  off as LXD normally uses self-signed certificates.

CLI Examples:

Full dict with all available information:

```
salt '*' lxd.container_list
```

For a list of names:

```
salt '*' lxd.container_list true
```

See also container-attributes.

```python
def container_migrate(name, stop_and_start=False, remote_addr=None,
cert=None, key=None, verify_cert=True, src_remote_addr=None, src_cert=None,
src_key=None, src_verify_cert=None)
```

Migrate a container.

If the container is running, it either must be shut down first (use stop_and_start=True) or criu must be installed
  on the source and destination machines.

For this operation both certs need to be authenticated, use lxd.authenticate <salt.modules.lxd.
authenticate to authenticate your cert(s).

name : Name of the container to migrate
stop_and_start : Stop the container on the source and start it on dest
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
  its a TCP Address!
  Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

down
cert : PEM Formatted SSL Certificate.
  Examples: ~/.config/lxc/client.crt
down
key : PEM Formatted SSL Key.
  Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it
  off as LXD normally uses self-signed certificates.

CLI Example:

```bash
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~
→/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/client.crt ~
→/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
salt '*' lxd.container_migrate phpmyadmin stop_and_start=true remote_addr=https://
srv02:8443 cert=~/.config/lxc/client.crt key=~/.config/lxc/client.key verify_
cert=False src_remote_addr=https://srv01:8443
```

```
salt '*' lxd.container_rename(name, newname, remote_addr=None, cert=None, key=None,
verify_cert=True)
```

Rename a container

name : Name of the container to Rename }
newname : The new name of the container
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_restart(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Restart a container
name : Name of the container to restart
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_start(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Start a container
name : Name of the container to start
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_state(name=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Get container state
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_stop(name, timeout=30, force=True, remote_addr=None, cert=None, key=None, verify_cert=True)

Stop a container
name : Name of the container to stop
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and
its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.modules.lxd.container_unfreeze(name, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Unfreeze a container

name : Name of the container to unfreeze

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt.modules.lxd.image_alias_add(image, alias, description='', remote_addr=None, cert=None, key=None, verify_cert=True)
```

Create an alias on the given image

image : An image alias, a fingerprint or a image object

alias : The alias to add

description : Description of the alias

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

```
salt.modules.lxd.image_alias_delete(image, alias, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete an alias (this is currently not restricted to the image)

image : An image alias, a fingerprint or a image object

alias : The alias to delete

remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

cert : PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

key : PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
CLI Examples:

```shell
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

```
salt.modules.lxd.image_copy_lxd(source, src_remote_addr, src_cert, src_key, src_verify_cert, remote_addr, cert, key, verify_cert=True, aliases=None, public=None, auto_update=None, _raw=False)
```

Copy an image from another LXD instance

- **source**: An alias or a fingerprint of the source.
- **src_remote_addr**: An URL to the source remote daemon
  - Examples: https://mysourceserver.lan:8443
- **src_cert**: PEM Formatted SSL Certificate for the source
  - Examples: ~/.config/lxc/client.crt
- **src_key**: PEM Formatted SSL Key for the source
  - Examples: ~/.config/lxc/client.key
- **src_verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
- **remote_addr**: Address of the destination daemon
  - Examples: https://mydestserver.lan:8443
- **cert**: PEM Formatted SSL Certificate for the destination
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key for the destination
  - Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
- **aliases** [None] List of aliases to append to the copied image
- **public** [None] Make this image public available, None = copy source
- **auto_update** [None] Wherever to auto-update from the original source, None = copy source
- **_raw** [False] Return the raw pylxd object or a dict of the destination image?

CLI Examples:

```
salt '*' lxd.image_copy_lxd xenial/amd64 https://srv01:8443 ~/.config/lxc/client.crt ~/.config/lxc/client.key false
```

```
salt '*' lxd.image_delete xenial/amd64
```

Delete an image by an alias or fingerprint

- **name**: The alias or fingerprint of the image to delete, can be a obj for the states.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_delete xenial/amd64
```

```
salt.modules.lxd.image_from_file(filename, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, saltenv='base', _raw=False)
```

Create an image from a file
filename : The filename of the rootfs
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [ ] List of aliases to append to the copied image
public [False] Make this image public available
saltenv [base] The saltenv to use for salt:// copies
_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:
```
salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=['"busybox--amd64"']
```

salt.modules.lxd.image_from_simplestreams(server, alias, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, auto_update=False, _raw=False)

Create an image from simplestreams
server : Simplestreams server URI
alias : The alias of the image to retrieve
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [ ] List of aliases to append to the copied image
public [False] Make this image public available
auto_update [False] Should LXD auto update that image?
_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:
```
salt '*' lxd.image_from_simplestreams "https://cloud-images.ubuntu.com/releases" →"trusty/amd64" aliases=['"t", "trusty/amd64"]' auto_update=True
```

salt.modules.lxd.image_from_url(url, remote_addr=None, cert=None, key=None, verify_cert=True, aliases=None, public=False, auto_update=False, _raw=False)

Create an image from an url
url : The URL from where to download the image
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [ ] List of aliases to append to the copied image
public [False] Make this image public available
auto_update [False] Should LXD auto update that image?
_raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:
```
salt '*' lxd.image_from_url url= "https://myserver.lan:8443 /var/lib/mysocket.sock' →'aliases=['"t", "trusty/amd64"]'
```

25.7. execution modules 2191
off as LXD normally uses self-signed certificates.

aliases     [ ] List of aliases to append to the copied image
public      [False] Make this image public available
auto_update [False] Should LXD auto update that image?
                    _raw [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

```python
salt '*' lxd.image_from_url https://dl.stgraber.org/lxd
```

```python
salt.modules.lxd.image_get(fingerprint, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)
```

Get an image by its fingerprint

**fingerprint**: The fingerprint of the image to retrieve

**remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

**cert**: PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

**key**: PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
_salt '*' lxd.image_get <fingerprint>
```

```python
salt.modules.lxd.image_get_by_alias(alias, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)
```

Get an image by an alias

**alias**: The alias of the image to retrieve

**remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

**cert**: PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt

**key**: PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

**verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```
salt '*' lxd.image_get_by_alias xenial/amd64
```

```python
salt.modules.lxd.image_list(list_aliases=False, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Lists all images from the LXD.

**list_aliases**:

Return a dict with the fingerprint as key and a list of aliases as value instead.

**remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock

```
salt '*' lxd.image_list
```
salt.modules.lxd.init(storage_backend='dir', trust_password=None, network_address=None, network_port=None, storage_create_device=None, storage_create_loop=None, storage_pool=None)

Calls lxd init --auto -- opts

storage_backend : Storage backend to use (zfs or dir, default: dir)
trust_password : Password required to add new clients
network_address [None] Address to bind LXD to (default: none)
network_port [None] Port to bind LXD to (Default: 8443)
storage_create_device [None] Setup device based storage using this DEVICE
storage_create_loop [None] Setup loop based storage with this SIZE in GB
storage_pool [None] Storage pool to use or create

CLI Examples:
To listen on all IPv4/IPv6 Addresses:

salt '*' lxd.init dir PaSsW0rD [::]

To not listen on Network:

salt '*' lxd.init

salt.modules.lxd.normalize_input_values(config, devices)

normalize config input so returns can be put into mongodb, which doesn't like .

This is not meant to be used on the commandline.

CLI Examples:

salt '*' lxd.normalize_input_values config={} devices={}

salt.modules.lxd.profile_config_delete(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a profile config item.

name : The name of the profile to delete the config item.
config_key : The config key for the value to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
salt '*' lxd.profile_config_delete autostart boot.autostart.boot.autostart.delay

salt.modules.lxd.profile_config_get(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a profile config item.

name : The name of the profile to get the config item from.
config_key : The key for the item to retrieve.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
salt '*' lxd.profile_config_get autostart boot.autostart

salt.modules.lxd.profile_config_set(name, config_key, config_value, remote_addr=None, cert=None, key=None, verify_cert=True)

Set a profile config item.

name : The name of the profile to set the config item to.
config_key : The items key.
config_value : Its items value.
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
salt '*' lxd.profile_config_set autostart boot.autostart 0

salt.modules.lxd.profile_create(name, config=None, devices=None, description=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Creates a profile.

name : The name of the profile to get.
config : A config dict or None (None = unset).
Can also be a list:

[{'key': 'boot.autostart', 'value': 1}, {'key': 'security.privileged', 'value': '1'}]
devices : A device dict or None (None = unset).
description : A description string or None (None = unset).
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```bash
salt '*' lxd.profile_create autostart config="(boot.autostart: 1, boot.autostart.delay: 2, boot.autostart.priority: 1)"
```

```bash
salt '*' lxd.profile_create shared_mounts devices="[shared_mount: {type: 'disk', source: '/home/shared', path: '/home/shared'}]"
```

See the lxd-docs for the details about the config and devices dicts.

salt.modules.lxd.profile_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Deletes a profile.

- **name**: The name of the profile to delete.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
salt '*' lxd.profile_delete shared_mounts
```

salt.modules.lxd.profile_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a profile device.

- **name**: The name of the profile to delete the device.
- **device_name**: The name of the device to delete.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
  - Examples: ~/.config/lxc/client.crt
- **key**: PEM Formatted SSL Key.
  - Examples: ~/.config/lxc/client.key
- **verify_cert** [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
salt '*' lxd.profile_device_delete autostart eth1
```

salt.modules.lxd.profile_device_get(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a profile device.

- **name**: The name of the profile to get the device from.
- **device_name**: The name of the device to retrieve.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
- **cert**: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt

key: PEM Formatted SSL Key.

Examples: ~/.config/lxc/client.key

verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_get default eth0
```

salt.modules.lxd.profile_device_set(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)

Set a profile device.

name: The name of the profile to set the device to.

device_name: The name of the device to set.

remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt
device_type: The type of device to set.

Examples: ~/.config/lxc/client.key

verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged parent=lxdb0
```

salt.modules.lxd.profile_get(name, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Gets a profile from the LXD

name: The name of the profile to get.

remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.

Examples: ~/.config/lxc/client.crt
device_type: The type of device to set.

Examples: ~/.config/lxc/client.key

verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_raw: Return the pylxd object, this is internal and by states in use.

CLI Examples:

```
salt '*' lxd.profile_get autostart
```

salt.modules.lxd.profile_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Lists all profiles from the LXD.

list_names: 

Return a list of names instead of full blown dicts.

remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

salt.modules.lxd.pylxd_client_get(*remote_addr=None, cert=None, key=None, verify_cert=True*)
Get an pylxd client, this is not meant to be run over the CLI.
remote_addr: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
See the requests-docs for the SSL stuff.

salt.modules.lxd.pylxd_save_object(obj)
    Saves an object (profile/image/container) and translate its excception on failure
    obj: The object to save
This is an internal method, no CLI Example.

salt.modules.lxd.pylxd_version()
Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.pylxd_version
```

salt.modules.lxd.snapshots_all(*container, remote_addr=None, cert=None, key=None, verify_cert=True*)
Get all snapshots for a container
container: The name of the container to get.
remote_addr: An URL to a remote server. The ‘cert’ and ‘key’ fields must also be provided if ‘remote_addr’ is defined.
    Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
    Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
    Examples: ~/.config/lxc/client.key
verify_cert: [True] Verify the ssl certificate. Default: True
CLI Examples:

```
salt '*' lxd.snapshots_all test-container
```

salt.modules.lxd.snapshots_create(*container, name=None, remote_addr=None, cert=None, key=None, verify_cert=True*)
Create a snapshot for a container
container: The name of the container to get.
name: The name of the snapshot.
remote_addr: An URL to a remote server. The ‘cert’ and ‘key’ fields must also be provided if ‘remote_addr’ is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert: [True] Verify the ssl certificate. Default: True

CLI Examples:
salt '*' lxd.snapshots_create test-container test-snapshot

salt.modules.lxd.snapshots_delete(container, name, remote_addr=None, cert=None, key=None, verify_cert=True)
Delete a snapshot for a container
container: The name of the container to get.
name: The name of the snapshot.
remote_addr: An URL to a remote server. The ‘cert’ and ‘key’ fields must also be provided if ‘remote_addr’ is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert: [True] Verify the ssl certificate. Default: True
CLI Examples:
salt '*' lxd.snapshots_delete test-container test-snapshot

salt.modules.lxd.snapshots_get(container, name, remote_addr=None, cert=None, key=None, verify_cert=True)
Get information about snapshot for a container
container: The name of the container to get.
name: The name of the snapshot.
remote_addr: An URL to a remote server. The ‘cert’ and ‘key’ fields must also be provided if ‘remote_addr’ is defined.
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert: PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key: PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert: [True] Verify the ssl certificate. Default: True
CLI Examples:
salt '*' lxd.snapshots_get test-container test-snapshot

salt.modules.lxd.sync_config_devices(obj, newconfig, newdevices, test=False)
Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all changes made.
obj: The object to sync with / or just test with.
newconfig: The new config to check with the obj.
newdevices: The new devices to check with the obj.
test: Wherever to not change anything and give "Would change" message.

salt.modules.lxd.version()
Returns the actual lxd version.

CLI Example:

```
salt '*' lxd.version
```

### 25.7.239 salt.modules.mac_assistive

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

**class** `salt.modules.mac_assistive.TccDB(path=None)`

- `disable(app_id)`
- `enable(app_id)`
- `enabled(app_id)`
- `install(app_id, enable=True)`
- `installed(app_id)`
- `remove(app_id)`

**salt.modules.mac_assistive.enable** *(app_id, enabled=True)*

Enable or disable an existing assistive access application.

- `app_id` The bundle ID or command to set assistive access status.
- `enabled` Sets enabled or disabled status. Default is `True`.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

**salt.modules.mac_assistive.enabled** *(app_id)*

Check if a bundle ID or command is listed in assistive access and enabled.

- `app_id` The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

**salt.modules.mac_assistive.install** *(app_id, enable=True)*

Install a bundle ID or command as being allowed to use assistive access.

- `app_id` The bundle ID or command to install for assistive access.
- `enabled` Sets enabled or disabled status. Default is `True`.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

**salt.modules.mac_assistive.installed** *(app_id)*

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

- `app_id` The bundle ID or command to check installed status.

CLI Example:
salt '٭' assistive.installed /usr/bin/osascript
salt '٭' assistive.installed com.smileonmymac.textexpander

salt.modules.mac_assistive.remove(app_id)
Remove a bundle ID or command as being allowed to use assistive access.
app_id The bundle ID or command to remove from assistive access list.

CLI Example:
salt '٭' assistive.remove /usr/bin/osascript
salt '٭' assistive.remove com.smileonmymac.textexpander

25.7.240 salt.modules.mac_brew_pkg

Homebrew for macOS

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.mac_brew_pkg.available_version(*names, **kwargs)
This function is an alias of latest_version.
Return the latest version of the named package available for upgrade or installation
Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>

salt.modules.mac_brew_pkg.hold(name=None, pkgs=None, sources=None, **kwargs)
Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.
name The name of the package, e.g., 'tmux'

CLI Example:
salt '*' pkg.hold <package name>

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '*' pkg.hold pkgs=['"foo", "bar"]'

salt.modules.mac_brew_pkg.info_installed(*names, **kwargs)
Return the information of the named package(s) installed on the system.

New in version 2016.3.1.
names The names of the packages for which to return information.

CLI Example:
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt.modules.mac_brew_pkg.install(name=None, pkgs=None, taps=None, options=None, **kwargs)
    Install the passed package(s) with brew install
    name  The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.
    CLI Example:
    ```
salt '*' pkg.install <package name>
```
    taps  Unofficial GitHub repos to use when updating and installing formulas.
    CLI Example:
    ```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps=['josegonzalez/php', 'homebrew/dupes']
```
    options  Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen
    options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will
    be passed to all packages. Unrecognized options for a package will be silently ignored by brew.
    CLI Example:
    ```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps=['josegonzalez/php', 'homebrew/dupes']
```
    Multiple Package Installation Options:
    pkgs  A list of formulas to install. Must be passed as a python list.
    CLI Example:
    ```
salt '*' pkg.install pkgs=['foo','bar']
```
    Returns a dict containing the new package names and versions:
    ```
    {'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
    ```
    CLI Example:
    ```
salt '*' pkg.install 'package package package'
    ```

salt.modules.mac_brew_pkg.latest_version(*names, **kwargs)
    Return the latest version of the named package available for upgrade or installation
    Currently chooses stable versions, falling back to devel if that does not exist.
    CLI Example:
    ```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
    ```

salt.modules.mac_brew_pkg.list_pkgs(versions_as_list=False, **kwargs)
    List the packages currently installed in a dict:
    ```
    {'<package_name>': '<version>'}
    ```
    CLI Example:
    ```
salt '*' pkg.list_pkgs
    ```
salt.modules.mac_brew_pkg.list_upgrades(refresh=True, include_casks=False, **kwargs)
Check whether or not an upgrade is available for all packages

CLI Example:
```
salt '*' pkg.list_upgrades
```

salt.modules.mac_brew_pkg.pin(name=None, pkgs=None, sources=None, **kwargs)
Set package in 'hold' state, meaning it will not be upgraded.
New in version 3001.

name The name of the package, e.g., `tmux`

CLI Example:
```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.hold pkgs=['"foo", "bar"']
```

salt.modules.mac_brew_pkg.refresh_db(**kwargs)
Update the homebrew package repository.

CLI Example:
```
salt '*' pkg.refresh_db
```

salt.modules.mac_brew_pkg.remove(name=None, pkgs=None, **kwargs)
Removes packages with brew uninstall.

name The name of the package to be deleted.

Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"']
```

salt.modules.mac_brew_pkg.unhold(name=None, pkgs=None, sources=None, **kwargs)
Set package current in 'hold' state to install state, meaning it will be upgraded.
New in version 3001.

name The name of the package, e.g., `tmux`

CLI Example:
```
salt '*' pkg.unhold <package name>
```

pkgs A list of packages to unhold. Must be passed as a python list.

CLI Example:
```
salt '*' pkg.unhold pkgs=['"foo", "bar"']
```
salt.modules.mac_brew_pkg.unpin(name=None, pkgs=None, sources=None, **kwargs)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs

A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.upgrade(refresh=True, **kwargs)

Upgrade outdated, unpinned brews.

refresh Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{
'package': {
'old': '<old-version>',
'new': '<new-version>'
}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.mac_brew_pkg.upgrade_available(pkg, **kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_brew_pkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

25.7.241 salt.modules.mac_desktop

macOS implementations of various commands in the "desktop" interface

salt.modules.mac_desktop.get_output_volume()

Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

salt.modules.mac_desktop.lock()

Lock the desktop session

CLI Example:
salt '⋆' desktop.lock

```
salt.modules.mac_desktop.say('words')
```

Say some words.
\begin{itemize}
\item \textbf{words} \hspace{1em} The words to execute the say command with.
\end{itemize}

CLI Example:
```
salt '⋆' desktop.say <word0> <word1> ... <wordN>
```

```
salt.modules.mac_desktop.screensaver()
```

Launch the screensaver.

CLI Example:
```
salt '⋆' desktop.screensaver
```

```
salt.modules.mac_desktop.set_output_volume(volume)
```

Set the volume of sound.
\begin{itemize}
\item \textbf{volume} \hspace{1em} The level of volume. Can range from 0 to 100.
\end{itemize}

CLI Example:
```
salt '⋆' desktop.set_output_volume <volume>
```

\section*{25.7.242 \texttt{salt.modules.mac_group}}

Manage groups on Mac OS 10.7+

```
salt.modules.mac_group.add(name, gid=None, **kwargs)
```

Add the specified group
\begin{itemize}
\item \textbf{name} \hspace{1em} Name of the new group
\item \textbf{gid} \hspace{1em} Use GID for the new group
\end{itemize}

CLI Example:
```
salt '⋆' group.add foo 3456
```

```
salt.modules.mac_group.adduser(group, name)
```

Add a user in the group.

CLI Example:
```
salt '⋆' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

```
salt.modules.mac_group.chgid(name, gid)
```

Change the gid for a named group

CLI Example:
```
salt '⋆' group.chgid foo 4376
```

```
salt.modules.mac_group.delete(name)
```

Remove the named group

CLI Example:
### salt.modules.mac_group

#### deluser

Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

#### getent

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

#### info

Return information about a group

CLI Example:

```
salt '*' group.info foo
```

#### members

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'.

### 25.7.243 salt.modules.mac_keychain

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

#### get_default_keychain

Get the default keychain

- **user** The user to check the default keychain of
- **domain** The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

#### get_friendly_name

Get the friendly name of the given certificate

- **cert** The certificate to install
- **password** The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

25.7. execution modules
CLI Example:
```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

```
salt.modules.mac_keychain.get_hash(name, password=None)
Returns the hash of a certificate in the keychain.
name  The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a
p12 file.
password  The password that is used in the certificate. Only required if you passing a p12 file. Note: This will
be outputted to logs
CLI Example:
```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

```
salt.modules.mac_keychain.install(cert, password, keychain='''/Library/Keychains/System.keychain',
 allow_any=False, keychain_password=None)
Install a certificate
cert  The certificate to install
password  The password for the certificate being installed formatted in the way described for openssl command
in the PASS PHRASE ARGUMENTS section.
    Note: The password given here will show up as plaintext in the job returned info.
keychain  The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
allow_any  Allow any application to access the imported certificate without warning
keychain_password  If your keychain is likely to be locked pass the password and it will be unlocked before
running the import
    Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
```
salt '*' keychain.install test.p12 test123
```

```
salt.modules.mac_keychain.list_certs(keychain='''/Library/Keychains/System.keychain'
List all of the installed certificates
keychain  The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
CLI Example:
```
salt '*' keychain.list_certs
```

```
salt.modules.mac_keychain.set_default_keychain(keychain, domain='''user', user=None)
Set the default keychain
keychain  The location of the keychain to set as default
domain  The domain to use valid values are user|system|common|dynamic, the default is user
user  The user to set the default keychain as
CLI Example:
```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain
```

```
salt.modules.mac_keychain.uninstall(cert_name, keychain='''/Library/Keychains/System.keychain',
 keychain_password=None)
Uninstall a certificate from a keychain
cert_name  The name of the certificate to remove
keychain  The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain
keychain_password  If your keychain is likely to be locked pass the password and it will be unlocked before
running the import
    Note: The password given here will show up as plaintext in the returned job info.
CLI Example:

```
salt '*' keychain.install test.p12 test123
```

```
salt.modules.mac_keychain.unlock_keychain(keychain, password)
```
Unlock the given keychain with the password

**keychain**  The keychain to unlock

**password**  The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

## 25.7.244 salt.modules.mac_pkgutil

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

```
salt.modules.mac_pkgutil.forget(package_id)
```
New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

**Warning:** DO NOT use this command to fix broken package design

**Parameters**

- **package_id** *(str)* -- The name of the package to forget

**Returns**  True if successful, otherwise False

**Return type**  *bool*

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

```
salt.modules.mac_pkgutil.install(source, package_id)
```
Install a .pkg from an URI or an absolute path.

**Parameters**

- **source** *(str)* -- The path to a package.
- **package_id** *(str)* -- The package ID

**Returns**  True if successful, otherwise False

**Return type**  *bool*

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.apple.pkg.gcc4.2Leo
```

```
salt.modules.mac_pkgutil.is_installed(package_id)
```
Returns whether a given package id is installed.

**Returns**  True if installed, otherwise False

**Return type**  *bool*

CLI Example:
List the installed packages.

**Returns** A list of installed packages

**Return type** list

**CLI Example:**

`salt '*' pkgutil.list`

---

### 25.7.245 `salt.modules.mac_portspkg`

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg./something/` won't want to return. Use `salt-run jobs.active` on the master to check for potentially long-running calls to `port`.

Finally, ports database updates are always handled with `port selfupdate` as opposed to `port sync`. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don’t upgrade the packaging software when doing a package database update. In other words `salt mac-machine pkg.refresh_db` is more like `apt-get update; apt-get upgrade dpkg apt-get` than simply `apt-get update`.

**salt.modules.mac_portspkg.available_version(‘names’, **kwargs)**

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

**Options:**

- `refresh` Update ports with `port selfupdate`

**CLI Example:**

`salt '*' pkg.latest_version <package name>`

`salt '*' pkg.latest_version <package1> <package2> <package3>`

**salt.modules.mac_portspkg.install(name=None, refresh=False, pkgs=None, **kwargs)**

Install the passed package(s) with `port install`

**name** The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

**CLI Example:**

`salt '*' pkg.install <package name>`

**version** Specify a version to pkg to install. Ignored if pkgs is specified.

**CLI Example:**
salt '*/ pkg.install <package name>
salt '*/ pkg.install git-core version='1.8.5.5'

variant Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:
salt '*/ pkg.install <package name>
salt '*/ pkg.install git-core version='1.8.5.5' variant='+credential_osxkeychain+doc+pcre'

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:
salt '*/ pkg.install pkgs=["foo","bar"]
salt '*/ pkg.install pkgs=["foo@1.2","bar"]
salt '*/ pkg.install pkgs=["foo@1.2+ssl","bar@2.3"]

Returns a dict containing the new package names and versions:

{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}

CLI Example:
salt '*/ pkg.install 'package package package'

salt.modules.mac_portspkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation

Options:
refresh Update ports with port selfupdate

CLI Example:
salt '*/ pkg.latest_version <package name>
salt '*/ pkg.latest_version <package1> <package2> <package3>

salt.modules.mac_portspkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed in a dict:

{ '<package_name>': '<version>' }

CLI Example:
salt '*/ pkg.list_pkgs

salt.modules.mac_portspkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages

Options:
refresh Update ports with port selfupdate

CLI Example:
salt '*/ pkg.list_upgrades

salt.modules.mac_portspkg.refresh_db(**kwargs)
Update ports with port selfupdate

CLI Example:

25.7. execution modules
salt modules.mac_portspkg.remove(name=None, pkgs=None, **kwargs)
Removes packages with port uninstall.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.
New in version 0.16.0.
Returns a dict containing the changes.
CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'

salt.modules.mac_portspkg.upgrade(refresh=True, **kwargs)
Run a full upgrade using MacPorts 'port upgrade outdated'
Options:
refresh Update ports with port selfupdate
Returns a dictionary containing the changes:

{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}

CLI Example:
salt '*' pkg.upgrade

salt.modules.mac_portspkg.upgrade_available(pkg, refresh=True, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.mac_portspkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
25.7.246  `salt.modules.mac_power`

Module for editing power settings on macOS

New in version 2016.3.0.

`salt.modules.mac_power.get_computer_sleep()`  
Display the amount of idle time until the computer sleeps.  
  
  **Returns**: A string representing the sleep settings for the computer  
  
  **Return type**: str  

CLI Example:

```
salt '*' power.get_computer_sleep
```

`salt.modules.mac_power.get_display_sleep()`  
Display the amount of idle time until the display sleeps.  
  
  **Returns**: A string representing the sleep settings for the display  
  
  **Return type**: str

CLI Example:

```
salt '*' power.get_display_sleep
```

`salt.modules.mac_power.get_harddisk_sleep()`  
Display the amount of idle time until the hard disk sleeps.  
  
  **Returns**: A string representing the sleep settings for the hard disk  
  
  **Return type**: str

CLI Example:

```
salt '*' power.get_harddisk_sleep
```

`salt.modules.mac_power.get_restart_freeze()`  
Displays whether 'restart on freeze' is on or off if supported  
  
  **Returns**: A string value representing the "restart on freeze" settings  
  
  **Return type**: string

CLI Example:

```
salt '*' power.get_restart_freeze
```

`salt.modules.mac_power.get_restart_power_failure()`  
Displays whether 'restart on power failure' is on or off if supported  
  
  **Returns**: A string value representing the "restart on power failure" settings  
  
  **Return type**: string

CLI Example:

```
salt '*' power.get_restart_power_failure
```

`salt.modules.mac_power.get_sleep()`  
Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.  
  
  **Returns**: A dictionary containing the sleep status for Computer, Display, and Hard Disk  
  
  **Return type**: dict

CLI Example:

```
salt '*' power.get_sleep
```

`salt.modules.mac_power.get_sleep_on_power_button()`  
Displays whether 'allow power button to sleep computer' is on or off if supported
Returns A string value representing the "allow power button to sleep computer" settings
Return type string

CLI Example:
salt '*' power.get_sleep_on_power_button

salt.modules.mac_power.get_wake_on_modem()
Displays whether 'wake on modem' is on or off if supported
Returns A string value representing the "wake on modem" settings
Return type str

CLI Example:
salt '*' power.get_wake_on_modem

salt.modules.mac_power.get_wake_on_network()
Displays whether 'wake on network' is on or off if supported
Returns A string value representing the "wake on network" settings
Return type string

CLI Example:
salt '*' power.get_wake_on_network

salt.modules.mac_power.set_computer_sleep(minutes)
Set the amount of idle time until the computer sleeps. Pass "Never" of "Off" to never sleep.
Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype int, str
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off

salt.modules.mac_power.set_display_sleep(minutes)
Set the amount of idle time until the display sleeps. Pass "Never" of "Off" to never sleep.
Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype int, str
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off

salt.modules.mac_power.set_harddisk_sleep(minutes)
Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.
Parameters minutes -- Can be an integer between 1 and 180 or "Never" or "Off"
Ptype int, str
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off

salt.modules.mac_power.set_restart_freeze(enabled)
Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

**Parameters** enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

**CLI Example:**

```
salt '*' power.set_restart_freeze True
```

**salt.modules.mac_power.set_restart_power_failure(enabled)**

Set whether or not the computer will automatically restart after a power failure.

**Parameters** enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

**CLI Example:**

```
salt '*' power.set_restart_power_failure True
```

**salt.modules.mac_power.set_sleep(minutes)**

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

**Parameters** minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

**Ptype** int, str

**Returns** True if successful, False if not

**Return type** bool

**CLI Example:**

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

**salt.modules.mac_power.set_sleep_on_power_button(enabled)**

Set whether or not the power button can sleep the computer.

**Parameters** enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

**CLI Example:**

```
salt '*' power.set_sleep_on_power_button True
```

**salt.modules.mac_power.set_wake_on_modem(enabled)**

Set whether or not the computer will wake from sleep when modem activity is detected.

**Parameters** enabled (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

**CLI Example:**

```
salt '*' power.set_wake_on_modem True
```

**salt.modules.mac_power.set_wake_on_network(enabled)**

Set whether or not the computer will wake from sleep when network activity is detected.
**Parameters** enabled *(bool)* -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns** True if successful, False if not

**Return type** bool

CLI Example:

```
salt '*' power.set_wake_on_network True
```

### 25.7.247 salt.modules.mac_service

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

- `/System/Library/LaunchDaemons/`
- `/System/Library/LaunchAgents/`
- `/Library/LaunchDaemons/`
- `/Library/LaunchAgents/`

# As of version "2019.2.0" support for user-specific services were added.
- `/Users/foo/Library/LaunchAgents/`

**Note:** As of the 2019.2.0 release, if a service is located in a LaunchAgent path and a runas user is NOT specified, the current console user will be used to properly interact with the service.

**Note:** As of the 3002 release, if a service name of salt-minion is passed this module will convert it over to its macOS equivalent name, in this case to com.saltstack.salt.minion. This is true for salt-master, salt-api, and salt-syndic as well.

**salt.modules.mac_service.available**(name)

Check that the given service is available.

**Parameters** name *(str)* -- The name of the service

**Returns** True if the service is available, otherwise False

**Return type** bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

**salt.modules.mac_service.disable**(name, runas=None)

Disable a launchd service. Raises an error if the service fails to be disabled

**Parameters**

- name *(str)* -- Service label, file name, or full path
- runas *(str)* -- User to run launchctl commands

**Returns** True if successful or if the service is already disabled

**Return type** bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```
salt.modules.mac_service.disabled(name, runas=None, domain='system')
Check if the specified service is not enabled. This is the opposite of service.enabled
Parameters
- name (str) -- The name to look up
- runas (str) -- User to run launchctl commands
- domain (str) -- domain to check for disabled services. Default is system.
Returns True if the specified service is NOT enabled, otherwise False
Return type bool
CLI Example:
```
salt '*' service.disabled org.cups.cupsd
```

salt.modules.mac_service.enable(name, runas=None)
Enable a launchd service. Raises an error if the service fails to be enabled
Parameters
- name (str) -- Service label, file name, or full path
- runas (str) -- User to run launchctl commands
Returns True if successful or if the service is already enabled
Return type bool
CLI Example:
```
salt '*' service.enable org.cups.cupsd
```

salt.modules.mac_service.enabled(name, runas=None)
Check if the specified service is enabled (not disabled, capable of being loaded/bootstrapped).

Note: Previously this function would see if the service is loaded via launchctl list to determine if the
service is enabled. This was not an accurate way to do so. The new behavior checks to make sure its not
disabled to determine the status. Please use service.loaded for the previous behavior.

Parameters
- name (str) -- The name of the service to look up.
- runas (str) -- User to run launchctl commands.
Returns True if the specified service enabled, otherwise False
Return type bool
CLI Example:
```
salt '*' service.enabled org.cups.cupsd
```

salt.modules.mac_service.get_all(runas=None)
Return a list of services that are enabled or available. Can be used to find the name of a service.
Parameters runas (str) -- User to run launchctl commands
Returns A list of all the services available or enabled
Return type list
CLI Example:
```
salt '*' service.get_all
```

salt.modules.mac_service.get_enabled(runas=None)
Return a list of all services that are enabled. Can be used to find the name of a service.
Parameters **runas** *(str)* -- User to run launchctl commands
Returns A list of all the services enabled on the system
Return type **list**

CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.mac_service.launchctl *(sub_cmd, *args, **kwargs)*
Run a launchctl command and raise an error if it fails

Parameters
- **sub_cmd** *(str)* -- Sub command supplied to launchctl
- **args** *(tuple)* -- Tuple containing additional arguments to pass to launchctl
- **kwargs** *(dict)* -- Dictionary containing arguments to pass to cmd.run_all
- **return_stdout** *(bool)* -- A keyword argument. If true return the stdout of the launchctl command

Returns True if successful, raise CommandExecutionError if not, or the stdout of the launchctl command if requested

Return type **bool**, **str**

CLI Example:
```
salt '*' service.launchctl debug org.cups.cupsd
```

salt.modules.mac_service.list *(name=None, runas=None)*
Run launchctl list and return the output

Parameters
- **name** *(str)* -- The name of the service to list
- **runas** *(str)* -- User to run launchctl commands

Returns If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type **str**

CLI Example:
```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

salt.modules.mac_service.loaded *(name, runas=None)*
Check if the specified service is loaded.

Parameters
- **name** *(str)* -- The name of the service to look up
- **runas** *(str)* -- User to run launchctl commands

Returns True if the specified service is loaded, otherwise False

Return type **bool**

CLI Example:
```
salt '*' service.loaded org.cups.cupsd
```

salt.modules.mac_service.missing *(name)*
The inverse of service.available Check that the given service is not available.

Parameters **name** *(str)* -- The name of the service
Returns True if the service is not available, otherwise False
Return type **bool**
salt.modules.mac_service.restart(name, runas=None)
Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- name (str) -- Service label, file name, or full path
- runas (str) -- User to run launchctl commands

Returns True if successful
Return type bool

CLI Example:
```
salt '*' service.restart org.cups.cupsd
```

salt.modules.mac_service.show(name)
Show properties of a launchctl service

Parameters name (str) -- Service label, file name, or full path

Returns The service information if the service is found

Return type dict

CLI Example:
```
salt '*' service.show org.cups.cupsd # service label
salt '*' service.show org.cups.cupsd.plist # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist # full path
```

salt.modules.mac_service.start(name, runas=None)
Start a launchd service. Raises an error if the service fails to start

Note: To start a service in macOS the service must be enabled first. Use service.enable to enable the service.

Parameters

- name (str) -- Service label, file name, or full path
- runas (str) -- User to run launchctl commands

Returns True if successful or if the service is already running

Return type bool

CLI Example:
```
salt '*' service.start org.cups.cupsd
```

salt.modules.mac_service.status(name, sig=None, runas=None)
Return the status for a service.

Note: Previously this function would return a PID for a running service with a PID or 'loaded' for a loaded service without a PID. This was changed to have better parity with other service modules that return True/False.
- **name** *(str)* -- Used to find the service from launchctl. Can be the service Label, file name, or path to the service file. (normally a plist)

- **sig** *(str)* -- Find the service with status.pid instead. Note that name must still be provided.

- **runas** *(str)* -- User to run launchctl commands.

  **Returns**  True if running, otherwise False.

  **Return type**  str

  CLI Example:

  ```
  salt '*' service.status cups
  ```

```python
salt.modules.mac_service.stop(name, runas=None)
```

Stop a launchd service. Raises an error if the service fails to stop

**Note:** Though **service.stop** will unload a service in macOS, the service will start on next boot unless it is disabled. Use **service.disable** to disable the service

**Parameters**

- **name** *(str)* -- Service label, file name, or full path

- **runas** *(str)* -- User to run launchctl commands

  **Returns**  True if successful or if the service is already stopped

  **Return type**  bool

  CLI Example:

  ```
  salt '*' service.stop org.cups.cupsd
  ```

**25.7.248 salt.modules.mac_shadow**

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

```python
salt.modules.mac_shadow.del_password(name)
```

Deletes the account password

  **Parameters**  name *(str)* -- The user name of the account

  **Returns**  True if successful, otherwise False

  **Return type**  bool

  ** Raises**  CommandExecutionError on user not found or any other unknown error

  CLI Example:

  ```
  salt '*' shadow.del_password username
  ```

```python
salt.modules.mac_shadow.get_account_created(name)
```

Get the date/time the account was created

  **Parameters**  name *(str)* -- The username of the account

  **Returns**  The date/time the account was created (yyyy-mm-dd hh:mm:ss)

  **Return type**  str

  ** Raises**  CommandExecutionError on user not found or any other unknown error

  CLI Example:
**salt.modules.mac_shadow.get_change(name)**

Gets the date on which the password expires

Parameters
- **name (str)** -- The name of the user account

Returns
- The date the password will expire

Return type
- str

Raises
- CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change admin
```

**salt.modules.mac_shadow.get_expire(name)**

Gets the date on which the account expires

Parameters
- **name (str)** -- The name of the user account

Returns
- The date the account expires

Return type
- str

Raises
- CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

**salt.modules.mac_shadow.get_last_change(name)**

Get the date/time the account was changed

Parameters
- **name (str)** -- The username of the account

Returns
- The date/time the account was modified (yyyy-mm-dd hh:mm:ss)

Return type
- str

Raises
- CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

**salt.modules.mac_shadow.get_login_failed_count(name)**

Get the number of failed login attempts

Parameters
- **name (str)** -- The username of the account

Returns
- The number of failed login attempts

Return type
- int

Raises
- CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

**salt.modules.mac_shadow.get_login_failed_last(name)**

Get the date/time of the last failed login attempt

Parameters
- **name (str)** -- The username of the account

Returns
- The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)

Return type
- str

Raises
- CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

**salt.modules.mac_shadow.get_maxdays(name)**

Get the maximum age of the password

Parameters
- **name (str)** -- The username of the account
Returns  The maximum age of the password in days
Return type  int
Raises  CommandExecutionError on user not found or any other unknown error

CLI Example:

```bash
salt '*' shadow.get_maxdays admin 90
```

`salt.modules.mac_shadow.info(name)`
Return information for the specified user

Parameters  name (str) -- The username

Returns  A dictionary containing the user's shadow information
Return type  dict

CLI Example:

```bash
salt '*' shadow.info admin
```

`salt.modules.mac_shadow.set_change(name, date)`
Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters
  * name (str) -- The name of the user account
  * date (date) -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns  True if successful, otherwise False
Return type  bool
Raises  CommandExecutionError on user not found or any other unknown error

CLI Example:

```bash
salt '*' shadow.set_change username 09/21/2016
```

`salt.modules.mac_shadow.set_expire(name, date)`
Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters
  * name (str) -- The name of the user account
  * date (datetime) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns  True if successful, False if not
Return type  bool
Raises  CommandExecutionError on user not found or any other unknown error

CLI Example:

```bash
salt '*' shadow.set_expire username 07/23/2015
```

`salt.modules.mac_shadow.set_inactdays(name, days)`
Set the number if inactive days before the account is locked. Not available in macOS

Parameters
  * name (str) -- The user name
  * days (int) -- The number of days

Returns  Will always return False until macOS supports this feature.
Return type  bool

CLI Example:
salt.modules.mac_shadow.set_inactdays(name, days)
Set the maximum age of the password in days
Parameters
- **name** *(str)* -- The username of the account
- **days** *(int)* -- The maximum age of the account in days
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on user not found or any other unknown error
CLI Example:
salt '*' shadow.set_inactdays admin 90

salt.modules.mac_shadow.set_maxdays(name, days)
Set the maximum age of the password in days
Parameters
- **name** *(str)* -- The username of the account
- **days** *(int)* -- The maximum age of the account in days
Returns True if successful, False if not
Return type bool
CLI Example:
salt '*' shadow.set_maxdays admin 90

salt.modules.mac_shadow.set_mindays(name, days)
Set the minimum password age in days. Not available in macOS.
Parameters
- **name** *(str)* -- The username of the account
- **days** *(int)* -- The number of days
Returns Will always return False until macOS supports this feature.
Return type bool
CLI Example:
salt '*' shadow.set_mindays admin 90

salt.modules.mac_shadow.set_password(name, password)
Set the password for a named user (insecure, the password will be in the process list while the command is running)
Parameters
- **name** *(str)* -- The name of the local user, which is assumed to be in the local directory service
- **password** *(str)* -- The plaintext password to set
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' mac_shadow.set_password macuser macpassword

salt.modules.mac_shadow.set_warndays(name, days)
Set the number of days before the password expires that the user will start to see a warning. Not available in macOS.
Parameters
- **name** *(str)* -- The user name
- **days** *(int)* -- The number of days
Returns Will always return False until macOS supports this feature.
Return type bool
CLI Example:
25.7.249 salt.modules.mac_softwareupdate

Support for the softwareupdate command on MacOS.

salt.modules.mac_softwareupdate.download(name)

Download a named update so that it can be installed later with the update or update_all functions

Parameters
    name (str) -- The update to download.

Returns
    True if successful, otherwise False

Return type
    bool

CLI Example:

    salt '*' softwareupdate.download <update name>

salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)

Download all available updates so that they can be installed later with the update or update_all functions. It returns a list of updates that are now downloaded.

Parameters

    • recommended (bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
    • restart (bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns
    A list containing all downloaded updates on the system.

Return type
    list

CLI Example:

    salt '*' softwareupdate.download_all

salt.modules.mac_softwareupdate.get_catalog()

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned.

Returns
    The catalog being used for update lookups

Return type
    str

CLI Example:

    salt '*' softwareupdates.get_catalog

salt.modules.mac_softwareupdate.ignore(name)

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters
    name -- The name of the update to add to the ignore list.

Returns
    True if successful, False if not

Return type
    bool

CLI Example:

    salt '*' softwareupdate.ignore <update-name>
salt.modules.mac_softwareupdate.list_available

List all available updates.

Parameters

- **recommended** (bool) -- Show only recommended updates.
- **restart** (bool) -- Show only updates that require a restart.

Returns Returns a dictionary containing the updates
Return type dict

CLI Example:
salt '*' softwareupdate.list_available

salt.modules.mac_softwareupdate.list_downloads

Return a list of all updates that have been downloaded locally.

Returns A list of updates that have been downloaded
Return type list

CLI Example:
salt '*' softwareupdate.list_downloads

salt.modules.mac_softwareupdate.list_ignored

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

Returns The list of ignored updates
Return type list

CLI Example:
salt '*' softwareupdate.list_ignored

salt.modules.mac_softwareupdate.reset_catalog

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' softwareupdates.reset_catalog

salt.modules.mac_softwareupdate.reset_ignored

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns True if the list was reset, Otherwise False
Return type bool

CLI Example:
salt '*' softwareupdate.reset_ignored

salt.modules.mac_softwareupdate.schedule_enable

Enable/disable automatic update scheduling.

Parameters enable -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.
Type bool str

Returns True if scheduling is enabled, False if disabled
Return type bool

CLI Example:
salt.modules.mac_softwareupdate.schedule_enabled()
Check the status of automatic update scheduling.

Parameters
- url (str) -- The url to the update catalog

Returns
- True if scheduling is enabled, False if disabled

Return type
- bool

CLI Example:
salt '*' softwareupdate.schedule_enabled

salt.modules.mac_softwareupdate.set_catalog(url)
Set the Software Update Catalog to the URL specified

Parameters
- url (str) -- The url to the update catalog

Returns
- True if successful, False if not

Return type
- bool

CLI Example:
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog

salt.modules.mac_softwareupdate.update(name)
Install a named update.

Parameters
- name (str) -- The name of the of the update to install.

Returns
- True if successfully updated, otherwise False

Return type
- bool

CLI Example:
salt '*' softwareupdate.update <update-name>

salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)
Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters
- recommended (bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- restart (bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns
- A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.

Return type
- dict

CLI Example:
salt '*' softwareupdate.update_all

salt.modules.mac_softwareupdate.update_available(name)
Check whether or not an update is available with a given name.

Parameters
- name (str) -- The name of the update to look for

Returns
- True if available, False if not

Return type
- bool

CLI Example:
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
25.7.250 salt.modules.mac_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.mac_sysctl.assign(name, value)
    Assign a single sysctl parameter for this minion
    name  The name of the sysctl value to edit.
    value The sysctl value to apply.
    CLI Example:

    salt '*' sysctl.assign net.inet.icmp.icmplim 50

salt.modules.mac_sysctl.get(name)
    Return a single sysctl parameter for this minion
    name  The name of the sysctl value to display.
    CLI Example:

    salt '*' sysctl.get hw.physmem

salt.modules.mac_sysctl.persist(name, value, config='/etc/sysctl.conf', apply_change=False)
    Assign and persist a simple sysctl parameter for this minion
    name  The name of the sysctl value to edit.
    value The sysctl value to apply.
    config The location of the sysctl configuration file.
    apply_change Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to
        True, the changes are applied to the system.
    CLI Example:

    salt '*' sysctl.persist net.inet.icmp.icmplim 50
    salt '*' sysctl.persist coretemp_load NO config='/etc/sysctl.conf'

salt.modules.mac_sysctl.show(config_file=False)
    Return a list of sysctl parameters for this minion
    config: Pull the data from the system configuration file instead of the live data.
    CLI Example:

    salt '*' sysctl.show

25.7.251 salt.modules.mac_system

System module for sleeping, restarting, and shutting down the system on Mac OS X
New in version 2016.3.0.

Warning: Using this module will enable atrun on the system if it is disabled.

salt.modules.mac_system.get_boot_arch()
    Get the kernel architecture setting from com.apple.Boot.plist
    Returns A string value representing the boot architecture setting
    Return type str
    CLI Example:
salt '('* system.get_boot_arch

salt.modules.mac_system.get_computer_name()
  Gets the computer name
  Returns The computer name
  Return type str
  CLI Example:
  salt '('* system.get_computer_name

salt.modules.mac_system.get_disable_keyboard_on_lock()
  Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.
  Returns True if disable keyboard on lock is on, False if off
  Return type bool
  CLI Example:
  salt '('* system.get_disable_keyboard_on_lock

salt.modules.mac_system.get_remote_events()
  Displays whether remote apple events are on or off.
  Returns True if remote apple events are on, False if off
  Return type bool
  CLI Example:
  salt '('* system.get_remote_events

salt.modules.mac_system.get_remote_login()
  Displays whether remote login (SSH) is on or off.
  Returns True if remote login is on, False if off
  Return type bool
  CLI Example:
  salt '('* system.get_remote_login

salt.modules.mac_system.get_restart_delay()
  Get the number of seconds after which the computer will start up after a power failure.
  Returns A string value representing the number of seconds the system will delay restart after
          power loss
  Return type str
  CLI Example:
  salt '('* system.get_restart_delay

salt.modules.mac_system.get_startup_disk()
  Displays the current startup disk
  Returns The current startup disk
  Return type str
  CLI Example:
  salt '('* system.get_startup_disk

salt.modules.mac_system.get_subnet_name()
  Gets the local subnet name
  Returns The local subnet name
  Return type str
CLI Example:

```bash
salt '*' system.get_subnet_name
```

`salt.modules.mac_system.halt(at_time=None)`

Halt a running system

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>at_time</code></td>
<td>Any valid at expression. For example, some valid at expressions could be:</td>
</tr>
<tr>
<td></td>
<td>• noon</td>
</tr>
<tr>
<td></td>
<td>• midnight</td>
</tr>
<tr>
<td></td>
<td>• fri</td>
</tr>
<tr>
<td></td>
<td>• 9:00 AM</td>
</tr>
<tr>
<td></td>
<td>• 2:30 PM tomorrow</td>
</tr>
<tr>
<td></td>
<td>• now + 10 minutes</td>
</tr>
</tbody>
</table>

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```bash
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

`salt.modules.mac_system.list_startup_disks()`

List all valid startup disks on the system.

**Returns**

A list of valid startup disks

**Return type**

list

CLI Example:

```bash
salt '*' system.list_startup_disks
```

`salt.modules.mac_system.restart(at_time=None)`

Restart the system

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>at_time</code></td>
<td>Any valid at expression. For example, some valid at expressions could be:</td>
</tr>
<tr>
<td></td>
<td>• noon</td>
</tr>
<tr>
<td></td>
<td>• midnight</td>
</tr>
<tr>
<td></td>
<td>• fri</td>
</tr>
<tr>
<td></td>
<td>• 9:00 AM</td>
</tr>
<tr>
<td></td>
<td>• 2:30 PM tomorrow</td>
</tr>
<tr>
<td></td>
<td>• now + 10 minutes</td>
</tr>
</tbody>
</table>

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'

salt.modules.mac_system.set_boot_arch(arch='default')
Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: When this function fails with the error changes to kernel architecture failed to save!, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

Parameters arch (str) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:
  • i386
  • x86_64
  • default

Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' system.set_boot_arch i386

salt.modules.mac_system.set_computer_name(name)
Set the computer name
Parameters name (str) -- The new computer name
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' system.set_computer_name "Mike's Mac"

salt.modules.mac_system.set_disable_keyboard_on_lock(enable)
Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.
Parameters enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' system.set_disable_keyboard_on_lock False

salt.modules.mac_system.set_remote_events(enable)
Set whether the server responds to events sent by other computers (such as AppleScripts)
Parameters enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively
Returns True if successful, False if not
Return type bool

CLI Example:
salt '*' system.set_remote_events On

salt.modules.mac_system.set_remote_login(enable)
Set the remote login (SSH) to either on or off.
Parameters `enable (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' system.set_remote_login True
```

salt.modules.mac_system.set_restart_delay(seconds)

Set the number of seconds after which the computer will start up after a power failure.

**Warning:** This command fails with the following error:

```
Error, IOServiceOpen returned 0x10000003
```

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

Parameters `seconds (int)` -- The number of seconds. Must be a multiple of 30

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' system.set_restart_delay 180
```

salt.modules.mac_system.set_startup_disk(path)

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters `path (str)` -- The valid startup disk path

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
salt '*' system.set_startup_disk /System/Library/CoreServices
```

salt.modules.mac_system.set_subnet_name(name)

Set the local subnet name

Parameters `name (str)` -- The new local subnet name

Note: Spaces are changed to dashes. Other special characters are removed.

Returns True if successful, False if not

Return type bool

CLI Example:

```bash
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

salt.modules.mac_system.shutdown(at_time=None)

Shutdown the system

Parameters `at_time (str)` -- Any valid at expression. For example, some valid at expressions could be:
• noon
• midnight
• fri
• 9:00 AM
• 2:30 PM tomorrow
• now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

documentation for `salt.modules.mac_system.sleep` function:

```
salt.modules.mac_system.sleep(at_time=None)
```

Sleep the system. If a user is active on the system it will likely fail to sleep.

**Parameters**

`at_time (str)` -- Any valid at expression. For example, some valid at expressions could be:

• noon
• midnight
• fri
• 9:00 AM
• 2:30 PM tomorrow
• now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

### 25.7.252 salt.modules.mac_timezone

Module for editing date/time settings on macOS

New in version 2016.3.0.

documentation for `salt.modules.mac_timezone.get_date` function:

```
salt.modules.mac_timezone.get_date()
```

Displays the current date

**Returns** the system date

**Return type** `str`
salt.modules.mac_timezone.get_hwclock()  
Get current hardware clock setting (UTC or localtime)  

CLI Example:  
```
salt '*' timezone.get_hwclock
```

salt.modules.mac_timezone.get_offset()  
Displays the current time zone offset  
    Returns The current time zone offset  
    Return type str  

CLI Example:  
```
salt '*' timezone.get_offset
```

salt.modules.mac_timezone.get_time()  
Get the current system time.  
    Returns The current time in 24 hour format  
    Return type str  

CLI Example:  
```
salt '*' timezone.get_time
```

salt.modules.mac_timezone.get_time_server()  
Display the currently set network time server.  
    Returns the network time server  
    Return type str  

CLI Example:  
```
salt '*' timezone.get_time_server
```

salt.modules.mac_timezone.get_using_network_time()  
Display whether network time is on or off  
    Returns True if network time is on, False if off  
    Return type bool  

CLI Example:  
```
salt '*' timezone.get_using_network_time
```

salt.modules.mac_timezone.get_zone()  
Displays the current time zone  
    Returns The current time zone  
    Return type str  

CLI Example:  
```
salt '*' timezone.get_zone
```

salt.modules.mac_timezone.get_zonecode()  
Displays the current time zone abbreviated code  
    Returns The current time zone code  
    Return type str  

CLI Example:  
```
salt '*' timezone.get_zonecode
```

salt.modules.mac_timezone.list_zones()  
Displays a list of available time zones. Use this list when setting a time zone using timezone.set_zone

25.7. execution modules 2231
Returns a list of time zones  
Return type list

CLI Example:
salt '*' timezone.list_zones

salt.modules.mac_timezone.set_date(date)
Set the current month, day, and year

Parameters date (str) -- The date to set. Valid date formats are:
- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

Returns True if successful, False if not  
Return type bool  
 Raises SaltInvocationError on Invalid Date format  
 Raises CommandExecutionError on failure

CLI Example:
salt '*' timezone.set_date 1/13/2016

salt.modules.mac_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

CLI Example:
salt '*' timezone.set_hwclock UTC

salt.modules.mac_timezone.set_time(time)
Sets the current time. Must be in 24 hour format.

Parameters time (str) -- The time to set in 24 hour format. The value must be double quoted.  
 ie: "17:46"

Returns True if successful, False if not  
Return type bool  
 Raises SaltInvocationError on Invalid Time format  
 Raises CommandExecutionError on failure

CLI Example:
salt '*' timezone.set_time "17:34"

salt.modules.mac_timezone.set_time_server(time_server='time.apple.com')
Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters time_server -- IP or DNS name of the network time server. If nothing is passed  
 the time server will be set to the macOS default of 'time.apple.com'

Type str

Returns True if successful, False if not  
Return type bool  
 Raises CommandExecutionError on failure

CLI Example:
salt '*' timezone.set_time_server time.acme.com

salt.modules.mac_timezone.set_using_network_time(enable)
Set whether network time is on or off.
Salt Documentation, Release 3006.4

**Parameters**

**enable** -- True to enable, False to disable. Can also use 'on' or 'off'

**Type** str bool

**Returns** True if successful, False if not

**Return type** bool

**Raises** CommandExecutionError on failure

CLI Example:

```bash
salt '*' timezone.set_using_network_time True
```

```python
salt.modules.mac_timezone.set_zone(time_zone)
```

Set the local time zone. Use `timezone.list_zones` to list valid `time_zone` arguments

**Parameters**

**time_zone** (str) -- The time zone to apply

**Returns** True if successful, False if not

**Return type** bool

**Raises** SaltInvocationError on Invalid Timezone

**Raises** CommandExecutionError on failure

CLI Example:

```bash
salt '*' timezone.set_zone America/Denver
```

```python
salt.modules.mac_timezone.zone_compare(time_zone)
```

Compares the given timezone name with the system timezone name.

**Returns** True if they are the same, False if not

**Return type** bool

CLI Example:

```bash
salt '*' timezone.zone_compare America/Boise
```

---

**25.7.253 salt.modules.mac_user**

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).

```python
salt.modules.mac_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, full_name=None, createhome=True, **kwargs)
```

Add a user to the minion

**Example:**

```bash
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.mac_user.chfullname(name, fullname)
```

Change the user's Full Name

**Example:**

```bash
salt '*' user.chfullname foo 'Foo Bar'
```

```python
salt.modules.mac_user.chgid(name, gid)
```

Change the default group of the user

**Example:**

```bash
salt '*' user.chgid name <gid>
```
salt 'スター' user.chgid foo 4376

salt.modules.mac_user.chgroups(name, groups, append=False)
Change the groups to which the user belongs. Note that the user’s primary group does not have to be one of the groups passed, membership in the user’s primary group is automatically assumed.

**groups** Groups to which the user should belong, can be passed either as a python list or a comma-separated string

**append** Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members

CLI Example:
salt 'スター' user.chgroups foo wheel,root

salt.modules.mac_user.chhome(name, home, **kwargs)
Change the home directory of the user

CLI Example:
salt 'スター' user.chhome foo /Users/foo

salt.modules.mac_user.chshell(name, shell)
Change the default shell of the user

CLI Example:
salt 'スター' user.chshell foo /bin/zsh

salt.modules.mac_user.chuid(name, uid)
Change the uid for a named user

CLI Example:
salt 'スター' user.chuid foo 4376

salt.modules.mac_user.delete(name, remove=False, force=False)
Remove a user from the minion

CLI Example:
salt 'スター' user.delete name remove=True force=True

salt.modules.mac_user.disable_auto_login()
New in version 2016.3.0.
Disables auto login on the machine

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:
salt 'スター' user.disable_auto_login

salt.modules.mac_user.enable_auto_login(name, password)
New in version 2016.3.0.
Configures the machine to auto login with the specified user

**Parameters**

- **name** (str) -- The user account use for auto login
password (str) -- The password to user for auto login

New in version 2017.7.3.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

salt.modules.mac_user.get_auto_login()

New in version 2016.3.0.

Gets the current setting for Auto Login

Returns If enabled, returns the user name, otherwise returns False

Return type str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

salt.modules.mac_user.getent(refresh=False)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.mac_user.info(name)

Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.mac_user.list_groups(name)

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.mac_user.list_users()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.mac_user.primary_group(name)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:
salt '*' user.primary_group saltadmin

salt.modules.mac_user.rename(name, new_name)

Change the username for a named user

CLI Example:
salt '*' user.rename name new_name

25.7.254 salt.modules.mac_xattr

This module allows you to manage extended attributes on files or directories

salt '*' xattr.list /path/to/file

salt.modules.mac_xattr.clear(path)

Causes the all attributes on the file/directory to be removed

Parameters
path (str) -- The file(s) to get attributes from

Returns True if successful, otherwise False

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:
salt '*' xattr.delete /path/to/file "com.test.attr"

salt.modules.mac_xattr.delete(path, attribute)

Removes the given attribute from the file

Parameters

• path (str) -- The file(s) to get attributes from

• attribute (str) -- The attribute name to be deleted from the file/directory

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:
salt '*' xattr.delete /path/to/file "com.test.attr"

salt.modules.mac_xattr.list_(path, **kwargs)

List all of the extended attributes on the given file/directory

Parameters

• path (str) -- The file(s) to get attributes from

• hex (bool) -- Return the values with forced hexadecimal values

Returns A dictionary containing extended attributes and values for the given file

Return type dict

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True

salt.modules.mac_xattr.read(path, attribute, **kwargs)

Read the given attributes on the given file/directory
**Parameters**

- **path** *(str)* -- The file to get attributes from
- **attribute** *(str)* -- The attribute to read
- **hex** *(bool)* -- Return the values with forced hexadecimal values

**Returns**

A string containing the value of the named attribute

**Return type** *str*

**Raises**

CommandExecutionError on file not found, attribute not found, and any other unknown error

**CLI Example:**

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

**salt.modules.mac_xattr.write** *(path, attribute, value, **kwargs)*

Causes the given attribute name to be assigned the given value

**Parameters**

- **path** *(str)* -- The file(s) to get attributes from
- **attribute** *(str)* -- The attribute name to be written to the file/directory
- **value** *(str)* -- The value to assign to the given attribute
- **hex** *(bool)* -- Set the values with forced hexadecimal values

**Returns**

True if successful, otherwise False

**Return type** *bool*

**Raises**

CommandExecutionError on file not found or any other unknown error

**CLI Example:**

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

**25.7.255 salt.modules.macdefaults**

Set defaults on Mac OS

**salt.modules.macdefaults.delete** *(domain, key, user=None)*

Delete a default from the system

**CLI Example:**

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType
salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

- **domain** The name of the domain to delete from
- **key** The key of the given domain to delete
- **user** The user to delete the defaults with

**salt.modules.macdefaults.read** *(domain, key, user=None)*

Read a default from the system

**CLI Example:**

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType
salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```
domain The name of the domain to read from
key The key of the given domain to read from
user The user to read the defaults as

salt.modules.macdefaults.write(domain, key, value, type='string', user=None)
Write a default to the system

CLI Example:

```bash
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server
salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain The name of the domain to write to
key The key of the given domain to write to
value The value to write to the given key
type The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-
add, dict, dict-add
user The user to write the defaults to

25.7.256 salt.modules.macpackage

Install pkg, dmg and .app applications on macOS minions.

salt.modules.macpackage.get_mpkg_ids(mpkg)
Attempt to get the package IDs from a mounted .mpkg file
Parameters mpkg (str) -- The location of the mounted mpkg file
Returns List of package IDs
Return type list

CLI Example:

```bash
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

salt.modules.macpackage.get_pkg_id(pkg)
Attempt to get the package ID from a .pkg file
Parameters pkg (str) -- The location of the pkg file
Returns List of all of the package IDs
Return type list

CLI Example:

```bash
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

salt.modules.macpackage.install(pkg, target='LocalSystem', store=False, allow_untrusted=False)
Install a pkg file
Parameters

- pkg (str) -- The package to install
- target (str) -- The target in which to install the package to
- store (bool) -- Should the package be installed as if it was from the store?
- allow_untrusted (bool) -- Allow the installation of untrusted packages?

Returns A dictionary containing the results of the installation
Return type dict

CLI Example:
salt '*' macpackage.install test.pkg

salt.modules.macpackage.install_app(app, target=~/Applications/)
Install an app file by moving it into the specified Applications directory

Parameters
  • app (str) -- The location of the .app file
  • target (str) -- The target in which to install the package to Default is "/Applications/"

Returns The results of the rsync command
Return type str

CLI Example:
salt '*' macpackage.install_app /tmp/tmp.app /Applications/

salt.modules.macpackage.installed_pkgs()
Return the list of installed packages on the machine

Returns List of installed packages
Return type list

CLI Example:
salt '*' macpackage.installed_pkgs

salt.modules.macpackage.mount(dmg)
Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

Parameters dmg (str) -- The location of the dmg file to mount

Returns Tuple containing the results of the command along with the mount point
Return type tuple

CLI Example:
salt '*' macpackage.mount /tmp/software.dmg

salt.modules.macpackage.uninstall_app(app)
Uninstall an app file by removing it from the Applications directory

Parameters app (str) -- The location of the .app file

Returns True if successful, otherwise False
Return type bool

CLI Example:
salt '*' macpackage.uninstall_app /Applications/app.app

salt.modules.macpackage.unmount(mountpoint)
Attempt to unmount a dmg file from a temporary location

Parameters mountpoint (str) -- The location of the mount point

Returns The results of the hdutil detach command
Return type str

CLI Example:
salt '*' macpackage.unmount /dev/disk2
25.7.257 salt.modules.makeconf

Support for modifying make.conf under Gentoo

salt.modules.makeconf.append_cflags(value)
Add to or create a new CFLAGS in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.append_cflags '-pipe'

salt.modules.makeconf.append_cxxflags(value)
Add to or create a new CXXFLAGS in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.append_cxxflags '-pipe'

salt.modules.makeconf.append_emerge_default_opts(value)
Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.append_emerge_default_opts '--jobs'

salt.modules.makeconf.append_features(value)
Add to or create a new FEATURES in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.append_features 'webrsync-gpg'

salt.modules.makeconf.append_gentoo_mirrors(value)
Add to or create a new GENTOO_MIRRORS in the make.conf
Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>', 'new': '<new-value>'}}
```
CLI Example:

```bash
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

```python
salt.modules.makeconf.append_makeopts(value)

Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```json```
{"<variable>": {"old": '<old-value>',
  "new": '<new-value>'}}
```

CLI Example:

```bash
salt '*' makeconf.append_makeopts '-j3'
```

```python
salt.modules.makeconf.append_var(var, value)

Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```json```
{"<variable>": {"old": '<old-value>',
  "new": '<new-value>'}}
```

CLI Example:

```bash
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

```python
salt.modules.makeconf.cflags_contains(value)

Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```bash
salt '*' makeconf.cflags_contains '-pipe'
```

```python
salt.modules.makeconf.chost_contains(value)

Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```bash
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

```python
salt.modules.makeconf.cxxflags_contains(value)

Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```bash
salt '*' makeconf.cxxflags_contains '-pipe'
```

```python
salt.modules.makeconf.emerge_default_opts_contains(value)

Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:
```
salt '*' makeconf.emerge_default_opts_contains '--jobs'

```
salt.modules.makeconf.features_contains(value)
Verify if FEATURES variable contains a value in make.conf
Return True if value is set for var

CLI Example:
salt '*' makeconf.features_contains 'webrsync-gpg'
```

```
salt.modules.makeconf.gentoo_mirrors_contains(value)
Verify if GENTOO_MIRRORS variable contains a value in make.conf
Return True if value is set for var

CLI Example:
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

```
salt.modules.makeconf.get_cflags()
Get the value of CFLAGS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_cflags
```

```
salt.modules.makeconf.get_chost()
Get the value of CHOST variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_chost
```

```
salt.modules.makeconf.get_cxxflags()
Get the value of CXXFLAGS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_cxxflags
```

```
salt.modules.makeconf.get_emerge_default_opts()
Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
salt '*' makeconf.get_emerge_default_opts
```

```
salt.modules.makeconf.get_features()
Get the value of FEATURES variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf

CLI Example:
```
salt '*' makeconf.get_features

salt.modules.makeconf.get_gentoo_mirrors()
Get the value of GENTOO_MIRRORS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt '*' makeconf.get_gentoo_mirrors

salt.modules.makeconf.get_makeopts()
Get the value of MAKEOPTS variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt '*' makeconf.get_makeopts

salt.modules.makeconf.get_sync()
Get the value of SYNC variable in the make.conf
Return the value of the variable or None if the variable is not in the make.conf
CLI Example:
salt '*' makeconf.get_sync

salt.modules.makeconf.get_var(var)
Get the value of a variable in make.conf
Return the value of the variable or None if the variable is not in make.conf
CLI Example:
salt '*' makeconf.get_var 'LINGUAS'

salt.modules.makeconf.makeopts_contains(value)
Verify if MAKEOPTS variable contains a value in make.conf
Return True if value is set for var
CLI Example:
salt '*' makeconf.makeopts_contains '-j3'

salt.modules.makeconf.remove_var(var)
Remove a variable from the make.conf
Return a dict containing the new value for the variable:

```json```
{
  '<variable>': {
    'old': '<old-value>',
    'new': '<new-value>'
  }
}
```

CLI Example:
salt '*' makeconf.remove_var 'LINGUAS'

25.7. execution modules
```
salt.modules.makeconf.set_cflags(value)
Set the CFLAGS variable
Return a dict containing the new value for variable:

```{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

```
salt.modules.makeconf.set_chost(value)
Set the CHOST variable
Return a dict containing the new value for variable:

```{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

```
salt.modules.makeconf.set_cxxflags(value)
Set the CXXFLAGS variable
Return a dict containing the new value for variable:

```{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

```
salt.modules.makeconf.set_emerge_default_opts(value)
Set the EMERGE_DEFAULT_OPTS variable
Return a dict containing the new value for variable:

```{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}

CLI Example:
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

```
salt.modules.makeconf.set_gentoo_mirrors(value)
Set the GENTOO_MIRRORS variable
Return a dict containing the new value for variable:

```{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}

CLI Example:
```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'

```
salt.modules.makeconf.set_makeopts(value)

Set the MAKEOPTS variable

Return a dict containing the new value for variable:

{<'variable'>: {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

```
salt.modules.makeconf.set_sync(value)

Set the SYNC variable

Return a dict containing the new value for variable:

{<'variable'>: {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

```
salt.modules.makeconf.set_var(var, value)

Set a variable in the make.conf

Return a dict containing the new value for variable:

{<'variable'>: {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

```
salt.modules.makeconf.sync_contains(value)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

```
salt.modules.makeconf.trim_cflags(value)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

{<'variable'>: {'old': '<old-value>',
               'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```
salt.modules.makeconf.trim_cxxflags(value)
Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{"<variable>": {"old": '"old-value"',
   'new': '"new-value"'}}
```

CLI Example:
```
salt '*' makeconf.trim_cxxflags '-pipe'
```

salt.modules.makeconf.trim_emerge_default_opts(value)
Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{"<variable>": {"old": '"old-value"',
   'new': '"new-value"'}}
```

CLI Example:
```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

salt.modules.makeconf.trim_features(value)
Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{"<variable>": {"old": '"old-value"',
   'new': '"new-value"'}}
```

CLI Example:
```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

salt.modules.makeconf.trim_gentoo_mirrors(value)
Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{"<variable>": {"old": '"old-value"',
   'new': '"new-value"'}}
```

CLI Example:
```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.trim_makeopts(value)
Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{"<variable>": {"old": '"old-value"',
   'new': '"new-value"'}}
```

CLI Example:
salt '*' makeconf.trim_makeopts '-j3'

salt.modules.makeconf.trim_var(var, value)
Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```{"<variable>": {"old": '<old-value>',
'new': '<new-value>'}}
```

CLI Example:
salt '*' makeconf.trim_var 'LINGUAS' 'en'

salt.modules.makeconf.var_contains(var, value)
Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:
salt '*' makeconf.var_contains 'LINGUAS' 'en'

25.7.258 salt.modules.mandrill

Mandrill

Send out emails using the Mandrill API.

In the minion configuration file, the following block is required:

```yaml
mandrill:
  key: <API_KEY>
```

New in version 2018.3.0.

salt.modules.mandrill.send(message, asynchronous=False, ip_pool=None, send_at=None, api_url=None, api_version=None, api_key=None)

Send out the email using the details from the message argument.

message  The information on the message to send. This argument must be sent as dictionary with at fields as specified in the Mandrill API documentation.

asynchronous: False  Enable a background sending mode that is optimized for bulk sending. In asynchronous mode, messages/send will immediately return a status of "queued" for every recipient. To handle rejections when sending in asynchronous mode, set up a webhook for the 'reject' event. Defaults to false for messages with no more than 10 recipients; messages with more than 10 recipients are always sent asynchronously, regardless of the value of asynchronous.

ip_pool  The name of the dedicated ip pool that should be used to send the message. If you do not have any dedicated IPs, this parameter has no effect. If you specify a pool that does not exist, your default pool will be used instead.

send_at  When this message should be sent as a UTC timestamp in YYYY-MM-DD HH:MM:SS format. If you specify a time in the past, the message will be sent immediately. An additional fee applies for scheduled email, and this feature is only available to accounts with a positive balance.

Note:  For further details please consult the API documentation.

CLI Example:
```python
salt '*' mandrill.send message="{'subject': 'Hi', 'from_email': 'test@example.com', 'to': [{'email': 'recv@example.com', 'type': 'to'}]}"
```

**message** structure example (as YAML for readability):

```yaml
message:
    text: |
        This is the body of the email.
        This is the second line.
    subject: Email subject
    from_name: Test At Example Dot Com
    from_email: test@example.com
    to:
        - email: recv@example.com
          type: to
          name: Recv At Example Dot Com
        - email: cc@example.com
          type: cc
          name: CC At Example Dot Com
    important: true
    track_clicks: true
    track_opens: true
    attachments:
        - type: text/x-yaml
          name: yaml_file.yml
          content: aV9hbV9zdXBlcl9jdXJpb3VzOiB0cnVl
```

Output example:

```yaml
minion:  # Hangout
    comment:  # Hangout
    out:  # Hangout
    |  # Hangout
    _id: c4353540a3c123eca112bbdd704ab6  # Hangout
    email: recv@example.com  # Hangout
    reject_reason:  # Hangout
        None  # Hangout
    status: sent  # Hangout
    result: True  # Hangout
```

### 25.7.259 salt.modules.marathon

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

```python
salt.modules.marathon.app(id)
```

Return the current server configuration for the specified app.

**CLI Example:**
**salt** marathon-minion-id marathon.app my-app

`salt.modules.marathon.apps()`  
Return a list of the currently installed app ids.  
CLI Example:

```bash
salt marathon-minion-id marathon.apps
```

`salt.modules.marathon.has_app(id)`  
Return whether the given app id is currently configured.  
CLI Example:

```bash
salt marathon-minion-id marathon.has_app my-app
```

`salt.modules.marathon.info()`  
Return configuration and status information about the marathon instance.  
CLI Example:

```bash
salt marathon-minion-id marathon.info
```

`salt.modules.marathon.restart_app(id, restart=False, force=True)`  
Restart the current server configuration for the specified app.  
**Parameters**

- `restart` -- Restart the app  
- `force` -- Override the current deployment  
CLI Example:

```bash
salt marathon-minion-id marathon.restart_app my-app true true
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.  
The force option tells marathon to ignore the current app deployment if there is one.

`salt.modules.marathon.rm_app(id)`  
Remove the specified app from the server.  
CLI Example:

```bash
salt marathon-minion-id marathon.rm_app my-app
```

`salt.modules.marathon.update_app(id, config)`  
Update the specified app with the given configuration.  
CLI Example:

```bash
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```
25.7.260 salt.modules.match

The match module allows for match routines to be run and determine target specs

salt.modules.match.compound(tgt, minion_id=None)
Return True if the minion ID matches the given compound target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

salt '*' match.compound 'L@cheese,foo and *'

salt.modules.match.data(tgt)
Return True if the minion matches the given data target

CLI Example:

salt '*' match.data 'spam:eggs'

salt.modules.match.filter_by(lookup, tgt_type='compound', minion_id=None, merge=None, merge_lists=False, default='default')
Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03

Pillar Example:

# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, minion_id=grains['id'], default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}

salt.modules.match.glob(tgt, minion_id=None)
Return True if the minion ID matches the given glob target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

salt '*' match.glob '*'

salt.modules.match.grain(tgt, delimiter=': ')
Return True if the minion matches the given grain target. The delimiter argument can be used to specify a different delimiter.

CLI Example:

salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
delimeter  Specify an alternate delimiter to use when traversing a nested dict
          New in version 2014.7.0.
    delim  Specify an alternate delimiter to use when traversing a nested dict
          New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.grain_pcre(tgt, delimeter=\':\')
    Return True if the minion matches the given grain_pcre target. The delimeter argument can be used to
    specify a different delimiter.

    CLI Example:

    Salt '\*\' match.grain_pcre 'os:Fede.*'
    Salt '\*\' match.grain_pcre 'ipv6|2001:.\*\' delimeter='|'

    delimeter  Specify an alternate delimiter to use when traversing a nested dict
          New in version 2014.7.0.
    delim  Specify an alternate delimiter to use when traversing a nested dict
          New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.ifelse(*args, tgt_type='compound', minion_id=None, merge=None, merge_lists=False)
    New in version 3006.0.
    Evaluate each pair of arguments up to the last one as a (matcher, value) tuple, returning value if matched. If
    none match, returns the last argument.

    The ifelse function is like a multi-level if-else statement. It was inspired by CFEngine's ifelse function
    which in turn was inspired by Oracle's DECODE function. It must have an odd number of arguments (from 1
    to N). The last argument is the default value, like the else clause in standard programming languages. Every
    pair of arguments before the last one are evaluated as a pair. If the first one evaluates true then the second
    one is returned, as if you had used the first one in a compound match expression. Boolean values can also be
    used as the first item in a pair, as it will be translated to a match that will always match ("*") or never match
    ("SALT_IFELSE_MATCH_NOTHING") a target system.

    This is essentially another way to express the filter_by functionality in way that's familiar to CFEngine
    or Oracle users. Consider using filter_by unless this function fits your workflow.

    CLI Example:

        Salt '\*\' match.ifelse 'foo\*\' 'Foo!' 'bar\*\' 'Bar!' minion_id=bar03

salt.modules.match.ipcidr(tgt)
    Return True if the minion matches the given ipcidr target

    CLI Example:

    Salt '\*\' match.ipcidr '192.168.44.0/24'

delimeter Pillar Example:

    '172.16.0.0/12':
    - match: ipcidr
    - nodeclass: internal
salt.modules.match.list(tgt, minion_id=None)
Return True if the minion ID matches the given list target
minion_id Specify the minion ID to match against the target expression

    New in version 2014.7.0.
    CLI Example:
    
    `salt '*' match.list 'server1,server2'`

salt.modules.match.pcre(tgt, minion_id=None)
Return True if the minion ID matches the given pcre target
minion_id Specify the minion ID to match against the target expression

    New in version 2014.7.0.
    CLI Example:
    
    `salt '*' match.pcre '.', '*'`

salt.modules.match.pillar(tgt, delimiter=': ')
Return True if the minion matches the given pillar target. The delimiter argument can be used to specify a different delimiter.

    CLI Example:
    
    `salt '*' match.pillar 'cheese:foo'`
    `salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter= '|'`

delimiter Specify an alternate delimiter to use when traversing a nested dict

    New in version 2014.7.0.
delim Specify an alternate delimiter to use when traversing a nested dict

    New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.pillar_pcre(tgt, delimiter=': ')
Return True if the minion matches the given pillar_pcre target. The delimiter argument can be used to specify a different delimiter.

    CLI Example:
    
    `salt '*' match.pillar_pcre 'cheese:(swiss|american)'`
    `salt '*' match.pillar_pcre 'clone_url|https://github.com/saltstack/salt.git' delimiter= '|'`

delimiter Specify an alternate delimiter to use when traversing a nested dict

    New in version 2014.7.0.
delim Specify an alternate delimiter to use when traversing a nested dict

    New in version 0.16.4.
    Deprecated since version 2015.8.0.

salt.modules.match.search_by(lookup, tgt_type='compound', minion_id=None)
Search a dictionary of target strings for matching targets
This is the inverse of match.filter_by and allows matching values instead of matching keys. A minion can be matched by multiple entries.

    New in version 2017.7.0.
CLI Example:

```bash
salt '*\' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```yaml
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}
```

# Make the filtered data available to Pillar:

```yaml
roles: {{ roles | yaml() }}
```

25.7.261 salt.modules.mattermost

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```yaml
mattermost:
    hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    api_url: https://example.com
```

salt.modules.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)

Send a message to a Mattermost channel.

Parameters

- **channel** -- The channel name, either will work.
- **username** -- The username of the poster.
- **message** -- The message to send to the Mattermost channel.
- **api_url** -- The Mattermost api url, if not specified in the configuration.
- **hook** -- The Mattermost hook, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```bash
salt '*\' mattermost.post_message message='Build is done'
```

25.7.262 salt.modules.mdadm_raid

Salt module to manage RAID arrays with mdadm

salt.modules.mdadm_raid.add(name, device)

Add new device to RAID array.

CLI Example:

```bash
salt '*\' raid.add /dev/md0 /dev/sda1
```
salt.modules.mdadm_raid.assemble(name, devices, test_mode=False, **kwargs)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

**Note:** Adding test_mode=True as an argument will print out the mdadm command that would have been run.

- **name** The name of the array to assemble.
- **devices** The list of devices comprising the array to assemble.
- **kwargs** Optional arguments to be passed to mdadm.

**returns**

- **test_mode=True**: Prints out the full command.
- **test_mode=False** (Default): Executes command on the host(s) and prints out the mdadm output.

For more info, read the mdadm manpage.

salt.modules.mdadm_raid.create(name, level, devices, metadata='default', test_mode=False, **kwargs)

Create a RAID device.

