it will still be removed.

Default is None.

Returns
A dictionary containing the results of the install

Return type
dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited
# string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True

# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install "['XPS-Viewer', 'SNMP-Service',
↪'RemoteAccess']" True recurse=True exclude="Web-Server"
```

salt.modules.win_servermanager.**list_available**()

List available features to install

Returns
A list of available features as returned by the Get-WindowsFeature PowerShell command

Return type
str

CLI Example:

```
salt '*' win_servermanager.list_available
```

salt.modules.win_servermanager.**list_installed**()

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

Returns
A dictionary of installed features

Return type
dict

CLI Example:

```
salt '*' win_servermanager.list_installed
```

salt.modules.win_servermanager.**remove**(*feature*, *remove_payload=False*, *restart=False*)

Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while

to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

Parameters

- **feature** (*str, list*) -- The name of the feature(s) to remove. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

  New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- **remove_payload** (bool, optional) -- True will cause the feature to be removed from the side-by-side store (`%SystemDrive%:\Windows\WinSxS`).

  Default is `False`.
- **restart** (bool, optional) -- Restarts the computer when uninstall is complete, if required by the role/feature removed.

  Default is `False`.

Returns

A dictionary containing the results of the uninstall

Return type

dict

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

26.7.508 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: Rewritten to use PyWin32

`salt.modules.win_service.`**`available`**(*name*)

Check if a service is available on the system.

Parameters

name (*str*) -- The name of the service to check

Returns

`True` if the service is available, `False` otherwise

Return type

bool

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.`**`create`**(*name*, *bin_path*, *exe_args=None*, *display_name=None*, *description=None*, *service_type='own'*, *start_type='manual'*, *start_delayed=False*, *error_control='normal'*, *load_order_group=None*, *dependencies=None*, *account_name='.\\LocalSystem'*, *account_password=None*, *run_interactive=False*, ***kwargs*)

Create the named service.

New in version 2015.8.0.

Parameters

- **name** (*str*) -- Specifies the service name. This is not the display_name.
- **bin_path** (*str*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: `C:\path\to\binary.exe`.

- **exe_args** (str, optional) -- Any additional arguments required by the service binary.

  Default is None.
- **display_name** (str, optional) -- The name to be displayed in the service manager. If not passed, the name will be used.

  Default is None.
- **description** (str, optional) -- A description of the service.

  Default is None.
- **service_type** (str, optional) -- Specifies the service type. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services

  Default is "own".
- **start_type** (str, optional) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the bootloader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started

  Default is "manual".
- **start_delayed** (bool, optional) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set.

  Default is False.
- **error_control** (str, optional) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (default): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user

  Default is "normal".
- **load_order_group** (str, optional) -- The name of the load order group to which this service belongs.

  Default is None.
- **dependencies** (list, optional) -- A list of services or load ordering groups that must start before this service.

  Default is None.
- **account_name** (str, optional) -- The name of the account under which the service should run. For own type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT AuthorityLocalService
  - NT AuthorityNetworkService
  - NT AuthorityLocalSystem

- .LocalSystem

Default is `\LocalSystem`.

- **`account_password`** (`str`, optional) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise, a password must be specified.

  Default is `None`.

- **`run_interactive`** (`bool`, optional) -- If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

  Default is `False`.

Returns
A dictionary containing information about the new service

Return type
dict

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='
↪<display name>'
```

`salt.modules.win_service.`**`create_win_salt_restart_task`**`()`

Create a task in Windows task scheduler to enable restarting the salt-minion

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

`salt.modules.win_service.`**`delete`**`(`*name*, *timeout=90*`)`

Delete the named service

Parameters

- **`name`** (*`str`*) -- The name of the service to delete
- **`timeout`** (`int`, optional) -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted.

  New in version 2017.7.9,2018.3.4.

  Default is 90 seconds.

Returns
`True` if successful, otherwise **`False`**. Also returns **`True`** if the service is not present

Return type
bool

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.win_service.`**`disable`**`(`*name*, ***kwargs*`)`

Disable the named service to start at boot

Parameters
`name` (*`str`*) -- The name of the service to disable.

Returns
`True` if disabled, otherwise `False`
Return type
bool

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.win_service.**disabled**(*name*)

Check to see if the named service is disabled to start on boot

Parameters
name (*str*) -- The name of the service to check
Returns
`True` if the service is disabled, otherwise `False`
Return type
bool

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.win_service.**enable**(*name*, *start_type='auto'*, *start_delayed=False*, ***kwargs*)

Enable the named service to start at boot

Parameters
- **name** (*str*) -- The name of the service to enable.
- **start_type** (`str`, optional) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started

  Default is "auto".
- **start_delayed** (`bool`, optional) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set.

  Default is `False`.

Returns
`True` if successful, otherwise `False`
Return type
bool

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.win_service.**enabled**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

Parameters
name (*str*) -- The name of the service to check
Returns
`True` if the service is set to start, otherwise `False`
Return type
bool

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.win_service.**execute_salt_restart_task**()

Run the Windows Salt restart task

Returns

`True` if successful, otherwise `False`

Return type

bool

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

salt.modules.win_service.**get_all**()

Return all installed services

Returns

Returns a list of all services on the system.

Return type

list

CLI Example:

```
salt '*' service.get_all
```

salt.modules.win_service.**get_disabled**()

Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

Returns

A list of disabled services.

Return type

list

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.win_service.**get_enabled**()

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

Returns

A list of enabled services

Return type

list

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.win_service.**get_service_name**(**args*)

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

Returns

A dictionary of display names and service names

Return type
dict

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP
↪Client'
```

salt.modules.win_service.**getsid**(*name*)

Return the SID for this windows service

Parameters
name (*str*) -- The name of the service for which to return the SID

Returns
A string representing the SID for the service

Return type
str

CLI Example:

```
salt '*' service.getsid <service name>
```

salt.modules.win_service.**info**(*name*)

Get information about a service on the system

Parameters
name (*str*) -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

Returns
A dictionary containing information about the service.

Return type
dict

CLI Example:

```
salt '*' service.info spooler
```

salt.modules.win_service.**missing**(*name*)

The inverse of service.available.

Parameters
name (*str*) -- The name of the service to check

Returns
`True` if the service is missing, `False` otherwise

Return type
bool

CLI Example:

```
salt '*' service.missing <service name>
```

salt.modules.win_service.**modify**(*name*, *bin_path=None*, *exe_args=None*, *display_name=None*, *description=None*, *service_type=None*, *start_type=None*, *start_delayed=None*, *error_control=None*, *load_order_group=None*, *dependencies=None*, *account_name=None*, *account_password=None*, *run_interactive=None*)

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the service. Can be found using the `service.get_service_name` function.
- **bin_path** (`str`, optional) -- The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`.

  Default is `None`.
- **exe_args** (`str`, optional) -- Any arguments required by the service executable.

  Default is `None`.
- **display_name** (`str`, optional) -- The name to display in the service manager.

  Default is `None`.
- **description** (`str`, optional) -- The description to display for the service.

  Default is `None`.
- **service_type** (`str`, optional) -- Specifies the service type. `None` defaults to `own`. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services

  Default is `None`.
- **start_type** (`str`, optional) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started

  Default is `None`.
- **start_delayed** (`bool`, optional) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set.

  Default is `None`.
- **error_control** (`str`, optional) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues. No notification is given to the user

  Default is `None`.
- **load_order_group** (`str`, optional) -- The name of the load order group to which this service belongs.

  Default is `None`.
- **dependencies** (`list`, optional) -- A list of services or load ordering groups that must start before this service.

  Default is `None`.
- **account_name** (`str`, optional) -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format.

The following are examples of valid built-in service accounts:
- NT AuthorityLocalService
- NT AuthorityNetworkService
- NT AuthorityLocalSystem
- .LocalSystem

Default is `None`.

- **`account_password`** (`str`, optional) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise, a password must be specified.

  Default is `None`.

- **`run_interactive`** (`bool`, optional) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

  Default is `None`.

Returns
a dictionary of changes made

Return type
dict

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.`**`restart`**(*name*, *timeout=90*)

Restart the named service. This issues a stop command followed by a start.

Parameters

- **`name`** -- The name of the service to restart.

  Note: If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

- **`timeout`** (`int`, optional) -- The time in seconds to wait for the service to stop and start before returning.

  Note: The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

  New in version 2017.7.9,2018.3.4.

  Default is 90 seconds.

Returns
`True` if successful, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.`**`start`**(*name*, *timeout=90*)

Start the specified service.

Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to `Manual` start.

Parameters

- **name** (*str*) -- The name of the service to start
- **timeout** (int, optional) -- The time in seconds to wait for the service to start before returning.

  New in version 2017.7.9,2018.3.4.

  Default is 90 seconds.

Returns

True if successful, otherwise **False**. Also returns **True** if the service is already started

Return type

bool

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.win_service.`**`status`**(*name*, **args*, ***kwargs*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Changed in version 3006.0: Returns "Not Found" if the service is not found on the system

Parameters

name (*str*) -- The name of the service to check

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise str: Not Found if the service is not found on the system

Return type

bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.win_service.`**`stop`**(*name*, *timeout=90*)

Stop the specified service

Parameters

- **name** (*str*) -- The name of the service to stop
- **timeout** (int, optional) -- The time in seconds to wait for the service to stop before returning.

  New in version 2017.7.9,2018.3.4.

  Default is 90 seconds.

Returns

True if successful, otherwise **False**. Also returns **True** if the service is already stopped

Return type

bool

CLI Example:

```
salt '*' service.stop <service name>
```

26.7.509 salt.modules.win_shadow

Manage the shadow file

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see *here*.

salt.modules.win_shadow.**info**(*name*)

Return information for the specified user.

Note: This just returns dummy data so that salt states can work.

Parameters

name (*str*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.win_shadow.**require_password_change**(*name*)

Require the user to change their password the next time they log in.

Parameters

name (*str*) -- The name of the user account to require a password change.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

salt.modules.win_shadow.**set_expire**(*name*, *expire*)

Set the expiration date for a user account.

Parameters

- **name** (*str*) -- The name of the user account to edit.
- **expire** (*str*) -- The date the account will expire.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

salt.modules.win_shadow.**set_password**(*name*, *password*)

Set the password for a named user.

Parameters

- **name** (*str*) -- The name of the user account.

- **password** (*str*) -- The new password.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

salt.modules.win_shadow.**unlock_account**(*name*)

Unlocks a user account.

Parameters
name (*str*) -- The name of the user account to unlock.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

26.7.510 salt.modules.win_shortcut

Execution module for creating shortcuts on Windows. Handles file shortcuts (*.lnk*) and url shortcuts (*.url*). Allows for the configuration of icons and hot keys on file shortcuts. Changing the icon and hot keys are unsupported for url shortcuts.

New in version 3005.

salt.modules.win_shortcut.**create**(*path*, *target*, *arguments=''*, *description=''*, *hot_key=''*, *icon_index=0*, *icon_location=''*, *window_style='Normal'*, *working_dir=''*, *backup=False*, *force=False*, *make_dirs=False*, *user=None*)

Create a new shortcut. This can be a file shortcut (`.lnk`) or a url shortcut (`.url`).

Parameters

- **path** (*str*) -- The full path to the shortcut. Must have a *.lnk* or *.url* file extension.
- **target** (*str*) -- The full path to the target.
- **arguments** (*str*, optional) -- Any arguments to be passed to the target.

  Default is "".
- **description** (*str*, optional) -- The description for the shortcut. This is shown in the `Comment` field of the dialog box.

  Default is "".
- **hot_key** (*str*, optional) -- A combination of hot Keys to trigger this shortcut. This is something like `Ctrl+Alt+D`. This is shown in the `Shortcut key` field in the dialog box. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext

  Default is "".
- **icon_index** (*int*, optional) -- The index for the icon to use in files that contain multiple icons.

  Default is 0.

- **icon_location** (str, optional) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file.

  Default is "".
- **window_style** (str, optional) -- The window style the program should start in. This is shown in the Run field of the dialog box. Valid options are:
  - Normal
  - Minimized
  - Maximized

  Default is "Normal".
- **working_dir** (str, optional) -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.

  Default is "".
- **backup** (bool, optional) -- If there is already a shortcut with the same name, set this value to True to backup the existing shortcut and continue creating the new shortcut.

  Default is False.
- **force** (bool, optional) -- If there is already a shortcut with the same name and you aren't backing up the shortcut, set this value to True to remove the existing shortcut and create a new with these settings.

  Default is False.
- **make_dirs** (bool, optional) -- If the parent directory structure does not exist for the new shortcut, create it.

  Default is False.
- **user** (str, optional) -- The user to be the owner of any directories created by setting make_dirs to True. If no value is passed, Salt will use the user account that it is running under.

  Default is "".

Returns
True if successful.

Return type
bool

Raises
- ***CommandExecutionError*** -- If the path is not a .lnk or .url file extension.
- ***CommandExecutionError*** -- If there is an existing shortcut with the same name and backup and force are both False
- ***CommandExecutionError*** -- If the parent directory is not created and make_dirs is False
- ***CommandExecutionError*** -- If there was an error creating the parent directories

CLI Example:

```
# Create a shortcut and set the ``Shortcut key`` (``hot_key``)
salt '*' shortcut.create 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪' hot_key='Ctrl+Alt+N'

# Create a shortcut and change the icon to the 3rd one in the icon file
salt '*' shortcut.create 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪' icon_location='C:\path\to\icon.ico' icon_index=2
```

(continues on next page)

(continued from previous page)

```
# Create a shortcut and change the startup mode to full screen
salt '*' shortcut.create 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪' window_style='Maximized'

# Create a shortcut and change the icon
salt '*' shortcut.create 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪' icon_location='C:\path\to\icon.ico'

# Create a shortcut and force it to overwrite an existing shortcut
salt '*' shortcut.create 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪' force=True

# Create a shortcut and create any parent directories if they are missing
salt '*' shortcut.create 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪' make_dirs=True
```

`salt.modules.win_shortcut.`**`get`**(*path*)

Gets the properties for a shortcut

Parameters

`path` (*str*) -- The path to the shortcut. Must have a *.lnk* or *.url* file extension.

Returns

A dictionary containing all available properties for the specified shortcut

Return type

dict

CLI Example:

```
salt '*' shortcut.get path='C:\path\to\shortcut.lnk'
```

`salt.modules.win_shortcut.`**`modify`**(*path*, *target=''*, *arguments=''*, *description=''*, *hot_key=''*, *icon_index=0*, *icon_location=''*, *window_style='Normal'*, *working_dir=''*)

Modify an existing shortcut. This can be a file shortcut (`.lnk`) or a url shortcut (`.url`).

Parameters

- **`path`** (*str*) -- The full path to the shortcut. Must have a *.lnk* or *.url* file extension.
- **`target`** (*str*, optional) -- The full path to the target.

  Default is "".
- **`arguments`** (*str*, optional) -- Any arguments to be passed to the target.

  Default is "".
- **`description`** (*str*, optional) -- The description for the shortcut. This is shown in the `Comment` field of the dialog box.

  Default is "".
- **`hot_key`** (*str*, optional) -- A combination of hot Keys to trigger this shortcut. This is something like `Ctrl+Alt+D`. This is shown in the `Shortcut key` field in the dialog box. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext

  Default is "".
- **`icon_index`** (*int*, optional) -- The index for the icon to use in files that contain multiple icons.

Default is 0.

- **icon_location** (str, optional) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file.

  Default is "".
- **window_style** (str, optional) -- The window style the program should start in. This is shown in the Run field of the dialog box. Valid options are:
  - Normal
  - Minimized
  - Maximized

  Default is "Normal".
- **working_dir** (str, optional) -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.

  Default is "".

Returns
True if successful.

Return type
bool

CLI Example:

```
# Modify an existing shortcut. Set it to target notepad.exe
salt '*' shortcut.modify 'C:\path\to\shortcut.lnk' 'C:\Windows\notepad.exe
↪'
```

26.7.511 salt.modules.win_smtp_server

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

depends
wmi

salt.modules.win_smtp_server.**get_connection_ip_list**(*as_wmi_format=False*, *server='SmtpSvc/1'*)

Get the IPGrant list for the SMTP virtual server.

Parameters

- **as_wmi_format** (bool, optional) -- Returns the connection IPs as a list in the format WMI expects.

  Default is False.
- **server** (str, optional) -- The SMTP server name.

  Default is "SmtpSvc/1".

Returns
A dictionary of the IP and subnet pairs.

Return type
dict

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

salt.modules.win_smtp_server.**get_log_format**(*server='SmtpSvc/1'*)

Get the active log format for the SMTP virtual server.

Parameters

server (str, optional) -- The SMTP server name.

Default is "SmtpSvc/1".

Returns

A string of the log format name.

Return type

str

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

salt.modules.win_smtp_server.**get_log_format_types**()

Get all available log format names and ids.

Returns

A dictionary of the log format names and IDs.

Return type

dict

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

salt.modules.win_smtp_server.**get_relay_ip_list**(*server='SmtpSvc/1'*)

Get the RelayIpList list for the SMTP virtual server.

Parameters

server (str, optional) -- The SMTP server name.

Default is "SmtpSvc/1".

Returns

A list of the relay IPs.

Return type

list

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

salt.modules.win_smtp_server.**get_server_setting**(*settings*, *server='SmtpSvc/1'*)

Get the value of the setting for the SMTP virtual server.

Parameters

- **settings** (*list*) -- A list of the setting names.
- **server** (str, optional) -- The SMTP server name.

  Default is "SmtpSvc/1".

Returns

A dictionary of the provided settings and their values.

Return type

dict

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings='["MaxRecipients"]'
```

salt.modules.win_smtp_server.**get_servers**()

Get the SMTP virtual server names.

Returns
A list of the SMTP virtual servers.

Return type
list

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

salt.modules.win_smtp_server.**set_connection_ip_list**(*addresses=None*, *grant_by_default=False*, *server='SmtpSvc/1'*)

Set the IPGrant list for the SMTP virtual server.

Parameters

- **addresses** (dict, optional) -- A dictionary of IP + subnet pairs.

  Default is None.
- **grant_by_default** (bool, optional) -- Whether the addresses should be a blacklist or whitelist.

  Default is False.
- **server** (str, optional) -- The SMTP server name.

  Default is "SmtpSvc/1".

Returns
A boolean representing whether the change succeeded.

Return type
bool

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses='{"127.0.0.1":
↪"255.255.255.255"}'
```

salt.modules.win_smtp_server.**set_log_format**(*log_format*, *server='SmtpSvc/1'*)

Set the active log format for the SMTP virtual server.

Parameters

- **log_format** (*str*) -- The log format name.
- **server** (str, optional) -- The SMTP server name.

  Default is "SmtpSvc/1".

Returns
A boolean representing whether the change succeeded.

Return type
bool

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

salt.modules.win_smtp_server.**set_relay_ip_list**(*addresses=None*, *server='SmtpSvc/1'*)

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.
↪0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.
↪0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses** (list, optional) -- A list of the relay IPs. The order of the list is important.

  Default is None.
- **server** (str, optional) -- The SMTP server name.

  Default is "SmtpSvc/1".

Returns

A boolean representing whether the change succeeded.

Return type

bool

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses='["192.168.1.1",
↪"172.16.1.1"]'
```

salt.modules.win_smtp_server.**set_server_setting**(*settings*, *server='SmtpSvc/1'*)

Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters

- **settings** (*dict*) -- A dictionary of the setting names and their values.
- **server** (str, optional) -- The SMTP server name.

  Default is "SmtpSvc/1".

Returns

A boolean representing whether all changes succeeded.

Return type

bool

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings='{"MaxRecipients":
↪"500"}'
```

26.7.512 salt.modules.win_snmp

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

salt.modules.win_snmp.**get_agent_service_types**()

Get the sysServices types that can be configured.

Returns
A list of service types.

Return type
list

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

salt.modules.win_snmp.**get_agent_settings**()

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns
A dictionary of the agent settings.

Return type
dict

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

salt.modules.win_snmp.**get_auth_traps_enabled**()

Determine whether the host is configured to send authentication traps.

Returns
`True` if traps are enabled, otherwise `False`

Return type
bool

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

salt.modules.win_snmp.**get_community_names**()

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
    Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
    Read Only
```

Returns
A dictionary of community names and permissions.

Return type
dict

CLI Example:

```
salt '*' win_snmp.get_community_names
```

salt.modules.win_snmp.**get_permission_types**()

Get the permission types that can be configured for communities.

Returns

A list of permission types.

Return type

list

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

salt.modules.win_snmp.**set_agent_settings**(*contact=None*, *location=None*, *services=None*)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **contact** (str, optional) -- The SNMP contact.
- **location** (str, optional) -- The SNMP location.
- **services** (list, optional) -- A list of selected services. The possible service names can be found via win_snmp.get_agent_service_types. To disable all services pass a list of None, ie: ['None']

  Default is None.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location=
↪'Place' services='["Physical"]'
```

salt.modules.win_snmp.**set_auth_traps_enabled**(*status=True*)

Manage the sending of authentication traps.

Parameters

status (bool, optional) -- True to enable traps. False to disable.

Default is True.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

salt.modules.win_snmp.**set_community_names**(*communities*)

Manage the SNMP accepted community names and their permissions.

Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError

---

Parameters

communities (*dict*) -- A dictionary of SNMP community names and permissions. The

possible permissions can be found via `win_snmp.get_permission_types`.

Returns
`True` if successful, otherwise `False`.

Return type
bool

Raises
CommandExecutionError -- If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities='{"TestCommunity":
↪"Read Only"}'
```

26.7.513 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem-solving if your minion is having problems.

New in version 0.12.0.

depends

- wmi

class salt.modules.win_status.**SYSTEM_PERFORMANCE_INFORMATION**

salt.modules.win_status.**cpuload**()

New in version 2015.8.0.

Return the processor load as a percentage.

CLI Example:

```
salt '*' status.cpuload
```

salt.modules.win_status.**cpustats**()

Return information about the CPU.