**Changed in version 2014.7.0.**

**Warning:** Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde']" test_mode=True
```

**Note:** Adding test_mode=True as an argument will print out the mdadm command that would have been run.

- **name** The name of the array to create.
- **level** The RAID level to use when creating the raid.
- **devices** A list of devices used to build the array.
- **metadata** Version of metadata to use when creating the array.
- **kwargs** Optional arguments to be passed to mdadm.

**returns**

- **test_mode=True**: Prints out the full command.
- **test_mode=False** (Default): Executes command on remote the host(s) and prints out the mdadm output.

**Note:** It takes time to create a RAID array. You can check the progress in "resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the mdadm(8) manpage
salt.modules.mdadm_raid.destroy(device)
    Destroy a RAID device.
    
    WARNING This will zero the superblock of all members of the RAID array.
    
    CLI Example:
    
    salt '*' raid.destroy /dev/md0

salt.modules.mdadm_raid.detail(device='''/dev/md0''')
    Show detail for a specified RAID device
    
    CLI Example:
    
    salt '*' raid.detail '/dev/md0'

salt.modules.mdadm_raid.examine(device, quiet=False)
    Show detail for a specified RAID component device
    
    device Device to examine, that is part of the RAID
    quiet If the device is not part of the RAID, do not show any error
    
    CLI Example:
    
    salt '*' raid.examine '/dev/sda1'

salt.modules.mdadm_raid.list_()
    List the RAID devices.
    
    CLI Example:
    
    salt '*' raid.list

salt.modules.mdadm_raid.save_config()
    Save RAID configuration to config file.
    
    Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf
    
    Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored
    
    CLI Example:
    
    salt '*' raid.save_config

salt.modules.mdadm_raid.stop()
    Shut down all arrays that can be shut down (i.e. are not currently in use).
    
    CLI Example:
    
    salt '*' raid.stop
25.7.263 salt.modules.mdata

Module for managing metadata in SmartOS Zones

New in version 2016.3.0.

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform smartos

salt.modules.mdata.delete_(‘keyname’)  
Delete metadata
prop [string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.get_(‘keyname’)  
Get metadata
keyname [string] name of key

Note: If no keynames are specified, we get all (public) properties

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.list_()  
List available metadata

CLI Example:

```
salt '*' mdata.list
```

salt.modules.mdata.put_(keyname, val)  
Put metadata
prop [string] name of property
val [string] value to set

CLI Example:

```
salt '*' mdata.list
```

25.7.264 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

salt.modules.memcached.add(key, value, host=’127.0.0.1’, port=11211, time=0, min_compress_len=0)  
Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:
### memcached.add

This function is an alias of `decr`.

Increment the value of a key

CLI Example:

```
salt '*' memcached.add <key> <value>
```

### memcached.decr

Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>

salt '*' memcached.decrement <key> 2
```

### memcached.delete

Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

### memcached.get

Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

### memcached.incr

This function is an alias of `increment`.

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>

salt '*' memcached.increment <key> 2
```

### memcached.increment

Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>

salt '*' memcached.increment <key> 2
```

### memcached.replace

Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of `memcached.add`

CLI Example:

```
salt '*' memcached.replace <key> <value>
```
Salt Documentation, Release 3006.4

salt.modules.memcached.set_(key, value, host='127.0.0.1', port=11211, time=0, min_compress_len=0)
Set a key on the memcached server, overwriting the value if it exists.

CLI Example:
```
salt '*' memcached.set <key> <value>
```

salt.modules.memcached.status(host='127.0.0.1', port=11211)
Get memcached status

CLI Example:
```
salt '*' memcached.status
```

25.7.265 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

salt.modules.mine.delete(fun)
Remove specific function contents of minion.

Parameters
- **fun** *(str)* -- The name of the function.

Return type **bool**

Returns True on success.

CLI Example:
```
salt '*' mine.delete 'network.interfaces'
```

salt.modules.mine.flush()
Remove all mine contents of minion.

Return type **bool**

Returns True on success

CLI Example:
```
salt '*' mine.flush
```

salt.modules.mine.get(tgt, fun, tgt_type='glob', exclude_minion=False)
Get data from the mine.

Parameters
- **tgt** *(str)* -- Target whose mine data to get.
- **fun** *(str or list)* -- Function to get the mine data of. You can specify multiple functions to retrieve using either a list or a comma-separated string of functions.
- **tgt_type** *(str)* -- Default glob. Target type to use with tgt. See Targeting Minions for more information. Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
- **exclude_minion** *(bool)* -- Excludes the current minion from the result set.

CLI Example:
```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'G@os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```
See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the **Mine Runner module** instead; it can be invoked from a Pillar SLS file using the `saltutil.runner` module. For example:

```python
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

```python
salt.modules.mine.get_docker(interfaces=None, cidrs=None, with_container_id=False)
```

Changed in version 2017.7.8,2018.3.3: When `docker.update_mine` is set to `False` for a given minion, no mine data will be populated for that minion, and thus none will be returned for it.

Changed in version 2019.2.0: `docker.update_mine` now defaults to `False`

Get all mine data for `docker.ps` and run an aggregation routine. The `interfaces` parameter allows for specifying the network interfaces from which to select IP addresses. The `cidrs` parameter allows for specifying a list of subnets which the IP address must match.

`with_container_id` Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```shell
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces=['eth0', 'eth1']
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs=['107.170.147.0/24', '172.17.42.0/24']
salt '*' mine.get_docker interfaces=['eth0', 'eth1'] cidrs=['107.170.147.0/24',
    '172.17.42.0/24']
```

```python
salt.modules.mine.send(name, *args, **kwargs)
```

Send a specific function and its result to the salt mine. This gets stored in either the local cache, or the salt master's cache.

**Parameters**

- `name` *(str)* -- Name of the function to add to the mine.

The following pameters are extracted from kwargs if present:

**Parameters**

- `mine_function` *(str)* -- The name of the execution_module.function to run and whose value will be stored in the salt mine. Defaults to `name`.

- `allow_tgt` *(str)* -- Targeting specification for ACL. Specifies which minions are allowed to access this function. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

- `allow_tgt_type` *(str)* -- Type of the targeting specification. This value will be ignored if `allow_tgt` is not specified. Please note both your master and minion need to be on, at least, version 3000 for this to work properly.

Remaining args and kwargs will be passed on to the function to run.

**Return type** `bool`

**Returns** Whether executing the function and storing the information was successful.

Changed in version 3000: Added `allow_tgt`- and `allow_tgt_type`-parameters to specify which minions are allowed to access this function. See *Targeting Minions* for more information about targeting.

CLI Example:
salt '*' mine.send network.ip_addrs interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs interface=eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs interface=eth0→allow_tgt='@grain:value' allow_tgt_type=compound

salt.modules.mine.update(clear=False, mine_functions=None)
Call the configured functions and send the data back up to the master. The functions to be called are merged from the master config, pillar and minion config under the option mine_functions:

mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []

This function accepts the following arguments:

Parameters

- **clear**(bool) -- Default: False Specifies whether updating will clear the existing values (True), or whether it will update them (False).
- **mine_functions**(dict) -- Update (or clear, see clear) the mine data on these functions only. This will need to have the structure as defined on https://docs.saltproject.io/en/latest/topics/mine/index.html#mine-functions

This feature can be used when updating the mine for functions that require a refresh at different intervals than the rest of the functions specified under mine_functions in the minion/master config or pillar. A potential use would be together with the scheduler, for example:

```
schedule:
  lldp_mine_update:
    function: mine.update
    kwargs:
      mine_functions:
        net.lldp: []
    hours: 12
```

In the example above, the mine for net.lldp would be refreshed every 12 hours, while network.ip_addrs would continue to be updated as specified in mine_interval.

The function cache will be populated with information from executing these functions

CLI Example:
salt '*' mine.update

salt.modules.mine.valid()
List valid entries in mine configuration.

CLI Example:
salt '*' mine.valid
25.7.266  salt.modules.minion

Module to provide information about minions

salt.modules.minion.kill(timeout=15)
Kill the salt minion.

timeout int seconds to wait for the minion to die.
If you have a monitor that restarts salt-minion when it dies then this is a great way to restart after a
minion upgrade.

CLI Example:

```
salt minion[12] minion.kill

minion1:
  ---------
  killed: 7874
  retcode: 0

minion2:
  ---------
  killed: 29071
  retcode: 0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion
in as the retcode value: 0 is success, anything else is a failure.

salt.modules.minion.list()
Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as salt-key -L

CLI Example:

```
salt 'master' minion.list
```

salt.modules.minion.restart()
Kill and restart the salt minion.

The configuration key minion_restart_command is an argv list for the command to restart the minion. If
minion_restart_command is not specified or empty then the argv of the current process will be used.

if the configuration value minion_restart_command is not set and the -d (daemonize) argument is missing from argv then the minion will be killed but will not be restarted and will require the parent process to
perform the restart. This behavior is intended for managed salt minion processes.

CLI Example:

```
salt minion[12] minion.restart

minion1:
  ---------
  comment: - Restart using process argv:
            - /home/omniture/install/bin/salt-minion
            - -d
            - -c
            - /home/omniture/install/etc/salt
```
(continues on next page)
killed: 10070
restart: ---------
stderr: stdout: retcode: 0
minion2: ----------
comment:
- Using configuration minion_restart_command:
  - /home/omniture/install/bin/salt-minion
  - --not-an-option
  - -d
  - -c
  - /home/omniture/install/etc/salt
  - Restart failed
killed: 10896
restart: ---------
stderr:
Usage: salt-minion
salt-minion: error: no such option: --not-an-option
stdout: retcode: 64

The result of the command shows the process ID of minion1 that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero retcode and possibly output in the stderr and/or stdout values along with addition information in the comment field as is demonstrated with minion2.

25.7.267 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

salt.modules.mod_random.get_str(length=20, chars=None, lowercase=True, uppercase=True, digits=True, punctuation=True, whitespace=False, printable=False)

New in version 2014.7.0.

Changed in version 3004: Changed the default character set used to include symbols and implemented arguments to control the used character set.

Returns a random string of the specified length.

length [20] Any valid number of bytes.
chars [None] New in version 3004.

String with any character that should be used to generate random string.

This argument supersedes all other character controlling arguments.

lowercase [True] New in version 3004.
Use lowercase letters in generated random string. (see `string.ascii_lowercase`)

This argument is superseded by chars.

**uppercase**  [True] New in version 3004.

Use uppercase letters in generated random string. (see `string.ascii_uppercase`)

This argument is superseded by chars.

**digits**  [True] New in version 3004.

Use digits in generated random string. (see `string.digits`)

This argument is superseded by chars.

**printable**  [False] New in version 3004.

Use printable characters in generated random string and includes lowercase, uppercase, digits, punctuation and whitespace. (see `string.printable`)

It is disabled by default as includes whitespace characters which some systems do not handle well in passwords. This argument also supersedes all other classes because it includes them.

This argument is superseded by chars.

**punctuation**  [True] New in version 3004.

Use punctuation characters in generated random string. (see `string.punctuation`)

This argument is superseded by chars.

**whitespace**  [False] New in version 3004.

Use whitespace characters in generated random string. (see `string.whitespace`)

It is disabled by default as some systems do not handle whitespace characters in passwords well.

This argument is superseded by chars.

CLI Example:

```
salt '*' random.get_str 128
salt '*' random.get_str 128 chars='abc123.!()'
salt '*' random.get_str 128 lowercase=False whitespace=True
```

salt.modules.mod_random.hash(value, algorithm='sha512')

New in version 2014.7.0.

Encodes a value with the specified encoder.

**value** The value to be hashed.

**algorithm**  [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.

CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

salt.modules.mod_random.rand_int(start=1, end=10, seed=None)

Returns a random integer number between the start and end number.

New in version 2015.5.3.

**start**  [1] Any valid integer number

**end**  [10] Any valid integer number

**seed** Optional hashable object

Changed in version 2019.2.0: Added seed argument. Will return the same result when run with the same seed.

CLI Example:

```
salt '*' random.rand_int 1 10
```
salt.modules.mod_random.sample \texttt{(value, size, seed=None)}

Return a given sample size from a list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

\texttt{value} A list to be used as input.
\texttt{size} The sample size to return.
\texttt{seed} Any value which will be hashed as a seed for random.

CLI Example:

\begin{verbatim}
salt '*' random.sample ['"one", "two"] 1 seed="something"
\end{verbatim}

salt.modules.mod_random.seed \texttt{(range=10, hash=None)}

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.

New in version 2015.8.0.

\texttt{hash}: \texttt{None} Any hashable object.
\texttt{range}: \texttt{10} Any valid integer number

CLI Example:

\begin{verbatim}
salt '*' random.seed 10 hash=None
\end{verbatim}

salt.modules.mod_random.shadow_hash \texttt{(crypt_salt=None, password=None, algorithm='sha512')} 

Generates a salted hash suitable for /etc/shadow.

\texttt{crypt_salt} [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.
\texttt{password} [None] Value to be salted and hashed. If one is not provided, a random password will be generated.
\texttt{algorithm} [sha512] Hash algorithm to use.

CLI Example:

\begin{verbatim}
salt '*' random.shadow_hash 'MySALT' 'MyP@sswd' md5
\end{verbatim}

salt.modules.mod_random.shuffle \texttt{(value, seed=None)}

Return a shuffled copy of an input list. By default, the random number generator uses the current system time unless given a seed value.

New in version 3005.

\texttt{value} A list to be used as input.
\texttt{seed} Any value which will be hashed as a seed for random.

CLI Example:

\begin{verbatim}
salt '*' random.shuffle ['"one", "two"] seed="something"
\end{verbatim}

salt.modules.mod_random.str_encode \texttt{(value, encoder='base64')} 

New in version 2014.7.0.

\texttt{value} The value to be encoded.
\texttt{encoder} [base64] The encoder to use on the subsequent string.

CLI Example:

\begin{verbatim}
salt '*' random.str_encode 'I am a new string' base64
\end{verbatim}
25.7.268  salt.modules.modjk

Below is an example of the configuration needed for this module. This configuration data can be placed either in grains or pillar.

If using grains, this can be accomplished statically or via a grain module.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```yaml
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600

salt.modules.modjk.bulk_activate(workers, lbn, profile='default')
Activate all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt.modules.modjk.bulk_disable(workers, lbn, profile='default')
Disable all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt.modules.modjk.bulk_recover(workers, lbn, profile='default')
Recover all the given workers in the specific load balancer

CLI Examples:
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile
```
salt.modules.modjk.bulk_stop(workers, lbn, profile='default')
Stop all the given workers in the specific load balancer

CLI Examples:
```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.dump_config(profile='default')
Dump the original configuration that was loaded from disk

CLI Examples:
```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

salt.modules.modjk.get_running(profile='default')
Get the current running config (not from disk)

CLI Examples:
```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

salt.modules.modjk.lb_edit(lbn, settings, profile='default')
Edit the loadbalancer settings

Note:  http://tomcat.apache.org/connectors-doc/reference/status.html  Data Parameters for the standard Update Action

CLI Examples:
```
salt '*' modjk.lb_edit loadbalancer1 "{"vlr": 1, 'vlt': 60}" 
salt '*' modjk.lb_edit loadbalancer1 "{"vlr": 1, 'vlt': 60}" other-profile
```

salt.modules.modjk.list_configured_members(lbn, profile='default')
Return a list of member workers from the configuration files

CLI Examples:
```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

salt.modules.modjk.recover_all(lbn, profile='default')
Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:
```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

salt.modules.modjk.reset_stats(lbn, profile='default')
Reset all runtime statistics for the load balancer

CLI Examples:
salt.modules.modjk.reset_stats(
    loadbalancer1,
    profile='default'
)
Return the modjk version

salt.modules.modjk.reset_stats(
    loadbalancer1,
    other-profile
)

salt.modules.modjk.version(profile='default')
Return the modjk version

salt.modules.modjk.version
salt.modules.modjk.version other-profile

salt.modules.modjk.worker_activate(
    worker,
    lbn,
    profile='default'
)
Set the worker to activate state in the lbn load balancer

salt.modules.modjk.worker_activate(
    node1,
    loadbalancer1,
    profile='default'
)
salt.modules.modjk.worker_activate(
    node1,
    loadbalancer1,
    other-profile
)

salt.modules.modjk.worker_disable(
    worker,
    lbn,
    profile='default'
)
Set the worker to disable state in the lbn load balancer

salt.modules.modjk.worker_disable(
    node1,
    loadbalancer1,
    profile='default'
)
salt.modules.modjk.worker_disable(
    node1,
    loadbalancer1,
    other-profile
)

salt.modules.modjk.worker_edit(
    worker,
    lbn,
    settings,
    profile='default'
)
Edit the worker settings

salt.modules.modjk.worker_edit(
    node1,
    loadbalancer1,
    "\{'vwf": 500, 'vwd': 60\}"
)
salt.modules.modjk.worker_edit(
    node1,
    loadbalancer1,
    "\{'vwf": 500, 'vwd': 60\}"
    other-profile
)

salt.modules.modjk.worker_recover(
    worker,
    lbn,
    profile='default'
)
Set the worker to recover this module will fail if it is in OK state

salt.modules.modjk.worker_recover(
    node1,
    loadbalancer1,
    profile='default'
)
salt.modules.modjk.worker_recover(
    node1,
    loadbalancer1,
    other-profile
)

salt.modules.modjk.worker_status(
    worker,
    profile='default'
)
Return the state of the worker

salt.modules.modjk.worker_status(
    node1,
    profile='default'
)
salt.modules.modjk.worker_status(
    node1,
    other-profile
)

salt.modules.modjk.worker_stop(
    worker,
    lbn,
    profile='default'
)
Set the worker to stopped state in the lbn load balancer

salt.modules.modjk.worker_stop(
    node1,
    loadbalancer1,
    profile='default'
)
salt.modules.modjk.worker_stop(
    node1,
    loadbalancer1,
    other-profile
)
salt '*/' modjk.worker_activate node1 loadbalancer1
salt '*/' modjk.worker_activate node1 loadbalancer1 other-profile

salt.modules.modjk.workers(profile='default')

Return a list of member workers and their status

CLI Examples:

salt '*/' modjk.workers
salt '*/' modjk.workers other-profile

25.7.269 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration

This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```python
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.collection_create(collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

New in version 3006.0.

Create a collection in the specified database.

collection The name of the collection to create.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

salt '*/' mongodb.collection_create mycollection <user> <password> <host> <port> ←<database>

salt.modules.mongodb.collection_drop(collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

New in version 3006.0.

Drop a collection in the specified database.

collection The name of the collection to drop.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:
salt modules.mongodb.collections_list

New in version 3006.0.

List the collections available in the specified database.

- **user**: The user to connect to MongoDB as. Default is None.
- **password**: The password to use to connect to MongoDB as. Default is None.
- **host**: The host where MongoDB is running. Default is None.
- **port**: The port where MongoDB is running. Default is None.
- **authdb**: The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.collections_list mycollection <user> <password> <host> <port> → <database>
```

salt modules.mongodb.db_exists

Checks if a database exists in MongoDB.

- **name**: The name of the database to check for.
- **user**: The user to connect to MongoDB as. Default is None.
- **password**: The password to use to connect to MongoDB as. Default is None.
- **host**: The host where MongoDB is running. Default is None.
- **port**: The port where MongoDB is running. Default is None.
- **authdb**: The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

salt modules.mongodb.db_list

List all MongoDB databases.

- **user**: The user to connect to MongoDB as. Default is None.
- **password**: The password to use to connect to MongoDB as. Default is None.
- **host**: The host where MongoDB is running. Default is None.
- **port**: The port where MongoDB is running. Default is None.
- **authdb**: The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

salt modules.mongodb.db_remove

Remove a MongoDB database.

- **name**: The name of the database to remove.
- **user**: The user to connect to MongoDB as. Default is None.
- **password**: The password to use to connect to MongoDB as. Default is None.
- **host**: The host where MongoDB is running. Default is None.
- **port**: The port where MongoDB is running. Default is None.
- **authdb**: The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```
salt.modules.mongodb.find(
collection, query=None, user=None, password=None, host=None,
port=None, database='admin', authdb=None)

Find an object or list of objects in a collection

collection The collection to find the objects in.
query The query to use when locating objects in the collection.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.find mycollection '[["foo": "FOO", "bar": "BAR"]]' <user>
←<password> <host> <port> <database>
```

salt.modules.mongodb.insert(
objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Insert an object or list of objects into a collection

objects The objects to insert into the collection, should be provided as a list.

collection The collection to insert the objects into.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.insert '[["foo": "FOO", "bar": "BAR"], "foo": "BAZ", "bar": "BAM"]' mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.remove(
collection, query=None, user=None, password=None, host=None, port=None, database='admin', w=1, authdb=None)

Remove an object or list of objects from a collection

collection The collection to remove objects from based on the query.
query Query to determine which objects to remove.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
database The database where the collection is.
w The number of matches to remove from the collection.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.remove mycollection '[["foo": "FOO", "bar": "BAR"], "foo": "BAZ", "bar": "BAM"]' <user> <password> <host> <port> <database>
```

salt.modules.mongodb.update_one(
objects, collection, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Update an object into a collection

http://api.mongodb.com/python/current/api/pymongo/collection.html#
pymongo.collection.Collection.update_one

New in version 2016.11.0.

objects The objects to update in the collection, should be provided as a list.
collection The collection to insert the objects into.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

```bash
salt '*' mongodb.update_one '["_id": "my_minion"] {"bar": "BAR"}' mycollection
<user> <password> <host> <port> <database>
```

```
salt.modules.mongodb.user_create(name, passwd, user=None, password=None, host=None,
    port=None, database='admin', authdb=None, roles=None)
```

Create a MongoDB user

name The name of the user to create.
password The password for the user that is being created.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
database The MongoDB database to use when checking if the user exists. Default is admin.
authdb The MongoDB database to use for authentication. Default is None.
roles The roles that should be associated with the user. Default is None.

CLI Example:

```bash
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password>
<host> <port> <database>
```

```
salt.modules.mongodb.user_exists(name, user=None, password=None, host=None,
    port=None, database='admin', authdb=None)
```

Checks if a user exists in MongoDB

user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
database The MongoDB database to use when checking if the user exists. Default is admin.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

```bash
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

```
salt.modules.mongodb.user_find(name, user=None, password=None, host=None,
    port=None, database='admin', authdb=None)
```

Get single user from MongoDB

name The name of the user to find.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
database The MongoDB database to use when looking for the user. Default is admin.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

```bash
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database>
```

```
salt.modules.mongodb.user_grant_roles(name, roles, database, user=None, password=None,
    host=None, port=None, authdb=None)
```

25.7. execution modules
Grant one or many roles to a MongoDB user

name  The user to grant the specified roles to.
roles  The roles to grant to the specified user.
database  The database to grant the roles against for the specified user.
user  The user to connect to MongoDB as. Default is None.
password  The password to use to connect to MongoDB as. Default is None.
host  The host where MongoDB is running. Default is None.
port  The host where MongoDB is running. Default is None.
authdb  The MongoDB database to use for authentication. Default is None.

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe ['"readWrite"'] dbname admin adminpwd
    → localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe ["{"role": "readWrite", "db": "dbname" }
    → , {"role": "read", "db": "otherdb"}]
    dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.user_list(user=None, password=None, host=None, port=None, database='admin', authdb=None)

List users of a MongoDB database

user  The user to connect to MongoDB as. Default is None.
password  The password to use to connect to MongoDB as. Default is None.
host  The host where MongoDB is running. Default is None.
port  The host where MongoDB is running. Default is None.
database  The MongoDB database to use when listing users. Default is admin.
authdb  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_remove(name, user=None, password=None, host=None, port=None, database='admin', authdb=None)

Remove a MongoDB user

name  The name of the user that should be removed.
user  The user to connect to MongoDB as. Default is None.
password  The password to use to connect to MongoDB as. Default is None.
host  The host where MongoDB is running. Default is None.
port  The host where MongoDB is running. Default is None.
authdb  The MongoDB database to use for authentication. Default is None.

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.user_revoke_roles(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Revoke one or many roles to a MongoDB user

user  The user to connect to MongoDB as. Default is None.
roles  The roles to revoke from the specified user.
database  The database to revoke the roles from for the specified user.
password  The password to use to connect to MongoDB as. Default is None.
host  The host where MongoDB is running. Default is None.
port  The host where MongoDB is running. Default is None.
authdb  The MongoDB database to use for authentication. Default is None.

CLI Examples:
salt ' '*' mongodb.user_revoke_roles johndoe 
  
earmory 
  
27017

salt ' '*' mongodb.user_revoke_roles janedoe 
  
earmory 
  
adminpwd 
  
localhost 27017

salt.modules.mongodb.user_roles_exists(name, roles, database, user=None, password=None, host=None, port=None, authdb=None)

Checks if a user of a MongoDB database has specified roles

name The name of the user to check for the specified roles.
roles The roles to check are associated with the specified user.
database The database to check has the specified roles for the specified user.
user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Examples:

salt ' '*' mongodb.user_roles_exists johndoe 
  
earmory 
  
adminpwd localhost 27017

salt.modules.mongodb.version(user=None, password=None, host=None, port=None, database='admin', authdb=None)

Get MongoDB instance version

user The user to connect to MongoDB as. Default is None.
password The password to use to connect to MongoDB as. Default is None.
host The host where MongoDB is running. Default is None.
port The host where MongoDB is running. Default is None.
authdb The MongoDB database to use for authentication. Default is None.

CLI Example:

salt ' '*' mongodb.version <user> <password> <host> <port> <database>

25.7.270 salt.modules.monit

Monit service module. This module will create a monit type service watcher.
salt.modules.monit.configtest()

New in version 2016.3.0.
Test monit configuration syntax

CLI Example:

salt '*' monit.configtest

salt.modules.monit.id_(reset=False)

New in version 2016.3.0.
Return monit unique id.
reset [False] Reset current id and generate a new id when it's True.

25.7. execution modules
**CLI Example:**
```
salt '*' monit.id [reset=True]
```

`salt.modules.monit.monitor(name)`
Monitor service via monit

**CLI Example:**
```
salt '*' monit.monitor <service name>
```

`salt.modules.monit.reload_()`
New in version 2016.3.0.
Reload monit configuration

**CLI Example:**
```
salt '*' monit.reload
```

`salt.modules.monit.restart(name)`
Restart service via monit

**CLI Example:**
```
salt '*' monit.restart <service name>
```

`salt.modules.monit.start(name)`

**CLI Example:**
```
salt '*' monit.start <service name>
```

`salt.modules.monit.status(svc_name='')`
Display a process status from monit

**CLI Example:**
```
salt '*' monit.status
salt '*' monit.status <service name>
```

`salt.modules.monit.stop(name)`
Stops service via monit

**CLI Example:**
```
salt '*' monit.stop <service name>
```

`salt.modules.monit.summary(svc_name='')`
Display a summary from monit

**CLI Example:**
```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

`salt.modules.monit.unmonitor(name)`
Unmonitor service via monit

**CLI Example:**
salt 'salt '*' monit.unmonitor <service name>

salt.modules.monit.validate()
    New in version 2016.3.0.
    Check all services
    CLI Example:
    salt 'salt '*' monit.validate

salt.modules.monit.version()
    New in version 2016.3.0.
    Return version from monit -V
    CLI Example:
    salt 'salt '*' monit.version

25.7.271 salt.modules.moosefs

Module for gathering and managing information about MooseFS

salt.modules.moosefs.dirinfo(path, opts=None)
    Return information on a directory located on the Moose
    CLI Example:
    salt 'salt '*' moosefs.dirinfo /path/to/dir/ [-n][h|H]]

salt.modules.moosefs.fileinfo(path)
    Return information on a file located on the Moose
    CLI Example:
    salt 'salt '*' moosefs.fileinfo /path/to/dir/

salt.modules.moosefs.getgoal(path, opts=None)
    Return goal(s) for a file or directory
    CLI Example:
    salt 'salt '*' moosefs.getgoal /path/to/file [-n][h|H]]
    salt 'salt '*' moosefs.getgoal /path/to/dir/ [-n][h|H][r]]

salt.modules.moosefs.mounts()
    Return a list of current MooseFS mounts
    CLI Example:
    salt 'salt '*' moosefs.mounts
25.7.272 `salt.modules.mount`

Salt module to manage Unix mounts and the fstab file

`salt.modules.mount.active(extended=False)`
List the active mounts.

CLI Example:
```
salt '*' mount.active
```

`salt.modules.mount.automaster(config='/etc/auto_salt')`
List the contents of the auto master

CLI Example:
```
salt '*' mount.automaster
```

`salt.modules.mount.delete_mount_cache(real_name)`
New in version 2018.3.0.
Provide information if the path is mounted

CLI Example:
```
salt '*' mount.delete_mount_cache /mnt/share
```

`salt.modules.mount.filesystems(config='/etc/filesystems')`
New in version 2018.3.3.
List the contents of the filesystems

CLI Example:
```
salt '*' mount.filesystems
```

`salt.modules.mount.fstab(config='/etc/fstab')`
Changed in version 2016.3.2.
List the contents of the fstab

CLI Example:
```
salt '*' mount.fstab
```

`salt.modules.mount.get_device_from_path(path)`
Return the underlying device for a specified path.
New in version 3006.0.

CLI Example:
```
salt '*' mount.get_device_from_path /
```

`salt.modules.mount.get_mount_from_path(path)`
Return the mount providing a specified path.
New in version 3006.0.

CLI Example:
salt '.*' mount.get_mount_from_path /opt/some/nested/path

salt.modules.mount.is_fuse_exec(cmd)
  Returns true if the command passed is a fuse mountable application.
  CLI Example:
  ```
  salt '.*' mount.is_fuse_exec sshfs
  ```

salt.modules.mount.is_mounted(name)
  New in version 2014.7.0.
  Provide information if the path is mounted
  CLI Example:
  ```
  salt '.*' mount.is_mounted /mnt/share
  ```

salt.modules.mount.mount(name, device=False, mkmnt=False, fstype='', opts='defaults', user=None, util='mount')
  Mount a device
  CLI Example:
  ```
  salt '.*' mount.mount /mnt/foo /dev/sdz1 True
  ```

salt.modules.mount.read_mount_cache(name)
  New in version 2018.3.0.
  Provide information if the path is mounted
  CLI Example:
  ```
  salt '.*' mount.read_mount_cache /mnt/share
  ```

salt.modules.mount.remount(name, device, mkmnt=False, fstype='', opts='defaults', user=None)
  Attempt to remount a device, if the device is not already mounted, mount is called
  CLI Example:
  ```
  salt '.*' mount.remount /mnt/foo /dev/sdz1 True
  ```

salt.modules.mount.rm_automaster(name, device, config='/etc/auto_salt')
  Remove the mount point from the auto_master
  CLI Example:
  ```
  salt '.*' mount.rm_automaster /mnt/foo /dev/sdg
  ```

salt.modules.mount.rm_filesystems(name, device, config='/etc/filesystems')
  New in version 2018.3.3.
  Remove the mount point from the filesystems
  CLI Example:
  ```
  salt '.*' mount.rm_filesystems /mnt/foo /dev/sdg
  ```

salt.modules.mount.rm_fstab(name, device, config='/etc/fstab')
  Changed in version 2016.3.2.
Remove the mount point from the fstab

CLI Example:

```bash
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

salt.modules.mount.**rm_vfstab**(name, device, config='/etc/vfstab')

New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```bash
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

salt.modules.mount.**set_automaster**(name, device, fstype, opts='', config='/etc/auto_salt', test=False, not_change=False, **kwargs)

Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```bash
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.**set_filesystems**(name, device, vfstype, opts='-', mount='true', config='/etc/filesystems', test=False, match_on='auto', not_change=False, **kwargs)

New in version 2018.3.3.

Verify that this mount is represented in the filesystems, change the mount to match the data passed, or add the mount if it is not present on AIX

If the entry is found via match_on and not_change is True, the current line will be preserved.

Provide information if the path is mounted

Parameters

- **name** -- The name of the mount point where the device is mounted.
- **device** -- The device that is being mounted.
- **vfstype** -- The file system that is used (AIX has two fstypes, fstype and vfstype - similar to Linux fstype)
- **opts** -- Additional options used when mounting the device.
- **mount** -- Mount if not mounted, default True.
- **config** -- Configuration file, default /etc/filesystems.
- **match** -- File systems type to match on, default auto

CLI Example:

```bash
salt '*' mount.set_filesystems /mnt/foo /dev/sdz1 jfs2
```

salt.modules.mount.**set_fstab**(name, device, fstype, opts='defaults', dump=0, pass_num=0, config='/etc/fstab', test=False, match_on='auto', not_change=False, **kwargs)

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via match_on and not_change is True, the current line will be preserved.
CLI Example:

```bash
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

```
salt.modules.mount.set_vfstab(name, device, fs_type, options='-\'', device_fsck='-', pass_fsck='-', mount_at_boot='yes', config='/etc/vfstab', test=False, match_on='auto', not_change=False, **kwargs)
```

New in version 2016.3.2.

Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

If the entry is found via `match_on` and `not_change` is True, the current line will be preserved.

CLI Example:

```bash
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

```
salt.modules.mount.swapoff(name)
```

Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```bash
salt '*' mount.swapoff /root/swapfile
```

```
salt.modules.mount.swapon(name, priority=None)
```

Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```bash
salt '*' mount.swapon /root/swapfile
```

```
salt.modules.mount.swaps()
```

Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```bash
salt '*' mount.swaps
```

```
salt.modules.mount.umount(name, device=None, user=None, util='mount')
```

Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```bash
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```bash
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

```
salt.modules.mount.vfstab(config='/etc/vfstab')
```

New in version 2016.3.2.

List the contents of the vfstab

CLI Example:
salt modules.mount.write_mount_cache (real_name, device, mkmnt, fstype, mount_opts)

New in version 2018.3.0.

Provide information if the path is mounted

Parameters

• real_name -- The real name of the mount point where the device is mounted.
• device -- The device that is being mounted.
• mkmnt -- Whether or not the mount point should be created.
• fstype -- The file system that is used.
• mount_opts -- Additional options used when mounting the device.

Returns

Boolean if message was sent successfully.

CLI Example:
salt '*' mount.write_mount_cache /mnt/share /dev/sda1 False ext4 defaults,nosuid

25.7.273 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

• FreeTDS
• pymssql Python module

configuration

In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port: 1433
mssql.user: 'sysdba'
mssql.password: 'Some preferable complex password'
mssql.database: '
```

The default for the port is '1433' and for the database is '' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

salt.modules.mssql.db_create (database, containment='NONE', new_database_options=none, **kwargs)

Creates a new database. Does not update options of existing databases. new_database_options can only be a list of strings

CLI Example:
salt minion mssql.db_create DB_NAME

salt.modules.mssql.db_exists (database_name, **kwargs)

Find if a specific database exists on the MS SQL server.

CLI Example:
salt minion mssql.db_exists database_name='DBNAME'

salt.modules.mssql.db_list(**kwargs)
Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

salt.modules.mssql.db_remove(database_name, **kwargs)
Drops a specific database from the MS SQL server. It will not drop any of 'master', 'model', 'msdb' or 'tempdb'.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

salt.modules.mssql.login_create(login, new_login_password=None, new_login_domain='', new_login_roles=None, new_login_options=None, **kwargs)
Creates a new login. Does not update password of existing logins. For Windows authentication, provide new_login_domain. For SQL Server authentication, provide new_login_password. Since hashed passwords are varbinary values, if the new_login_password is 'int / long', it will be considered to be HASHED.

new_login_roles a list of SERVER roles
new_login_options a list of strings

CLI Example:

```
salt minion mssql.login_create LOGINNAME database=DBNAME [new_login_password=PASSWORD]
```

salt.modules.mssql.login_exists(login, domain='', **kwargs)
Find if a login exists in the MS SQL server. domain, if provided, will be prepended to login

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.login_remove(login, **kwargs)
Removes an login.

CLI Example:

```
salt minion mssql.login_remove LOGINNAME
```

salt.modules.mssql.role_create(role, owner=None, grants=None, **kwargs)
Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option. grants is list of strings.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba grants=['SELECT', 'INSERT', 'UPDATE', 'DELETE', 'EXECUTE']
```

salt.modules.mssql.role_exists(role, **kwargs)
Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

25.7. execution modules
salt.modules.mssql.role_list(**kwargs)
    Lists database roles.
    CLI Example:
    ```bash
    salt minion mssql.role_list
    ```

salt.modules.mssql.role_remove(role, **kwargs)
    Remove a database role.
    CLI Example:
    ```bash
    salt minion mssql.role_create role=test_role01
    ```

salt.modules.mssql.tsql_query(query, **kwargs)
    Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an empty list if no data is available.
    CLI Example:
    ```bash
    salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
    ```

salt.modules.mssql.user_create(username, login=None, domain='', database=None, roles=None, options=None, **kwargs)
    Creates a new user. If login is not specified, the user will be created without a login. domain, if provided, will be prepended to username. options can only be a list of strings
    CLI Example:
    ```bash
    salt minion mssql.user_create USERNAME database=DBNAME
    ```

salt.modules.mssql.user_exists(username, domain='', database=None, **kwargs)
    Find if an user exists in a specific database on the MS SQL server. domain, if provided, will be prepended to username
    CLI Example:
    ```bash
    salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
    ```

salt.modules.mssql.user_list(**kwargs)
    Get the user list for a specific database on the MS SQL server.
    CLI Example:
    ```bash
    salt minion mssql.user_list [database='DBNAME']
    ```

salt.modules.mssql.user_remove(username, **kwargs)
    Removes an user.
    CLI Example:
    ```bash
    salt minion mssql.user_remove USERNAME database=DBNAME
    ```

salt.modules.mssql.version(**kwargs)
    Return the version of a MS SQL server.
    CLI Example:
    ```bash
    salt minion mssql.version
    ```
25.7.274 salt.modules.msteams

Module for sending messages to MS Teams

New in version 2017.7.0.

configuration This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
    hook_url: https://outlook.office.com/webhook/837
```

```
salt.modules.msteams.post_card(message, hook_url=None, title=None, theme_color=None)
```

Send a message to an MS Teams channel. 

:param message: The message to send to the MS Teams channel.
:param hook_url: The Teams webhook URL, if not specified in the configuration. 
:param title: Optional title for the posted card 
:param theme_color: Optional hex color highlight for the posted card 
:return: Boolean if message was sent successfully.

CLI Example:
```
salt '*' msteams.post_card message="Build is done"
```

25.7.275 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

```
salt.modules.munin.list_plugins()
```

List all the munin plugins

CLI Example:
```
salt '*' munin.list_plugins
```

```
salt.modules.munin.run(plugins)
```

Run one or more named munin plugins

CLI Example:
```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

```
salt.modules.munin.run_all()
```

Run all the munin plugins

CLI Example:
```
salt '*' munin.run_all
```
25.7.276 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

• Python module: MySQLdb, mysqlclient, or PyMySQL

configuration In order to connect to MySQL, certain configuration is required in either the relevant
minion config (/etc/salt/minion), or pillar.

Some sample configs might look like:

```python
mysql
  host: 'localhost'
  port: 3306
  user: 'root'
  pass: '
  db: 'mysql'
  unix_socket: '/tmp/mysql.sock'
  charset: 'utf8'
```

You can also use a defaults file:

```python
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: ‘charset’ connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using
the arguments defined here. Additionally, it is now possible to setup a user with no password.

salt.modules.mysql.alter_db(name, character_set=None, collate=None, **connection_args)

Modify database using ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s
COLLATE %(collation)s; query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

salt.modules.mysql.db_check(name, table=None, **connection_args)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

salt.modules.mysql.db_create(name, character_set=None, collate=None, **connection_args)

Adds a databases to the MySQL server.

name The name of the database to manage
character_set The character set, if left empty the MySQL default will be used
collate The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

salt.modules.mysql.db_exists(name, **connection_args)

Checks if a database exists on the MySQL server.

CLI Example:
salt 'dbh' mysql.db_exists 'dbname'

salt.modules.mysql.db_get(name, **connection_args)
Return a list of databases of a MySQL server using the output from the
SELECT DEFAULT_CHARACTER_SET_NAME, DEFAULT_COLLATION_NAME FROM
INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname'; query.

CLI Example:

```
salt 'dbh' mysql.db_get test
```

salt.modules.mysql.db_list(**connection_args)
Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:

```
salt 'dbh' mysql.db_list
```

salt.modules.mysql.db_optimize(name, table=None, **connection_args)
Optimizes the full database or just a given table

CLI Example:

```
salt 'dbh' mysql.db_optimize dbname
```

salt.modules.mysql.db_remove(name, **connection_args)
Removes a databases from the MySQL server.

CLI Example:

```
salt 'dbh' mysql.db_remove 'dbname'
```

salt.modules.mysql.db_repair(name, table=None, **connection_args)
Repairs the full database or just a given table

CLI Example:

```
salt 'dbh' mysql.db_repair dbname
```

salt.modules.mysql.db_tables(name, **connection_args)
Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt 'dbh' mysql.db_tables 'database'
```

salt.modules.mysql.file_query(database, file_name, **connection_args)
Run an arbitrary SQL query from the specified file and return the number of affected rows.

New in version 2017.7.0.

database
database to run script inside

file_name
File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt 'dbh' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt 'dbh' mysql.file_query mydb file_name=salt://sqlfile.sql
```
Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1}
```

```python
salt.modules.mysql.free_slave(**connection_args)
Frees a slave from its master. This is a WIP, do not use.
```

CLI Example:
```
salt '*' mysql.free_slave
```

```python
salt.modules.mysql.get_master_status(**connection_args)
Retrieves the master status from the minion.
```

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                     'Binlog_Ignore_DB': '',
                     'File': 'mysql-bin.000021',
                     'Position': 107}}
```

CLI Example:
```
salt '*' mysql.get_master_status
```

```python
salt.modules.mysql.get_slave_status(**connection_args)
Retrieves the slave status from the minion.
```

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                     'Exec_Master_Log_Pos': 107,
                     'Last_Errno': 0,
                     'Last_Error': '',
                     'Last_IO_Errno': 0,
                     'Last_IO_Error': '',
                     'Last_SQL_Errno': 0,
                     'Last_SQL_Error': '',
                     'Master_Host': 'comet.scion-eng.com',
                     'Master_Log_File': 'mysql-bin.000021',
                     'Master_Port': 3306,
                     'Master_SSL_Allowed': 'No',
                     'Master_SSL_CA_File': '',
                     'Master_SSL_CA_Path': '',
                     'Master_SSL_Cert': '',
                     'Master_SSL_Cipher': '',
                     'Master_SSL_Key': '',
                     'Master_SSL_Verify_Server_Cert': 'No',
                     'Master_Server_Id': 1,
                     'Master_User': 'replu',
                     'Read_Master_Log_Pos': 107,
                     'Relay_Log_File': 'klo-relay-bin.000071',
                     'Relay_Log_Pos': 253,
                     'Relay_Log_Space': 553,
                     'Relay_Master_Log_File': 'mysql-bin.000021',
                     'Replicate_Do_DB': '',
                     'Replicate_Do_Table': '',
                     'Replicate_Ignore_DB': '',
                     'Replicate_Ignore_Server_Ids': '',
                    }
```

(continues on next page)
{'Replicate_Ignore_Table': '', 'Replicate_Wild_Do_Table': '', 'Replicate_Wild_Ignore_Table': '', 'Seconds_Behind_Master': 0, 'Skip_Counter': 0, 'Slave_IO_Running': 'Yes', 'Slave_IO_State': 'Waiting for master to send event', 'Slave_SQL_Running': 'Yes', 'Until_Condition': 'None', 'Until_Log_File': '', 'Until_Log_Pos': 0}}

CLI Example:
```
salt '*' mysql.get_slave_status
```

**salt.modules.mysql.grant_add** *(grant, database, user, host='localhost', grant_option=False, escape=True, ssl_option=False, **connection_args)*

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:
```
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*'
```

**salt.modules.mysql.grant_exists** *(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)*

Checks to see if a grant exists in the database.

CLI Example:
```
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*'
```

**salt.modules.mysql.grant_revoke** *(grant, database, user, host='localhost', grant_option=False, escape=True, **connection_args)*

Removes a grant from the MySQL server.

CLI Example:
```
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*' 'frank'
```

**salt.modules.mysql.plugin_add** *(name, soname=None, **connection_args)*

Add a plugin.

CLI Example:
```
salt '*' mysql.plugin_add auth_socket
```

**salt.modules.mysql.plugin_remove** *(name, **connection_args)*

Remove a plugin.

CLI Example:
```
salt '*' mysql.plugin_remove auth_socket
```
salt.modules.mysql.plugin_status(name, **connection_args)
Return the status of a plugin.

CLI Example:
```
salt '*' mysql.plugin_status auth_socket
```

salt.modules.mysql.plugins_list(**connection_args)
Return a list of plugins and their status from the SHOW PLUGINS query.

CLI Example:
```
salt '*' mysql.plugins_list
```

salt.modules.mysql.processlist(**connection_args)
Retrieves the processlist from the MySQL server via "SHOW FULL PROCESSLIST".

Returns: a list of dicts, with each dict representing a process:

```
{'Command': 'Query', 'Host': 'localhost', 'Id': 39, 'Info': 'SHOW FULL PROCESSLIST', 'Rows_examined': 0, 'Rows_read': 1, 'Rows_sent': 0, 'State': 'None', 'Time': 0, 'User': 'root', 'db': 'mysql'}
```

CLI Example:
```
salt '*' mysql.processlist
```

salt.modules.mysql.query(database, query, **connection_args)
Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:
```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:
```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:
```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:
```
{'columns': ('id', 'name', 'cash'), 'query time': {'human': '1.0ms', 'raw': '0.001'}, 'results': ((1L, 'User 1', Decimal('110.000000')), (2L, 'User 2', Decimal('215.636756')), (3L, 'User 3', Decimal('0.040000'))), 'rows returned': 3L}
```

CLI Example:
```python
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```json
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1}
```

CLI Example:

```bash
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```json
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1}
```

Jinja Example: Run a query on mydb and use row 0, column 0’s data.

```python
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')|results[0][0] }}
```

```python
salt.modules.mysql.quote_identifier(identifier, for_grants=False)
```

Return an identifier name (column, table, database, etc) escaped for MySQL.

This means surrounded by `"` character and escaping this character inside. It also means doubling the `%` character for MySQLdb internal usage.

**Parameters**

- **identifier** -- the table, column or database identifier
- **for_grants** -- is False by default, when using database names on grant queries you should set it to True to also escape `"` and `%` characters as requested by MySQL. Note that these characters should only be escaped when requesting grants on the database level (my_%db.*) but not for table level grants (my._db.'foo')

CLI Example:

```bash
salt '*' mysql.quote_identifier 'foo`bar'
```

```python
salt.modules.mysql.showglobal(**connection_args)
```

Retrieves the show global variables from the minion.

**Returns**: show global variables full dict

CLI Example:

```bash
salt '*' mysql.showglobal
```

```python
salt.modules.mysql.showvariables(**connection_args)
```

Retrieves the show variables from the minion.

**Returns**: show variables full dict

CLI Example:

```bash
salt '*' mysql.showvariables
```

```python
salt.modules.mysql.slave_lag(**connection_args)
```

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:
salt '.*' mysql.slave_lag

salt.modules.mysql.status(**connection_args**)

Return the status of a MySQL server using the output from the SHOW STATUS query.

CLI Example:

```bash
salt '.*' mysql.status
```

salt.modules.mysql.tokenize_grant(grant)

External wrapper function :param grant: :return: dict

CLI Example:

```bash
salt '.*' mysql.tokenize_grant
"GRANT SELECT, INSERT ON testdb.* TO
→'testuser'@'localhost'"
```

salt.modules.mysql.user_chpass(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=None, password_column=None, **connection_args**)

Change password for a MySQL user

- **host** Host for which this user/password combo applies
- **password** The password to use for the new user. Will take precedence over the password_hash option if both are specified.
- **password_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the *.

A password hash can be obtained from the mysql command-line client like so:

```sql
mysql> SELECT PASSWORD('mypass');
+--------------------------------------------------+
| PASSWORD('mypass')                              |
+--------------------------------------------------+
| *6C89893666AEF75BB670D8EA7A7FC1176A95CEF4       |
+--------------------------------------------------+
1 row in set (0.00 sec)
```

- **allow_passwordless** If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```bash
salt '.*' mysql.user_chpass frank localhost newpassword
salt '.*' mysql.user_chpass frank localhost password_hash='hash'
salt '.*' mysql.user_chpass frank localhost allow_passwordless=True
```

salt.modules.mysql.user_create(user, host='localhost', password=None, password_hash=None, allow_passwordless=False, unix_socket=False, password_column=None, auth_plugin='mysql_native_password', **connection_args**)

Creates a MySQL user

- **host** Host for which this user/password combo applies
- **password** The password to use for the new user. Will take precedence over the password_hash option if both are specified.
- **password_hash** The password in hashed form. Be sure to quote the password because YAML doesn't like the *.

A password hash can be obtained from the mysql command-line client like so:
allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

unix_socket If True and allow_passwordless is True then will be used unix_socket auth plugin.

password_column The password column to use in the user table.

auth_plugin The authentication plugin to use, default is to use the mysql_native_password plugin.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```shell
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

```
salt.modules.mysql.user_exists(user, host='localhost', password=None, password_hash=None,
passwordless=False, unix_socket=False, password_column=None,
**connection_args)
```

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting password and password_hash, and using passwordless=True.

New in version 0.16.2: The passwordless option was added.

CLI Example:

```shell
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_string'
```

```
salt.modules.mysql.user_grants(user, host='localhost', **connection_args)
```

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```shell
salt '*' mysql.user_grants 'frank' 'localhost'
```

```
salt.modules.mysql.user_info(user, host='localhost', **connection_args)
```

Get full info on a MySQL user

CLI Example:

```shell
salt '*' mysql.user_info root localhost
```

```
salt.modules.mysql.user_list(**connection_args)
```

Return a list of users on a MySQL server

CLI Example:

```shell
salt '*' mysql.user_list
```

```
salt.modules.mysql.user_remove(user, host='localhost', **connection_args)
```

Delete MySQL user
CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

```
salt.modules.mysql.verify_login(user, password=None, **connection_args)
```

Attempt to login using the provided credentials. If successful, return true. Otherwise, return False.

CLI Example:

```
salt '*' mysql.verify_login root password
```

```
salt.modules.mysql.version(**connection_args)
```

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

### 25.7.277 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

**depends** PyNaCl, https://github.com/pyca/pynacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don’t advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use `--local` when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

**configuration** The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have `pillar_opts=True`:

```
# cat /etc/salt/master.d/nacl.conf
nacl.conf:
  box_type: sealedbox (default)
  sk_file: /etc/salt/pki/master/nacl (default)
  pk_file: /etc/salt/pki/master/nacl.pub (default)
  sk: None
  pk: None
```

Usage can override the config defaults:

```
salt-call nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your `sk_file` and `pk_file` use:

```
salt-call --local nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-call --local nacl.keygen
local:
  pk: /kfGX7PbWeu099702PBBkWLPg/9p06IQRswkdWHCDk0=
```

(continues on next page)
Now with your keypair, you can encrypt data:

You have two option, sealedbox or secretbox.

SecretBox is data encrypted using private key $pk$. Sealedbox is encrypted using public key $pk$.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```bash
salt-call --local nacl.enc asecretpass
```

To decrypt the data:

```bash
salt-call --local nacl.dec
data = 'tqXzeIjTAM9XF0mdLcpEdkLmbfBGPj2oTkmlgrm3S1DTVVHNNh9h8mU1GkllGq/+cYsk6m5WhGdk58=
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```bash
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnuiD1ulg4kXsbeCE7/NoeKEzd4nLeyCfpd9k=
```

The developer can then use a less-secure system to encrypt data.

```bash
salt-call --local nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```yaml
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6h0bWj0llUA+uaVyvou3vJ4=')}}json
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')}}json
  cert_key2: {{salt.nacl.dec_file('salt://certs/example.com/key.nacl')}}json
```

Larger files like certificates can be encrypted with:

```bash
salt-call nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

In pillars rended with jinja be sure to include `json` so line breaks are encoded:
cert: "{{salt.nacl.dec('S2uogToXkgENz9...085KYt')}|json}}"

In states rendered with jinja it is also good practice to include json:

```
{{sls}}
  private key:
    file.managed:
      - name: /etc/ssl/private/cert.key
      - mode: 700
      - contents: "{{pillar['pillarexample']['cert_key']|json}}"
```

Optional small program to encrypt data without needing salt modules.

```
#!/bin/python3
import sys, base64, nacl.public
pk = base64.b64decode('YOURPUBKEY')
b = nacl.public.SealedBox(pk)
data = sys.stdin.buffer.read()
print(base64.b64encode(b.encrypt(data)).decode())
```

```
echo 'apassword' | nacl_enc.py
```

salt.modules.nacl.dec(data, **kwargs)
   Alias to {box_type}_decrypt
   box_type: secretbox, sealedbox(default)

salt.modules.nacl.dec_file(name, out=None, **kwargs)
   This is a helper function to decrypt a file and return its contents.
   You can provide an optional output file using out
   name can be a local file or when not using salt-run can be a url like salt://, https:// etc.
   CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-call nacl.dec_file name=salt://crt/mcert.nacl out=/tmp/id_rsa
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
```

salt.modules.nacl.enc(data, **kwargs)
   Alias to {box_type}_encrypt
   box_type: secretbox, sealedbox(default)

salt.modules.nacl.enc_file(name, out=None, **kwargs)
   This is a helper function to encrypt a file and return its contents.
   You can provide an optional output file using out
   name can be a local file or when not using salt-run can be a url like salt://, https:// etc.
   CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-call nacl.enc_file name=salt://crt/mcert.nacl out=/tmp/cert
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_file=/etc/salt/pki/master/nacl.pub
```

salt.modules.nacl.keygen(sk_file=None, pk_file=None, **kwargs)
   Use PyNaCl to generate a keypair.
If no `sk_file` is defined return a keypair.

If only the `sk_file` is defined `pk_file` will use the same name with a postfix `.pub`.

When the `sk_file` is already existing, but `pk_file` is not. The `pk_file` will be generated using the `sk_file`.

CLI Examples:

```bash
salt-call nacl.keygen
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-call nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/master/nacl.pub
salt-call --local nacl.keygen
```

`salt.modules.nacl.sealedbox_decrypt`(*data, **kwargs*)

Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```bash
salt-call nacl.sealedbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.sealedbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
```

`salt.modules.nacl.sealedbox_encrypt`(*data, **kwargs*)

Encrypt data using a public key generated from `nacl.keygen`. The encrypted data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```bash
salt-run nacl.sealedbox_encrypt data=datatoenc
salt-call --local nacl.sealedbox_encrypt data=datatoenc pk_file=/etc/salt/pki/master/nacl.pub
salt-call --local nacl.sealedbox_encrypt data=datatoenc pk='vrwQF7cNiNAVQVAiS3bvcbJUnF0cN6f9U9YTDZ9mBfzQ=
```

`salt.modules.nacl.secretbox_decrypt`(*data, **kwargs*)

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```bash
salt-call nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/master/nacl
```

`salt.modules.nacl.secretbox_encrypt`(*data, **kwargs*)

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```bash
salt-run nacl.secretbox_encrypt datatoenc
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-call --local nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
```
25.7.278 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.
salt.modules.nagios.list_plugins()

List all the nagios plugins

CLI Example:
```
salt '*' nagios.list_plugins
```

salt.modules.nagios.retcode(plugin, args='', key_name=None)
Run one nagios plugin and return retcode of the execution

salt.modules.nagios.retcode_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:

```
------
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: -w 0.8 -c 1
  APT:
    - check_apt
------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed
You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:
```
salt '*' nagios.retcode webserver
```

salt.modules.nagios.run(plugin, args="")
Run nagios plugin and return all the data execution with cmd.run

CLI Example:
```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

salt.modules.nagios.run_all(plugin, args="")
Run nagios plugin and return all the data execution with cmd.run_all

salt.modules.nagios.run_all_pillar(pillar_name)
Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
------
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
```

(continues on next page)
check_load: `-w 0.8 -c 1`

APT:
- check_apt

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:
```
salt '*' nagios.run webserver
```

`salt.modules.nagios.run_pillar(pillar_name)`
Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
webserver:
  Ping_google:
    - check_icmp: 8.8.8.8
    - check_icmp: google.com
  Load:
    - check_load: `-w 0.8 -c 1`
  APT:
    - check_apt
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:
```
salt '*' nagios.run webserver
```

### 25.7.279 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.
New in version 2015.8.0.

`salt.modules.nagios_rpc.host_status(hostname=None, **kwargs)`
Check status of a particular host By default statuses are returned in a numeric format.

Parameters:
- `hostname` The hostname to check the status of the service in Nagios.
- `numeric` Turn to false in order to return status in text format (‘OK’ instead of 0, ‘Warning’ instead of 1 etc)

CLI Example:
```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```
salt.modules.nagios_rpc.service_status(\n    hostname=None, \n    service=None, \n    **kwargs)\n
Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:
hostname The hostname to check the status of the service in Nagios.
service The service to check the status of in Nagios.
numeric Turn to false in order to return status in text format ('OK' instead of 0, 'Warning' instead of 1 etc)

Returns status: 'OK', 'Warning', 'Critical' or 'Unknown'

CLI Example:

```bash
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP' numeric=False
```

25.7.280 salt.modules.namecheap_domains

Namecheap Domain Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```yaml
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains.check(`domains_to_check`) Checks the availability of domains domains_to_check array of strings List of domains to check Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:

```bash
salt 'my-minion' namecheap_domains.check domain-to-check
```

salt.modules.namecheap_domains.create(domain_name, years, **kwargs) Try to register the specified domain name domain_name The domain name to be registered years Number of years to register Returns the following information:
- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
• Whether or not registration is instant
• The amount charged for registration
• The domain ID
• The order ID
• The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

salt.modules.namecheap_domains.get_info(domain_name)

Returns information about the requested domain

```
domain_name  string Domain name to get information about
```

CLI Example:

```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

salt.modules.namecheap_domains.get_list(list_type=None, search_term=None, page=None, page_size=None, sort_by=None)

Returns a list of domains for the particular user as a list of objects offset by page length of page_size

```
list_type  [ALL] One of ALL, EXPIRING, EXPIRED
search_term  Keyword to look for on the domain list
page  [1] Number of result page to return
page_size  [20] Number of domains to be listed per page (minimum: 10, maximum: 100)
sort_by  One of NAME, NAME_DESC, EXPIREDATE, EXPIREDATE_DESC, CREATEDATE, or CREATEDATE_DESC
```

CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

salt.modules.namecheap_domains.get_tld_list()

Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

salt.modules.namecheap_domains.reactivate(domain_name)

Try to reactivate the expired domain name

Returns the following information:
• Whether or not the domain was reactivated successfully
• The amount charged for reactivation
• The order ID
• The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

salt.modules.namecheap_domains.renew(domain_name, years, promotion_code=None)

Try to renew the specified expiring domain name for a specified number of years

```
domain_name  The domain name to be renewed
years  Number of years to renew
```

Returns the following information:
• Whether or not the domain was renewed successfully
• The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

CLI Example:
```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

25.7.281 salt.modules.namecheap_domains_dns

Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_domains_dns.get_hosts(sld, tld)

Retrieves DNS host record settings for the requested domain.

- returns a dictionary of information about the requested domain
- sld  SLD of the domain name
- tld  TLD of the domain name

CLI Example:
```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

salt.modules.namecheap_domains_dns.get_list(sld, tld)

Gets a list of DNS servers associated with the requested domain.

- returns a dictionary of information about requested domain
- sld  SLD of the domain name
- tld  TLD of the domain name

CLI Example:
```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

salt.modules.namecheap_domains_dns.set_custom(sld, tld, nameservers)

Sets domain to use custom DNS servers.

- returns True if the custom nameservers were set successfully
- sld  SLD of the domain name
- tld  TLD of the domain name
nameservers array of strings List of nameservers to be associated with this domain

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

salt.modules.namecheap_domains_dns.set_default(sld, tld)
Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.

sld SLD of the domain name
tld TLD of the domain name

Returns True if the domain was successfully pointed at the default DNS servers.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

salt.modules.namecheap_domains_dns.set_hosts(sld, tld, hosts)
Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully

sld SLD of the domain name
tld TLD of the domain name

hosts Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

- hostname
- recordtype - One of A, AAAA, CNAME, MX, MXE, TXT, URL, URL301, or FRAME
- address - URL or IP address
- ttl - An integer between 60 and 60000 (default: 1800)

Additionally, the mxpref key can be present, but must be accompanied by an emailtype key.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

25.7.282 salt.modules.namecheap_domains_ns

Namecheap Nameserver Management

New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```
salt.modules.namecheap_domains_ns.create(sld, tld, nameserver, ip)
Creates a new nameserver. Returns True if the nameserver was created successfully.
sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
ip Nameserver IP address
CLI Example:
salt '*' namecheap_domains_ns.create sld tld nameserver ip

salt.modules.namecheap_domains_ns.delete(sld, tld, nameserver)
Deletes a nameserver. Returns True if the nameserver was deleted successfully
sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to delete
CLI Example:
salt '*' namecheap_domains_ns.delete sld tld nameserver

salt.modules.namecheap_domains_ns.get_info(sld, tld, nameserver)
Retrieves information about a registered nameserver. Returns the following information:
• IP Address set for the nameserver
• Domain name which was queried
• A list of nameservers and their statuses
sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to retrieve
CLI Example:
salt '*' namecheap_domains_ns.get_info sld tld nameserver

salt.modules.namecheap_domains_ns.update(sld, tld, nameserver, old_ip, new_ip)
Deletes a nameserver. Returns True if the nameserver was updated successfully.
sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
old_ip Current ip address
new_ip New ip address
CLI Example:
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip

25.7.283 salt.modules.namecheap_ssl
Namecheap SSL Certificate Management
New in version 2017.7.0.
Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

<table>
<thead>
<tr>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>namecheap.name: companyname</td>
</tr>
<tr>
<td>namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3</td>

</tbody>
</table>

salt.modules.namecheap_ssl.activate(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file

certificate_id Unique ID of the SSL certificate you wish to activate

web_server_type The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apachepopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

approver_email The email ID which is on the approver email list.
Note: http_dc_validation must be set to False if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:
```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

```
salt.modules.namecheap_ssl.create(years, certificate_type, promotion_code=None, sans_to_add=None)
```

Creates a new SSL certificate. Returns the following information:
- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

years [1] Number of years to register

certificate_type Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotional_code**  An optional promo code to use when creating the certificate

**sans_to_add**  [0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.

<table>
<thead>
<tr>
<th>Provider</th>
<th>Product name</th>
<th>Default number of domains (domain from CSR is counted here)</th>
<th>Maximum number of total domains</th>
<th>Maximum number of domains that can be passed in sans_to_add parameter</th>

</tbody>
</table>

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

```python
salt.modules.namecheap_ssl.get_info(certificate_id, return_certificate=False, return_type=None)
```

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL certificate with two keys:
- **ssl** - Contains the metadata information
- **certificate** - Contains the details for the certificate such as the CSR, Approver, and certificate data

**certificate_id**  Unique ID of the SSL certificate

**return_certificate**  [False] Set to True to ask for the certificate in response

**return_type**  Optional type for the returned certificate. Can be either "Individual" (for X.509 format) or "PKCS7"
Note: Required if return_certificate is True

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

```python
salt.modules.namecheap_ssl.get_list(**kwargs)
```

Returns a list of SSL certificates for a particular user.

**ListType** [All] Possible values:
- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

**SearchTerm** Keyword to look for on the SSL list

**Page** [1] Page number to return

**PageSize** [20] Total number of SSL certificates to display per page (minimum: 10, maximum: 100)

**SortBy** One of PURCHASEDATE, PURCHASEDATE_DESC, SSLTYPE, SSLTYPE_DESC, EXPIREDATETIME, EXPIREDATETIME_DESC, Host_Name, or Host_Name_DESC

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.get_list Processing
```

```python
salt.modules.namecheap_ssl.parse_csr(csr_file, certificate_type, http_dc_validation=False)
```

Parses the CSR. Returns a dictionary of result values.

**csr_file** Path to Certificate Signing Request file

**certificate_type** Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
• Secure Site
• Secure Site Pro
• Secure Site Pro with EV
• Secure Site with EV
• True BusinessID
• True BusinessID Multi Domain
• True BusinessID Wildcard
• True BusinessID with EV
• True BusinessID with EV Multi Domain
• Unified Communications

**http_dc_validation** [False] Set to True if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```bash
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

```python
salt.modules.namecheap_ssl.reissue(csr_file, certificate_id, web_server_type, approver_email=None, http_dc_validation=False, **kwargs)
```

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file
certificate_id Unique ID of the SSL certificate you wish to activate
web_server_type The type of certificate format to return. Possible values include:
  • apache2
  • apacheapachessl
  • apacheopenssl
  • apacheraven
  • apachessl
  • apachessleay
  • c2net
  • cobaltseries
  • cpanel
  • domino
  • dominogo4625
  • dominogo4626
  • ensim
  • hsphere
  • ibmhttp
  • iis
  • iis4
  • iis5
  • iplanet
  • ipswitch
  • netscape
  • other
  • plesk
  • tomcat
  • weblogic
  • website
  • webstar
  • zeusv3

approver_email The email ID which is on the approver email list.

---

Note: **http_dc_validation** must be set to **False** if this option is used.
**http_dc_validation** [False] Whether or not to activate using HTTP-based validation.

*Note:* For other parameters which may be required, see [here](#).

---

**CLI Example:**
```
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.renew(years, certificate_id, certificate_type, promotion_code=None)`
Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

**years** [1] Number of years to register

**certificate_id** Unique ID of the SSL certificate you wish to renew

**certificate_type** Type of SSL Certificate. Possible values include:
- EV Multi Domain SSL
- EV SSL
- EV SSL GSG
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

**promotional_code** An optional promo code to use when renewing the certificate

**CLI Example:**
```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```
25.7.284 salt.modules.namecheap_users

Namecheap User Management
New in version 2017.7.0.

Prerequisites

This module uses the requests Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

**salt.modules.namecheap_users.check_balances**(minimum=100)

Checks if the provided minimum value is present in the user's account.

- Returns a boolean. Returns False if the user's account balance is less than the provided minimum or True if greater than the minimum.
- minimum [100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

**salt.modules.namecheap_users.get_balances()**

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

**Note:** If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequired-ForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```
25.7.285  salt.modules.napalm_bgp

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor  Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity  new
depends  napalm
platform  unix

Dependencies

•  napalm proxy minion

New in version 2016.11.0.

salt.modules.napalm_bgp.config(group=None, neighbor=None, **kwargs)

Provides the BGP configuration on the device.

Parameters

•  **group** -- Name of the group selected to display the configuration.
•  **neighbor** -- IP Address of the neighbor to display the configuration. If the group
   parameter is not specified, the neighbor setting will be ignored.

Returns  A dictionary containing the BGP configuration from the network device. The keys of the
main dictionary are the group names.

Each group has the following properties:

•  type (string)
•  description (string)
•  apply_groups (string list)
•  multihop_ttl (int)
•  multipath (True/False)
•  local_address (string)
•  local_as (int)
•  remote_as (int)
•  import_policy (string)
•  export_policy (string)
•  remove_private_as (True/False)
•  prefix_limit (dictionary)
•  neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

•  description (string)
•  import_policy (string)
•  export_policy (string)
•  local_address (string)
•  local_as (int)
•  remote_as (int)
•  authentication_key (string)
•  prefix_limit (dictionary)
•  route_reflector_client (True/False)
•  nhs (True/False)

CLI Example:
Output Example:

```json
{
   'PEERS-GROUP-NAME':{
      'type': 'external',
      'description': 'Here we should have a nice description',
      'apply_groups': ['BGP-PREFIX-LIMIT'],
      'import_policy': 'PUBLIC-PEER-IN',
      'export_policy': 'PUBLIC-PEER-OUT',
      'remove_private': True,
      'multipath': True,
      'multihop_ttl': 30,
      'neighbors':{
         '192.168.0.1':{
            'description': 'Facebook [CDN]',
            'prefix_limit':{
               'inet':{
                  'unicast':{
                     'limit': 100,
                     'teardown':{
                        'threshold': 95,
                        'timeout': 5
                     }
                  }
               }
            }
         },
         'peer-as': 32934,
         'route_reflector': False,
         'nhs': True
      },
      '172.17.17.1':{
         'description': 'Twitter [CDN]',
         'prefix_limit':{
            'inet':{
               'unicast':{
                  'limit': 500,
                  'no-validate': 'IMPORT-FLOW-ROUTES'
               }
            }
         }
      },
      'peer-as': 13414,
      'route_reflector': False,
      'nhs': False
   }
}
```

`salt.modules.napalm_bgp.neighbors(neighbor=None, **kwargs)`

Provides details regarding the BGP sessions configured on the network device.

Parameters `neighbor` -- IP Address of a specific neighbor.
Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)
- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
* flap_count (int)

CLI Example:

```bash
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:

```json
{
  'default': {
    8121: [
      {
        'up': True,
        'local_as': 13335,
        'remote_as': 8121,
        'local_address': '172.101.76.1',
        'local_address_configured': True,
        'local_port': 179,
        'remote_address': '192.247.78.0',
        'router_id': '192.168.0.1',
        'remote_port': 58380,
        'multihop': False,
        'import_policy': '4-NTT-TRANSIT-IN',
        'export_policy': '4-NTT-TRANSIT-OUT',
        'input_messages': 123,
        'output_messages': 13,
        'input_updates': 123,
        'output_updates': 5,
        'messages_queued_out': 23,
        'connection_state': 'Established',
        'previous_connection_state': 'EstabSync',
        'last_event': 'RecvKeepAlive',
        'suppress_4byte_as': False,
        'local_as_prepend': False,
        'holdtime': 90,
        'configured_holdtime': 90,
        'keepalive': 30,
        'configured_keepalive': 30,
        'active_prefix_count': 132808,
        'received_prefix_count': 566739,
        'accepted_prefix_count': 566479,
        'suppressed_prefix_count': 0,
        'advertise_prefix_count': 0,
        'flap_count': 27
      }
    ]
  }
}
```
25.7.286 salt.modules.napalm_formula

NAPALM Formula helpers

New in version 2019.2.0.

This is an Execution Module providing helpers for various NAPALM formulas, e.g., napalm-interfaces-formula, napalm-bgp-formula, napalm-ntp-formula etc., meant to provide various helper functions to make the templates more readable.

salt.modules.napalm_formula.container_path(model, key=None, container=None, delim=': ')

Return the list of all the possible paths in a container, down to the config container. This function can be used to verify that the model is a Python object correctly structured and respecting the OpenConfig hierarchy.

model The OpenConfig-structured object to inspect.
delim: The key delimiter. In particular cases, it is indicated to use // as : might be already used in various cases, e.g., IPv6 addresses, interface name (e.g., Juniper QFX series), etc.

CLI Example:

```
salt '*' napalm_formula.container_path "{"interfaces": {"interface": {"Ethernet1 →": {"config": {"name": 'Ethernet1'}}}}}"n```

The example above would return a list with the following element:

```
interfaces:interface:Ethernet1:config
```

Other output examples:

```
- interfaces:interface:Ethernet1:config
- interfaces:interface:Ethernet1:subinterfaces:subinterface:0:config
- interfaces:interface:Ethernet2:config
```

salt.modules.napalm_formula.defaults(model, defaults, delim='//', flipped_merge=False)

Apply the defaults to a Python dictionary having the structure as described in the OpenConfig standards.

model The OpenConfig model to apply the defaults to.
defaults The dictionary of defaults. This argument must equally be structured with respect to the OpenConfig standards.

For ease of use, the keys of these support glob matching, therefore we don't have to provide the defaults for each entity but only for the entity type. See an example below.
delim: // The key delimiter to use. Generally, // should cover all the possible cases, and you don't need to override this value.
flipped_merge: False Whether should merge the model into the defaults, or the defaults into the model.

Default: False (merge the model into the defaults, i.e., any defaults would be overridden by the values from the model).

CLI Example:

```
salt '*' napalm_formula.defaults "{"interfaces": {"interface": {"Ethernet1 →": {"config": {"name": 'Ethernet1'}}}}}", {"interfaces": {"interface": {'*': {"config": {"enabled": True}}}}})n```

As one can notice in the example above, the * corresponds to the interface name, therefore, the defaults will be applied on all the interfaces.

salt.modules.napalm_formula.dictupdate(dest, upd, recursive_update=True, merge_lists=False)

Recursive version of the default dict.update.

Merges upd recursively into dest

If recursive_update=False, will use the classic dict.update, or fall back on a manual merge (helpful for non-dict types like FunctionWrapper).
If `merge_lists=True`, will aggregate list object types instead of replace. The list in `upd` is added to the list in `dest`, so the resulting list is `dest[key] + upd[key]`. This behaviour is only activated when `recursive_update=True`. By default `merge_lists=False`.

```python
salt.modules.napalm_formula.render_field(dictionary, field, prepend=None, append=None, quotes=False, **opts)
```

Render a field found under the `field` level of the hierarchy in the `dictionary` object. This is useful to render a field in a Jinja template without worrying that the hierarchy might not exist. For example if we do the following in Jinja: ```{{ interfaces.interface.Ethernet5.config.description }}``` for the following object: ```{'interfaces': {'interface': {'Ethernet1': {'config': {'enabled': True}}}}}``` it would error, as the `Ethernet5` key does not exist. With this helper, we can skip this and avoid existence checks. This must be however used with care.

- **dictionary** The dictionary to traverse.
- **field** The key name or part to traverse in the `dictionary`.
- **prepend**: `None` The text to prepend in front of the text. Usually, we need to have the name of the field too when generating the configuration.
- **append**: `None` Text to append at the end.
- **quotes**: `False` Whether should wrap the text around quotes.

CLI Example:

```
salt '*' napalm_formula.render_field "{'enabled': True}" enabled
# This would return the value of the "enabled" leaf key
salt '*' napalm_formula.render_field "{'enabled': True}" description
# This would not error
```

Jinja usage example:

```
{% set config = {'enabled': True, 'description': 'Interface description'} %}
{{ salt.napalm_formula.render_field(config, 'description', quotes=True) }}
```

The example above would be rendered on Arista / Cisco as:

```
description "Interface description"
```

While on Junos (the semicolon is important to be added, otherwise the configuration won’t be accepted by Junos):

```
description "Interface description";
```

```python
salt.modules.napalm_formula.render_fields(dictionary, *fields, **opts)
```

This function works similarly to `render_field` but for a list of fields from the same dictionary, rendering, indenting and distributing them on separate lines.

- **dictionary** The dictionary to traverse.
- **fields** A list of field names or paths in the `dictionary`.
- **indent**: `0` The indentation to use, prepended to the rendered field.
- **separator**: `\n` The separator to use between fields.

CLI Example:

```
salt '*' napalm_formula.render_fields "{'mtu': 68, 'description': 'Interface description'}" mtu description
```

Jinja usage example:

```
{% set config={"mtu": 68, "description": 'Interface description'} %}
{{ salt.napalm_formula.render_fields(config, 'mtu', 'description', quotes=True) }}
```

The Jinja example above would generate the following configuration:
mtu "68"
description "Interface description"

salt.modules.napalm_formula.setval(key, val, dict_=None, delim=':')[72x669] Set a value under the dictionary hierarchy identified under the key. The target 'foo/bar/baz' returns the dictionary hierarchy {'foo': {'bar': {'baz': {}}}].

Note: Currently this doesn't work with integers, i.e. cannot build lists dynamically.

CLI Example:
salt '*' formula.setval foo:baz:bar True

salt.modules.napalm_formula.traverse(data, key, default=None, delimiter=':')[72x518] Traverse a dict or list using a colon-delimited (or otherwise delimited, using the delimiter param) target string. The target foo:bar:0 will return data['foo'][ 'bar'][0] if this value exists, and will otherwise return the dict in the default argument. Function will automatically determine the target type. The target foo:bar:0 will return data['foo'][ 'bar'][0] if data like {'foo': {'bar': ['baz']}} ,if data like {'foo': {'bar': {'0': 'baz'}}} then return data['foo'][ 'bar'][ '0']

CLI Example:
salt '*' napalm_formula.traverse "{"foo": {"bar": {"baz": True}}}" foo:baz:bar

25.7.287 salt.modules.napalm_mod

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

salt.modules.napalm_mod.alive(**kwargs)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:
salt '*' napalm.alive

Output Example:

result: True
out:
  is_alive: False
comment: ''

salt.modules.napalm_mod.call(method, *args, **kwargs)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

Note: This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'

Salt Documentation, Release 3006.4

```
salt.modules.napalm_mod.compliance_report(filepath=None, string=None, render='jinja|yaml', **kwargs)
```

Return the compliance report.

**filepath**  The absolute path to the validation file.

**string**  New in version 2019.2.0.

The compliance report send as inline string, to be used as the file to send through the renderer system.

**Note:** Not all render modules can work with strings; the `py` renderer requires a file, for example.

**renderer**: `jinja|yaml`  New in version 2019.2.0.

The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.

**kwargs**  Changed in version 2019.2.0.

Keyword args to pass to Salt's `compile_template()` function.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
salt '*' napalm.compliance_report salt://path/to/validator.sls
```

Validation File Example (pure YAML):

```
- get_facts:
  os_version: 4.17

- get_interfaces_ip:
  Management1:
    ipv4:
      10.0.2.14:
        prefix_length: 24
        _mode: strict
```

Validation File Example (as Jinja + YAML):

```
- get_facts:
  os_version: {{ grains.version }}
- get_interfaces_ip:
   Loopback0:
```

(continues on next page)
ipv4:
   {{ grains.lo0.ipv4 }}:
   prefix_length: 24
   _mode: strict
- get_bgp_neighbors: {{ pillar.bgp.neighbors }}

Output Example:

device1:
    {'comment': None}
    {'out': None}
    {'complies': False}
    {'get_facts': None}
    {'complies': False}
    {'extra': None}
    {'missing': None}
    {'present': None}
    {'os_version': None}
    {'actual_value': None}
    {'complies': False}
    {'nested': False}
    {'get_interfaces_ip': None}
    {'complies': False}
    {'extra': None}
    {'missing': None}
    {'present': None}
    {'skipped': None}
    {'result': True}

salt.modules.napalm_mod.config_diff_text(source1='candidate', candidate_path=None, source2='running', running_path=None)

New in version 2019.2.0.

Return the diff, as text, between the two different configuration sources. The sources can be either specified using the source1 and source2 arguments when retrieving from the managed network device.

source1: candidate The source from where to retrieve the configuration to be compared with. Available options: candidate, running, startup. Default: candidate.

candidate_path Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp:/, etc.

source2: running The source from where to retrieve the configuration to compare with. Available options: candidate, running, startup. Default: running.

running_path Absolute or remote path from where to load the running configuration text. This argument
allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv**: **base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

**CLI Example:**

```sh
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

salt.modules.napalm_mod.config_diff_tree(source1='candidate',
                                         candidate_path=None,
                                         source2='running',
                                         running_path=None)

New in version 2019.2.0.

Return the diff, as Python dictionary, between two different sources. The sources can be either specified using the `source1` and `source2` arguments when retrieving from the managed network device.

**source1**: **candidate** The source from where to retrieve the configuration to be compared with. Available options: `candidate`, `running`, `startup`. Default: `candidate`.

**candidate_path** Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**source2**: **running** The source from where to retrieve the configuration to compare with. Available options: `candidate`, `running`, `startup`. Default: `running`.

**running_path** Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

**saltenv**: **base** Salt fileserver environment from which to retrieve the file. Ignored if `candidate_path` or `running_path` is not a `salt://` URL.

**CLI Example:**

```sh
salt '*' napalm.config_diff_text
salt '*' napalm.config_diff_text candidate_path=https://bit.ly/2mAdq7z
# Would compare the running config with the configuration available at
# https://bit.ly/2mAdq7z
```

**CLI Example:**

```sh
salt '*' napalm.config_diff_tree
salt '*' napalm.config_diff_tree running startup
```

salt.modules.napalm_mod.config_filter_lines(parent_regex, child_regex, source='running')

New in version 2019.2.0.

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the `parent_regex` argument, and the child matches the `child_regex` regular expression. The result is a list of dictionaries with the following keys:

- **match**: a boolean value that tells whether `child_regex` matched any children lines.
- **parent**: the parent line (as text).
- **child**: the child line (as text). If no child line matched, this field will be `None`.

**Note**: This function is only available only when the underlying library `ciscoconfparse` is installed. See `ciscoconfparse module` for more details.

**parent_regex** The regular expression to match the parent configuration lines against.

**child_regex** The regular expression to match the child configuration lines against.

**source**: **running** The configuration type to retrieve from the network device. Default: `running`. Available options: `running`, `startup`, `candidate`.

**CLI Example:**
salt.modules.napalm_mod.config_find_lines(regex, source='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `regex` argument. The configuration is read from the network device interrogated.

**regex**  The regular expression to match the configuration lines against.

**source**: *running*  The configuration type to retrieve from the network device. Default: *running*. Available options: *running*, *startup*, *candidate*.

CLI Example:

```
salt '*' napalm.config_find_lines '^interface Ethernet1\d'
```

salt.modules.napalm_mod.config_lines_w_child(parent_regex, child_regex, source='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having child lines matching `child_regex`. The configuration is read from the network device interrogated.

**parent_regex**  The regular expression to match the parent configuration lines against.

**child_regex**  The regular expression to match the child configuration lines against.

**source**: *running*  The configuration type to retrieve from the network device. Default: *running*. Available options: *running*, *startup*, *candidate*.

CLI Example:

```
salt '*' napalm.config_lines_w_child '^interface' 'ip address'
salt '*' napalm.config_lines_w_child '^interface' 'shutdown' source=candidate
```

salt.modules.napalm_mod.config_lines_wo_child(parent_regex, child_regex, source='running')

New in version 2019.2.0.

Return the configuration lines that match the regular expressions from the `parent_regex` argument, having the child lines *not* matching `child_regex`. The configuration is read from the network device interrogated.

**parent_regex**  The regular expression to match the parent configuration lines against.

**child_regex**  The regular expression to match the child configuration lines against.

**source**: *running*  The configuration type to retrieve from the network device. Default: *running*. Available options: *running*, *startup*, *candidate*.

CLI Example:

```
salt '*' napalm.config_lines_wo_child '^interface' 'ip address'
salt '*' napalm.config_lines_wo_child '^interface' 'shutdown' source=candidate
```
salt.modules.napalm_mod.config_merge_diff(source='running', merge_config=None, merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge diff, as text, after merging the merge config into the configuration source requested (without loading the config on the device).

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.
saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:
```bash
salt '*' napalm.config_merge_diff merge_path=salt://path/to/merge.cfg
```

class CONFIG_MERGE_Diff(NAPALM):
    def __init__(self, device, api, merge_config, merge_path, saltenv):
        self.device = device
        self.api = api
        self.merge_config = merge_config
        self.merge_path = merge_path
        self.saltenv = saltenv

        if self.merge_path is not None:
            self.config = self.api.get_config(self.merge_path)
        else:
            self.config = self.api.get_config(self.merge_path, self.saltenv)

        if self.merge_config is not None:
            self.config += self.merge_config

        self.diff = self.api.get_diff(self.config, self.initial_config)

        return self.diff

salt.modules.napalm_mod.config_merge_text(source='running', merge_config=None, merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge result of the configuration from source with the merge configuration, as plain text (without loading the config on the device).

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.
saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:
```bash
salt '*' napalm.config_merge_text merge_path=salt://path/to/merge.cfg
```

class CONFIG_MERGE_Text(NAPALM):
    def __init__(self, device, api, merge_config, merge_path, saltenv):
        self.device = device
        self.api = api
        self.merge_config = merge_config
        self.merge_path = merge_path
        self.saltenv = saltenv

        if self.merge_path is not None:
            self.config = self.api.get_config(self.merge_path)
        else:
            self.config = self.api.get_config(self.merge_path, self.saltenv)

        if self.merge_config is not None:
            self.config += self.merge_config

        self.text = self.api.config_merge_text(self.config)

        return self.text

salt.modules.napalm_mod.config_merge_tree(source='running', merge_config=None, merge_path=None, saltenv='base')

New in version 2019.2.0.

Return the merge tree of the initial_config with the merge_config, as a Python dictionary.

merge_config The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.
merge_path Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.
saltenv: base Salt fileserver environment from which to retrieve the file. Ignored if merge_path is not a salt:// URL.

CLI Example:
```bash
salt '*' napalm.config_merge_tree merge_path=salt://path/to/merge.cfg
```

class CONFIG_MERGE_Tree(NAPALM):
    def __init__(self, device, api, merge_config, merge_path, saltenv):
        self.device = device
        self.api = api
        self.merge_config = merge_config
        self.merge_path = merge_path
        self.saltenv = saltenv

        if self.merge_path is not None:
            self.config = self.api.get_config(self.merge_path)
        else:
            self.config = self.api.get_config(self.merge_path, self.saltenv)

        if self.merge_config is not None:
            self.config += self.merge_config

        self.tree = self.api.config_merge_tree(self.config)

        return self.tree

salt.modules.napalm_mod.config_tree(source='running', with_tags=False)

New in version 2019.2.0.

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the
with_tags argument, this function may provide different views, valuable in different situations.
source: running The configuration type to retrieve from the network device. Default: running. Available
options: running, startup, candidate.
with_tags: False Whether this function should return a detailed view, with tags.
CLI Example:

```bash
salt '*' napalm.config_tree
```

salt.modules.napalm_mod.junos_call(fun, *args, **kwargs)
New in version 2019.2.0.

Execute an arbitrary function from the junos execution module. To check what args and kwargs you must send to the function, please consult the appropriate documentation.
fun The name of the function. E.g., set_hostname.
args List of arguments to send to the junos function invoked.
kwargs Dictionary of key-value arguments to send to the junos function invoked.
CLI Example:

```bash
salt '*' napalm.junos_fun cli 'show system commit'
```

salt.modules.napalm_mod.junos_cli(command, format=None, dev_timeout=None, dest=None, **kwargs)
New in version 2019.2.0.

Execute a CLI command and return the output in the specified format.
command The command to execute on the Junos CLI.
format: text Format in which to get the CLI output (either text or xml).
dev_timeout: 30 The NETCONF RPC timeout (in seconds).
dest Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion.
To push the files to the Master, use cp.push.
CLI Example:

```bash
salt '*' napalm.junos_cli 'show lldp neighbors'
```

salt.modules.napalm_mod.junos_commit(**kwargs)
New in version 2019.2.0.

Commit the changes loaded in the candidate configuration.
dev_timeout: 30 The NETCONF RPC timeout (in seconds).
comment Provide a comment for the commit.
confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
sync: False When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.
force_sync: False When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
full When True, requires all the daemons to check and evaluate the new configuration.
detail When True, return commit detail.
CLI Examples:

```bash
salt '*' napalm.junos_commit comment='Committing via Salt' detail=True
salt '*' napalm.junos_commit dev_timeout=60 confirm=10
salt '*' napalm.junos_commit sync=True dev_timeout=90
```

salt.modules.napalm_mod.junos_copy_file(src, dst, **kwargs)
New in version 2019.2.0.
Copies the file on the remote Junos device.

src  The source file path. This argument accepts the usual Salt URIs (e.g., `salt://`, `http://`, `https://`, `s3://`, `ftp://`, etc.).
dst  The destination path on the device where to copy the file.

CLI Example:

```
salt '*' napalm.junos_copy_file https://example.com/junos.cfg /var/tmp/myjunos.cfg
```

```
salt.modules.napalm_mod.junos_facts(**kwargs)
```

New in version 2019.2.0.

The complete list of Junos facts collected by `junos-eznc`.

CLI Example:

```
salt '*' napalm.junos_facts
```

```
salt.modules.napalm_mod.junos_install_os(path=None, **kwargs)
```

New in version 2019.2.0.

Installs the given image on the device.

path  The image file source. This argument supports the following URIs:

- Absolute path on the Minion.
- `salt://` to fetch from the Salt fileserv.
- `ftp://`
- `swift://`
- `s3://`

dev_timeout: 30 The NETCONF RPC timeout (in seconds)
reboot: `False` Whether to reboot the device after the installation is complete.
no_copy: `False` If `True` the software package will not be copied to the remote device.

CLI Example:

```
salt '*' napalm.junos_install_os salt://images/junos_16_1.tgz reboot=True
```

```
salt.modules.napalm_mod.junos_rpc(cmd=None, dest=None, format=None, **kwargs)
```

New in version 2019.2.0.

Execute an RPC request on the remote Junos device.

cmd  The RPC request to the executed. To determine the RPC request, you can check the from the command line of the device, by executing the usual command followed by `| display xml rpc`, e.g., `show lldp neighbors | display xml rpc`.
dest  Destination file where the RPC output is stored. Note that the file will be stored on the Proxy Minion. To push the files to the Master, use `cp.push` Execution function.
format: `xml` The format in which the RPC reply is received from the device.
dev_timeout: 30 The NETCONF RPC timeout.
filter  Used with the `get-config` RPC request to filter out the config tree.
terse: `False` Whether to return terse output.

**Note:** Some RPC requests may not support this argument.

interface_name  Name of the interface to query.

CLI Example:

```
salt '*' napalm.junos_rpc get-lldp-neighbors-information
salt '*' napalm.junos_rpc get-config <configuration><system><ntp/></system><configuration>
```

(continues on next page)
salt.modules.napalm_mod.netmiko_args(**kwargs)
New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the netmiko module.

When running in a non-native NAPALM driver (e.g., panos, f5`, mos - either from https://github.com/napalm-automation-community or defined in user’s own environment, one can specify the Netmiko device type (the device_type argument) via the netmiko_device_type_map configuration option / Pillar key, e.g.,

```python
netmiko_device_type_map:
    f5: f5_ltm
    dellos10: dell_os10
```

The configuration above defines the mapping between the NAPALM os Grain and the Netmiko device_type, e.g., when the NAPALM Grain is f5, it would use the f5_ltm SSH Netmiko driver to execute commands over SSH on the remote network device.

CLI Example:

```bash
salt '*' napalm.netmiko_args
```

salt.modules.napalm_mod.netmiko_call(method, *args, **kwargs)
New in version 2019.2.0.

Execute an arbitrary Netmiko method, passing the authentication details from the existing NAPALM connection.

method The name of the Netmiko method to execute.
args List of arguments to send to the Netmiko method specified in method.
kwargs Key-value arguments to send to the execution function specified in method.

CLI Example:

```bash
salt '*' napalm.netmiko_call send_command 'show version'
```

salt.modules.napalm_mod.netmiko_commands(*commands, **kwargs)
New in version 2019.2.0.

Invoke one or more commands to be executed on the remote device, via Netmiko. Returns a list of strings, with the output from each command.

commands A list of commands to be executed.
expect_string Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.
delay_factor: 1 Multiplying factor used to adjust delays (default: 1).
max_loops: 500 Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.
auto_find_prompt: True Whether it should try to auto-detect the prompt (default: True).
strip_prompt: True Remove the trailing router prompt from the output (default: True).
strip_command: True Remove the echo of the command from the output (default: True).
normalize: True Ensure the proper enter is sent at end of command (default: True).
use_textfsm: False Process command output through TextFSM template (default: False).

CLI Example:

```bash
salt '*' napalm.netmiko_commands 'show version' 'show interfaces'
```
salt.modules.napalm_mod.netmiko_config(*config_commands, **kwargs)
New in version 2019.2.0.

Load a list of configuration commands on the remote device, via Netmiko.

**Warning:** Please remember that netmiko does not have any rollback safeguards and any configuration change will be directly loaded into the running config if the platform doesn't have the concept of candidate config.

On Junos, or other platforms that have this capability, the changes will not be loaded into the running config, and the user must set the commit argument to True to transfer the changes from the candidate into the running config before exiting.

**config_commands** A list of configuration commands to be loaded on the remote device.

**config_file** Read the configuration commands from a file. The file can equally be a template that can be rendered using the engine of choice (see template_engine).

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**exit_config_mode:** True Determines whether or not to exit config mode after complete.

**delay_factor:** 1 Factor to adjust delays.

**max_loops:** 150 Controls wait time in conjunction with delay_factor (default: 150).

**strip_prompt:** False Determines whether or not to strip the prompt (default: False).

**strip_command:** False Determines whether or not to strip the command (default: False).

**config_mode_command** The command to enter into config mode.

**commit:** False Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

CLI Example:

```shell
salt '*' napalm.netmiko_config 'set system ntp peer 1.2.3.4' commit=True
```

salt.modules.napalm_mod.netmiko_conn(**kwargs)
New in version 2019.2.0.

Return the connection object with the network device, over Netmiko, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules.

USAGE Example:

```python
conn = __salt__['napalm.netmiko_conn']()
res = conn.send_command('show interfaces')
conn.disconnect()
```

salt.modules.napalm_mod.netmiko_fun(fun, *args, **kwargs)
New in version 2019.2.0.
Call an arbitrary function from the Netmiko module, passing the authentication details from the existing NAPALM connection.

**fun** The name of the function from the Netmiko to invoke.

**args** List of arguments to send to the execution function specified in `fun`.

**kwargs** Key-value arguments to send to the execution function specified in `fun`.

**CLI Example:**

```
salt '*' napalm.netmiko_fun send_command 'show version'
```

**salt.modules.napalm_mod.netmiko_multi_call**

New in version 2019.2.0.

Execute a list of arbitrary Netmiko methods, passing the authentication details from the existing NAPALM connection.

**methods** List of dictionaries with the following keys:

- **name**: the name of the Netmiko function to invoke.
- **args**: list of arguments to send to the `name` method.
- **kwargs**: key-value arguments to send to the `name` method.

**CLI Example:**

```
salt '*' napalm.netmiko_multi_call "\{'name": 'send_command', 'args': ['show version']\}" "\{'name": 'send_command', 'args': ['show interfaces']\}"
```

**salt.modules.napalm_mod.nxos_api_config**

New in version 2019.2.0.

Configures the Nexus switch with the specified commands, via the NX-API.

**commands** The list of configuration commands to load on the Nexus switch.

**Note:** This argument is ignored when `config_file` is specified.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`
- `https://`
- `ftp://`
- `s3://`
- `swift://`

**template_engine**: `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context**: `None` Variables to add to the template context.

**defaults**: `None` Default values of the `context` dict.

**saltenv**: `base` Salt files server environment from which to retrieve the file. Ignored if `config_file` is not a `salt://` URL.

**CLI Example:**

```
salt '*' napalm.nxos_api_config 'spanning-tree mode mstp'
salt '*' napalm.nxos_api_config config_file=https://bit.ly/2LGLcDy context="\{'servers": ['1.2.3.4']\}"""'
```

**salt.modules.napalm_mod.nxos_api_rpc**

New in version 2019.2.0.
Execute an arbitrary RPC request via the Nexus API.

**commands**  The RPC commands to be executed.

**method**: **cli**  The type of the response, i.e., raw text (**cli_ascii**) or structured document (**cli**). Defaults to **cli** (structured data).

**CLI Example:**

```
salt '*' napalm.nxos_api_rpc 'show version'
```

```python
salt.modules.napalm_mod.nxos_api_show(commands, raw_text=True, **kwargs)
```

New in version 2019.2.0.

Execute one or more show (non-configuration) commands.

**commands**  The commands to be executed.

**raw_text**: **True**  Whether to return raw text or structured data.

**CLI Example:**

```
salt '*' napalm.nxos_api_show 'show version'  
salt '*' napalm.nxos_api_show 'show bgp sessions' 'show processes' raw_text=False
```

```python
salt.modules.napalm_mod.pyeapi_call(method, *args, **kwargs)
```

New in version 2019.2.0.

Invoke an arbitrary method from the **pyeapi** library. This function forwards the existing connection details to the **pyeapi.run_commands** execution function.

**method**  The name of the **pyeapi** method to invoke.

**kwargs**  Key-value arguments to send to the **pyeapi** method.

**CLI Example:**

```
salt '*' napalm.pyeapi_call run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_call get_config as_string=True
```

```python
salt.modules.napalm_mod.pyeapi_config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)
```

New in version 2019.2.0.

Configures the Arista switch with the specified commands, via the **pyeapi** library. This function forwards the existing connection details to the **pyeapi.run_commands** execution function.

**commands**  The list of configuration commands to load on the Arista switch.

**Note**: This argument is ignored when **config_file** is specified.

**config_file**  The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- **salt://**
- **https://**
- **ftp://**
- **s3://**
- **swift://**

**template_engine**: **jinja**  The template engine to use when rendering the source file. Default: **jinja**. To simply fetch the file without attempting to render, set this argument to **None**.

**context**: **None**  Variables to add to the template context.

**defaults**: **None**  Default values of the **context** dict.

**saltenv**: **base**  Salt fileserver environment from which to retrieve the file. Ignored if **config_file** is not a **salt://** URL.

---

25.7. execution modules 2327
Salt Documentation, Release 3006.4

CLI Example:
```
salt '*' napalm.pyeapi_config 'ntp server 1.2.3.4'
```

**salt.modules.napalm_mod.pyeapi_conn(**``kwargs``)**

New in version 2019.2.0.

Return the connection object with the Arista switch, over pyeapi, passing the authentication details from the existing NAPALM connection.

**Warning:** This function is not suitable for CLI usage, more rather to be used in various Salt modules, to reusing the established connection, as in opposite to opening a new connection for each task.

Usage example:
```
conn = __salt__['napalm.pyeapi_conn']()
res1 = conn.run_commands('show version')
res2 = conn.get_config(as_string=True)
```

**salt.modules.napalm_mod.pyeapi_nxos_api_args(**``prev_kwargs``)**

New in version 2019.2.0.

Return the key-value arguments used for the authentication arguments for the pyeapi execution module.

CLI Example:
```
salt '*' napalm.pyeapi_nxos_api_args
```

**salt.modules.napalm_mod.pyeapi_run_commands(**``commands``, **``kwargs``)**

Execute a list of commands on the Arista switch, via the pyeapi library. This function forwards the existing connection details to the pyeapi.run_commands execution function.

- **commands** A list of commands to execute.
- **encoding:** `json` The requested encoding of the command output. Valid values for encoding are `json` (default) or `text`.

CLI Example:
```
salt '*' napalm.pyeapi_run_commands 'show version' encoding=text
salt '*' napalm.pyeapi_run_commands 'show ip bgp neighbors'
```

**salt.modules.napalm_mod.reconnect(**``force=False``, **``kwargs``)**

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

**Note:** This function can be used only when running proxy minions.

CLI Example:
```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

**salt.modules.napalm_mod.rpc(**``command``, **``kwargs``)**

New in version 2019.2.0.

This is a wrapper to execute RPC requests on various network operating systems supported by NAPALM, invoking the following functions for the NAPALM native drivers:
- `napalm.junos_rpc` for `junos`
- `napalm.pyeapi_run_commands` for `eos`
- `napalm.nxos_api_rpc` for `nxos`
- `napalm.netmiko_commands` for `ios`, `iosxr`, and `nxos_ssh`

**command** The RPC command to execute. This depends on the nature of the operating system.

**kwargs** Key-value arguments to be sent to the underlying Execution function.

The function capabilities are extensible in the user environment via the `napalm_rpc_map` configuration option / Pillar, e.g.,

```python
napalm_rpc_map:
  f5: napalm.netmiko_commands
  panos: panos.call
```

The mapping above reads: when the NAPALM os Grain is `f5`, then call `napalm.netmiko_commands` for RPC requests.

By default, if the user does not specify any map, non-native NAPALM drivers will invoke the `napalm.netmiko_commands` Execution function.

CLI Example:

```bash
salt '*' napalm.rpc 'show version'
salt '*' napalm.rpc get-interfaces
```

### `salt.modules.napalm_mod.scp_get`

New in version 2019.2.0.

Transfer files and directories from remote network device to the localhost of the Minion.

**remote_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.

**recursive:** *False* Transfer files and directories recursively.

**preserve_times:** *False* Preserve `mtime` and `atime` of transferred files and directories.

**passphrase** Used for decrypting private keys.

**pkey** An optional private key to use for authentication.

**key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout** An optional timeout (in seconds) for the TCP connect.

**socket_timeout:** *10* The channel socket timeout in seconds.

**buff_size:** *16384* The size of the SCP send buffer.

**allow_agent:** *True* Set to *False* to disable connecting to the SSH agent.

**look_for_keys:** *True* Set to *False* to disable searching for discoverable private key files in `/~/.ssh/`.

**banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth_timeout** An optional timeout (in seconds) to wait for an authentication response.

**auto_add_policy:** *False* Automatically add the host to the `known_hosts`.

CLI Example:

```bash
salt '*' napalm.scp_get /var/tmp/file /tmp/file auto_add_policy=True
```
salt.modules.napalm_mod.scp_put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)

New in version 2019.2.0.

Transfer files and directories to remote network device.

**Note:** This function is only available only when the underlying library `scp` is installed. See `scp module` for more details.

- `files` A single path or a list of paths to be transferred.
- `remote_path` The path on the remote device where to store the files.
- `recursive` (default: `False`) Transfer files and directories recursively.
- `preserve_times` (default: `False`) Preserve `mtime` and `atime` of transferred files and directories.
- `saltenv` (default: `base`) The name of the Salt environment. Ignored when `files` is not a `salt://` URL.
- `hostname` The hostname of the remote device.
- `port` (default: `22`) The port of the remote device.
- `username` The username required for SSH authentication on the device.
- `password` Used for password authentication. It is also used for private key decryption if `passphrase` is not given.
- `passphrase` Used for decrypting private keys.
- `pkey` An optional private key to use for authentication.
- `key_filename` The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- `timeout` An optional timeout (in seconds) for the TCP connect.
- `socket_timeout` (default: `10`) The channel socket timeout in seconds.
- `buff_size` (default: `16384`) The size of the SCP send buffer.
- `allow_agent` (default: `True`) Set to `False` to disable connecting to the SSH agent.
- `look_for_keys` (default: `True`) Set to `False` to disable searching for discoverable private key files in `~/.ssh/`.
- `banner_timeout` An optional timeout (in seconds) to wait for the SSH banner to be presented.
- `auth_timeout` An optional timeout (in seconds) to wait for an authentication response.
- `auto_add_policy` (default: `False`) Automatically add the host to the `known_hosts`.

CLI Example:

```
salt '*' napalm.scp_put /path/to/file /var/tmp/file auto_add_policy=True
```
Dependencies

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

```
salt.modules.napalm_netacl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

- **filter_name** The name of the filter.
- **pillar_key** The root key of the whole policy config.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

```
salt.modules.napalm_netacl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)
```

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

- **filter_name** The name of the filter.
- **term_name** The name of the term.
- **pillar_key: acl** The root key of the whole policy config. Default: `acl`.
- **pillarenv** Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
- **saltenv** Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

```
salt.modules.napalm_netacl.load_filter_config(filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, **kwargs)
```

Generate and load the configuration of a policy filter.

**Note:** The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

- **filter_name** The name of the policy filter.
- **filter_options** Additional filter options. These options are platform-specific. See the complete list of options.
- **terms** List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.
- **prepend**: `True` When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.
- **pillar_key: acl** The key in the pillar containing the default attributes values. Default: `acl`. 
pillarenv  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv  Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True  Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.
only_lower_merge: False  Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: False. This option requires merge_pillar, otherwise it is ignored.
revision_id  Add a comment in the filter config having the description for the changes applied.
revision_no  The revision count.
revision_date: True  Boolean flag: display the date when the filter configuration was generated. Default: True.
revision_date_format: %Y/%m/%d  The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: False  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
   ←debug=True
```

Output Example:

```
edge01.bjm01:
    --------
   already_configured: False
   comment:
   diff:
      [edit firewall]
      + family inet {
      +    /*
      +    ** $Date: 2017/03/22 $
      +    **
      +    */
      + filter my-filter {
      +    interface-specific;
      +    term my-term {
      +        from {
      +          source-port [ 1234 1235 ];
      +        }
      +        then {
      +          reject;
      +        }
      +    }
      +    term my-other-term {
      +        from {
      +          protocol tcp;
      +          source-port 5678-5680;
      +        }
      +        then accept;
      +    }
```
(continues on next page)
The filter configuration has been loaded from the pillar, having the following structure:

```plaintext
netacl:
- my-filter:
  terms:
    - my-term:
      source_port:
        - 1234
        - 1235
      action: reject
    - my-other-term:
      source_port:
        - 5678
        - 5680
      protocol: tcp
      action: accept
```
Generate and load the configuration of the whole policy.

Note: The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the filters and/or inside the pillar.

When merging the filters with the pillar data, consider the prepend argument to make sure the order is correct!

filters List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.
prepend: True When merge_pillar is set as True, the final list of filters generated by merging the filters from filters with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to False.
pillar_key: acl The key in the pillar containing the default attributes values. Default: acl.
pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.
merge_pillar: True Merge the CLI variables with the pillar. Default: True.

The merge logic depends on the prepend argument and the CLI has higher priority than the pillar.
only_lower_merge: False Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False. This option requires merge_pillar, otherwise it is ignored.
revision_id Add a comment in the policy config having the description for the changes applied.
revision_no The revision count.
revision_date: True Boolean flag: display the date when the policy configuration was generated. Default: True.
revision_date_format: %Y/%m/%d The date format to be used when generating the perforce data. Default: %Y/%m/%d (%year/%month/%day).
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

The output is a dictionary having the same form as net.load_config.

CLI Example:

salt 'edge01.flw01' netacl.load_policy_config debug=True

Output Example:

The policy configuration has been loaded from the pillar, having the following structure:

```
acl:
  - my-filter:
    terms:
      - my-term:
        source_port:
          - 1234
          - 1235
        protocol:
          - tcp
          - udp
        source_address: 1.2.3.4
        action: reject
      - my-other-term:
```

(continues on next page)
```python
source_port:
    - [5678, 5680]
protocol: tcp
action: accept

block-icmp:
terms:
    - first-term:
        protocol:
            - icmp
        action: reject
```

```
salt.modules.napalm_netacl.load_term_config(filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', test=False, commit=True, debug=False, source_service=None, destination_service=None, **term_fields)
```

Generate and load the configuration of a policy term.

**filter_name**  The name of the policy filter.

**term_name**  The name of the term.

**filter_options**  Additional filter options. These options are platform-specific. See the complete list of options.

**pillar_key**: `acl`  The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
    - my-filter:
        terms:
            - my-term:
                source_port: 1234
                source_address:
                    - 1.2.3.4/32
                    - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

**pillarenv**  Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**  Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar**: `True`  Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

**revision_id**  Add a comment in the term config having the description for the changes applied.

**revision_no**  The revision count.

**revision_date**: `True`  Boolean flag: display the date when the term configuration was generated. Default: `True`.

**revision_date_format**: `%Y/%m/%d`  The date format to be used when generating the perforce data. Default: `%Y/%m/%d (<year>/<month>/<day>).`

**test**: `False`  Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

**commit**: `True`  Commit? Default: `True`.

**debug**: `False`  Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

**source_service**  A special service to choose from. This is a helper so the user is able to select a source just
using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the `file state`.

destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

---

**Note:** The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

**Note:** The following fields can be also a single value and a list of values:
- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:
**destination_address**: 172.17.17.1/24

or as a list of destination IP addresses:

<table>
<thead>
<tr>
<th><strong>destination_address</strong>:</th>
</tr>
</thead>
<tbody>
<tr>
<td>172.17.17.1/24</td>
</tr>
<tr>
<td>172.17.19.1/24</td>
</tr>
</tbody>
</table>

or a list of services to be matched:

<table>
<thead>
<tr>
<th><strong>source_service</strong>:</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntp</td>
</tr>
<tr>
<td>snmp</td>
</tr>
<tr>
<td>ldap</td>
</tr>
<tr>
<td>bgpd</td>
</tr>
</tbody>
</table>

**Note:** The port fields **source_port** and **destination_port** can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

**source_port**:

```
- - 1000
- 2000
- - 3000
- 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as *net.load_config*.

**CLI Example:**

```bash
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

**Output Example:**

```
edge01.bjm01:
-------------
already_configured: False
comment: Configuration discarded.
diff: [edit firewall]

+ + + + 1.2.3.4/32;
+ + } - destination-address {
+ + 5.6.7.8/32;
+ + }
+ + }
+ + then accept;
+ + }
+ + }
+ + }
loaded_config:
  firewall {
    family inet {
      replace:
      /*
      ** $Date: 2017/03/22 $
      **
      */
      filter filter-name {
        interface-specific;
        term term-name {
          from {
            source-address {
              1.2.3.4/32;
            }
            destination-address {
              5.6.7.8/32;
            }
          }
          then accept;
        }
      }
    }
  }
result:
  True

25.7.289 salt.modules.napalm_network

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy 'napalm'.

  codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
  maturity new
  depends napalm
  platform unix
Dependencies

- napalm proxy minion

New in version 2016.11.0.
Changed in version 2017.7.0.

salt.modules.napalm_network.arp(interface='', ipaddr='', macaddr='', **kwargs)
NAPALM returns a list of dictionaries with details of the ARP entries.

Parameters

- interface -- interface name to filter on
- ipaddr -- IP address to filter on
- macaddr -- MAC address to filter on

Returns
List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac': '5c:5e:ab:da:3c:f0',
        'ip': '172.17.17.1',
        'age': 1454496274.84
    },
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac': '66:0e:94:96:e0:ff',
        'ip': '172.17.17.2',
        'age': 1435641582.49
    }
]
```

salt.modules.napalm_network.blockreplace(marker_start, marker_end, content='', append_if_not_found=False, prepend_if_not_found=False, show_changes=True, append_newline=False, source='running', path=None, test=False, commit=True, debug=False, replace=True)

New in version 2019.2.0.

Replace content of the configuration source, delimited by the line markers.

A block of content delimited by comments can help you manage several lines without worrying about old entries removal.

marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

marker_end The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output.

content The content to be used between the two lines identified by marker_start and marker_stop.
append_if_not_found: False If markers are not found and set to True then, the markers and content will be appended to the file.
prepend_if_not_found: False If markers are not found and set to True then, the markers and content will be prepended to the file.
append_newline: False Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.
show_changes: True Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).
path: None Save the temporary configuration to a specific path, then read from there. This argument is optional, can be used when you prefers a particular location of the temporary file.
test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.
commit: True Commit the configuration changes? Default: True.
debug: False Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.
replace: True Load and replace the configuration. Default: True.

CLI Example:
```
salt '*' net.blockreplace 'ntp' 'interface' ''
```

**salt.modules.napalm_network.cancel_commit(jid)**
New in version 2019.2.0.

Cancel a commit scheduled to be executed via the commit_in and commit_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit is scheduled via the functions named above.

CLI Example:
```
salt '*' net.cancel_commit 20180726083540640360
```

**salt.modules.napalm_network.cli(**commands, **kwargs)**
Returns a dictionary with the raw output of all commands passed as arguments.
commands List of commands to be executed on the device.
textfsm_parse: False Try parsing the outputs using the TextFSM templates.

New in version 2018.3.0.

**Note:** This option can be also specified in the minion configuration file or pillar as napalm_cli_textfsm_parse.

textfsm_path The path where the TextFSM templates can be found. This option implies the usage of the TextFSM index file. textfsm_path can be either absolute path on the server, either specified using the following URL mschemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

New in version 2018.3.0.

**Note:** This needs to be a directory with a flat structure, having an index file (whose name can be specified using the index_file option) and a number of TextFSM templates.
Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

**textfsm_template** The path to a certain the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`
New in version 2018.3.0.

**textfsm_template_dict** A dictionary with the mapping between a command and the corresponding TextFSM path to use to extract the data. The TextFSM paths can be specified as in `textfsm_template`.
New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `napalm_cli_textfsm_template_dict`.

**platform_grain_name**: *os* The name of the grain used to identify the platform name in the TextFSM index file. Default: `os`.
New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

**platform_column_name**: *Platform* The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.
New in version 2018.3.0.

Note: This is field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

**index_file**: *index* The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.
New in version 2018.3.0.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

**saltenv**: *base* Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.
New in version 2018.3.0.

**include_empty**: *False* Include empty files under the `textfsm_path`.
New in version 2018.3.0.
include_pat  Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

exclude_pat  Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2018.3.0.

**Note:** If used with include_pat, files matching this pattern will be excluded from the subset of files defined by include_pat.

**CLI Example:**

```
salt '* net.cli "show version" "show chassis fan"
```

**CLI Example with TextFSM template:**

```
salt '* net.cli textfsm_parse=True textfsm_path=salt://textfsm/
```

**Example output:**

```
{
    'show version and haiku': "Hostname: re0.edge01.arn01
                        Model: mx480
                        Junos: 13.3R6.5
                        Help me, Obi-Wan
                        I just saw Episode Two
                        You're my only hope",
    'show chassis fan': [
        "Item" : "Status" , "RPM" , "Measurement"
        Top Rear Fan   OK   3840   Spinning@
        Bottom Rear Fan OK   3840   Spinning@
        Top Middle Fan  OK   3900   Spinning@
        Bottom Middle Fan OK   3840   Spinning@
        Top Front Fan   OK   3810   Spinning@
        Bottom Front Fan OK   3840   Spinning@
    ],
}
```

**Example output with TextFSM parsing:**

```
{
    "comment": "",
    "result": true,
    "out": {
        "sh ver": {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
```

(continues on next page)
salt.modules.napalm_network.commit(inherit_napalm_device=None, **kwargs)

Commits the configuration changes made on the network device.

CLI Example:
salt '*' net.commit

salt.modules.napalm_network.compare_config(inherit_napalm_device=None, **kwargs)

Returns the difference between the running config and the candidate config.

CLI Example:
salt '*' net.compare_config

salt.modules.napalm_network.config(source=None, **kwargs)

New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration
sources supported by the network device. At most, there will be:

• running config
• startup config
• candidate config

To return only one of the configurations, you can use the source argument.

source Which configuration type you want to display, default is all of them.

Options:
• running
• candidate
• startup

Returns

The object returned is a dictionary with the following keys:

• running (string): Representation of the native running configuration.

• candidate (string): Representation of the native candidate configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

• startup (string): Representation of the native startup configuration. If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:
salt '*' net.config
salt '*' net.config source=candidate
salt.modules.napalm_network.config_changed(
    inherit_napalm_device=None,
    **kwargs
)
Will prompt if the configuration has been changed.

Returns A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:
```
salt '*' net.config_changed
```

salt.modules.napalm_network.config_control(
    inherit_napalm_device=None,
    **kwargs
)
Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:
```
salt '*' net.config_control
```

salt.modules.napalm_network.confirm_commit(jid)
New in version 2019.2.0.

Confirm a commit scheduled to be reverted via the revert_in and revert_at arguments from the net.load_template or net.load_config execution functions. The commit ID is displayed when the commit confirmed is scheduled via the functions named above.

CLI Example:
```
salt '*' net.confirm_commit 20180726083540640360
```

salt.modules.napalm_network.connected(**kwargs)
Specifies if the connection to the device succeeded.

CLI Example:
```
salt '*' net.connected
```

salt.modules.napalm_network.discard_config(
    inherit_napalm_device=None,
    **kwargs
)
Discards the changes applied.

CLI Example:
```
salt '*' net.discard_config
```

salt.modules.napalm_network.environment(**kwargs)
Returns the environment of the device.

CLI Example:
```
salt '*' net.environment
```

Example output:
```
{
    'fans': {
        'Bottom Rear Fan': {
            'status': True
        },
        'Bottom Middle Fan': {
    
(continues on next page)
{'status': True},
    'Top Middle Fan': {
        'status': True
    },
    'Bottom Front Fan': {
        'status': True
    },
    'Top Front Fan': {
        'status': True
    },
    'Top Rear Fan': {
        'status': True
    }
},
'memory': {
    'available_ram': 16349,
    'used_ram': 4934
},
'temperature': {
    'FPC 0 Exhaust A': {
        'is_alert': False,
        'temperature': 35.0,
        'is_critical': False
    }
},
'cpu': {
    '1': {
        '%usage': 19.0
    },
    '0': {
        '%usage': 35.0
    }
}
}

```
salt.modules.napalm_network.facts(**kwargs)
```

Returns characteristics of the network device. :return: a dictionary with the following keys:

- **uptime** - Uptime of the device in seconds.
- **vendor** - Manufacturer of the device.
- **model** - Device model.
- **hostname** - Hostname of the device
- **fqdn** - Fqdn of the device
- **os_version** - String with the OS version running on the device
- **serial_number** - Serial number of the device
- **interface_list** - List of the interfaces of the device

CLI Example:
```
salt '* net.facts
```

Example output:
```
{
    'os_version': '13.3R6.5',
    'uptime': 10117140,
    'interface_list': [
```
Salt Documentation, Release 3006.4

salt.modules.napalm_network.interfaces(**kwargs)

Returns details of the interfaces on the device.

Returns

A dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
    'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': '',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': 'dead:beef:dead',
    },
    'Ethernet1': {
        'is_up': True,
        'is_enabled': True,
        'description': 'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': 'beef:dead:beef',
    }
}
```

salt.modules.napalm_network.ipaddrs(**kwargs)

Returns IP addresses configured on the device.

Returns

A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys 'ipv4' and 'ipv6' (one, both or none) which are themselves dictionaries with the IP addresses as keys.

CLI Example:
salt '...' net.ipaddrs

Example output:

```json
{
  'FastEthernet8': {
    'ipv4': {
      '10.66.43.169': {
        'prefix_length': 22
      }
    },
  },
  'Loopback555': {
    'ipv4': {
      '192.168.1.1': {
        'prefix_length': 24
      }
    },
    'ipv6': {
      '1::1': {
        'prefix_length': 64
      },
      '2001:DB8:1::1': {
        'prefix_length': 64
      },
      'FE80::3': {
        'prefix_length': 'N/A'
      }
    }
  }
}
```

salt.modules.napalm_networklldp(interface='', **kwargs)

Returns a detailed view of the LLDP neighbors.

**Parameters**

- **interface** -- interface name to filter on

**Returns**

A dictionary with the LLDL neighbors. The keys are the interfaces with LLDP activated on.

**CLI Example:**

```
salt '...' net.lldp
salt '...' net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```json
{
  'TenGigE0/0/0/8': [
    {
      'parent_interface': 'Bundle-Ether8',
      'interface_description': 'TenGigE0/0/0/8',
      'remote_chassis_id': '8c60.4f69.e96c',
      'remote_system_name': 'switch',
      'remote_port': 'Eth2/2/1',
      'remote_port_description': 'Ethernet2/2/1',
      'remote_system_description': 'Cisco Nexus Operating System (NX-OS)®
Software 7.1(0)N1(1a)

TAC support: http://www.cisco.com/tac

Copyright (c) 2002–2015, Cisco Systems, Inc. All rights reserved.
```

(continues on next page)
Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag already_configured will be set as True to point this out.

To avoid committing the configuration, set the argument test to True and will discard (dry run).

To keep the changes but not commit, set commit to False.

To replace the config, set replace to True.

filename Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- salt:// to fetch the template from the Salt fileserver.
- http:// or https://
- ftp://
- s3://
- swift://

Changed in version 2018.3.0.

text String containing the desired configuration. This argument is ignored when filename is specified.

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False

and will commit the changes on the device.

debug: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

New in version 2016.11.2.

replace: False Load and replace the configuration. Default: False.

New in version 2016.11.2.

commit_in: None Commit the changes in a specific number of minutes / hours. Example of accepted formats:
- 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.
**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**commit_at:** None Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

**Note:** This feature works on any platforms, as it does not rely on the native features of the network operating system.

**Note:** After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the `net.cancel_commit` execution function, using the commit ID returned by this function.

**Warning:** Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

**revert_in:** None Commit and revert the changes in a specific number of minutes/hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**revert_at:** None Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

**Note:** To confirm the commit, and prevent reverting the changes, you will have to execute the `net.
The `confirm_commit` function, using the commit ID returned by this function.

**Warning:** This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

**saltenv:** base Specifies the Salt environment name.

New in version 2018.3.0.

**Returns** a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

CLI Example:

```bash
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file' commit=False
```

Example output:

```json
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': 'add interfaces xe-0/0/5+ description "Adding a description";
}
```

Renders a configuration template (default: Jinja) and loads the result on the device.
By default this function will commit the changes. If there are no changes, it does not commit, discards the config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

**template_name** Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
  base:
    - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt:///templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:
- `salt:///my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https://example.com/template.mako`
- `ftp://example.com/template.py`

Changed in version 2019.2.0: This argument can now support a list of templates to be rendered. The resulting configuration text is loaded at once, as a single configuration chunk.

**template_source**: `None` Inline config template to be rendered and loaded on the device.

**template_hash**: `None` Hash of the template file. Format: `{hash_type: 'md5', 'hsum': <md5sum>}`

New in version 2016.11.2.

**context**: `None` Overrides default context variables passed to the template.

New in version 2019.2.0.

**template_hash_name**: `None` When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

**saltenv**: `base` Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

**template_engine**: `jinja` The following templates engines are supported:
- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

New in version 2016.11.2.

**skip_verify**: `True` If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.
test: False  Dry run? If set to True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: True  Commit? (default: True)

debug: False  Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw result after the template was rendered.

New in version 2016.11.2.

replace: False  Load and replace the configuration.

New in version 2016.11.2.

commit_in: None  Commit the changes in a specific number of minutes / hours. Example of accepted formats: 5 (commit in 5 minutes), 2m (commit in 2 minutes), 1h (commit the changes in 1 hour), 5h30m (commit the changes in 5 hours and 30 minutes).

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

commit_at: None  Commit the changes at a specific time. Example of accepted formats: 1am (will commit the changes at the next 1AM), 13:20 (will commit at 13:20), 1:20am, etc.

Note: This feature works on any platforms, as it does not rely on the native features of the network operating system.

Note: After the command is executed and the diff is not satisfactory, or for any other reasons you have to discard the commit, you are able to do so using the net.cancel_commit execution function, using the commit ID returned by this function.

Warning: Using this feature, Salt will load the exact configuration you expect, however the diff may change in time (i.e., if an user applies a manual configuration change, or a different process or command changes the configuration in the meanwhile).

New in version 2019.2.0.

revert_in: None  Commit and revert the changes in a specific number of minutes / hours. Example of accepted formats: 5 (revert in 5 minutes), 2m (revert in 2 minutes), 1h (revert the changes in 1 hour), 5h30m (revert the changes in 5 hours and 30 minutes).
Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

`revert_at`: None Commit and revert the changes at a specific time. Example of accepted formats: 1am (will commit and revert the changes at the next 1AM), 13:20 (will commit and revert at 13:20), 1:20am, etc.

Note: To confirm the commit, and prevent reverting the changes, you will have to execute the `net.confirm_commit` function, using the commit ID returned by this function.

Warning: This works on any platform, regardless if they have or don’t have native capabilities to confirming a commit. However, please be very cautious when using this feature: on Junos (as it is the only NAPALM core platform supporting this natively) it executes a commit confirmed as you would do from the command line. All the other platforms don’t have this capability natively, therefore the revert is done via Salt. That means, your device needs to be reachable at the moment when Salt will attempt to revert your changes. Be cautious when pushing configuration changes that would prevent you reach the device.

Similarly, if an user or a different process apply other configuration changes in the meanwhile (between the moment you commit and till the changes are reverted), these changes would be equally reverted, as Salt cannot be aware of them.

New in version 2019.2.0.

`defaults`: None Default variables/context passed to the template.

New in version 2016.11.2.

`template_vars` Dictionary with the arguments/context to be used when the template is rendered.

Note: Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

Note: It is more recommended to use the `context` argument to avoid conflicts between CLI arguments and template variables.
Returns a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires debug to be set as True
- diff (str): returns the config changes applied

The template can use variables from the grains, pillar or opts, for example:

```python
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```
salt '*' net.load_template set_ntp_peers peers=['192.168.0.1']  # uses NAPALM

# default templates
# inline template:
salt -G 'os:junos' net.load_template template_source='system { host-name {{host_ name}}; }'
host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template template_source='system { host-name {{grains.model}}.lab; }'
# if the device is a MX480, the command above will set the hostname as: MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template template_source='system { host-name {{pillar.proxy.host}}; }'

salt '*' net.load_template https://bit.ly/2OhSgqP hostname='example'  # will commit
salt '*' net.load_template https://bit.ly/2OhSgqP hostname='example' test=True  # dry run

salt '*' net.load_template salt://templates/example.jinja debug=True  # Using the salt:// URI

# render a mako template:
salt '*' net.load_template salt://templates/example.mako template_engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True
peers=['192.168.0.1']
peers=['192.168.0.1']
```

(continues on next page)
# render multiple templates at once

Example output:
```
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': 'edit system
        host-name edge01.bjm01',
    'loaded_config': 'system { host-name edge01.bjm01; }
'}
```

salt.modules.napalm_network.mac(address='', interface='', vlan=0, **kwargs)
Returns the MAC Address Table on the device.

Parameters
- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

Returns A list of dictionaries representing the entries in the MAC Address Table

CLI Example:
salt '*' net.mac
salt '*' net.mac vlan=10

Example output:
```
[
    {
        'mac': '00:1c:58:29:4a:71',
        'interface': 'xe-3/0/2',
        'static': False,
        'active': True,
        'moves': 1,
        'vlan': 10,
        'last_move': 1454417742.58
    },
    {
        'mac': '8c:60:4f:58:e1:c1',
        'interface': 'xe-1/0/1',
        'static': False,
        'active': True,
        'moves': 2,
        'vlan': 42,
        'last_move': 1453191948.11
    }
]
```

salt.modules.napalm_network.optics(**kwargs)
New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.
Returns

Returns a dictionary where the keys are as listed below:

- intf_name (unicode)
  - physical_channels
    - channels (list of dicts)
      - index (int)
      - state
        - input_power
          instant (float)
          avg (float)
          min (float)
          max (float)
        - output_power
          instant (float)
          avg (float)
          min (float)
          max (float)
        - laser_bias_current
          instant (float)
          avg (float)
          min (float)
          max (float)

CLI Example:

```
salt '*' net.optics
```

salt.modules.napalm_network.patch(patchfile, options='', saltenv='base', source_hash=None, show_changes=True, source='running', path=None, test=False, commit=True, debug=False, replace=True)

New in version 2019.2.0.

Apply a patch to the configuration source, and load the result into the running config of the device.

patchfile A patch file to apply to the configuration source.

options Options to pass to patch.

source_hash If the patch file (specified via the patchfile argument) is an HTTP(S) or FTP URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

show_changes: True Controls how changes are presented. If True, this function will return the of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).

path: None Save the temporary configuration to a specific path, then read from there. This argument is optional, can the user prefers a particular location of the temporary file.
test: **False**  Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

commit: **True**  Commit the configuration changes? Default: True.

debug: **False**  Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: **True**  Load and replace the configuration. Default: True.

**CLI Example:**
```bash
salt '*' net.patch https://example.com/running_config.patch
```

salt.modules.napalm_network.ping( *destination*, *source=*
`None`, *ttl=*
`None`, *timeout=*
`None`, *size=*
`None`, *count=*
`None`, *vrf=*
`None`, **kwargs)```

Executes a ping on the network device and returns a dictionary as a result.

**destination**  Hostname or IP address of remote host

**source**  Source address of echo request

**ttl**  IP time-to-live value (IPv6 hop-limit value) (1..255 hops)

**timeout**  Maximum wait time after sending final packet (seconds)

**size**  Size of request packets (0..65468 bytes)

**count**  Number of ping requests to send (1..2000000000 packets)

**vrf**  VRF (routing instance) for ping attempt

New in version 2016.11.4.

**CLI Example:**
```bash
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

salt.modules.napalm_network.replace_pattern( *pattern*, *repl*, *count=*
`0`, *flags=*
`8`, *bufsize=*
`1`, *append_if_not_found=*
`False`, *prepend_if_not_found=*
`False`, *not_found_content=*
`None`, *search_only=*
`False`, *show_changes=*
`True`, *backslash Literal=*
`False`, *source=*
`None`, *path=*
`None`, *test=*
`False`, *replace=*
`True`, *debug=*
`False`, *commit=*
`True`)```

New in version 2019.2.0.

Replace occurrences of a pattern in the configuration source. If show_changes is True, then a diff of what changed will be returned, otherwise a True will be returned when changes are made, and False when no changes are made. This is a pure Python implementation that wraps Python's sub().

**pattern**  A regular expression, to be matched using Python's search().

**repl**  The replacement text.

**count**  0  Maximum number of pattern occurrences to be replaced. If count is a positive integer n, only n occurrences will be replaced, otherwise all occurrences will be replaced.

**flags**  8  A list of flags defined in the re module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., ['IGNORECASE', 'MULTILINE']. Optionally, flags may be an int, with a value corresponding to the XOR () of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize**  1  How much of the configuration to buffer into memory at once. The default value 1 processes one line at a time. The special value file may be specified which will read the entire file into memory before processing.

**append_if_not_found**  False  If set to True, and pattern is not found, then the content will be appended to the file.

**prepend_if_not_found**  False  If set to True and pattern is not found, then the content will be prepended to the file.

**not_found_content**  Content to use for append/prepend if not found. If None (default), uses repl. Useful
when repl uses references to group in pattern.

**search_only:** False If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

**show_changes:** True If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

**backslash_literal:** False Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

**source:** running The configuration source. Choose from: running, candidate, or startup. Default: running.

**path** Save the temporary configuration to a specific path, then read from there.

**test:** False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

**commit:** True Commit the configuration changes? Default: True.

**debug:** False Debug mode. Will insert a new key in the output dictionary, as loaded_config containing the raw configuration loaded on the device.

**replace:** True Load and replace the configuration. Default: True.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' net.replace_pattern "bind-address\s*=\"" bind-address:
```

CLI Example:

```
salt '*' net.replace_pattern PREFIX-LIST_NAME new-prefix-list-name
salt '*' net.replace_pattern bgp-group-name new-bgp-group-name count=1
```

salt.modules.napalm_network.rollback(*kwargs)
Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

salt.modules.napalm_network.save_config(source=None, path=None)
New in version 2019.2.0.
Save the configuration to a file on the local file system.

**source:** running The configuration source. Choose from: running, candidate, startup. Default: running.

**path** Absolute path to file where to save the configuration. To push the files to the Master, use cp.push Execution function.

CLI Example:

```
salt '*' net.save_config source=running
```

salt.modules.napalm_network.traceroute(destination, source=None, ttl=None, timeout=None, vrf=None, **kwargs)
Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

**destination** Hostname or address of remote host

**source** Source address to use in outgoing traceroute packets

**ttl** IP maximum time-to-live value (or IPv6 maximum hop-limit value)

**timeout** Number of seconds to wait for response (seconds)

**vrf** VRF (routing instance) for traceroute attempt
New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

25.7.290 salt.modules.napalm_ntp

NAPALM NTP

Manages NTP on network devices.

codeauthor Mircea Ulinic <ping@mirceaunimic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion
- NET basic features

See also:

NTP peers management state

New in version 2016.11.0.

salt.modules.napalm_ntp.delete_peers(*peers, **options)
Removes NTP peers configured on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool)** (**commit**) -- discard loaded config. By default **test** is False (will not discard the changes)
- **(bool)** -- commit loaded config. By default **commit** is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the **commit** option. For a dry run, use the **test** argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.delete_servers(*servers, **options)
Removes NTP servers configured on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool)** (**commit**) -- discard loaded config. By default **test** is False (will not discard the changes)
• *(bool)* -- commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```bash
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.peers(**kwargs)

Returns a list the NTP peers configured on the network device.

Returns: configured NTP peers as list.

CLI Example:

```bash
salt '*' ntp.peers
```

Example output:

```bash
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::cb00:840a'
]
```

salt.modules.napalm_ntp.servers(**kwargs)

Returns a list of the configured NTP servers on the device.

CLI Example:

```bash
salt '*' ntp.servers
```

Example output:

```bash
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::cb00:840a'
]
```

salt.modules.napalm_ntp.set_peers(*peers, **options)

Configures a list of NTP peers on the device.

Parameters:

- *peers* -- list of IP Addresses/Domain Names
- *(bool)* *(test)* -- discard loaded config. By default `test` is False (will not discard the changes)

Commit `commit` *(bool)* commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:
salt.modules.napalm_ntp.set_servers(*servers, **options)

Configures a list of NTP servers on the device.

Parameters

- `servers` -- list of IP Addresses/Domain Names
- `(bool)`(test) -- discard loaded config. By default `test` is False (will not discard the changes)

Commit `(bool)` commit loaded config. By default `commit` is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True     # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False  # preserves the changes, but does not commit
```

salt.modules.napalm_ntp.stats(peer=None, **kwargs)

Returns a dictionary containing synchronization details of the NTP peers.

Parameters `peer` -- Returns only the details of a specific NTP peer.

Returns a list of dictionaries, with the following keys:

- `remote`
- `referenceid`
- `synchronized`
- `stratum`
- `type`
- `when`
- `hostpoll`
- `reachability`
- `delay`
- `offset`
- `jitter`

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
    {
        'remote': '188.114.101.4',
        'referenceid': '188.114.100.1',
        'synchronized': True,
        'stratum': 4,
        'type': '-',
        'when': '107',
        'hostpoll': 256,
    }
]
```

(continues on next page)
25.7.291 salt.modules.napalm_probes

NAPALM Probes

Manages RPM/SLA probes on the network device.

codeauthor Mircea Ulinic <ping@mirceaulinic.net> & Jerome Fleury <jf@cloudflare.com>
maturity new
depends napalm
platform unix

Dependencies

- napalm proxy minion
- NET basic features

Probes configuration management state

New in version 2016.11.0.

salt.modules.napalm_probes.config(**kwargs)

Returns the configuration of the RPM probes.

Returns A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
    'probe1':{
        'test1': { 
            'probe_type' : 'icmp-ping',
            'target' : '192.168.0.1',
            'source' : '192.168.0.2',
            'probe_count' : 13,
            'test_interval': 3
        },
        'test2': { 
            'probe_type' : 'http-ping',
            'target' : '172.17.17.1',
            'source' : '192.17.17.2',
            'probe_count' : 5,
        }
    }
}
```
'test_interval': 60
}
}

salt.modules.napalm_probes.delete_probes(probes, test=False, commit=True, **kwargs)

Removes RPM/SLA probes from the network device. Calls the configuration template 'delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns A dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the **already_configured** flag (example below)
- **comment** (str): a message for the user
- **already_configured** (bool): flag to check if there were no changes applied
- **diff** (str): returns the config changes applied

Input example:

```python
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.results(**kwargs)

Provides the results of the measurements of the RPM/SLA probes.

::return a dictionary with the results of the probes.

CLI Example:

salt '*' probes.results

Output example:

```python
{
    'probe1': {
        'test1': {
            'last_test_min_delay' : 63.120,
            'global_test_min_delay' : 62.912,
            'current_test_avg_delay' : 63.190,
            'global_test_max_delay' : 177.349,
        }
    }
}
```

(continues on next page)
'current_test_max_delay': 63.302,
'global_test_avg_delay': 63.802,
'last_test_avg_delay': 63.438,
'last_test_max_delay': 65.356,
'probe_type': 'icmp-ping',
'rtt': 63.138,
'last_test_loss': 0,
'round_trip_jitter': -59.0,
'target': '192.168.0.1',
'source': '192.168.0.2',
'probe_count': 15,
'current_test_min_delay': 63.138,
'
'test2': {
  'last_test_min_delay': 176.384,
  'global_test_min_delay': 169.226,
  'current_test_avg_delay': 177.098,
  'global_test_max_delay': 292.628,
  'current_test_max_delay': 180.055,
  'global_test_avg_delay': 177.959,
  'last_test_avg_delay': 177.178,
  'last_test_max_delay': 184.671,
  'probe_type': 'icmp-ping',
  'rtt': 176.449,
  'last_test_loss': 0,
  'round_trip_jitter': -34.0,
  'target': '172.17.17.1',
  'source': '172.17.17.2',
  'probe_count': 15,
  'current_test_min_delay': 176.402
}
}

```
salt.modules.napalm_probes.schedule_probes(probes, test=False, commit=True, **kwargs)
```

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

**Parameters**

- **probes** -- Dictionary with a similar format as the output dictionary of the function `config()`, where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** `MergeConfigException` -- If there is an error on the configuration sent.

**Returns** a dictionary having the following keys:

- **result** (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

Input example:

```python
probes = {
    'new_probe':{
        'new_test1': {},
        'new_test2': {}
    }
}
```

```python
salt.modules.napalm_probes.set_probes(probes, test=False, commit=True, **kwargs)
```

Configures RPM/SLA probes on the device. Calls the configuration template 'set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is False only in case of failure.
  In case there are no changes to be applied and successfully performs all operations it is still True and so will be the already_configured flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example - via state/script:

```python
probes = {
    'new_probe':{
        'new_test1': {
            'probe_type': 'icmp-ping',
            'target': '192.168.0.1',
            'source': '192.168.0.2',
            'probe_count': 13,
            'test_interval': 3
        },
        'new_test2': {
            'probe_type': 'http-ping',
            'target': '172.17.17.1',
            'source': '192.17.17.2',
            'probe_count': 5,
            'test_interval': 60
        }
    }
}
```

```python
set_probes(probes)
```

CLI Example - to push changes on the fly (not recommended):
salt 'junos_minion' probes.set_probes "{'new_probe':{'new_test1':{'probe_type': 'icmp-ping', 'target':'192.168.0.1','source':'192.168.0.2','probe_count':13,'test_interval':3}}}" test=True

Output example - for the CLI example above:

```python
junos_minion:  
----------  
already_configured:  
    False  
comment:  
    Configuration discarded.  
diff:  
    [edit services rpm]  
        probe transit { ... }  
        + probe new_probe {  
            + test new_test1 {  
                + probe-type icmp-ping;  
                + target address 192.168.0.1;  
                + probe-count 13;  
                + test-interval 3;  
                + source-address 192.168.0.2;  
            }  
        }  
result:  
    True
```

25.7.292 salt.modules.napalm_route

NAPALM Route

Retrieves route details from network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion

New in version 2016.11.0.
salt.modules.napalm_route.show(destination, protocol=None, **kwargs)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

Note: This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.
destination  destination prefix.
protocol (optional)  protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show 172.16.0.0/25
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```json
{
    '172.16.0.0/25': [
        {
            'protocol': 'BGP',
            'last_active': True,
            'current_active': True,
            'age': 1178693,
            'routing_table': 'inet.0',
            'next_hop': '192.168.0.11',
            'outgoing_interface': 'xe-1/1/1.100',
            'preference': 170,
            'selected_next_hop': False,
            'protocol_attributes': {
                'remote_as': 65001,
                'metric': 5,
                'local_as': 13335,
                'as_path': '',
                'remote_address': '192.168.0.11',
                'metric2': 0,
                'local_preference': 0,
                'communities': [
                    '0:2',
                    'no-export'
                ],
                'preference2': -1
            },
            'inactive_reason': ''
        },
        {
            'protocol': 'BGP',
            'last_active': False,
            'current_active': False,
            'age': 2359429,
            'routing_table': 'inet.0',
            'next_hop': '192.168.0.17',
            'outgoing_interface': 'xe-1/1/1.100',
            'preference': 170,
            'selected_next_hop': True,
            'protocol_attributes': {
                'remote_as': 65001,
                'metric': 5,
                'local_as': 13335,
                'as_path': '',
                'remote_address': '192.168.0.17',
                'metric2': 0,
                'local_preference': 0,
                'communities': [
                    '0:2',
                    'no-export'
                ],
                'preference2': -1
            },
            'inactive_reason': ''
        }
    ]
}
(continues on next page)
```
25.7.293 salt.modules.napalm_snmp

NAPALM SNMP

Manages SNMP on network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion
- NET basic features

See also:
SNMP configuration management state

New in version 2016.11.0.

salt.modules.napalm_snmp.config(**kwargs)
Returns the SNMP configuration

CLI Example:

```bash
salt '* snmp.config
```

salt.modules.napalm_snmp.remove_config(chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs)
Removes a configuration element from the SNMP configuration.

Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:
  - acl (if any policy / ACL need to be set)
  - mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
• **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
• **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config
  immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns A dictionary having the following keys:

• result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the *already_configured* flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

CLI Example:
```
salt '*' snmp.remove_config community='abcd'
```

salt.modules.napalm_snmp.update_config(*chassis_id=None, community=None, contact=None, location=None, test=False, commit=True, **kwargs*)

Updates the SNMP configuration.

Parameters

• **chassis_id** -- (optional) Chassis ID
• **community** -- (optional) A dictionary having the following optional keys:
  • acl (if any policy / ACL need to be set)
  • mode: rw or ro. Default: ro

Parameters

• **contact** -- Contact details
• **location** -- Location
• **test** -- Dry run? If set as True, will apply the config, discard and return the changes.
  Default: False
• **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config
  immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

• result (bool): if the config was applied successfully. It is False only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still True and so will be the *already_configured* flag (example below)
• comment (str): a message for the user
• already_configured (bool): flag to check if there were no changes applied
• diff (str): returns the config changes applied

CLI Example:
```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

25.7. execution modules 2371
25.7.294 salt.modules.napalm_users

NAPALM Users

Manages the configuration of the users on network devices.

codeauthor Mircea Ulinic <ping@mirceaulinic.net>
maturity new
depends napalm
platform unix

Dependencies

- NAPALM proxy minion

See also:

Users management state

New in version 2016.11.0.

salt.modules.napalm_users.config(**kwargs)

Returns the configuration of the users on the device

CLI Example:

```bash
salt '*' users.config
```

Output example:

```yaml
{
    'mircea': {
        'level': 15,
        'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/,
        'sshkeys': ['ssh-rsa

(continues on next page)
```
### salt.modules.napalm_users.delete_users

Removes users from the configuration of network devices.

**Parameters**

- `users` -- Dictionary formatted as the output of the function `config()`
- `test` -- Dry run? If set as True, will apply the config, discard and return the changes.
  
  Default: False
- `commit` -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** `MergeConfigException` -- If there is an error on the configuration sent.

**Return** a dictionary having the following keys

- result (bool): if the config was applied successfully. It is `False` only in case of failure.
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

**CLI Example:**

```python
salt '*' users.delete_users "{'mircea': {}}"
```

### salt.modules.napalm_users.set_users

Configures users on network devices.

**Parameters**

- `users` -- Dictionary formatted as the output of the function `config()`
- `test` -- Dry run? If set as True, will apply the config, discard and return the changes.
  
  Default: False
- `commit` -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

**Raises** `MergeConfigException` -- If there is an error on the configuration sent.

**Return** a dictionary having the following keys

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

**CLI Example:**

```python
salt '*' users.set_users "{'mircea': {}}"
```
25.7.295 salt.modules.napalm_yang_mod

NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

salt.modules.napalm_yang_mod.compliance_report(data, *models, **kwargs)
Return the compliance report using YANG objects.

- **data**: Dictionary structured with respect to the models referenced.
- **models**: A list of models to be used when generating the config.
- **filepath**: The absolute path to the validation file.

CLI Example:

```bash
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=~/.validate.yml
```

Output Example:

```json
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    },
    "extra": []
  }
}
```

salt.modules.napalm_yang_mod.diff(candidate, running, *models)
Returns the difference between two configuration entities structured according to the YANG model.

**Note**: This function is recommended to be used mostly as a state helper.

- **candidate**: First model to compare.
- **running**: Second model to compare.
- **models**: A list of models to be used when comparing.

CLI Example:

```bash
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```json
{
  "interfaces": {
    "interface": {
      "both": {
        "Port-Channel1": {
          // (continues on next page)
        }
      }
    }
  }
}
```
"config": {  
  "mtu": {  
    "first": "0",  
    "second": "9000"  
  }  
},  
"first_only": [  
  "Loopback0"  
],  
"second_only": [  
  "Loopback1"  
]  
}

salt.modules.napalm_yang_mod.get_config(data, *models, **kwargs)

Return the native config.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config () models.openconfig_interfaces
```

Output Example:

```
interface et1
  ip address 192.168.1.1/24
  description Uplink1
  mtu 9000
interface et2
  ip address 192.168.2.1/24
  description Uplink2
  mtu 9000
```

salt.modules.napalm_yang_mod.load_config(data, *models, **kwargs)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: None Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: False Dry run? If set as True, will apply the config, discard and return the changes. Default: False and will commit the changes on the device.

debg: False Debug mode. Will insert a new key under the output dictionary, as loaded_config containing the raw configuration loaded on the device.

replace: False Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config () models.openconfig_interfaces test=True&
  → debug=True
```

25.7. execution modules
Output Example:

device1:
  ---------
  already_configured:
  False
  comment:

</interfaces>
</configuration>

result: True

salt.modules.napalm_yang_mod.parse('models, **kwargs)
Parse configuration from the device.
models A list of models to be used when parsing.
config: False Parse config.
state: False Parse state.
profiles: None Use certain profiles to parse. If not specified, will use the device default profile(s).
CLI Example:
salt '*' napalm_yang.parse models.openconfig_interfaces

Output Example:
{
  "interfaces": {
    "interface": {
      "local": {
        "name": "local",
    
(continues on next page)

}
25.7.296 `salt.modules.netaddress`

Module for getting information about network addresses.

New in version 2016.3.0.

**depends** netaddr

**salt.modules.netaddress.cidr_broadcast**(`cidr`)  
Get the broadcast address associated with a CIDR address.  

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.cidr_netmask**(`cidr`)  
Get the netmask address associated with a CIDR address.  

CLI Example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

**salt.modules.netaddress.list_cidr_ips**(`cidr`)  
Get a list of IP addresses from a CIDR.  

CLI Example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

**salt.modules.netaddress.list_cidr_ips_ipv6**(`cidr`)  
Get a list of IPv6 addresses from a CIDR.  

CLI Example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```
25.7.297 salt.modules.netbox

NetBox

Module to query NetBox

codeauthor Zach Moody <zmoody@do.co>
maturity new
depends pynetbox

The following config should be in the minion config file. In order to work with secrets you should provide a token and path to your private key file:

```yaml
netbox:
  url: <NETBOX_URL>
  token: <NETBOX_USERNAME_API_TOKEN (OPTIONAL)>
  keyfile: */PATH/TO/NETBOX/KEY (OPTIONAL)>
```

New in version 2018.3.0.

salt.modules.netbox.create_circuit(name, provider_id, circuit_type, description=None)

New in version 2019.2.0.

Create a new Netbox circuit

- name Name of the circuit
- provider_id The netbox id of the circuit provider
- circuit_type The name of the circuit type
- asn The ASN of the circuit provider
- description The description of the circuit

CLI Example:

```
salt myminion netbox.create_circuit NEW_CIRCUIT_01 Telia Transit 1299 "New Telia\n→circuit"
```

salt.modules.netbox.create_circuit_provider(name, asn=None)

New in version 2019.2.0.

Create a new Netbox circuit provider

- name The name of the circuit provider
- asn The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.create_circuit_provider Telia 1299
```

salt.modules.netbox.create_circuit_termination(circuit, interface, device, speed, xconnect_id=None, term_side='A')

New in version 2019.2.0.

Terminate a circuit on an interface

- circuit The name of the circuit
- interface The name of the interface to terminate on
- device The name of the device the interface belongs to
- speed The speed of the circuit, in Kbps
- xconnect_id The cross-connect identifier
- term_side The side of the circuit termination

CLI Example:
salt modules.netbox.create_circuit_type(name)

New in version 2019.2.0.

Create a new Netbox circuit type.

name The name of the circuit type

CLI Example:
salt myminion netbox.create_circuit_type Transit

salt modules.netbox.create_device(name, role, model, manufacturer, site)

New in version 2019.2.0.

Create a new device with a name, role, model, manufacturer and site. All these components need to be already in Netbox.

name The name of the device, e.g., edge_router
role String of device role, e.g., router
model String of device model, e.g., MX480
manufacturer String of device manufacturer, e.g., Juniper
site String of device site, e.g., BRU

CLI Example:
salt myminion netbox.create_device edge_router router MX480 Juniper BRU

salt modules.netbox.create_device_role(role, color)

New in version 2019.2.0.

Create a device role

role String of device role, e.g., router

CLI Example:
salt myminion netbox.create_device_role router

salt modules.netbox.create_device_type(model, manufacturer)

New in version 2019.2.0.

Create a device type. If the manufacturer doesn't exist, create a new manufacturer.

model String of device model, e.g., MX480
manufacturer String of device manufacturer, e.g., Juniper

CLI Example:
salt myminion netbox.create_device_type MX480 Juniper

salt modules.netbox.create_interface(device_name, interface_name, mac_address=None, description=None, enabled=None, lag=None, lag_parent=None, form_factor=None)

New in version 2019.2.0.

Attach an interface to a device. If not all arguments are provided, they will default to Netbox defaults.

device_name The name of the device, e.g., edge_router
interface_name The name of the interface, e.g., TenGigE0/0/0/0
mac_address String of mac address, e.g., 50:87:89:73:92:C8
description String of interface description, e.g., NTT
enabled String of boolean interface status, e.g., True
lag Boolean of interface lag status, e.g., True
**lag_parent** String of interface lag parent name, e.g., ae13

**form_factor** Integer of form factor id, obtained through _choices API endpoint, e.g., 200

CLI Example:

```bash
salt myminion netbox.create_interface edge_router ae13 description="Core uplink"
```

salt.modules.netbox.create_interface_connection(interface_a, interface_b)

New in version 2019.2.0.

Create an interface connection between 2 interfaces

interface_a Interface id for Side A
interface_b Interface id for Side B

CLI Example:

```bash
salt myminion netbox.create_interface_connection 123 456
```

salt.modules.netbox.create_inventory_item(device_name, item_name, manufacturer_name=None, serial='', part_id='', description='')

New in version 2019.2.0.

Add an inventory item to an existing device.

device_name The name of the device, e.g., edge_router.
item_name String of inventory item name, e.g., Transceiver.
manufacturer_name String of inventory item manufacturer, e.g., Fiberstore.
serial String of inventory item serial, e.g., FS1238931.
part_id String of inventory item part id, e.g., 740-01234.
description String of inventory item description, e.g., SFP+-10G-LR.

CLI Example:

```bash
salt myminion netbox.create_inventory_item edge_router Transceiver part_id=740-01234
```

salt.modules.netbox.create_ipaddress(ip_address, family, device=None, interface=None)

New in version 2019.2.0.

Add an IP address, and optionally attach it to an interface.

ip_address The IP address and CIDR, e.g., 192.168.1.1/24
family Integer of IP family, e.g., 4
device The name of the device to attach IP to, e.g., edge_router
interface The name of the interface to attach IP to, e.g., ae13

CLI Example:

```bash
salt myminion netbox.create_ipaddress 192.168.1.1/24 4 device=edge_router interface=ae13
```

salt.modules.netbox.create_manufacturer(name)

New in version 2019.2.0.

Create a device manufacturer.

name The name of the manufacturer, e.g., Juniper

CLI Example:

```bash
salt myminion netbox.create_manufacturer Juniper
```

salt.modules.netbox.create_platform(platform)

New in version 2019.2.0.
Create a new device platform

```python
platform String of device platform, e.g., junos
CLI Example:
salt myminion netbox.create_platform junos
```

salt.modules.netbox.create_site(site)

New in version 2019.2.0.

Create a new device site

```python
site String of device site, e.g., BRU
CLI Example:
salt myminion netbox.create_site BRU
```

salt.modules.netbox.delete_interface(device_name, interface_name)

New in version 2019.2.0.

Delete an interface from a device.

```python
device_name The name of the device, e.g., edge_router.
interface_name The name of the interface, e.g., ae13
CLI Example:
salt myminion netbox.delete_interface edge_router ae13
```

salt.modules.netbox.delete_inventory_item(item_id)

New in version 2019.2.0.

Remove an item from a devices inventory. Identified by the netbox id

```python
item_id Integer of item to be deleted
CLI Example:
salt myminion netbox.delete_inventory_item 1354
```

salt.modules.netbox.delete_ipaddress(ipaddr_id)

New in version 2019.2.0.

Delete an IP address. IP addresses in Netbox are a combination of address and the interface it is assigned to.

```python
id The Netbox id for the IP address.
CLI Example:
salt myminion netbox.delete_ipaddress 9002
```

salt.modules.netbox.filter_(app, endpoint, **kwargs)

Get a list of items from NetBox.

```python
app String of netbox app, e.g., dcim, circuits, ipam
endpoint String of app endpoint, e.g., sites, regions, devices
kwargs Optional arguments that can be used to filter. All filter keywords are available in Netbox, which can be found by surfing to the corresponding API endpoint, and clicking Filters. e.g., role=router
Returns a list of dictionaries
CLI Example:
salt myminion netbox.filter dcim devices status=1 role=router
```

salt.modules.netbox.get_(app, endpoint, id=None, **kwargs)

Get a single item from NetBox.

```python
app String of netbox app, e.g., dcim, circuits, ipam
endpoint String of app endpoint, e.g., sites, regions, devices
```
Returns a single dictionary
To get an item based on ID.

```
salt myminion netbox.get dcim devices id=123
```

Or using named arguments that correspond with accepted filters on the NetBox endpoint.

```
salt myminion netbox.get dcim devices name=my-router
```

**salt.modules.netbox.get_circuit_provider** (*name*, *asn=none*)

New in version 2019.2.0.

Get a circuit provider with a given name and optional ASN.

- **name** The name of the circuit provider
- **asn** The ASN of the circuit provider

CLI Example:

```
salt myminion netbox.get_circuit_provider Telia 1299
```

**salt.modules.netbox.get_interfaces** (*device_name=None*, **kwargs**)

New in version 2019.2.0.

Returns interfaces for a specific device using arbitrary netbox filters

- **device_name** The name of the device, e.g., edge_router
- **kwargs** Optional arguments to be used for filtering

CLI Example:

```
salt myminion netbox.get_interfaces edge_router name="et-0/0/5"
```

**salt.modules.netbox.get_ipaddresses** (*device_name=None*, **kwargs**)

New in version 2019.2.0.

Filters for an IP address using specified filters

- **device_name** The name of the device to check for the IP address
- **kwargs** Optional arguments that can be used to filter, e.g., family=4

CLI Example:

```
salt myminion netbox.get_ipaddresses device_name family=4
```

**salt.modules.netbox.make_interface_child** (*device_name*, *interface_name*, *parent_name*)

New in version 2019.2.0.

Set an interface as part of a LAG.

- **device_name** The name of the device, e.g., edge_router.
- **interface_name** The name of the interface to be attached to LAG, e.g., xe-1/0/2.
- **parent_name** The name of the LAG interface, e.g., ae13.

CLI Example:

```
salt myminion netbox.make_interface_child xe-1/0/2 ae13
```

**salt.modules.netbox.make_interface_lag** (*device_name*, *interface_name*)

New in version 2019.2.0.

Update an interface to be a LAG.

- **device_name** The name of the device, e.g., edge_router.
- **interface_name** The name of the interface, e.g., ae13.

CLI Example:
salt.modules.netbox.openconfig_interfaces

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-interfaces YANG model, containing physical and configuration data available in Netbox, e.g., IP addresses, MTU, enabled / disabled, etc.

device_name: None The name of the device to query the interface data for. If not provided, will use the Minion ID.

CLI Example:
salt '*' netbox.openconfig_interfaces
salt '*' netbox.openconfig_interfaces device_name=cr1.thn.lon

salt.modules.netbox.openconfig_lacp

New in version 2019.2.0.

Return a dictionary structured as standardised in the openconfig-lacp YANG model, with configuration data for Link Aggregation Control Protocol (LACP) for aggregate interfaces.

Note: The interval and lacp_mode keys have the values set as SLOW and ACTIVE respectively, as this data is not currently available in Netbox, therefore defaulting to the values defined in the standard. See interval and lacp_mode for further details.

device_name: None The name of the device to query the LACP information for. If not provided, will use the Minion ID.

CLI Example:
salt '*' netbox.openconfig_lacp
salt '*' netbox.openconfig_lacp device_name=cr1.thn.lon

salt.modules.netbox.slugify

'Slugify given value. Credit to Djangoproject https://docs.djangoproject.com/en/2.0/_modules/django/utils/text/#slugify

salt.modules.netbox.update_device

New in version 2019.2.0.

Add attributes to an existing device, identified by name.

name The name of the device, e.g., edge_router

kwargs Arguments to change in device, e.g., serial=JN2932930

CLI Example:
salt myminion netbox.update_device edge_router serial=JN2932920

salt.modules.netbox.update_interface

New in version 2019.2.0.

Update an existing interface with new attributes.

device_name The name of the device, e.g., edge_router

interface_name The name of the interface, e.g., ae13

kwargs Arguments to change in interface, e.g., mac_address=50:87:69:53:32:D0

CLI Example:
salt myminion netbox.update_interface edge_router ae13 mac_address=50:87:69:53:32:D0

(continues on next page)
25.7.298 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

```
salt.modules.netbsd_sysctl.assign(name, value)
```
Assign a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

```
salt.modules.netbsd_sysctl.get(name)
```
Return a single sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.get hw.physmem
```

```
salt.modules.netbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
```
Assign and persist a simple sysctl parameter for this minion

CLI Example:
```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

```
salt.modules.netbsd_sysctl.show(config_file=False)
```
Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file instead of the live data.

CLI Example:
```
salt '*' sysctl.show
```

25.7.299 salt.modules.netbsdservice

The service module for NetBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

```
salt.modules.netbsdservice.available(name)
```
Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

```
salt.modules.netbsdservice.disable(name, **kwargs)
```
Disable the named service to start at boot

CLI Example:
salt '*' service.disable <service name>

salt.modules.netbsdservice.disabled(name)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.disabled <service name>

salt.modules.netbsdservice.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>

salt.modules.netbsdservice.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service name>

salt.modules.netbsdservice.force_reload(name)
Force-reload the named service

CLI Example:
salt '*' service.force_reload <service name>

salt.modules.netbsdservice.get_all()
Return all available boot services

CLI Example:
salt '*' service.get_all

salt.modules.netbsdservice.get_disabled()
Return a set of services that are installed but disabled

CLI Example:
salt '*' service.get_disabled

salt.modules.netbsdservice.get_enabled()
Return a list of service that are enabled on boot

CLI Example:
salt '*' service.get_enabled

salt.modules.netbsdservice.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
salt '*' service.missing sshd
salt.modules.netbsdservice.reload_(name)
Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.netbsdservice.restart(name)
Restart the named service

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.netbsdservice.start(name)
Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.netbsdservice.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:
```
salt '*' service.status <service name> [service signature]
```

salt.modules.netbsdservice.stop(name)
Stop the specified service

CLI Example:
```
salt '*' service.stop <service name>
```

25.7.300  salt.modules.netmiko_mod

Netmiko Execution Module

New in version 2019.2.0.

Execution module to interface the connection with a remote network device. It is flexible enough to execute the commands both when running under a Netmiko Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., device_type, ip, username, password etc.

**codeauthor** Mircea Ulinic <ping@mirceaulinic.net> & Kirk Byers <ktbyers@twb-tech.com>

**maturity** new

**depends** netmiko
platform unix

Dependencies

The netmiko proxy modules requires Netmiko to be installed: `pip install netmiko`.

Usage

This module can equally be used via the netmiko Proxy module (check documentation), or directly from an arbitrary (Proxy) Minion that is running on a server (computer) having access to the network device, and has the netmiko library installed.