Returns

dict: A dictionary containing information about the CPU stats.

CLI Example:

```
salt * status.cpustats
```

salt.modules.win_status.**diskusage**(*human_readable=False*, *path=None*)

New in version 2015.8.0.

Return the disk usage for this minion.

Parameters

- **human_readable** (bool, optional) -- If `True`, usage will be in KB/MB/GB etc.

  Default is `False`.
- **path** (str, optional) -- The path to the disk. Usually a drive letter such as `C:\`.

  Default is `None`.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

salt.modules.win_status.**loadavg**()

Returns counter information related to the load of the machine.

Returns

A dictionary of counters.

Return type
dict

CLI Example:

```
salt * status.loadavg
```

salt.modules.win_status.**master**(*master=None*, *connected=True*)

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, is must be resolvable to a valid IPv4 address.

Parameters

- **master** (str, optional) -- The master address, FQDN, or hostname to connect to.

  Default is None.
- **connected** (bool, optional) -- If True, fire an event if the master is connected, otherwise fire an event if the master is disconnected.

  Default is True.

CLI Example:

```
salt '*' status.master
```

salt.modules.win_status.**meminfo**()

Return information about physical and virtual memory on the system.

Returns
A dictionary of information about memory on the system.

Return type
dict

CLI Example:

```
salt * status.meminfo
```

salt.modules.win_status.**procs**(*count=False*)

Return the process data.

Parameters

count (bool, optional) -- If True, this function will simply return the number of processes.

New in version 2015.8.0.

Default is False.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

salt.modules.win_status.**saltmem**(*human_readable=False*)

New in version 2015.8.0.

Returns the amount of memory that salt is using.

Parameters

human_readable (bool, optional) -- Return the value in a nicely formatted number.

Default is False.

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

salt.modules.win_status.**uptime**(*human_readable=False*)

New in version 2015.8.0.

Return the system uptime for the machine.

Parameters

human_readable (bool, optional) -- If True, return uptime in human-readable format, otherwise return seconds.

Default is False.

Note: Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

Returns

The uptime in seconds or human-readable format depending on the value of human_readable

Return type

str

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

salt.modules.win_status.**vmstats**()

Return information about the virtual memory on the machine.

Returns

A dictionary of virtual memory stats.

Return type

dict

CLI Example:

```
salt * status.vmstats
```

26.7.514 salt.modules.win_system

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

depends

- pywintypes
- win32api
- win32con
- win32net
- wmi

salt.modules.win_system.**get_computer_desc**()

Get the Windows computer description.

Returns
Returns the computer description if found. Otherwise, returns `False`.
Return type
str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

salt.modules.win_system.**get_computer_description**()

This function is an alias of `get_computer_desc`.
Get the Windows computer description.
Returns:
str: Returns the computer description if found. Otherwise, returns `False`.
CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

salt.modules.win_system.**get_computer_name**()

Get the Windows computer name
Returns
Returns the computer name if found. Otherwise, returns `False`.
Return type
str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

salt.modules.win_system.**get_domain_workgroup**()

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.
Returns
The name of the domain or workgroup.
Return type
str

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

salt.modules.win_system.**get_hostname**()

Get the hostname of the windows minion.

New in version 2016.3.0.
Returns
Returns the hostname of the windows minion
Return type
str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

salt.modules.win_system.**get_pending_component_servicing**()

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns

`True` if there are pending Component Based Servicing tasks, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

salt.modules.win_system.**get_pending_computer_name**()

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, `None` will be returned. If there was an error retrieving the pending computer name, `False` will be returned, and an error message will be logged to the minion log.

Returns

Returns the pending name if pending restart. Returns `None` if not pending restart.

Return type

str

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

salt.modules.win_system.**get_pending_domain_join**()

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns

`True` if there is a pending domain join action, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.get_pending_domain_join
```

salt.modules.win_system.**get_pending_file_rename**()

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

Returns

`True` if there are pending file rename operations, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.get_pending_file_rename
```

salt.modules.win_system.**get_pending_reboot**()

Determine whether there is a reboot pending.

New in version 2016.11.0.

Returns

`True` if the system is pending reboot, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.get_pending_reboot
```

salt.modules.win_system.**get_pending_reboot_details**()

Determine which check is signalling that the system is pending a reboot. Useful in determining why your system is signalling that it needs a reboot.

New in version 3001.

Returns
A dictionary of the results of each system that would indicate a pending reboot.

Return type
dict

CLI Example:

```
salt '*' system.get_pending_reboot_details
```

salt.modules.win_system.**get_pending_servermanager**()

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

Returns
`True` if there are pending Server Manager tasks, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.get_pending_servermanager
```

salt.modules.win_system.**get_pending_update**()

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

Returns
`True` if there are pending updates, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.get_pending_update
```

salt.modules.win_system.**get_pending_windows_update**()

Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

Returns
`True` if the Windows Update system reports a pending update, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.get_pending_windows_update
```

salt.modules.win_system.**get_reboot_required_witnessed**()

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return `True` if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns
`True` if the `Requires reboot` registry flag is set to `1`, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

salt.modules.win_system.**get_system_date**()

Get the Windows system date

Returns
Returns the system date.

Return type
str

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.win_system.**get_system_info**()

Get system information.

Note: Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

---

Returns
Dictionary containing information about the system to include name, description, version, etc...

Return type
dict

CLI Example:

```
salt 'minion-id' system.get_system_info
```

salt.modules.win_system.**get_system_time**()

Get the system time.

Returns
Returns the system time in HH:MM:SS AM/PM format.

Return type
str

CLI Example:

```
salt 'minion-id' system.get_system_time
```

salt.modules.win_system.**halt**(*timeout=5*, *in_seconds=False*)

Halt a running system.

Parameters

- **timeout** (int, optional) -- Number of minutes/seconds before halting the system.

  Default is 5 minutes.
- **in_seconds** (bool, optional) -- Whether to treat timeout as seconds or minutes.

  Default is True.

  New in version 2015.8.0.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' system.halt 5 True
```

salt.modules.win_system.**init**(*runlevel*)

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:

```
salt '*' system.init 3
```

salt.modules.win_system.**join_domain**(*domain*, *username=None*, *password=None*, *account_ou=None*, *account_exists=False*, *restart=False*)

Join a computer to an Active Directory domain. Requires a reboot.

Parameters

- **domain** (*str*) -- The domain to which the computer should be joined, e.g. example.com.
- **username** (str, optional) -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user.

  Default is None.
- **password** (str, optional) -- Password of the specified user.

  Default is None.
- **account_ou** (str, optional) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com.

  Default is None.
- **account_exists** (bool, optional) -- If set to True the computer will only join the domain if the account already exists. If set to False, the computer account will be created if it does not exist, otherwise it will use the existing account.

  Default is False.
- **restart** (bool, optional) -- True will restart the computer after a successful join.
  Default is False.

  New in version 2015.5.7,2015.8.2.

Returns

Returns a dictionary if successful, otherwise False

Return type
dict

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
                 username='joinuser' password='joinpassword' \
                 account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
                 account_exists=False, restart=True
```

salt.modules.win_system.**lock**()

Lock the workstation.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' system.lock
```

salt.modules.win_system.**poweroff**(*timeout=5*, *in_seconds=False*)

Power off a running system.

Parameters

- **timeout** (`int`, optional) -- Number of minutes/seconds before powering off the system.

  Default is 5 minutes.
- **in_seconds** (`bool`, optional) -- Whether to treat timeout as seconds or minutes.

  New in version 2015.8.0.

  Default is `False`.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.poweroff 5
```

salt.modules.win_system.**reboot**(*timeout=5*, *in_seconds=False*, *wait_for_reboot=False*, *only_on_pending_reboot=False*)

Reboot a running system.