When running outside of the netmiko Proxy (i.e., from another Proxy Minion type, or regular Minion), the netmiko connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the netmiko key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the netmiko Proxy Module:

- device_type - Class selection based on device type. Supported options:
  - a10: A10 Networks
  - accedian: Accedian Networks
  - alcatel_aos: Alcatel AOS
  - alcatel_sros: Alcatel SROS
  - apresia_aeos: Apresia AEOS
  - arista_eos: Arista EOS
  - aruba_os: Aruba
  - avaya_ers: Avaya ERS
  - avaya_vsp: Avaya VSP
  - brocade_fastiron: Brocade Fastiron
  - brocade_netiron: Brocade Netiron
  - brocade_nos: Brocade NOS
  - brocade_vdx: Brocade NOS
  - brocade_vyos: VyOS
  - checkpoint_gaia: Check Point GAiA
  - calix_b6: Calix B6
  - ciena_saos: Ciena SAOS
  - cisco_asa: Cisco SA
  - cisco_ios: Cisco IOS
  - cisco_nxos: Cisco NX-os
  - cisco_s300: Cisco S300
  - cisco_tp: Cisco TpTeCe
  - cisco_wlc: Cisco WLC
- cisco_xe: Cisco IOS
- cisco_xr: Cisco XR
- coriant: Coriant
- dell_force10: Dell Force10
- dell_os10: Dell OS10
- dell_powerconnect: Dell PowerConnect
- eltex: Eltex
- enterasys: Enterasys
- extreme: Extreme
- extreme_wing: Extreme Wing
- f5_ltm: F5 LTM
- fortinet: Fortinet
- generic_termserver: TerminalServer
- hp_comware: HP Comware
- hp_procurve: HP Procurve
- huawei: Huawei
- huawei_vrpv8: Huawei VRPV8
- juniper: Juniper Junos
- juniper_junos: Juniper Junos
- linux: Linux
- mellanox: Mellanox
- mrv_optiswitch: MrvOptiswitch
- netapp_cdot: NetAppcDot
- netscaler: Netscaler
- ovs_linux: OvsLinux
- paloalto_panos: PaloAlto Panos
- pluribus: Pluribus
- quanta_mesh: Quanta Mesh
- ruckus_fastiron: Ruckus Fastiron
- ubiquiti_edge: Ubiquiti Edge
- ubiquiti_edgeswitch: Ubiquiti Edge
- vyatta_vyos: VyOS
- vyos: VyOS
- brocade_fastiron_telnet: Brocade Fastiron over Telnet
- brocade_netiron_telnet: Brocade Netiron over Telnet
- cisco_ios_telnet: Cisco IOS over Telnet
- `apresia_aeos_telnet`: Apresia AEOS over Telnet
- `arista_eos_telnet`: Arista EOS over Telnet
- `hp_procurve_telnet`: HP Procurve over Telnet
- `hp_comware_telnet`: HP Comware over Telnet
- `juniper_junos_telnet`: Juniper Junos over Telnet
- `calix_b6_telnet`: Calix B6 over Telnet
- `dell_powerconnect_telnet`: Dell PowerConnect over Telnet
- `generic_termserver_telnet`: TerminalServer over Telnet
- `extreme_telnet`: Extreme Networks over Telnet
- `ruckus_fastiron_telnet`: Ruckus Fastiron over Telnet
- `cisco_ios_serial`: Cisco IOS over serial port

- `ip`: IP address of target device (not required if `host` is provided)
- `host`: Hostname of target device (not required if `ip` is provided)
- `username`: Username to authenticate against target device, if required
- `password`: Password to authenticate against target device, if required
- `secret`: The enable password if target device requires one
- `port`: The destination port used to connect to the target device
- `global_delay_factor`: Multiplication factor affecting Netmiko delays (default: 1)
- `use_keys`: Connect to target device using SSH keys (default: False)
- `key_file`: Filename path of the SSH key file to use
- `allow_agent`: Enable use of SSH key-agent
- `ssh_strict`: Automatically reject unknown SSH host keys (default: False, which means unknown SSH host keys will be accepted)
- `system_host_keys`: Load host keys from the user's "known_hosts" file (default: False)
- `alt_host_keys`: If True, host keys will be loaded from the file specified in `alt_key_file` (default: False)
- `alt_key_file`: SSH host key file to use (if `alt_host_keys=True`)
- `ssh_config_file`: File name of OpenSSH configuration file
- `timeout`: Connection timeout, in seconds (default: 90)
- `session_timeout`: Set a timeout for parallel requests, in seconds (default: 60)
- `keepalive`: Send SSH keepalive packets at a specific interval, in seconds. Currently defaults to 0, for backwards compatibility (it will not attempt to keep the connection alive using the KEEPALIVE packets)
- `default_enter`: Character(s) to send to correspond to enter key (default: \n)
- `response_return`: Character(s) to use in normalized return data to represent enter key (default: \n)

Example (when not running in a netmiko Proxy Minion):
In case the username and password are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a netmiko Proxy, e.g.:

```bash
salt '*' netmiko.send_command 'show version' host=router1.example.com device__type=juniper
salt '*' netmiko.send_config https://bit.ly/2sgljCB host=sw2.example.com device__type=cisco_ios
```

**Note:** Remember that the above applies only when not running in a netmiko Proxy Minion. If you want to use the `<salt.proxy.netmiko_px>`, please follow the documentation notes for a proper setup.

salt.modules.netmiko_mod.call(
    method, 'args', **'kwargs'  
)  
Invoke an arbitrary Netmiko method.  
method The name of the Netmiko method to invoke.  
args A list of arguments to send to the method invoked.  
kwargs Key-value dictionary to send to the method invoked.

salt.modules.netmiko_mod.commit(**'kwargs')  
Commit the configuration changes.

**Warning:** This function is supported only on the platforms that support the commit operation.

CLI Example:

```bash
salt '*' netmiko.commit
```

salt.modules.netmiko_mod.enter_config_mode(**'kwargs')  
Enter into config mode.  
config_command Configuration command to send to the device.  
pattern Pattern to terminate reading of channel.  

CLI Example:

```bash
salt '*' netmiko.enter_config_mode
salt '*' netmiko.enter_config_mode device_type='juniper_junos' ip='192.168.0.1' 
    →username='example'
```

salt.modules.netmiko_mod.exit_config_mode(**'kwargs')  
Exit from configuration mode.  
exit_config Command to exit configuration mode.  
pattern Pattern to terminate reading of channel.  

CLI Example:

```bash
salt '*' netmiko.exit_config_mode
salt '*' netmiko.exit_config_mode device_type='juniper' ip='192.168.0.1' username= 
    →'example'
```

salt.modules.netmiko_mod.get_connection(**'kwargs')  
Return the Netmiko connection object.
Warning: This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs** Key-value dictionary with the authentication details.

**USAGE Example:**

```python
conn = __salt__['netmiko.get_connection'](host='router1.example.com', username='example', password='example')
show_if = conn.send_command('show interfaces')
conn.disconnect()
```

dsalt.modules.netmiko_mod.multi_call(*methods, **kwargs)

Invoke multiple Netmiko methods at once, and return their output, as list.

**methods** A list of dictionaries with the following keys:

- name: the name of the Netmiko method to be executed.
- args: list of arguments to be sent to the Netmiko method.
- kwargs: dictionary of arguments to be sent to the Netmiko method.

**kwargs** Key-value dictionary with the connection details (when not running under a Proxy Minion).

**salt.modules.netmiko_mod.send_command(command_string, **kwargs)**

Execute command_string on the SSH channel using a pattern-based mechanism. Generally used for show commands. By default this method will keep waiting to receive data until the network device prompt is detected. The current network device prompt will be determined automatically.

**command_string** The command to be executed on the remote device.

**expect_string** Regular expression pattern to use for determining end of output. If left blank will default to being based on router prompt.

**delay_factor:** 1 Multiplying factor used to adjust delays (default: 1).

**max_loops:** 500 Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

**auto_find_prompt:** True Whether it should try to auto-detect the prompt (default: True).

**strip_prompt:** True Remove the trailing router prompt from the output (default: True).

**strip_command:** True Remove the echo of the command from the output (default: True).

**normalize:** True Ensure the proper enter is sent at end of command (default: True).

**use_textfsm:** False Process command output through TextFSM template (default: False).

**CLI Example:**

```python
salt '*' netmiko.send_command 'show version'
salt '*' netmiko.send_command 'show_version' host='router1.example.com' username='example' device_type='cisco_ios'
```

dsalt.modules.netmiko_mod.send_command_timing(command_string, **kwargs)

Execute command_string on the SSH channel using a delay-based mechanism. Generally used for show commands.

**command_string** The command to be executed on the remote device.

**delay_factor:** 1 Multiplying factor used to adjust delays (default: 1).

**max_loops:** 500 Controls wait time in conjunction with delay_factor. Will default to be based upon self.timeout.

**strip_prompt:** True Remove the trailing router prompt from the output (default: True).

**strip_command:** True Remove the echo of the command from the output (default: True).

**normalize:** True Ensure the proper enter is sent at end of command (default: True).

**use_textfsm:** False Process command output through TextFSM template (default: False).

**CLI Example:**

```python
```
salt.modules.netmiko_mod.send_config(config_file=None, config_commands=None, template_engine='jinja', commit=False, context=None, defaults=None, saltenv='base', **kwargs)

Send configuration commands down the SSH channel. Return the configuration lines sent to the device.

The function is flexible to send the configuration from a local or remote file, or simply the commands as list.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**config_commands** Multiple configuration commands to be sent to the device.

*Note:* This argument is ignored when **config_file** is specified.

**template_engine:** `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**commit:** `False` Commit the configuration changes before exiting the config mode. This option is by default disabled, as many platforms don't have this capability natively.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**exit_config_mode:** `True` Determines whether or not to exit config mode after complete.

**delay_factor:** `1` Factor to adjust delays.

**max_loops:** `150` Controls wait time in conjunction with delay_factor (default: 150).

**strip_prompt:** `False` Determines whether or not to strip the prompt (default: `False`).

**strip_command:** `False` Determines whether or not to strip the command (default: `False`).

**config_mode_command** The command to enter into config mode.

**CLI Example:**

```
salt '*' netmiko.send_config config_commands="['interface GigabitEthernet3', 'no ip address']"
salt '*' netmiko.send_config config_commands="['snmp-server location {{ grains.location }}']"
salt '*' netmiko.send_config config_file=salt://config.txt
salt '*' netmiko.send_config config_file=https://bit.ly/2sgljCB device_type='cisco_ios' ip='1.2.3.4' username='example'
```
25.7.301 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

depends
• nsnitro Python module

Note: You can install nsnitro using:

```bash
pip install nsnitro
```

configuration

This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples:

Calls relying on configuration passed using /etc/salt/minion, grains, or pillars:

```
salt-call netscaler.server_exists server_name
```

Calls passing configuration as opts

```
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4
  netscaler_user=username netscaler_pass=password
salt-call netscaler.server_exists server_name netscaler_host=1.2.3.5
  netscaler_user=username2 netscaler_pass=password2
salt-call netscaler.server_enable server_name2 netscaler_host=1.2.3.5
salt-call netscaler.server_up server_name3 netscaler_host=1.2.3.6 netscaler_
  useSSL=False
```

salt.modules.netscaler.server_add(s_name, s_ip, s_state= None, **connection_args)
Add a server
Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

salt.modules.netscaler.server_delete(s_name, **connection_args)
Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

salt.modules.netscaler.server_disable(s_name, **connection_args)
Disable a server globally

CLI Example:
salt '*' netscaler.server_disable 'serverName'

salt.modules.netscaler.server_enable(s_name, **connection_args)
    Enables a server globally
    CLI Example:
    salt '*' netscaler.server_enable 'serverName'

salt.modules.netscaler.server_enabled(s_name, **connection_args)
    Check if a server is enabled globally
    CLI Example:
    salt '*' netscaler.server_enabled 'serverName'

salt.modules.netscaler.server_exists(s_name, ip=None, s_state=None, **connection_args)
    Checks if a server exists
    CLI Example:
    salt '*' netscaler.server_exists 'serverName'

salt.modules.netscaler.server_update(s_name, s_ip, **connection_args)
    Update a server's attributes
    CLI Example:
    salt '*' netscaler.server_update 'serverName' 'serverIP'

salt.modules.netscaler.service_disable(s_name, s_delay=None, **connection_args)
    Disable a service
    CLI Example:
    salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'

salt.modules.netscaler.service_enable(s_name, **connection_args)
    Enable a service
    CLI Example:
    salt '*' netscaler.service_enable 'serviceName'

salt.modules.netscaler.service_exists(s_name, **connection_args)
    Checks if a service exists
    CLI Example:
    salt '*' netscaler.service_exists 'serviceName'

salt.modules.netscaler.service_up(s_name, **connection_args)
    Checks if a service is UP
    CLI Example:
    salt '*' netscaler.service_up 'serviceName'
Salt modules.netscaler.servicegroup_add

```python
salt.modules.netscaler.servicegroup_add(sg_name, sg_type='HTTP', **connection_args)
```

Add a new service group. If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:

```bash
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

Salt modules.netscaler.servicegroup_delete

```python
salt.modules.netscaler.servicegroup_delete(sg_name, **connection_args)
```

Delete a new service group

CLI Example:

```bash
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

Salt modules.netscaler.servicegroup_exists

```python
salt.modules.netscaler.servicegroup_exists(sg_name, sg_type=None, **connection_args)
```

Checks if a service group exists

CLI Example:

```bash
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

Salt modules.netscaler.servicegroup_server_add

```python
salt.modules.netscaler.servicegroup_server_add(sg_name, s_name, s_port, **connection_args)
```

Add a server:port member to a servicegroup

CLI Example:

```bash
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName'

salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName' 'serverPort'
```

Salt modules.netscaler.servicegroup_server_delete

```python
salt.modules.netscaler.servicegroup_server_delete(sg_name, s_name, s_port, **connection_args)
```

Remove a server:port member from a servicegroup

CLI Example:

```bash
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName'

salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName' 'serverPort'
```

Salt modules.netscaler.servicegroup_server_disable

```python
salt.modules.netscaler.servicegroup_server_disable(sg_name, s_name, s_port, **connection_args)
```

Disable a server:port member of a servicegroup

CLI Example:

```bash
salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName'

salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName' 'serverPort'
```

Salt modules.netscaler.servicegroup_server_enable

```python
salt.modules.netscaler.servicegroup_server_enable(sg_name, s_name, s_port, **connection_args)
```

Enable a server:port member of a servicegroup

CLI Example:

```bash
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName'

salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName' 'serverPort'
```
salt.modules.netscaler.servicegroup_server_exists(\texttt{sg\_name}, \texttt{s\_name}, \texttt{s\_port=None}, **\texttt{connection\_args})

Check if a server:port combination is a member of a servicegroup

CLI Example:

```bash
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName' → 'serverPort'
```

salt.modules.netscaler.servicegroup_server_up(\texttt{sg\_name}, \texttt{s\_name}, \texttt{s\_port}, **\texttt{connection\_args})

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```bash
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName' → 'serverPort'
```

salt.modules.netscaler.vserver_add(\texttt{v\_name}, \texttt{v\_ip}, \texttt{v\_port}, \texttt{v\_type}, **\texttt{connection\_args})

Add a new lb vserver

CLI Example:

```bash
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort' → 'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

salt.modules.netscaler.vserver_delete(\texttt{v\_name}, **\texttt{connection\_args})

Delete a lb vserver

CLI Example:

```bash
salt '*' netscaler.vserver_delete 'vserverName'
```

salt.modules.netscaler.vserver_exists(\texttt{v\_name}, \texttt{v\_ip=None}, \texttt{v\_port=None}, \texttt{v\_type=None}, **\texttt{connection\_args})

Checks if a vserver exists

CLI Example:

```bash
salt '*' netscaler.vserver_exists 'vserverName'
```

salt.modules.netscaler.vserver_servicegroup_add(\texttt{v\_name}, \texttt{sg\_name}, **\texttt{connection\_args})

Bind a servicegroup to a vserver

CLI Example:

```bash
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_delete(\texttt{v\_name}, \texttt{sg\_name}, **\texttt{connection\_args})

Unbind a servicegroup from a vserver

CLI Example:

```bash
salt '*' netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.vserver_servicegroup_exists(\texttt{v\_name}, \texttt{sg\_name}, **\texttt{connection\_args})

Checks if a servicegroup is tied to a vserver
**CLI Example:**
```
salt '*' netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

**salt.modules.netscaler.vserver_sslcert_add(v_name, sc_name, **connection_args)**
Binds a SSL certificate to a vserver

**CLI Example:**
```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

**salt.modules.netscaler.vserver_sslcert_delete(v_name, sc_name, **connection_args)**
Unbinds a SSL certificate from a vserver

**CLI Example:**
```
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

**salt.modules.netscaler.vserver_sslcert_exists(v_name, sc_name, **connection_args)**
Checks if a SSL certificate is tied to a vserver

**CLI Example:**
```
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

### 25.7.302 salt.modules.network

Module for gathering and managing network information

**salt.modules.network.active_tcp()**
Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

**CLI Example:**
```
salt '*' network.active_tcp
```

**salt.modules.network.arp()**
Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

**CLI Example:**
```
salt '*' network.arp
```

**salt.modules.network.calc_net(ip_addr, netmask=None)**
Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

**CLI Example:**
```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

**salt.modules.network.connect(host, port=None, **kwargs)**
Test connectivity to a host using a particular port from the minion.
New in version 2014.7.0.

CLI Example:

```bash
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp\n  timeout=3
```

**salt.modules.network.convert_cidr(cidr)**

returns the network address, subnet mask and broadcast address of a cidr address

New in version 2016.3.0.

CLI Example:

```bash
salt '*' network.convert_cidr 172.31.0.0/16
```

**salt.modules.network.default_route(family=None)**

Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' network.default_route
```

**salt.modules.network.dig(host)**

Performs a DNS lookup with dig

CLI Example:

```bash
salt '*' network.dig archlinux.org
```

**salt.modules.network.fqdns()**

Return all known FQDNs for the system by enumerating all interfaces and then trying to reverse resolve them (excluding 'lo' interface).

CLI Example:

```bash
salt '*' network.fqdns
```

**salt.modules.network.get_bufsize(iface)**

Return network buffer sizes as a dict (currently linux only)

CLI Example:

```bash
salt '*' network.get_bufsize eth0
```

**salt.modules.network.get_fqdn()**

Get fully qualified domain name

CLI Example:
salt '...' network.get_fqdn

salt.modules.network.get_hostname()
Get hostname
CLI Example:
  salt '...' network.get_hostname

salt.modules.network.get_route(ip)
Return routing information for given destination ip
New in version 2015.5.3.
Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD
Changed in version 2016.11.4: Added support for AIX
CLI Example:
  salt '...' network.get_route 10.10.10.10

salt.modules.network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
  salt '...' network.hw_addr eth0

salt.modules.network.hwaddr(iface)
This function is an alias of hw_addr.
  Return the hardware address (a.k.a. MAC address) for a given interface
CLI Example:
  salt '...' network.hw_addr eth0

salt.modules.network.ifacestartswith(cidr)
Retrieve the interface name from a specific CIDR
New in version 2016.11.0.
CLI Example:
  salt '...' network.ifacestartswith 10.0

salt.modules.network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False.
CLI Example:
  salt '...' network.in_subnet 10.0.0.0/16

salt.modules.network.interface(iface)
Return the inet address for a given interface
New in version 2014.7.0.
CLI Example:
salt 'salt '*' network.interface eth0

salt.modules.network.**interface_ip**(iface)

Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt 'salt '*' network.interface_ip eth0
```

salt.modules.network.**interfaces**()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt 'salt '*' network.interfaces
```

salt.modules.network.**ip_addrs**(interface=None, include_loopback=False, cidr=None, type=None)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If 'type' is 'public', then only public addresses will be returned. Ditto for 'type'='private'.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt 'salt '*' network.ip_addrs
```

salt.modules.network.**ip_addrs6**(interface=None, include_loopback=False, cidr=None)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via 'cidr="2000::/3"' will return only the addresses which are within that subnet.

Changed in version 3001: interface can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

```
salt 'salt '*' network.ip_addrs6
```

salt.modules.network.**ip_in_subnet**(ip_addr, cidr)

Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt 'salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

salt.modules.network.**ip_networks**(interface=None, include_loopback=False, verbose=False)

New in version 3001.

Returns a list of IPv4 networks to which the minion belongs.

**interface** Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:
salt.modules.network.ip_networks6(\texttt{interface=None, include\_loopback=False, verbose=False})

New in version 3001.

Returns a list of IPv6 networks to which the minion belongs.

\texttt{interface} Restrict results to the specified interface(s). This value can be either a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

\begin{verbatim}
salt '*' network.ip_networks6
salt '*' network.ip_networks6 interface=docker0
salt '*' network.ip_networks6 interface=docker0,eth0
salt '*' network.ip_networks6 interface=eth*
\end{verbatim}

salt.modules.network.ipaddrs(\texttt{interface=None, include\_loopback=False, cidr=None, type=None})

This function is an alias of \texttt{ip\_addrs}.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless ‘include\_loopback=True’ is indicated. If ‘interface’ is provided, then only IP addresses from that interface will be returned. Providing a CIDR via ‘cidr=2000:0:0/3’ will return only the addresses which are within that subnet. If ‘type’ is ‘public’, then only public addresses will be returned. Ditto for ‘type’=‘private’.

Changed in version 3001: \texttt{interface} can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

\begin{verbatim}
salt '*' network.ip_addrs
\end{verbatim}

salt.modules.network.ipaddr6(\texttt{interface=None, include\_loopback=False, cidr=None})

This function is an alias of \texttt{ip\_addrs6}.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless ‘include\_loopback=True’ is indicated. If ‘interface’ is provided, then only IP addresses from that interface will be returned. Providing a CIDR via ‘cidr=2000::/3’ will return only the addresses which are within that subnet.

Changed in version 3001: \texttt{interface} can now be a single interface name or a list of interfaces. Globbing is also supported.

CLI Example:

\begin{verbatim}
salt '*' network.ip_addrs6
\end{verbatim}

salt.modules.network.iphexval(\texttt{ip})

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

\begin{verbatim}
salt '*' network.iphexval 10.0.0.1
\end{verbatim}

salt.modules.network.is_loopback(\texttt{ip\_addr})

Check if the given IP address is a loopback address

New in version 2014.7.0.
Changed in version 2015.8.0: IPv6 support

CLI Example:
```
salt '*' network.is_loopback 127.0.0.1
```

salt.modules.network.is_private(ip_addr)
Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:
```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.mod_bufsize(iface, *args, **kwargs)
Modify network interface buffers (currently linux only)

CLI Example:
```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

salt.modules.network.mod_hostname(hostname)
Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:
```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.netstat()
Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:
```
salt '*' network.netstat
```

salt.modules.network.ping(host, timeout=False, return_boolean=False)
Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:
```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.
Return a True or False instead of ping output.
```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

```
salt.modules.network.reverse_ip(ip_addr)
```

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

```
salt.modules.network.routes(family=None)
```

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

```
salt.modules.network.subnets(interfaces=None)
```

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

```
salt.modules.network.subnets6()
```

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

```
salt.modules.network.traceroute(host)
```

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

```
salt.modules.network.wol(mac, bcast='255.255.255.255', destport=9)
```

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

25.7. execution modules
25.7.303  salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

• neutronclient Python module

configuration  This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```python
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```python
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

Note:  this is required to use keystone v3 as for authentication.

```python
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```
Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the verify option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystealauth to search for the certificates on its own.(defaults to True)

```python
salt.modules.neutron.add_gateway_router(router, ext_network, profile=None)
```

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- `router` -- ID or name of the router
- `ext_network` -- ID or name of the external network the gateway
- `profile` -- Profile to build on (Optional)

Returns Added Gateway router information

```python
salt.modules.neutron.add_interface_router(router, subnet, profile=None)
```

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- `router` -- ID or name of the router
- `subnet` -- ID or name of the subnet
- `profile` -- Profile to build on (Optional)

Returns Added interface information

```python
salt.modules.neutron.create_firewall_rule(protocol, action, profile=None, **kwargs)
```

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
   tenant_id= TENANT_ID name= NAME description= DESCRIPTION ip_version= IP_
   version
   source_ip_address= SOURCE_IP_ADDRESS destination_ip_address= DESTINATION_IP_
   address
   source_port= SOURCE_PORT
   destination_port= DESTINATION_PORT shared= SHARED enabled= ENABLED
```

Parameters

- `protocol` -- Protocol for the firewall rule, choose "tcp","udp", "icmp" or "None".
- `action` -- Action for the firewall rule, choose "allow" or "deny".
- `tenant_id` -- The owner tenant ID. (Optional)
- `name` -- Name for the firewall rule. (Optional)
- `description` -- Description for the firewall rule. (Optional)
- `ip_version` -- IP protocol version, default: 4. (Optional)
- `source_ip_address` -- Source IP address or subnet. (Optional)
- `destination_ip_address` -- Destination IP address or subnet. (Optional)
- `source_port` -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- `destination_port` -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- `shared` -- Set shared to True, default: False. (Optional)
- `enabled` -- To enable this rule, default: True. (Optional)
salt.modules.neutron.create_floatingip(floating_network, port=None, profile=None)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- `floating_network` -- Network name or ID to allocate floatingIP from
- `port` -- Of the port to be associated with the floatingIP (Optional)
- `profile` -- Profile to build on (Optional)

Returns Created floatingIP information

salt.modules.neutron.create_ikepolicy(name, profile=None, **kwargs)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
    phase1_negotiation_mode=main auth_algorithm=sha1
    encryption_algorithm=aes-128 pfs=group5
```

Parameters

- `name` -- Name of the IKE policy
- `phase1_negotiation_mode` -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- `auth_algorithm` -- Authentication algorithm in lowercase, default: sha1 (Optional)
- `encryption_algorithm` -- Encryption algorithm in lowercase, default:aes-128 (Optional)
- `pfs` -- Prefect Forward Security in lowercase, default: group5 (Optional)
- `units` -- IKE lifetime attribute, default: seconds (Optional)
- `value` -- IKE lifetime attribute, default: 3600 (Optional)
- `ike_version` -- IKE version in lowercase, default: v1 (Optional)
- `profile` -- Profile to build on (Optional)
- `kwargs` --

Returns Created IKE policy information

salt.modules.neutron.create_ipsec_site_connection(name, ipsecpolicy, ikepolicy, vpnservice, peer_cidrs, peer_address, peer_id, psk, admin_state_up=True, profile=None, **kwargs)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
    ipsec-policy-name ikepolicy-name vpnservice-name
    192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

Parameters

- `name` -- Set friendly name for the connection
- `ipsecpolicy` -- IPSec policy ID or name associated with this connection
- `ikepolicy` -- IKE policy ID or name associated with this connection
- `vpnservice` -- VPN service instance ID or name associated with this connection
- `peer_cidrs` -- Remote subnet(s) in CIDR format
- `peer_address` -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default: bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default: 1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns: Created IPSec site connection information

```
salt.modules.neutron.create_ipsecpolicy(name, profile=None, **kwargs)
```

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
    transform_protocol=esp auth_algorithm=sha1
    encapsulation_mode=tunnel encryption_algorithm=aes-128
```

Parameters

- **name** -- Name of the IPSec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default: aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns: Created IPSec policy information

```
salt.modules.neutron.create_network(name, router_ext=None, admin_state_up=True, network_type=None, physical_network=None, segmentation_id=None, shared=None, profile=None)
```

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** -- Name of network to create
- **admin_state_up** -- should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
• profile -- Profile to build on (Optional)

Returns Created network information

```
salt.modules.neutron.create_port(name, network, device_id=None, admin_state_up=True, profile=None)
```

Creates a new port

CLI Example:
```
salt '*' neutron.create_port network-name port-name
```

Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device_id** -- ID of device (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created port information

```
salt.modules.neutron.create_router(name, ext_network=None, admin_state_up=True, profile=None)
```

Creates a new router

CLI Example:
```
salt '*' neutron.create_router new-router-name
```

Parameters

- **name** -- Name of router to create (must be first)
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created router information

```
salt.modules.neutron.create_security_group(name=None, description=None, profile=None)
```

Creates a new security group

CLI Example:
```
salt '*' neutron.create_security_group security-group-name
  → description='Security group for servers'
```

Parameters

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created security group information

```
salt.modules.neutron.create_security_group_rule(security_group, remote_group_id=None, direction='ingress', protocol=None, port_range_min=None, port_range_max=None, ether-type='IPv4', profile=None)
```

Creates a new security group rule

CLI Example:
```python
salt '*' neutron.show_security_group_rule security-group-rule-id
```

**Parameters**

- `security_group` -- Security group name or ID to add rule
- `remote_group_id` -- Remote security group name or ID to apply rule (Optional)
- `direction` -- Direction of traffic: ingress/egress, default: ingress (Optional)
- `protocol` -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- `port_range_min` -- Starting port range (Optional)
- `port_range_max` -- Ending port range (Optional)
- `ethertype` -- IPv4/IPv6, default: IPv4 (Optional)
- `profile` -- Profile to build on (Optional)

**Returns**

Created security group rule information

```python
salt.modules.neutron.create_subnet(network, cidr, name=None, ip_version=4, profile=None)
```

* Creates a new subnet

**CLI Example:**

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

**Parameters**

- `network` -- Network ID or name this subnet belongs to
- `cidr` -- CIDR of subnet to create (Ex. '192.168.1.0/24')
- `name` -- Name of the subnet to create (Optional)
- `ip_version` -- Version to use, default is 4(IPv4) (Optional)
- `profile` -- Profile to build on (Optional)

**Returns**

Created subnet information

```python
salt.modules.neutron.create_vpnservice(subnet, router, name, admin_state_up=True, profile=None)
```

* Creates a new VPN service

**CLI Example:**

```
salt '*' neutron.create_vpnservice router-name name
```

**Parameters**

- `subnet` -- Subnet unique identifier for the VPN service deployment
- `router` -- Router unique identifier for the VPN service
- `name` -- Set a name for the VPN service
- `admin_state_up` -- Set admin state up to true or false, default: True (Optional)
- `profile` -- Profile to build on (Optional)

**Returns**

Created VPN service information

```python
salt.modules.neutron.delete_firewall_rule(firewall_rule, profile=None)
```

* Deletes the specified firewall_rule

**CLI Example:**

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

**Parameters**

- `firewall_rule` -- ID or name of firewall rule to delete
- `profile` -- Profile to build on (Optional)

**Returns**

True(Succeed) or False

```python
salt.modules.neutron.delete_floatingip(floatingip_id, profile=None)
```

* Deletes the specified floating IP

**25.7. execution modules**
CLI Example:

```bash
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters

- `floatingip_id` -- ID of floatingIP to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_ikepolicy(ikepolicy, profile=None)
```

Deletes the specified IKEPolicy

CLI Example:

```bash
echo 'salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters

- `ikepolicy` -- ID or name of IKE policy to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_ipsec_site_connection(ipsec_site_connection, profile=None)
```

Deletes the specified IPsecSiteConnection

CLI Example:

```bash
echo 'salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters

- `ipsec_site_connection` -- ID or name of ipsec site connection to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_ipsecpolicy(ipsecpolicy, profile=None)
```

Deletes the specified IPsecPolicy

CLI Example:

```bash
echo 'salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters

- `ipsecpolicy` -- ID or name of IPSec policy to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False

```python
salt.modules.neutron.delete_network(network, profile=None)
```

Deletes the specified network

CLI Example:

```bash
echo 'salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters

- `network` -- ID or name of network to delete
- `profile` -- Profile to build on (Optional)

Returns True(Succeed) or False
salt.modules.neutron.delete_port(port, profile=None)
   Deletes the specified port
   CLI Example:
   
   ```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
   ```

   Parameters
   - `port` -- port name or ID
   - `profile` -- Profile to build on (Optional)

   Returns True(Succeed) or False

salt.modules.neutron.delete_quota(tenant_id, profile=None)
   Delete the specified tenant's quota value
   CLI Example:
   
   ```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
   ```

   Parameters
   - `tenant_id` -- ID of tenant to quota delete
   - `profile` -- Profile to build on (Optional)

   Returns True(Delete succeed) or False(Delete failed)

salt.modules.neutron.delete_router(router, profile=None)
   Delete the specified router
   CLI Example:
   
   ```
salt '*' neutron.delete_router router-name
   ```

   Parameters
   - `router` -- ID or name of router to delete
   - `profile` -- Profile to build on (Optional)

   Returns True(Succeed) or False

salt.modules.neutron.delete_security_group(security_group, profile=None)
   Deletes the specified security group
   CLI Example:
   
   ```
salt '*' neutron.delete_security_group security-group-name
   ```

   Parameters
   - `security_group` -- ID or name of security group to delete
   - `profile` -- Profile to build on (Optional)

   Returns True(Succeed) or False

salt.modules.neutron.delete_security_group_rule(security_group_rule_id, profile=None)
   Deletes the specified security group rule
   CLI Example:
   
   ```
salt '*' neutron.delete_security_group_rule security-group-rule-id
   ```

   Parameters
   - `security_group_rule_id` -- ID of security group rule to delete
   - `profile` -- Profile to build on (Optional)
Returns  True(Succeed) or False

```
salt.modules.neutron.delete_subnet(subnet, profile=None)
```
Deletes the specified subnet

CLI Example:
```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters
- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns  True(Succeed) or False

```
salt.modules.neutron.delete_vpnservice(vpnservice, profile=None)
```
Deletes the specified VPN service

CLI Example:
```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters
- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

Returns  True(Succeed) or False

```
salt.modules.neutron.get_quotas_tenant(profile=None)
```
Fetches tenant info in server's context for following quota operation

CLI Example:
```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters  **profile** -- Profile to build on (Optional)

Returns  Quotas information

```
salt.modules.neutron.list_agents(profile=None)
```
List agents.

CLI Example:
```
salt '*' neutron.list_agents
```

Parameters  **profile** -- Profile to build on (Optional)

Returns  agents message.

```
salt.modules.neutron.list_extensions(profile=None)
```
Fetches a list of all extensions on server side

CLI Example:
```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters  **profile** -- Profile to build on (Optional)

Returns  List of extensions

```
salt.modules.neutron.list_firewall_rules(profile=None)
```
Fetches a list of all firewall rules for a tenant
CLI Example:

```
salt '*' neutron.list_firewall_rules
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of firewall rules

salt.modules.neutron.list_firewalls(*profile=None*)

Fetches a list of all firewalls for a tenant

CLI Example:

```
salt '*' neutron.list_firewalls
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of firewalls

salt.modules.neutron.list_floatingips(*profile=None*)

Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of floatingIP

salt.modules.neutron.list_ikepolicies(*profile=None*)

Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of IKE policy

salt.modules.neutron.list_ipsec_site_connections(*profile=None*)

Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of IPSec site connection

salt.modules.neutron.list_ipsecpolicies(*profile=None*)

Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns List of IPSec policy
salt.module.neutron.list_l3_agent_hosting_routers(router, profile=None)
List L3 agents hosting a router.

CLI Example:

    salt '*' neutron.list_l3_agent_hosting_routers router

:param router: router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

salt.module.neutron.list_networks(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

    salt '*' neutron.list_networks
    salt '*' neutron.list_networks profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns List of network

salt.module.neutron.list_ports(profile=None)
Fetches a list of all networks for a tenant

CLI Example:

    salt '*' neutron.list_ports
    salt '*' neutron.list_ports profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns List of port

salt.module.neutron.list_quotas(profile=None)
Fetches all tenants quotas

CLI Example:

    salt '*' neutron.list_quotas
    salt '*' neutron.list_quotas profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns List of quotas

salt.module.neutron.list_routers(profile=None)
Fetches a list of all routers for a tenant

CLI Example:

    salt '*' neutron.list_routers
    salt '*' neutron.list_routers profile=openstack1

Parameters
profile -- Profile to build on (Optional)

Returns List of router

salt.module.neutron.list_security_group_rules(profile=None)
Fetches a list of all security group rules for a tenant

CLI Example:

    salt '*' neutron.list_security_group_rules
    salt '*' neutron.list_security_group_rules profile=openstack1
**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of security group rule

`salt.modules.neutron.list_security_groups(profile=None)`
Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of security group

`salt.modules.neutron.list_subnets(profile=None)`
Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

**Parameters** `profile` -- Profile to build on (Optional)

**Returns** List of VPN service

`salt.modules.neutron.list_vpnservices(retrieve_all=True, profile=None, **kwargs)`
Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

**Parameters**

- `retrieve_all` -- True or False, default: True (Optional)
- `profile` -- Profile to build on (Optional)

**Returns** List of VPN service

`salt.modules.neutron.remove_gateway_router(router, profile=None)`
Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

**Parameters**

- `router` -- ID or name of router
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False

`salt.modules.neutron.remove_interface_router(router, subnet, profile=None)`
Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

**Parameters**

- `router` -- ID or name of the router
- `subnet` -- ID or name of the subnet
- `profile` -- Profile to build on (Optional)

**Returns** True(Succeed) or False
salt.modules.neutron.show_firewall(firewall, profile=None)
Fetched information of a specific firewall rule

CLI Example:
```
salt '*' neutron.show_firewall firewall
```

Parameters
- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

Returns
firewall information

salt.modules.neutron.show_firewall_rule(firewall_rule, profile=None)
Fetched information of a specific firewall rule

CLI Example:
```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters
- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

Returns
firewall rule information

salt.modules.neutron.show_floatingip(floatingip_id, profile=None)
Fetched information of a certain floatingIP

CLI Example:
```
salt '*' neutron.show_floatingip floatingip-id
```

Parameters
- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns
Floating IP information

salt.modules.neutron.show_ikepolicy(ikepolicy, profile=None)
Fetched information of a specific IKEPolicy

CLI Example:
```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns
IKE policy information

salt.modules.neutron.show_ipsec_site_connection(ipsec_site_connection, profile=None)
Fetched information of a specific IPSecSiteConnection

CLI Example:
```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns
IPSec site connection information
salt.modules.neutron.show_ipsecpolicy(ipsecpolicy, profile=None)
Fetches information of a specific IPsecPolicy

CLI Example:
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name

Parameters
- **ipsecpolicy** -- ID or name of IPsec policy to look up
- **profile** -- Profile to build on (Optional)

Returns
IPsec policy information

salt.modules.neutron.show_network(network, profile=None)
Fetches information of a certain network

CLI Example:
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1

Parameters
- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns
Network information

salt.modules.neutron.show_port(port, profile=None)
Fetches information of a certain port

CLI Example:
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1

Parameters
- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns
Port information

salt.modules.neutron.show_quota(tenant_id, profile=None)
Fetches information of a certain tenant's quotas

CLI Example:
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1

Parameters
- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns
Quota information

salt.modules.neutron.show_router(router, profile=None)
Fetches information of a certain router

CLI Example:
salt '*' neutron.show_router router-name

Parameters
- **router** -- ID or name of router to look up
• **profile** -- Profile to build on (Optional)

Returns Router information

salt.modules.neutron.show_security_group (security_group, profile=None)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

Parameters

• **security_group** -- ID or name of security group to look up
  • **profile** -- Profile to build on (Optional)

Returns Security group information

salt.modules.neutron.show_security_group_rule (security_group_rule_id, profile=None)

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

• **security_group_rule_id** -- ID of security group rule to look up
  • **profile** -- Profile to build on (Optional)

Returns Security group rule information

salt.modules.neutron.show_subnet (subnet, profile=None)

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

Parameters

• **subnet** -- ID or name of subnet to look up
  • **profile** -- Profile to build on (Optional)

Returns Subnet information

salt.modules.neutron.show_vpnservice (vpnservice, profile=None, **kwargs)

Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters

• **vpnservice** -- ID or name of vpn service to look up
  • **profile** -- Profile to build on (Optional)

Returns VPN service information

salt.modules.neutron.update_firewall_rule (firewall_rule, protocol=None, action=None, name=None, description=None, ip_version=None, source_ip_address=None, destination_ip_address=None, source_port=None, destination_port=None, shared=None, enabled=None, profile=None)

Update a firewall rule

CLI Example:
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
  → action=ACTION
  → name=NAME description=DESCRIPTION ip_version=IP_VERSION
  → source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
  → ADDRESS
  → source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
  → enabled=ENABLED

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose "tcp","udp","icmp" or "None". (Optional)
- **action** -- Action for the firewall rule, choose "allow" or "deny". (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.update_floatingip(floatingip_id, port=None, profile=None)

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to None or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated floating IP information

salt.modules.neutron.update_network(network, name, profile=None)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns Value of updated network information

salt.modules.neutron.update_port(port, name, admin_state_up=True, profile=None)

Updates a port

CLI Example:
salt '*' neutron.update_port port-name network-name new-port-name

Parameters
- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated port information

salt.modules.neutron.update_quota(tenant_id, subnet=None, router=None, network=None, floatingip=None, port=None, security_group=None, security_group_rule=None, profile=None)

Update a tenant's quota

CLI Example:
salt '*' neutron.update_quota tenant-id subnet=40 router=50 network=10 floatingip=30 port=30

Parameters
- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated quota

salt.modules.neutron.update_router(router, name=None, admin_state_up=None, profile=None, **kwargs)

Updates a router

CLI Example:
salt '*' neutron.update_router router_id name=new-router-name admin_state_up=True

Parameters
- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns Value of updated router information

salt.modules.neutron.update_security_group(security_group, name=None, description=None, profile=None)

Updates a security group

CLI Example:
salt '*' neutron.update_security_group security-group-name new-security-group-name
Parameters
- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated security group information

salt.modules.neutron.update_subnet(subnet, name, profile=None)
Updates a subnet

CLI Example:
```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters
- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

Returns Value of updated subnet information

salt.modules.neutron.update_vpnservice(vpnservice, desc, profile=None)
Updates a VPN service

CLI Example:
```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters
- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

Returns Value of updated VPN service information

25.7.304 salt.modules.neutronng

Neutron module for interacting with OpenStack Neutron
New in version 2018.3.0.
:depends: shade

Example configuration
```
neutron:
    cloud: default

neutron:
    auth:
        username: admin
        password: password123
        user_domain_name: mydomain
        project_name: myproject
        project_domain_name: myproject
        auth_url: https://example.org:5000/v3
        identity_api_version: 3
```

salt.modules.neutronng.compare_changes(obj, **kwargs)
Compare two dicts returning only keys that exist in the first dict and are different in the second one

25.7. execution modules
salt.modules.neutronng.get_openstack_cloud(auth=None)
Return an openstack_cloud

salt.modules.neutronng.get_operator_cloud(auth=None)
Return an operator_cloud

salt.modules.neutronng.list_networks(auth=None, **kwargs)
List networks
filters A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.list_networks
salt '*' neutronng.list_networks filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}';
```

salt.modules.neutronng.list_subnets(auth=None, **kwargs)
List subnets
filters A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.list_subnets
salt '*' neutronng.list_subnets filters='{"tenant_id": "1dcac318a83b4610b7a7f7ba01465548"}';
```

salt.modules.neutronng.network_create(auth=None, **kwargs)
Create a network
name Name of the network being created
shared [False] If True, set the network as shared
admin_state_up [True] If True, Set the network administrative state to "up"
external [False] Control whether or not this network is externally accessible
provider An optional Python dictionary of network provider options
project_id The project ID on which this network will be created
CLI Example:

```
salt '*' neutronng.network_create name=network2 shared=True admin_state_up=True external=True
salt '*' neutronng.network_create name=network3 provider='{"network_type": "vlan", "segmentation_id": "4010", "physical_network": "provider"}'; project_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.network_delete(auth=None, **kwargs)
Delete a network
name_or_id Name or ID of the network being deleted
CLI Example:

```
salt '*' neutronng.network_delete name_or_id=network1
salt '*' neutronng.network_delete name_or_id=1dcac318a83b4610b7a7f7ba01465548
```

salt.modules.neutronng.network_get(auth=None, **kwargs)
Get a single network
filters A Python dictionary of filter conditions to push down
CLI Example:

```
salt '*' neutronng.network_get name=XLB4
```
salt.modules.neutronng.security_group_create(auth=None, **kwargs)
Create a security group. Use security_group_get to create default.

project_id The project ID on which this security group will be created

CLI Example:

salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
salt '*' neutronng.security_group_create name=secgroup1 description="Very secure security group"
→ id=1dcac318a83b4610b7a7f7ba01465548

salt.modules.neutronng.security_group_delete(auth=None, **kwargs)
Delete a security group

name_or_id The name or unique ID of the security group

CLI Example:

salt '*' neutronng.security_group_delete name_or_id=secgroup1

salt.modules.neutronng.security_group_get(auth=None, **kwargs)
Get a single security group. This will create a default security group if one does not exist yet for a particular project id.

filters A Python dictionary of filter conditions to push down

CLI Example:

salt '*' neutronng.security_group_get
→ name=1dcac318a83b4610b7a7f7ba01465548
salt '*' neutronng.security_group_get name=default filters='{
  → "tenant_id":"2e778bb64ca64a199eb526b5958d8710"'}

salt.modules.neutronng.security_group_rule_create(auth=None, **kwargs)
Create a rule in a security group

secgroup_name_or_id The security group name or ID to associate with this security group rule. If a non-unique group name is given, an exception is raised.

port_range_min The minimum port number in the range that is matched by the security group rule. If the protocol is TCP or UDP, this value must be less than or equal to the port_range_max attribute value. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

port_range_max The maximum port number in the range that is matched by the security group rule. The port_range_min attribute constrains the port_range_max attribute. If nova is used by the cloud provider for security groups, then a value of None will be transformed to -1.

protocol The protocol that is matched by the security group rule. Valid values are None, tcp, udp, and icmp.

remote_ip_prefix The remote IP prefix to be associated with this security group rule. This attribute matches the specified IP prefix as the source IP address of the IP packet.

remote_group_id The remote group ID to be associated with this security group rule

direction Either ingress or egress; the direction in which the security group rule is applied. For a compute instance, an ingress security group rule is applied to incoming (ingress) traffic for that instance. An egress rule is applied to traffic leaving the instance

ethertype Must be IPv4 or IPv6, and addresses represented in CIDR must match the ingress or egress rules

project_id Specify the project ID this security group will be created on (admin-only)

CLI Example:

salt '*' neutronng.security_group_rule_create secgroup_name_or_id=secgroup1
→ id=secgroup1
The unique ID of the security group rule

CLI Example:

```
salt '*' neutronng.security_group_rule_delete name_or_id=
  →id=1dcac318a83b4610b7a7f7ba01465548
```

**security_group_update**

Update a security group

- **secgroup**: Name, ID or Raw Object of the security group to update
- **name**: New name for the security group
- **description**: New description for the security group

CLI Example:

```
salt '*' neutronng.security_group_update secgroup=secgroup1
description="Very secure security group"
  →id=1dcac318a83b4610b7a7f7ba01465548
```

Call functions to create Shade cloud objects in __context__ to take advantage of Shade’s in-memory caching across several states

- **network_name_or_id**: The unique name or ID of the attached network. If a non-unique name is supplied, an exception is raised.
- **cidr**: The CIDR
- **ip_version**: The IP version, which is 4 or 6.
- **enable_dhcp**: [False] Set to True if DHCP is enabled and False if disabled
- **subnet_name**: The name of the subnet
- **tenant_id**: The ID of the tenant who owns the network. Only administrative users can specify a tenant ID other than their own.
- **allocation_pools**: A list of dictionaries of the start and end addresses for the allocation pools.
- **gateway_ip**: The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
- **disable_gateway_ip**: [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.
- **dns_nameservers**: A list of DNS name servers for the subnet
- **host_routes**: A list of host route dictionaries for the subnet
- **ipv6_ra_mode**: IPv6 Router Advertisement mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
- **ipv6_address_mode**: IPv6 address mode. Valid values are dhcpv6-stateful, dhcpv6-stateless, or slaac.
- **use_default_subnetpool**: If True, use the default subnetpool for ip_version to obtain a CIDR. It is required to pass None to the cidr argument when enabling this option.
### CLI Example:

```yaml
salt '*' neutronng_subnet_create network_name_or_id=network1
    subnet_name=subnet1

salt '*' neutronng_subnet_create subnet_name=subnet2
    network_name_or_id=network2
    enable_dhcp=True
    allocation_pools='[["start": "192.168.199.2", "end": "192.168.199.254"],
        "gateway_ip": "192.168.199.1",
        "cidr": "192.168.199.0/24"
        ]'

salt '*' neutronng_subnet_create network_name_or_id=network1
    subnet_name=subnet1
    dns_nameservers=['8.8.8.8', '8.8.8.7']
```

### salt.modules.neutronng_subnet_delete( auth=None,**kwargs)
Delete a subnet

- **name** Name or ID of the subnet to update

### CLI Example:

```yaml
salt '*' neutronng_subnet_delete name=subnet1
salt '*' neutronng_subnet_delete name=1dcac318a83b4610b7a7f7ba01465548
```

### salt.modules.neutronng_subnet_get( auth=None,**kwargs)
Get a single subnet

- **filters** A Python dictionary of filter conditions to push down

### CLI Example:

```yaml
salt '*' neutronng_subnet_get name=subnet1
```

### salt.modules.neutronng_subnet_update( auth=None,**kwargs)
Update a subnet

- **name_or_id** Name or ID of the subnet to update
- **subnet_name** The new name of the subnet
- **enable_dhcp** Set to True if DHCP is enabled and False if disabled
- **gateway_ip** The gateway IP address. When you specify both allocation_pools and gateway_ip, you must ensure that the gateway IP does not overlap with the specified allocation pools.
- **disable_gateway_ip** [False] Set to True if gateway IP address is disabled and False if enabled. It is not allowed with gateway_ip.
- **allocation_pools** A list of dictionaries of the start and end addresses for the allocation pools.
- **dns_nameservers** A list of DNS name servers for the subnet
- **host_routes** A list of host route dictionaries for the subnet

```yaml
salt '*' neutronng_subnet_update name=subnet1 subnet_name=subnet2
salt '*' neutronng_subnet_update name=subnet1 dns_nameservers=['8.8.8.8', '8.8.8.7']
```

### 25.7.305 salt.modules.nexus

Module for fetching artifacts from Nexus 3.x

New in version 2018.3.0.

### salt.modules.nexus.get_latest_release( nexus_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)

Gets the latest release of the artifact

- **nexus_url** URL of nexus instance
repository  Release repository in nexus to retrieve artifact from, for example: libs-releases

group_id  Group Id of the artifact

artifact_id  Artifact Id of the artifact

packaging  Packaging type (jar,war,ear,etc)

target_dir  Target directory to download artifact to (default: /tmp)

target_file  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username  nexus username. Optional parameter.

password  nexus password. Optional parameter.

**salt.modules.nexus.get_latest_snapshot**

```
(nexus_url, repository, group_id, artifact_id, packaging, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets latest snapshot of the given artifact

**nexus_url**  URL of nexus instance

**repository**  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

**group_id**  Group Id of the artifact

**artifact_id**  Artifact Id of the artifact

**packaging**  Packaging type (jar,war,ear,etc)

**target_dir**  Target directory to download artifact to (default: /tmp)

**target_file**  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

**classifier**  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**  nexus username. Optional parameter.

**password**  nexus password. Optional parameter.

**salt.modules.nexus.get_release**

```
(nexus_url, repository, group_id, artifact_id, packaging, version, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets the specified release of the artifact

**nexus_url**  URL of nexus instance

**repository**  Release repository in nexus to retrieve artifact from, for example: libs-releases

**group_id**  Group Id of the artifact

**artifact_id**  Artifact Id of the artifact

**packaging**  Packaging type (jar,war,ear,etc)

**version**  Version of the artifact

**target_dir**  Target directory to download artifact to (default: /tmp)

**target_file**  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

**classifier**  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**  nexus username. Optional parameter.

**password**  nexus password. Optional parameter.

**salt.modules.nexus.get_snapshot**

```
(nexus_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None)
```

Gets snapshot of the desired version of the artifact

**nexus_url**  URL of nexus instance

**repository**  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots

**group_id**  Group Id of the artifact

**artifact_id**  Artifact Id of the artifact

**packaging**  Packaging type (jar,war,ear,etc)

**version**  Version of the artifact

**snapshot_version**  Snapshot version to download artifact to (default: None)

**target_dir**  Target directory to download artifact to (by default it is target_dir/artifact_id-version.packaging)

**classifier**  Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username  nexus username. Optional parameter.
password  nexus password. Optional parameter.

salt.modules.nexus.get_snapshot_version_string(nexus_url, repository, group_id, artifact_id, packaging, version, classifier=None, username=None, password=None)

Gets the specific version string of a snapshot of the desired version of the artifact

nexus_url  URL of nexus instance
repository  Snapshot repository in nexus to retrieve artifact from, for example: libs-snapshots
group_id  Group Id of the artifact
artifact_id  Artifact Id of the artifact
packaging  Packaging type (jar, war, ear, etc)
version  Version of the artifact
classifier  Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.
username  nexus username. Optional parameter.
password  nexus password. Optional parameter.

exception  salt.modules.nexus.nexusError(value)

25.7.306  salt.modules.nfs3

Module for managing NFS version 3.

salt.modules.nfs3.add_export(exports='/etc/exports', path=None, hosts=None, options=None)
Add an export

CLI Example:
salt '*' nfs3.add_export path='/srv/test' hosts='127.0.0.1' options=['rw']

salt.modules.nfs3.del_export(exports='/etc/exports', path=None)
Remove an export

CLI Example:
salt '*' nfs.del_export /media/storage

salt.modules.nfs3.list_exports(exports='/etc/exports')
List configured exports

CLI Example:
salt '*' nfs.list_exports

salt.modules.nfs3.reloadExports()
Trigger a reload of the exports file to apply changes

CLI Example:
salt '*' nfs3.reload_exports
25.7.307 salt.modules.nftables

Support for nftables

salt.modules.nftables.append(table='filter', chain=None, rule=None, family='ipv4')

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```bash
salt '*' nftables.append filter input
rule='tcp dport 22 log accept'
```

IPv6:
```bash
salt '*' nftables.append filter input
rule='tcp dport 22 log accept' 
family=ipv6
```

salt.modules.nftables.build_rule(table=None, chain=None, command=None, position='', full=None, family='ipv4', **kwargs)

Build a well-formatted nftables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with insert or delete), it may be specified as position. This will only be useful if full is True.

If connstate is passed in, it will automatically be changed to state.

CLI Examples:

```bash
salt '*' nftables.build_rule match=state  
  connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3  
  full=True match=state state=related,established jump=accept
```

IPv6:
```bash
salt '*' nftables.build_rule match=state  
  connstate=related,established jump=accept  
  family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3  
  full=True match=state state=related,established jump=accept  
  family=ipv6
```

salt.modules.nftables.check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```bash
salt '*' nftables.check filter input
rule='tcp dport 22 log accept'
```

IPv6:
```bash
salt '*' nftables.check filter input
```
**Salt Documentation, Release 3006.4**

(continued from previous page)

```python
rule='tcp dport 22 log accept' \ 
family=ipv6
```

salt.modules.nftables.check_chain(table='filter', chain=None, family='ipv4')

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```bash
salt '*' nftables.check_chain filter input
IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

salt.modules.nftables.check_table(table=None, family='ipv4')

Check for the existence of a table

CLI Example:

```bash
salt '*' nftables.check_table nat
```

salt.modules.nftables.delete(table, chain=None, position=None, rule=None, family='ipv4')

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```bash
salt '*' nftables.delete filter input position=3
salt '*' nftables.delete filter input \ 
   rule='tcp dport 22 log accept'
IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6
salt '*' nftables.delete filter input \ 
   rule='tcp dport 22 log accept' \ 
   family=ipv6
```

salt.modules.nftables.delete_chain(table='filter', chain=None, family='ipv4')

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```bash
salt '*' nftables.delete_chain filter input
salt '*' nftables.delete_chain filter foo
IPv6:
salt '*' nftables.delete_chain filter input family=ipv6
salt '*' nftables.delete_chain filter foo family=ipv6
```

25.7. execution modules 2433
salt.modules.nftables.delete_table(table, family='ipv4')

New in version 2014.7.0.

Create new custom table.

CLI Example:

```bash
salt '*' nftables.delete_table filter
IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

salt.modules.nftables.flush(table='filter', chain='', family='ipv4')

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```bash
salt '*' nftables.flush filter
salt '*' nftables.flush filter input
IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.get_policy(table='filter', chain=None, family='ipv4')

New in version 3002.

Return the current policy for the specified table/chain

**table** Name of the table containing the chain to check

**chain** Name of the chain to get the policy for

**family** Networking family, either ipv4 or ipv6

CLI Example:

```bash
salt '*' nftables.get_policy filter input
IPv6:
salt '*' nftables.get_policy filter input family=ipv6
```

salt.modules.nftables.get_rule_handle(table='filter', chain=None, rule=None, family='ipv4')

Get the handle for a particular rule

*This function accepts a rule in a standard nftables command format*, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```bash
salt '*' nftables.get_rule_handle filter input \rule='tcp dport 22 log accept'IPv6:
salt '*' nftables.get_rule_handle filter input \rule='tcp dport 22 log accept' \family=ipv6
```

salt.modules.nftables.get_rules(family='ipv4')

Return a data structure of the current, in-memory rules

CLI Example:
salt '*' nftables.get_rules
salt '*' nftables.get_rules family=ipv6

salt.modules.nftables.get_rules_json(family='ipv4')
New in version 3002.
Return a list of dictionaries comprising the current, in-memory rules
family Networking family, either ipv4 or ipv6

CLI Example:
salt '*' nftables.get_rules_json
salt '*' nftables.get_rules_json family=ipv6

salt.modules.nftables.get_saved_rules(conf_file=None)
Return a data structure of the rules in the conf file

CLI Example:
salt '*' nftables.get_saved_rules

salt.modules.nftables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
Insert a rule into the specified table & chain, at the specified position.
If position is not specified, rule will be inserted in first position.
This function accepts a rule in a standard nftables command format, starting with the chain. Trying to
force users to adapt to a new method of creating rules would be irritating at best, and we already have
a parser that can handle it.

CLI Examples:
salt '*' nftables.insert filter input \ 
rule='tcp dport 22 log accept'
salt '*' nftables.insert filter input position=3 \ 
rule='tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \ 
rule='tcp dport 22 log accept' \ 
family=ipv6
salt '('* nftables.insert filter input position=3 \ 
rule='tcp dport 22 log accept' \ 
family=ipv6

salt.modules.nftables.list_tables(family='ipv4')
Return a data structure of the current, in-memory tables

CLI Example:
salt '*' nftables.list_tables
salt '*' nftables.list_tables family=ipv6

salt.modules.nftables.new_chain(table='filter', chain=None, table_type=None, hook=None, priority=None, family='ipv4')
New in version 2014.7.0.
Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input
salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0
salt '*' nftables.new_chain filter foo
IPv6:
salt '*' nftables.new_chain filter input family=ipv6
salt '*' nftables.new_chain filter input \
    table_type=filter hook=input priority=0 family=ipv6
salt '*' nftables.new_chain filter foo family=ipv6
```

**salt.modules.nftables.new_table**(*table, family='ipv4'*):

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter
IPv6:
salt '*' nftables.new_table filter family=ipv6
```

**salt.modules.nftables.save**(*filename=None, family='ipv4'*):

Changed in version 3002.

Save the current in-memory rules to disk. On systems where /etc/nftables is a directory, a file named salt-all-in-one.nft will be dropped inside by default. The main nftables configuration will need to include this file.

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

**salt.modules.nftables.set_policy**(*table='filter', chain=None, policy=None, family='ipv4'*):

New in version 3002.

Set the current policy for the specified table/chain. This only works on chains with an existing base chain.

- **table**: Name of the table containing the chain to modify
- **chain**: Name of the chain to set the policy for
- **policy**: accept or drop
- **family**: Networking family, either ipv4 or ipv6

CLI Example:

```
salt '*' nftables.set_policy filter input accept
IPv6:
salt '*' nftables.set_policy filter input accept family=ipv6
```

**salt.modules.nftables.version**()

Return version from nftables --version

CLI Example:
25.7.308 salt.modules.nginx

Support for nginx

salt.modules.nginx.build_info()  
Return server and build arguments  
CLI Example:

```bash
salt '*' nginx.build_info
```

salt.modules.nginx.configtest()  
test configuration and exit  
CLI Example:

```bash
salt '*' nginx.configtest
```

salt.modules.nginx.signal(signal=None)  
Signals nginx to start, reload, reopen or stop.  
CLI Example:

```bash
salt '*' nginx.signal reload
```

salt.modules.nginx.status(url='http://127.0.0.1/status')  
Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule  
url The URL of the status page. Defaults to 'http://127.0.0.1/status'  
CLI Example:

```bash
salt '*' nginx.status
```

salt.modules.nginx.version()  
Return server version from nginx -v  
CLI Example:

```bash
salt '*' nginx.version
```

25.7.309 salt.modules.nilrt_ip

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.apply_network_settings(**settings)  
Apply global network configuration.  
CLI Example:

```bash
salt '*' ip.apply_network_settings
```

salt.modules.nilrt_ip.build_interface(iface, iface_type, enabled, **settings)  
Build an interface script for a network interface.  
CLI Example:
salt 'salt '*' ip.build_interface eth0 eth <settings>

salt.modules.nilrt_ip.build_network_settings(**settings)
Build the global network script.
CLI Example:
salt 'salt '*' ip.build_network_settings <settings>

salt.modules.nilrt_ip.disable(interface)
Disable the specified interface
Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
  interface (str) -- interface label
Returns True if the service was disabled, otherwise an exception will be thrown.
Return type bool
CLI Example:
salt 'salt '*' ip.disable interface-label

salt.modules.nilrt_ip.down(interface, iface_type=None)
Disable the specified interface
Change adapter mode to Disabled. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
  interface (str) -- interface label
Returns True if the service was disabled, otherwise an exception will be thrown.
Return type bool
CLI Example:
salt 'salt '*' ip.down interface-label

salt.modules.nilrt_ip.enable(interface)
Enable the specified interface
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters
  interface (str) -- interface label
Returns True if the service was enabled, otherwise an exception will be thrown.
Return type bool
CLI Example:
salt 'salt '*' ip.enable interface-label

salt.modules.nilrt_ip.get_interface(iface)
Returns details about given interface.
CLI Example:
salt 'salt '*' ip.get_interface eth0

salt.modules.nilrt_ip.get_interfaces_details()
Get details about all the interfaces on the minion
Returns information about all interfaces omitting loopback
Return type dictionary
CLI Example:
salt 'salt '*' ip.get_interfaces_details
salt.modules.nilrt_ip.get_network_settings()
Return the contents of the global network script.

CLI Example:
salt '*' ip.get_network_settings

salt.modules.nilrt_ip.set_dhcp_linklocal_all(interface)
Configure specified adapter to use DHCP with linklocal fallback
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters interface (str) -- interface label
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type bool
CLI Example:
salt '*' ip.set_dhcp_linklocal_all interface-label

salt.modules.nilrt_ip.set_dhcp_only_all(interface)
Configure specified adapter to use DHCP only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters interface (str) -- interface label
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type bool
CLI Example:
salt '*' ip.dhcp_only_all interface-label

salt.modules.nilrt_ip.set_ethercat(interface, master_id)
Configure specified adapter to use EtherCAT adapter mode. If successful, the target will need reboot if it
doesn't already use EtherCAT adapter mode, otherwise will return true.
Parameters • interface (str) -- interface label
• master_id -- EtherCAT Master ID
Returns True if the settings were applied, otherwise an exception will be thrown.
CLI Example:
salt '*' ip.set_ethercat interface-label master-id

salt.modules.nilrt_ip.set_linklocal_only_all(interface)
Configure specified adapter to use linklocal only
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters interface (str) -- interface label
Returns True if the settings were applied, otherwise an exception will be thrown.
Return type bool
CLI Example:
salt '*' ip.linklocal_only_all interface-label

salt.modules.nilrt_ip.set_static_all(interface, address, netmask, gateway, nameservers=None)
Configure specified adapter to use ipv4 manual settings
Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.
Parameters • interface (str) -- interface label
• **address** *(str)* -- ipv4 address
• **netmask** *(str)* -- ipv4 netmask
• **gateway** *(str)* -- ipv4 gateway
• **nameservers** *(str)* -- list of nameservers servers separated by spaces (Optional)

**Returns** True if the settings were applied, otherwise an exception will be thrown.

**Return type** bool

**CLI Example:**
```
salt '*' ip.set_static_all interface-label address netmask gateway nameservers
```

salt.modules.nilrt_ip.up *(interface, iface_type=None)*

Enable the specified interface

Change adapter mode to TCP/IP. If previous adapter mode was EtherCAT, the target will need reboot.

**Parameters**
- **interface** *(str)* -- interface label

**Returns** True if the service was enabled, otherwise an exception will be thrown.

**Return type** bool

**CLI Example:**
```
salt '*' ip.up interface-label
```

### 25.7.310 salt.modules.nix

**Work with Nix packages**

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a pkg module, but explicitly as nix.*.

For more information on nix, see the nix documentation.

salt.modules.nix.collect_garbage()

Completely removed all currently ‘uninstalled’ packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

**Returns** How much space was freed and how many derivations were removed

**Return type** str

**Warning:** This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

salt.modules.nix.install *(pkgs, **kwargs)*

Installs a single or multiple packages via nix

**Parameters**
- **pkgs** *(list(str))* -- packages to update
- **attributes** *(bool)* -- Pass the list of packages or single package as attributes, not package names. default: False

**Returns** Installed packages. Example element: gcc-3.3.2

**Return type** list(str)
salt '★' nix.install package [package2 ...]
salt '★' nix.install attributes=True attr.name [attr.name2 ...]

salt.modules.nix.list_pkgs (installed=True, attributes=True)
Lists installed packages. Due to how nix works, it defaults to just doing a nix-env -q.

Parameters
  • installed (bool) -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
  • attributes (bool) -- show the attributes of the packages when listing all packages. Default: True

Returns Packages installed or available, along with their attributes.
Return type list(list(str))

salt '★' nix.list_pkgs
salt '★' nix.list_pkgs installed=False

salt.modules.nix.uninstall('pkgs')
Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a nix.purge function, to clear the package cache of unused packages.

Parameters pkgs (list(str)) -- List, single package to uninstall

Returns Packages that have been uninstalled
Return type list(str)

salt '★' nix.uninstall pkg1 [pkg2 ...]

salt.modules.nix.upgrade('pkgs')
Runs an update operation on the specified packages, or all packages if none is specified.

Parameters pkgs (list(str)) -- List of packages to update

Returns The upgraded packages. Example element: ['libxslt-1.1.0', 'libxslt-1.1.10']
Return type list(tuple(str, str))

salt '★' nix.update
salt '★' nix.update pkgs=one,two

25.7.311 salt.modules.nova

Module for handling OpenStack Nova calls

depends
  • novaclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion’s config file. For example:

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles. For example:
openstack1:
  keystone.user: admin  
  keystone.password: verybadpass     
  keystone.tenant: admin     
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin  
  keystone.password: verybadpass     
  keystone.tenant: admin     
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the `use_keystoneauth` option in the pillar or minion config.

---

**Note:** This is required to use keystone v3 as for authentication.

```
keystone.user: admin      
keystone.password: verybadpass      
keystone.tenant: admin     
keystone.auth_url: 'http://127.0.0.1:5000/v3/'     
keystone.use_keystoneauth: true     
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

---

**Note:** By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the `verify` option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

```
salt.modules.nova.boot(name, flavor_id=0, image_id=0, profile=None, timeout=300)
```

Boot (create) a new instance

- **name** Name of the new instance (must be first)
- **flavor_id** Unique integer ID for the flavor
- **image_id** Unique integer ID for the image
- **timeout** How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The `flavor_id` and `image_id` are obtained from `nova.flavor_list` and `nova.image_list`
salt.modules.nova.delete(instance_id, profile=None)
Delete an instance

**instance_id**  ID of the instance to be deleted

CLI Example:

```
salt '*' nova.delete 1138
```

salt.modules.nova.flavor_create(name, flavor_id=0, ram=0, disk=0, vcpus=1, profile=None)
Add a flavor to nova (nova flavor-create). The following parameters are required:

**name**  Name of the new flavor (must be first)

**flavor_id**  Unique integer ID for the new flavor

**ram**  Memory size in MB

**disk**  Disk size in GB

**vcpus**  Number of vcpus

CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
```

salt.modules.nova.flavor_delete(flavor_id, profile=None)
Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

salt.modules.nova.flavor_list(profile=None)
Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

salt.modules.nova.image_list(name=None, profile=None)
Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

salt.modules.nova.image_meta_delete(image_id=None, name=None, keys=None, profile=None)
Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

salt.modules.nova.image_meta_set(image_id=None, name=None, **kwargs)
Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

salt.modules.nova.keypair_add(name, pubfile=None, pubkey=None, profile=None)
Add a keypair to nova (nova keypair-add)
CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

salt.modules.nova.keypair_delete(name, profile=None)
Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

salt.modules.nova.keypair_list(profile=None)
Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

salt.modules.nova.list_(profile=None)
To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

salt.modules.nova.lock(instance_id, profile=None)
Lock an instance

instance_id ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

salt.modules.nova.resume(instance_id, profile=None)
Resume an instance

instance_id ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

salt.modules.nova.secgroupp_create(name, description, profile=None)
Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroupp_create mygroup 'This is my security group'
```

salt.modules.nova.secgroupp_delete(name, profile=None)
Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroupp_delete mygroup
```

salt.modules.nova.secgroupp_list(profile=None)
Return a list of available security groups (nova items-list)

CLI Example:
salt '*' nova.secgroup_list

salt.modules.nova.server_by_name(name, profile=None)
Retrun information about a server
name Server Name
CLI Example:

salt '*' nova.server_by_name myserver profile=openstack

salt.modules.nova.server_list(profile=None)
Retrun list of active servers
CLI Example:

salt '*' nova.server_list

salt.modules.nova.server_list_detailed(profile=None)
Retrun detailed list of active servers
CLI Example:

salt '*' nova.server_list_detailed

salt.modules.nova.server_show(server_id, profile=None)
Retrun detailed information for an active server
CLI Example:

salt '*' nova.server_show <server_id>

salt.modules.nova.show(server_id, profile=None)
To maintain the feel of the nova command line, this function simply calls the server_show function.
CLI Example:

salt '*' nova.show

salt.modules.nova.suspend(instance_id, profile=None)
Suspend an instance
instance_id ID of the instance to be suspended
CLI Example:

salt '*' nova.suspend 1138

salt.modules.nova.volume_attach(name, server_name, device='/dev/xvdb': profile=None, timeout=300)
Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to attach to
device Name of the device on the server
profile Profile to build on
CLI Example:

salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device='/dev/xvdb'
→ profile=openstack
Salt Documentation, Release 3006.4

salt.modules.nova.volume_create(name, size=100, snapshot=None, voltype=None, profile=None)
Create a block storage volume
name Name of the new volume (must be first)
size Volume size
snapshot Block storage snapshot id
voltype Type of storage
profile Profile to build on
CLI Example:
salt '*' nova.volume_create myblock size=300 profile=openstack

salt.modules.nova.volume_delete(name, profile=None)
Destroy the volume
name Name of the volume
profile Profile to build on
CLI Example:
salt '*' nova.volume_delete myblock profile=openstack

salt.modules.nova.volume_detach(name, profile=None, timeout=300)
Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to detach from
profile Profile to build on
CLI Example:
salt '*' nova.volume_detach myblock profile=openstack

salt.modules.nova.volume_list(search_opts=None, profile=None)
List storage volumes
search_opts Dictionary of search options
profile Profile to use
CLI Example:
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'
,→profile=openstack

salt.modules.nova.volume_show(name, profile=None)
Create a block storage volume
name Name of the volume
profile Profile to use
CLI Example:
salt '*' nova.volume_show myblock profile=openstack

2446

Chapter 25. Salt Module Reference


25.7.312  `salt.modules.npm`

Manage and query NPM packages.

```python
salt.modules.npm.cache_clean(path=None, runas=None, env=None, force=False)
```
Clean cached NPM packages.

- **path** The cache subpath to delete, or None to clear the entire cache
- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.
- **force** Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:
```
salt '*' npm.cache_clean force=True
```

```python
salt.modules.npm.cache_list(path=None, runas=None, env=None)
```
List NPM cached packages.

- **path** The cache subpath to list, or None to list the entire cache
- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:
```
salt '*' npm.cache_clean
```

```python
salt.modules.npm.cache_path(runas=None, env=None)
```
List path of the NPM cache directory.

- **runas** The user to run NPM with
- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

CLI Example:
```
salt '*' npm.cache_path
```

```python
salt.modules.npm.install(pkg=None, pkgs=None, dir=None, runas=None, registry=None, env=None, dry_run=False, silent=True)
```
Install an NPM package.

- **pkg** A package name in any format accepted by NPM, including a version identifier
- **pkgs** A list of package names in the same format as the `name` parameter
- **dir** The target directory in which to install the package, or None for global installation
- **runas** The user to run NPM with
- **registry** The NPM registry to install the package from.

New in version 2014.7.0.

- **env** Environment variables to set when invoking npm. Uses the same `env` format as the `cmd.run` execution function.

New in version 2014.7.0.
silent  Whether or not to run NPM install with --silent flag.

    New in version 2016.3.0.

dry_run  Whether or not to run NPM install with --dry-run flag.

    New in version 2015.8.4.
silent  Whether or not to run NPM install with --silent flag.

    New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script
salt '*' npm.install coffee-script@1.0.1
```

```
salt.modules.npm.list( pkg=None, dir=None, runas=None, env=None, depth=None)
```

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

pkg  Limit package listing by name

dir  The directory whose packages will be listed, or None for global installation

runas  The user to run NPM with

    New in version 2014.7.0.

ev  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

    New in version 2014.7.0.

depth  Limit the depth of the packages listed

    New in version 2016.11.6,2017.7.0.

CLI Example:

```
salt '*' npm.list
```

```
salt.modules.npm.uninstall(pkg, dir=None, runas=None, env=None)
```

Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.

pkg  A package name in any format accepted by NPM

dir  The target directory from which to uninstall the package, or None for global installation

runas  The user to run NPM with

env  Environment variables to set when invoking npm. Uses the same env format as the cmd.run execution function.

    New in version 2015.5.3.

CLI Example:

```
salt '*' npm.uninstall coffee-script
```
25.7.313 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in /var/lib/machines, while those running systemd < 219 will place them in /var/lib/container.

salt.modules.nspawn.bootstrap_container(name, dist=None, version=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```bash
salt myminion nspawn.bootstrap_container <name>
```

salt.modules.nspawn.bootstrap_salt(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```bash
salt '*' nspawn.bootstrap_salt arch1
```

salt.modules.nspawn.copy_to(name, source, dest, overwrite=False, makedirs=False)

Copy a file from the host into a container

name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.

CLI Example:

```bash
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

salt.modules.nspawn.cp(name, source, dest, overwrite=False, makedirs=False)

This function is an alias of copy_to.

name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.

CLI Example:
salt.modules.nspawn.destroy(name, stop=False)
This function is an alias of remove. Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (nspawn.pull_raw, nspawn.pull_tar, nspawn.pull_dkr).

**stop** [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:
```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.disable(name)
Set the named container to not be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.enable(name)
Set the named container to be launched at boot

CLI Example:
```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.exists(name)
Returns true if the named container exists

CLI Example:
```
salt myminion nspawn.exists <name>
```

salt.modules.nspawn.info(name, **kwargs)
Return info about a container

**Note:** The container must be running for machinectl to gather information about it. If the container is stopped, then this function will start it.

**start** [False] If True, then the container will be started to retrieve the info. A **Started** key will be in the return data if the container was started.

CLI Example:
```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

salt.modules.nspawn.list_()
This function is an alias of list_running.
Lists running nspawn containers

Note: nspawn.list also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

salt.modules.nspawn.list_all()  
Lists all nspawn containers  

CLI Example:

```
salt myminion nspawn.list_all
```

salt.modules.nspawn.list_running()  
Lists running nspawn containers  

Note: nspawn.list also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

salt.modules.nspawn.list_stopped()  
Lists stopped nspawn containers  

CLI Example:

```
salt myminion nspawn.list_stopped
```

salt.modules.nspawn.pid(name)  
Returns the PID of a container  

name  Container name  

CLI Example:

```
salt myminion nspawn.pid arch1
```

salt.modules.nspawn.poweroff(name)  
Issue a clean shutdown to the container. Equivalent to running machinectl poweroff on the named container.  

For convenience, running nspawn.stop``(as shown in the CLI examples below) is equivalent to running ``nspawn.poweroff.  

Note: machinectl poweroff is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via systemctl.

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```
**Salt Documentation, Release 3006.4**

salt.modules.nspawn.pull_dkr(url, name, index)

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

**Note:** Requires systemd >= 219

**Parameters:**
- `url` URL from which to download the container
- `name` Name for the new container
- `index` URL of the Docker index server from which to pull (must be an http:// or https:// URL).

**CLI Examples:**
```
salt myminion nspawn.pull_dkr centos/centos6 cent6
index=https://get.docker.com
```
```
salt myminion nspawn.pull_docker centos/centos6 cent6
index=https://get.docker.com
```

salt.modules.nspawn.pull_docker(url, name, index)

This function is an alias of `pull_dkr`.

Execute a `machinectl pull-dkr` to download a docker image and add it to `/var/lib/machines` as a new container.

**Note:** Requires systemd >= 219

**Parameters:**
- `url` URL from which to download the container
- `name` Name for the new container
- `index` URL of the Docker index server from which to pull (must be an http:// or https:// URL).

**CLI Examples:**
```
salt myminion nspawn.pull_dkr centos/centos6 cent6
index=https://get.docker.com
```
```
salt myminion nspawn.pull_docker centos/centos6 cent6
index=https://get.docker.com
```

salt.modules.nspawn.pull_raw(url, name, verify=False)

Execute a `machinectl pull-raw` to download a `.qcow2` or raw disk image, and add it to `/var/lib/machines` as a new container.

**Note:** Requires systemd >= 219

**Parameters:**
- `url` URL from which to download the container
- `name` Name for the new container
- `verify` [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

**CLI Examples:**
```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/linux/
   releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_64.raw.xz
   fedora21
```
salt.modules.nspawn.pull_tar

Execute a machinectl pull-raw to download a .tar container image, and add it to /var/lib/machines as a new container.

**Note:** Requires systemd >= 219

url  URL from which to download the container
name  Name for the new container
verify [False] Perform signature or checksum verification on the container. See the machinectl(1) man page (section titled "Image Transfer Commands") for more information on requirements for image verification. To perform signature verification, use verify=signature. For checksum verification, use verify=checksum. By default, no verification will be performed.

CLI Examples:

```bash
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.01.tar.gz arch2
```

salt.modules.nspawn.reboot

Reboot the container by sending a SIGINT to its init process. Equivalent to running machinectl reboot on the named container.

For convenience, running nspawn.restart (as shown in the CLI examples below) is equivalent to running nspawn.reboot.

**Note:** machinectl reboot is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via systemctl.

CLI Examples:

```bash
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

salt.modules.nspawn.remove

Remove the named container

**Warning:** This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (nspawn.pull_raw, nspawn.pull_tar, nspawn.pull_dkr).

stop [False] If True, the container will be destroyed even if it is running/frozen.

CLI Examples:

```bash
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.restart

This is a compatibility function which simply calls nspawn.reboot.

salt.modules.nspawn.recode

Run cmd.retcode within a container
name  Name of the container in which to run the command

 cmd  Command to run

 no_start  [False]  If the container is not running, don't start it

 preserve_state  [True]  After running the command, return the container to its previous state

 stdin  [None]  Standard input to be used for the command

 output_loglevel  [debug]  Level at which to log the output from the command. Set to quiet to suppress logging.

 use_vt  [False]  Use SaltStack's utils.vt to stream output to console. Assumes output=all.

 keep_env  [None]  If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

 CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

salt.modules.nspawn.run(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.run within a container

 name  Name of the container in which to run the command

 cmd  Command to run

 no_start  [False]  If the container is not running, don't start it

 preserve_state  [True]  After running the command, return the container to its previous state

 stdin  [None]  Standard input to be used for the command

 output_loglevel  [debug]  Level at which to log the output from the command. Set to quiet to suppress logging.

 use_vt  [False]  Use SaltStack's utils.vt to stream output to console.

 keep_env  [None]  If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

 CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

salt.modules.nspawn.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run cmd.run_all within a container

Note:  While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.
Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stderr` within a container

- **name**: Name of the container in which to run the command
- **cmd**: Command to run
- **no_start** [False]: If the container is not running, don’t start it
- **preserve_state** [True]: After running the command, return the container to its previous state
- **stdin** [None]: Standard input to be used for the command
- **output_loglevel** [debug]: Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** [False]: Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
- **keep_env** [None]: If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

```
salt.modules.nspawn.run_stdout(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.run_stdout` within a container

- **name**: Name of the container in which to run the command
- **cmd**: Command to run
- **no_start** [False]: If the container is not running, don’t start it
- **preserve_state** [True]: After running the command, return the container to its previous state
- **stdin** [None]: Standard input to be used for the command
- **output_loglevel** [debug]: Level at which to log the output from the command. Set to quiet to suppress logging.
- **use_vt** [False]: Use SaltStack’s utils.vt to stream output to console. Assumes output=all.
- **keep_env** [None]: If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

```
salt.modules.nspawn.start(name)
```

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

```
salt.modules.nspawn.state(name)
```

Return state of container (running or stopped)
CLI Example:

```
salt myminion nspawn.state <name>
```

`salt.modules.nspawn.stop(name, kill=False)`

This is a compatibility function which provides the logic for nspawn.poweroff and nspawn.terminate.

`salt.modules.nspawn.terminate(name)`

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

**Note:** `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

### 25.7.314 `salt.modules.nxos`  
Execution module for Cisco NX OS Switches.

New in version 2016.11.0.

**This module supports execution using a Proxy Minion or Native Minion:**
1) Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details.
2) Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the GuestShell running on the NX-OS device.

- **maturity** new
- **platform** nxos

**Note:** To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.

Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

Native minion configuration options:
nxos:
  cookie: 'username'
  save_config: False

**cookie** Use the option to override the default cookie ‘admin:local’ when connecting over UDS and use ‘username:local’ instead. This is needed when running the salt-minion in the GuestShell using a non-admin user.

  This option is ignored for SSH and NX-API Proxy minions.

**save_config** If True, 'copy running-config starting-config' is issues for every configuration command. If False, Running config is not saved to startup config Default: True

  The recommended approach is to use the `save_running_config` function instead of this option to improve performance. The default behavior controlled by this option is preserved for backwards compatibility.

The APIs defined in this execution module can also be executed using salt-call from the GuestShell environment as follows.