Parameters

- **timeout** (`int`, optional) -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`.

  Default is 5 minutes.
- **in_seconds** (`bool`, optional) -- `True` will cause the `timeout` parameter to be in seconds. `False` will be in minutes.

  Default is `False`.

  New in version 2015.8.0.
- **wait_for_reboot** (`bool`, optional) -- `True` will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot.

Default is False.

New in version 2015.8.0.

- **only_on_pending_reboot** (bool, optional) -- If this is set to True, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*).

  Default is False.

Returns
True if successful (a reboot will occur), otherwise False.

Return type
bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

salt.modules.win_system.**set_computer_desc**(*desc=None*)

Set the Windows computer description.

Parameters
desc (str, optional) -- The computer description.

Default is None.

Returns
Description if successful, otherwise False.

Return type
str

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

salt.modules.win_system.**set_computer_description**(*desc=None*)

This function is an alias of set_computer_desc.

Set the Windows computer description.

Args:
desc (str, optional): The computer description.
Default is None.

Returns:
str: Description if successful, otherwise False.

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs
↪to Dave!'
```

salt.modules.win_system.**set_computer_name**(*name*)

Set the Windows computer name

Parameters

name (*str*) -- The new name to give the computer. Requires a reboot to take effect.

Returns

Returns a dictionary containing the old and new names. bool: `False` if failed to set computer name

Return type

dict

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

salt.modules.win_system.**set_domain_workgroup**(*workgroup*)

Set the domain or workgroup the computer belongs to.

New in version 3001.

Parameters

workgroup (*str*) -- The name of the domain or workgroup.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt 'minion-id' system.set_domain_workgroup LOCAL
```

salt.modules.win_system.**set_hostname**(*hostname*)

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters

hostname (*str*) -- The hostname to set.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

salt.modules.win_system.**set_reboot_required_witnessed**()

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *'Reboot required'* will be assigned the value of *1*.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

salt.modules.win_system.**set_system_date**(*newdate*)

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters

newdate (*str*) -- The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.win_system.**set_system_date_time**(*years=None*, *months=None*, *days=None*, *hours=None*, *minutes=None*, *seconds=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Parameters

- **years** (`int`, optional) -- Years digit, ie: 2015

  Default is `None`.
- **months** (`int`, optional) -- Months digit: 1 - 12

  Default is `None`.
- **days** (`int`, optional) -- Days digit: 1 - 31

  Default is `None`.
- **hours** (`int`, optional) -- Hours digit: 0 - 23

  Default is `None`.
- **minutes** (`int`, optional) -- Minutes digit: 0 - 59

  Default is `None`.
- **seconds** (`int`, optional) -- Seconds digit: 0 - 59

  Default is `None`.

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' system.set_system_date_ time 2015 5 12 11 37 53
```

salt.modules.win_system.**set_system_time**(*newtime*)

Set the system time.

Parameters

newtime (*str*) -- The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

salt.modules.win_system.**shutdown**(*message=None*, *timeout=5*, *force_close=True*, *reboot=False*, *in_seconds=False*, *only_on_pending_reboot=False*)

Shutdown a running system.

Parameters

- **message** (`str`, optional) -- The message to display to the user before shutting down.

  Default is `None`.
- **timeout** (`int`, optional) -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

  If timeout is not zero, InitiateSystemShutdown displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the lpMessage parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

  If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

  Default is 5 minutes
- **in_seconds** (`bool`, optional) --
  `True` will cause the `timeout` parameter to be in seconds.
  `False` will be in minutes.

  Default is `False`.
  New in version 2015.8.0.
- **force_close** (`bool`, optional) -- `True` will force close all open applications. `False` will display a dialog box instructing the user to close open applications.

  Default is `True`.
- **reboot** (`bool`, optional) -- `True` restarts the computer immediately after shutdown. `False` powers down the system.

  Default is `False`.
- **only_on_pending_reboot** (`bool`, optional) -- If `True` the shutdown will only proceed if there is a reboot pending. `False` will shutdown the system. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.

  Default is `False`.

Returns

`True` if successful (a shutdown or reboot will occur),
otherwise `False`

Return type
bool

CLI Example:

```
salt '*' system.shutdown 'System will shutdown in 5 minutes'
```

salt.modules.win_system.**shutdown_abort**()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.**shutdown_hard**()

Shutdown a running system with no timeout or warning.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.shutdown_hard
```

salt.modules.win_system.**start_time_service**()

Start the Windows time service.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.start_time_service
```

salt.modules.win_system.**stop_time_service**()

Stop the Windows time service.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' system.stop_time_service
```

salt.modules.win_system.**unjoin_domain**(*username=None*, *password=None*, *domain=None*, *workgroup='WORKGROUP'*, *disable=False*, *restart=False*)

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters

- **username** (str, optional) -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like

`user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be `None`.

Default is `None`.

- **`password`** (`str`, optional) -- The password of the specified user.

  Default is `None`.
- **`domain`** (`str`, optional) -- The domain from which to unjoin the computer. Can be `None`.

  Default is `None`.
- **`workgroup`** (`str`, optional) -- The workgroup to join the computer to.

  Default is `WORKGROUP`.

  New in version 2015.5.7,2015.8.2.
- **`disable`** (`bool`, optional) -- `True` to disable the computer account in Active Directory.

  Default is `False`
- **`restart`** (`bool`, optional) -- `True` will restart the computer after successful unjoin.

  Default is `False`.

  New in version 2015.5.7,2015.8.2.

Returns

Returns a dictionary if successful, otherwise `False`.