```
salt-call --local nxos.sendline 'show lldp neighbors' raw_text
```

**Note:** The functions in this module should be executed like so:

```
salt '*' nxos.<function> salt '*' nxos.get_user username=admin
```

For backwards compatibility, the following syntax will be supported until the 3001 release.

```
salt '*' nxos.cmd <function> salt '*' nxos.cmd get_user username=admin
```

```
salt.modules.nxos.add_config(lines, **kwargs)
Add one or more config lines to the NX-OS device running config.
lines Configuration lines to add
save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True
```  

```
salt '*' nxos.add_config 'snmp-server community TESTSTRINGHERE group network-→operator'
```

**Note:** For more than one config added per command, lines should be a list.

```
salt.modules.nxos.check_password(username, password, encrypted=False, **kwargs)
Verify user password.
username Username on which to perform password check
password Password to check
encrypted Whether or not the password is encrypted Default: False
```

```
salt.modules.nxos.check_role(username, role, **kwargs)
Verify role assignment for user.
```

```
salt '?x' nxos.check_role username=admin role=network-admin
```

```
salt.modules.nxos.cmd(command, *args, **kwargs)
NOTE: This function is preserved for backwards compatibility. This allows commands to be executed using either of the following syntactic forms.
```  

```
salt '*' nxos.cmd <function>
or
```

25.7. execution modules
salt '*' nxos.<function>

command function from salt.modules.nxos to run
args positional args to pass to command function
kwargs key word arguments to pass to command function

```text
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='\$5$lkjsdfoi$blahblahblah\n' encrypted=True
```

salt.modules.nxos.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly to the running-config.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the switch in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when config_file is specified.

**template_engine:** jinja The template engine to use when rendering the source file. Default: jinja. To simply fetch the file without attempting to render, set this argument to None.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**save_config** If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

CLI Example:

```text
salt '*' nxos.config commands="[\'spanning-tree mode mstp\']"
salt '*' nxos.config config_file=salt://config.txt	salt '*' nxos.config config_file=https://bit.ly/2LGLcDy context="[\'servers\': [\'1.2.3.4\']}"
```

salt.modules.nxos.delete_config(lines, **kwargs)

Delete one or more config lines to the switch running config.

**lines** Configuration lines to remove.

**save_config** If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True
salt '*' nxos.delete_config 'snmp-server community TESTSTRINGHERE group network-operator'

Note: For more than one config deleted per command, lines should be a list.

salt.modules.nxos.find(pattern, **kwargs)
Find all instances where the pattern is in the running configuration.

salt '*' nxos.find '^snmp-server.*$'

Note: This uses the re.MULTILINE regex format for python, and runs the regex against the whole show_run output.

salt.modules.nxos.get_roles(username, **kwargs)
Get roles assigned to a username.

salt.modules.nxos.get_user(username, **kwargs)
Get username line from switch.

salt.modules.nxos.grains(**kwargs)
Get grains for minion.

salt.modules.nxos.grains_refresh(**kwargs)
Refresh the grains for the NX-OS device.

salt.modules.nxos.ping(**kwargs)
Ping the device on the other end of the connection.

salt.modules.nxos.remove_user(username, **kwargs)
Remove user from switch.
username Username to remove
save_config If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

salt '*' nxos.remove_user username=daniel

salt.modules.nxos.replace(old_value, new_value, full_match=False, **kwargs)
Replace string or full line matches in switch's running config.
If full_match is set to True, then the whole line will need to be matched as part of the old value.

salt '*' nxos.replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'

salt.modules.nxos.save_running_config(**kwargs)
Save the running configuration to startup configuration.

salt '*' nxos.save_running_config

salt.modules.nxos.sendline(command, method='cli_show_ascii', **kwargs)
Send arbitrary commands to the NX-OS device.
command The command or list of commands to be sent. ['cmd1','cmd2'] is converted to 'cmd1 ; cmd2'.
method: cli_show_ascii: Return raw test or unstructured output. cli_show: Return structured output. cli_conf: Send configuration commands to the device. Defaults to cli_show_ascii. NOTE: method is ignored for SSH proxy minion. All data is returned unstructured.
error_pattern  Use the option to pass in a regular expression to search for in the returned output of the command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

salt.modules.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256', **kwargs)

Set users password on switch.
username  Username to configure
password  Password to configure for username
encrypted  Whether or not to encrypt the password Default: False
role  Configure role for the username Default: None
crypt_salt  Configure crypt_salt setting Default: None
algorithm  Encryption algorithm Default: sha256
save_config  If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

salt '*' nxos.set_password admin TestPass
salt '*' nxos.set_password admin \
  password='\$5$2FwW0zvK$s7.Hr3YltMNHuywQQ3nfOd.gAPHgs3S0BYdGT3.E.A' \
  encrypted=True

salt.modules.nxos.set_role(username, role, **kwargs)
Assign role to username.
username  Username for role configuration
role  Configure role for username
save_config  If False, don't save configuration commands to startup configuration. If True, save configuration to startup configuration. Default: True

salt '*' nxos.set_role username=daniel role=vdc-admin.

salt.modules.nxos.show(commands, raw_text=True, **kwargs)
Execute one or more show (non-configuration) commands.
commands  The commands to be executed.
raw_text: True  Whether to return raw text or structured data. NOTE: raw_text option is ignored for SSH proxy minion. Data is returned unstructured.

CLI Example:
salt-call --local nxos.show 'show version'
salt 'regular-minion' nxos.show 'show interfaces' host=sw01.example.com 
  username=test password=test

salt.modules.nxos.show_run(**kwargs)
Shortcut to run show running-config on the NX-OS device.
salt '*' nxos.show_run

salt.modules.nxos.show_ver(**kwargs)
Shortcut to run show version on the NX-OS device.
salt '*' nxos.show_ver

salt.modules.nxos.system_info(**kwargs)
Return system information for grains of the minion.
salt '*' nxos.system_info
salt.modules.nxos.unset_role(username, role, **kwargs)
    Remove role from username.
    username Username for role removal
    role Role to remove

    save_config If False, don't save configuration commands to startup configuration. If True, save configuration
to startup configuration. Default: True

    salt '*' nxos.unset_role username=daniel role=vdc-admin

25.7.315  salt.modules.nxos_api

Execution module to manage Cisco Nexus Switches (NX-OS) over the NX-API
New in version 2019.2.0.

Execution module used to interface the interaction with a remote or local Nexus switch whether we're running in a
Proxy Minion or regular Minion (or regular Minion running directly on the Nexus switch).

    codeauthor Mircea Ulinic <ping@mirceaulinic.net>
    maturity new
    platform any

Note: To be able to use this module you need to enable to NX-API on your switch, by executing feature nxapi
in configuration mode.

Configuration example:

    switch# conf t
    switch(config)# feature nxapi

To check that NX-API is properly enabled, execute show nxapi.

Output example:

    switch# show nxapi
    nxapi enabled
    HTTPS Listen on port 443

Note: NX-API requires modern NXOS distributions, typically at least 7.0 depending on the hardware. Due to
reliability reasons it is recommended to run the most recent version.

guide/b_Cisco_Nexus_7000_Series_NX-OS_Programmability_Guide/b_Cisco_Nexus_7000_Series_NX-OS_
Programmability_Guide_chapter_0101.html for more details.
Usage

This module can equally be used via the `nxos_api` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API. Given that there are no external dependencies, this module can very well used when using the regular Salt Minion directly installed on the switch.

When running outside of the `nxos_api` Proxy (i.e., from another Proxy Minion type, or regular Minion), the NX-API connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `nxos_api` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `nxos_api` Proxy Module:

**transport:**  `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** `localhost` The IP address or DNS host name of the connection device.

**username:** `admin` The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** `True` Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

When there is no certificate configuration on the device and this option is set as `True` (default), the commands will fail with the following error: `SSLError: [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed (._ssl.c:581)`. In this case, you either need to configure a proper certificate on the device (recommended), or bypass the checks setting this argument as `False` with all the security risks considered.

Example (when not running in a `nxos_api` Proxy Minion):

```yaml
nxos_api:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `nxos_api` Proxy, e.g.:

```shell
call --local nxos_api.show 'show lldp neighbors' raw_text
# The command above is available when running in a regular Minion where Salt is installed
salt '*' nxos_api.show 'show version' raw_text=False
```

**Note:** Remember that the above applies only when not running in a `nxos_api` Proxy Minion. If you want to use the `nxos_api` Proxy, please follow the documentation notes for a proper setup.
salt.modules.nxos_api.config(commands=None, config_file=None, template_engine='jinja', context=None, defaults=None, saltenv='base', **kwargs)

Configures the Nexus switch with the specified commands.

This method is used to send configuration commands to the switch. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

**Warning:** All the commands will be applied directly into the running-config.

**config_file** The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.

This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands** The commands to send to the switch in config mode. If the `commands` argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

**Note:** This argument is ignored when `config_file` is specified.

**template_engine:** `jinja` The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context** Variables to add to the template context.

**defaults** Default values of the context_dict.

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** `localhost` The IP address or DNS host name of the connection device.

**username:** `admin` The username to pass to the device to authenticate the NX-API connection.

**password** The password to pass to the device to authenticate the NX-API connection.

**port** The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

**timeout:** 60 Time in seconds to wait for the device to respond. Default: 60 seconds.

**verify:** `True` Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to `True`.

**CLI Example:**

```bash
salt '*' nxos_api.config commands="[{'spanning-tree mode mstp'}]"
salt '*' nxos_api.config config_file=salt://config.txt
salt '*' nxos_api.config config_file=https://bit.ly/2LGLcDy context="{'servers': ['1.2.3.4']}"
```

salt.modules.nxos_api.rpc(commands, method='cli', **kwargs)

Execute an arbitrary RPC request via the Nexus API.

**commands** The commands to be executed.

**method:** `cli` The type of the response, i.e., raw text (`cli_ascii`) or structured document (`cli`). Defaults to `cli` (structured data).

**transport:** `https` Specifies the type of connection transport to use. Valid values for the connection are `http`, and `https`.

**host:** `localhost` The IP address or DNS host name of the connection device.
username: **admin**  The username to pass to the device to authenticate the NX-API connection.
password  The password to pass to the device to authenticate the NX-API connection.
port  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
timeout: **60**  Time in seconds to wait for the device to respond. Default: 60 seconds.
verify: **True**  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:
```
salt-call --local nxos_api.rpc 'show version'
```

```
salt.modules.nxos_api.show(commands, raw_text=True, **kwargs)
```
Execute one or more show (non-configuration) commands.

- **commands**  The commands to be executed. Multiple commands should be specified as a list.
- **raw_text**: **True**  Whether to return raw text or structured data.
- **transport**: **https**  Specifies the type of connection transport to use. Valid values for the connection are http, and https.
- **host**: **localhost**  The IP address or DNS host name of the connection device.
- **username**: **admin**  The username to pass to the device to authenticate the NX-API connection.
- **password**  The password to pass to the device to authenticate the NX-API connection.
- **port**  The TCP port of the endpoint for the NX-API connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).
- **timeout: **60**  Time in seconds to wait for the device to respond. Default: 60 seconds.
- **verify: **True**  Either a boolean, in which case it controls whether we verify the NX-API TLS certificate, or a string, in which case it must be a path to a CA bundle to use. Defaults to True.

CLI Example:
```
salt-call --local nxos_api.show 'show version'
salt '*' nxos_api.show "['show bgp sessions','show processes']" raw_text=False
salt 'regular-minion' nxos_api.show 'show interfaces' host=sw01.example.com
  --username=test password=test
```

**25.7.316 salt.modules.nxos_upgrade**

Execution module to upgrade Cisco NX-OS Switches.

New in version 3001.

**This module supports execution using a Proxy Minion or Native Minion:**

1)  Proxy Minion: Connect over SSH or NX-API HTTP(S). See `salt.proxy.nxos` for proxy minion setup details.

2)  Native Minion: Connect over NX-API Unix Domain Socket (UDS). Install the minion inside the Guest-Shell running on the NX-OS device.

- **maturity**: **new**
- **platform**: **nxos**
- **codeauthor**: Michael G Wiebe

**Note:** To use this module over remote NX-API the feature must be enabled on the NX-OS device by executing `feature nxapi` in configuration mode.

This is not required for NX-API over UDS.
Configuration example:

```
switch# conf t
switch(config)# feature nxapi
```

To check that NX-API is properly enabled, execute `show nxapi`.

Output example:

```
switch# show nxapi
nxapi enabled
HTTPS Listen on port 443
```

```
salt.modules.nxos_upgrade.check_upgrade_impact(system_image, kickstart_image=None, issu=True, **kwargs)
```

Display upgrade impact information without actually upgrading the device.

- **system_image** (Mandatory Option) Path on bootflash: to system image upgrade file.
- **kickstart_image** Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None
- **issu** In Service Software Upgrade (non-disruptive). When True, the upgrade will abort if issu is not possible. When False: Force (disruptive) Upgrade/Downgrade. Default: True
- **timeout** Timeout in seconds for long running 'install all' impact command. Default: 900
- **error_pattern** Use the option to pass in a regular expression to search for in the output of the 'install all impact' command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.check_upgrade_impact system_image=nxos.9.2.1.bin
salt 'n7k' nxos.check_upgrade_impact system_image=n7000-s2-dk9.8.1.1.bin \
    kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```

```
salt.modules.nxos_upgrade.upgrade(system_image, kickstart_image=None, issu=True, **kwargs)
```

Upgrade NX-OS switch.

- **system_image** (Mandatory Option) Path on bootflash: to system image upgrade file.
- **kickstart_image** Path on bootflash: to kickstart image upgrade file. (Not required if using combined system/kickstart image file) Default: None
- **issu** Set this option to True when an In Service Software Upgrade or non-disruptive upgrade is required. The upgrade will abort if issu is not possible. Default: True
- **timeout** Timeout in seconds for long running 'install all' upgrade command. Default: 900
- **error_pattern** Use the option to pass in a regular expression to search for in the output of the 'install all upgrade command that indicates an error has occurred. This option is only used when proxy minion connection type is ssh and otherwise ignored.

```
salt 'n9k' nxos.upgrade system_image=nxos.9.2.1.bin
salt 'n7k' nxos.upgrade system_image=n7000-s2-dk9.8.1.1.bin \
    kickstart_image=n7000-s2-kickstart.8.1.1.bin issu=False
```
25.7.317 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
| omapi.server_ip: 127.0.0.1 |
| omapi.server_port: 7991 |
```

depends pypureomapi Python module

```
salt.modules.omapi.add_host(mac, name=None, ip=None, ddns=False, group=None, supersede_host=False)
```

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

```
salt.modules.omapi.delete_host(mac=None, name=None)
```

Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

25.7.318 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

```
salt.modules.openbsd_sysctl.assign(name, value)
```

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

```
salt.modules.openbsd_sysctl.get(name)
```

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

```
salt.modules.openbsd_sysctl.persist(name, value, config='/etc/sysctl.conf')
```

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

```
salt.modules.openbsd_sysctl.show(config_file=False)
```

Return a list of sysctl parameters for this minion

**config:** Pull the data from the system configuration file instead of the live data.
25.7.319 salt.modules.openbsdpkg

Package support for OpenBSD

Note: The package repository is configured on each host using `/etc/installurl` from OpenBSD 6.1 onwards. Earlier releases relied on `/etc/pkg.conf`.

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple flavors, and branches which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

- rsync
- vim--no_x11
- ruby%2.3

```
salt.openbsdpkg.install(name=None, pkgs=None, sources=None, **kwargs)
```

Install the passed package

Return a dict containing the new package names and versions:

```
{
'<package>' : {
  'old' : '<old-version>',
  'new' : '<new-version>'
}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs=['<package name>', '<package name>']
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources=['<pkg name>': 'salt://pkgs/<pkg filename>']
```

```
salt.openbsdpkg.latest_version(*names, **kwargs)
```

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

```
salt.openbsdpkg.list_pkgs(versions_as_list=False, **kwargs)
```

List the packages currently installed as a dict:
{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

```
salt.modules.openbsdpkg.purge(name=None, pkgs=None, **kwargs)
```
Remove a package and extra configuration files.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['"foo", "bar"]'

```
salt.modules.openbsdpkg.remove(name=None, pkgs=None, purge=False, **kwargs)
```
Remove a single package with `pkg_delete`

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'

```
salt.modules.openbsdpkg.upgrade(name=None, pkgs=None, **kwargs)
```
Run a full package upgrade (`pkg_add -u`), or upgrade a specific package if `name` or `pkgs` is provided. `name` is ignored when `pkgs` is specified.

Returns a dictionary containing the changes:

New in version 2019.2.0.

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade
salt '*' pkg.upgrade python%2.7

```
salt.modules.openbsdpkg.upgrade_available(name, **kwargs)
```
Check whether or not an upgrade is available for a given package

New in version 2019.2.0.

CLI Example:
salt.modules.openbsdppkg.version(names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

25.7.320 salt.modules.openbsdrcctl_service.py

The rcctl service module for OpenBSD

salt.modules.openbsdrcctl_service.available(name)

Return True if the named service is available.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.openbsdrcctl_service.disable(name, **kwargs)

Disable the named service to not start at boot.

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.openbsdrcctl_service.disabled(name)

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.openbsdrcctl_service.enable(name, **kwargs)

Enable the named service to start at boot.

flags [None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

salt.modules.openbsdrcctl_service.enabled(name, **kwargs)

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.

name Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

salt.modules.openbsdrcctl_service.get_all()

Return all installed services.
CLI Example:

```
salt '*' service.get_all
```

`salt.modules.openbsdrcctl_service.get_disabled()`
Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.openbsdrcctl_service.get_enabled()`
Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.openbsdrcctl_service.missing(name)`
The inverse of `service.available`. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.openbsdrcctl_service.reload_(name)`
Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.openbsdrcctl_service.restart(name)`
Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.openbsdrcctl_service.start(name)`
Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.openbsdrcctl_service.status(name, sig=None)`
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.openbsdrcctl_service.stop(name)`
Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```
25.7.321 salt.modules.openbsdservice

The service module for OpenBSD

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see [here](#).

salt.modules.openbsdservice.available(name)

New in version 2014.7.0.

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```shell
salt '*' service.available sshd
```

salt.modules.openbsdservice.disabled(name)

New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```shell
salt '*' service_disabled <service name>
```

salt.modules.openbsdservice.enabled(name, **kwargs)

New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```shell
salt '*' service.enabled <service name>
```

salt.modules.openbsdservice.get_all()

New in version 2014.7.0.

Return all available boot services

CLI Example:

```shell
salt '*' service.get_all
```

salt.modules.openbsdservice.get_disabled()

New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```shell
salt '*' service.get_disabled
```

salt.modules.openbsdservice.get_enabled()

New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:
salt ' starvation service.get_enabled

salt.modules.openbsdservice.missing(name)
New in version 2014.7.0.
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:

salt '*' service.missing sshd

salt.modules.openbsdservice.reload_(name)
New in version 2014.7.0.
Reload the named service
CLI Example:

salt '*' service.reload <service name>

salt.modules.openbsdservice.restart(name)
Restart the named service
CLI Example:

salt '*' service.restart <service name>

salt.modules.openbsdservice.start(name)
Start the specified service
CLI Example:

salt '*' service.start <service name>

salt.modules.openbsdservice.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters
   • name (str) -- The name of the service to check
   • sig (str) -- Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool
CLI Example:

salt '*' service.status <service name> [service signature]

salt.modules.openbsdservice.stop(name)
Stop the specified service
CLI Example:

salt '*' service.stop <service name>
25.7.322 salt.modules.openscap

Module for OpenSCAP Management

```
salt.modules.openscap.xccdf(params)
```

Run oscap xccdf commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

It needs file_recv set to True in the master configuration file.

CLI Example:

```
salt '*' openscap.xccdf 'eval --profile Default /usr/share/openscap/scapyast2sec-xccdf.xml'
```

25.7.323 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

- maintainer Jeffrey C. Ollie <jeff@ocjtech.us>
- maturity new
- depends
- platform linux

```
salt.modules.openstack_config.delete(filename, section, parameter)
```

Delete a value from an OpenStack configuration file.

- filename The full path to the configuration file
- section The section from which to delete the parameter
- parameter The parameter to delete

CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

```
salt.modules.openstack_config.get(filename, section, parameter)
```

Get a value from an OpenStack configuration file.

- filename The full path to the configuration file
- section The section from which to search for the parameter
- parameter The parameter to return

CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

```
salt.modules.openstack_config.set_(filename, section, parameter, value)
```

Set a value in an OpenStack configuration file.

- filename The full path to the configuration file
- section The section in which the parameter will be set
- parameter The parameter to change
- value The value to set

CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

25.7. execution modules
25.7.324 salt.modules.openstack_mng

Module for OpenStack Management

codeauthor Konrad Mosoń <mosonkonrad@gmail.com>
maturity new
depends openstack-utils
platform linux

```
salt.modules.openstack_mng.restart_service(service_name, minimum_running_time=None)
```

Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:
```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

```
salt.modules.openstack_mng.start_service(service_name)
```

Start OpenStack service immediately

CLI Example:
```
salt '*' openstack_mng.start_service neutron
```

```
salt.modules.openstack_mng.stop_service(service_name)
```

Stop OpenStack service immediately

CLI Example:
```
salt '*' openstack_mng.stop_service neutron
```

25.7.325 salt.modules.openvswitch

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

```
salt.modules.openvswitch.bridge_create(br, may_exist=True, parent=None, vlan=None)
```

Creates a new bridge.

Parameters

- `br` -- string bridge name
- `may_exist` -- bool if False - attempting to create a bridge that exists returns False.
- `parent` -- string name of the parent bridge (if the bridge shall be created as a fake bridge). If specified, vlan must also be specified.
- `versionadded:` (.) -- 3006.0:
- `vlan` -- int VLAN ID of the bridge (if the bridge shall be created as a fake bridge). If specified, parent must also be specified.
- `versionadded:` -- 3006.0:

Returns True on success, else False.

New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.bridge_create br0

salt.modules.openvswitch.bridge_delete(br, if_exists=True)
Deletes bridge and all of its ports.

Parameters
  - br -- A string - bridge name
  - if_exists -- Bool, if False - attempting to delete a bridge that does not exist returns
    False.

Returns True on success, else False.
New in version 2016.3.0.
CLI Example:
salt '*' openvswitch.bridge_delete br0

salt.modules.openvswitch.bridge_exists(br)
Tests whether bridge exists as a real or fake bridge.

Returns True if Bridge exists, else False.
New in version 2016.3.0.
CLI Example:
salt '*' openvswitch.bridge_exists br0

salt.modules.openvswitch.bridge_list()
Lists all existing real and fake bridges.

Returns List of bridges (or empty list), False on failure.
New in version 2016.3.0.
CLI Example:
salt '*' openvswitch.bridge_list

salt.modules.openvswitch.bridge_to_parent(br)
New in version 3006.0.
Returns the parent bridge of a bridge.

Parameters
  - br -- string bridge name

Returns Name of the parent bridge. This is the same as the bridge name if the bridge is not a fake
  bridge. If the bridge does not exist, False is returned.
CLI Example:
salt '*' openvswitch.bridge_to_parent br0

salt.modules.openvswitch.bridge_to_vlan(br)
New in version 3006.0.
Returns the VLAN ID of a bridge.

Parameters
  - br -- string bridge name

Returns VLAN ID of the bridge. The VLAN ID is 0 if the bridge is not a fake bridge. If the bridge
  does not exist, False is returned.
CLI Example:
salt '*' openvswitch.bridge_to_vlan br0

salt.modules.openvswitch.db_get(table, record, column, if_exists=False)
New in version 3006.0.
gets a column's value for a specific record.

Parameters
- `table` -- string name of the database table
- `record` -- string identifier of the record
- `column` -- string name of the column
- `if_exists` -- boolean if True, it is not an error if the record does not exist.

Returns The column's value.

CLI Example:

```
salt '*' openvswitch.db_get Port br0 vlan_mode
```

salt.modules.openvswitch.db_set(table, record, column, value, if_exists=False)

Sets a column's value for a specific record.

Parameters
- `table` -- string name of the database table
- `record` -- string identifier of the record
- `column` -- string name of the column
- `value` -- string the value to be set
- `if_exists` -- boolean if True, it is not an error if the record does not exist.

Returns None on success and an error message on failure.

CLI Example:

```
salt '*' openvswitch.db_set Interface br0 mac 02:03:04:05:06:07
```

salt.modules.openvswitch.interface_get_options(port)

Port's interface's optional parameters.

Parameters `port` -- A string - port name.

Returns String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.interface_get_options tap0
```

salt.modules.openvswitch.interface_get_type(port)

Type of port's interface.

Parameters `port` -- A string - port name.

Returns String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example:

```
salt '*' openvswitch.interface_get_type tap0
```

salt.modules.openvswitch.port_add(br, port, may_exist=False, internal=False)

Creates on bridge a new port named port.

Returns True on success, else False.

Parameters
- `br` -- A string - bridge name
- `port` -- A string - port name
- `may_exist` -- Bool, if False - attempting to create a port that exists returns False.
- `internal` -- A boolean to create an internal interface if one does not exist.

New in version 2016.3.0.

CLI Example:
salt.modules.openvswitch.port_add br0 8080

salt.modules.openvswitch.port_create_gre(br, port, id, remote)
Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters
- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

Returns
True on success, else False.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

salt.modules.openvswitch.port_create_vlan(br, port, id, internal=False)
Isolate VM traffic using VLANs.

Parameters
- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

Returns
True on success, else False.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_create_vlan br0 tap0 100

salt.modules.openvswitch.port_create_vxlan(br, port, id, remote, dst_port=None)
Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters
- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst_port** -- An integer - port to use when creating tunnelport in the switch.

Returns
True on success, else False.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472

salt.modules.openvswitch.port_get_tag(port)
Lists tags of the port.

Parameters
**port** -- A string - port name.

Returns
List of tags (or empty list), False on failure.
New in version 2016.3.0.

CLI Example:
salt '*' openvswitch.port_get_tag tap0

salt.modules.openvswitch.port_list(br)
Lists all of the ports within bridge.
**Parameters**

- `br` -- A string - bridge name.

**Returns**

List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example:

```shell
salt '*' openvswitch.port_list br0
```

salt.modules.openvswitch.port_remove(br, port, if_exists=True)

Deletes port.

**Parameters**

- `br` -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- `port` -- A string - port name.
- `if_exists` -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

**Returns**

True on success, else False.

New in version 2016.3.0.

CLI Example:

```shell
salt '*' openvswitch.port_remove br0 8080
```

### 25.7.326 salt.modules.opkg

Support for Opkg

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

New in version 2016.3.0.

**Note:** For version comparison support on opkg < 0.3.4, the opkg-utils package must be installed.

salt.modules.opkg.available_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```shell
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.opkg.check_extra_requirements(pkgname, pkgver)

Check if the installed package already has the given requirements. There's nothing do to here for nipkg.py, therefore it will always return True.

salt.modules.opkg.del_repo(repo, **kwargs)

Delete a repo from /etc/opkg/*.conf

If the file does not contain any other repo configuration, the file itself will be deleted.
CLI Examples:

```
salt '*' pkg.del_repo repo
```

```
salt.modules.opkg.file_dict('packages', **kwargs)
```

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.opkg.file_list('packages', **kwargs)
```

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

```
salt.modules.opkg.get_repo(repo, **kwargs)
```

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo repo
```

```
salt.modules.opkg.hold(name=None, pkgs=None, sources=None, **kwargs)
```

Set package in 'hold' state, meaning it will not be upgraded.

name  The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs  A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs=["foo", "bar"]
```

```
salt.modules.opkg.info_installed('names', **kwargs)
```

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

Parameters

- names -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- attr -- Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.

Valid attributes are: arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

CLI Example:
salt.modules.opkg.install\((name=None, refresh=False, pkgs=None, sources=None, reinstall=False, **kwargs)\)

Install the passed package, add refresh=True to update the opkg database.

**name**  The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

**CLI Example:**

```
salt '*' pkg.install <package name>
```

**refresh**  Whether or not to refresh the package database before installing.

**version**  Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.

New in version 2017.7.0.

**reinstall**  [False]  Specifying reinstall=True will use opkg install --force-reinstall rather than simply opkg install for requested packages that are already installed.

If a version is specified with the requested package, then opkg install --force-reinstall will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

**pkgs**  A list of packages to install from a software repository. Must be passed as a python list.

**CLI Example:**

```
salt '*' pkg.install pkgs=['"foo", "bar"]
salt '*' pkg.install pkgs=['"foo", {"bar": "1.2.3-0ubuntu0"}]
```

**sources**  A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

**CLI Example:**

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]
```

**install_recommends**  Whether to install the packages marked as recommended. Default is True.

**only_upgrade**  Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

salt.modules.opkg.latest_version\((names, **kwargs)\)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.list_pkgs(versions_as_list=False, **kwargs)`
List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.opkg.list_repos(**kwargs)`
Lists all repos on /etc/opkg/*.conf

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.opkg.list_upgrades(refresh=True, **kwargs)`
List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.opkg.mod_repo(repo, **kwargs)`
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:
- `repo` alias by which opkg refers to the repo.
- `uri` the URI to the repo.
- `compressed` defines (True or False) if the index file is compressed
- `enabled` enable or disable (True or False) repository but do not remove if disabled.
- `refresh` enable or disable (True or False) auto-refresh of the repositories

CLI Examples:

```
salt '*' pkg.mod_repo repo uri=http://new/uri
salt '*' pkg.mod_repo repo enabled=False
```

`salt.modules.opkg.owner(**paths, **kwargs)`
Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`
`<salt.modules.opkg.version>`, if a single path is passed, a string will be returned, and if multiple paths
are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned
for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```
salt.modules.opkg.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported by opkg, this function is identical to pkg.remove.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.opkg.refresh_db(failhard=False, **kwargs)

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt.

Values can be one of the following:

- **True**: Database updated successfully
- **False**: Problem updating database

failhard If False, return results of failed lines as False for the package database that encountered the error. If True, raise an error with a list of the package databases that encountered errors.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.opkg.remove(name=None, pkgs=None, **kwargs)

Remove packages using opkg remove.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

remove_dependencies Remove package and all dependencies

New in version 2019.2.0.

auto_remove_deps Remove packages that were installed automatically to satisfy dependencies

New in version 2019.2.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
salt '*' pkg.remove pkgs='["foo", "bar"]' remove_dependencies=True auto_remove_deps=True
```

salt.modules.opkg.unhold(name=None, pkgs=None, sources=None, **kwargs)

Set package current in 'hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., 'tmux'

CLI Example:
salt '-packages' pkg.unhold <package name>

**pkgs**  A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '* pkg.unhold pkgs=['foo', 'bar']`
```

**salt.modules.opkg.upgrade**(refresh=True, **kwargs)

Upgrades all packages via opkg upgrade

Returns a dictionary containing the changes:

```
{"<package>": {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '* pkg.upgrade`
```

**salt.modules.opkg.upgrade_available**(name, **kwargs)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '* pkg.upgrade_available <package name>
```

**salt.modules.opkg.version**(names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '* pkg.version <package name>
salt '* pkg.version <package1> <package2> <package3> ...
```

**salt.modules.opkg.version_clean**(version)

Clean the version string removing extra data. There's nothing do to here for nipkg.py, therefore it will always return the given version.

**salt.modules.opkg.version_cmp**(pkg1, pkg2, ignore_epoch=False, **kwargs)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

**ignore_epoch** [False] Set to True to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '* pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```
25.7.327 salt.modules.opsgenie

Module for sending data to OpsGenie
New in version 2018.3.0.

configuration  This module can be used in Reactor System for posting data to OpsGenie as a remote-execution function.

For example:

```python
opsgenie_event_poster:
  local.opsgenie.post_data:
    - tgt: 'salt-minion'
    - kwarg:
        name: event.reactor
        api_key: XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX
        reason: {{ data['data']['reason'] }}
        action_type: Create

salt.modules.opsgenie.post_data(api_key=None, name='OpsGenie Execution Module', reason=None, action_type=None)
```

Post data to OpsGenie. It's designed for Salt's Event Reactor.

After configuring the sls reaction file as shown above, you can trigger the module with your designated tag (og-tag in this case).

CLI Example:

```bash
salt-call event.send 'og-tag' '{"reason" : "Overheating CPU!"}'
```

Required parameters:
api_key  It's the API Key you've copied while adding integration in OpsGenie.
reason  It will be used as alert's default message in OpsGenie.
action_type  OpsGenie supports the default values Create/Close for action_type. You can customize this field with OpsGenie's custom actions for other purposes like adding notes or acknowledging alerts.

Optional parameters:
name  It will be used as alert's alias. If you want to use the close functionality you must provide name field for both states like in this case.

25.7.328 salt.modules.oracle

Oracle DataBase connection module

maintainer  Vladimir Bormotov <bormotov@gmail.com>
maturity  new
depends  cx_Oracle
platform  all

configuration  module provide connections for multiple Oracle DB instances.

OS Environment

```bash
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar
```
oracle:
  dbs:
    <db>:
      uri: connection credentials in format:
        user/password@host[:port]/sid[ servicename as {sysdba|sysoper}]

  <db>:
    uri: ...... 
```

salt.modules.oracle.client_version()
Oracle Client Version

CLI Example:
```
salt '*' oracle.client_version
```

salt.modules.oracle.run_query(db, query)
Run SQL query and return result

CLI Example:
```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.show_dbs(*dbs)
Show databases configuration from pillar. Filter by *args

CLI Example:
```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.show_env()
Show Environment used by Oracle Client

CLI Example:
```
salt '*' oracle.show_env
```

Note: at first _connect() NLS_LANG will forced to '.AL32UTF8'

salt.modules.oracle.show_pillar(item=None)
Show Pillar segment oracle.* and subitem with notation "item:subitem"

CLI Example:
```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

salt.modules.oracle.version(*dbs)
Server Version (select banner from v$version)

CLI Example:
```
salt '*' oracle.version
salt '*' oracle.version my_db
```
25.7.329 salt.modules.osquery

New in version 2015.8.0.

salt.modules.osquery.acpi_tables(attrs=None, where=None)
    Return acpi_tables information from osquery
    CLI Example:
    ```
salt '*' osquery.acpi_tables
    ```

salt.modules.osquery.alf(attrs=None, where=None)
    Return alf information from osquery
    CLI Example:
    ```
salt '*' osquery.alf
    ```

salt.modules.osquery.alf_exceptions(attrs=None, where=None)
    Return alf_exceptions information from osquery
    CLI Example:
    ```
salt '*' osquery.alf_exceptions
    ```

salt.modules.osquery.alf_explicit_auths(attrs=None, where=None)
    Return alf_explicit_auths information from osquery
    CLI Example:
    ```
salt '*' osquery.alf_explicit_auths
    ```

salt.modules.osquery.alf_services(attrs=None, where=None)
    Return alf_services information from osquery
    CLI Example:
    ```
salt '*' osquery.alf_services
    ```

salt.modules.osquery.apps(attrs=None, where=None)
    Return apps information from osquery
    CLI Example:
    ```
salt '*' osquery.apps
    ```

salt.modules.osquery.apt_sources(attrs=None, where=None)
    Return apt_sources information from osquery
    CLI Example:
    ```
salt '*' osquery.apt_sources
    ```

salt.modules.osquery.arp_cache(attrs=None, where=None)
    Return arp_cache information from osquery
    CLI Example:
salt '*' osquery.arp_cache

salt.modules.osquery.block_devices(attrs=None, where=None)
Return block_devices information from osquery
CLI Example:
salt '*' osquery.block_devices

salt.modules.osquery.certificates(attrs=None, where=None)
Return certificates information from osquery
CLI Example:
salt '*' osquery.certificates

salt.modules.osquery.chrome_extensions(attrs=None, where=None)
Return chrome_extensions information from osquery
CLI Example:
salt '*' osquery.chrome_extensions

salt.modules.osquery.cpuid(attrs=None, where=None)
Return cpuid information from osquery
CLI Example:
salt '*' osquery.cpuid

salt.modules.osquery.crontab(attrs=None, where=None)
Return crontab information from osquery
CLI Example:
salt '*' osquery.crontab

salt.modules.osquery.deb_packages(attrs=None, where=None)
Return deb_packages information from osquery
CLI Example:
salt '*' osquery.deb_packages

salt.modules.osquery.etc_hosts(attrs=None, where=None)
Return etc_hosts information from osquery
CLI Example:
salt '*' osquery.etc_hosts

salt.modules.osquery.etc_services(attrs=None, where=None)
Return etc_services information from osquery
CLI Example:
salt '*' osquery.etc_services

25.7. execution modules
salt.modules.osquery.file_(attrs=None, where=None)
    Return file information from osquery
    CLI Example:
    ```
salt '*' osquery.file
    ```

salt.modules.osquery.file_changes(attrs=None, where=None)
    Return file_changes information from osquery
    CLI Example:
    ```
salt '*' osquery.file_changes
    ```

salt.modules.osquery.firefox_addons(attrs=None, where=None)
    Return firefox_addons information from osquery
    CLI Example:
    ```
salt '*' osquery.firefox_addons
    ```

salt.modules.osquery.groups(attrs=None, where=None)
    Return groups information from osquery
    CLI Example:
    ```
salt '*' osquery.groups
    ```

salt.modules.osquery.hardware_events(attrs=None, where=None)
    Return hardware_events information from osquery
    CLI Example:
    ```
salt '*' osquery.hardware_events
    ```

salt.modules.osquery.hash_(attrs=None, where=None)
    Return hash information from osquery
    CLI Example:
    ```
salt '*' osquery.hash
    ```

salt.modules.osquery.homebrew_packages(attrs=None, where=None)
    Return homebrew_packages information from osquery
    CLI Example:
    ```
salt '*' osquery.homebrew_packages
    ```

salt.modules.osquery.interface_addresses(attrs=None, where=None)
    Return interface_addresses information from osquery
    CLI Example:
    ```
salt '*' osquery.interface_addresses
    ```

salt.modules.osquery.interface_details(attrs=None, where=None)
    Return interface_details information from osquery
    CLI Example:
salt '*

osquery.interface_details

salt.modules.osquery.iokit_devicetree(attrs=None, where=None)
Return iokit_devicetree information from osquery
CLI Example:

    salt '*

osquery.iokit_devicetree

salt.modules.osquery.iokit_registry(attrs=None, where=None)
Return iokit_registry information from osquery
CLI Example:

    salt '*

osquery.iokit_registry

salt.modules.osquery.kernel_extensions(attrs=None, where=None)
Return kernel_extensions information from osquery
CLI Example:

    salt '*

osquery.kernel_extensions

salt.modules.osquery.kernel_info(attrs=None, where=None)
Return kernel_info information from osquery
CLI Example:

    salt '*

osquery.kernel_info

salt.modules.osquery.kernel_integrity(attrs=None, where=None)
Return kernel_integrity information from osquery
CLI Example:

    salt '*

osquery.kernel_integrity

salt.modules.osquery.kernel_modules(attrs=None, where=None)
Return kernel_modules information from osquery
CLI Example:

    salt '*

osquery.kernel_modules

salt.modules.osquery.keychain_items(attrs=None, where=None)
Return keychain_items information from osquery
CLI Example:

    salt '*

osquery.keychain_items

salt.modules.osquery.last(attrs=None, where=None)
Return last information from osquery
CLI Example:

    salt '*

osquery.last
salt.modules.osquery.launchd
Return launchd information from osquery

    CLI Example:

    salt '*' osquery.launchd

salt.modules.osquery.listening_ports
Return listening_ports information from osquery

    CLI Example:

    salt '*' osquery.listening_ports

salt.modules.osquery.logged_in_users
Return logged_in_users information from osquery

    CLI Example:

    salt '*' osquery.logged_in_users

salt.modules.osquery.memory_map
Return memory_map information from osquery

    CLI Example:

    salt '*' osquery.memory_map

salt.modules.osquery.mounts
Return mounts information from osquery

    CLI Example:

    salt '*' osquery.mounts

salt.modules.osquery.nfs_shares
Return nfs_shares information from osquery

    CLI Example:

    salt '*' osquery.nfs_shares

salt.modules.osquery.nvram
Return nvram information from osquery

    CLI Example:

    salt '*' osquery.nvram

salt.modules.osquery.os_version
Return os_version information from osquery

    CLI Example:

    salt '*' osquery.os_version

salt.modules.osquery.osquery_extensions
Return osquery_extensions information from osquery

    CLI Example:
Salt Documentation, Release 3006.4

salt '.*' osquery.osquery_extensions

salt.modules.osquery.osquery_flags(\texttt{attrs=None, where=None})
Return osquery_flags information from osquery

\texttt{salt '.*' osquery.osquery_flags}

salt.modules.osquery.osquery_info(\texttt{attrs=None, where=None})
Return osquery_info information from osquery

\texttt{salt '.*' osquery.osquery_info}

salt.modules.osquery.osquery_registry(\texttt{attrs=None, where=None})
Return osquery_registry information from osquery

\texttt{salt '.*' osquery.osquery_registry}

salt.modules.osquery.passwd_changes(\texttt{attrs=None, where=None})
Return passwd_changes information from osquery

\texttt{salt '.*' osquery.passwd_changes}

salt.modules.osquery.pci_devices(\texttt{attrs=None, where=None})
Return pci_devices information from osquery

\texttt{salt '.*' osquery.pci_devices}

salt.modules.osquery.preferences(\texttt{attrs=None, where=None})
Return preferences information from osquery

\texttt{salt '.*' osquery.preferences}

salt.modules.osquery.process_envs(\texttt{attrs=None, where=None})
Return process_envs information from osquery

\texttt{salt '.*' osquery.process_envs}

salt.modules.osquery.process_memory_map(\texttt{attrs=None, where=None})
Return process_memory_map information from osquery

\texttt{salt '.*' osquery.process_memory_map}

25.7. execution modules
salt.modules.osquery.process_open_files(attrs=None, where=None)

Return process_open_files information from osquery

CLI Example:
```
salt '*' osquery.process_open_files
```

salt.modules.osquery.process_open_sockets(attrs=None, where=None)

Return process_open_sockets information from osquery

CLI Example:
```
salt '*' osquery.process_open_sockets
```

salt.modules.osquery.processes(attrs=None, where=None)

Return processes information from osquery

CLI Example:
```
salt '*' osquery.processes
```

salt.modules.osquery.quarantine(attrs=None, where=None)

Return quarantine information from osquery

CLI Example:
```
salt '*' osquery.quarantine
```

salt.modules.osquery.query(sql=None)

Return time information from osquery

CLI Example:
```
salt '*' osquery.query "select * from users;"
```

salt.modules.osquery.routes(attrs=None, where=None)

Return routes information from osquery

CLI Example:
```
salt '*' osquery.routes
```

salt.modules.osquery.rpm_packages(attrs=None, where=None)

Return cpuid information from osquery

CLI Example:
```
salt '*' osquery.rpm_packages
```

salt.modules.osquery.safari_extensions(attrs=None, where=None)

Return safari_extensions information from osquery

CLI Example:
```
salt '*' osquery.safari_extensions
```

salt.modules.osquery.shared_memory(attrs=None, where=None)

Return shared_memory information from osquery

CLI Example:
salt '*' osquery.shared_memory

salt.modules.osquery.shell_history(attrs=None, where=None)
    Return shell_history information from osquery
    CLI Example:
    
    salt '*' osquery.shell_history

salt.modules.osquery.smbios_tables(attrs=None, where=None)
    Return smbios_tables information from osquery
    CLI Example:
    
    salt '*' osquery.smbios_tables

salt.modules.osquery.startup_items(attrs=None, where=None)
    Return startup_items information from osquery
    CLI Example:
    
    salt '*' osquery.startup_items

salt.modules.osquery.suid_bin(attrs=None, where=None)
    Return suid_bin information from osquery
    CLI Example:
    
    salt '*' osquery.suid_bin

salt.modules.osquery.system_controls(attrs=None, where=None)
    Return system_controls information from osquery
    CLI Example:
    
    salt '*' osquery.system_controls

salt.modules.osquery.time_(attrs=None)
    Return time information from osquery
    CLI Example:
    
    salt '*' osquery.time

salt.modules.osquery.usb_devices(attrs=None, where=None)
    Return usb_devices information from osquery
    CLI Example:
    
    salt '*' osquery.usb_devices

salt.modules.osquery.users(attrs=None, where=None)
    Return users information from osquery
    CLI Example:
    
    salt '*' osquery.users
salt.modules.osquery.version()  
Return version of osquery  
CLI Example:  
```
salt '*' osquery.version
```

salt.modules.osquery.xattr_where_from(attrs=None, where=None)  
Return xattr_where_from information from osquery  
CLI Example:  
```
salt '*' osquery.xattr_where_from
```

salt.modules.osquery.xprotect_entries(attrs=None, where=None)  
Return xprotect_entries information from osquery  
CLI Example:  
```
salt '*' osquery.xprotect_entries
```

salt.modules.osquery.xprotect_reports(attrs=None, where=None)  
Return xprotect_reports information from osquery  
CLI Example:  
```
salt '*' osquery.xprotect_reports
```

25.7.330 salt.modules.out

Output Module

New in version 2018.3.0.

Execution module that processes JSON serializable data and returns string having the format as processed by the outputters.

Although this does not bring much value on the CLI, it turns very handy in applications that require human readable data rather than Python objects.

For example, inside a Jinja template:
```
{{ salt.out.string_format(complex_object, out='highstate') }}
```

salt.modules.out.html_format(data, out='nested', opts=None, **kwargs)  
Return the formatted string as HTML.  
```
data  The JSON serializable object.
out: nested  The name of the output to use to transform the data. Default: nested.
opts  Dictionary of configuration options. Default: __opts__.
kwargs  Arguments to sent to the outputter module.
```

CLI Example:  
```
salt '*' out.html_format "{"key": 'value'}" out=yaml
```

salt.modules.out.out_format(data, out='nested', opts=None, **kwargs)  
Return the formatted outputter string for the Python object.  
```
data  The JSON serializable object.
out: nested  The name of the output to use to transform the data. Default: nested.
```

CLI Example:  
```
salt '*' out.out_format "{"key": 'value'}" out=yaml
```
opts  Dictionary of configuration options. Default: __opts__.

kwargs  Arguments to sent to the outtputter module.

CLI Example:

```bash
salt '*' out.out_format "{'key': 'value'}"
```

salt.modules.out.string_format(data, out='nested', opts=None, **kwargs)

Return the outtputter formatted string, removing the ANSI escape sequences.

data  The JSON serializable object.

out: nested The name of the output to use to transform the data. Default: nested.

opts  Dictionary of configuration options. Default: __opts__.

kwargs  Arguments to sent to the outtputter module.

CLI Example:

```bash
salt '*' out.string_format "{'key': 'value'}" out=table
```

25.7.331  salt.modules.pacmanpkg

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

---

Important:  If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

---

salt.modules.pacmanpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.pacmanpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacmanpkg.file_list(*packages, **kwargs)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```
salt.modules.pacmanpkg.group_diff(name)

New in version 2016.11.0.
Lists which of a group's packages are installed and which are not installed
Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:
```
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacmanpkg.group_info(name)

New in version 2016.11.0.
Lists all packages in the specified group

CLI Example:
```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacmanpkg.group_list()

New in version 2016.11.0.
Lists all groups known by pacman on this system

CLI Example:
```
salt '*' pkg.group_list
```

salt.modules.pacmanpkg.install(name=None, refresh=False, sysupgrade=None, pkgs=None, sources=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install (pacman -S) the specified packag(s). Add refresh=True to install with -y, add sysupgrade=True to install with -u.

**name** The name of the package to be installed. Note that this parameter is ignored if either pkgs or sources is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the sources option.

CLI Example:
```
salt '*' pkg.install <package name>
```

**refresh** Whether or not to refresh the package database before installing.
**sysupgrade** Whether or not to upgrade the system packages before installing. If refresh is set to True but sysupgrade is not specified, -u will be applied

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the version parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:
Salt Documentation, Release 3006.4

salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.
CLI Example:
salt '*' pkg.install
,→"},

sources='[{"foo": "salt://foo.pkg.tar.xz
{"bar": "salt://bar.pkg.tar.xz"}]'

Returns a dict containing the new package names and versions:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}

salt.modules.pacmanpkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.pacmanpkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.pacmanpkg.list_repo_pkgs(*args, **kwargs)
Returns all available packages. Optionally, package names (and name globs) can be passed and the results will
be filtered to packages matching those names.
This function can be helpful in discovering the version or repo to specify in a pkg.installed state.
The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest
to oldest. If byrepo is set to True, then the return dictionary will contain repository names at the top level,
and each repository will map packages to lists of version numbers. For example:
# With byrepo=False (default)
{
'bash': ['4.4.005-2'],
'nginx': ['1.10.2-2']
}
# With byrepo=True
{
'core': {
'bash': ['4.4.005-2']
},
'extra': {
'nginx': ['1.10.2-2']
(continues on next page)

25.7. execution modules

2497


fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.
byrepo [False] When True, the return data for each package will be organized by repository.
refresh [False] When True, the package database will be refreshed (i.e. pacman -Sy) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

salt.modules.pacmanpkg.list_upgrades(refresh=False, root=None, **kwargs)
List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pacmanpkg.owner(*paths, **kwargs)
New in version 2014.7.0.
Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/zsh
```

salt.modules.pacmanpkg.purge(name=None, pkgs=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a pacman -Rsc

name  The name of the package to be deleted.

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.pacmanpkg.refresh_db( root=None, **kwargs)
    Just run a pacman -Sy, return a dict:

    ```
    {
        '<database name>': Bool
    }
    ```

    CLI Example:

    ```
    salt '*' pkg.refresh_db
    ```

salt.modules.pacmanpkg.remove(name=None, pkgs=None, **kwargs)
    Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

    Remove packages with pacman -R.

    **name** The name of the package to be deleted.

    Multiple Package Options:

    **pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

    New in version 0.16.0.

    Returns a dict containing the changes.

    CLI Example:

    ```
    salt '*' pkg.remove <package name>
    salt '*' pkg.remove <package1>,<package2>,<package3>
    salt '*' pkg.remove pkgs='["foo", "bar"]'
    ```

salt.modules.pacmanpkg.upgrade(refresh=False, root=None, **kwargs)
    Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

    Run a full system upgrade, a pacman -Syu

    **refresh** Whether or not to refresh the package database before installing.

    Returns a dictionary containing the changes:

    ```
    {
        '<package>': {
            'old': '<old-version>',
            'new': '<new-version>'
        }
    }
    ```

    CLI Example:

    ```
    salt '*' pkg.upgrade
    ```

salt.modules.pacmanpkg.upgrade_available(name, **kwargs)
    Check whether or not an upgrade is available for a given package.
CLI Example:
```
salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.pacmanpkg.version('names', **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.
```

CLI Example:
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 25.7.332 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

**configuration** This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
```
my-pagerduty-account:
pagerduty.api_key: F3Rbyjbe43rfFwF2214
pagerduty.subdomain: mysubdomain
```

```
salt.modules.pagerduty.create_event(service_key=None, description=None, details=None, incident_key=None, profile=None)
Create an event in PagerDuty. Designed for use in states.
```

CLI Example:
```
salt myminion pagerduty.create_event <service_key> <description> <details> → profile=my-pagerduty-account
```

The following parameters are required:
- **service_key** This key can be found by using pagerduty.list_services.
- **description** This is a short description of the event.
- **details** This can be a more detailed description of the event.
- **profile** This refers to the configuration profile to use to connect to the PagerDuty service.

```
salt.modules.pagerduty.list_escalation_policies(profile=None, api_key=None)
This function is an alias of list_policies.
List escalation policies belonging to this account
```

CLI Example:
```
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account
```

```
salt.modules.pagerduty.list_incidents(profile=None, api_key=None)
List incidents belonging to this account
```

CLI Example:
```
salt myminion pagerduty.list_incidents my-pagerduty-account
```
salt.modules.pagerduty.list_maintenance_windows(profile=None, api_key=None)
This function is an alias of list_windows.
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

salt.modules.pagerduty.list_policies(profile=None, api_key=None)
List escalation policies belonging to this account

CLI Example:
salt myminion pagerduty.list_policies my-pagerduty-account
salt myminion pagerduty.list_escalation_policies my-pagerduty-account

salt.modules.pagerduty.list_schedules(profile=None, api_key=None)
List schedules belonging to this account

CLI Example:
salt myminion pagerduty.list_schedules my-pagerduty-account

salt.modules.pagerduty.list_services(profile=None, api_key=None)
List services belonging to this account

CLI Example:
salt myminion pagerduty.list_services my-pagerduty-account

salt.modules.pagerduty.list_users(profile=None, api_key=None)
List users belonging to this account

CLI Example:
salt myminion pagerduty.list_users my-pagerduty-account

salt.modules.pagerduty.list_windows(profile=None, api_key=None)
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account
salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

25.7.333 salt.modules.pagerduty_util

Module for managing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion
config, minion pillar, or master config. The default configuration profile name is 'pagerduty.'

For example:

```
pagerduty:
pagerduty.api_key: F3Rbyjbve43rfFwF2214
pagerduty.subdomain: mysubdomain
```
For PagerDuty API details, see [https://developer.pagerduty.com/documentation/rest](https://developer.pagerduty.com/documentation/rest)

```python
salt.modules.pagerduty_util.create_or_update_resource(resource_name, identifier_fields, data, diff=None, profile='pagerduty', subdomain=None, api_key=None)
```

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavior is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

**Examples**

```python
create_or_update_resource("user", ["id","name","email"])
create_or_update_resource("escalation_policies", ["id","name"], diff=my_diff_function)
```

```python
salt.modules.pagerduty_util.delete_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
```

delete any pagerduty resource

Helper method for absent()

**Example**

```python
delete_resource("users", key, ["id","name","email"])
```

```python
salt.modules.pagerduty_util.get_escalation_policies(profile='pagerduty', subdomain=None, api_key=None)
```

List escalation_policies belonging to this account

CLI Example:

```bash
salt myminion pagerduty.get_escalation_policies
```

```python
salt.modules.pagerduty_util.get_resource(resource_name, key, identifier_fields, profile='pagerduty', subdomain=None, api_key=None)
```

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:

```python
get_resource('users', key, ['name', 'email'], ...) 
```

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

```python
salt.modules.pagerduty_util.get_schedules(profile='pagerduty', subdomain=None, api_key=None)
```

List schedules belonging to this account

CLI Example:
salt myminion pagerduty.get_schedules

```
salt.modules.pagerduty_util.get_services(profile='pagerduty', subdomain=None, api_key=None)
```

List services belonging to this account

CLI Example:
```
salt myminion pagerduty.get_services
```

```
salt.modules.pagerduty_util.get_users(profile='pagerduty', subdomain=None, api_key=None)
```

List users belonging to this account

CLI Example:
```
salt myminion pagerduty.get_users
```

```
salt.modules.pagerduty_util.resource_absent(resource, identifier_fields, profile='pagerduty', subdomain=None, api_key=None, **kwargs)
```

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

**Example**
```
resource_absent("users", ["id","name","email"])
```

```
salt.modules.pagerduty_util.resource_present(resource, identifier_fields, diff=None, profile='pagerduty', subdomain=None, api_key=None, **kwargs)
```

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

**Example**
```
resource_present("users", ["id","name","email"])
```

25.7.334 salt.modules.pam

Support for pam
```
salt.modules.pam.read_file(file_name)
```

This is just a test function, to make sure parsing works

CLI Example:
```
salt '*' pam.read_file /etc/pam.d/login
```
25.7.335 salt.modules.panos

Module to provide Palo Alto compatibility to Salt

codeauthor Spencer Ervin <spencer ervin@hotmail.com>
maturity new
depends none
platform unix

New in version 2018.3.0.

**Configuration**

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

See also:

*Palo Alto Proxy Module*

**About**

This execution module was designed to handle connections to a Palo Alto based firewall. This module adds support to send connections directly to the device through the XML API or through a brokered connection to Panorama.

salt.modules.panos.add_config_lock()
    Prevent other users from changing configuration until the lock is released.
    CLI Example:
    ```
salt '*' panos.add_config_lock
    ```

salt.modules.panos.check_antivirus()
    Get anti-virus information from PaloAlto Networks server
    CLI Example:
    ```
salt '*' panos.check_antivirus
    ```

salt.modules.panos.check_software()
    Get software information from PaloAlto Networks server.
    CLI Example:
    ```
salt '*' panos.check_software
    ```

salt.modules.panos.clear_commit_tasks()
    Clear all commit tasks.
    CLI Example:
    ```
salt '*' panos.clear_commit_tasks
    ```

salt.modules.panos.commit()
    Commits the candidate configuration to the running configuration.
    CLI Example:
salt 'panos.commit'

salt.modules.panos.deactivate_license(key_name=None)
Deactivates an installed license. Required version 7.0.0 or greater.

key_name(str): The file name of the license key installed.

CLI Example:
salt '*' panos.deactivate_license key_name=License_File_Name.key

salt.modules.panos.delete_license(key_name=None)
Remove license keys on disk.

key_name(str): The file name of the license key to be deleted.

CLI Example:
salt '*' panos.delete_license key_name=License_File_Name.key

salt.modules.panos.download_antivirus()
Download the most recent anti-virus package.

CLI Example:
salt '*' panos.download_antivirus

salt.modules.panos.download_software_file(filename=None, synch=False)
Download software packages by filename.

Parameters
- filename(str) -- The filename of the PANOS file to download.
- synch(bool) -- If true then the file will synch to the peer unit.

CLI Example:
salt '*' panos.download_software_file PanOS_5000-8.0.0
salt '*' panos.download_software_file PanOS_5000-8.0.0 True

salt.modules.panos.download_software_version(version=None, synch=False)
Download software packages by version number.

Parameters
- version(str) -- The version of the PANOS file to download.
- synch(bool) -- If true then the file will synch to the peer unit.

CLI Example:
salt '*' panos.download_software_version 8.0.0
salt '*' panos.download_software_version 8.0.0 True

salt.modules.panos.fetch_license(auth_code=None)
Get new license(s) using from the Palo Alto Network Server.

auth_code The license authorization code.

CLI Example:
salt '*' panos.fetch_license
salt '*' panos.fetch_license auth_code=foobar

salt.modules.panos.get_address(address=None, vsys='1')
Get the candidate configuration for the specified get_address object. This will not return address objects that are marked as pre-defined objects.
address(str): The name of the address object.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address myhost
salt '*' panos.get_address myhost 3
```

```
salt.modules.panos.get_address_group(addressgroup=None, vsys='1')
```
Get the candidate configuration for the specified address group. This will not return address groups that are marked as pre-defined objects.

addressgroup(str): The name of the address group.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_address_group foobar
salt '*' panos.get_address_group foobar 3
```

```
salt.modules.panos.get_address_group
```

```
salt.modules.panos.get_admins_active()
```
Show active administrators.

CLI Example:

```
salt '*' panos.get_admins_active
```

```
salt.modules.panos.get_admins_all()
```
Show all administrators.

CLI Example:

```
salt '*' panos.get_admins_all
```

```
salt.modules.panos.get_antivirus_info()
```
Show information about available anti-virus packages.

CLI Example:

```
salt '*' panos.get_antivirus_info
```

```
salt.modules.panos.get_arp()
```
Show ARP information.

CLI Example:

```
salt '*' panos.get_arp
```

```
salt.modules.panos.get_cli_idle_timeout()
```
Show timeout information for this administrative session.

CLI Example:

```
salt '*' panos.get_cli_idle_timeout
```

```
salt.modules.panos.get_cli_permissions()
```
Show cli administrative permissions.

CLI Example:
salt '*' panos.get_cli_permissions

salt.modules.panos.get_disk_usage()
    Report filesystem disk space usage.
    CLI Example:
    salt '*' panos.get_disk_usage

salt.modules.panos.get_dns_server_config()
    Get the DNS server configuration from the candidate configuration.
    CLI Example:
    salt '*' panos.get_dns_server_config

salt.modules.panos.get_domain_config()
    Get the domain name configuration from the candidate configuration.
    CLI Example:
    salt '*' panos.get_domain_config

salt.modules.panos.get_dos_blocks()
    Show the DoS block-ip table.
    CLI Example:
    salt '*' panos.get_dos_blocks

salt.modules.panos.get_fqdn_cache()
    Print FQDNs used in rules and their IPs.
    CLI Example:
    salt '*' panos.get_fqdn_cache

salt.modules.panos.get_ha_config()
    Get the high availability configuration.
    CLI Example:
    salt '*' panos.get_ha_config

salt.modules.panos.get_ha_link()
    Show high-availability link-monitoring state.
    CLI Example:
    salt '*' panos.get_ha_link

salt.modules.panos.get_ha_path()
    Show high-availability path-monitoring state.
    CLI Example:
    salt '*' panos.get_ha_path
salt.modules.panos.get_ha_state()
Show high-availability state information.

CLI Example:
```
salt '*' panos.get_ha_state
```

salt.modules.panos.get_ha_transitions()
Show high-availability transition statistic information.

CLI Example:
```
salt '*' panos.get_ha_transitions
```

salt.modules.panos.get_hostname()
Get the hostname of the device.

CLI Example:
```
salt '*' panos.get_hostname
```

salt.modules.panos.get_interface_counters(name='all')
Get the counter statistics for interfaces.

Parameters
name (str) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:
```
salt '*' panos.get_interface_counters
salt '*' panos.get_interface_counters ethernet1/1
```

salt.modules.panos.get_interfaces(name='all')
Show interface information.

Parameters
name (str) -- The name of the interface to view. By default, all interface statistics are viewed.

CLI Example:
```
salt '*' panos.get_interfaces
salt '*' panos.get_interfaces ethernet1/1
```

salt.modules.panos.get_job(jid=None)
List all a single job by ID.

jid The ID of the job to retrieve.

CLI Example:
```
salt '*' panos.get_job jid=15
```

salt.modules.panos.get_jobs(state='all')
List all jobs on the device.

state The state of the jobs to display. Valid options are all, pending, or processed. Pending jobs are jobs that are currently in a running or waiting state. Processed jobs are jobs that have completed execution.

CLI Example:
```
salt '*' panos.get_jobs
salt '*' panos.get_jobs state=pending
```

salt.modules.panos.get_lacp()
Show LACP state.
CLI Example:
```bash
salt '*' panos.get_lacp
```

**salt.modules.panos.get_license_info()**
Show information about owned license(s).

CLI Example:
```bash
salt '*' panos.get_license_info
```

**salt.modules.panos.get_license_tokens()**
Show license token files for manual license deactivation.

CLI Example:
```bash
salt '*' panos.get_license_tokens
```

**salt.modules.panos.get_lldp_config()**
Show lldp config for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_config
```

**salt.modules.panos.get_lldp_counters()**
Show lldp counters for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_counters
```

**salt.modules.panos.get_lldp_local()**
Show lldp local info for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_local
```

**salt.modules.panos.get_lldp_neighbors()**
Show lldp neighbors info for interfaces.

CLI Example:
```bash
salt '*' panos.get_lldp_neighbors
```

**salt.modules.panos.get_local_admins()**
Show all local administrator accounts.

CLI Example:
```bash
salt '*' panos.get_local_admins
```

**salt.modules.panos.get_logdb_quota()**
Report the logdb quotas.

CLI Example:
```bash
salt '*' panos.get_logdb_quota
```
salt.modules.panos.get_master_key()
    Get the master key properties.
    CLI Example:
    ```
    salt '*' panos.get_master_key
    ```

salt.modules.panos.get_ntp_config()
    Get the NTP configuration from the candidate configuration.
    CLI Example:
    ```
    salt '*' panos.get_ntp_config
    ```

salt.modules.panos.get_ntp_servers()
    Get list of configured NTP servers.
    CLI Example:
    ```
    salt '*' panos.get_ntp_servers
    ```

salt.modules.panos.get_operational_mode()
    Show device operational mode setting.
    CLI Example:
    ```
    salt '*' panos.get_operational_mode
    ```

salt.modules.panos.get_panorama_status()
    Show panorama connection status.
    CLI Example:
    ```
    salt '*' panos.get_panorama_status
    ```

salt.modules.panos.get_permitted_ips()
    Get the IP addresses that are permitted to establish management connections to the device.
    CLI Example:
    ```
    salt '*' panos.get_permitted_ips
    ```

salt.modules.panos.get_platform()
    Get the platform model information and limitations.
    CLI Example:
    ```
    salt '*' panos.get_platform
    ```

salt.modules.panos.get_predefined_application(application=None)
    Get the configuration for the specified pre-defined application object. This will only return pre-defined application objects.
    application(str): The name of the pre-defined application object.
    CLI Example:
    ```
    salt '*' panos.get_predefined_application saltstack
    ```
salt.modules.panos.get_security_rule(rulename=None, vsys='1')
Get the candidate configuration for the specified security rule.

rulename(str): The name of the security rule.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_security_rule rule01
salt '*' panos.get_security_rule rule01 3
```

salt.modules.panos.get_service(service=None, vsys='1')
Get the candidate configuration for the specified service object. This will not return services that are marked as pre-defined objects.

service(str): The name of the service object.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service tcp-443
salt '*' panos.get_service tcp-443 3
```

salt.modules.panos.get_service_group(servicegroup=None, vsys='1')
Get the candidate configuration for the specified service group. This will not return service groups that are marked as pre-defined objects.

servicegroup(str): The name of the service group.
vsys(str): The string representation of the VSYS ID.

CLI Example:

```
salt '*' panos.get_service_group foobar
salt '*' panos.get_service_group foobar 3
```

salt.modules.panos.get_session_info()
Show device session statistics.

CLI Example:

```
salt '*' panos.get_session_info
```

salt.modules.panos.get_snmp_config()
Get the SNMP configuration from the device.

CLI Example:

```
salt '*' panos.get_snmp_config
```

salt.modules.panos.get_software_info()
Show information about available software packages.

CLI Example:

```
salt '*' panos.get_software_info
```

salt.modules.panos.get_system_date_time()
Get the system date/time.

CLI Example:
salt '*' panos.get_system_date_time

`salt.modules.panos.get_system_files()`  
List important files in the system.  
CLI Example:  
salt '*' panos.get_system_files

`salt.modules.panos.get_system_info()`  
Get the system information.  
CLI Example:  
salt '*' panos.get_system_info

`salt.modules.panos.get_system_services()`  
Show system services.  
CLI Example:  
salt '*' panos.get_system_services

`salt.modules.panos.get_system_state(mask=None)`  
Show the system state variables.  
*mask* Filters by a subtree or a wildcard.  
CLI Example:  
salt '*' panos.get_system_state  
salt '*' panos.get_system_state mask=cfg.ha.config.enabled  
salt '*' panos.get_system_state mask=cfg.ha.*

`salt.modules.panos.get_uncommitted_changes()`  
Retrieve a list of all uncommitted changes on the device. Requires PANOS version 8.0.0 or greater.  
CLI Example:  
salt '*' panos.get_uncommitted_changes

`salt.modules.panos.get_users_config()`  
Get the local administrative user account configuration.  
CLI Example:  
salt '*' panos.get_users_config

`salt.modules.panos.get_vlans()`  
Show all VLAN information.  
CLI Example:  
salt '*' panos.get_vlans

`salt.modules.panos.get_xpath(xpath='')`  
Retrieve a specified xpath from the candidate configuration.  
xpath(str): The specified xpath in the candidate configuration.  
CLI Example:
salt ' '*' panos.get_xpath /config/shared/service

salt.modules.panos.get_zone(zone='', vsys='1')
Get the candidate configuration for the specified zone.
zone(str): The name of the zone.
vsys(str): The string representation of the VSYS ID.
CLI Example:
salt ' '*' panos.get_zone trust
salt ' '*' panos.get_zone trust 2

salt.modules.panos.get_zones(vsyst='1')
Get all the zones in the candidate configuration.
vsys(str): The string representation of the VSYS ID.
CLI Example:
salt ' '*' panos.get_zones
salt ' '*' panos.get_zones 2

salt.modules.panos.install_antivirus(version=None, latest=False, synch=False, skip_commit=False)
Install anti-virus packages.

Parameters
- **version** (str) -- The version of the PANOS file to install.
- **latest** (bool) -- If true, the latest anti-virus file will be installed. The specified version option will be ignored.
- **synch** (bool) -- If true, the anti-virus will synch to the peer unit.
- **skip_commit** (bool) -- If true, the install will skip committing to the device.

CLI Example:
salt ' '*' panos.install_antivirus 8.0.0

salt.modules.panos.install_license()
Install the license key(s).
CLI Example:
salt ' '*' panos.install_license

salt.modules.panos.install_software(version=None)
Upgrade to a software package by version.

Parameters
- **version** (str) -- The version of the PANOS file to install.

CLI Example:
salt ' '*' panos.install_license 8.0.0

salt.modules.panos.reboot()
Reboot a running system.
CLI Example:
salt ' '*' panos.reboot
salt.modules.panos.refresh_fqdn_cache(force=False)

Force refreshes all FQDNs used in rules.

- **force** Forces all fqdn refresh

CLI Example:

```salt '*' panos.refresh_fqdn_cache
salt '*' panos.refresh_fqdn_cache force=True```

salt.modules.panos.remove_config_lock()

Release config lock previously held.

CLI Example:

```
salt '*' panos.remove_config_lock```

salt.modules.panos.resolve_address(address=None, vsys=None)

Resolve address to ip address. Required version 7.0.0 or greater.

- **address** Address name you want to resolve.
- **vsys** The vsys name.

CLI Example:

```salt '*' panos.resolve_address foo.bar.com
salt '*' panos.resolve_address foo.bar.com vsys=2```

salt.modules.panos.save_device_config(filename=None)

Save device configuration to a named file.

- **filename** The filename to save the configuration to.

CLI Example:

```
salt '*' panos.save_device_config foo.xml```

salt.modules.panos.save_device_state()

Save files needed to restore device to local disk.

CLI Example:

```
salt '*' panos.save_device_state```

salt.modules.panos.set_authentication_profile(profile=None, deploy=False)

Set the authentication profile of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```
Parameters

- **profile** (str) -- The name of the authentication profile to set.
- **deploy** (bool) -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_authentication_profile foo
salt '*' panos.set_authentication_profile foo deploy=True```

salt.modules.panos.set_hostname(hostname=None, deploy=False)

Set the hostname of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

```
Parameters

- **hostname** (str) -- The hostname to set
- **deploy** (bool) -- If true then commit the full candidate configuration, if false only set pending change.
```
salt '*' panos.set_hostname newhostname
deploy=True

salt.modules.panos.set_management_http(enabled=True, deploy=False)
Enables or disables the HTTP management service on the device.

CLI Example:
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_http
enabled=False deploy=True

salt.modules.panos.set_management_https(enabled=True, deploy=False)
Enables or disables the HTTPS management service on the device.

CLI Example:
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_https
enabled=False deploy=True

salt.modules.panos.set_management_icmp(enabled=True, deploy=False)
Enables or disables the ICMP management service on the device.

CLI Example:
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_icmp
enabled=False deploy=True

salt.modules.panos.set_management_ocsp(enabled=True, deploy=False)
Enables or disables the HTTP OCSP management service on the device.

CLI Example:
Parameters
- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

salt '*' panos.set_management_ocsp
enabled=False deploy=True

salt.modules.panos.set_management_snmp(enabled=True, deploy=False)
Enables or disables the SNMP management service on the device.

25.7. execution modules
CLI Example:

Parameters

- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_snmp
salt '*' panos.set_management_snmp enabled=False deploy=True
```

**salt.modules.panos.set_management_ssh**(enabled=True, deploy=False)

Enables or disables the SSH management service on the device.

CLI Example:

Parameters

- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_ssh
salt '*' panos.set_management_ssh enabled=False deploy=True
```

**salt.modules.panos.set_management_telnet**(enabled=True, deploy=False)

Enables or disables the Telnet management service on the device.

CLI Example:

Parameters

- **enabled (bool)** -- If true the service will be enabled. If false the service will be disabled.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_management_telnet
salt '*' panos.set_management_telnet enabled=False deploy=True
```

**salt.modules.panos.set_ntp_authentication**(target=None, authentication_type=None, key_id=None, authentication_key=None, algorithm=None, deploy=False)

Set the NTP authentication of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- **target (str)** -- Determines the target of the authentication. Valid options are primary, secondary, or both.
- **authentication_type (str)** -- The authentication type to be used. Valid options are symmetric, autokey, and none.
- **key_id (int)** -- The NTP authentication key ID.
- **authentication_key (str)** -- The authentication key.
- **algorithm (str)** -- The algorithm type to be used for a symmetric key. Valid options are md5 and sha1.
- **deploy (bool)** -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_authentication target=both authentication_type=autokey
salt '*' ntp.set_authentication target=primary authentication_type=none
```

(continues on next page)
salt Documentation, Release 3006.4

(continued from previous page)

```
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_→id=15 authentication_key=mykey algorithm=md5
salt '*' ntp.set_authentication target=both authentication_type=symmetric key_→id=15 authentication_key=mykey algorithm=md5 deploy=True
```

**salt.modules.panos.set_ntp_servers**(primary_server=None, secondary_server=None, deploy=False)

Set the NTP servers of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- primary_server (str) -- The primary NTP server IP address or FQDN.
- secondary_server (str) -- The secondary NTP server IP address or FQDN.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' ntp.set_servers 0.pool.ntp.org 1.pool.ntp.org
salt '*' ntp.set_servers primary_server=0.pool.ntp.org secondary_server=1.pool.→ntp.org
salt '*' ntp.ser_servers 0.pool.ntp.org 1.pool.ntp.org deploy=True
```

**salt.modules.panos.set_permitted_ip**(address=None, deploy=False)

Add an IPv4 address or network to the permitted IP list.

CLI Example:

Parameters

- address (str) -- The IPv4 address or network to allow access to add to the Palo Alto device.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_permitted_ip 10.0.0.1
salt '*' panos.set_permitted_ip 10.0.0.0/24
salt '*' panos.set_permitted_ip 10.0.0.1 deploy=True
```

**salt.modules.panos.set_timezone**(tz=None, deploy=False)

Set the timezone of the Palo Alto proxy minion. A commit will be required before this is processed.

CLI Example:

Parameters

- tz (str) -- The name of the timezone to set.
- deploy (bool) -- If true then commit the full candidate configuration, if false only set pending change.

```
salt '*' panos.set_timezone UTC
salt '*' panos.set_timezone UTC deploy=True
```

**salt.modules.panos.shutdown()**

Shut down a running system.

CLI Example:

```
salt '*' panos.shutdown
```

**salt.modules.panos.test_fib_route**(ip=None, vr='vr1')

Perform a route lookup within active route table (fib).

25.7. execution modules 2517
ip (str): The destination IP address to test.
vr (str): The name of the virtual router to test.

CLI Example:

```
salt '*' panos.test_fib_route 4.2.2.2
salt '*' panos.test_fib_route 4.2.2.2 my-vr
```

**salt.modules.panos.test_security_policy**

```
salt.modules.panos.test_security_policy(sourcezone=None, destinationzone=None, source=None, destination=None, protocol=None, port=None, application=None, category=None, vsys='1', allrules=False)
```

Checks which security policy as connection will match on the device.

sourcezone (str): The source zone matched against the connection.
destinationzone (str): The destination zone matched against the connection.
source (str): The source address. This must be a single IP address.
destination (str): The destination address. This must be a single IP address.
protocol (int): The protocol number for the connection. This is the numerical representation of the protocol.
port (int): The port number for the connection.
application (str): The application that should be matched.
category (str): The category that should be matched.
vsys (int): The numerical representation of the VSYS ID.
allrules (bool): Show all potential match rules until first allow rule.

CLI Example:

```
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
protocol=6 port=22
salt '*' panos.test_security_policy sourcezone=trust destinationzone=untrust
protocol=6 port=22 vsys=2
```

**salt.modules.panos.unlock_admin**

```
salt.modules.panos.unlock_admin(username=None)
```

Unlocks a locked administrator account.

username Username of the administrator.

CLI Example:

```
salt '*' panos.unlock_admin username=bob
```

### 25.7.336 salt.modules.parallels

Manage Parallels Desktop VMs with prlctl and prlsvrctl. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the **Parallels Desktop Reference Guide**.

This module requires the prlctl binary to be installed to run most functions. To run parallels.prlsvrctl, the prlsvrctl binary is required.

What has not been implemented yet can be accessed through parallels.prlctl and parallels.prlsvrctl (note the preceding double dash -- as necessary):
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev

New in version 2016.3.0.

salt.modules.parallels.clone(name, new_name, linked=False, template=False, runas=None)
Clone a VM

New in version 2016.11.0.
Parameters
- name (str) -- Name/ID of VM to clone
- new_name (str) -- Name of the new VM
- linked (bool) -- Create a linked virtual machine.
- template (bool) -- Create a virtual machine template instead of a real virtual machine.
- runas (str) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_tpl template=True runas=macdev
```

salt.modules.parallels.delete(name, runas=None)
Delete a VM

New in version 2016.11.0.
Parameters
- name (str) -- Name/ID of VM to clone
- runas (str) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.delete_snapshot(name, snap_name, runas=None, all=False)
Delete a snapshot

Note: Deleting a snapshot from which other snapshots are derived will not delete the derived snapshots

Parameters
- name (str) -- Name/ID of VM whose snapshot will be deleted
- snap_name (str) -- Name/ID of snapshot to delete
- runas (str) -- The user that the prlctl command will be run as
- all (bool) -- Delete all snapshots having the name given

New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True runas=macdev
```

salt.modules.parallels.exec_(name, command, runas=None)
Run a command on a VM
Parameters
- name (str) -- Name/ID of VM whose exec will be returned
- `command (str)` -- Command to run on the VM
- `runas (str)` -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.exists(name, runas=None)`
Query whether a VM exists
New in version 2016.11.0.
Parameters
- `name (str)` -- Name/ID of VM
- `runas (str)` -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.exists macvm runas=macdev
```

`salt.modules.parallels.list_snapshots(name, snap_name=None, tree=False, names=False, runas=None)`
List the snapshots
Parameters
- `name (str)` -- Name/ID of VM whose snapshots will be listed
- `snap_id (str)` -- Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot sub-tree having this snapshot as the root snapshot
- `tree (bool)` -- List snapshots in tree format rather than tabular format
- `names (bool)` -- List snapshots as ID, name pairs
- `runas (str)` -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

`salt.modules.parallels.list_vms(name=None, info=False, all=False, args=None, runas=None, template=False)`
List information about the VMs
Parameters
- `name (str)` -- Name/ID of VM to list
  Changed in version 2016.11.0: No longer implies `info=True`
- `info (str)` -- List extra information
- `all (bool)` -- List all non-template VMs
- `args (tuple)` -- Additional arguments given to prctl list
- `runas (str)` -- The user that the prlctl command will be run as
- `template (bool)` -- List the available virtual machine templates. The real virtual machines will not be included in the output

New in version 2016.11.0.

Example:
```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```
salt.modules.parallels.prlctl(sub_cmd, args=None, runas=None)
Execute a prlctl command

Parameters
• **sub_cmd** (str) -- prlctl subcommand to execute
• **args** (str) -- The arguments supplied to prlctl <sub_cmd>
• **runas** (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```

salt.modules.parallels.prlsrvctl(sub_cmd, args=None, runas=None)
Execute a prlsrvctl command

New in version 2016.11.0.

Parameters
• **sub_cmd** (str) -- prlsrvctl subcommand to execute
• **args** (str) -- The arguments supplied to prlsrvctl <sub_cmd>
• **runas** (str) -- The user that the prlsrvctl command will be run as

Example:
```
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

salt.modules.parallels.reset(name, runas=None)
Reset a VM by performing a hard shutdown and then a restart

Parameters
• **name** (str) -- Name/ID of VM to reset
• **runas** (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.reset macvm runas=macdev
```

salt.modules.parallels.restart(name, runas=None)
Restart a VM by gracefully shutting it down and then restarting it

Parameters
• **name** (str) -- Name/ID of VM to restart
• **runas** (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.restart macvm runas=macdev
```

salt.modules.parallels.revert_snapshot(name, snap_name, runas=None)
Revert a VM to a snapshot

Parameters
• **name** (str) -- Name/ID of VM to revert
• **snap_name** (str) -- Name/ID of snapshot to revert to
• **runas** (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

salt.modules.parallels.snapshot(name, snap_name=None, desc=None, runas=None)
Create a snapshot
Parameters

- **name** *(str)* -- Name/ID of VM to take a snapshot of
- **snap_name** *(str)* -- Name of snapshot
- **desc** *(str)* -- Description of snapshot
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean → install with updates' runas=macdev
```

**salt.modules.parallels.snapshot_id_to_name** *(name, snap_id, strict=False, runas=None)*

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** *(str)* -- Name/ID of VM whose snapshots are inspected
- **snap_id** *(str)* -- ID of the snapshot
- **strict** *(bool)* -- Raise an exception if a name cannot be found for the given snap_id
- **runas** *(str)* -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```bash
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66 runas=macdev
```

**salt.modules.parallels.snapshot_name_to_id** *(name, snap_name, strict=False, runas=None)*

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- **name** *(str)* -- Name/ID of VM whose snapshots are inspected
- **snap_name** *(str)* -- Name of the snapshot
- **strict** *(bool)* -- Raise an exception if multiple snapshot IDs are found
- **runas** *(str)* -- The user that the prlctl command will be run as

CLI Example:

```bash
salt '*' parallels.snapshot_name_to_id macvm original runas=macdev
```

**salt.modules.parallels.start** *(name, runas=None)*

Start a VM

Parameters

- **name** *(str)* -- Name/ID of VM to start
- **runas** *(str)* -- The user that the prlctl command will be run as

Example:

```bash
salt '*' parallels.start macvm runas=macdev
```

**salt.modules.parallels.status** *(name, runas=None)*
Status of a VM

Parameters
- name (str) -- Name/ID of VM whose status will be returned
- runas (str) -- The user that the prlctl command will be run as

Example:
```
salt '*' parallels.status macvm runas=macdev
```

```
salt.modules.parallels.stop(name, kill=False, runas=None)
```
Stop a VM

Parameters
- name (str) -- Name/ID of VM to stop
- kill (bool) -- Perform a hard shutdown
- runas (str) -- The user that the prlctl command will be run as

Example:
```
salt '*'parallels.stop macvm runas=macdev
salt '*'parallels.stop macvm kill=True runas=macdev
```

25.7.337 salt.modules.parted_partition

Module for managing partitions on POSIX-like systems.

depends
- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for parted(8) for more information, or the online docs at:

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead.

For further information, please reference the man page for sfdisk(8).

```
salt.modules.parted_partition.align_check(device, part_type, partition)
```
Check if partition satisfies the alignment constraint of part_type. Type must be "minimal" or "optimal".

CLI Example:
```
salt '*'partition.align_check /dev/sda minimal 1
```

```
salt.modules.parted_partition.check(device, minor)
```
Checks if the file system on partition <minor> has any errors.

CLI Example:
```
salt '*'partition.check 1
```

```
salt.modules.parted_partition.cp(device, from_minor, to_minor)
```
Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:
```
salt '*'partition.cp /dev/sda 2 3
```
salt.modules.parted_partition.disk_set(device, flag, state)
Changes a flag on selected device.

A flag can be either "on" or "off" (make sure to use proper quoting, see YAML Idiosyncrasies). Some or all of these flags will be available, depending on what disk label you are using.
Valid flags are:
- cylinder_alignment
- pmbr_boot
- implicit_partition_table

CLI Example:

```bash
salt '*' partition.disk_set /dev/sda pmbr_boot "on"
```

salt.modules.parted_partition.disk_toggle(device, flag)
Toggle the state of <flag> on <device>. Valid flags are the same as the disk_set command.

CLI Example:

```bash
salt '*' partition.disk_toggle /dev/sda pmbr_boot
```

salt.modules.parted_partition.exists(device='')
Check to see if the partition exists

CLI Example:

```bash
salt '*' partition.exists /dev/sdb1
```

salt.modules.parted_partition.get_block_device()
Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```bash
salt '*' partition.get_block_device
```

salt.modules.parted_partition.get_id(device, minor)
Prints the system ID for the partition. Some typical values are:

- b: FAT32 (vfat)
- 7: HPFS/NTFS
- 82: Linux Swap
- 83: Linux
- 8e: Linux LVM
- fd: Linux RAID Auto

CLI Example:

```bash
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted_partition.list_(device, unit=None)
Prints partition information of given <device>

CLI Examples:

```bash
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```
salt.modules.parted_partition.mkfs(device, fs_type)
Makes a filesystem <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed).

CLI Example:
```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted_partition.mklabel(device, label_type)
Create a new disklabel (partition table) of label_type.
Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pe98", or "sun".

CLI Example:
```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted_partition.mkpart(device, part_type, fs_type=None, start=None, end=None)
Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of "primary", "logical", or "extended".

CLI Examples:
```
salt '*' partition.mkpart /dev/sda primary
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
```

salt.modules.parted_partition.mkpartfs(device, part_type, fs_type=None, start=None, end=None)
The mkpartfs actually is an alias to mkpart and is kept for compatibility. To know the valid options and usage syntax read mkpart documentation.

CLI Examples:
```
salt '*' partition.mkpartfs /dev/sda primary
salt '*' partition.mkpartfs /dev/sda primary fs_type=fat32 start=0 end=639
```

salt.modules.parted_partition.name(device, partition, name)
Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:
```
salt '*' partition.name /dev/sda 1 'My Documents'
```

salt.modules.parted_partition.probe(*devices)
Ask the kernel to update its local partition data. When no args are specified all block devices are tried.
Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:
```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

salt.modules.parted_partition.rescue(device, start, end)
Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:
salt '*' partition.rescue /dev/sda 0 8056

**salt.modules.parted_partition.resize**(*device, minor, start, end*)
Resizes the partition with number `<minor>`.

The partition will start `<start>` from the beginning of the disk, and end `<end>` from the beginning of the disk.
resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

**salt.modules.parted_partition.rm**(*device, minor*)
Removes the partition with number `<minor>`.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

**salt.modules.parted_partition.set_**(*device, minor, flag, state*)
Changes a flag on the partition with number `<minor>`.

A flag can be either "on" or "off" (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are:

- boot
- root
- swap
- hidden
- raid
- lvm
- lba
- hp-service
- palo
- prep
- msftres
- bios_grub
- atvrecv
- diag
- legacy_boot
- msftdata
- ist
- esp
- type

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot "on"
```

**salt.modules.parted_partition.set_id**(*device, minor, system_id*)
Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
```
(continues on next page)
CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

```
salt.modules.parted_partition.system_types()
List the system types that are supported by the installed version of sfdisk
```

CLI Example:

```
salt '*' partition.system_types
```

```
salt.modules.parted_partition.toggle(device, partition, flag)
Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.
```

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

### 25.7.338  `salt.modules.pcs`

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

```
depends pcs
```

New in version 2016.3.0.

```
salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)
Authorize nodes to the cluster
```

```
   nodes a list of nodes which should be authorized to the cluster
   pcsuser user for communication with PCS (default: hacluster)
   pcspasswd password for pcsuser (default: hacluster)
   extra_args list of extra option for the 'pcs cluster auth' command. The newer cluster host command has no extra args and so will ignore it.
```

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org, node2.example.org ]'
   pcsuser=hacluster pcspasswd=hoonetorg extra_args=['--force']
```

```
salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)
Create a CIB-file from the current CIB of the cluster
```

```
   cibfile name/path of the file containing the CIB
   scope specific section of the CIB (default: configuration)
   extra_args additional options for creating the CIB-file
```

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

```
salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)
Push a CIB-file as the new CIB to the cluster
```

```
   cibfile name/path of the file containing the CIB
   scope specific section of the CIB (default: configuration)
```
**extra_args** additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

```{.bash}
salt.modules.pcs.cluster_destroy(extra_args=None)

```
Destroy corosync cluster using the pcs command

**extra_args** list of extra option for the 'pcs cluster destroy' command (only really --all)

CLI Example:

```
salt '*' pcs.cluster_destroy extra_args=--all
```

```{.bash}
salt.modules.pcs.cluster_node_add(node, extra_args=None)

```
Add a node to the pacemaker cluster via pcs command

**node** node that should be added

**extra_args** list of extra option for the 'pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

```{.bash}
salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)

```
Setup pacemaker cluster via pcs command

**nodes** a list of nodes which should be set up

**pcsclustername** Name of the Pacemaker cluster (default: pcscluster)

**extra_args** list of extra option for the 'pcs cluster setup' command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org, node2.example.org ]' →
  pcsclustername=pcscluster
```

```{.bash}
salt.modules.pcs.config_show(cibfile=None)

```
Show config of cluster

**cibfile** name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

```{.bash}
salt.modules.pcs.is_auth(nodes, pcsuser='hacluster', pcspasswd='hacluster')

```
Check if nodes are already authorized

**nodes** a list of nodes to be checked for authorization to the cluster

**pcsuser** user for communication with PCS (default: hacluster)

**pcspasswd** password for pcsuser (default: hacluster)

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org, node2.example.org]' →
  pcsuser=hacluster pcspasswd=hoonetorg
```

```{.bash}
salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)

```
Create an item via pcs command (mainly for use with the pcs state module)

**item** config, property, resource, constraint etc.

**item_id** id of the item

**item_type** item type

**create** create command (create or set f.e., default: create)

**extra_args** additional options for the pcs command

**cibfile** use cibfile instead of the live CIB
salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)
    Show an item via pcs command (mainly for use with the pcs state module)
    item config, property, resource, constraint etc.
    item_id id of the item
    item_type item type
    show show command (probably None, default: show or status for newer implementation)
    extra_args additional options for the pcs command
    cibfile use cibfile instead of the live CIB

salt.modules.pcs[prop_set](prop, value, extra_args=None, cibfile=None)
    Set the value of a cluster property
    prop name of the property
    value value of the property prop
    extra_args additional options for the pcs property command
    cibfile use cibfile instead of the live CIB

    CLI Example:
    
    salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_cluster.cib'  

salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)
    Show the value of a cluster property
    prop name of the property
    extra_args additional options for the pcs property command
    cibfile use cibfile instead of the live CIB

    CLI Example:
    
    salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'  

salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)
    Create a resource via pcs command
    resource_id name for the resource
    resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
    resource_options additional options for creating the resource
    cibfile use cibfile instead of the live CIB for manipulation

    CLI Example:
    
    salt '*' pcs.resource_create resource_id='galera' resource_type='ocf:heartbeat:galera' resource_options="["wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.example.org", '--master']" cibfile='/tmp/cib_for_galera.cib'  

salt.modules.pcs.resource_show(resource_id, extra_args=None, cibfile=None)
    Show a resource via pcs command
    resource_id name of the resource
    extra_args additional options for the pcs command
    cibfile use cibfile instead of the live CIB

    CLI Example:
    
    salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'  

salt.modules.pcs.stonith_create(stonith_id, stonith_device_type, stonith_device_options=None, cibfile=None)
    Create a stonith resource via pcs command
stonith_id  name for the stonith resource
stonith_device_type  name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options  additional options for creating the stonith resource
cibfile  use cibfile instead of the live CIB for manipulation

CLI Example:

```shell
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
    stonith_device_options='"[pcmk_host_map=node1.example.org:01;node2.example.org:02',
        \"power_wait=5","verbose=1","debug=/var/log/pcsd/eps_fence.log","login=hidden",
        \"ipaddr=myepsdevice.example.org",\"action=reboot",
        \"passwd=hoonetorg\"]" cibfile='/tmp/cib_for_stonith.cib'
```

salt.modules.pcs.stonith_show(stonith_id, extra_args=None, cibfile=None)
  Show the value of a cluster stonith
  stonith_id  name for the stonith resource
e extra_args  additional options for the pcs stonith command
cibfile  use cibfile instead of the live CIB

CLI Example:

```shell
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'
```

25.7.339  salt.modules.pdbedit

Manage accounts in Samba’s passdb using pdbedit

maintainer  Jorge Schrauwen <sjorge@blackdot.be>
maturity  new
platform  posix

New in version 2017.7.0.

salt.modules.pdbedit.create(login, password, password_hashed=False, machine_account=False)
  Create user account
  login  [string] login name
  password  [string] password
  password_hashed  [boolean] set if password is a nt hash instead of plain text
  machine_account  [boolean] set to create a machine trust account instead

CLI Example:

```shell
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

salt.modules.pdbedit.delete(login)
  Delete user account
  login  [string] login name

CLI Example:

```shell
salt '*' pdbedit.delete wash
```

salt.modules.pdbedit.generate_nt_hash(password)
  Generate a NT HASH

CLI Example:
```
salt '*' pdbedit.generate_nt_hash my_passwd
```

salt.modules.pdbedit.get_user(login, hashes=False)
Get user account details

**login** [string] login name
**hashes** [boolean] include NTHASH and LMHASH in verbose output

CLI Example:
```
salt '*' pdbedit.get kaylee
```

salt.modules.pdbedit.list_users(verbos=True, hashes=False)
List user accounts

**verbose** [boolean] return all information
**hashes** [boolean] include NT HASH and LM HASH in verbose output

CLI Example:
```
salt '*' pdbedit.list
```

salt.modules.pdbedit.modify(login, password=None, password_hashed=False, domain=None, profile=None, script=None, drive=None, homedir=None, fullname=None, account_desc=None, account_control=None, machine_sid=None, user_sid=None, reset_login_hours=False, reset_bad_password_count=False)
Modify user account

**login** [string] login name
**password** [string] password
**password_hashed** [boolean] set if password is a nt hash instead of plain text
**domain** [string] users domain
**profile** [string] profile path
**script** [string] logon script
**drive** [string] home drive
**homedir** [string] home directory
**fullname** [string] full name
**account_desc** [string] account description
**machine_sid** [string] specify the machines new primary group SID or rid
**user_sid** [string] specify the users new primary group SID or rid
**account_control** [string] specify user account control properties

**Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

**reset_login_hours** [boolean] reset the users allowed logon hours
**reset_bad_password_count** [boolean] reset the stored bad login counter

**Note:** if user is absent and password is provided, the user will be created

CLI Example:
```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
```
25.7.340 salt.modules.pecl

Manage PHP pecl extensions.

```python
salt.modules.pecl.install(pecls, defaults=False, force=False, preferred_state='stable')
```

New in version 0.17.0.

- **pecls**: The pecl extensions to install.
- **defaults**: Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
- **force**: Whether to force the installed version or not

CLI Example:

```bash
call '*' pecl.install fuse
```

```python
salt.modules.pecl.list_(channel=None)
```

List installed pecl extensions.

CLI Example:

```bash
call '*' pecl.list
```

```python
salt.modules.pecl.uninstall(pecls)
```

Uninstall one or several pecl extensions.

CLI Example:

```bash
call '*' pecl.uninstall fuse
```

```python
salt.modules.pecl.update(pecls)
```

Update one or several pecl extensions.

CLI Example:

```bash
call '*' pecl.update fuse
```

25.7.341 salt.modules.peeringdb

PeeringDB Module

New in version 2019.2.0.

Execution module for the basic interaction with the PeeringDB API.

While for GET operations (the functions prefixed by `get_`) the credentials are optional, there are some specific details that are visible only to authenticated users. Moreover, the credentials are required when adding or updating information. That means, the module can equally work out of the box without any further configuration with the limitations imposed by the PeeringDB API.

For complete API documentation, please refer to [https://www.peeringdb.com/apidocs/](https://www.peeringdb.com/apidocs/).

Configuration (in the opts or Pillar):

```python
peeringdb:
    username: salt
    password: @lt
```
salt.modules.peeringdb.get_fac(**kwargs)
Return the details of the facility identified using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

CLI Example:
```
salt '*' peeringdb.get_fac id=1774
salt '*' peeringdb.get_fac state=UT
```

salt.modules.peeringdb.get_ix(**kwargs)
Return the details of an IX (Internet Exchange) using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IXs registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ix/ix_list

CLI Example:
```
salt '*' peeringdb.get_ix id=1
salt '*' peeringdb.get_ix city='Milwaukee'
```

salt.modules.peeringdb.get_ixfac(**kwargs)
Return the details of an IX (Internet Exchange) facility using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixfac/ixfac_list

CLI Example:
```
salt '*' peeringdb.get_ixfac id=1
salt '*' peeringdb.get_ixfac city='Milwaukee'
```

salt.modules.peeringdb.get_ixlan(**kwargs)
Return the details of an IX (Internet Exchange) together with the networks available in this location (and their details), using the search filters specified in the query.

Note: If no `id` or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixlan/ixlan_list

CLI Example:
```
salt '*' peeringdb.get_ixlan id=780
salt '*' peeringdb.get_ixlan city='Milwaukee'
```

salt.modules.peeringdb.get_i xpfx(**kwargs)
Return the details of an IX (Internet Exchange) together with the PeeringDB IDs of the networks available in this location, using the search filters specified in the query.
Note: If no id or filter arguments are specified, it will return all the possible IX LAN facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/ixpfx/ixpfx_list

**CLI Example:**
```python
salt '*' peeringdb.get_ixpfx id=780
salt '*' peeringdb.get_ixpfx city='Milwaukee'
```

### salt.modules.peeringdb.get_net(**kwargs)**

Return the details of a network identified using the search filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible networks registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/net/net_list

**CLI Example:**
```python
salt '*' peeringdb.get_net id=4224
salt '*' peeringdb.get_net asn=13335
salt '*' peeringdb.get_net city='Salt Lake City'
salt '*' peeringdb.get_net name__startswith=GTT
```

### salt.modules.peeringdb.get_netfac(**kwargs)**

Return the list of facilities used by a particular network, given the id or other filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible network facilities registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netfac/netfac_list

**CLI Example:**
```python
salt '*' peeringdb.get_netfac id=780
salt '*' peeringdb.get_netfac city='Milwaukee'
```

### salt.modules.peeringdb.get_netixlan(**kwargs)**

Return the IP addresses used by a particular network at all the IXs where it is available. The network is selected either via the id argument or the other filters specified in the query.

Note: If no id or filter arguments are specified, it will return all the possible IP addresses, of all networks, at all IXs, registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/netixlan/netixlan_list

**CLI Example:**
```python
salt '*' peeringdb.get_netixlan asn=13335
salt '*' peeringdb.get_netixlan ipaddr4=185.1.114.25
```
salt.modules.peeringdb.get_org(**kwargs)
Return the details of an organisation together with the networks available in this location, using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible organisations registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/org/org_list

CLI Example:
```
salt '*' peeringdb.get_org id=2
salt '*' peeringdb.get_org city=Duesseldorf
```

salt.modules.peeringdb.get_poc(**kwargs)
Return the details of a person of contact together using the search filters specified in the query.

**Note:** If no id or filter arguments are specified, it will return all the possible contacts registered in PeeringDB.

The available filters are documented at: https://www.peeringdb.com/apidocs/#!/poc/poc_list

CLI Example:
```
salt '*' peeringdb.get_poc id=6721
salt '*' peeringdb.get_poc email__contains='@cloudflare.com'
```

### 25.7.342 salt.modules.pf

Control the OpenBSD packet filter (PF).

**codeauthor** Jasper Lievisse Adriaanse <j@jasper.la>

New in version 2019.2.0.

salt.modules.pf.disable()
Disable the Packet Filter.

CLI Example:
```
salt '*' pf.disable
```

salt.modules.pf.enable()
Enable the Packet Filter.

CLI Example:
```
salt '*' pf.enable
```

salt.modules.pf.flush(modifier)
Flush the specified packet filter parameters.
**modifier:** Should be one of the following:
- all
- info
- osfp
- rules
• sources
• states
• tables

Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

CLI Example:

salt '*' pf.flush states

salt.modules.pf.load(file='/etc/pf.conf', noop=False)

Load a ruleset from the specific file, overwriting the currently loaded ruleset.
file: Full path to the file containing the ruleset.
noop: Don't actually load the rules, just parse them.

CLI Example:

salt '*' pf.load /etc/pf.conf.d/lockdown.conf

salt.modules.pf.loglevel(level)

Set the debug level which limits the severity of log messages printed by `pf(4)`.
level: Log level. Should be one of the following: emerg, alert, crit, err, warning, notice, info or debug (OpenBSD); or none, urgent, misc, loud (FreeBSD).

CLI Example:

salt '*' pf.loglevel emerg

salt.modules.pf.show(modifier)

Show filter parameters.
modifier: Modifier to apply for filtering. Only a useful subset of what pfctl supports can be used with Salt.
• rules
• states
• tables

CLI Example:

salt '*' pf.show rules

salt.modules.pf.table(command, table, **kwargs)

Apply a command on the specified table.
table: Name of the table.
command: Command to apply to the table. Supported commands are:
• add
• delete
• expire
• flush
• kill
• replace
• show
• test
• zero

Please refer to the OpenBSD `pfctl(8)` documentation for a detailed explanation of each command.

CLI Example:

salt '*' pf.table expire table=spam_hosts number=300
salt '*' pf.table add table=local_hosts addresses='["127.0.0.1", ":1"]'
25.7.343 salt.modules.philips_hue

Philips HUE lamps module for proxy.
New in version 2015.8.3.

25.7.344 salt.modules.pillar

Extract the pillar data for this minion

```
salt.modules.pillar.data(*args, **kwargs)
```

This function is an alias of `items`. Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

```
pillar
```

If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

```
pillar_enc
```

If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

---

**Note:** This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

---

```
pillarenv
```

Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

```
saltenv
```

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

---

```
salt.modules.pillar.ext(external, pillar=None)
```

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext_pillar types are now tunable using the on_demand_ext_pillar config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

```
ex_pillar
```

A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated ext_pillar configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load(""
... ext_pillar:
```

(continues on next page)
... - git:
... - issue38440 https://github.com/terminalmage/git_pillar:
... - env: base
... """

>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}

In the above example, the value to pass would be {'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

    salt '*' pillar.ext '{libvirt: _}'
    salt '*' pillar.ext "{'git': ['master https://github.com/myuser/myrepo']}"
    salt '*' pillar.ext "{'git': ['mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]]}"

salt.modules.pillar.fetch(key, default=<Constant.NOT_SET>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.0.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

    {'pkg': {'apache': 'httpd'}}

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

pkg:apache

key The pillar key to get value from.

default The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is not specified, then it will be an empty string, unless pillar_raise_on_missing is set to True, in which case an error will be raised.

merge [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.
Note: This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.
pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.
saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

```
salt.modules.pillar.file_exists(path, saltenv=None)
```

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

**path** The path to the file in question. Will be treated as a relative path

**saltenv** Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

```
salt.modules.pillar.filter_by(lookup_dict, pillar, merge=None, default='default', base=None)
```

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

**Parameters**

- **lookup_dict** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:
# this will render 'got some salt' if `role` begins with
# 'salt'
salt '*' pillar.filter_by '{salt*: got some salt, default:}
# salt is not here}' role

- **pillar** -- The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the lookup_dict dictionary.

  The pillar value can be a list. The function will return the lookup_dict value for a first found item in the list matching one of the lookup_dict keys.

- **merge** -- A dictionary to merge with the results of the pillar selection from lookup_dict. This allows another dictionary to override the values in the lookup_dict.

- **default** -- default lookup_dict's key used if the pillar does not exist or if the pillar value has no match on lookup_dict. If unspecified the value is "default".

- **base** -- A lookup_dict key to use for a base dictionary. The pillar-selected lookup_dict is merged over this and then finally the merge dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```bash
class 'role' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}'
```

salt.modules.pillar.get(key, default=<Constant.NOT_SET>, merge=False, merge_nested_lists=None, delimiter=':', pillarenv=None, saltenv=None)

New in version 0.14.0.

Attempt to retrieve the named value from in-memory pillar data. If the pillar key is not present in the in-memory pillar, then the value specified in the default option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```json
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```python
pkg:apache
```

- **key** The pillar key to get value from

- **default** The value specified by this option will be returned if the desired pillar key does not exist.

  If a default value is not specified, then it will be an empty string, unless pillar_raise_on_missing is set to True, in which case an error will be raised.

- **merge** [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

- **merge_nested_lists** If set to False, lists nested within the retrieved pillar dictionary will overwrite lists in default. If set to True, nested lists will be merged into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.
**Note:** This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.
pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.
saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

**CLI Example:**

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.item`(`args`, `**kwargs`)

New in version 0.16.2.

Return one or more pillar entries from the in-memory pillar data.
delimiter Delimiter used to traverse nested dictionaries.

**Note:** This is different from `pillar.get` in that no default value can be specified. `pillar.get` should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of `pillar.get` however is when it is desirable to retrieve the values of more than one key, since `pillar.get` can only retrieve one key at a time.

New in version 2015.8.0.
pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion’s pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.
saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

**CLI Examples:**

---

25.7. execution modules
salt 'salt '*' pillar.item foo
salt 'salt '*' pillar.item foo:bar
salt 'salt '*' pillar.item foo bar baz

salt.modules.pillar.items(*args, **kwargs)
Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with row() which returns the pillar data that is currently loaded into the minion.

pillar If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.
pillar_enc If specified, the data passed in the pillar argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the Pillar Encryption documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

pillarenv Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's pillarenv option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.
saltenv Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

CLI Example:
salt 'salt '*' pillar.items

salt.modules.pillar.keys(key, delimiter=:')
Attempt to retrieve a list of keys from the named value from the pillar.
The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.
delimiter Specify an alternate delimiter to use when traversing a nested dict

CLI Example:
salt 'salt '*' pillar.keys web:sites

salt.modules.pillar.ls(*args)
Calls the master for a fresh pillar, generates the pillar data on the fly (same as items()), but only shows the available main keys.

CLI Examples:
salt 'salt '*' pillar.ls

salt.modules.pillar.obfuscate(*args, **kwargs)
New in version 2015.8.0.
Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `<str>'`
- `['secret', 1]` becomes `['<str>', '<int>']`
- `{'login': 'someusername', 'pwd': 'secret'}` becomes `{'login': '<str>', 'pwd': '<str>'}`

CLI Examples:

```
salt '*' pillar.obfuscate
```

**salt.modules.pillar.raw** *(key=*

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional `key` argument, you can select a subtree of the pillar raw data:

```
salt '*' pillar.raw key='roles'
```

### 25.7.345 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

**Windows Support**

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:salt\bin\Scripts' bin_env='C:salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.
State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```python
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```python
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you’re having problems, you might try doubling the back slashes. For example, cwd: ‘C:\salt\bin\scripts’. Sometimes python thinks the single back slash is an escape character.

There is a known incompatibility between Python2 pip>=10.* and Salt <=2018.3.0. The issue is described here: https://github.com/saltstack/salt/issues/46163

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

```python
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None, **kwargs)
```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv

salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False, no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None, no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False, ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, extra_args=None, cache_dir=None, no_binary=False, disable_version_check=False, **kwargs)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs Comma separated list of packages to install
requirements Path to requirements
bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.

**Note:** For Windows, if the pip module is being used to upgrade the pip package, bin_env should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

use_wheel Prefer wheel archives (requires pip>=1.4)
no_use_wheel Force to not use wheel archives (requires pip>=1.4,<10.0.0)
no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them
log Log file where a complete (maximum verbosity) record will be kept
proxy Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**Note:** If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass False as a value.

timeout Set the socket timeout (default 15 seconds)
editable install something editable (e.g. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)
find_links URL to search for packages
index_url Base URL of Python Package Index
extra_index_url Extra URLs of package indexes to use in addition to index_url
no_index Ignore package index
mirrors Specific mirror URL(s) to query (automatically adds --use-mirrors)

**Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use index_url and/or extra_index_url instead.
**build**  Unpack packages into `build` dir
**target**  Install packages into `target` dir
**download**  Download packages into `download` instead of installing them
**download_cache** | `cache_dir`  Cache downloaded packages in `download_cache` or `cache_dir` dir
**source**  Check out editable packages into `source` dir
**upgrade**  Upgrade all packages to the newest available version
**force_reinstall**  When upgrading, reinstall all packages even if they are already up-to-date.
**ignore_installed**  Ignore the installed packages (reinstalling instead)
**exists_action**  Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
**no_deps**  Ignore package dependencies
**no_install**  Download and unpack all packages, but don't actually install them
**no_download**  Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)
**install_options**  Extra arguments to be supplied to the setup.py install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple `--install-option` options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
**global_options**  Extra global options to be supplied to the setup.py call before the install command.
**user**  The user under which to run pip
**cwd**  Directory from which to run pip
**pre_releases**  Include pre-releases in the available versions
**cert**  Provide a path to an alternate CA bundle
**allow_all_external**  Allow the installation of all externally hosted files
**allow_external**  Allow the installation of externally hosted files (comma separated list)
**allow_unverified**  Allow the installation of insecure and unverifiable files (comma separated list)
**process_dependency_links**  Enable the processing of dependency links
**env_vars**  Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

**trusted_host**  Mark this host as trusted, even though it does not have valid or any HTTPS.
**use_vt**  Use VT terminal emulation (see output while installing)
**no_cache_dir**  Disable the cache.
**extra_args**  pip keyword and positional arguments not yet implemented in salt

Example:

```
salt '*' pip.install pandas extra_args="[{'--latest-pip-kwarg': 'param'}, '--latest-pip-arg']"
```

**Warning:** If unsupported options are passed here that are not supported in a minion's version of pip, a **No such option error** will be thrown.

Will be translated into the following pip command:

```
pip install pandas --latest-pip-kwarg param --latest-pip-arg
```

**disable_version_check**  Pip may periodically check PyPI to determine whether a new version of pip is available to download. Passing True for this option disables that check.

CLI Example:
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin

Complicated CLI Example:
salt '*' pip.install markdown,django editable=git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True

salt.modules.pip.is_installed(pkgname, bin_env=None, user=None, cwd=None)
New in version 2018.3.0.
Changed in version 3006.0.
Filter list of installed modules and return True if pkgname exists in the list of packages installed.
CLI Example:
salt '*' pip.is_installed salt

salt.modules.pip.list_(prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)
Changed in version 3006.0.
Output list of installed apps from pip list in JSON format and check to see if prefix exists in the list of packages installed.

Note: If the version of pip available is older than 9.0.0, parsing the freeze function output will be used to determine the name and version of installed modules.

CLI Example:
salt '*' pip.list salt

salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False, include_beta=False, include_rc=False, user=None, cwd=None, index_url=None, extra_index_url=None)
New in version 2017.7.3.
List all available versions of a pip package
pkg The package to check
bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
include_alpha Include alpha versions in the list
include_beta Include beta versions in the list
include_rc Include release candidates versions in the list
user The user under which to run pip
cwd Directory from which to run pip
index_url Base URL of Python Package Index .. versionadded:: 2019.2.0
extra_index_url Additional URL of Python Package Index .. versionadded:: 2019.2.0
CLI Example:
salt '*' pip.list_all_versions <package name>
salt.modules.pip.list_freeze_parse(prefix=None, bin_env=None, user=None, cwd=None, env_vars=None, **kwargs)

New in version 3006.0.

Filter list of installed apps from freeze and check to see if prefix exists in the list of packages installed.

**Note:** If the version of pip available is older than 8.0.3, the packages wheel, setuptools, and distribute will not be reported by this function even if they are installed. Unlike pip.freeze, this function always reports the version of pip which is installed.

CLI Example:
```
salt '*' pip.list_freeze_parse salt
```

salt.modules.pip.list_upgrades(bin_env=None, user=None, cwd=None)

Check whether or not an upgrade is available for all packages

CLI Example:
```
salt '*' pip.list_upgrades
```

salt.modules.pip.uninstall(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None, timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)

Uninstall packages individually or from a pip requirements file

- **pkgs** - comma separated list of packages to install
- **requirements** - Path to requirements file
- **bin_env** - Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. /usr/bin/pip-2.7 or /usr/bin/pip-2.6. If a directory path is specified, it is assumed to be a virtualenv.
- **log** - Log file where a complete (maximum verbosity) record will be kept
- **proxy** - Specify a proxy in the format user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

**Note:** If the Minion has a globally configured proxy - it will be used even if no proxy was set here. To explicitly disable proxy for pip you should pass False as a value.

- **timeout** - Set the socket timeout (default 15 seconds)
- **user** - The user under which to run pip
- **cwd** - Directory from which to run pip
- **use_vt** - Use VT terminal emulation (see output while installing)

CLI Example:
```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt.modules.pip.upgrade(bin_env=None, user=None, cwd=None, use_vt=False)

New in version 2015.5.0.

Upgrades outdated pip packages.

**Note:** On Windows you can’t update salt from pip using salt, so salt will be skipped
Returns a dict containing the changes.

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
```
salt '*' pip.upgrade
```

**salt.modules.pip.upgrade_available** *(pkg, bin_env=None, user=None, cwd=None)*

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:
```
salt '*' pip.upgrade_available <package name>
```

**salt.modules.pip.version** *(bin_env=None, cwd=None, user=None)*

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns `None`.

Changed in version 3001.1: The `user` parameter was added, to allow specifying the user who runs the version command.

CLI Example:
```
salt '*' pip.version
```

### 25.7.346 salt.modules.pkg_resource

Resources needed by pkg providers

**salt.modules.pkg_resource.add_pkg** *(pkgs, name, pkgver)*

Add a package to a dict of installed packages.

CLI Example:
```
salt '*' pkg_resource.add_pkg '{}' bind 9
```

**salt.modules.pkg_resource.check_extra_requirements** *(pkgnmae, pkgver)*

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return `True`.

CLI Example:
```
salt '*' pkg_resource.check_extra_requirements <pkgnmae> <extra_requirements>
```

**salt.modules.pkg_resource.format_pkg_list** *(packages, versions_as_list, attr)*

Formats packages according to parameters for `list_pkgs`.

**salt.modules.pkg_resource.format_version** *(epoch, version, release)*

Formats a version string for `list_pkgs`.

**salt.modules.pkg_resource.pack_sources** *(sources, normalize=True)*

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

```
'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]' would become {"foo": 
"salt://foo.rpm", "bar": "salt://bar.rpm"}
```
normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:
```
salt '*' pkg_resource.pack_sources '[["foo": "salt://foo.rpm"], 
  
  ["bar": "salt:// bar.rpm"]]'
```

```
salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)
```

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:
```
salt '*' pkg_resource.parse_targets
```

```
salt.modules.pkg_resource.sort_pkglist(pkgs)
```

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:
```
salt '*' pkg_resource.sort_pkglist ['3.45', '2.13']
```

```
salt.modules.pkg_resource.stringify(pkgs)
```

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:
```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

```
salt.modules.pkg_resource.version(*names, **kwargs)
```

Common interface for obtaining the version of installed packages.

CLI Example:
```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

```
salt.modules.pkg_resource.version_clean(verstr)
```

Clean the version string removing extra data. This function will simply try to call pkg.version_clean.

CLI Example:
```
salt '*' pkg_resource.version_clean <version_string>
```

```
salt.modules.pkg_resource.version_compare(ver1, oper, ver2, ignore_epoch=False)
```

Perform a version comparison, using (where available) platform-specific version comparison tools to make the comparison.

ver1 The first version to be compared
oper One of <, !=, >=, <=, >
ver2 The second version to be compared
Note: To avoid shell interpretation, each of the above values should be quoted when this function is used on the CLI.

ignore_epoch  [False] If True, both package versions will have their epoch prefix stripped before comparison.

This function is useful in Jinja templates, to perform specific actions when a package's version meets certain criteria. For example:

```
{% set postfix_version = salt.pkg.version('postfix') %}
{% if postfix_version and salt.pkg_resource.version_compare(postfix_version, '>=', '3.3', ignore_epoch=True) %}
  {%- do stuff %}
{% endif %}
```

CLI Examples:

```
salt myminion pkg_resource.version_compare '3.5' '>=' '2.4'
salt myminion pkg_resource.version_compare '3.5' '>=' '2.4' ignore_epoch=True
```

25.7.347  salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.pkgin.available_version(*names, **kwargs)

This function is an alias of latest_version.

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.file_dict(*packages, **kwargs)

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

salt.modules.pkgin.file_list(package, **kwargs)

List the files that belong to a package.

CLI Examples:
salt '*' pkg.file_list nginx

salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install the passed package

- name: The name of the package to be installed.
- refresh: Whether or not to refresh the package database before installing.
- fromrepo: Specify a package repository to install from.

Multiple Package Installation Options:

- pkgs: A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:
salt '*' pkg.install pkgs='["foo","bar"]'

- sources: A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'

Return a dict containing the new package names and versions:

```json
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }
}
```

CLI Example:
salt '*' pkg.install <package name>

salt.modules.pkgin.latest_version(*names, **kwargs)

Changed in version 2016.3.0.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...

salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)

Changed in version 2016.3.0.

List the packages currently installed as a dict:

```json
{ '<package_name>': '<version>' }
```

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

New in version 2018.3.0.

- refresh: Whether or not to refresh the package database before installing.
CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pkgin.normalize_name(pkgs, **kwargs)`  
Normalize package names

**Note:** Nothing special to do to normalize, just return the original. (We do need it to be compatible with the pkg_resource provider.)

`salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)`  
Package purges are not supported, this function is identical to `remove()`.

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.refresh_db(force=False, **kwargs)`  
Use pkg update to get latest pkg_summary

**force** Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.remove(name=None, pkgs=None, **kwargs)`  

**name** The name of the package to be deleted.

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.search(pkg_name, **kwargs)`  
Searches for an exact match using pkgin ^package$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```
salt.modules.pkgin.upgrade(refresh=True, pkgs=None, **kwargs)

Run pkg upgrade, if pkgin used. Otherwise do nothing

**refresh** Whether or not to refresh the package database before installing.

### Multiple Package Upgrade Options:

**pkgs** A list of packages to upgrade from a software repository. Must be passed as a python list.

**CLI Example:**
```
salt '*' pkg.upgrade pkgs=["foo","bar"]
```

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

**CLI Example:**
```
salt '*' pkg.upgrade
```

salt.modules.pkgin.version(*names, **kwargs)

Return a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**
```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 25.7.348 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install is not available), see here.

**Warning:** This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (pkgng.install, pkgng.delete, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the sys.doc function:
```
salt bsdminion sys.doc pkgng
```

This module provides an interface to pkg(8). It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the providers parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

salt.modules.pkgng.audit(jail=None, chroot=None, root=None)

Audits installed packages against known vulnerabilities

**CLI Example:**
**salt pkg.audit**

Audit packages within the specified jail

**CLI Example:**

```
salt '*' pkg.audit jail=<jail name or id>
```

**Jail** Audit packages within the specified jail

**CLI Example:**

```
salt '*' pkg.audit jail=<jail name or id>
```

**Chroot** Audit packages within the specified chroot (ignored if jail is specified)

**Root** Audit packages within the specified root (ignored if jail is specified)

**CLI Example:**

```
salt '*' pkg.audit chroot=/path/to/chroot
```

**salt.modules.pkgng.autoremove** *(jail=None, chroot=None, root=None, dryrun=False)*

Delete packages which were automatically installed as dependencies and are not required anymore.

**Dryrun** Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

**CLI Example:**

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

**salt.modules.pkgng.available_version** *(names, **kwargs)*

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

**CLI Example:**

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

**salt.modules.pkgng.backup** *(file_name, jail=None, chroot=None, root=None)*

Export installed packages into yaml+mtree file

**CLI Example:**

```
salt '*' pkg.backup /tmp/pkg
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

**Jail** Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

**CLI Example:**

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

**Chroot** Backup packages from the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

**Root** Backup packages from the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

**CLI Example:**

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

---

**25.7. execution modules**

2555
salt.modules.pkgng.check(jail=None, chroot=None, root=None, depends=False, recompute=False, checksum=False, checklibs=False)

Sanity checks installed packages

- **jail** Perform the sanity check in the specified jail
  
  CLI Example:
  
  ```
  salt '*' pkg.check jail=<jail name or id>
  ```

- **chroot** Perform the sanity check in the specified chroot (ignored if jail is specified)
  
  CLI Example:
  
  ```
  salt '*' pkg.check chroot=/path/to/chroot
  ```

- **root** Perform the sanity check in the specified root (ignored if jail is specified)
  
  CLI Example:
  
  ```
  salt '*' pkg.check root=/path/to/root
  ```

Of the below, at least one must be set to True.

- **depends** Check for and install missing dependencies.
  
  CLI Example:
  
  ```
  salt '*' pkg.check depends=True
  ```

- **recompute** Recompute sizes and checksums of installed packages.
  
  CLI Example:
  
  ```
  salt '*' pkg.check recompute=True
  ```

- **checksum** Find invalid checksums for installed packages.
  
  CLI Example:
  
  ```
  salt '*' pkg.check checksum=True
  ```

- **checklibs** Regenerates the library dependency metadata for a package.
  
  CLI Example:
  
  ```
  salt '*' pkg.check checklibs=True
  ```

salt.modules.pkgng.clean(jail=None, chroot=None, root=None, clean_all=False, dryrun=False)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
```
clean_all  Clean all packages from the local cache (not just those that have been superseded by newer versions).

**CLI Example:**

```
salt '*' pkg.clean clean_all=True
```

**dryrun**  Dry-run mode. This list of changes to the local cache is always printed, but no changes are actually made.

**CLI Example:**

```
salt '*' pkg.clean dryrun=True
```

```salt.modules.pkgng.delete(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, **kwargs)`

This function is an alias of `remove`.

Remove a package from the database and system

**Note:** This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

**name**  The package to remove

**CLI Example:**

```
salt '*' pkg.remove <package name>
```

**jail**  Delete the package from the specified jail

**chroot**  Delete the package from the specified chroot (ignored if `jail` is specified)

**root**  Delete the package from the specified root (ignored if `jail` is specified)

**all_installed**  Deletes all installed packages from the system and empties the database. **USE WITH CAUTION!**

**CLI Example:**

```
salt '*' pkg.remove all all_installed=True force=True
```

**force**  Forces packages to be removed despite leaving unresolved dependencies.

**CLI Example:**

```
salt '*' pkg.remove <package name> force=True
```

**glob**  Treat the package names as shell glob patterns.

**CLI Example:**

```
salt '*' pkg.remove <package name> glob=True
```

**dryrun**  Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

**CLI Example:**

```
salt '*' pkg.remove <package name> dryrun=True
```

**recurse**  Delete all packages that require the listed package as well.

**CLI Example:**
`salt '*' pkg.remove <package name> recurse=True`

**regex** Treat the package names as regular expressions.

CLI Example:
```bash
salt '*' pkg.remove <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:
```bash
salt '*' pkg.remove <extended regular expression> pcre=True
```

**salt.modules.pkgng.fetch**

```python
fetch(name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False)
```

Fetches remote packages

CLI Example:
```bash
salt '*' pkg.fetch <package name>
```

**jail** Fetch package in the specified jail

CLI Example:
```bash
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

**chroot** Fetch package in the specified chroot (ignored if jail is specified)

**root** Fetch package in the specified root (ignored if jail is specified)

CLI Example:
```bash
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

**fetch_all** Fetch all packages.

CLI Example:
```bash
salt '*' pkg.fetch <package name> fetch_all=True
```

**quiet** Quiet mode. Show less output.

CLI Example:
```bash
salt '*' pkg.fetch <package name> quiet=True
```

**fromrepo** Fetches packages from the given repo if multiple repo support is enabled. See pkg.conf(5).

CLI Example:
```bash
salt '*' pkg.fetch <package name> fromrepo=repo
```

**glob** Treat pkg_name as a shell glob pattern.

CLI Example:
```bash
salt '*' pkg.fetch <package name> glob=True
```

**regex** Treat pkg_name as a regular expression.

CLI Example:
Treat pkg_name is an extended regular expression.

CLI Example:
```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:
```
salt '*' pkg.fetch <package name> local=True
```

Fetch the package and its dependencies as well.

CLI Example:
```
salt '*' pkg.fetch <package name> depends=True
```

Version-lock packages

Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.lock instead.

name The name of the package to be held.

Multiple Package Options:

pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

This function is an alias of version.

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).

Get package version information for the specified jail

Get package version information for the specified chroot (ignored if jail is specified)

Get package version information for the specified root (ignored if jail is specified)

Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:
salt '*/' pkg.version <package name>
salt '*/' pkg.version <package name> jail=<jail name or id>
salt '*/' pkg.version <package1> <package2> <package3> ...

salt.modules.pkgng.install(name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall Requires=False, regex=False, pcre=False, batch=False, **kwargs)

Install package(s) from a repository
name The name of the package to install

CLI Example:
```
salt '*/' pkg.install <package name>
```
jail Install the package into the specified jail

CLI Example:
```
salt '*/' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:
```
salt '*/' pkg.install <package name> force=True
```
glob Treat the package names as shell glob patterns.

CLI Example:
```
salt '*/' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.

CLI Example:
```
salt '*/' pkg.install <package name> local=True
```
dryrun Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:
```
salt '*/' pkg.install <package name> dryrun=True
```

quiet Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:
```
salt '*/' pkg.install <package name> quiet=True
```

reinstall requires When used with force, reinstalls any packages that require the given package.

CLI Example:
```
salt '*/' pkg.install <package name> reinstall requires=True force=True
```

Changed in version 2014.7.0: require kwarg renamed to reinstall requires
**fromrepo**  In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

**regex**  Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

**pcre**  Treat the package names as extended regular expressions.

CLI Example:

```

```

**batch**  Use BATCH=true for pkg install, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

---

**salt.modules.pkgng.latest_version(**`names`, `**kwargs`)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

**salt.modules.pkgng.list_locked(**`**kwargs`)**

Query the package database those packages which are locked against reinstallation, modification or deletion.

Returns returns a list of package names with version strings

CLI Example:

```
salt '*' pkg.list_locked
```

**jail**  List locked packages within the specified jail

CLI Example:

```
salt '*' pkg.list_locked jail=<jail name or id>
```

**chroot**  List locked packages within the specified chroot (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked chroot=/path/to/chroot
```

**root**  List locked packages within the specified root (ignored if jail is specified)

CLI Example:

```
salt '*' pkg.list_locked root=/path/to/chroot
```
salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)

List the packages currently installed as a dict:

{'<package_name>': '<version>'}

**jail** List the packages in the specified jail

**chroot** List the packages in the specified chroot (ignored if **jail** is specified)

**root** List the packages in the specified root (ignored if **jail** is specified)

**with_origin** [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

**CLI Example:**

```shell
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

salt.modules.pkgng.list_upgrades(refresh=True, **kwargs)

List those packages for which an upgrade is available

The **fromrepo** argument is also supported, as used in pkg states.

**CLI Example:**

```shell
salt '*' pkg.list_upgrades
```

**jail** List upgrades within the specified jail

**CLI Example:**

```shell
salt '*' pkg.list_upgrades jail=<jail name or id>
```

**chroot** List upgrades within the specified chroot (ignored if **jail** is specified)

**CLI Example:**

```shell
salt '*' pkg.list_upgrades chroot=/path/to/chroot
```

**root** List upgrades within the specified root (ignored if **jail** is specified)

**CLI Example:**

```shell
salt '*' pkg.list_upgrades root=/path/to/chroot
```

salt.modules.pkgng.lock(name, **kwargs)

Lock the named package against reinstallation, modification or deletion.

Returns True if the named package was successfully locked.

**CLI Example:**

```shell
salt '*' pkg.lock <package name>
```

**jail** Lock packages within the specified jail

**CLI Example:**

```shell
salt '*' pkg.lock <package name> jail=<jail name or id>
```
chroot  Lock packages within the specified chroot (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.lock <package name> chroot=/path/to/chroot
```

root  Lock packages within the specified root (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.lock <package name> root=/path/to/chroot
```

salt.modules.pkgng.locked(name, **kwargs)
Query the package database to determine if the named package is locked against reinstallation, modification or deletion.

Returns True if the named package is locked, False otherwise.

CLI Example:

```bash
salt '*' pkg.locked <package name>
```

jail  Test if a package is locked within the specified jail

CLI Example:

```bash
salt '*' pkg.locked <package name> jail=<jail name or id>
```

chroot  Test if a package is locked within the specified chroot (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.locked <package name> chroot=/path/to/chroot
```

root  Test if a package is locked within the specified root (ignored if jail is specified)

CLI Example:

```bash
salt '*' pkg.locked <package name> root=/path/to/chroot
```

salt.modules.pkgng.parse_config(file_name='/usr/local/etc/pkg.conf')
Return dict of uncommented global variables.

CLI Example:

```bash
salt '*' pkg.parse_config
```

NOTE: not working properly right now

salt.modules.pkgng.purge(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)
This function is an alias of remove.
Remove a package from the database and system

Note:  This function can accessed using pkg.delete in addition to pkg.remove, to more closely match the CLI usage of pkg(8).

name  The package to remove

CLI Example:
salt '***' pkg.remove <package name>

**jail** Delete the package from the specified jail
**chroot** Delete the package from the specified chroot (ignored if jail is specified)
**root** Delete the package from the specified root (ignored if jail is specified)
**all_installed** Deletes all installed packages from the system and empties the database. **USE WITH CAUTION!**

CLI Example:

```bash
salt '***' pkg.remove all all_installed=True force=True
```

**force** Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```bash
salt '***' pkg.remove <package name> force=True
```

**glob** Treat the package names as shell glob patterns.

CLI Example:

```bash
salt '***' pkg.remove <package name> glob=True
```

**dryrun** Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```bash
salt '***' pkg.remove <package name> dryrun=True
```

**recurse** Delete all packages that require the listed package as well.

CLI Example:

```bash
salt '***' pkg.remove <package name> recurse=True
```

**regex** Treat the package names as regular expressions.

CLI Example:

```bash
salt '***' pkg.remove <regular expression> regex=True
```

**pcre** Treat the package names as extended regular expressions.

CLI Example:

```bash
salt '***' pkg.remove <extended regular expression> pcre=True
```

**salt.modules.pkgng.refresh_db** *(jail=None, chroot=None, root=None, force=False, **kwargs)*

Refresh PACKAGESITE contents

**Note:** This function can accessed using pkg.update in addition to pkg.refresh_db, to more closely match the CLI usage of pkg(8).

CLI Example:

```bash
salt '***' pkg.refresh_db
```

**jail** Refresh the pkg database within the specified jail
**chroot** Refresh the pkg database within the specified chroot (ignored if jail is specified)
**root** Refresh the pkg database within the specified root (ignored if jail is specified)
force  Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```bash
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.remove(name=None, pkgs=None, jail=None, chroot=None, root=None, all_installed=False, force=False, glob=False, dryrun=False, recurse=False, regex=False, pcre=False, **kwargs)`

Remove a package from the database and system

**Note:** This function can be accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

**name**  The package to remove

CLI Example:

```bash
salt '*' pkg.remove <package name>
```

**jail**  Delete the package from the specified jail

**chroot**  Delete the package from the specified chroot (ignored if `jail` is specified)

**root**  Delete the package from the specified root (ignored if `jail` is specified)

**all_installed**  Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```bash
salt '*' pkg.remove all all_installed=True force=True
```

**force**  Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```bash
salt '*' pkg.remove <package name> force=True
```

**glob**  Treat the package names as shell glob patterns.

CLI Example:

```bash
salt '*' pkg.remove <package name> glob=True
```

**dryrun**  Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```bash
salt '*' pkg.remove <package name> dryrun=True
```

**recurse**  Delete all packages that require the listed package as well.

CLI Example:

```bash
salt '*' pkg.remove <package name> recurse=True
```

**regex**  Treat the package names as regular expressions.

CLI Example:

```bash
salt '*' pkg.remove <regular expression> regex=True
```

**pcre**  Treat the package names as extended regular expressions.

CLI Example:
salt documentation, release 3006.4

```
salt '*'
```

salt.modules.pkgng.remove <extended regular expression> pcre=True

```
salt.modules.pkgng.restore(file_name, jail=None, chroot=None, root=None)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:
```
salt '*'
pkg.restore /tmp/pkg
```

jail  Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:
```
salt '*'
pkg.restore /tmp/pkg jail=<jail name or id>
```

chroot  Restore database to the specified chroot (ignored if jail is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

root  Restore database to the specified root (ignored if jail is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:
```
salt '*'
pkg.restore /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.search(name, jail=None, chroot=None, root=None, exact=False, glob=False, regex=False, pcre=False, comment=False, desc=False, full=False, depends=False, size=False, quiet=False, origin=False, prefix=False)

Searches in remote package repositories

CLI Example:
```
salt '*'
pkg.search pattern
```

jail  Perform the search using the pkg.conf(5) from the specified jail

CLI Example:
```
salt '*'
pkg.search pattern jail=<jail name or id>
```

chroot  Perform the search using the pkg.conf(5) from the specified chroot (ignored if jail is specified)

root  Perform the search using the pkg.conf(5) from the specified root (ignored if jail is specified)

CLI Example:
```
salt '*'
pkg.search pattern chroot=/path/to/chroot
```

exact  Treat pattern as exact pattern.

CLI Example:
```
salt '*'
pkg.search pattern exact=True
```

glob  Treat pattern as a shell glob pattern.

CLI Example:
```
salt '*'
pkg.search pattern glob=True
```
regex  Treat pattern as a regular expression.

CLI Example:

```bash
salt '*' pkg.search pattern regex=True
```

pcre  Treat pattern as an extended regular expression.

CLI Example:

```bash
salt '*' pkg.search pattern pcre=True
```

comment  Search for pattern in the package comment one-line description.

CLI Example:

```bash
salt '*' pkg.search pattern comment=True
```

desc  Search for pattern in the package description.

CLI Example:

```bash
salt '*' pkg.search pattern desc=True
```

full  Displays full information about the matching packages.

CLI Example:

```bash
salt '*' pkg.search pattern full=True
```

depends  Displays the dependencies of pattern.

CLI Example:

```bash
salt '*' pkg.search pattern depends=True
```

size  Displays the size of the package

CLI Example:

```bash
salt '*' pkg.search pattern size=True
```

quiet  Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```bash
salt '*' pkg.search pattern quiet=True
```

origin  Displays pattern origin.

CLI Example:

```bash
salt '*' pkg.search pattern origin=True
```

prefix  Displays the installation prefix for each package matching pattern.

CLI Example:

```bash
salt '*' pkg.search pattern prefix=True
```

```python
salt.modules.pkgng.stats(local=False, remote=False, jail=None, chroot=None, root=None, bytes=False)
```

Return pkgng stats.

CLI Example:
salt '('* pkg.stats

local  Display stats only for the local package database.

   CLI Example:
   
   salt '* pkg.stats local=True

remote  Display stats only for the remote package database(s).

   CLI Example:
   
   salt '* pkg.stats remote=True

bytes  Display disk space usage in bytes only.

   CLI Example:
   
   salt '* pkg.stats bytes=True

jail  Retrieve stats from the specified jail.

   CLI Example:
   
   salt '* pkg.stats jail=<jail name or id> local=True
   salt '* pkg.stats jail=<jail name or id> remote=True

chroot  Retrieve stats from the specified chroot (ignored if jail is specified).

root  Retrieve stats from the specified root (ignored if jail is specified).

   CLI Example:
   
   salt '* pkg.stats chroot=/path/to/chroot
   salt '* pkg.stats chroot=/path/to/chroot local=True
   salt '* pkg.stats chroot=/path/to/chroot remote=True

salt.modules.pkgng.unhold(name=None, pkgs=None, **kwargs)

Remove version locks

Note: This function is provided primarily for compatibility with some parts of states.pkg. Consider using pkg.unlock instead.

name  The name of the package to be unheld

Multiple Package Options:
pkgs  A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

   Returns a dict containing the changes.

   CLI Example:
   
   salt '* pkg.unhold <package name>
   salt '* pkg.unhold pkgs=['"foo", "bar"]'

salt.modules.pkgng.unlock(name, **kwargs)

Unlock the named package against reinstallation, modification or deletion.

   Returns True if the named package was successfully unlocked.

   CLI Example:
salt '*' pkg.unlock <package name>

**jail** Unlock packages within the specified jail

CLI Example:

```
salt '*' pkg.unlock <package name> jail=<jail name or id>
```

**chroot** Unlock packages within the specified chroot (ignored if *jail* is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> chroot=/path/to/chroot
```

**root** Unlock packages within the specified root (ignored if *jail* is specified)

CLI Example:

```
salt '*' pkg.unlock <package name> root=/path/to/chroot
```

salt.modules.pkgng.update(*jail=*, *chroot=*, *root=*, *force=False*, **kwargs)

This function is an alias of refresh_db.

Refresh PACKAGESITE contents

**Note:** This function can be accessed using *pkg.update* in addition to *pkg.refresh_db*, to more closely match the CLI usage of pkg(8).

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pkgng.update_package_site(*new_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use http://, ftp://, or https:// protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

salt.modules.pkgng.updating(*name*, *jail=*, *chroot=*, *root=*, *filedate=*, *filename=*)

‘Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```
jail  Perform the action in the specified jail
   CLI Example:
   ```
salt '* pkg.updating foo jail=<jail name or id>
```

chroot  Perform the action in the specified chroot (ignored if jail is specified)
root   Perform the action in the specified root (ignored if jail is specified)
   CLI Example:
   ```
salt '* pkg.updating foo chroot=/path/to/chroot
```

filedate  Only entries newer than date are shown. Use a YYYYMMDD date format.
   CLI Example:
   ```
salt '* pkg.updating foo filedate=20130101
```

filename  Defines an alternative location of the UPDATING file.
   CLI Example:
   ```
salt '* pkg.updating foo filename=/tmp/UPDATING
```

salt.modules.pkgng.upgrade(*names, **kwargs)
   Upgrade named or all packages (run a pkg upgrade). If <package name> is omitted, the operation is executed on all packages.
   Returns a dictionary containing the changes:
   ```
{"<package>": {'old': '<old-version>', 'new': '<new-version>'}}
```
   CLI Example:
   ```
salt '*' pkg.upgrade <package name>
```

jail  Audit packages within the specified jail
   CLI Example:
   ```
salt '* pkg.upgrade <package name> jail=<jail name or id>
```

chroot  Audit packages within the specified chroot (ignored if jail is specified)
root   Audit packages within the specified root (ignored if jail is specified)
   CLI Example:
   ```
salt '* pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with jail or chroot.

force  Force reinstalling/upgrading the whole set of packages.
   CLI Example:
   ```
salt '*' pkg.upgrade <package name> force=True
```

local  Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg upgrade.
   CLI Example:
Salt Documentation, Release 3006.4

`salt '*' pkg.upgrade <package name> local=True`

**dryrun**  Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

**fromrepo**  In multi-repo mode, override the pkg.conf ordering and only attempt to upgrade packages from the named repository.

CLI Example:

```
salt '*' pkg.upgrade <package name> fromrepo=repo
```

**fetchonly**  Do not perform installation of packages, merely fetch packages that should be upgraded and detect possible conflicts.

CLI Example:

```
salt '*' pkg.upgrade <package name> fetchonly=True
```

salt.modules.pkgng.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**Note:** This function can accessed using pkg.info in addition to pkg.version, to more closely match the CLI usage of pkg(8).

**jail**  Get package version information for the specified jail

**chroot**  Get package version information for the specified chroot (ignored if jail is specified)

**root**  Get package version information for the specified root (ignored if jail is specified)

**with_origin**  [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ... 
```

salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```
jail  Perform the check in the specified jail

CLI Example:

```sh
salt '* pkg.which <file name> jail=<jail name or id>
```

chroot  Perform the check in the specified chroot (ignored if jail is specified)

root  Perform the check in the specified root (ignored if jail is specified)

CLI Example:

```sh
salt '* pkg.which <file name> chroot=/path/to/chroot
```

origin  Shows the origin of the package instead of name-version.

CLI Example:

```sh
salt '* pkg.which <file name> origin=True
```

quiet  Quiet output.

CLI Example:

```sh
salt '* pkg.which <file name> quiet=True
```

25.7.349 salt.modules.pkgutil

Pkgutil support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to ‘pkg.install’ is not available), see here.

salt.modules.pkgutil.available_version(*names*, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```sh
salt '* pkgutil.latest_version CSWpython
salt '* pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.install(*name=None, refresh=False, version=None, pkgs=None, **kwargs*)

Install packages using the pkgutil tool.

CLI Example:

```sh
salt '* pkg.install <package_name>
salt '* pkg.install SMClgcc346
```

Multiple Package Installation Options:

**pkgs**  A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:
salt ['*'] pkg.install pkgs='["foo", "bar"]'
salt ['*'] pkg.install pkgs='["foo", {"bar": "1.2.3"}]'

Returns a dict containing the new package names and versions:

{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}

salt.modules.pkgutil.latest_version('names', **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...

salt.modules.pkgutil.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

{'<package_name>': '<version>'}

CLI Example:

salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True

salt.modules.pkgutil.list_upgrades(refresh=True, **kwargs)

List all available package upgrades on this system

CLI Example:

salt '*' pkgutil.list_upgrades

salt.modules.pkgutil.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported, this function is identical to remove().

name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'

salt.modules.pkgutil.refresh_db()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

salt '*' pkgutil.refresh_db
salt.modules.pkgutil.remove(name=None, pkgs=None, **kwargs)
Remove a package and all its dependencies which are not in use by other packages.

Multiple Package Options:

name The name of the package to be deleted.

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

salt.modules.pkgutil.upgrade(refresh=True)
Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```json
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```bash
salt '*' pkgutil.upgrade
```

salt.modules.pkgutil.upgrade_available(name)
Check if there is an upgrade available for a certain package

CLI Example:

```bash
salt '*' pkgutil.upgrade_available CSWpython
```

salt.modules.pkgutil.version(*names, **kwargs)
Returns a version if the package is installed, else returns an empty string

CLI Example:

```bash
salt '*' pkgutil.version CSWpython
```

25.7.350 salt.modules.portage_config

Configure portage(5)

salt.modules.portage_config.append_to_package_conf(conf, atom='', flags=None, string='', overwrite=False)
Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```bash
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -\nlibvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1 -\n" flags=['ldap', '-libvirt']"
```
salt.modules.portage_config.append_use_flags(atom, uses=None, overwrite=False)

Append a list of use flags for a given package or DEPEND atom

CLI Example:
```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "[ldap', '->libvirt']"
```

salt.modules.portage_config.enforce_nice_config()

Enforce a nice tree structure for /etc/portage/package.* configuration files.

See also:
salt.modules.ebuild.ex_mod_init() for information on automatically running this when pkg is used.

CLI Example:
```
salt '*' portage_config.enforce_nice_config
```

salt.modules.portage_config.filter_flags(use, use_expand_hidden, usemasked, useforced)

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

salt.modules.portage_config.get_all_cpv_use(cp)

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return: use, use_expand_hidden, usemask, useforce

salt.modules.portage_config.get_cleared_flags(cp)

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

salt.modules.portage_config.get_flags_from_package_conf(conf, atom)

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.get_flags_from_package_conf license salt
```

salt.modules.portage_config.get_installed_use(cp, use='USE')

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags
salt.modules.portage_config.get_iuse(cp)
New in version 2015.8.0.
Gets the current IUSE flags from the tree.
@type: cpv: string @param cpv: cat/pkg @type list @returns [] or the list of IUSE flags

salt.modules.portage_config.get_missing_flags(conf, atom, flags)
Find out which of the given flags are currently not set.

CLI Example:
```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl']"
```

salt.modules.portage_config.has_flag(conf, atom, flag)
Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.has_use(atom, use)
Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.has_use salt libvirt
```

salt.modules.portage_config.is_changed_uses(cp)
New in version 2015.8.0.
Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.is_present(conf, atom)
Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:
```
salt '*' portage_config.is_present unmask salt
```

### 25.7.351 salt.modules.postfix

Support for Postfix
This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.delete(queue_id)
Delete message(s) from the mail queue

CLI Example:
salt 'salt' postfix.delete 5C33CA0DEA
salt 'salt' postfix.delete ALL

**salt.modules.postfix.hold(queue_id)**
Put message(s) on hold from the mail queue

CLI Example:
salt 'salt' postfix.hold 5C33CA0DEA
salt 'salt' postfix.hold ALL

**salt.modules.postfix.requeue(queue_id)**
Requeue message(s) in the mail queue

CLI Example:
salt 'salt' postfix.requeue 5C33CA0DEA
salt 'salt' postfix.requeue ALL

**salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')**
Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:
salt <minion> postfix.set_main mailq_path /usr/bin/mailq

**salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y',
        wakeup='n', maxproc='100', command='', write_conf=True,
        path='/etc/postfix/master.cf')**
Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation.

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the write_conf option to False, it will skip writing the file.

CLI Example:
salt <minion> postfix.set_master smtp inet n y n 100 smtpd

**salt.modules.postfix.show_main(path='/etc/postfix/main.cf')**
Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:
salt <minion> postfix.show_main
salt <minion> postfix.show_main path=/path/to/main.cf
salt.modules.postfix.show_master(path='/etc/postfix/master.cf')
    Return a dict of active config values. This does not include comments, spacing or order.
    The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.
    CLI Examples:
    
    salt <minion> postfix.show_master
    salt <minion> postfix.show_master path=/path/to/master.cf

salt.modules.postfix.show_queue()
    Show contents of the mail queue
    CLI Example:
    
    salt '*' postfix.show_queue

salt.modules.postfix.unhold(queue_id)
    Set held message(s) in the mail queue to unheld
    CLI Example:
    
    salt '*' postfix.unhold 5C33CA0DEA
    salt '*' postfix.unhold ALL

25.7.352 salt.modules.postgres

Module to provide Postgres compatibility to salt.

    configuration In order to connect to Postgres, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

    postgres.host: 'localhost'
    postgres.port: '5432'
    postgres.user: 'postgres' -> db user
    postgres.pass: ''
    postgres.maintenance_db: 'postgres'

    The default for the maintenance_db is 'postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar

    To prevent Postgres commands from running arbitrarily long, a timeout (in seconds) can be set

    postgres.timeout: 60

    New in version 3006.0.

    note This module uses MD5 hashing which may not be compliant with certain security audits.

    note When installing postgres from the official postgres repos, on certain linux distributions, either the psql or the initdb binary is not automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

    postgres.bins_dir: '/usr/pgsql-9.5/bin/'
salt.modules.postgres.available_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

List available postgresql extensions

CLI Example:
```
salt '*' postgres.available_extensions
```

salt.modules.postgres.create_extension(name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Install a postgresql extension

CLI Example:
```
salt '*' postgres.create_extension 'adminpack'
```

salt.modules.postgres.create_metadata(name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get lifecycle information about an extension

CLI Example:
```
salt '*' postgres.create_metadata adminpack
```

salt.modules.postgres.datadir_exists(name)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:
```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name  Name of the directory to check

salt.modules.postgres.datadir_init(name, auth='password', user=None, password=None, encoding='UTF8', locale=None, waldir=None, checksums=False, runas=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:
```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name  The name of the directory to initialize
auth  The default authentication method for local connections
password  The password to set for the postgres user
user  The database superuser name
encoding  The default encoding for new databases
locale  The default locale for new databases
waldir  The transaction log (WAL) directory (default is to keep WAL inside the data directory)

New in version 2019.2.0.
checksums  If True, the cluster will be created with data page checksums.

Note: Data page checksums are supported since PostgreSQL 9.3.

New in version 2019.2.0.

runas  The system user the operation should be performed on behalf of

salt.modules.postgres.db_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, owner=None, owner_recursive=False, runas=None)

Change tablespace or/and owner of database.

CLI Example:

    salt '*' postgres.db_alter dbname owner=otheruser

salt.modules.postgres.db_create(name, user=None, host=None, port=None, maintenance_db=None, password=None, tablespace=None, encoding=None, lc_collate=None, lc_ctype=None, owner=None, template=None, runas=None)

Adds a databases to the Postgres server.

CLI Example:

    salt '*' postgres.db_create 'dbname'
    salt '*' postgres.db_create 'dbname' template=template_postgis

salt.modules.postgres.db_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a database exists on the Postgres server.

CLI Example:

    salt '*' postgres.db_exists 'dbname'

salt.modules.postgres.db_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return dictionary with information about databases of a Postgres server.

CLI Example:

    salt '*' postgres.db_list

salt.modules.postgres.db_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a databases from the Postgres server.

CLI Example:

    salt '*' postgres.db_remove 'dbname'

salt.modules.postgres.drop_extension(name, if_exists=None, restrict=None, cascade=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Drop an installed postgresql extension

CLI Example:
salt '*' postgres.drop_extension 'adminpack'

salt.modules.postgres.get_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get info about an available postgresql extension

CLI Example:

salt '*' postgres.get_available_extension plpgsql

salt.modules.postgres.get_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Get info about an installed postgresql extension

CLI Example:

salt '*' postgres.get_installed_extension plpgsql

salt.modules.postgres.group_create(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolerolepassword=None, groups=None, runas=None)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

salt '*' postgres.group_create 'groupname' user='user' host='hostname' port='port' password='password' rolepassword='rolepassword'

salt.modules.postgres.group_remove(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Removes a group from the Postgres server.

CLI Example:

salt '*' postgres.group_remove 'groupname'

salt.modules.postgres.group_update(groupname, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, login=None, inherit=None, superuser=None, replication=None, rolerolepassword=None, groups=None, runas=None)

Updates a postgres group

CLI Examples:

salt '*' postgres.group_update 'username' user='user' host='hostname' port='port' password='password' rolepassword='rolepassword'

salt.modules.postgres.has_privileges(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.
Check if a role has the specified privileges on an object

CLI Example:

```sh
salt '*' postgres.has_privileges user_name table_name table \\ SELECT,INSERT maintenance_db=db_name
```

- **name** Name of the role whose privileges should be checked on object_type
- **object_name** Name of the object on which the check is to be performed
- **object_type** The object type, which can be one of the following:
  - table
  - sequence
  - schema
  - tablespace
  - language
  - database
  - group
  - function
- **privileges** Comma separated list of privileges to check, from the list below:
  - INSERT
  - CREATE
  - TRUNCATE
  - CONNECT
  - TRIGGER
  - SELECT
  - USAGE
  - TEMPORARY
  - UPDATE
  - EXECUTE
  - REFERENCES
  - DELETE
  - ALL
- **grant_option** If grant_option is set to True, the grant option check is performed
- **prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default `public` schema
- **maintenance_db** The database to connect to
- **user** database username if different from config or default
- **password** user password if any password for a specified user
- **host** Database host if different from config or default
- **port** Database port if different from config or default
- **runas** System user all operations should be performed on behalf of

```python
salt.modules.postgres.installed_extensions(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

List installed postgresql extensions

CLI Example:

```sh
salt '*' postgres.installed_extensions
```

```python
salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
```

Test if a specific extension is available

CLI Example:
salt '*' postgres.is_available_extension

salt.modules.postgres.is_installed_extension(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

salt.modules.postgres.language_create(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

name Language to install

maintenance_db The database to install the language in

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

salt.modules.postgres.language_exists(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name Language to check for

maintenance_db The database to check in

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

salt.modules.postgres.language_list(maintenance_db, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db The database to check

user database username if different from config or default

password user password if any password for a specified user
**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```python
salt.modules.postgres.language_remove(name, maintenance_db, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```bash
salt '*' postgres.language_remove plpgsql dbname
```

**name** Language to remove

**maintenance_db** The database to install the language in

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

```python
salt.modules.postgres.owner_to(dbname, ownername, user=None, host=None, port=None, password=None, runas=None)
```

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```bash
salt '*' postgres.owner_to 'dbname' 'username'
```

```python
salt.modules.postgres.privileges_grant(name, object_name, object_type, privileges=None, grant_option=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```bash
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

**name** Name of the role to which privileges should be granted

**object_name** Name of the object on which the grant is to be performed

**object_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**privileges** Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
Salt Documentation, Release 3006.4

- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

**grant_option** If grant_option is set to True, the recipient of the privilege can in turn grant it to others

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

**salt.modules.postgres.privileges_list**(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Return a list of privileges for the specified object.

**CLI Example:**
```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

**name** Name of the object for which the permissions should be returned

**object_type** The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

**prepend** Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

**maintenance_db** The database to connect to

**user** database username if different from config or default

**password** user password if any password for a specified user

**host** Database host if different from config or default

**port** Database port if different from config or default

**runas** System user all operations should be performed on behalf of

**salt.modules.postgres.privileges_revoke**(name, object_name, object_type, privileges=None, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)

New in version 2016.3.0.

Revoke privileges on a postgres object

**CLI Example:**
name Name of the role whose privileges should be revoked
object_name Name of the object on which the revoke is to be performed
object_type The object type, which can be one of the following:
  • table
  • sequence
  • schema
  • tablespace
  • language
  • database
  • group
  • function
privileges Comma separated list of privileges to revoke, from the list below:
  • INSERT
  • CREATE
  • TRUNCATE
  • CONNECT
  • TRIGGER
  • SELECT
  • USAGE
  • TEMPORARY
  • UPDATE
  • EXECUTE
  • REFERENCES
  • DELETE
  • ALL
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.psql_query(query, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, write=False)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING rolconnlimit) SELECT * FROM updated;
query The query string.
user Database username, if different from config or default.
host Database host, if different from config or default.
port Database port, if different from the config or default.
maintenance_db The database to run the query against.
password User password, if different from the config or default.
runas User to run the command as.
write Mark query as READ WRITE transaction.

CLI Example:
salt '*' postgres.psql_query 'select * from pg_stat_activity'
salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)

Return a dict with information about users of a Postgres server. Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \ 
  user='user' \ 
  db_user='user' db_password='password' 
  db_host='hostname' db_port='port'
```

salt.modules.postgres.schema_exists(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname Database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_get(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname Database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.schema_list(dbname, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Return a dict with information about schemas in a Postgres database.

CLI Example:
salt '*' postgres.schema_list dbname

dbname  Database name we query on
user   The system user the operation should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None, db_password=None, db_host=None, db_port=None)

Removes a schema from the Postgres server.

CLI Example:
salt '*' postgres.schema_remove dbname schemaname

dbname  Database name we work on
schemaname  The schema's name we’ll remove
user   System user all operations should be performed on behalf of
db_user  database username if different from config or default
db_password  user password if any password for a specified user
db_host  Database host if different from config or default
db_port  Database port if different from config or default

salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, maintenance_db=None, password=None, new_name=None, new_owner=None, set_option=None, reset_option=None, runas=None)

Change tablespace name, owner, or options.

CLI Example:
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option=\"\{'seq_page_cost': '1.1'\}\"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost

New in version 2015.8.0.

salt.modules.postgres.tablespace_create(name, location, options=None, owner=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Adds a tablespace to the Postgres server.

CLI Example:
salt '*' postgres.tablespace_create tablespacename '/path/datadir'

New in version 2015.8.0.

salt.modules.postgres.tablespace_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Checks if a tablespace exists on the Postgres server.

CLI Example:
salt '*' postgres.tablespace_exists 'dbname'
New in version 2015.8.0.
salt.modules.postgres.tablespace_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Return dictionary with information about tablespaces of a Postgres server.

CLI Example:
salt '*' postgres.tablespace_list

New in version 2015.8.0.
salt.modules.postgres.tablespace_remove(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Removes a tablespace from the Postgres server.

CLI Example:
salt '*' postgres.tablespace_remove tsname

New in version 2015.8.0.
salt.modules.postgres.user_create(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, inherit=None, login=None, connlimit=None, encrypted=None, superuser=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)
Creates a Postgres user.

CLI Examples:
salt '*' postgres.user_create 'username' user='user' 
  host='hostname' port='port' password='password' \
  rolepassword='rolepassword' valid_until='valid_until'

salt.modules.postgres.user_exists(name, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Checks if a user exists on the Postgres server.

CLI Example:
salt '*' postgres.user_exists 'username'

salt.modules.postgres.user_list(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False)
Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:
salt '*' postgres.user_list

salt.modules.postgres.user_remove(username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)
Removes a user from the Postgres server.

CLI Example:
salt '*' postgres.user_remove 'username'
salt.modules.postgres.user_update(username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None)

Updates a Postgres user.

CLI Examples:

```bash
salt '*' postgres.user_update 'username' user='user' \ host='hostname' port='port' password='password' \ rolepassword='rolepassword' valid_until='valid_until'
```

salt.modules.postgres.version(user=None, host=None, port=None, maintenance_db=None, password=None, runas=None)

Return the version of a Postgres server.

CLI Example:

```bash
salt '*' postgres.version
```

25.7.353 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.bulk_build(jail, pkg_file, keep=False)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```bash
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

salt.modules.poudriere.create_jail(name, arch, version='9.0-RELEASE')

Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:

```bash
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.create_ports_tree()

Not working need to run portfetch non interactive

salt.modules.poudriere.delete_jail(name)

Deletes poudriere jail with name

CLI Example:

```bash
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.info_jail(name)

Show information on name poudriere jail

CLI Example:
salt '*' poudriere.info_jail head-amd64

salt.modules.poudriere.is_jail(name)
Return True if jail exists False if not
CLI Example:
salt '*' poudriere.is_jail <jail name>

salt.modules.poudriere.list_jails()
Return a list of current jails managed by poudriere
CLI Example:
salt '*' poudriere.list_jails

salt.modules.poudriere.list_ports()
Return a list of current port trees managed by poudriere
CLI Example:
salt '*' poudriere.list_ports

salt.modules.poudriere.make_pkgng_aware(jname)
Make jail jname pkgng aware
CLI Example:
salt '*' poudriere.make_pkgng_aware <jail name>

salt.modules.poudriere.parse_config(config_file=None)
Returns a dict of poudriere main configuration definitions
CLI Example:
salt '*' poudriere.parse_config

salt.modules.poudriere.update_jail(name)
Run freebsd-update on name poudriere jail
CLI Example:
salt '*' poudriere.update_jail freebsd:10:x86:64

salt.modules.poudriere.update_ports_tree(ports_tree)
Updates the ports tree, either the default or the ports_tree specified
CLI Example:
salt '*' poudriere.update_ports_tree staging

salt.modules.poudriere.version()
Return poudriere version
CLI Example:
salt '*' poudriere.version

25.7. execution modules
25.7.354 salt.modules.powerpath

powerpath support.
Assumes RedHat
salt.modules.powerpath.add_license(key)
    Add a license
salt.modules.powerpath.has_powerpath()
salt.modules.powerpath.list_licenses()
    returns a list of applied powerpath license keys
salt.modules.powerpath.remove_license(key)
    Remove a license

25.7.355 salt.modules.proxy

This module allows you to manage proxy settings

salt '*' network.get_http_proxy

salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')
    Returns the current ftp proxy settings
    network_service The network service to apply the changes to, this only necessary on macOS
    CLI Example:
    salt '*' proxy.get_ftp_proxy Ethernet

salt.modules.proxy.get_http_proxy(network_service='Ethernet')
    Returns the current http proxy settings
    network_service The network service to apply the changes to, this only necessary on macOS
    CLI Example:
    salt '*' proxy.get_http_proxy Ethernet

salt.modules.proxy.get_https_proxy(network_service='Ethernet')
    Returns the current https proxy settings
    network_service The network service to apply the changes to, this only necessary on macOS
    CLI Example:
    salt '*' proxy.get_https_proxy Ethernet

salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')
    Returns the current domains that can bypass the proxy
    network_service The network service to get the bypass domains from, this is only necessary on macOS
    CLI Example:
    salt '*' proxy.get_proxy_bypass

salt.modules.proxy.get_proxy_win()
    Gets all of the proxy settings in one call, only available on Windows
    CLI Example:
    salt '*' proxy.get_proxy_win
salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the ftp proxy settings
- server: The proxy server to use
- port: The port used by the proxy server
- user: The username to use for the proxy server if required
- password: The password to use if required by the server
- network_service: The network service to apply the changes to, this only necessary on macOS
- bypass_hosts: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
```

salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.
- server: The proxy server to use
- port: The port used by the proxy server
- user: The username to use for the proxy server if required
- password: The password to use if required by the server
- network_service: The network service to apply the changes to, this only necessary on macOS
- bypass_hosts: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_pass
```

salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.
- server: The proxy server to use
- port: The port used by the proxy server
- user: The username to use for the proxy server if required
- password: The password to use if required by the server
- network_service: The network service to apply the changes to, this only necessary on macOS
- bypass_hosts: The hosts that are allowed to by pass the proxy. Only used on Windows for other OS’s use set_proxy_bypass to edit the bypass hosts.

CLI Example:
```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_pass
```

salt.modules.proxy.set_proxy_bypass(domains, network_service='Ethernet')

Sets the domains that can bypass the proxy
- domains: An array of domains allowed to bypass the proxy
- network_service: The network service to apply the changes to, this only necessary on macOS

CLI Example:
```
salt '*' proxy.set_proxy_bypass "["127.0.0.1", 'localhost']"
```

salt.modules.proxy.set_proxy_win(server, port, types=None, bypass_hosts=None)

salt.25.7. execution modules 2593
Sets the http proxy settings, only works with Windows.

- **server** The proxy server to use
- **password** The password to use if required by the server
- **types** The types of proxy connections should be setup with this server. Valid types are:
  - http
  - https
  - ftp

- **bypass_hosts** The hosts that are allowed to bypass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types=['http', 'https']
```

## 25.7.356 salt.modules.ps

A salt interface to psutil, a system and process library. See [http://code.google.com/p/psutil](http://code.google.com/p/psutil).