Return type

dict

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \
                 password='unjoinpassword' disable=True \
                 restart=True
```

26.7.515 salt.modules.win_task

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

`salt.modules.win_task.`**`add_action`**(*name=None*, *location='\\'*, *action_type='Execute'*, ***kwargs*)

Add an action to a task.

Parameters

- **`name`** (*`str`*) -- The name of the task to which to add the action.
- **`location`** (`str`, optional) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **`action_type`** (`str`, optional) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email

– Message

Default is "Execute".

Required keyword arguments for each action_type:

Execute

Execute a command or an executable

cmd (str):

(required) The command or executable to run.

arguments (str):

(optional) Arguments to be passed to the command or executable. To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

- `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

Batch files do not need an interpreter and may be passed to the cmd parameter directly.

start_in (str):

(optional) The current working directory for the command.

Email

Send and email. Requires `server`, `from`, and `to` or `cc`.

from (str): The sender

reply_to (str): Who to reply to

to (str): The recipient

cc (str): The CC recipient

bcc (str): The BCC recipient

subject (str): The subject of the email

body (str): The Message Body of the email

server (str): The server used to send the email

attachments (list):

A list of attachments. These will be the paths to the files to attach. ie: `attachments="['C:\attachment1.txt', 'C:\attachment2.txt']"`

Message

Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

title (str):

The dialog box title.

message (str):

The dialog box message body

Returns

A dictionary containing the task configuration.

Return type

dict

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

salt.modules.win_task.**add_trigger**(*name=None*, *location='\\'*, *trigger_type=None*, *trigger_enabled=True*, *start_date=None*, *start_time=None*, *end_date=None*, *end_time=None*, *random_delay=None*, *repeat_interval=None*, *repeat_duration=None*, *repeat_stop_at_duration_end=False*, *execution_time_limit=None*, *delay=None*, ***kwargs*)

Add a trigger to a Windows Scheduled task.

Note: Arguments are parsed by the YAML loader and are subject to yaml's idiosyncrasies. Therefore, time values in some formats (`%H:%M:%S` and `%H:%M`) should to be quoted.

See YAML IDIOSYNCRASIES for more details.

Parameters

- **name** (*str*) -- The name of the task to which to add the trigger.
- **location** (str, optional) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **trigger_type** (str, optional) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange

  Default is `None`.
- **trigger_enabled** (bool, optional) -- Boolean value that indicates whether the trigger is enabled.

  Default is `True`.
- **start_date** (str, optional) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d

  Default is `None`.
- **start_time** (str, optional) -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M

  Default is `None`.
- **end_date** (str, optional) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:

  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d

  Default is None.
- **end_time** (str, optional) -- The time when the trigger is deactivated. If this is not passed with end_date it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M

  Default is None.
- **random_delay** (str, optional) -- The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

  Default is None.

  Note: This parameter applies to the following trigger types
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay

- **repeat_interval** (str, optional) -- The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

  Default is None.
- **repeat_duration** (str, optional) -- How long the pattern is repeated. Valid values are:
  - Indefinitely
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 12 hours
  - 1 day

  Default is None.
- **repeat_stop_at_duration_end** (bool, optional) -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

  Default is False.

- **execution_time_limit** (str, optional) -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

  Default is None.
- **delay** (str, optional) -- The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

  Default is None.

Note: This parameter applies to the following trigger types:
- OnLogon
- OnBoot
- Event
- OnTaskCreation
- OnSessionChange

---

kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event
The trigger will be fired by an event.
subscription (str):
An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

Once
No special parameters required.

Daily
The task will run daily.
days_interval (int):
The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly
The task will run weekly.
weeks_interval (int):
The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.
days_of_week (list):

Sets the days of the week on which the task runs. Should be a list. ie: `['Monday','Wednesday','Friday']`. Valid entries are the names of the days of the week.

Monthly

The task will run monthly.

months_of_year (list):

Sets the months of the year during which the task runs. Should be a list. ie: `['January','July']`. Valid entries are the full names of all the months.

days_of_month (list):

Sets the days of the month during which the task runs. Should be a list. ie: `[1, 15, 'Last']`. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

last_day_of_month (bool):

Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

Note: You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to `True`.

MonthlyDay

The task will run monthly on the specified day.

months_of_year (list):

Sets the months of the year during which the task runs. Should be a list. ie: `['January','July']`. Valid entries are the full names of all the months.

weeks_of_month (list):

Sets the weeks of the month during which the task runs. Should be a list. ie: `['First','Third']`. Valid options are:

- First
- Second
- Third
- Fourth

last_week_of_month (bool):

Boolean value that indicates that the task runs on the last week of the month.

days_of_week (list):

Sets the days of the week during which the task runs. Should be a list. ie: `['Monday','Wednesday','Friday']`. Valid entries are the names of the days of the week.

OnIdle

No special parameters required.

OnTaskCreation

No special parameters required.

OnBoot

No special parameters required.

OnLogon

No special parameters required.

OnSessionChange

The task will be triggered by a session change.

session_user_name (str):

Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

state_change (str):

Sets the kind of Terminal Server session change that would trigger a task launch.
Valid options are:

- ConsoleConnect: When you connect to a user session (switch users)
- ConsoleDisconnect: When you disconnect a user session (switch users)
- RemoteConnect: When a user connects via Remote Desktop
- RemoteDisconnect: When a user disconnects via Remote Desktop
- SessionLock: When the workstation is locked
- SessionUnlock: When the workstation is unlocked

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
↪enabled=True start_date=2016/12/1 start_time='"12:01"'
```

`salt.modules.win_task.`**`clear_triggers`**(*name*, *location='\\'*)

Remove all triggers from the task.

Parameters

- **`name`** (*str*) -- The name of the task from which to clear all triggers.
- **`location`** (`str`, optional) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

`salt.modules.win_task.`**`create_folder`**(*name*, *location='\\'*)

Create a folder in which to create tasks.

Parameters

- **`name`** (*str*) -- The name of the folder. This will be displayed in the task scheduler.
- **`location`** (`str`, optional) -- A string value representing the location in which to create the folder.

  Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

`salt.modules.win_task.`**`create_task`**(*name*, *location='\\'*, *user_name='System'*, *password=None*, *force=False*, ***kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- *edit_task()*
- *add_action()*
- *add_trigger()*

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (str, optional) -- A string value representing the location in which to create the task.

  Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **user_name** (str, optional) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

  Default is "System".
- **password** (str, optional) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

  Default is None.
- **force** (bool, optional) -- If the task exists, overwrite the existing task.

  Default is False.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True
↪action_type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_
↪date=2016-12-1 start_time='"01:00"'
```

salt.modules.win_task.**create_task_from_xml**(*name*, *location='\\'*, *xml_text=None*, *xml_path=None*, *user_name='System'*, *password=None*)

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (str, optional) -- A string value representing the location in which to create the task.

  Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **xml_text** (str, optional) -- A string of xml representing the task to be created. This will be overridden by `xml_path` if passed.

  Default is None.
- **xml_path** (str, optional) -- The path to an XML file on the local system containing the xml that defines the task. This will override `xml_text`.

  Default is None.
- **user_name** (str, optional) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

  Default is "System".
- **password** (str, optional) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

  Default is None.

Returns
`True` if successful, otherwise `False`. str: A string with the error message if there is an error.

Return type
bool

Raises
- ***ArgumentValueError*** -- If arguments are invalid
- ***CommandExecutionError*** --

CLI Example:

```
salt '*' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

salt.modules.win_task.**delete_folder**(*name*, *location='\\'*)

Delete a folder from the task scheduler.

Parameters
- **name** (*str*) -- The name of the folder to delete.
- **location** (*str*) -- A string value representing the location of the folder.

  Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

salt.modules.win_task.**delete_task**(*name*, *location='\\'*)

Delete a task from the task scheduler.

Parameters
- **name** (*str*) -- The name of the task to delete.
- **location** (*str*, optional) -- A string value representing the location of the task.

  Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

salt.modules.win_task.**edit_task**(*name=None*, *location='\\'*, *user_name=None*, *password=None*, *description=None*, *enabled=None*, *hidden=None*, *run_if_idle=None*, *idle_duration=None*, *idle_wait_timeout=None*, *idle_stop_on_end=None*, *idle_restart=None*, *ac_only=None*, *stop_if_on_batteries=None*, *wake_to_run=None*, *run_if_network=None*, *network_id=None*, *network_name=None*, *allow_demand_start=None*, *start_when_available=None*, *restart_every=None*, *restart_count=3*, *execution_time_limit=None*, *force_stop=None*, *delete_after=None*, *multiple_instances=None*, ***kwargs*)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (str, optional) -- A string value representing the location in which to create the task.

  Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user_name** (str, optional) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

  Default is None.
- **password** (str, optional) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

  Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

  Default is None.
- **description** (str, optional) -- A string representing the text that will be displayed in the description field in the task scheduler.

  Default is None.
- **enabled** (bool, optional) -- A boolean value representing whether or not the task is enabled.

  Default is False.
- **hidden** (bool, optional) -- A boolean value representing whether the task is hidden.

  Default is False.
- **run_if_idle** (bool, optional) -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.