### depends

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

#### salt.modules.ps.boot_time

*Return the boot time in number of seconds since the epoch began.*

CLI Example:

```
salt '*' ps.boot_time
```

#### salt.modules.ps.cpu_percent

*Return the percent of time the CPU is busy.*

- **interval** the number of seconds to sample CPU usage over
- **per_cpu** if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

#### salt.modules.ps.cpu_times

*Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.*

- **per_cpu** if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

#### salt.modules.ps.disk_io_counters

*Return disk I/O statistics.*

CLI Example:

```
salt '*' ps.disk_io_counters
salt '*' ps.disk_io_counters device=sda1
```
salt.modules.ps.disk_partition_usage(all=False)
    Return a list of disk partitions plus the mount point, filesystem and usage statistics.
    CLI Example:
    ```
    salt '*' ps.disk_partition_usage
    ```

salt.modules.ps.disk_partitions(all=False)
    Return a list of disk partitions and their device, mount point, and filesystem type.
    All if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.
    CLI Example:
    ```
    salt '*' ps.disk_partitions
    ```

salt.modules.ps.disk_usage(path)
    Given a path, return a dict listing the total available space as well as the free space, and used space.
    CLI Example:
    ```
    salt '*' ps.disk_usage /home
    ```

salt.modules.ps.get_pid_list()
    Return a list of process ids (PIDs) for all running processes.
    CLI Example:
    ```
    salt '*' ps.get_pid_list
    ```

salt.modules.ps.get_users()
    Return logged-in users.
    CLI Example:
    ```
    salt '*' ps.get_users
    ```

salt.modules.ps.kill_pid(pid, signal=15)
    Kill a process by PID.
    ```
    salt 'minion' ps.kill_pid pid [signal=signal_number]
    ```
    pid PID of process to kill.
    signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).
    Example:
    Send SIGKILL to process with PID 2000:
    ```
    salt 'minion' ps.kill_pid 2000 signal=9
    ```

salt.modules.ps.lsof(name)
    Retrieve the lsof information of the given process name.
    CLI Example:
    ```
    salt '*' ps.lsof apache2
    ```

salt.modules.ps.netstat(name)
    Retrieve the netstat information of the given process name.
    CLI Example:
salt.modules.ps.*

salt.modules.ps.network_io_counters(interface=None)
Return network I/O statistics.

CLI Example:
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0

salt.modules.ps.num_cpus()
Return the number of CPUs.

CLI Example:
salt '*' ps.num_cpus

salt.modules.ps.pgrep(pattern, user=None, full=False, pattern_is_regex=False)
Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

salt '*' ps.pgrep pattern [user=username] [full=(true|false)]

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.
pattern_is_regex This flag enables ps.pgrep to mirror the regex search functionality found in the pgrep command line utility.

New in version 3001.

Examples:
Find all httpd processes on all 'www' minions:
salt 'www.*' ps.pgrep httpd

Find all bash processes owned by user 'tom':
salt '*' ps.pgrep bash user=tom

salt.modules.ps.pkill(pattern, user=None, signal=15, full=False)
Kill processes matching a pattern.

salt '*' ps.pkill pattern [user=username] [signal=signal_number] \[
[full=(true|false)]

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:
Send SIGHUP to all httpd processes on all 'www' minions:
salt 'www.*' ps.pkill httpd signal=1

Send SIGKILL to all bash processes owned by user 'tom':

salt 'x' ps.pkill bash signal=9 user=tom

salt.modules.ps.proc_info(pid, attrs=None)

Return a dictionary of information for a process id (PID).

CLI Example:

salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'

pid  PID of process to query.

attrs  Optional list of desired process attributes. The list of possible attributes can be found here: https://psutil.readthedocs.io/en/latest/#processes

salt.modules.ps.psaux(name)

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:

salt '*' ps.psaux www-data.+apache2

salt.modules.ps.sss(name)

Retrieve the ss information of the given process name.

CLI Example:

salt '*' ps.ss apache2

New in version 2016.11.6.

salt.modules.ps.status(status)

New in version 3006.0.

Returns a list of processes according to their state.

CLI Example:

salt '*' ps.status STATUS

where STATUS is one of

- running
- sleeping
- disk_sleep
- stopped
- tracing_stop
- zombie
- dead
- wake_kill
- waking
- parked (Linux)
- idle (Linux, macOS, FreeBSD)
- locked (FreeBSD)
- waiting (FreeBSD)
• suspended (NetBSD)

salt.modules.ps.swap_memory()
New in version 2014.7.0.
Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:
```
salt '*' ps.swap_memory
```

salt.modules.ps.top(num_processes=5, interval=3)
Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:
```
salt '*' ps.top
salt '*' ps.top 5 10
```

salt.modules.ps.total_physical_memory()
Return the total number of bytes of physical memory.

CLI Example:
```
salt '*' ps.total_physical_memory
```

salt.modules.ps.virtual_memory()
New in version 2014.7.0.
Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:
```
salt '*' ps.virtual_memory
```

25.7.357 salt.modules.publish

Publish a command from a minion to a target

salt.modules.publish.full_data(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5)
Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:
```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention
If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```bash
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

salt.modules.publish.publish(tgt, fun, arg=None, tgt_type='glob', returner='', timeout=5, via_master=None)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```bash
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```bash
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

**Attention**

If you need to pass a value to a function argument and that value contains an equal sign, you must include the argument name. For example:

```bash
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```bash
salt '*' publish.publish test.kwarg arg="[cheese=spam,'spam=cheese']"
```

When running via salt-call, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.
salt.modules.publish.runner(fun, arg=None, timeout=5)
   Execute a runner on the master and return the data from the runner function
   CLI Example:
   
   salt publish.runner manage.down

25.7.358 salt.modules.puppet

Execute puppet routines

salt.modules.puppet.disable(message=None)
   New in version 2014.7.0.
   Disable the puppet agent
   message  New in version 2015.5.2.
      Disable message to send to puppet
   CLI Example:
   
   salt '*' puppet.disable
   salt '*' puppet.disable 'Disabled, contact XYZ before enabling'

salt.modules.puppet.enable()
   New in version 2014.7.0.
   Enable the puppet agent
   CLI Example:
   
   salt '*' puppet.enable

salt.modules.puppet.fact(name, puppet=False)
   Run facter for a specific fact
   CLI Example:
   
   salt '*' puppet.fact kernel

salt.modules.puppet.facts(puppet=False)
   Run facter and return the results
   CLI Example:
   
   salt '*' puppet.facts

salt.modules.puppet.noop(*args, **kwargs)
   Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.
   CLI Example:
   
   salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules→tags=basefiles::edit,apache::server
salt.modules.puppet.plugin_sync()

Runs a plugin sync between the puppet master and agent

CLI Example:
```
salt '*' puppet.plugin_sync
```

salt.modules.puppet.run(*args, **kwargs)

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:
```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
   →tags=basefiles::edit,apache::server
```

salt.modules.puppet.status()

New in version 2014.7.0.

Display puppet agent status

CLI Example:
```
salt '*' puppet.status
```

salt.modules.puppet.summary()

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:
```
salt '*' puppet.summary
```

25.7.359 salt.modules.purefa

Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the purestorage python package in your python installation path that is running salt.

  ```
  pip install purestorage
  ```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

  1) From the minion config
pure_tags:
  fa:
    san_ip: management vip or hostname for the FlashArray
    api_token: A valid api token for the FlashArray being managed

2) From environment (PUREFA_IP and PUREFA_API)

3) From the pillar (PUREFA_IP and PUREFA_API)

maintainer Simon Dodsley (simon@purestorage.com)
maturity new
requires purestorage
platform all

New in version 2018.3.0.
salt.modules.purefa.hg_create(name, host=None, volume=None)
Create a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup already exists, or if named host or volume do not exist.
New in version 2018.3.0.
name [string] name of hostgroup (truncated to 63 characters)
host [string] name of host to add to hostgroup
volume [string] name of volume to add to hostgroup

CLI Example:
salt '*' purefa.hg_create foo host=bar volume=vol

salt.modules.purefa.hg_delete(name)
Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).
Will return False is hostgroup is already in a deleted state.
New in version 2018.3.0.
name [string] name of hostgroup

CLI Example:
salt '*' purefa.hg_delete foo

salt.modules.purefa.hg_remove(name, volume=None, host=None)
Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.
Will return False if hostgroup does not exist, or named host or volume are not in the hostgroup.
New in version 2018.3.0.
name [string] name of hostgroup
volume [string] name of volume to remove from hostgroup
host [string] name of host to remove from hostgroup

CLI Example:
salt '*' purefa.hg_remove foo volume=test host=bar

salt.modules.purefa.hg_update(name, host=None, volume=None)
Adds entries to a hostgroup on a Pure Storage FlashArray.
Will return False is hostgroup doesn't exist, or host or volume do not exist.
New in version 2018.3.0.
name  [string] name of hostgroup
host  [string] name of host to add to hostgroup
volume  [string] name of volume to add to hostgroup

CLI Example:
```
salt '*' purefa.hg_update foo host=bar volume=vol
```

salt.modules.purefa.host_create(name, iqn=None, wwn=None, nqn=None)

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name  [string] name of host (truncated to 63 characters)
iqn  [string] iSCSI IQN of host
nqn  [string] NVMeF NQN of host .. versionadded:: 3006.0
wwn  [string] Fibre Channel WWN of host

CLI Example:
```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>' nqn='
→<Valid NQN>'
```

salt.modules.purefa.host_delete(name)

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn’t exist.

New in version 2018.3.0.

name  [string] name of host

CLI Example:
```
salt '*' purefa.host_delete foo
```

salt.modules.purefa.host_update(name, iqn=None, wwn=None, nqn=None)

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name  [string] name of host
nqn  [string] Additional NVMeF NQN of host .. versionadded:: 3006.0
iqn  [string] Additional iSCSI IQN of host
wwn  [string] Additional Fibre Channel WWN of host

CLI Example:
```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>' nqn='
→<Valid NQN>'
```

salt.modules.purefa.pg_create(name, hostgroup=None, host=None, volume=None, enabled=True)

Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:
- Protection Group already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.
name [string] name of protection group
hostgroup [string] name of hostgroup to add to protection group
host [string] name of host to add to protection group
volume [string] name of volume to add to protection group

CLI Example:
```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]\[true | false]
```

salt.modules.purefa.pg_delete(name, eradicate=False)
Delete a protection group on a Pure Storage FlashArray.
Will return False if protection group is already in a deleted state.

New in version 2018.3.0.
name [string] name of protection group

CLI Example:
```
salt '*' purefa.pg_delete foo
```

salt.modules.purefa.pg_eradicate(name)
Eradicate a deleted protection group on a Pure Storage FlashArray.
Will return False if protection group is not in a deleted state.

New in version 2018.3.0.
name [string] name of protection group

CLI Example:
```
salt '*' purefa.pg_eradicate foo
```

salt.modules.purefa.pg_remove(name, hostgroup=None, host=None, volume=None)
Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.
**Will return False in the following cases:**
• Protection group does not exist
• Specified type is not currently associated with the protection group

New in version 2018.3.0.
name [string] name of hostgroup
hostgroup [string] name of hostgroup to remove from protection group
host [string] name of host to remove from hostgroup
volume [string] name of volume to remove from hostgroup

CLI Example:
```
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

salt.modules.purefa.pg_update(name, hostgroup=None, host=None, volume=None)
Update a protection group on a Pure Storage FlashArray.
**Will return False in the following cases:**
• Protection group does not exist
• Incorrect type selected for current protection group type
• Specified type does not exist

New in version 2018.3.0.
name [string] name of protection group
hostgroup [string] name of hostgroup to add to protection group
host [string] name of host to add to protection group
volume [string] name of volume to add to protection group

CLI Example:
salt '∗' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]

salt.modules.purefa.snap_create(name, suffix=None)
Create a volume snapshot on a Pure Storage FlashArray.
Will return False if volume selected to snap does not exist.
New in version 2018.3.0.
name [string] name of volume to snapshot
suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.
CLI Example:
salt '∗' purefa.snap_create foo
salt '∗' purefa.snap_create foo suffix=bar

salt.modules.purefa.snap_delete(name, suffix=None, eradicate=False)
Delete a volume snapshot on a Pure Storage FlashArray.
Will return False if selected snapshot does not exist.
New in version 2018.3.0.
name [string] name of volume
suffix [string] name of snapshot
eradicate [boolean] Eradicate snapshot after deletion if True. Default is False
CLI Example:
salt '∗' purefa.snap_delete foo suffix=snap eradicate=True

salt.modules.purefa.snap_eradicate(name, suffix=None)
Eradicate a deleted volume snapshot on a Pure Storage FlashArray.
Will return False if snapshot is not in a deleted state.
New in version 2018.3.0.
name [string] name of volume
suffix [string] name of snapshot
CLI Example:
salt '∗' purefa.snap_eradicate foo suffix=snap

salt.modules.purefa.snap_volume_create(name, target, overwrite=False)
Create R/W volume from snapshot on a Pure Storage FlashArray.
Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.
New in version 2018.3.0.
name [string] name of volume snapshot
target [string] name of clone volume
overwrite [boolean] overwrite clone if already exists (default: False)
CLI Example:
salt '∗' purefa.snap_volume_create foo.bar clone overwrite=True

salt.modules.purefa.volume_attach(name, host)
Attach a volume to a host on a Pure Storage FlashArray.
Host and volume must exist or else will return False.
New in version 2018.3.0.
name  [string] name of volume
host  [string] name of host

CLI Example:

```bash
salt '*' purefa.volume_attach foo bar
```

salt.modules.purefa.volume_clone (name, target, overwrite=False)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

name  [string] name of volume
target  [string] name of clone volume
overwrite  [boolean] overwrite clone if already exists (default: False)

CLI Example:

```bash
salt '*' purefa.volume_clone foo bar overwrite=True
```

salt.modules.purefa.volume_create (name, size=None)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

name  [string] name of volume
size  [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```bash
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

salt.modules.purefa.volume_delete (name, eradicate=False)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist or is already in a deleted state.

New in version 2018.3.0.

name  [string] name of volume
eradicate  [boolean] Eradicate volume after deletion if True. Default is False

CLI Example:

```bash
salt '*' purefa.volume_delete foo eradicate=True
```

salt.modules.purefa.volume_detach (name, host)

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.

name  [string] name of volume
host  [string] name of host

CLI Example:

```bash
salt '*' purefa.volume_detach foo bar
```

salt.modules.purefa.volume_eradicate (name)

Eradicate a deleted volume on a Pure Storage FlashArray.
Will return False is volume is not in a deleted state.

New in version 2018.3.0.

```
name [string] name of volume
```

CLI Example:

```
salt '*' purefa.volume_eradicate foo
```

```python
salt.modules.purefa.volume_extend(name, size)
```

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

```
name [string] name of volume
size [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.
```

CLI Example:

```
salt '*' purefa.volume_extend foo 10T
```

### 25.7.360 salt.modules.purefb

Management of Pure Storage FlashBlade

#### Installation Prerequisites

- You will need the `purity_fb` python package in your python installation path that is running salt.

  ```bash
  pip install purity_fb
  ```

- Configure Pure Storage FlashBlade authentication. Use one of the following three methods.
  1) From the minion config

     ```yaml
     pure_tags:
     fb:
       san_ip: management vip or hostname for the FlashBlade
       api_token: A valid api token for the FlashBlade being managed
     ```

  2) From environment (PUREFB_IP and PUREFB_API)

  3) From the pillar (PUREFB_IP and PUREFB_API)

#### maintainer

Simon Dodsley (simon@purestorage.com)

#### maturity

new

#### requires

purity_fb

#### platform

all

New in version 2019.2.0.

```python
salt.modules.purefb.fs_create(name, size=None, proto='NFS', nfs_rules='*(rw,no_root_squash)', snapshot=False)
```

Create a filesystem on a Pure Storage FlashBlade.

Will return False if filesystem already exists.

New in version 2019.2.0.
name [string] name of filesystem (truncated to 63 characters)
proto [string] (Optional) Sharing protocol (NFS, CIFS or HTTP). If not specified default is NFS
snapshot: boolean (Optional) Are snapshots enabled on the filesystem. Default is False
nfs_rules [string] (Optional) export rules for NFS. If not specified default is *(rw,no_root_squash).
  Refer to Pure Storage documentation for formatting rules.
size [string] if specified capacity of filesystem. If not specified default to 32G. Refer to Pure Storage documenta-
tion for formatting rules.

CLI Example:

```salt
salt '*' purefb.fs_create foo proto=CIFS
salt '*' purefb.fs_create foo size=10T
```

salt.modules.purefb.fs_delete(name, eradicate=False)
Delete a share on a Pure Storage FlashBlade.

Will return False if filesystem doesn’t exist or is already in a deleted state.

New in version 2019.2.0.

name [string] name of filesystem
eradicate [boolean] (Optional) Eradicate filesystem after deletion if True. Default is False

CLI Example:

```salt
salt '*' purefb.fs_delete foo eradicate=True
```

salt.modules.purefb.fs_eradicate(name)
Eradiate a deleted filesystem on a Pure Storage FlashBlade.

Will return False if filesystem is not in a deleted state.

New in version 2019.2.0.

name [string] name of filesystem

CLI Example:

```salt
salt '*' purefb.fs_eradicate foo
```

salt.modules.purefb.fs_extend(name, size)
Resize an existing filesystem on a Pure Storage FlashBlade.

Will return False if new size is less than or equal to existing size.

New in version 2019.2.0.

name [string] name of filesystem
size [string] New capacity of filesystem. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```salt
salt '*' purefb.fs_extend foo 10T
```

salt.modules.purefb.fs_update(name, rules, snapshot=False)
Update filesystem on a Pure Storage FlashBlade.

Allows for change of NFS export rules and enabling/disabled of snapshotting capability.

New in version 2019.2.0.

name [string] name of filesystem
rules [string] NFS export rules for filesystem Refer to Pure Storage documentation for formatting rules.
snapshot: boolean (Optional) Enable/Disable snapshots on the filesystem. Default is False

CLI Example:
salt '...' purefb.fs_nfs_update foo rules='10.234.112.23(ro), 10.234.112.24(rw)' snapshot=True

salt.modules.purefb.snap_create(name, suffix=None)
Create a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if filesystem selected to snap does not exist.

New in version 2019.2.0.
name [string] name of filesystem to snapshot
suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:
salt '...' purefb.snap_create foo
salt '...' purefb.snap_create foo suffix=bar

salt.modules.purefb.snap_delete(name, suffix=None, eradicate=False)
Delete a filesystem snapshot on a Pure Storage FlashBlade.

Will return False if selected snapshot does not exist.

New in version 2019.2.0.
name [string] name of filesystem
suffix [string] name of snapshot
eradicate [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:
salt '...' purefb.snap_delete foo suffix= snap eradicate=True

salt.modules.purefb.snap_eradicate(name, suffix=None)
Eradicate a deleted filesystem snapshot on a Pure Storage FlashBlade.

Will return False if snapshot is not in a deleted state.

New in version 2019.2.0.
name [string] name of filesystem
suffix [string] name of snapshot

CLI Example:
salt '...' purefb.snap_eradicate foo suffix= snap

25.7.361 salt.modules.pushbullet

Module for sending messages to Pushbullet (https://www.pushbullet.com)

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

pushbullet:
  api_key: 'ABC123abc123ABC123abc123ABC123ab'

For example:

pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."

25.7. execution modules
salt.modules.pushbullet.push_note

Pushing a text note.

Parameters

- `device` -- Pushbullet target device
- `title` -- Note title
- `body` -- Note body

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushbullet.push_note device="Chrome" title="Example title" body="Example body."
```

25.7.362 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)

New in version 2016.3.0.

configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

salt.modules.pushover_notify.post_message

Send a message to a Pushover user or group.

Parameters

- `user` -- The user or group to send to, must be key of user or group not email address.
- `message` -- The message to send to the PushOver user or group.
- `title` -- Specify who the message is from.
- `priority` -- The priority of the message, defaults to 0.
- `expire` -- The message should expire after N number of seconds.
- `retry` -- The number of times the message should be retried.
- `sound` -- The sound to associate with the message.
- `api_version` -- The PushOver API version, if not specified in the configuration.
- `token` -- The PushOver token, if not specified in the configuration.

Returns

Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done'
```

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title='Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```
25.7.363 salt.modules.pw_group

Manage groups on FreeBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

```python
salt.modules.pw_group.add(name, gid=None, **kwargs)
```

Add the specified group

- `name` Name of the new group
- `gid` Use GID for the new group

CLI Example:

```
salt '*' group.add foo 3456
```

```python
salt.modules.pw_group.adduser(name, username)
```

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

```python
salt.modules.pw_group.chgid(name, gid)
```

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

```python
salt.modules.pw_group.delete(name)
```

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

```python
salt.modules.pw_group.deluser(name, username)
```

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

```python
salt.modules.pw_group.getent(refresh=False)
```

Return info on all groups

CLI Example:

```
salt '*' group.getent
```

```python
salt.modules.pw_group.info(name)
```

Return information about a group
CLI Example:

```
salt '*' group.info foo
```

**salt.modules.pw_group.members**(name, members_list)

Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

### 25.7.364 salt.modules.pw_user

Manage users with the pw command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

**salt.modules.pw_user.add***(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, loginclass=None, **kwargs)***

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

**salt.modules.pw_user.chfullname**(name, fullname)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

**salt.modules.pw_user.chgid**(name, gid)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

**salt.modules.pw_user.chgroups**(name, groups, append=False)

Change the groups to which a user belongs

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

**salt.modules.pw_user.chhome**(name, home, persist=False)

Set a new home directory for an existing user
name: Username to modify  
home: New home directory to set  
persist: [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```bash
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.pw_user.chhomephone(name, homephone)`  
Change the user's Home Phone

CLI Example:

```bash
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.pw_user.chloginclass(name, loginclass, root=None)`  
Change the default login class of the user  
New in version 2016.3.5.

CLI Example:

```bash
salt '*' user.chloginclass foo staff
```

`salt.modules.pw_user.chroomnumber(name, roomnumber)`  
Change the user's Room Number

CLI Example:

```bash
salt '*' user.chroomnumber foo 123
```

`salt.modules.pw_user.chshell(name, shell)`  
Change the default shell of the user

CLI Example:

```bash
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.pw_user.chuid(name, uid)`  
Change the uid for a named user

CLI Example:

```bash
salt '*' user.chuid foo 4376
```

`salt.modules.pw_user.chworkphone(name, workphone)`  
Change the user's Work Phone

CLI Example:

```bash
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.delete(name, remove=False, force=False)`  
Remove a user from the minion

CLI Example:

```bash
salt '*' user.delete name remove=True force=True
```
salt.modules.pw_user.get_loginclass(name)
Get the login class of the user
New in version 2016.3.0.
CLI Example:

```bash
salt '*' user.get_loginclass foo
```

salt.modules.pw_user.getent(refresh=False)
Return the list of all info for all users
CLI Example:

```bash
salt '*' user.getent
```

salt.modules.pw_user.info(name)
Return user information
CLI Example:

```bash
salt '*' user.info root
```

salt.modules.pw_user.list_groups(name)
Return a list of groups the named user belongs to
CLI Example:

```bash
salt '*' user.list_groups foo
```

salt.modules.pw_user.list_users()
Return a list of all users
CLI Example:

```bash
salt '*' user.list_users
```

salt.modules.pw_user.rename(name, new_name)
Change the username for a named user
CLI Example:

```bash
salt '*' user.rename name new_name
```

### 25.7.365 salt.modules.pyenv

Manage python installations with pyenv.

**Note:** Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version 2014.4.0.

salt.modules.pyenv.default(python=None, runas=None)
Returns or sets the currently defined default python.
```
python=None The version to set as the default. Should match one of the versions listed by `pyenv, versions`. Leave blank to return the current default.
```
CLI Example:
salt.modules.pyenv.do(cmdline=None, runas=None)
Execute a python command with pyenv's shims from the user or the system.

CLI Example:

salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy

salt.modules.pyenv.do_with_python(python, cmdline, runas=None)
Execute a python command with pyenv's shims using a specific python version.

CLI Example:

salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy

salt.modules.pyenv.install(runas=None, path=None)
Install pyenv systemwide

CLI Example:

salt '*' pyenv.install

salt.modules.pyenv.install_python(python, runas=None)
Install a python implementation.

CLI Example:

salt '*' pyenv.install_python 2.0.0-p0

salt.modules.pyenv.is_installed(runas=None)
Check if pyenv is installed.

CLI Example:

salt '*' pyenv.is_installed

salt.modules.pyenv.list_(runas=None)
List the installable versions of python.

CLI Example:

salt '*' pyenv.list

salt.modules.pyenv.rehash(runas=None)
Run pyenv rehash to update the installed shims.

CLI Example:

salt '*' pyenv.rehash

salt.modules.pyenv.uninstall_python(python, runas=None)
Uninstall a python implementation.

python The version of python to uninstall. Should match one of the versions listed by pyenv.versions

CLI Example:
salt.modules.pyenv.update(runas=None, path=None)
   Updates the current versions of pyenv and python-Build
   CLI Example:
   ```
salt '*' pyenv.update
   ```

salt.modules.pyenv.versions(runas=None)
   List the installed versions of python.
   CLI Example:
   ```
salt '*' pyenv.versions
   ```

25.7.366 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions
   ```
depends qemu-img
   ```
salt.modules.qemu_img.convert(orig, dest, fmt)
   Convert an existing disk image to another format using qemu-img
   CLI Example:
   ```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
   ```

salt.modules.qemu_img.make_image(location, size, fmt)
   Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu
   CLI Example:
   ```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
   salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
   ```

25.7.367 salt.modules.qemu_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.
salt.modules.qemu_nbd.clear(mnt)
   Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions
   CLI Example:
   ```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}'
   ```
salt.modules.qemu_nbd.connect(image)
Activate nbd for an image file.

CLI Example:
salt '*' qemu_nbd.connect /tmp/image.raw

salt.modules.qemu_nbd.init(image, root=None)
Mount the named image via qemu-nbd and return the mounted roots

CLI Example:
salt '*' qemu_nbd.init /srv/image.qcow2

salt.modules.qemu_nbd.mount(nbd, root=None)
Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:
salt '*' qemu_nbd.mount /dev/nbd0

25.7.368 salt.modules.quota

Module for managing quotas on POSIX-like systems.

salt.modules.quota.get_mode(device)
Report whether the quota system for this device is on or off

CLI Example:
salt '*' quota.get_mode

salt.modules.quota.off(device)
Turns off the quota system

CLI Example:
salt '*' quota.off

salt.modules.quota.on(device)
Turns on the quota system

CLI Example:
salt '*' quota.on

salt.modules.quota.report(mount)
Report on quotas for a specific volume

CLI Example:
salt '*' quota.report /media/data

salt.modules.quota.set_(device, **kwargs)
Calls out to setquota, for a specific user or group

CLI Example:
salt '*

```bash
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

```python
salt.modules.quota.stats()

Runs the quotastats command, and returns the parsed output

CLI Example:

```bash
salt '*' quota.stats
```

```

salt.modules.quota.warn()

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```bash
salt '*' quota.warn
```

### 25.7.369 Salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user(name, password=None, runas=None)`

Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:

```bash
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost(vhost, runas=None)`

Adds a vhost via rabbitmqctl add_vhost.

CLI Example:

```bash
salt '*' rabbitmq.add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password(name, password, runas=None)`

Changes a user's password.

CLI Example:

```bash
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password(name, password, runas=None)`

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```bash
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password(name, runas=None)`

Removes a user's password.

CLI Example:
```
salt '*' rabbitmq.clear_password rabbit_user
```

```
salt.modules.rabbitmq.cluster_status(runas=None)
    return rabbitmq cluster_status
    CLI Example:
    salt '*' rabbitmq.cluster_status
```

```
salt.modules.rabbitmq.delete_policy(vhost, name, runas=None)
    Delete a policy based on rabbitmqctl clear_policy.
    Reference: http://www.rabbitmq.com/ha.html
    CLI Example:
    salt '*' rabbitmq.delete_policy / HA
```

```
salt.modules.rabbitmq.delete_upstream(name, runas=None)
    Deletes an upstream via rabbitmqctl clear_parameter.
    Parameters
    • name (str) -- The name of the upstream to delete.
    • runas (str) -- The name of the user to run the command as.
    CLI Example:
    salt '*' rabbitmq.delete_upstream upstream_name
    New in version 3000.
```

```
salt.modules.rabbitmq.delete_user(name, runas=None)
    Deletes a user via rabbitmqctl delete_user.
    CLI Example:
    salt '*' rabbitmq.delete_user rabbit_user
```

```
salt.modules.rabbitmq.delete_vhost(vhost, runas=None)
    Deletes a vhost rabbitmqctl delete_vhost.
    CLI Example:
    salt '*' rabbitmq.delete_vhost 'vhost_name'
```

```
salt.modules.rabbitmq.disable_plugin(name, runas=None)
    Disable a RabbitMQ plugin via the rabbitmq-plugins command.
    CLI Example:
    salt '*' rabbitmq.disable_plugin foo
```

```
salt.modules.rabbitmq.enable_plugin(name, runas=None)
    Enable a RabbitMQ plugin via the rabbitmq-plugins command.
    CLI Example:
    salt '*' rabbitmq.enable_plugin foo
```

```
salt.modules.rabbitmq.force_reset(runas=None)
    Forcefully Return a RabbitMQ node to its virgin state
```

**25.7. execution modules**

salt.modules.rabbitmq.joint_cluster(host, user='rabbit', ram_node=None, runas=None)
Join a rabbit cluster

CLI Example:
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit

salt.modules.rabbitmq.list_available_plugins(runas=None)
Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:
salt '*' rabbitmq.list_available_plugins

salt.modules.rabbitmq.list_enabled_plugins(runas=None)
Returns a list of the names of the enabled plugins.

CLI Example:
salt '*' rabbitmq.list_enabled_plugins

salt.modules.rabbitmq.list_permissions(vhost, runas=None)
Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:
salt '*' rabbitmq.list_permissions /myvhost

salt.modules.rabbitmq.list_policies(vhost='/', runas=None)
Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
salt '*' rabbitmq.list_policies

salt.modules.rabbitmq.list_queues(runas=None, *args)
Returns queue details of the / virtual host

CLI Example:
salt '*' rabbitmq.list_queues messages consumers

salt.modules.rabbitmq.list_queues_vhost(vhost, runas=None, *args)
Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use list_queues instead.

CLI Example:
salt '*' rabbitmq.list_queues_vhost /messages consumers

salt.modules.rabbitmq.list_upstreams(runas=None)
Returns a dict of upstreams based on rabbitmqctl list_parameters.

Parameters runas (str) -- The name of the user to run this command as.
New in version 3000.
salt.modules.rabbitmq.list_user_permissions(name, runas=None)
List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:
salt '*' rabbitmq.list_user_permissions user

salt.modules.rabbitmq.list_users(runas=None)
Return a list of users based off of rabbitmqctl user_list.

CLI Example:
salt '*' rabbitmq.list_users

salt.modules.rabbitmq.list_vhosts(runas=None)
Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:
salt '*' rabbitmq.list_vhosts

salt.modules.rabbitmq.plugin_is_enabled(name, runas=None)
Return whether the plugin is enabled.

CLI Example:
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name

salt.modules.rabbitmq.policy_exists(vhost, name, runas=None)
Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:
salt '*' rabbitmq.policy_exists / HA

salt.modules.rabbitmq.reset(runas=None)
Return a RabbitMQ node to its virgin state

CLI Example:
salt '*' rabbitmq.reset

salt.modules.rabbitmq.set_permissions(vhost, user, conf=".*", write=".*", read=".*", runas=None)
Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:
salt '*' rabbitmq.set_permissions myvhost myuser

salt.modules.rabbitmq.set_policy(vhost, name, pattern, definition, priority=None, runas=None, apply_to=None)
Set a policy based on rabbitmqctl set_policy.
Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```sql
salt '* rabbitmq.set_policy / HA '.*' '"ha-mode":"all"'
```

salt.modules.rabbitmq.set_upstream(name, uri=None, prefetch_count=None, reconnect_delay=None, ack_mode=None, trust_user_id=None, exchange=None, max_hops=None, expires=None, message_ttl=None, ha_policy=None, queue=None, runas=None)

Configures an upstream via rabbitmqctl set_parameter. This can be an exchange-upstream, a queue-upstream or both.

**Parameters**

- **name (str)** -- The name of the upstream to configure.

The following parameters apply to federated exchanges and federated queues:

**Parameters**

- **uri (str)** -- The AMQP URI(s) for the upstream.
- **prefetch_count (int)** -- The maximum number of unacknowledged messages copied over a link at any one time. Default: 1000
- **reconnect_delay (int)** -- The duration (in seconds) to wait before reconnecting to the broker after being disconnected. Default: 1
- **ack_mode (str)** -- Determines how the link should acknowledge messages. If set to **on-confirm** (the default), messages are acknowledged to the upstream broker after they have been confirmed downstream. This handles network errors and broker failures without losing messages, and is the slowest option. If set to **on-publish**, messages are acknowledged to the upstream broker after they have been published downstream. This handles network errors without losing messages, but may lose messages in the event of broker failures. If set to **no-ack**, message acknowledgements are not used. This is the fastest option, but may lose messages in the event of network or broker failures.
- **trust_user_id (bool)** -- Determines how federation should interact with the validated user-id feature. If set to true, federation will pass through any validated user-id from the upstream, even though it cannot validate it itself. If set to false or not set, it will clear any validated user-id it encounters. You should only set this to true if you trust the upstream server (and by extension, all its upstreams) not to forge user-ids.

The following parameters apply to federated exchanges only:

**Parameters**

- **exchange (str)** -- The name of the upstream exchange. Default is to use the same name as the federated exchange.
- **max_hops (int)** -- The maximum number of federation links that a message published to a federated exchange can traverse before it is discarded. Default is 1. Note that even if max-hops is set to a value greater than 1, messages will never visit the same node twice due to travelling in a loop. However, messages may still be duplicated if it is possible for them to travel from the source to the destination via multiple routes.
- **expires (int)** -- The expiry time (in milliseconds) after which an upstream queue for a federated exchange may be deleted, if a connection to the upstream broker is lost. The default is 'none', meaning the queue should never expire. This setting controls how long the upstream queue will last before it is eligible for deletion if the connection is lost. This value is used to set the "x-expires" argument for the upstream queue.
- **message_ttl (int)** -- The expiry time for messages in the upstream queue for a federated exchange (see expires), in milliseconds. Default is None, meaning messages should never expire. This does not apply to federated queues. This value is used to set the "x-message-ttl" argument for the upstream queue.
- **ha_policy (str)** -- Determines the "x-ha-policy" argument for the upstream queue.
for a federated exchange (see expires). This is only of interest when connecting to old
brokers which determine queue HA mode using this argument. Default is None,
meaning the queue is not HA.

The following parameter applies to federated queues only:

**Parameters**

- `queue (str)` -- The name of the upstream queue. Default is to use the same name as
  the federated queue.
- `runas (str)` -- The name of the user to run the command as.

**CLI Example:**

```bash
salt '*' rabbitmq.set_upstream upstream_name ack_mode=on-confirm max_hops=1
       trust_user_id=True url=amqp://hostname
```

New in version 3000.

**salt.modules.rabbitmq.set_user_tags(name, tags, runas=None)**

Add user tags via rabbitmqctl set_user_tags

**CLI Example:**

```bash
salt '*' rabbitmq.set_user_tags myadmin administrator
```

**salt.modules.rabbitmq.start_app(runas=None)**

Start the RabbitMQ application.

**CLI Example:**

```bash
salt '*' rabbitmq.start_app
```

**salt.modules.rabbitmq.status(runas=None)**

return rabbitmq status

**CLI Example:**

```bash
salt '*' rabbitmq.status
```

**salt.modules.rabbitmq.stop_app(runas=None)**

Stops the RabbitMQ application, leaving the Erlang node running.

**CLI Example:**

```bash
salt '*' rabbitmq.stop_app
```

**salt.modules.rabbitmq.upstream_exists(name, runas=None)**

Return whether the upstream exists based on rabbitmqctl list_parameters.

**Parameters**

- `name (str)` -- The name of the upstream to check for.
- `runas (str)` -- The name of the user to run the command as.

**CLI Example:**

```bash
salt '*' rabbitmq.upstream_exists rabbit_upstream
```

New in version 3000.

**salt.modules.rabbitmq.user_exists(name, runas=None)**

Return whether the user exists based on rabbitmqctl list_users.

**CLI Example:**
salt '*' rabbitmq.user_exists rabbit_user

```python
salt.modules.rabbitmq.vhost_exists(name, runas=None)
```

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```bash
salt '*' rabbitmq.vhost_exists rabbit_host
```

### 25.7.370 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in /etc/salt/minion:

```yaml
rallydev:
  username: myuser@example.com
  password: 123pass
```

```python
salt.modules.rallydev.list_items(name)
```

List items of a particular type

CLI Examples:

```bash
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

```python
salt.modules.rallydev.list_users()
```

List the users

CLI Example:

```bash
salt myminion rallydev.list_users
```

```python
salt.modules.rallydev.query_item(name, query_string, order='Rank')
```

Query a type of record for one or more items. Requires a valid query string. See [https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp](https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp) for information on query syntax.

CLI Example:

```bash
salt myminion rallydev.query_<item name> <query string> [order]
salt myminion rallydev.query_task '(Name contains github)' Rank
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

```python
salt.modules.rallydev.query_user(query_string, order='UserName')
```

Update a user

CLI Example:

```bash
salt myminion rallydev.query_user '(Name contains Jo)'
```

```python
salt.modules.rallydev.show_artifact(id_)
```

Show an artifact

CLI Example:
salt myminion rallydev.show_artifact <artifact id>

salt.modules.rallydev.show_item(name, id_)
    Show an item
    CLI Example:
    salt myminion rallydev.show_item <item name> <item id>

salt.modules.rallydev.show_user(id_)
    Show a user
    CLI Example:
    salt myminion rallydev.show_user <user id>

salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)
    Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.
    CLI Example:
    salt myminion rallydev.update_item <item name> <item id> field=<field> value=<value>
    salt myminion rallydev.update_item <item name> <item id> postdata=<post data>

salt.modules.rallydev.update_user(id_, field, value)
    Update a user
    CLI Example:
    salt myminion rallydev.update_user <user id> <field> <new value>

25.7.371 salt.modules.random_org

Module for retrieving random information from Random.org
New in version 2015.5.0.

configuration  This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

    random_org:
        api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
        api_version: 1

salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)
    List all Slack users.
    Parameters
        - api_key -- The Random.org api key.
        - api_version -- The Random.org api version.
        - format -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.
    Returns  The user list.
    CLI Example:
salt.'*'.get_integers(number=5, min=1, max=6)
salt.'*'.get_integers(number=5, min=1, max=6)

```
salt.modules.random_org.generateDecimalFractions(api_key=None, api_version=None, **kwargs)
```

Generates true random decimal fractions

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1, 1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1, 20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of decimal fraction

CLI Example:

```
salt.'*'.random_org.generateDecimalFractions(number=10, decimalPlaces=4)
salt.'*'.random_org.generateDecimalFractions(number=10, decimalPlaces=4)
replacment=True
```

```
salt.modules.random_org.generateGaussians(api_key=None, api_version=None, **kwargs)
```

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1, 1e4] range.
- **mean** -- The distribution’s mean. Must be within the [-1e6, 1e6] range.
- **standardDeviation** -- The distribution’s standard deviation. Must be within the [-1e6, 1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2, 20] range.

Returns The user list.

CLI Example:

```
salt.'*'.random_org.generateGaussians(number=10, mean=0.0, standardDeviation=1.00)
salt.'*'.random_org.generateGaussians(number=10, mean=0.0, standardDeviation=1.00)
significantDigits=8
```

```
salt.modules.random_org.generateIntegers(api_key=None, api_version=None, **kwargs)
```

Generate random integers

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9, 1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9, 1e9] range.
• replacement -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

• base -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6
salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

salt.modules.random_org.generateStrings (api_key=None, api_version=None, **kwargs)
Generate random strings.

Parameters
• api_key -- The Random.org api key.
• api_version -- The Random.org api version.
• number -- The number of strings to generate.
• length -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
• characters -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
• replacement -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=←'abcdefghijklmnopqrstuvwxyz'
salt '*' random_org.generateStrings number=10 length=16 characters←'abcdefghijklmnopqrstuvwxyz'
```

salt.modules.random_org.generateUUIDs (api_key=None, api_version=None, **kwargs)
Generate a list of random UUIDs.

Parameters
• api_key -- The Random.org api key.
• api_version -- The Random.org api version.
• number -- How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs.

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

salt.modules.random_org.getUsage (api_key=None, api_version=None)
Show current usages statistics.

Parameters
• api_key -- The Random.org api key.
• api_version -- The Random.org api version.
Returns

The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage
salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=1
```

### 25.7.372 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

salt.modules.rbac_solaris.auth_add(user, auth)

Add authorization to user

- **user** [string] username
- **auth** [string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.auth_get(user, computed=True)

List authorization for user

- **user** [string] username
- **computed** [boolean] merge results from auths command into data from user_attr

CLI Example:

```
salt '*' rbac.auth_get leo
```

salt.modules.rbac_solaris.auth_list()

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

salt.modules.rbac_solaris.auth_rm(user, auth)

Remove authorization from user

- **user** [string] username
- **auth** [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.profile_add(user, profile)

Add profile to user

- **user** [string] username
- **profile** [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

salt.modules.rbac_solaris.profile_get(user, default_hidden=True)

List profiles for user

---

Chapter 25. Salt Module Reference
user [string] username
default_hidden [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

salt.modules.rbac_solaris.profile_list()
List all available profiles
default_only [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

salt.modules.rbac_solaris.profile_rm(user, profile)
Remove profile from user
user [string] username
profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

salt.modules.rbac_solaris.role_add(user, role)
Add role to user
user [string] username
role [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

salt.modules.rbac_solaris.role_get(user)
List roles for user
user [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.role_list()
List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.role_rm(user, role)
Remove role from user
user [string] username
role [string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

25.7. execution modules
### 25.7.373 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

#### salt.modules.rbenv.default

```
Default module for setting or returning the current default ruby version.

**Arguments**

- `ruby` (default: None): The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

**CLI Examples**

- `salt '*' rbenv.default`
- `salt '*' rbenv.default 2.0.0-p0`
```

#### salt.modules.rbenv.do

```
Execute a ruby command with rbenv's shims from the user or the system

**Arguments**

- `cmdline` (default: None): `username` (default: None): `env` (default: None)

**CLI Examples**

- `salt '*' rbenv.do 'gem list bundler'`
- `salt '*' rbenv.do 'gem list bundler' deploy`
```

#### salt.modules.rbenv.do_with_ruby

```
Execute a ruby command with rbenv's shims using a specific ruby version

**Arguments**

- `ruby` (default: None): `cmdline` (default: None): `runas` (default: None)

**CLI Examples**

- `salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'`
- `salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy`
```

#### salt.modules.rbenv.install

```
Install rbenv systemwide

**Arguments**

- `runas` (default: None): `path` (default: None)

**CLI Example**

- `salt '*' rbenv.install`
```

#### salt.modules.rbenv.install_ruby

```
Install a ruby implementation.

**Arguments**

- `ruby` (default: None): `runas` (default: None)

**CLI Example**

- `salt '*' rbenv.install_ruby 2.0.0-p0`
```

#### salt.modules.rbenv.is_installed

```
Check if rbenv is installed

**Arguments**

- `runas` (default: None)

**CLI Example**

- `salt '*' rbenv.is_installed`
```
salt '*' rbenv.is_installed

salt.modules.rbenv.list_(runas=None)
   List the installable versions of ruby
   runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
   CLI Example:
   ```
salt '*' rbenv.list
   ```

salt.modules.rbenv.rehash(runas=None)
   Run rbenv rehash to update the installed shims
   runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
   CLI Example:
   ```
salt '*' rbenv.rehash
   ```

salt.modules.rbenv.uninstall_ruby(ruby, runas=None)
   Uninstall a ruby implementation.
   ruby The version of ruby to uninstall. Should match one of the versions listed by rbenv.versions.
   runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
   CLI Example:
   ```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
   ```

salt.modules.rbenv.update(runas=None, path=None)
   Updates the current versions of rbenv and ruby-build
   runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.
   CLI Example:
   ```
salt '*' rbenv.update
   ```

salt.modules.rbenv.versions(runas=None)
   List the installed versions of ruby
   CLI Example:
   ```
salt '*' rbenv.versions
   ```

25.7.374 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.disable()
   Disable RDP the service on the server
   CLI Example:
   ```
salt '*' rdp.disable
   ```

salt.modules.rdp.disconnect_session(session_id)
   Disconnect a session.
New in version 2016.11.0.

Parameters

**session_id** -- The numeric Id of the session.

Returns A boolean representing whether the disconnect succeeded.

CLI Example:

```python
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

salt.modules.rdp.enable()

Enable RDP the service on the server

CLI Example:

```python
salt '*' rdp.enable
```

salt.modules.rdp.get_session(session_id)

Get information about a session.

New in version 2016.11.0.

Parameters

**session_id** -- The numeric Id of the session.

Returns A dictionary of session information.

CLI Example:

```python
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

salt.modules.rdp.list_sessions(logged_in_users_only=False)

List information about the sessions.

New in version 2016.11.0.

Parameters

**logged_in_users_only** -- If True, only return sessions with users logged in.

Returns A list containing dictionaries of session information.

CLI Example:

```python
salt '*' rdp.list_sessions
```

salt.modules.rdp.logoff_session(session_id)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters

**session_id** -- The numeric Id of the session.

Returns A boolean representing whether the logoff succeeded.

CLI Example:

```python
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

salt.modules.rdp.status()

Show if rdp is enabled on the server

CLI Example:

```python
salt '*' rdp.status
```
25.7.375 salt.modules.rebootmgr module

Module for rebootmgr :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

New in version 3004.

salt.modules.rebootmgr.cancel()
Cancels an already running reboot.

CLI Example:

```python
salt microos rebootmgr cancel
```

salt.modules.rebootmgr.get_group()
The currently set lock group for etcd.

CLI Example:

```python
salt microos rebootmgr get_group
```

salt.modules.rebootmgr.get_strategy()
The currently used reboot strategy of rebootmgrd will be printed.

CLI Example:

```python
salt microos rebootmgr get_strategy
```

salt.modules.rebootmgr.get_window()
The currently set maintenance window will be printed.

CLI Example:

```python
salt microos rebootmgr get_window
```

salt.modules.rebootmgr.is_active()
Check if the rebootmgrd is running and active or not.

CLI Example:

```python
salt microos rebootmgr is_active
```

salt.modules.rebootmgr.lock(machine_id=None, group=None)
Lock a machine. If no group is specified, the local default group will be used. If no machine-id is specified, the local machine will be locked.

machine_id The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.
group Group name

CLI Example:

```python
salt microos rebootmgr lock group=group1
```

salt.modules.rebootmgr.reboot(order=None)
Tells rebootmgr to schedule a reboot.

With the [now] option, a forced reboot is done, no lock from etcd is requested and a set maintenance window is ignored. With the [fast] option, a lock from etcd is requested if needed, but a defined maintenance window is ignored.

order If specified, can be "now" or "fast"

CLI Example:
salt microos rebootmgr reboot
salt microos rebootmgt reboot order=now

salt.modules.rebootmgr.set_group(group)
Set the group, to which this machine belongs to get a reboot lock from etcd.
group Group name
CLI Example:
    salt microos rebootmgr set_group group=group_1

salt.modules.rebootmgr.set_max(max_locks, group=None)
Set the maximal number of hosts in a group, which are allowed to reboot at the same time.
number Maximal number of hosts in a group
group Group name
CLI Example:
    salt microos rebootmgr set_max 4

salt.modules.rebootmgr.set_strategy(strategy=None)
A new strategy to reboot the machine is set and written into /etc/rebootmgr.conf.
strategy If specified, must be one of those options:
  best-effort - This is the default strategy. If etcd is running, etcd-lock is used. If no etcd is running, but
               a maintenance window is specified, the strategy will be maint-window. If no maintenance window
               is specified, the machine is immediately rebooted (instantly).
  etcd-lock - A lock at etcd for the specified lock-group will be acquired before reboot. If a mainten-
               nance window is specified, the lock is only acquired during this window.
  maint-window - Reboot does happen only during a specified maintenance window. If no window is
                 specified, the instantly strategy is followed.
  instantly - Other services will be informed that a reboot will happen. Reboot will be done without
             getting any locks or waiting for a maintenance window.
  off - Reboot requests are temporary ignored. /etc/rebootmgr.conf is not modified.
CLI Example:
    salt microos rebootmgr set_strategy strategy=off

salt.modules.rebootmgr.set_window(time, duration)
Set's the maintenance window.
time The format of time is the same as described in systemd.time(7).
duration The format of duration is "[XXh][YYm]".
CLI Example:
    salt microos rebootmgr set_window time="Thu,Fri 2020-01-15 11:12:13" duration=1h

salt.modules.rebootmgr.status()
Returns the current status of rebootmgrd.
Valid returned values are: 0 - No reboot requested 1 - Reboot requested 2 - Reboot requested, waiting for
maintenance window 3 - Reboot requested, waiting for etcd lock.
CLI Example:
    salt microos rebootmgr status

salt.modules.rebootmgr.unlock(machine_id=None, group=None)
Unlock a machine. If no group is specified, the local default group will be used. If no machine-id is speci-
ified, the local machine will be locked.
machine_id The machine-id is a network wide, unique ID. Per default the ID from /etc/machine-id is used.
group Group name

CLI Example:

```
salt microos rebootmgr unlock group=group1
```

```python
salt.modules.rebootmgr.version()
```
Return the version of rebootmgrd

CLI Example:

```
salt microos rebootmgr version
```

### 25.7.376 **salt.modules.redis**

Module to provide redis functionality to Salt

New in version 2014.7.0.

**configuration** This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

**salt.modules.redismod.bgrewriteaof**

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

**salt.modules.redismod.bgsave**

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

**salt.modules.redismod.config_get**

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

**salt.modules.redismod.config_set**

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

**salt.modules.redismod.dbsize**

Return the number of keys in the selected database
CLI Example:

```bash
salt '*' redis.dbsize
```

`salt.modules.redismod.delete(*keys, **connection_args)`
Deletes the keys from redis, returns number of keys deleted

CLI Example:

```bash
salt '*' redis.delete foo
```

`salt.modules.redismod.exists(key, host=None, port=None, db=None, password=None)`
Return true if the key exists in redis

CLI Example:

```bash
salt '*' redis.exists foo
```

`salt.modules.redismod.expire(key, seconds, host=None, port=None, db=None, password=None)`
Set a keys time to live in seconds

CLI Example:

```bash
salt '*' redis.expire foo 300
```

`salt.modules.redismod.expireat(key, timestamp, host=None, port=None, db=None, password=None)`
Set a keys expire at given UNIX time

CLI Example:

```bash
salt '*' redis.expireat foo 1400000000
```

`salt.modules.redismod.flushall(host=None, port=None, db=None, password=None)`
Remove all keys from all databases

CLI Example:

```bash
salt '*' redis.flushall
```

`salt.modules.redismod.flushdb(host=None, port=None, db=None, password=None)`
Remove all keys from the selected database

CLI Example:

```bash
salt '*' redis.flushdb
```

`salt.modules.redismod.get_key(key, host=None, port=None, db=None, password=None)`
Get redis key value

CLI Example:

```bash
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip(host=None, port=None, password=None)`
Get host information about slave

New in version 2016.3.0.

CLI Example:
salt 'salt' redis.get_master_ip

salt.modules.redismod.hdel(key, *fields, **options)
Delete one of more hash fields.
New in version 2017.7.0.
CLI Example:
salt '*' redis.hdel foo_hash bar_field1 bar_field2

salt.modules.redismod.hexists(key, field, host=None, port=None, db=None, password=None)
Determine if a hash fields exists.
New in version 2017.7.0.
CLI Example:
salt '*' redis.hexists foo_hash bar_field

salt.modules.redismod.hget(key, field, host=None, port=None, db=None, password=None)
Get specific field value from a redis hash, returns dict
CLI Example:
salt '*' redis.hget foo_hash bar_field

salt.modules.redismod.hgetall(key, host=None, port=None, db=None, password=None)
Get all fields and values from a redis hash, returns dict
CLI Example:
salt '*' redis.hgetall foo_hash

salt.modules.redismod.hincrby(key, field, increment=1, host=None, port=None, db=None, password=None)
Increment the integer value of a hash field by the given number.
New in version 2017.7.0.
CLI Example:
salt '*' redis.hincrby foo_hash bar_field 5

salt.modules.redismod.hincrbyfloat(key, field, increment=1.0, host=None, port=None, db=None, password=None)
Increment the float value of a hash field by the given number.
New in version 2017.7.0.
CLI Example:
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17

salt.modules.redismod.hlen(key, host=None, port=None, db=None, password=None)
Returns number of fields of a hash.
New in version 2017.7.0.
CLI Example:
salt 'x' redis.hlen foo_hash

salt.modules.redismod.hmget(key, *fields, **options)
    Returns the values of all the given hash fields.
    New in version 2017.7.0.
    CLI Example:
    salt 'x' redis.hmget foo_hash bar_field1 bar_field2

salt.modules.redismod.hmset(key, **fieldsvals)
    Sets multiple hash fields to multiple values.
    New in version 2017.7.0.
    CLI Example:
    salt 'x' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2

salt.modules.redismod.hscan(key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None)
    Incrementally iterate hash fields and associated values.
    New in version 2017.7.0.
    CLI Example:
    salt 'x' redis.hscan foo_hash match='field_prefix_*' count=1

salt.modules.redismod.hset(key, field, value, host=None, port=None, db=None, password=None)
    Set the value of a hash field.
    New in version 2017.7.0.
    CLI Example:
    salt 'x' redis.hset foo_hash bar_field bar_value

salt.modules.redismod.hsetnx(key, field, value, host=None, port=None, db=None, password=None)
    Set the value of a hash field only if the field does not exist.
    New in version 2017.7.0.
    CLI Example:
    salt 'x' redis.hsetnx foo_hash bar_field bar_value

salt.modules.redismod.hvals(key, host=None, port=None, db=None, password=None)
    Return all the values in a hash.
    New in version 2017.7.0.
    CLI Example:
    salt 'x' redis.hvals foo_hash bar_field1 bar_value1

salt.modules.redismod.info(host=None, port=None, db=None, password=None)
    Get information and statistics about the server
    CLI Example:
salt '...' redis.info

salt.modules.redismod.key_type(key, host=None, port=None, db=None, password=None)
  Get redis key type
  CLI Example:
  salt '...' redis.type foo

salt.modules.redismod.keys(pattern='*', host=None, port=None, db=None, password=None)
  Get redis keys, supports glob style patterns
  CLI Example:
  salt '...' redis.keys
  salt '...' redis.keys test*

salt.modules.redismod.lastsave(host=None, port=None, db=None, password=None)
  Get the UNIX time in seconds of the last successful save to disk
  CLI Example:
  salt '...' redis.lastsave

salt.modules.redismod.llen(key, host=None, port=None, db=None, password=None)
  Get the length of a list in Redis
  CLI Example:
  salt '...' redis.llen foo_list

salt.modules.redismod.lrange(key, start, stop, host=None, port=None, db=None, password=None)
  Get a range of values from a list in Redis
  CLI Example:
  salt '...' redis.lrange foo_list 0 10

salt.modules.redismod.ping(host=None, port=None, db=None, password=None)
  Ping the server, returns False on connection errors
  CLI Example:
  salt '...' redis.ping

salt.modules.redismod.save(host=None, port=None, db=None, password=None)
  Synchronously save the dataset to disk
  CLI Example:
  salt '...' redis.save

salt.modules.redismod.sentinel_get_master_ip(master, host=None, port=None, password=None)
  Get ip for sentinel master
  New in version 2016.3.0.
  CLI Example:
set_key

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

shutdown

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

slaveof

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com

# Become master
salt '*' redis.slaveof
```

smembers

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

time

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

zcard

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

zrange

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```
25.7.377 salt.modules.reg

Manage the Windows registry

**Hives**

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER

**Keys**

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \). The following are valid methods of passing the key on the CLI:

- Using single backslashes: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)
- Using double backslashes: SOFTWARE\\Python

**Values or Entries**

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

**Example**

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="C:\Program Files\Realtek\Audio\HDA\RtkNGUI64.exe" -s
"NvBackend"="C:\Program Files (x86)\NVIDIA Corporation\Update Core\NvBackend. exe"
"BTMTrayAgent"="rundll32.exe "C:\Program Files (x86)\Intel\Bluetooth\btmshellex. dll",TrayApp"
```

In this example these are the values for each:

**Hive:** HKEY_LOCAL_MACHINE

**Key and subkeys:** SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run

**Value:**

- There are 3 value names:
  - RTHDVCPL
  - NvBackend
  - BTMTrayAgent
• Each value name has a corresponding value depends

  • salt.utils.win_reg

salt.modules.reg.broadcast_change() Refresh the windows environment.

**Note:** This will only effect new processes and windows. Services will not see the change until the system restarts.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**

```shell
salt '*' reg.broadcast_change
```

salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key (str)**: The key to remove (looks like a path)

- **use_32bit_registry (bool)**: Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns** A dictionary listing the keys that deleted successfully as well as those that failed to delete.

**Return type** dict

**CLI Example:**

The following example will remove delete_me and all its subkeys from the SOFTWARE key in HKEY_LOCAL_MACHINE:

```shell
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

salt.modules.reg.delete_value(hive, key, vname=None, use_32bit_registry=False)

Delete a registry value entry or the default value for a key.

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key (str)** -- The key (looks like a path) to the value name.

- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.

- **use_32bit_registry (bool)** -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' 'version'
```

salt.modules.reg.import_file(source, use_32bit_registry=False)
Import registry settings from a Windows REG file by invoking REG.EXE.
New in version 2018.3.0.
Parameters
- **source** (str) -- The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. salt://salt_master_path)
- **use_32bit_registry** (bool) -- If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.
Returns  True if successful, otherwise an error is raised
Return type  bool
Raises
- **ValueError** -- If the value of source is an invalid path or otherwise causes cp.
cache_file to return False
- **CommandExecutionError** -- If reg.exe exits with a non-0 exit code

CLI Example:
```
salt machine1 reg.import_file salt://win/printer_config/110_Canon/ →
--postinstall_config.reg
```

salt.modules.reg.key_exists(hive, key=None, use_32bit_registry=False)
Check that the key is found in the registry. This refers to keys and not value/data pairs.
Parameters
- **hive** (str) -- The hive to connect to
- **key** (str) -- The key to check
- **use_32bit_registry** (bool) -- Look in the 32bit portion of the registry

Returns  True if exists, otherwise False
Return type  bool

CLI Example:
```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

salt.modules.reg.list_keys(hive, key=None, use_32bit_registry=False)
Enumerates the subkeys in a registry key or hive.
Parameters
- **hive** (str) -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (str) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry** (bool) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns  A list of keys/subkeys under the hive or key.
Return type  list

CLI Example:
salt.modules.reg.list_values(hive, key=None, use_32bit_registry=False)
Enumerates the values in a registry key or hive.

**Note:** The (Default) value will only be returned if it is set, otherwise it will not be returned in the list of values.

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key (str)** -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.

- **use_32bit_registry (bool)** -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

**Returns**
A list of values under the hive or key.

**Return type**
list

**CLI Example:**

```
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip_
```

salt.modules.reg.read_value(hive, key, vname=None, use_32bit_registry=False)
Reads a registry value entry or the default value for a key. To read the default value, don't pass vname

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following:
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC

- **key (str)** -- The key (looks like a path) to the value name.

- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned.

- **use_32bit_registry (bool)** -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

**Returns**
A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

- bool: Returns False if the key is not found

  If vname is not passed:
  - Returns the first unnamed value (Default) as a string.
  - Returns none if first unnamed value is empty.

**Return type**
dict

**CLI Example:**

```
salt '*' reg.read_value HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip_
```
CLI Example:
The following will get the default value of the HKEY_LOCAL_MACHINE\SOFTWARE\Salt key

```bash
salt '* reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

```
salt '* reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ', use_32bit_registry=False, volatile=False)

Sets a value in the registry. If vname is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

**Parameters**

- **hive (str)** -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key (str)** -- The key (looks like a path) to the value name.
- **vname (str)** -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata (str, int, list, bytes)** -- The value you’d like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in vtype. The correspondence is as follows:

- REG_BINARY: Binary data (str in Py2, bytes in Py3)
- REG_DWORD: int
- REG_EXPAND_SZ: str
- REG_MULTI_SZ: list of str
- REG_QWORD: int
- REG_SZ: str

**Note:** When setting REG_BINARY, string data will be converted to binary.

**Note:** The type for the (Default) value is always REG_SZ and cannot be changed.

**Note:** This parameter is optional. If vdata is not passed, the Key will be created with no associated item/value pairs.

- **vtype (str)** -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry (bool)** -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile (bool)** -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

**Returns**

True if successful, otherwise False

**Return type** bool
CLI Example:
This will set the version value to 2015.5.2 in the SOFTWARESalt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' \n   -> '2015.5.2'
```

CLI Example:
This function is strict about the type of vdata. For instance this example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

CLI Example:
In this next example vdata is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' \n   -> vtype=REG_SZ vdata="'1.2'"
```

CLI Example:
This is an example of using vtype REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data' \n   -> vtype=REG_BINARY vdata='Salty Data'
```

CLI Example:
An example of using vtype REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data' \n   -> vtype=REG_MULTI_SZ vdata=['"Salt", "is", "great"]
```

```
salt.modules.reg.value_exists(hive, key, vname, use_32bit_registry=False)
```
Check that the value/data pair is found in the registry.

New in version 3000.

Parameters
- **hive** (*str*) -- The hive to connect to
- **key** (*str*) -- The key to check in
- **vname** (*str*) -- The name of the value/data pair you're checking
- **use_32bit_registry** (*bool*) -- Look in the 32bit portion of the registry

Returns
- **True** if exists, otherwise **False**

Return type
- **bool**

CLI Example:

```
salt '*' reg.value_exists HKLM SOFTWARE\Microsoft\Windows\CurrentVersion\CommonFilesDir
```

### 25.7.378 salt.modules.rest_pkg

Package support for the REST example

```
salt.modules.rest_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.rest_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)
salt.modules.rest_pkg.list_pkgs(versions_as_list=False, **kwargs)
```
salt.modules.rest_pkg.remove(name=None, pkgs=None, **kwargs)
salt.modules.rest_pkg.upgrade(refresh=True, skip_verify=True, **kwargs)
salt.modules.rest_pkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 25.7.379 salt.modules.rest_sample_utils

Utility functions for the rest_sample

salt.modules.rest_sample_utils.fix_outage()

"Fix" the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

salt.modules.rest_sample_utils.get_test_string()

Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

### 25.7.380 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.enabled(name, sig=None)

Only the 'redbull' service is 'enabled' in the test

salt.modules.rest_service.get_all()

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.rest_service.list_()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```
salt.modules.rest_service.restart(name, sig=None)
    Restart the specified service with rest_sample
    New in version 2015.8.0.
    CLI Example:
    
    ```
    salt '*' service.restart <service name>
    ```

salt.modules.rest_service.running(name, sig=None)
    Return whether this service is running.
    New in version 2015.8.0.

salt.modules.rest_service.start(name, sig=None)
    Start the specified service on the rest_sample
    New in version 2015.8.0.
    CLI Example:
    
    ```
    salt '*' service.start <service name>
    ```

salt.modules.rest_service.status(name, sig=None)
    Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to
    True/False values is returned.
    New in version 2015.8.0.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    • **name** *(str)* -- The name of the service to check
    • **sig** *(str)* -- Not implemented
    Returns  True if running, False otherwise
dict: Maps service name to True if running, False otherwise
    Return type  bool
    CLI Example:
    
    ```
    salt '*' service.status <service name>
    ```

salt.modules.rest_service.stop(name, sig=None)
    Stop the specified service on the rest_sample
    New in version 2015.8.0.
    CLI Example:
    
    ```
    salt '*' service.stop <service name>
    ```

**25.7.381 salt.modules.restartcheck**

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary
of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, [https://packages.debian.org/debian-goodies](https://packages.debian.org/debian-goodies)) and psdel by Sam Morris.

    codeauthor  Jiri Kotlin <jiri.kotlin@ultimum.io>
salt.modules.restartcheck.restartcheck

Analyzes files opened by running processes and seeks for packages which need to be restarted.

Parameters

- **ignorelist** -- string or list of packages to be ignored.
- **blacklist** -- string or list of file paths to be ignored.
- **excludepid** -- string or list of process IDs to be ignored.
- **verbose** -- boolean, enables extensive output.
- **timeout** -- int, timeout in minute.

Returns

{ 'result': False, 'comment': '<reason>' } String with checkrestart output if some package seems to need to be restarted or if no packages need restarting.

Return type

Dict on error

New in version 2015.8.3.

CLI Example:

```
salt '*' restartcheck.restartcheck
```

25.7.382 salt.modules.restconf

Execution module for RESTCONF Proxy minions

- **codeauthor** Jamie (Bear) Murphy <jamiemurphyit@gmail.com>
- **maturity** new
- **platform** any

salt.modules.restconf.get_data(path)

Returns an object containing the content of the request path with a GET request. Data returned will contain
a dict with at minimum a key of "status" containing the http status code Other keys that should be available
error (if http error), body, dict (parsed json to dict)

CLI Example:

```
salt '*' restconf.get_data restconf/yang-library-version
```

salt.modules.restconf.info()

Returns the RESTCONF capabilities PATH

CLI Example:

```
salt '*' restconf.info
```

salt.modules.restconf.path_check(primary_path, init_path)

Used to check which path responds with a 200 status Returns an array of True/False and a dict with keys path
+ path_method + response data, used in states code.

CLI Example:

```
salt '*' restconf.path_check restconf/yang-library-version/specific_item restconf/
         →yang-library-version
```

salt.modules.restconf.set_data(path, method, dict_payload)

Sends a post/patch/other type of rest method to a specified path with the specified method with specified
payload

CLI Example:
25.7.383 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.get_fun(returner, fun)
  Return info about last time fun was called on each minion
  CLI Example:
  ```
  salt '*' ret.get_fun mysql network.interfaces
  ```

salt.modules.ret.get_jid(returner, jid)
  Return the information for a specified job id
  CLI Example:
  ```
  salt '*' ret.get_jid redis 20421104181954700505
  ```

salt.modules.ret.get_jids(returner)
  Return a list of all job ids
  CLI Example:
  ```
  salt '*' ret.get_jids mysql
  ```

salt.modules.ret.get_minions(returner)
  Return a list of all minions
  CLI Example:
  ```
  salt '*' ret.get_minions mysql
  ```

25.7.384 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.apply_network_settings(**settings)
  Apply global network configuration.
  CLI Example:
  ```
  salt '*' ip.apply_network_settings
  ```

salt.modules.rh_ip.build_interface(iface, iface_type, enabled, **settings)
  Build an interface script for a network interface.
  CLI Example:
  ```
  salt '*' ip.build_interface eth0 eth <settings>
  ```

salt.modules.rh_ip.build_network_settings(**settings)
  Build the global network script.
  CLI Example:
salt '*' ip.build_network_settings <settings>

**salt.modules.rh_ip.build_routes**(*iface, **settings*)

Build a route script for a network interface.

CLI Example:

salt '*' ip.build_routes eth0 <settings>

**salt.modules.rh_ip.down**(iface, iface_type)

Shutdown a network interface

CLI Example:

salt '*' ip.down eth0

**salt.modules.rh_ip.get_interface**(iface)

Return the contents of an interface script

CLI Example:

salt '*' ip.get_interface eth0

**salt.modules.rh_ip.get_network_settings**(]

Return the contents of the global network script.

CLI Example:

salt '*' ip.get_network_settings

**salt.modules.rh_ip.get_routes**(iface)

Return the contents of the interface routes script.

CLI Example:

salt '*' ip.get_routes eth0

**salt.modules.rh_ip.up**(iface, iface_type)

Start up a network interface

CLI Example:

salt '*' ip.up eth0

### 25.7.385 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start is not available'), see [here](#).

**salt.modules.rh_service.available**(*name, limit=*")

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

**25.7. execution modules**
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit

salt.modules.rh_service.delete(name, **kwargs)
    Delete the named service
    New in version 2016.3.0.
    CLI Example:
    salt '*' service.delete <service name>

salt.modules.rh_service.disable(name, **kwargs)
    Disable the named service to start at boot
    CLI Example:
    salt '*' service.disable <service name>

salt.modules.rh_service.disabled(name)
    Check to see if the named service is disabled to start on boot
    CLI Example:
    salt '*' service.disabled <service name>

salt.modules.rh_service.enable(name, **kwargs)
    Enable the named service to start at boot
    CLI Example:
    salt '*' service.enable <service name>

salt.modules.rh_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot
    CLI Example:
    salt '*' service.enabled <service name>

salt.modules.rh_service.get_all(limit='')
    Return all installed services. Use the limit param to restrict results to services of that type.
    CLI Example:
    salt '*' service.get_all
    salt '*' service.get_all limit=upstart
    salt '*' service.get_all limit=sysvinit

salt.modules.rh_service.get_disabled(limit='')
    Return the disabled services. Use the limit param to restrict results to services of that type.
    CLI Example:
    salt '*' service.get_disabled
    salt '*' service.get_disabled limit=upstart
    salt '*' service.get_disabled limit=sysvinit
salt.modules.rh_service.get_enabled(*limit*)

Return the enabled services. Use the limit param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

salt.modules.rh_service.missing(name, *limit*)

The inverse of service.available. Return True if the named service is not available. Use the limit param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.reload_(name)

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.rh_service.restart(name)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rh_service.start(name)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rh_service.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- name (str) -- The name of the service to check
- sig (str) -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.rh_service.stop(name)

Stop the specified service

CLI Example:
salt 'stop' service.stop <service name>

25.7.386 salt.modules.riak

Riak Salt Module

salt.modules.riak.cluster_commit()
Commit Cluster Changes
Changed in version 2015.8.0.
CLI Example:
```
salt '*' riak.cluster_commit
```

salt.modules.riak.cluster_join(username, hostname)
Join a Riak cluster
Changed in version 2015.8.0.
CLI Example:
```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster
hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_leave(username, hostname)
Leave a Riak cluster
New in version 2015.8.0.
CLI Example:
```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster
hostname - The riak hostname you are connecting to

salt.modules.riak.cluster_plan()
Review Cluster Plan
Changed in version 2015.8.0.
CLI Example:
```
salt '*' riak.cluster_plan
```

salt.modules.riak.member_status()
Get cluster member status
Changed in version 2015.8.0.
CLI Example:
```
salt '*' riak.member_status
```

salt.modules.riak.services()
List available services on a node
New in version 2015.8.0.
CLI Example:
salt '*' riak.services

salt.modules.riak.start()
    Start Riak
    CLI Example:
    
    salt '*' riak.start

salt.modules.riak.status()
    Current node status
    New in version 2015.8.0.
    CLI Example:
    
    salt '*' riak.status

salt.modules.riak.stop()
    Stop Riak
    Changed in version 2015.8.0.
    CLI Example:
    
    salt '*' riak.stop

salt.modules.riak.test()
    Runs a test of a few standard Riak operations
    New in version 2015.8.0.
    CLI Example:
    
    salt '*' riak.test

25.7.387 salt.modules.rpm_lowpkg

Support for rpm

salt.modules.rpm_lowpkg.bin_pkg_info(path, saltenv='base')
    New in version 2015.8.0.
    Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).
    path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. salt://path/to/file.rpm). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.
    saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.
    CLI Example:
    
    salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
    salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm

salt.modules.rpm_lowpkg.checksum(paths, **kwargs)
    Return if the signature of a RPM file is valid.
    root use root as top level directory (default: "/")
    CLI Example:
Salt Documentation, Release 3006.4

salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm

salt.modules.rpm_lowpkg.diff(package_path, path)
Return a formatted diff between current file and original in a package. NOTE: this function includes all files
(configuration and not), but does not work on binary content.

Parameters
  • **package** -- Full pack of the RPM file
  • **path** -- Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI Example:
salt '*' lowpkg.diff /path/to/apache2.rpm /etc/apache2/httpd.conf

salt.modules.rpm_lowpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_
file on the system's rpm database (not generally recommended).

  • **root** use root as top level directory (default: ")")

CLI Examples:
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict

salt.modules.rpm_lowpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the
system's rpm database (not generally recommended).

  • **root** use root as top level directory (default: ")")

CLI Examples:
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list

salt.modules.rpm_lowpkg.info(*packages, **kwargs)
Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters
  • **packages**
  • **attr** -- Comma-separated package attributes. If no 'attr' is specified, all available
attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch,
size, license, signature, packager, url, summary, description.

  • **all_versions** -- Return information for all installed versions of the packages
  • **root** -- use root as top level directory (default: ")")

Returns

CLI Example:
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size all_
  versions=True

salt.modules.rpm_lowpkg.list_pkgs(*packages, **kwargs)
List the packages currently installed in a dict:
{'<package_name>': '<version>'}

root use root as top level directory (default: "/")

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm_lowpkg.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system’s RPM database.

New in version 2015.5.0.
root use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm_lowpkg.owner(*paths, **kwargs)
Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.
root use root as top level directory (default: "/")

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm_lowpkg.verify(*packages, **kwargs)
Runs an rpm -Va on a system, and returns the results in a dict
root use root as top level directory (default: "/")
Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the ignore_types keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

salt.modules.rpm_lowpkg.version_cmp(ver1, ver2, ignore_epoch=False)
Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.
ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

25.7. execution modules
25.7.388 salt.modules.rpmbuild_pkgbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

```
salt.modules.rpmbuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, 
saltenv='base', log_dir='/var/log/salt/pkgbuild')
```

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
   https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/
      python-libnacl.spec
   https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

```
salt.modules.rpmbuild_pkgbuild.make_repo(repodir, keyid=None, 
    env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', 
    timeout=15.0)
```

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.
keyid Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

|LQ0+BFciIfQBCADAPCtzxI5RL32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
|w82PCE8Y1jF/9Uk2m3RKVWp3YcLc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
|

|Ebe+83CQTqwSXPRtzXmy/b5WXDeM79CkLWvuGpXFoR76D+ECMRPv/rauwkEcNpnt
|R50mgHqvydEn04pWbn8JzQ09YX/Us0SHMBVzLC8eIiS2IopzalvX
|=JvW8

-----END PGP PRIVATE KEY BLOCK-----
gpg_pkg_priv_keyname: gpg_pkg_key.pem
gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
```

(continues on next page)
env

A dictionary of environment variables to be utilized in creating the repository.

**Note:** This parameter is not used for making **yum** repositories.

**use_passphrase** [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in **keyid**. Passphrase is received from Pillar data which could be passed on the command line with **pillar** parameter.

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

New in version 3001.1.

RHEL 8 and above leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

**gnupghome** [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with **keyid**.

**runas** [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

**timeout** [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild_pkgbuild.**make_src_pkg**(dest_dir, spec, sources, env=None, template=None, saltenv='base', runas='root')

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
    https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-
    →libnacl.spec
    https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```
This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion.

Changed in version 2017.7.0.

dest_dir  The directory on the minion to place the built package(s)
spec  The location of the spec file (used for rpms)
sources  The list of package sources
e env  A dictionary of environment variables to be set prior to execution.
template  Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.
saltenv  The saltenv to use for files downloaded from the salt filesever
runas  The user to run the build process as

New in version 2018.3.3.

Note: using SHA256 as digest and minimum level dist el6

25.7.389 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

\[\text{salt.modules.rsync.config}([\text{conf\_path}='/etc/rsyncd.conf'])\]

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from \text{cmd.run\_all}.

Returns the contents of the rsync config file

conf_path  [/etc/rsyncd.conf] Path to the config file

CLI Example:

\[\text{salt '*'} rsync.config\]

\[\text{salt.modules.rsync.rsync}([\text{src}, \text{dst}, \text{delete}=\text{False}, \text{force}=\text{False}, \text{update}=\text{False}, \text{passwordfile}=\text{None}, \text{exclude}=\text{None}, \text{excludefrom}=\text{None}, \text{dryrun}=\text{False}, \text{rsh}=\text{None}, \text{additional\_opts}=\text{None}, \text{saltenv}=\text{base'})\]

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from \text{cmd.run\_all}.

Rsync files from src to dst

data  The source location where files will be rsynced from.
dst  The destination location where files will be rsynced to.
delete  [False] Whether to enable the rsync --delete flag, which will delete extraneous files from dest dirs
force  [False] Whether to enable the rsync --force flag, which will force deletion of dirs even if not empty.
update  [False] Whether to enable the rsync --update flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.
passwordfile  A file that contains a password for accessing an rsync daemon. The file should contain just the password.
exclude  Whether to enable the rsync --exclude flag, which will exclude files matching a PATTERN.
excludefrom  Whether to enable the rsync --excludefrom flag, which will read exclude patterns from a file.
dryrun  [False] Whether to enable the rsync --dry-run flag, which will perform a trial run with no changes made.
rsh  Whether to enable the rsync --rsh flag, to specify the remote shell to use.
additional_opts  Any additional rsync options, should be specified as a list.
```

saltenv  Specify a salt fileserver environment to be used.
CLI Example:
salt '*' rsync.rsync /path/to/src /path/to/dest delete=True update=True
    → passwordfile=/etc/pass.crt exclude=exclude/dir
salt '*' rsync.rsync /path/to/src delete=True excludefrom=/xx.ini
salt '*' rsync.rsync /path/to/src delete=True exclude='[exclude1/dir,exclude2/dir]
    → ' additional_opts='["--partial", "--bwlimit=5000"]'
```

salt.modules.rsync.version()
Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from cmd.run_all.

Returns rsync version
CLI Example:
salt '*' rsync.version

```
25.7.390 salt.modules.runit

runit service module (http://smarden.org/runit)

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

```
myservice:
    service:
        - running
        - provider: runit
```

Provides virtual service module on systems using runit as init.