  Default is False.
- **idle_duration** (str, optional) -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour

  Default is None.
- **idle_wait_timeout** (str, optional) -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

  Default is None.

- **idle_stop_on_end** (bool, optional) -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.

  Default is None.
- **idle_restart** (bool, optional) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.

  Default is None.
- **ac_only** (bool, optional) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.

  Default is None.
- **stop_if_on_batteries** (bool, optional) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.

  Default is None.
- **wake_to_run** (bool, optional) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.

  Default is None.
- **run_if_network** (bool, optional) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.

  Default is None.
- **network_id** (guid, optional) -- GUID value that identifies a network profile.

  Default is None.
- **network_name** (str, optional) -- Sets the name of a network profile. The name is used for display purposes.

  Default is None.
- **allow_demand_start** (bool, optional) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.

  Default is None.
- **start_when_available** (bool, optional) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.

  Default is None.
- **restart_every** (str, optional) -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

  Default is None.
- **restart_count** (int, optional) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.

  Default is 3
- **execution_time_limit** (Union[bool, str], optional) -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour

- 2 hours
- 4 hours
- 8 hours
- 12 hours
- 1 day
- 3 days

Default is None.

- **force_stop** (bool, optional) -- Boolean value that indicates that the task may be terminated by using TerminateProcess.

  Default is None.
- **delete_after** (Union[bool, str], optional) -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days

  Default is None.
- **multiple_instances** (str, optional) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
  - Parallel
  - Queue
  - No New Instance
  - Stop Existing

  Default is None.

Returns
True if successful, otherwise False.

Return type
bool

CLI Example:

```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

salt.modules.win_task.**info**(*name*, *location='\\'*)

Get the details about a task in the task scheduler.

Parameters
- **name** (*str*) -- The name of the task for which to return the status.
- **location** (str, optional) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns
A dictionary containing the task configuration.

Return type
dict

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

salt.modules.win_task.**list_actions**(*name*, *location='\\'*)

List all actions that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list actions.
- **location** (str, optional) -- A string value representing the location of the task from which to list actions.

  Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
Returns a list of actions.

Return type
list

CLI Example:

```
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

`salt.modules.win_task.list_folders(location='\\')`

List all folders located in a specific location in the task scheduler.

Parameters
location (str, optional) -- A string value representing the folder from which you want to list tasks.

Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
Returns a list of folders.

Return type
list

CLI Example:

```
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

`salt.modules.win_task.list_tasks(location='\\')`

List all tasks located in a specific location in the task scheduler.

Parameters
location (str, optional) -- A string value representing the folder from which you want to list tasks.

Default is \ which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns
Returns a list of tasks.

Return type
list

CLI Example:

```
# List all tasks in the default location
salt 'minion-id' task.list_tasks
```

(continues on next page)

(continued from previous page)

```
# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

salt.modules.win_task.**list_triggers**(*name*, *location='\\'*)

List all triggers that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list triggers.
- **location** (str, optional) -- A string value representing the location of the task from which to list triggers.

  Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

Returns a list of triggers.

Return type

list

CLI Example:

```
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave
# location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

salt.modules.win_task.**run**(*name*, *location='\\'*)

Run a scheduled task manually.

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task.

  Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt 'minion-id' task.run <task_name>
```

salt.modules.win_task.**run_wait**(*name*, *location='\\'*)

Run a scheduled task and return when the task finishes

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (str, optional) -- A string value representing the location of the task.

  Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt 'minion-id' task.run_wait <task_name>
```

salt.modules.win_task.**status**(*name*, *location='\\'*)

Determine the status of a task. Is it Running, Queued, Ready, etc.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (str, optional) -- A string value representing the location of the task.

  Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

Return type

str

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

salt.modules.win_task.**stop**(*name*, *location='\\'*)

Stop a scheduled task.

Parameters

- **name** (*str*) -- The name of the task to stop.
- **location** (str, optional) -- A string value representing the location of the task.

  Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

26.7.516 salt.modules.win_timezone

Module for managing timezone on Windows systems.

class salt.modules.win_timezone.**TzMapper**(*unix_to_win*)

add(*k*, *v*)

get_unix(*key*, *default=None*)

get_win(*key*, *default=None*)

list_unix()

list_win()

remove(*k*)

salt.modules.win_timezone.**get_hwclock**()

Get current hardware clock setting (UTC or localtime)

Note: The hardware clock is always local time on Windows so this will always return "localtime".

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.win_timezone.**get_offset**()

Get current numeric timezone offset from UTC (i.e. -0700)

Returns
Offset from UTC

Return type
str

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.win_timezone.**get_zone**()

Get current timezone (i.e. America/Denver)

Returns
Timezone in unix format

Return type
str

Raises
CommandExecutionError -- If timezone could not be gathered

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.win_timezone.**get_zonecode**()

Get current timezone (i.e. PST, MDT, etc)

Returns
An abbreviated timezone code

Return type
str

CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.win_timezone.**list**(*unix_style=True*)

Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

Parameters
unix_style (bool, optional) -- `True` returns Unix-style timezones. `False` returns Windows-style timezones. Default is `True`.

Default is `True`.

Returns
A list of supported timezones.
Return type
list

CLI Example:

```
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

salt.modules.win_timezone.**set_hwclock**(*clock*)

Sets the hardware clock to be either UTC or localtime

Note: The hardware clock is always local time on Windows so this will always return `False`

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.win_timezone.**set_zone**(*timezone*)

Sets the timezone using the tzutil.
Parameters
timezone (*str*) -- A valid timezone.
Returns
`True` if successful, otherwise `False`.
Return type
bool
Raises
CommandExecutionError -- If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

salt.modules.win_timezone.**zone_compare**(*timezone*)

Compares the given timezone with the machine timezone. Mostly useful for running state checks.
Parameters
timezone (*str*) -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function.
Returns
`True` if they match, otherwise `False`.
Return type
bool

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

26.7.517 salt.modules.win_useradd

Module for managing Windows Users.

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *'user.info' is not available*), see *here*.

depends

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

Note: This currently only works with local user accounts, not domain accounts

`salt.modules.win_useradd.add`(*name*, *password=None*, *fullname=None*, *description=None*, *groups=None*, *home=None*, *homedrive=None*, *profile=None*, *logonscript=None*)

Add a user to the minion.

Parameters

- **name** (*str*) -- The username for the new account.
- **password** (str, optional) -- User's password in plain text.

  Default is None.
- **fullname** (str, optional) -- The user's full name.

  Default is None.
- **description** (str, optional) -- A brief description of the user account.

  Default is None.
- **groups** (str, optional) -- A list of groups to add the user to. (see chgroups)

  Default is None.
- **home** (str, optional) -- The path to the user's home directory.

  Default is None.
- **homedrive** (str, optional) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:.

  Default is None.
- **profile** (str, optional) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses its default profile directory.

  Default is None.
- **logonscript** (str, optional) -- Path to a login script to run when the user logs on.

  Default is None.

Returns
`True` if successful, otherwise `False`.
Return type
bool

CLI Example:

```
salt '*' user.add name password
```

salt.modules.win_useradd.**addgroup**(*name*, *group*)

Add user to a group

Parameters
- **name** (*str*) -- The username to add to the group
- **group** (*str*) -- The name of the group to which to add the user

Returns
`True` if successful, otherwise `False`.
Return type
bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.**chfullname**(*name*, *fullname*)

Change the full name of the user

Parameters
- **name** (*str*) -- The username for which to change the full name
- **fullname** (*str*) -- The new value for the full name

Returns
`True` if successful, otherwise `False`.
Return type
bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

salt.modules.win_useradd.**chgroups**(*name*, *groups*, *append=True*)

Change the groups this user belongs to, add append=False to make the user a member of only the specified groups

Parameters
- **name** (*str*) -- The username for which to change groups
- **groups** (*str, list*) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma-delimited string or a list.
- **append** (bool, optional) -- `True` adds the passed groups to the user's current groups. `False` sets the user's groups to the passed groups only.

  Default is `True`.

Returns
`True` if successful, otherwise `False`.
Return type
bool

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

salt.modules.win_useradd.**chhome**(*name*, *home*, ***kwargs*)

Change the home directory of the user, pass `True` for persist to move files to the new home directory if the old home directory exist.

Parameters

- **name** (*str*) -- The name of the user whose home directory you wish to change
- **home** (*str*) -- The new location of the home directory

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.chhome foo \\fileserver\home\foo True
```

`salt.modules.win_useradd.`**`chprofile`**(*name*, *profile*)

Change the profile directory of the user

Parameters

- **name** (*str*) -- The name of the user whose profile you wish to change
- **profile** (*str*) -- The new location of the profile

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.chprofile foo \\fileserver\profiles\foo
```

`salt.modules.win_useradd.`**`current`**(*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters

sam (`bool`, optional) -- `False` returns just the username without any domain notation. `True` returns the domain with the username in the SAM format. Ie: `domain\username`.

Returns

Returns username

Return type

str

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.`**`delete`**(*name*, *purge=False*, *force=False*)

Remove a user from the minion

Parameters

- **name** (*str*) -- The name of the user to delete
- **purge** (`bool`, optional) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to `True` the profile will be removed.

  Default is `False`.
- **force** (`bool`, optional) -- Boolean value indicating that the user account should be deleted even if the user is logged in. `True` will log the user out and delete user.

Default is `False`.

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.delete name
```

salt.modules.win_useradd.**getUserSid**(*username*)

Deprecated function. Please use get_user_sid instead

CLI Example:

```
salt '*' user.get_user_sid jsnuffy
```

salt.modules.win_useradd.**get_user_sid**(*username*)

Get the Security ID for the user

Parameters
username (*str*) -- The username for which to look up the SID

Returns
The user SID

Return type
str

CLI Example:

```
salt '*' user.get_user_sid jsnuffy
```

salt.modules.win_useradd.**getent**(*refresh=False*)

Return the list of all info for all users

Parameters
refresh (bool, optional) -- Refresh the cached user information. Useful when used from within a state function.

Default is `False`.

Returns
A dictionary containing information about all users on the system

Return type
dict

CLI Example:

```
salt '*' user.getent
```

salt.modules.win_useradd.**info**(*name*)

Return user information

Parameters
name (*str*) -- Username for which to display information

Returns
A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description

- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- expiration_date
- password_never_expires
- disallow_change_password
- gid

Return type
dict

CLI Example:

```
salt '*' user.info jsnuffy
```

salt.modules.win_useradd.**list_groups**(*name*)

Return a list of groups the named user belongs to

Parameters
name (*str*) -- The username for which to list groups

Returns
A list of groups to which the user belongs

Return type
list

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.win_useradd.**list_users**()

Return a list of all users on Windows

Returns
A list of all users on the system

Return type
list

CLI Example:

```
salt '*' user.list_users
```

salt.modules.win_useradd.**removegroup**(*name*, *group*)

Remove user from a group

Parameters
- **name** (*str*) -- The username to remove from the group
- **group** (*str*) -- The name of the group from which to remove the user

Returns
`True` if successful, otherwise `False`.

Return type
bool

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.**rename**(*name*, *new_name*)

Change the username for a named user

Parameters

- **name** (*str*) -- The username to change
- **new_name** (*str*) -- The new name for the current user

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

salt.modules.win_useradd.**setpassword**(*name*, *password*)

Set the user's password

Parameters

- **name** (*str*) -- The username for which to set the password
- **password** (*str*) -- The new password

Returns

`True` if successful, otherwise `False`.

Return type

bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

salt.modules.win_useradd.**update**(*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration_date=None*, *expired=None*, *account_disabled=None*, *unlock_account=None*, *password_never_expires=None*, *disallow_change_password=None*)

Updates settings for the Windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters

- **name** (*str*) -- The username to update.
- **password** (`str`, optional) -- New user password in plain text.

  Default is `None`.
- **fullname** (`str`, optional) -- The user's full name.

  Default is `None`.
- **description** (`str`, optional) -- A brief description of the user account.

  Default is `None`.
- **home** (`str`, optional) -- The path to the user's home directory.

  Default is `None`.
- **homedrive** (`str`, optional) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: `U:`.

  Default is `None`.

- **logonscript** (str, optional) -- The path to the logon script.

  Default is None.
- **profile** (str, optional) -- The path to the user's profile directory.

  Default is None.
- **expiration_date** (date, optional) -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.

  Default is None.
- **expired** (bool, optional) -- Pass True to expire the account. The user will be prompted to change their password at the next logon. Pass False to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the expiration_date as well.

  Default is None.
- **account_disabled** (bool, optional) -- True disables the account. False enables the account.

  Default is None.
- **unlock_account** (bool, optional) -- True unlocks a locked user account. False is ignored.

  Default is None.
- **password_never_expires** (bool, optional) -- True sets the password to never expire. False allows the password to expire.

  Default is None.
- **disallow_change_password** (bool, optional) -- True blocks the user from changing the password. False allows the user to change the password.

  Default is None.

Returns

True if successful, otherwise False.

Return type

bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
        home=\server\homeshare\bob homedrive=U:
```

26.7.518 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- *win_wua.available*
- win_wua.list

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- *win_wua.get*

- *win_wua.download*
- *win_wua.install*
- *win_wua.uninstall*

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and *win_wua.get* functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with py:func:*win_wua.list <salt.modules.win_wua.list_>* for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use *win_wua.download*, *win_wua.install*, or *win_wua.uninstall*. To update your system with the latest updates use `win_wua.list` and set `install=True`

You can also adjust the Windows Update settings using the *win_wua.set_wu_settings* function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

depends
salt.utils.win_update

`salt.modules.win_wua.`**`available`**(*software=True*, *drivers=True*, *summary=False*, *skip_installed=True*, *skip_hidden=True*, *skip_mandatory=False*, *skip_reboot=False*, *categories=None*, *severities=None*, *online=True*)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than *list()*. Good for finding a specific GUID or KB.

Parameters

- **`software`** (`bool`, optional) -- Include software updates in the results.

  Default is `True`.
- **`drivers`** (`bool`, optional) -- Include driver updates in the results.

  Default is `True`.
- **`summary`** (`bool`, optional) --
  - `True`: Return a summary of updates available for each category.
  - `False` (default): Return a detailed list of available updates.

  Default is `False`.
- **`skip_installed`** (`bool`, optional) -- Skip updates that are already installed.

  Default is `True`.
- **`skip_hidden`** (`bool`, optional) -- Skip updates that have been hidden.

  Default is `True`.

- **skip_mandatory** (bool, optional) -- Skip mandatory updates.

  Default is False.
- **skip_reboot** (bool, optional) -- Skip updates that require a reboot.

  Default is False.
- **categories** (*list*, optional) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender

  Default is None.
- **severities** (*list*, optional) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical
  - Important

  Default is None.