Service management rules (sv command):

```
service $n is ENABLED if file SERVICE_DIR/$n/run exists
service $n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/$n/run exists
service $n is DISABLED if AVAILABLE but not ENABLED
SERVICE_DIR/$n is normally a symlink to a AVAIL_SVR_DIR/$n folder
```

Service auto-start/stop mechanism:

```
sv (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.
autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.
```

Service's alias:

```
Service sva is an alias of service svc when AVAIL_SVR_DIR/sva symlinks to folder AVAIL_SVR_DIR/svc.
svc can't be enabled if it is already enabled through an alias already enabled, since sv files are stored in folder SERVICE_DIR/svc/.
XBPS package management uses a service's alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.
```

salt.modules.runit.add_svc_avail_path(path)
Add a path that may contain available services. Return True if added (or already present), False on error.
path  directory to add to AVAIL_SVR_DIRS
```

25.7. execution modules 2661
salt.modules.runit.available(name)

Returns True if the specified service is available, otherwise returns False.

- **name**: the service's name

CLI Example:
```
salt '*' runit.available <service name>
```

salt.modules.runit.disable(name, stop=False, **kwargs)

Don't start service name at boot Returns True if operation is successful

- **name**: the service's name
- **stop**: if True, also stops the service

CLI Example:
```
salt '*' service.disable <name> [stop=True]
```

salt.modules.runit.disabled(name)

Return True if the named service is disabled, False otherwise

- **name**: the service's name

CLI Example:
```
salt '*' service.disabled <service name>
```

salt.modules.runit.enable(name, start=False, **kwargs)

Start service name at boot. Returns True if operation is successful

- **name**: the service's name
- **start**: [False] If True, start the service once enabled.

CLI Example:
```
salt '*' service.enable <name> [start=True]
```

salt.modules.runit.enabled(name)

Return True if the named service is enabled, False otherwise

- **name**: the service's name

CLI Example:
```
salt '*' service.enabled <service name>
```

salt.modules.runit.full_restart(name)

Calls runit.restart()

- **name**: the service's name

CLI Example:
```
salt '*' runit.full_restart <service name>
```

salt.modules.runit.get_all()

Return a list of all available services

CLI Example:
```
salt '*' runit.get_all
```

salt.modules.runit.get_disabled()

Return a list of all disabled services

CLI Example:
salt '.*' service.get_disabled

salt.modules.runit.get_enabled()
    Return a list of all enabled services
    CLI Example:
        salt '.*' service.get_enabled

salt.modules.runit.get_svc_alias()
    Returns the list of service's name that are aliased and their alias path(s)

salt.modules.runit.get_svc_avail_path()
    Return list of paths that may contain available services

salt.modules.runit.get_svc_broken_path(name='*')
    Return list of broken path(s) in SERVICE_DIR that match name
    A path is broken if it is a broken symlink or can not be a runit service
    name a glob for service name. default is '*'
    CLI Example:
        salt '.*' runit.get_svc_broken_path <service name>

salt.modules.runit.missing(name)
    The inverse of runit.available. Returns True if the specified service is not available, otherwise returns False.
    name the service's name
    CLI Example:
        salt '.*' runit.missing <service name>

salt.modules.runit.reload_(name)
    Reload service
    name the service's name
    CLI Example:
        salt '.*' runit.reload <service name>

salt.modules.runit.remove(name)
    Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.
    name the service's name
    CLI Example:
        salt '.*' service.remove <name>

salt.modules.runit.restart(name)
    Restart service
    name the service's name
    CLI Example:
        salt '.*' runit.restart <service name>

salt.modules.runit.show(name)
    Show properties of one or more units/jobs or the manager
    name the service's name
    CLI Example:
salt '*' service.show <service name>

salt.modules.runit.start(name)
Start service
name  the service's name
CLI Example:
    salt '*' runit.start <service name>

salt.modules.runit.status(name, sig=None)
Return True if service is running
name  the service's name
sig  signature to identify with ps
CLI Example:
    salt '*' runit.status <service name>

salt.modules.runit.status_autostart(name)
Return True if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return False if the service is not enabled.
name  the service's name
CLI Example:
    salt '*' runit.status_autostart <service name>

salt.modules.runit.stop(name)
Stop service
name  the service's name
CLI Example:
    salt '*' runit.stop <service name>

25.7.391 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

salt.modules.rvm.do(ruby, command, runas=None, cwd=None, env=None)
Execute a command in an RVM controlled environment.
ruby  Which ruby to use
command  The rvm command to execute
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
cwd  The directory from which to run the rvm command. Defaults to the user's home directory.
env  CLI Example:
    salt '*' rvm.do 2.0.0 <command>

salt.modules.rvm.gemset_copy(source, destination, runas=None)
Copy all gems from one gemset to another.
source  The name of the gemset to copy, complete with ruby version
destination  The destination gemset
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
CLI Example:
```
salt '*' rvm.gemset_copy foobar bazquo
```

```python
class rvm:
    @staticmethod
    def gemset_create(ruby, gemset, runas=None):
        # Creates a gemset.
        # ruby: The ruby version for which to create the gemset.
        # gemset: The name of the gemset to create.
        # runas: The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
        # CLI Example:
        
        salt '*' rvm.gemset_create 2.0.0 foobar
```

```python
class rvm:
    @staticmethod
    def gemset_delete(ruby, gemset, runas=None):
        # Delete a gemset.
        # ruby: The ruby version to which the gemset belongs.
        # gemset: The gemset to delete.
        # runas: The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
        # CLI Example:
        
        salt '*' rvm.gemset_delete 2.0.0 foobar
```

```python
class rvm:
    @staticmethod
    def gemset_empty(ruby, gemset, runas=None):
        # Remove all gems from a gemset.
        # ruby: The ruby version to which the gemset belongs.
        # gemset: The gemset to empty.
        # runas: The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
        # CLI Example:
        
        salt '*' rvm.gemset_empty 2.0.0 foobar
```

```python
class rvm:
    @staticmethod
    def gemset_list(ruby='default', runas=None):
        # List all gemsets for the given ruby.
        # ruby: [default] The ruby version for which to list the gemsets.
        # runas: The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
        # CLI Example:
        
        salt '*' rvm.gemset_list
```

```python
class rvm:
    @staticmethod
    def gemset_list_all(runas=None):
        # List all gemsets for all installed rubies.
        # Note that you must have set a default ruby before this can work.
        # runas: The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
        # CLI Example:
        
        salt '*' rvm.gemset_list_all
```

```python
class rvm:
    @staticmethod
    def get(version='stable', runas=None):
        # Update RVM
        # version: [stable] Which version of RVM to install, (e.g. stable or head)
        # CLI Example:
        
```

25.7. execution modules
salt '*> rvm.get

salt.modules.rvm.install(runas=None)
  Install RVM system-wide
  runas  The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

  CLI Example:
  
salt '*> rvm.install

salt.modules.rvm.install_ruby(ruby, runas=None, opts=None, env=None)
  Install a ruby implementation.
  ruby  The version of ruby to install
  runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
  env  Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS
  opts  List of options to pass to the RVM installer (ie -C, --patch, etc)

  CLI Example:
  
salt '*> rvm.install_ruby 1.9.3-p385

salt.modules.rvm.is_installed(runas=None)
  Check if RVM is installed.

  CLI Example:
  
salt '*> rvm.is_installed

salt.modules.rvm.list_(runas=None)
  List all rvm-installed rubies
  runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

  CLI Example:
  
salt '*> rvm.list

salt.modules.rvm.reinstall_ruby(ruby, runas=None, env=None)
  Reinstall a ruby implementation
  ruby  The version of ruby to reinstall
  runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

  CLI Example:
  
salt '*> rvm.reinstall_ruby 1.9.3-p385

salt.modules.rvm.rubygems(ruby, version, runas=None)
  Installs a specific rubygems version in the given ruby
  ruby  The ruby for which to install rubygems
  version  The version of rubygems to install, or 'remove' to use the version that ships with 1.9
  runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

  CLI Example:
salt 'salt*' rvm.runyxems 2.0.0 1.8.24

```
salt.modules.rvm.set_default(ruby, runas=None)
Set the default ruby

ruby  The version of ruby to make the default
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:
```
salt 'salt*' rvm.set_default 2.0.0
```

```
salt.modules.rvm.wrapper(ruby_string, wrapper_prefix, runas=None, *binaries)
Install RVM wrapper scripts

ruby_string  Ruby/gemset to install wrappers for
wrapper_prefix  What to prepend to the name of the generated wrapper binaries
runas  The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.
binaries  [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:
```
salt 'salt*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

25.7.392 salt.modules.s3

Connection module for Amazon S3

configuration  This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

Warning: This is literally the pillar key s3.keyid or the config option s3.keyid, not:

```
s3:
  keyid: blah
```

A service_url may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A role_arn may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a service_url is not specified, the default is s3.amazonaws.com. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:
The service_url will form the basis for the final endpoint that is used to query the service. Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use Salt with a proxy for a S3 compatible storage. You can use either HTTPS protocol or HTTP protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default. AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is us-east-1.

This module should be usable to query other S3-like services, such as Eucalyptus.

**depends** requests

salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

salt.modules.s3.get(bucket=None; path=; return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:
To perform an action on a bucket:
salt myminion s3.get mybucket myfile.png action=acl

salt.modules.s3.head(bucket, path='', key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png

salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None, keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None, role_arn=None, path_style=None, https_enable=None)

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:
salt myminion s3.put mybucket
CLI Example to upload an object to a bucket:
salt myminion s3.put mybucket remotepath local_file=/path/to/file

25.7.393 salt.modules.s6

s6 service module

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

myservice:
  service:
    - running
    - provider: s6

Note that the enabled argument is not available with this provider.

codeauthor Marek Skrobacki <skrobul@skrobul.com>
salt.modules.s6.available(name)

Returns True if the specified service is available, otherwise returns False.

CLI Example:
```python
salt '*' s6.available foo

salt.modules.s6.full_restart(name)
Calls s6.restart() function
CLI Example:
salt '*' s6.full_restart <service name>

salt.modules.s6.get_all()
Return a list of all available services
CLI Example:
salt '*' s6.get_all

salt.modules.s6.missing(name)
The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.
CLI Example:
salt '*' s6.missing foo

salt.modules.s6.reload_(name)
Send a HUP to service via s6
CLI Example:
salt '*' s6.reload <service name>

salt.modules.s6.restart(name)
Restart service via s6. This will stop/start service
CLI Example:
salt '*' s6.restart <service name>

salt.modules.s6.start(name)
Starts service via s6
CLI Example:
salt '*' s6.start <service name>

salt.modules.s6.status(name, sig=None)
Return the status for a service via s6, return pid if running
CLI Example:
salt '*' s6.status <service name>

salt.modules.s6.stop(name)
Stops service via s6
CLI Example:
salt '*' s6.stop <service name>
```
salt.modules.s6.term(name)
Send a TERM to service via s6

CLI Example:
salt '*' s6.term <service name>

25.7.394 salt.modules.salt_proxy

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

salt.modules.salt_proxy.configure_proxy(proxyname, start=True)
Create the salt proxy file and start the proxy process if required

Parameters

- **proxynam**e -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started default = True

CLI Example:
salt deviceminion salt_proxy.configure_proxy p8000

salt.modules.salt_proxy.is_running(proxyname)
Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters **proxynam**e -- String name of the proxy (p8000 for example)

CLI Example:
salt deviceminion salt_proxy.is_running p8000

25.7.395 salt.modules.salt_version

Access Salt's elemental release code-names.

New in version 3000.

Salt's feature release schedule is based on the Periodic Table, as described in the Version Numbers documentation.

When a feature was added (or removed) in a specific release, it can be difficult to build out future-proof functionality that is dependent on a naming scheme that moves.

For example, a state syntax needs to change to support an option that will be removed in the future, but there are many Minion versions in use across an infrastructure. It would be handy to use some Jinja syntax to check for these instances to perform one state syntax over another.

A simple example might be something like the following:

```
{% set option_deprecated = salt['salt_version.less_than']("Sodium") %}

{% if option_deprecated %}
<use old syntax>
{% else %}
<use new syntax>
{% endif %}
```
salt.modules.salt_version.equal(name)
  Returns a boolean (True) if the minion's current version code name matches the named version.
  name  The release code name to check the version against.
  CLI Example:
  ```
salt '*' salt_version.equal 'Oxygen'
  ```

salt.modules.salt_version.get_release_number(name)
  Returns the release number of a given release code name in a MAJOR.PATCH format (for Salt versions < 3000) or MAJOR for newer Salt versions.
  If the release name has not been given an assigned release number, the function returns a string. If the release cannot be found, it returns None.
  name  The release code name for which to find a release number.
  CLI Example:
  ```
salt '*' salt_version.get_release_number 'Oxygen'
  ```

salt.modules.salt_version.greater_than(name)
  Returns a boolean (True) if the minion's current version code name is greater than the named version.
  name  The release code name to check the version against.
  CLI Example:
  ```
salt '*' salt_version.greater_than 'Oxygen'
  ```

salt.modules.salt_version.less_than(name)
  Returns a boolean (True) if the minion's current version code name is less than the named version.
  name  The release code name to check the version against.
  CLI Example:
  ```
salt '*' salt_version.less_than 'Oxygen'
  ```

25.7.396 salt.modules.saltcheck

A module for testing the logic of states and highstates on salt minions

codeauthor  William Cannon <william.cannon@gmail.com>
maturity  new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml. Saltcheck uses salt modules to return data, then runs an assertion against that return. This allows for testing with all the features included in salt modules.

In order to run state and highstate saltcheck tests, a sub-folder in the state directory must be created and named saltcheck-tests. Tests for a state should be created in files ending in *.tst and placed in the saltcheck-tests folder. tst files are run through the salt rendering system, enabling tests to be written in yaml (or renderer of choice), and include jinja, as well as the usual grain and pillar information. Like states, multiple tests can be specified in a tst file. Multiple tst files can be created in the saltcheck-tests folder, and should be named the same as the associated state. The id of a test works in the same manner as in salt state files and should be unique and descriptive.

New in version 3000: The saltcheck-tests folder can be customized using the saltcheck_test_location minion configuration setting. This setting is a relative path from the formula's salt:// path to the test files.
Usage

Example Default file system layout:

```
/srv/salt/apache/
  init.sls
  config.sls
  saltcheck-tests/
    init.tst
    config.tst
    deployment_validation.tst
```

Alternative example file system layout with custom saltcheck_test_location:

Minion configuration:

```
saltcheck_test_location: tests/integration/saltcheck
```

Filesystem layout:

```
/srv/salt/apache/
  init.sls
  config.sls
  tests/integration/saltcheck/
    init.tst
    config.tst
    deployment_validation.tst
```

Tests can be run for each state by name, for all apache/saltcheck/*.tst files, or for all states assigned to the minion in top.sls. Tests may also be created with no associated state. These tests will be run through the use of `saltcheck.run_state_tests`, but will not be automatically run by `saltcheck.run_highstate_tests`.

```
salt '*' saltcheck.run_state_tests apache,apache.config
salt '*' saltcheck.run_state_tests apache check_all=True
salt '*' saltcheck.run_highstate_tests
salt '*' saltcheck.run_state_tests apache.deployment_validation
```

Saltcheck Keywords

**module_and_function**: (str) This is the salt module which will be run locally, the same as `salt-call --local <module>`. The `saltcheck.state_apply` module name is special as it bypasses the local option in order to resolve state names when run in a master/minion environment.

**args**: (list) Optional arguments passed to the salt module

**kwargs**: (dict) Optional keyword arguments to be passed to the salt module

**assertion**: (str) One of the supported assertions and required except for `saltcheck.state_apply`. Tests which fail the assertion and expected_return, cause saltcheck to exit with a non-zero exit code.

**expected_return**: (str) Required except by `assertEmpty`, `assertNotEmpty`, `assertTrue`, `assertFalse`. The return of module_and_function is compared to this value in the assertion.
assertion_section: (str) Optional keyword used to parse the module_and_function return. If a salt module returns a dictionary as a result, the assertion_section value is used to lookup a specific value in that return for the assertion comparison.

assertion_section_delimiter: (str) Optional delimiter to use when splitting a nested structure. Defaults to ':'

print_result: (bool) Optional keyword to show results in the assertEqual, assertNotEqual, assertIn, and assertNotIn output. Defaults to True.

output_details: (bool) Optional keyword to display module_and_function, args, assertion_section, and assertion results text in the output. If print_result is False, assertion results will be hidden. This is a per test setting, but can be set globally for all tests by adding saltcheck_output_details: True in the minion configuration file. Defaults to False.

pillar_data: (dict) Optional keyword for passing in pillar data. Intended for use in potential test setup or teardown with the saltcheck.state_apply function.

skip: (bool) Optional keyword to skip running the individual test

New in version 3000: Multiple assertions can be run against the output of a single module_and_function call. The assertion, expected_return, assertion_section, and assertion_section_delimiter keys can be placed in a list under an assertions key. See the multiple assertions example below.

Sample Cases/Examples

Basic Example

```yaml
echo_test_hello:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
    assertion: assertEqual
    expected_return: 'hello'
```

Example with jinja

```jinja
{% for package in ["apache2", "openssh"] %}
{{ package }}
{% endfor %}
```

```jinja
{% for package in salt['pillar.get']("packages") %}
test_{{ package }}_latest:
  module_and_function: pkg.upgrade_available
  args:
    - {{ package }}
  assertion: assertFalse
{% endfor %}
```
Example with setup state including pillar

```yaml
setup_test_environment:
  module_and_function: saltcheck.state_apply
  args:
    - common
  pillar_data:
    data: value

verify_vim:
  module_and_function: pkg.version
  args:
    - vim
  assertion: assertNotEmpty
```

Example with jinja

```jinja
{% for package in ["apache2", "openssh"] %}
  test_{{ package }}_latest:
    module_and_function: pkg.upgrade_available
    args:
      - {{ package }}
    assertion: assertFalse
{% endfor %}
```
Example with skip

```yaml
package_latest:
  module_and_function: pkg.upgrade_available
  args:
    - apache2
  assertion: assertFalse
  skip: True
```

Example with assertion_section

```yaml
validate_shell:
  module_and_function: user.info
  args:
    - root
  assertion: assertEqual
  expected_return: /bin/bash
  assertion_section: shell
```

Example with a nested assertion_section

```yaml
validate_smb_signing:
  module_and_function: lgpo.get
  args:
    - 'Machine'
  kwargs:
    return_full_policy_names: True
  assertion: assertEqual
  expected_return: Enabled
  assertion_section: 'Computer Configuration|Microsoft network client: Digitally sign communications (always)'
  assertion_section_delimiter: '|
```

Example suppressing print results

```yaml
validate_env_nameNode:
  module_and_function: hadoop.dfs
  args:
    - text
    - /oozie/common/env.properties
  expected_return: nameNode = hdfs://nameservice2
  assertion: assertNotIn
  print_result: False
```
Example with multiple assertions and output_details

```yaml
multiple_validations:
  module_and_function: network.netstat
  assertions:
  - assertion: assertEqual
    assertion_section: "0:program"
    expected_return: "systemd-resolve"
  - assertion: assertEqual
    assertion_section: "0:proto"
    expected_return: "udp"
  output_details: True
```

Supported assertions

- `assertEqual`
- `assertNotEqual`
- `assertTrue`
- `assertFalse`
- `assertIn`
- `assertNotIn`
- `assertGreater`
- `assertGreaterEqual`
- `assertLess`
- `assertLessEqual`
- `assertEmpty`
- `assertNotEmpty`

Warning: The `saltcheck.state_apply` function is an alias for `state.apply`. If using the `ACL system saltcheck.*` might provide more capability than intended if only `saltcheck.run_state_tests` and `saltcheck.run_highstate_tests` are needed.

class salt.modules.saltcheck.SaltCheck(saltenv='base')
This class validates and runs the saltchecks

  run_test(test_dict)
  Run a single saltcheck test

class salt.modules.saltcheck.StateTestLoader(saltenv='base')
Class loads in test files for a state e.g. state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]

  add_test_files_for_sls(sls_name, check_all=False)
  Detects states used, caches needed files, and adds to test list

  load_test_suite()
  Load tests either from one file, or a set of files

salt.modules.saltcheck.parallel_scheck(data)
triggers salt-call in parallel
salt.modules.saltcheck.report_highstate_tests(saltenv=None)

Report on tests for states assigned to the minion through highstate. Quits with the exit code for the number of missing tests.

CLI Example:
```
salt '*' saltcheck.report_highstate_tests
```

New in version 3000.

salt.modules.saltcheck.run_highstate_tests(saltenv=None, only_fails=False)

Execute all tests for states assigned to the minion through highstate and return results

Parameters
- `saltenv (str)` -- optional saltenv. Defaults to base
- `only_fails (bool)` -- boolean to only print failure results

CLI Example:
```
salt '*' saltcheck.run_highstate_tests
```

salt.modules.saltcheck.run_state_tests(state, saltenv=None, check_all=False, only_fails=False)

Execute tests for a salt state and return results. Nested states will also be tested

Parameters
- `state (str)` -- state name for which to run associated .tst test files
- `saltenv (str)` -- optional saltenv. Defaults to base
- `check_all (bool)` -- boolean to run all tests in state/saltcheck-tests directory
- `only_fails (bool)` -- boolean to only print failure results

CLI Example:
```
salt '*' saltcheck.run_state_tests postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

salt.modules.saltcheck.run_state_tests_ssh(state, saltenv=None, check_all=False, only_fails=False)

This function is an alias of `run_state_tests`.

Execute tests for a salt state and return results. Nested states will also be tested

Parameters
- `state (str)` -- state name for which to run associated .tst test files
- `saltenv (str)` -- optional saltenv. Defaults to base
- `check_all (bool)` -- boolean to run all tests in state/saltcheck-tests directory
- `only_fails (bool)` -- boolean to only print failure results

CLI Example:
```
salt '*' saltcheck.run_state_tests_ssh postfix,common
```

Tests will be run in parallel by adding "saltcheck_parallel: True" in minion config. When enabled, saltcheck will use up to the number of cores detected. This can be limited by setting the "saltcheck_processes" value to an integer to set the maximum number of parallel processes.

salt.modules.saltcheck.run_test(**kwargs)

Execute one saltcheck test and return result

Parameters `arg test (keyword)`

CLI Example:
```python
salt '*' saltcheck.run_test
test='{"module_and_function": "test.echo",
    "assertion": "assertEqual",
    "expected_return": "This works!",
    "args": ["This works!"] }'
```
salt.modules.saltcheck.state_apply(state_name, **kwargs)

Runs `state.apply` with given options to set up test data. Intended to be used for optional test setup or teardown.

Reference the `state.apply` module documentation for arguments and usage options.

CLI Example:
```
salt '*' saltcheck.state_apply postfix
```

### 25.7.397 salt.modules.saltcloudmod

Control a salt cloud system

salt.modules.saltcloudmod.create(name, profile)

Create the named vm

CLI Example:
```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

### 25.7.398 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

- depends
  - esky Python module for update functionality

salt.modules.saltutil.clear_cache()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:
```
salt '*' saltutil.clear_cache
```

salt.modules.saltutil.clear_job_cache(hours=24)

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:
saltutil.clear_job_cache hours=12

salt.modules.saltutil.cmd(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:
salt '*' saltutil.cmd

salt.modules.saltutil.cmd_iter(tgt, fun, arg=(), timeout=None, tgt_type='glob', ret='', kwarg=None, ssh=False, **kwargs)

Changed in version 2017.7.0: The expr_form argument has been renamed to tgt_type, earlier releases must use expr_form.

Assuming this minion is a master, execute a salt command

CLI Example:
salt '*' saltutil.cmd_iter

salt.modules.saltutil.find_cached_job(jid)

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:
salt '*' saltutil.find_cached_job <job id>

salt.modules.saltutil.find_job(jid)

Return the data for a specific job id that is currently running.

jid The job id to search for and return data.

CLI Example:
salt '*' saltutil.find_job <job id>

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    --------
    arg:
        - 30
    fun:
        test.sleep
    jid:
        20160503150049487736
    pid:
        9601
    ret:
        tgt:
            my-minion
        tgt_type:
            glob
```
If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion: 
---------
```

**salt.modules.saltutil.is_running(fun)**

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:
```
salt '*' saltutil.is_running state.highstate
```

**salt.modules.saltutil.kill_all_jobs()**

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:
```
salt '*' saltutil.kill_all_jobs
```

**salt.modules.saltutil.kill_job(jid)**

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:
```
salt '*' saltutil.kill_job <job id>
```

**salt.modules.saltutil.list_extmods()**

New in version 2017.7.0.
List Salt modules which have been synced externally

CLI Examples:
```
salt '*' saltutil.list_extmods
```

**salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)**

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:
```
salt '*' saltutil.mmodule base test.ping
```

**salt.modules.saltutil.pillar_refresh(wait=False, timeout=30, clean_cache=True)**

This function is an alias of refresh_pillar.

Signal the minion to refresh the in-memory pillar data. See In-Memory Pillar Data vs. On-Demand Pillar Data.

- **param wait** Wait for pillar refresh to complete, defaults to False.
- **type wait** bool, optional
- **param timeout** How long to wait in seconds, only used when wait is True, defaults to 30.
- **type timeout** int, optional
- **param clean_cache** Clean the pillar cache, only used when pillar_cache is True. Defaults to True
**salt.modules.saltutil.refresh_beacons()**

Signal the minion to refresh the beacons.

CLI Example:

```bash
salt '*' saltutil.refresh_beacons
```

**salt.modules.saltutil.refresh_grains(**kwargs)**

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

**Note:** The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

- `refresh_pillar` [True] Set to False to keep pillar data from being refreshed.
- `clean_pillar_cache` [False] Set to True to refresh pillar cache.

CLI Examples:

```bash
salt '*' saltutil.refresh_grains
```

**salt.modules.saltutil.refresh_matchers()**

Signal the minion to refresh its matchers.

CLI Example:

```bash
salt '*' saltutil.refresh_matchers
```

**salt.modules.saltutil.refresh_modules(**kwargs)**

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to False.

CLI Example:

```bash
salt '*' saltutil.refresh_modules
```

**salt.modules.saltutil.refresh_pillar(**wait=False, timeout=30, clean_cache=True)**

Signal the minion to refresh the in-memory pillar data. See [In-Memory Pillar Data vs. On-Demand Pillar Data](#).

**Parameters**

- `wait` *(bool, optional)* -- Wait for pillar refresh to complete, defaults to False.
- `timeout` *(int, optional)* -- How long to wait in seconds, only used when wait is True, defaults to 30.
- `clean_cache` *(bool, optional)* -- Clean the pillar cache, only used when `pillar_cache` is True. Defaults to True

**Returns** Boolean status, True when the pillar_refresh event was fired successfully.

CLI Example:
salt.modules.saltutil.regen_keys()

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked
and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

salt.modules.saltutil.runner(name, arg=None, kwarg=None, full_return=False, saltenv='base',
                                  jid=None, **kwargs)

Execute a runner function. This function must be run on the master, either by targeting a minion running on
a master or by using salt-call on a master.

New in version 2014.7.0.

**name** The name of the function to run

**kwarg** Any keyword arguments to pass to the runner function

CLI Example:

```
In this example, assume that master_minion is a minion running on a master.

salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{'foo': 'bar'}"
```

salt.modules.saltutil.running()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.signal_job(jid, sig)

Sends a signal to the named salt job’s process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.sync_all(saltenv=None, refresh=True, extmod_whitelist=None,
                                  extmod_blacklist=None, clean_pillar_cache=False)

Changed in version 2015.8.11, 2016.3.2: On masterless minions, pillar modules are now synced, and refreshed
when refresh is set to True.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchro-
nizes custom modules, states, beacons, grains, returners, output modules, renderers, and utilis.

**refresh** [True] Also refresh the execution modules and recompile pillar data available to the minion. This
refresh will be performed even if no new dynamic modules are synced. Set to False to prevent this refresh.
Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
    module.run:
        - name: saltutil.sync_all
        - refresh: True
```

See here for a more detailed explanation of why this is necessary.

`extmod_whitelist` [None] dictionary of modules to sync based on type
`extmod_blacklist` [None] dictionary of modules to blacklist based on type
`clean_pillar_cache` [False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

```
salt.modules.saltutil.sync_beacons(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

- `saltenv` The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  - If not passed, then all environments configured in the top files will be checked for beacons to sync. If no top files are found, then the base environment will be synced.
- `refresh` [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.
- `extmod_whitelist` [None] comma-separated list of modules to sync
- `extmod_blacklist` [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

```
salt.modules.saltutil.sync_clouds(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

New in version 2017.7.0.

Sync cloud modules from `salt://_cloud` to the minion

- `saltenv` [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
- `refresh` [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.
- `extmod_whitelist` [None] comma-separated list of modules to sync
- `extmod_blacklist` [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.sync_engines(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2016.3.0.

Sync engine modules from salt://_engines to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev

salt.modules.saltutil.sync_executors(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 3000.

Sync executors from salt://_executors to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

salt '*' saltutil.sync_executors
salt '*' saltutil.sync_executors saltenv=dev
salt '*' saltutil.sync_executors saltenv=base,dev

salt.modules.saltutil.sync_grains(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None, clean_pillar_cache=False)

New in version 0.10.0.

Sync grains modules from salt://_grains to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for grains modules to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

25.7. execution modules
clean_pillar_cache  [False] Set to True to refresh pillar cache.

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

salt.modules.saltutil.sync_log_handlers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.0.

Sync log handlers from salt://_log_handlers to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for log handlers to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

salt.modules.saltutil.sync_matchers(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.0.

Sync engine modules from salt://_matchers to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new matcher modules are synced. Set to False to prevent this refresh.

extmod_whitelist  [None] comma-separated list of modules to sync

extmod_blacklist  [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_matchers
salt '*' saltutil.sync_matchers saltenv=base,dev
```

salt.modules.saltutil.sync_modules(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync execution modules from salt://_modules to the minion

saltenv  The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for execution modules to sync. If no top files are found, then the base environment will be synced.

refresh  [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.
**Important:** If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```yaml
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

- `extmod_whitelist` [None] comma-separated list of modules to sync
- `extmod_blacklist` [None] comma-separated list of modules to blacklist based on type

CLI Example:

```sh
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

```python
salt.modules.saltutil.sync_output(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

Sync outputters from `salt://_output` to the minion

- `saltenv` The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the `top files` will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

- `refresh` [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

```sh
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

```python
salt.modules.saltutil.sync_outputters(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)
```

This function is an alias of `sync_output`.

- `saltenv` The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
  
  If not passed, then all environments configured in the `top files` will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

- `refresh` [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to False to prevent this refresh.

```sh
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```
salt.modules.saltutil.sync_pillar(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None, clean_pillar_cache=False)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the salt://_pillar directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the _pillar directory from that environment. The default environment, if none is specified, is base.

**refresh** [True] Also refresh the execution modules available to the minion, and refresh pillar data.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

**clean_pillar_cache** [False] Set to True to refresh pillar cache.

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

salt.modules.saltutil.sync_proxymodules(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.8.2.

Sync proxy modules from salt://_proxy to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for proxy modules to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

salt.modules.saltutil.sync_renderers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync renderers from salt://_renderers to the minion

**saltenv** The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for renderers to sync. If no top files are found, then the base environment will be synced.

**refresh** [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this refresh.

**extmod_whitelist** [None] comma-separated list of modules to sync

**extmod_blacklist** [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt.modules.saltutil.sync_returners(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.

Sync returners from salt://_returners to the minion

<table>
<thead>
<tr>
<th>Salt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>saltenv</td>
<td>The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.</td>
</tr>
<tr>
<td>refresh</td>
<td>[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.</td>
</tr>
<tr>
<td>extmod_whitelist</td>
<td>[None] comma-separated list of modules to sync</td>
</tr>
<tr>
<td>extmod_blacklist</td>
<td>[None] comma-separated list of modules to blacklist based on type</td>
</tr>
</tbody>
</table>

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.sync_sdb(saltenv=None, extmod_whitelist=None, extmod_blacklist=None)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from salt://_sdb to the minion

<table>
<thead>
<tr>
<th>Salt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>saltenv</td>
<td>The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.</td>
</tr>
<tr>
<td>refresh</td>
<td>[False] This argument has no affect and is included for consistency with the other sync functions.</td>
</tr>
<tr>
<td>extmod_whitelist</td>
<td>[None] comma-separated list of modules to sync</td>
</tr>
<tr>
<td>extmod_blacklist</td>
<td>[None] comma-separated list of modules to blacklist based on type</td>
</tr>
</tbody>
</table>

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
```

salt.modules.saltutil.sync_serializers(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2019.2.0.

Sync serializers from salt://_serializers to the minion

<table>
<thead>
<tr>
<th>Salt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>saltenv</td>
<td>The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.</td>
</tr>
<tr>
<td>refresh</td>
<td>[True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new serializers are synced. Set to False to prevent this refresh.</td>
</tr>
<tr>
<td>extmod_whitelist</td>
<td>[None] comma-separated list of modules to sync</td>
</tr>
<tr>
<td>extmod_blacklist</td>
<td>[None] comma-separated list of modules to blacklist based on type</td>
</tr>
</tbody>
</table>

CLI Examples:
salt '*' saltutil.sync_serializers
salt '*' saltutil.sync_serializers saltenv=dev
salt '*' saltutil.sync_serializers saltenv=base,dev

salt.modules.saltutil.sync_states(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 0.10.0.
Sync state modules from salt://_states to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for state modules to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev

salt.modules.saltutil.sync_thorium(saltenv=None, refresh=False, extmod_whitelist=None, extmod_blacklist=None)

New in version 2018.3.0.
Sync Thorium modules from salt://_thorium to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for engines to sync. If no top files are found, then the base environment will be synced.

refresh: True If True, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to False to prevent this refresh.

extmod_whitelist comma-separated list of modules to sync
extmod_blacklist comma-separated list of modules to blacklist based on type

CLI Examples:
salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev

salt.modules.saltutil.sync_utils(saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None)

New in version 2014.7.0.
Sync utility modules from salt://_utils to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the top files will be checked for utility modules to sync. If no top files are found, then the base environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:
```python
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

salt.modules.saltutil.term_all_jobs()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```bash
salt '*' saltutil.term_all_jobs
```

salt.modules.saltutil.term_job(jid)

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```bash
salt '*' saltutil.term_job <job id>
```

salt.modules.saltutil.update( version=None )

Update the salt minion from the URL defined in opts['update_url'] VMware, Inc provides the latest builds here:
update_url: https://repo.saltproject.io/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```bash
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

salt.modules.saltutil.wheel(name, *args, **kwargs)

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

- **name**: The name of the function to run
- **args**: Any positional arguments to pass to the wheel function. A common example of this would be the match arg needed for key functions.

  New in version 2015.8.11.

- **kwargs**: Any keyword arguments to pass to the wheel function

CLI Example:

```bash
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

**Note**: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.
25.7.399  salt.modules.schedule

Module for managing the Salt schedule on a minion

Requires that python-dateutil is installed on the minion.

New in version 2014.7.0.

salt.modules.schedule.add(name, **kwargs)
Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args='[date >> /tmp/date.log]'
  → seconds=60

# Add job to Salt minion when the Salt minion is not running
salt '*' schedule.add job1 function='test.ping' seconds=3600 offline=True
```

salt.modules.schedule.build_schedule_item(name, **kwargs)
Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

salt.modules.schedule.copy(name, target, **kwargs)
Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

salt.modules.schedule.delete(name, **kwargs)
Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
# Delete job on Salt minion when the Salt minion is not running
salt '*' schedule.delete job1
```

salt.modules.schedule.disable(**kwargs)
Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

salt.modules.schedule.disable_job(name, **kwargs)
Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

salt.modules.schedule.enable(**kwargs)
Enable all scheduled jobs on the minion
CLI Example:

```bash
salt '*' schedule.enable
```

salt.modules.schedule.enable_job(name, **kwargs)
Enable a job in the minion's schedule

CLI Example:

```bash
salt '*' schedule.enable_job job1
```

salt.modules.schedule.is_enabled(name=None)
List a Job only if its enabled

If job is not specified, indicate if the scheduler is enabled or disabled.
New in version 2015.5.3.

CLI Example:

```bash
salt '*' schedule.is_enabled name=job_name
salt '***' schedule.is_enabled
```

salt.modules.schedule.job_status(name, time_fmt='%Y-%m-%dT%H:%M:%S')
Show the information for a particular job.

CLI Example:

```bash
salt '*' schedule.job_status job_name
```

salt.modules.schedule.list_(show_all=False, show_disabled=True, where=None, return_yaml=True, offline=False)
List the jobs currently scheduled on the minion

CLI Example:

```bash
salt '*' schedule.list
# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

salt.modules.schedule.modify(name, **kwargs)
Modify an existing job in the schedule

CLI Example:

```bash
salt '*' schedule.modify job1 function='test.ping' seconds=3600

# Modify job on Salt minion when the Salt minion is not running
salt '*' schedule.modify job1 function='test.ping' seconds=3600 offline=True
```

salt.modules.schedule.move(name, target, **kwargs)
Move scheduled job to another minion or minions.

CLI Example:

```bash
salt '*' schedule.move jobname target
```
salt.modules.schedule.postpone_job(name, current_time, new_time, **kwargs)
    Postpone a job in the minion's schedule
    Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.
    New in version 2018.3.0.
    CLI Example:
    ```
salt '*' schedule.postpone_job job current_time new_time
salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-%dT%H:%M:%S'
``` 

salt.modules.schedule.purge(**kwargs)
    Purge all the jobs currently scheduled on the minion
    CLI Example:
    ```
salt '*' schedule.purge
# Purge jobs on Salt minion
salt '*' schedule.purge
``` 

salt.modules.schedule.reload_()
    Reload saved scheduled jobs on the minion
    CLI Example:
    ```
salt '*' schedule.reload
``` 

salt.modules.schedule.run_job(name, force=False)
    Run a scheduled job on the minion immediately
    CLI Example:
    ```
salt '*' schedule.run_job job1
salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
``` 

salt.modules.schedule.save(**kwargs)
    Save all scheduled jobs on the minion
    CLI Example:
    ```
salt '*' schedule.save
``` 

salt.modules.schedule.show_next_fire_time(name, **kwargs)
    Show the next fire time for scheduled job
    New in version 2018.3.0.
    CLI Example:
    ```
salt '*' schedule.show_next_fire_time job_name
``` 

salt.modules.schedule.skip_job(name, current_time, **kwargs)
    Skip a job in the minion's schedule at specified time.
    Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.
New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

### 25.7.400 salt.modules.scp

**SCP Module**

New in version 2019.2.0.

Module to copy files via SCP

```
salt.modules.scp_mod.get(remote_path, local_path='', recursive=False, preserve_times=False,**kwargs)
```

Transfer files and directories from remote host to the localhost of the Minion.

- **remote_path** Path to retrieve from remote host. Since this is evaluated by scp on the remote host, shell wildcards and environment variables may be used.
- **recursive** : **False** Transfer files and directories recursively.
- **preserve_times** : **False** Preserve mtime and atime of transferred files and directories.
- **hostname** The hostname of the remote device.
- **port** : 22 The port of the remote device.
- **username** The username required for SSH authentication on the device.
- **password** Used for password authentication. It is also used for private key decryption if **passphrase** is not given.
- **passphrase** Used for decrypting private keys.
- **pkey** An optional private key to use for authentication.
- **key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.
- **timeout** An optional timeout (in seconds) for the TCP connect.
- **socket_timeout** : 10 The channel socket timeout in seconds.
- **buff_size** : 16384 The size of the SCP send buffer.
- **allow_agent** : **True** Set to False to disable connecting to the SSH agent.
- **look_for_keys** : **True** Set to False to disable searching for discoverable private key files in ~/.ssh/
- **banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.
- **auth_timeout** An optional timeout (in seconds) to wait for an authentication response.
- **auto_add_policy** : **False** Automatically add the host to the known_hosts.

CLI Example:

```
salt '*' scp.get /var/tmp/file /tmp/file hostname=10.10.10.1 auto_add_policy=True
```

```
salt.modules.scp_mod.put(files, remote_path=None, recursive=False, preserve_times=False, saltenv='base', **kwargs)
```

Transfer files and directories to remote host.

- **files** A single path or a list of paths to be transferred.
- **remote_path** The path on the remote device where to store the files.
- **recursive** : **True** Transfer files and directories recursively.
- **preserve_times** : **False** Preserve mtime and atime of transferred files and directories.
- **hostname** The hostname of the remote device.
- **port** : 22 The port of the remote device.
- **username** The username required for SSH authentication on the device.
- **password** Used for password authentication. It is also used for private key decryption if **passphrase** is not given.
- **passphrase** Used for decrypting private keys.
**pkey** An optional private key to use for authentication.

**key_filename** The filename, or list of filenames, of optional private key(s) and/or certificates to try for authentication.

**timeout** An optional timeout (in seconds) for the TCP connect.

**socket_timeout:** 10 The channel socket timeout in seconds.

**buff_size:** 16384 The size of the SCP send buffer.

**allow_agent:** True Set to False to disable connecting to the SSH agent.

**look_for_keys:** True Set to False to disable searching for discoverable private key files in ~/.ssh/.

**banner_timeout** An optional timeout (in seconds) to wait for the SSH banner to be presented.

**auth_timeout** An optional timeout (in seconds) to wait for an authentication response.

**auto_add_policy:** False Automatically add the host to the known_hosts.

**CLI Example:**
```
salt '*' scp.put /path/to/file /var/tmp/file hostname=server1 auto_add_policy=True
```

### 25.7.401 salt.modules.scsi

SCSI administration module

**salt.modules.scsi.ls gotten_size=True)**

List SCSI devices, with details

**CLI Examples:**
```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size [True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the `-'s` option in lsscsi.

New in version 2015.5.10.

**salt.modules.scsi.rescan_all(host)**

List scsi devices

**CLI Example:**
```
salt '*' scsi.rescan_all 0
```

### 25.7.402 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

**salt.modules.sdb.delete(uri)**

Delete a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb:// or the value is not successfully deleted, return False.

**CLI Example:**
```
salt '*' sdb.delete sdb://mymemcached/foo
```

**salt.modules.sdb.get(uri, strict=False)**

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided is not valid, then it will be returned as-is, unless strict=True was passed.

**CLI Example:**
salt 'sdb.get sdb://mymemcached/foo strict=True

salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```yaml
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{$ salt"sdb.get_or_set_hash"("sdb://mymemcached/some_user_password") }}'
```

CLI Example:

```bash
salt '*' sdb.get_or_set_hash 'sdb://mymemcached/SECRET_KEY' 50
```

**Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.sdb.set_(uri, value)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```bash
salt '*' sdb.set sdb://mymemcached/foo bar
```

### 25.7.403 salt.modules.seed

Virtual machine image management tools

salt.modules.seed.apply_(path, id=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)

Seed a location (disk image, directory, or block device) with the minion config, approve the minion’s key, and/or install salt-minion.

CLI Example:

```bash
salt 'minion' seed.apply path id [config=config_data] \[
gen_key=(true|false)] [approve_key=(true|false)] \[
[install=(true|false)]
```

- **path** Full path to the directory, device, or disk image on the target minion’s file system.
- **id** Minion id with which to seed the path.
- **config** Minion configuration options. By default, the ‘master’ option is set to the target host’s ‘master’.
- **approve_key** Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

**install**  Install salt-minion, if absent. Default: true.

**prep_install**  Prepare the bootstrap script, but don't run it. Default: false

```python
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None, priv_key=None)
```
Generate keys and config and put them in a tmp directory.

**pub_key**  absolute path or file content of an optional preseeded salt key

**priv_key**  absolute path or file content of an optional preseeded salt key

**CLI Example:**
```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
    [id_=minion_id] [approve_key=(true|false)]
```

```python
class.seed.prep_bootstrap(mpt)
```
Update and get the random script to a random place

**CLI Example:**
```
salt '*' seed.prep_bootstrap /tmp
```

## 25.7.404  salt.modules.selinux

Execute calls on selinux

**Note:**  This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

```python
class.selinux.fcontext_add_policy(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```
New in version 2019.2.0.

Adds the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to `semanage`.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

**name**  filespec of the file or directory. Regex syntax is allowed.

**file_type**  The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

**sel_type**  SELinux context type. There are many.

**sel_user**  SELinux user. Use `semanage login -l` to determine which ones are available to you.

**sel_level**  The MLS range of the SELinux context.

**CLI Example:**
```
salt '*' selinux.fcontext_add_policy my-policy
```

```python
class.selinux.fcontext_apply_policy(name, recursive=False)
```
New in version 2017.7.0.

Applies SELinux policies to filespec using `restorecon [-R] filespec`. Returns dict with changes if successful, the output of the restorecon command otherwise.

**name**  filespec of the file or directory. Regexp syntax is allowed.

**recursive**  Recursively apply SELinux policies.
CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

**salt.modules.selinux.fcontext_delete_policy**

```
(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

New in version 2019.2.0.

Deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

### Parameters

- **name** filespec of the file or directory. Regex syntax is allowed.
- **file_type** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to ‘a’ (all files).
- **sel_type** SELinux context type. There are many.
- **sel_user** SELinux user. Use `semanage login -l` to determine which ones are available to you.
- **sel_level** The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_delete_policy my-policy
```

**salt.modules.selinux.fcontext_get_policy**

```
(name, filetype=None, sel_type=None, sel_user=None, sel_level=None)
```

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- **filespec** (the name supplied and matched)
- **filetype** (the descriptive name of the filetype supplied)
- **sel_user**, **sel_role**, **sel_type**, **sel_level** (the selinux context)

- **name** filespec of the file or directory. Regex syntax is allowed.
- **filetype** The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to ‘a’ (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

**salt.modules.selinux.fcontext_policy_is_applied**

```
(name, recursive=False)
```

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

- **name** filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

**salt.modules.selinux.filetype_id_to_string**

```
(filetype='a')
```

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in `semanage fcontext -l`).

25.7. execution modules
salt.modules.selinux.getconfig()
    Return the selinux mode from the config file
    CLI Example:
    
    salt '*' selinux.getconfig

salt.modules.selinux.getenforce()
    Return the mode selinux is running in
    CLI Example:
    
    salt '*' selinux.getenforce

salt.modules.selinux.getsebool(boolean)
    Return the information on a specific selinux boolean
    CLI Example:
    
    salt '*' selinux.getsebool virt_use_usb

salt.modules.selinux.getsemod(module)
    Return the information on a specific selinux module
    CLI Example:
    
    salt '*' selinux.getsemod mysql

    New in version 2016.3.0.

salt.modules.selinux.install_semod(module_path)
    Install custom SELinux module from file
    CLI Example:
    
    salt '*' selinux.install_semod [salt://]path/to/module.pp

    New in version 2016.11.6.

salt.modules.selinux.list_sebool()
    Return a structure listing all of the selinux booleans on the system and what state they are in
    CLI Example:
    
    salt '*' selinux.list_sebool

salt.modules.selinux.list_semod()
    Return a structure listing all of the selinux modules on the system and what state they are in
    CLI Example:
    
    salt '*' selinux.list_semod

    New in version 2016.3.0.

salt.modules.selinux.port_add_policy(name, sel_type=None, protocol=None, port=None, sel_range=None)
    New in version 2019.2.0.
    Adds the SELinux policy for a given protocol and port.
    Returns the result of the call to semanage.
name  The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.  
**sel_type** The SELinux Type. Required.  
**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.  
**port** The port or port range. Required if name is not formatted.  
**sel_range** The SELinux MLS/MCS Security Range.  

CLI Example:

```bash
salt '*' selinux.port_add_policy add tcp/8080 http_port_t
salt '*' selinux.port_add_policy add foobar http_port_t protocol=tcp port=8091
```

salt.modules.selinux.port_delete_policy (name, protocol=None, port=None)

New in version 2019.2.0.

Deletes the SELinux policy for a given protocol and port.

Returns the result of the call to semanage.

**name** The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.  
**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.  
**port** The port or port range. Required if name is not formatted.

CLI Example:

```bash
salt '*' selinux.port_delete_policy tcp/8080
salt '*' selinux.port_delete_policy foobar protocol=tcp port=8091
```

salt.modules.selinux.port_get_policy (name, sel_type=None, protocol=None, port=None)

New in version 2019.2.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- **sel_type** (the selinux type)  
- **proto** (the protocol)  
- **port** (the port(s) and/or port range(s))

**name** The protocol and port spec. Can be formatted as `(tcp|udp)/(port|port-range)`.  
**sel_type** The SELinux Type.  
**protocol** The protocol for the port, tcp or udp. Required if name is not formatted.  
**port** The port or port range. Required if name is not formatted.

CLI Example:

```bash
salt '*' selinux.port_get_policy tcp/80
salt '*' selinux.port_get_policy foobar protocol=tcp port=80
```

salt.modules.selinux.remove_semod (module)

Remove SELinux module

CLI Example:

```bash
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.selinux_fs_path ()

Return the location of the SELinux VFS directory

CLI Example:

```bash
salt '*' selinux.selinux_fs_path
```
salt.modules.selinux.setenforce(mode)
Set the SELinux enforcing mode

CLI Example:
```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.setsebool(boolean, value, persist=False)
Set the value for a boolean

CLI Example:
```
salt '*' selinux.setsebool virt_use_usb off
```

salt.modules.selinux.setsebools(pairs, persist=False)
Set the value of multiple booleans

CLI Example:
```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

salt.modules.selinux.setsemod(module, state)
Enable or disable an SELinux module.

CLI Example:
```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

25.7.405 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

maintainer Benedikt Werner <benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>
maturity new
depends sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:
```
sensehat:
    rotation: 90
```

salt.modules.sensehat.clear(color=None)
Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:
```
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'  
```

salt.modules.sensehat.get_humidity()
Get the percentage of relative humidity from the humidity sensor.
salt.modules.sensehat.get_pixel(x, y)
    Returns the color of a single pixel on the LED matrix.
    x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
    y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

    Note: Please read the note for get_pixels

salt.modules.sensehat.get_pixels()
    Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.

    Note: When using set_pixels the pixel values can sometimes change when you read them again using get_pixels. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they’re passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

    The get_pixels method provides an accurate representation of how the pixels end up in frame buffer memory after you have called set_pixels.

salt.modules.sensehat.get_pressure()
    Gets the current pressure in Millibars from the pressure sensor.

salt.modules.sensehat.get_temperature()
    Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling get_temperature_from_humidity.

    If you get strange results try using get_temperature_from_pressure.

salt.modules.sensehat.get_temperature_from_humidity()
    Gets the temperature in degrees Celsius from the humidity sensor.

salt.modules.sensehat.get_temperature_from_pressure()
    Gets the temperature in degrees Celsius from the pressure sensor.

salt.modules.sensehat.low_light(low_light=True)
    Sets the LED matrix to low light mode. Useful in a dark environment.

    CLI Example:

    
    salt 'raspberry' sensehat.low_light
    salt 'raspberry' sensehat.low_light False

salt.modules.sensehat.set_pixel(x, y, color)
    Sets a single pixel on the LED matrix to a specified color.
    x  The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.
    y  The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.
    color  The new color of the pixel as a list of [R, G, B] values.

    CLI Example:

    salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'

salt.modules.sensehat.set_pixels(pixels)
    Sets the entire LED matrix based on a list of 64 pixel values
    pixels  A list of 64 [R, G, B] color values.
salt.modules.sensehat.show_image(image)
Displays an 8 x 8 image on the LED matrix.

image The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:
```
salt 'raspberry' sensehat.show_image /tmp/my_image.png
```

salt.modules.sensehat.show_letter(letter, text_color=None, back_color=None)
Displays a single letter on the LED matrix.

letter The letter to display

text_color The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).
back_color The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:
```
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

salt.modules.sensehat.show_message(message, msg_type=None, text_color=None, back_color=None, scroll_speed=0.1)
Displays a message on the LED matrix.

message The message to display
msg_type The type of the message. Changes the appearance of the message.

Available types are:

```
error: red text
warning: orange text
success: green text
info: blue text
```

scroll_speed The speed at which the message moves over the LED matrix. This value represents the time
paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

text_color The color in which the message is shown. Defaults to '[255, 255, 255]' (white).
back_color The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:
```
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255, 255, 0]' 0.2
```

25.7.406 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

salt.modules.sensors.sense(chip, fahrenheit=False)
Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:
```
/usr/bin/sensors
```
coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)

Given the above, the chip is 'coretemp-isa-0000'.

### 25.7.407 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

salt.modules.serverdensity_device.create(name, **params)

Function to create device in Server Density. For more info, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.delete(device_id)

Delete a device from Server Density. For more information, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')

Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)

Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
```

salt.modules.serverdensity_device.ls(**params)

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.update(device_id, **params)

Updates device information in Server Density. For more information see the API docs.

CLI Example:
25.7.408 salt.modules.servicenow

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

**depends** servicenow_rest python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

salt.modules.servicenow.delete_record(table, sys_id)

Delete an existing record

**Parameters**

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record

**CLI Example:**

```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)

Run a non-structured (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

**Parameters**

- **table** (str) -- The table name, e.g. sys_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

**CLI Example:**

```
salt myminion servicenow.non_structured_query sys_computer role=web
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

salt.modules.servicenow.set_change_request_state(change_id, state='approved')

Set the approval state of a change request/record

**Parameters**

- **change_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

**CLI Example:**

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

salt.modules.servicenow.update_record_field(table, sys_id, field, value)

Update the value of a record's field in a servicenow table

```bash
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
  → group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama
  → group=rock_lamas swapSpace=512
```
Parameters

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

25.7.409 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

**configuration** This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.call_hook

Send message to Slack incoming webhook.

Parameters

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slack WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.find_room

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_key** -- The Slack admin api key.

Returns The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.find_user

Find a user by name and return it.

25.7. execution modules
Parameters

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

Returns The user object.

CLI Example:

```bash
salt '*' slack.find_user name="ThomasHatch"
salt '*' slack.find_user name="ThomasHatch" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.list_rooms(api_key=None)

List all Slack rooms.

Parameters **api_key** -- The Slack admin api key.

Returns The room list.

CLI Example:

```bash
salt '*' slack.list_rooms
salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.list_users(api_key=None)

List all Slack users.

Parameters **api_key** -- The Slack admin api key.

Returns The user list.

CLI Example:

```bash
salt '*' slack.list_users
salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None, attachments=None, blocks=None)

Send a message to a Slack channel.

Changed in version 3003: Added **attachments** and **blocks** kwargs

Parameters

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from_name** -- Specify who the message is from.
- **api_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message.
- **attachments** -- Any attachments to be sent with the message.
- **blocks** -- Any blocks to be sent with the message.

Returns Boolean if message was sent successfully.

CLI Example:

```bash
salt '*' slack.post_message channel="Development Room" message="Build is done" from_name="Build Server"
```
25.7.410  salt.modules.slackware_service

The service module for Slackware

**Important:**  If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

```
salt.modules.slackware_service.available(name)
    Returns True if the specified service is available, otherwise returns False.
    New in version 3002.
    CLI Example:
    
salt '*' service.available ssd
```

```
salt.modules.slackware_service.disable(name, **kwargs)
    Disable the named service to start at boot
    New in version 3002.
    CLI Example:
    
salt '*' service.disable <service name>
```

```
salt.modules.slackware_service.disabled(name)
    Return True if the named service is enabled, false otherwise
    New in version 3002.
    CLI Example:
    
salt '*' service.disabled <service name>
```

```
salt.modules.slackware_service.enable(name, **kwargs)
    Enable the named service to start at boot
    New in version 3002.
    CLI Example:
    
salt '*' service.enable <service name>
```

```
salt.modules.slackware_service.enabled(name, **kwargs)
    Return True if the named service is enabled, false otherwise
    New in version 3002.
    CLI Example:
    
salt '*' service.enabled <service name>
```

```
salt.modules.slackware_service.force_reload(name)
    Force-reload the named service
    New in version 3002.
    CLI Example:
    
```
salt '*' service.force_reload <service name>

salt.modules.slackware_service.get_all()
Return all available boot services
New in version 3002.
CLI Example:
salt '*' service.get_all

salt.modules.slackware_service.get_disabled()
Return a set of services that are installed but disabled
New in version 3002.
CLI Example:
salt '*' service.get_disabled

salt.modules.slackware_service.get_enabled()
Return a list of service that are enabled on boot
New in version 3002.
CLI Example:
salt '*' service.get_enabled

salt.modules.slackware_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
New in version 3002.
CLI Example:
salt '*' service.missing sshd

salt.modules.slackware_service.reload_(name)
Reload the named service
New in version 3002.
CLI Example:
salt '*' service.reload <service name>

salt.modules.slackware_service.restart(name)
Restart the named service
New in version 3002.
CLI Example:
salt '*' service.restart <service name>

salt.modules.slackware_service.start(name)
Start the specified service
New in version 3002.
CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.slackware_service.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 3002.

**Parameters**

- `name (str)` -- The name of the service to check
- `sig (str)` -- Signature to use to find the service via ps

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.slackware_service.stop(name)`

Stop the specified service

New in version 3002.

CLI Example:

```
salt '*' service.stop <service name>
```

### 25.7.411 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.banner(width=72, commentchar='#', borderchar='-', blockstart=None, blockend=None, title=None, text=None, newline=False)`

Create a standardized comment block to include in a templated file.

A common technique in configuration management is to include a comment block in managed files, warning users not to modify the file. This function simplifies and standardizes those comment blocks.

**Parameters**

- `width` -- The width, in characters, of the banner. Default is 72.
- `commentchar` -- The character to be used in the starting position of each line. This value should be set to a valid line comment character for the syntax of the file in which the banner is being inserted. Multiple character sequences, like '//' are supported. If the file's syntax does not support line comments (such as XML), use the `blockstart` and `blockend` options.
- `borderchar` -- The character to use in the top and bottom border of the comment box. Must be a single character.
- `blockstart` -- The character sequence to use at the beginning of a block comment. Should be used in conjunction with `blockend`
- `blockend` -- The character sequence to use at the end of a block comment. Should be used in conjunction with `blockstart`
- `title` -- The first field of the comment block. This field appears centered at the top of the box.
- `text` -- The second field of the comment block. This field appears left-justified at the bottom of the box.
- **newline** -- Boolean value to indicate whether the comment block should end with a newline. Default is False.

Example 1 - the default banner:

```python
{{ salt['slsutil.banner']() }}
```

```
########################################################################
# #
# THIS FILE IS MANAGED BY SALT - DO NOT EDIT
# #
# The contents of this file are managed by Salt. Any changes to this
# file may be overwritten automatically and without warning.
# ########################################################################
```

Example 2 - a Javadoc-style banner:

```python
{{ salt['slsutil.banner'](commentchar=' *', borderchar='*', blockstart='/**', blockend=' */') }}
```

```
/**
 * THIS FILE IS MANAGED BY SALT - DO NOT EDIT
 * 
 * The contents of this file are managed by Salt. Any changes to this
 * file may be overwritten automatically and without warning.
 */
```

Example 3 - custom text:

```python
{{ set copyright='This file may not be copied or distributed without permission of VMware, Inc.' }}
{{ salt['slsutil.banner'](title='Copyright 2019 VMware, Inc.', text=copyright, width=60) }}
```

```
# #
# Copyright 2019 VMware, Inc.
# #
# This file may not be copied or distributed without
# permission of VMware, Inc.
########################################################################
```

salt.modules.slsutil.boolstr(value, true='true', false='false')

Convert a boolean value into a string. This function is intended to be used from within file templates to provide an easy way to take boolean values stored in Pillars or Grains, and write them out in the appropriate syntax for a particular file template.

**Parameters**

- **value** -- The boolean value to be converted
- **true** -- The value to return if value is True
- **false** -- The value to return if value is False

In this example, a pillar named `smtp:encrypted` stores a boolean value, but the template that uses that value needs `yes` or `no` to be written, based on the boolean value.

*Note: this is written on two lines for clarity. The same result could be achieved in one line.*
Salt Documentation, Release 3006.4

{% set encrypted = salt[pillar.get](smtp:encrypted, false) %}

use_tls: {{ salt['slsutil.boolstr'](encrypted, 'yes', 'no') }}

Result (assuming the value is True):

use_tls: yes

salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)

Deserialize a Python object using one of the available serializer modules.

CLI Example:

salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}'

Jinja Example:

{% set python_object = salt.slsutil.deserialize('json', \
    '{"foo": "Foo!"}') %}

salt.modules.slsutil.dir_exists(path, saltenv='base')

Return True if a directory exists in the state tree, False otherwise.

Parameters

- path (str) -- The fully qualified path to a directory in the state tree.
- saltenv (str) -- The fileserver environment to search. Default: base

New in version 3004.

CLI Example:

salt '*' slsutil.dir_exists nginx/files

salt.modules.slsutil.file_exists(path, saltenv='base')

Return True if a file exists in the state tree, False otherwise.

New in version 3004.

Parameters

- path (str) -- The fully qualified path to a file in the state tree.
- saltenv (str) -- The fileserver environment to search. Default: base

CLI Example:

salt '*' slsutil.file_exists nginx/defaults.yaml

salt.modules.slsutil.findup(startpath, filenames, saltenv='base')

Find the first path matching a filename or list of filenames in a specified directory or the nearest ancestor directory. Returns the full path to the first file found.

New in version 3004.

Parameters

- startpath (str) -- The fileserver path from which to begin the search. An empty string refers to the state tree root.
- filenames -- A filename or list of filenames to search for. Searching for directory names is also supported.
- saltenv (str) -- The fileserver environment to search. Default: base

Example: return the path to defaults.yaml, walking up the tree from the state file currently being processed.
salt.modules.slsutil.findup(tplfile, "defaults.yaml")

CLI Example:
salt '*' slsutil.findup formulas/shared/nginx map.jinja

salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)
Merge a data structure into another by choosing a merge strategy

Strategies:
- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'

salt.modules.slsutil.merge_all(lst, strategy='smart', renderer='yaml', merge_lists=False)
New in version 2019.2.0.
Merge a list of objects into each other in order

Parameters
- lst (Iterable) -- List of objects to be merged.
- strategy (String) -- Merge strategy. See utils.dictupdate.
- renderer (String) -- Renderer type. Used to determine strategy when strategy is 'smart'.
- merge_lists (Bool) -- Defines whether to merge embedded object lists.

CLI Example:
$ salt-call --output=txt slsutil.merge_all '{{foo: Foo}, {foo: Bar}}'
local: {u'foo': u'Bar'}

salt.modules.slsutil.path_exists(path, saltenv='base')
Return True if a path exists in the state tree, False otherwise. The path could refer to a file or directory.

New in version 3004.

Parameters
- path (str) -- The fully qualified path to a file or directory in the state tree.
- saltenv (str) -- The files system environment to search. Default: base

CLI Example:
salt '*' slsutil.path_exists nginx/defaults.yaml

salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)
Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.
This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters
- path -- The path to a file on Salt's fileserver (any URLs supported by cp.get_url) or on the local file system.
- string -- An inline string to be used as the file to send through the renderer system.
  Note, not all renderer modules can work with strings; the 'py' renderer requires a file,
for example.

- **default_renderer** -- The renderer pipe to send the file through; this is overrid-
den by a "she-bang" at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes
a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the
renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the
Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal
'jinja|yaml' and the other is using 'py':

```#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}, merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```#!py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this
function. The following is a usage example in Jinja:

```{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja default_renderer='jinja'
salt '*' slsutil.renderer /path/to/file.sls default_renderer='jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

salt.modules.slsutil.serialize(*serializer, obj, **mod_kwargs)*

Serialize a Python object using one of the available serializer modules.

CLI Example:

```salt '*' --no-parse=obj slsutil.serialize 'json' obj="{'foo': 'Foo!'}
```

Jinja Example:

```{% set json_string = salt.slsutil.serialize('json',
    {'foo': 'Foo!'} %}
```

salt.modules.slsutil.update(*dest, upd, recursive_update=True, merge_lists=False)*

Merge upd recursively into dest

If merge_lists=True, will aggregate list object types instead of replacing. This behavior is only activated
when recursive_update=True.
CLI Example:

```
salt 'salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

## 25.7.412 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

```
salt.modules.smartos_imgadm_avail(search=None, verbose=False)
```

Return a list of available images

- **search** [string] search keyword
- **verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt 'salt '*' imgadm_avail [percona]
```

```
salt 'salt '*' imgadm_avail verbose=True
```

```
salt.modules.smartos_imgadm.delete(uuid)
```

Remove an installed image

- **uuid** [string] Specifies uuid to import

CLI Example:

```
salt 'salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

```
salt.modules.smartos_imgadm.docker_to_uuid(uuid)
```

Get the image uuid from an imported docker image

New in version 2019.2.0.

```
salt.modules.smartos_imgadm.get(uuid)
```

Return info on an installed image

- **uuid** [string] uuid of image

CLI Example:

```
salt 'salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
```

```
salt 'salt '*' imgadm.get plexinc/pms-docker:plexpass
```

```
salt.modules.smartos_imgadm.import_image(uuid, verbose=False)
```

Import an image from the repository

- **uuid** [string] uuid to import
- **verbose** [boolean (False)] toggle verbose output

CLI Example:

```
salt 'salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

```
salt.modules.smartos_imgadm.list_installed(verbose=False)
```

Return a list of installed images

- **verbose** [boolean (False)] toggle verbose output

Changed in version 2019.2.0: Docker images are now also listed

CLI Example:

```
salt 'salt '*' imgadm.list
```

```
salt 'salt '*' imgadm.list docker=True
```

```
salt 'salt '*' imgadm.list verbose=True
```
salt.modules.smartos_imgadm.show(uuid)

Show manifest of a given image

- uuid [string] uuid of image

CLI Example:

```shell
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2a8b1f
salt '*' imgadm.show plexinc/pms-docker:plexpass
```

salt.modules.smartos_imgadm.source_add(source, source_type='imgapi')

Add a new source

- source [string] source url to add
- source_type [string (imgapi)] source type, either imgapi or docker

New in version 2019.2.0.

CLI Example:

```shell
salt '*' imgadm.source_add https://updates.joyent.com
salt '*' imgadm.source_add https://docker.io docker
```

salt.modules.smartos_imgadm.source_delete(source)

Delete a source

- source [string] source url to delete

New in version 2019.2.0.

CLI Example:

```shell
salt '*' imgadm.source_delete https://updates.joyent.com
```

salt.modules.smartos_imgadm.sources(verbos=False)

Return a list of available sources

- verbose [boolean (False)] toggle verbose output

New in version 2019.2.0.

CLI Example:

```shell
salt '*' imgadm.sources
```

salt.modules.smartos_imgadm.update_installed(uuid='')

Gather info on unknown image(s) (locally installed)

- uuid [string] optional uuid of image

CLI Example:

```shell
salt '*' imgadm.update [uuid]
```

salt.modules.smartos_imgadm.vacuum(verbos=False)

Remove unused images

- verbose [boolean (False)] toggle verbose output

CLI Example:

```shell
salt '*' imgadm.vacuum [verbose=True]
```

salt.modules.smartos_imgadm.version()

Return imgadm version

CLI Example:

```shell
salt '*' imgadm.version
```
25.7.413 salt.modules.smartos_nictagadm

Module for running nictagadm command on SmartOS

:maintainer: Jorge Schrauwen <sjorge@blackdot.be>
:maturity: new
:depends: nictagadm binary, dladm binary
:platform: smartos

New in version 2016.11.0.

salt.modules.smartos_nictagadm.add(name, mac, mtu=1500)
Add a new nictag

- name [string] name of new nictag
- mac [string] mac of parent interface or 'etherstub' to create a ether stub
- mtu [int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```

salt.modules.smartos_nictagadm.delete(name, force=False)
Delete nictag

- name [string] nictag to delete
- force [boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.exists(*nictag, **kwargs)
Check if nictags exists

- nictag [string] one or more nictags to check
- verbose [boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.list_nictags(include_etherstubs=True)
List all nictags

- include_etherstubs [boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

salt.modules.smartos_nictagadm.update(name, mac=None, mtu=None)
Update a nictag

- name [string] name of nictag
- mac [string] optional new mac for nictag
- mtu [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.vms(nictag)
List all vms connect to nictag

- nictag [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```
25.7.414 salt.modules.smartos_virt

virst compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.get_macs(domain)
Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.smartos_virt.init(**kwargs)
Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]'
```

salt.modules.smartos_virt.list_active_vms()
Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.smartos_virt.list_domains()
Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.smartos_virt.list_inactive_vms()
Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.smartos_virt.reboot(domain)
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

salt.modules.smartos_virt.setmem(domain, memory)
Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

salt.modules.smartos_virt.shutdown(domain)
Send a soft shutdown signal to the named vm

CLI Example:
**salt.modules.smartos_virt**

**start**(domain)

Start a defined domain

CLI Example:

```bash
salt '*' virt.start <domain>
```

**stop**(domain)

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```bash
salt '*' virt.destroy <domain>
```

**vm_info**(domain)

Return a dict with information about the specified VM on this CN

CLI Example:

```bash
salt '*' virt.vm_info <domain>
```

**vm_virt_type**(domain)

Return VM virtualization type: OS or KVM

CLI Example:

```bash
salt '*' virt.vm_virt_type <domain>
```

---

**salt.modules.smartos_vmadm**

Module for running vmadm command on SmartOS

**create**(from_file=None, **kwargs)

Create a new vm

- from_file [string] json file to create the vm from -- if present, all other options will be ignored
- kwargs [string|int|...] options to set for the vm

CLI Example:

```bash
salt '*' vmadm.create from_file=/tmp/new_vm.json
```

**create_snapshot**(vm, name, key='uuid')

Create snapshot of a vm

- vm [string] vm to be targeted
- name [string]
  - snapshot name: The snapshot name must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.
- key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```
salt.modules.smartos_vmadm.delete(vm, key='uuid')

Delete a vm

 vm [string]  vm to be deleted

 key [string [uuid|alias|hostname]]  value type of 'vm' parameter

 CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

salt.modules.smartos_vmadm.delete_snapshot(vm, name, key='uuid')

Delete snapshot of a vm

 vm [string]  vm to be targeted

 name [string]  

 snapshot name  The snapshot must be 64 characters or less and must only contain alphanumeric characters and characters in the set [_.%] to comply with ZFS restrictions.

 key [string [uuid|alias|hostname]]  value type of 'vm' parameter

 CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.get(vm, key='uuid')

Output the JSON object describing a VM

 vm [string]  vm to be targeted

 key [string [uuid|alias|hostname]]  value type of 'vm' parameter

 CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

salt.modules.smartos_vmadm.info(vm, info_type='all', key='uuid')

Lookup info on running kvm

 vm [string]  vm to be targeted

 info_type [string [all|block|blockstats|chardev|cpus|kvmpci|spice|version|vnc]]  info type to return

 key [string [uuid|alias|hostname]]  value type of 'vm' parameter

 CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

salt.modules.smartos_vmadm.list_vms(search=None, sort=None, order='uuid,type,ram,state,alias', keyed=True)

Return a list of VMs

 search [string]  vmadm filter property

 sort [string]  vmadm sort (-s) property

 order [string]  vmadm order (-o) property -- Default: uuid,type,ram,state,alias

 keyed [boolean]  specified if the output should be an array (False) or dict (True)  For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

 CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```
salt.modules.smartos_vmadm.lookup(search=None, order=None, one=False)
Return a list of VMs using lookup

- **search** [string] vmadm filter property
- **order** [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
- **one** [boolean] return only one result (vmadm's -1)

CLI Example:

```bash
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.reboot(vm, force=False, key='uuid')
Reboot a vm

- **vm** [string] vm to be rebooted
- **force** [boolean] force reboot of vm if true
- **key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.receive(uuid, source)
Receive a vm from a directory

- **uuid** [string] uuid of vm to be received
- **source** [string] source directory

CLI Example:

```bash
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.reprovision(vm, image, key='uuid')
Reprovision a vm

- **vm** [string] vm to be reprovisioned
- **image** [string] uuid of new image
- **key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

salt.modules.smartos_vmadm.rollback_snapshot(vm, name, key='uuid')
Rollback snapshot of a vm

- **vm** [string] vm to be targeted
- **name** [string] snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:.%] to comply with ZFS restrictions.
- **key** [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.send(vm, target, key='uuid')
Send a vm to a directory
vm [string] vm to be sent

target [string] target directory

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

**salt.modules.smartos_vmadm.start**(vm, options=None, key='uuid')

Start a vm

- vm [string] vm to be started
- options [string] optional additional options
- key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 order=c,once=d cdrom=/path/to/image.iso,ide
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

**salt.modules.smartos_vmadm.stop**(vm, force=False, key='uuid')

Stop a vm

- vm [string] vm to be stopped
- force [boolean] force stop of vm if true
- key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

**salt.modules.smartos_vmadm.sysrq**(vm, action='nmi', key='uuid')

Send non-maskable interrupt to vm or capture a screenshot

- vm [string] vm to be targeted
- action [string] nmi or screenshot -- Default: nmi
- key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```bash
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

**salt.modules.smartos_vmadm.update**(vm, from_file=None, key='uuid', **kwargs)

Update a new vm

- vm [string] vm to be updated
- from_file [string] json file to update the vm with -- if present, all other options will be ignored
- key [string [uuid|alias|hostname]] value type of 'vm' parameter
- kwargs [string|int...] options to update for the vm

CLI Example:

```bash
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_memory=1024
```

(continues on next page)
25.7.416 salt.modules.smbios

Interface to SMBIOS/DMI
(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMIdcode

salt.modules.smbios.get(string, clean=True)

Get an individual DMI string from SMBIOS info
string

The string to fetch. DMIdcode supports:
- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to True

CLI Example:
salt '*' smbios.get system-uuid clean=False

salt.modules.smbios.records(rec_type=None, fields=None, clean=True)

Return DMI records from SMBIOS
**type** Return only records of type(s) The SMBIOS specification defines the following DMI types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Information</th>
</tr>
</thead>

</table>

**clean**

Don't return well-known false information
(invalid UUID's, serial 00000000's, etcetera)

Defaults to True

**CLI Example:**

25.7. **execution modules**
25.7.417 salt.modules.smf_service

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

### salt.modules.smf_service.available(name)
Returns True if the specified service is available, otherwise returns False.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:
```
salt '*' service.available net-snmp
```

### salt.modules.smf_service.disable(name, **kwargs)
Disable the named service to start at boot

CLI Example:
```
salt '*' service.disable <service name>
```

### salt.modules.smf_service.disabled(name)
Check to see if the named service is disabled to start on boot

CLI Example:
```
salt '*' service.disabled <service name>
```

### salt.modules.smf_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
```
salt '*' service.enable <service name>
```

### salt.modules.smf_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot

CLI Example:
```
salt '*' service.enabled <service name>
```

### salt.modules.smf_service.get_all()
Return all installed services

CLI Example:
```
salt '*' service.get_all
```
salt.modules.smf_service.get_disabled()
Return the disabled services

CLI Example:
salt '*' service.get_disabled

salt.modules.smf_service.get_enabled()
Return the enabled services

CLI Example:
salt '*' service.get_enabled

salt.modules.smf_service.get_running()
Return the running services

CLI Example:
salt '*' service.get_running

salt.modules.smf_service.get_stopped()
Return the stopped services

CLI Example:
salt '*' service.get_stopped

salt.modules.smf_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
salt '*' service.missing net-snmp

salt.modules.smf_service.reload_(name)
Reload the named service

CLI Example:
salt '*' service.reload <service name>

salt.modules.smf_service.restart(name)
Restart the named service

CLI Example:
salt '*' service.restart <service name>

salt.modules.smf_service.start(name)
Start the specified service

CLI Example:
salt '*' service.start <service name>

salt.modules.smf_service.status(name, sig=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

**Parameters**
- `name (str)` -- The name of the service to check
- `sig (str)` -- Not implemented

**Returns** True if running, False otherwise

**Return type** `bool`

**CLI Example:**
```
salt '*' service.status <service name>
```

`salt.modules.smf_service.stop(name)`
Stop the specified service

**CLI Example:**
```
salt '*' service.stop <service name>
```

### 25.7.418 `salt.modules.smtp`

**Module for Sending Messages via SMTP**
New in version 2014.7.0.

**depends**
- `smtplib` python module

**configuration** This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:
```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:
```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```
**salt.modules.smtp.send_msg**

`send_msg` function can be used to send messages to SMTP recipients. The function is designed for use in states.

- **Recipient**: A single SMTP recipient or a comma-separated Python string for multiple recipients.
- **Message**: The content of the message.
- **Subject**: The subject of the message. (Default: 'Message from Salt')
- **Sender**: The sender's email address. (Default: None)
- **Server**: The server's domain name. (Default: None)
- **Use SSL**: A boolean indicating whether SSL should be used. (Default: True)
- **Username**: The username for authentication. (Default: None)
- **Password**: The password for authentication. (Default: None)
- **Profile**: The profile name for authentication. (Default: None)
- **Attachments**: A list of attachments. (Default: None)

**CLI Examples**

```
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com,admin2@example.com' 'This is a salt module test for multiple recipients' profile='my-smtp-account'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.com'
salt '*' smtp.send_msg 'admin@example.com' 'This is a salt module test' username='myuser' password='verybadpass' sender='admin@example.com' server='smtp.domain.com' attachments='["/var/log/messages"]'
```

### 25.7.419 salt.modules.snapper

**Module** to manage filesystem snapshots with the Snapper tool.

- **New in version 2016.11.0**

  - **codeauthor**: Duncan Mac-Vicar P. <dmacvicar@suse.de>
  - **codeauthor**: Pablo Suárez Hernández <psuarezhernandez@suse.de>

- **depends**: dbus Python module.

- **depends**: snapper [http://snapper.io](http://snapper.io), available in most distros

- **maturity**: new

- **platform**: Linux

**salt.modules.snapper.changed_files**

This function returns the files changed between two snapshots.

- **config**: Configuration name.
- **num_pre**: first snapshot ID to compare. Default is last snapshot.
- **num_post**: last snapshot ID to compare. Default is 0 (current state).

**CLI Example**

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

**salt.modules.snapper.create_baseline**

This function creates a snapshot marked as baseline.

- **tag**: Tag name for the baseline.
- **config**: Configuration name.

**CLI Example**

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

**salt.modules.snapper.create_config**

This function creates a new Snapper configuration.

- **name**: Configuration name.
- **subvolume**: Subvolume name.
- **fstype**: Filesystem type.
- **template**: Template name.
- **extra_opts**: Extra options.

**CLI Example**

```
salt '*' snapper.create_config
salt '*' snapper.create_config name=custom_fstype subvolume=my_subvolume fstype=ext4 template=my_template extra_opts=custom_option
```
name  Name of the new Snapper configuration.
subvolume  Path to the related subvolume.
fstype  Filesystem type of the subvolume.
template  Configuration template to use. (Default: default)
extra_opts  Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI Example:

```bash
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
  ->template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
  ->extra_opts='{"NUMBER_CLEANUP": False}''
```

```
salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, description=None, cleanup_algorithm='number', user-data=None, **kwargs)
```

Creates an snapshot

config  Configuration name.
snapshot_type  Specifies the type of the new snapshot. Possible values are single, pre and post.
pre_number  For post snapshots the number of the pre snapshot must be provided.
description  Description for the snapshot. If not given, the salt job will be used.
cleanup_algorithm  Set the cleanup algorithm for the snapshot.
number  Deletes old snapshots when a certain number of snapshots is reached.
timeline  Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post  Deletes pre/post snapshot pairs with empty diffs.
userdata  Set userdata for the snapshot (key-value pairs).

Returns the number of the created snapshot.

CLI Example:

```
salt '*' snapper.create_snapshot
```

```
salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')
```

Deletes an snapshot

config  Configuration name. (Default: root)
snapshots_ids  List of the snapshots IDs to be deleted.

CLI Example:

```
salt '*' snapper.delete_snapshot
salt '*' snapper.delete_snapshot config=54
salt '*' snapper.delete_snapshot config=54 snapshots_ids=[54,55,56]
```

```
salt.modules.snapper.diff(config='root', filename=None, num_pre=None, num_post=None)
```

Returns the differences between two snapshots

config  Configuration name.
filename  if not provided the showing differences between snapshots for all "text" files
num_pre  first snapshot ID to compare. Default is last snapshot
num_post  last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

```
salt.modules.snapper.diff_jid(jid, config='root')
```

Returns the changes applied by a jid
jid  The job id to lookup
config  Configuration name.

CLI Example:
salt '*' snapper.diff_jid  jid=20160607130930720112

salt.modules.snapper.get_config(name='root')
Retrieves all values from a given configuration

CLI Example:
salt '*' snapper.get_config

salt.modules.snapper.get_snapshot(number=0, config='root')
Get detailed information about a given snapshot

CLI Example:
salt '*' snapper.get_snapshot

salt.modules.snapper.list_configs()
List all available configs

CLI Example:
salt '*' snapper.list_configs

salt.modules.snapper.list_snapshots(config='root')
List available snapshots

CLI Example:
salt '*' snapper.list_snapshots config=myconfig

salt.modules.snapper.modify_snapshot(snapshot_id=None, description=None, userdata=None, cleanup=None, config='root')
Modify attributes of an existing snapshot.
config  Configuration name. (Default: root)
snapshot_id  ID of the snapshot to be modified.
cleanup  Change the cleanup method of the snapshot. (str)
description  Change the description of the snapshot. (str)
userdata  Change the userdata dictionary of the snapshot. (dict)

CLI Example:
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"

salt.modules.snapper.run(function, *args, **kwargs)
Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.
function  Salt function to call.
config  Configuration name. (default: "root")
description  A description for the snapshots. (default: None)
userdata  Data to include in the snapshot metadata. (default: None)
cleanup_algorithm  Snapper cleanup algorithm. (default: "number")
*args  args for the function to call. (default: None)
**kwargs kwargs for the function to call (default: None)
This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:
```
salt '*' snapper.run file.append args='"/etc/motd", "some text"]'
```

salt.modules.snapper.set_config(name='root', **kwargs)
Set configuration values

CLI Example:
```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:
```
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.status(config='root', num_pre=None, num_post=None)
Returns a comparison between two snapshots

config Configuration name.
num_pre first snapshot ID to compare. Default is last snapshot
num_post last snapshot ID to compare. Default is 0 (current state)

CLI Example:
```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.status_to_string(dbus_status)
Converts a numeric dbus snapper status into a string

CLI Example:
```
salt '*' snapper.status_to_string <dbus_status>
```

salt.modules.snapper.undo(config='root', files=None, num_pre=None, num_post=None)
Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

**Warning**: If one of the files has changes after num_post, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.

You to undo changes between num_pre and the current version of the files use num_post=0.

CLI Example:
```
salt '*' snapper.undo
```

salt.modules.snapper.undo_jid(jid, config='root')
Undo the changes applied by a salt job
jid The job id to lookup
config Configuration name.

CLI Example:
25.7.420 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform solaris,illumos

New in version 2016.3.0.

salt.modules.solaris_fmadm.acquit(fmri)
Acquit resource or acquit case
fmri: string fmri or uuid
CLI Example:
salt '*' fmadm.acquit fmri | uuid

salt.modules.solaris_fmadm.config()
Display fault manager configuration
CLI Example:
salt '*' fmadm.config

salt.modules.solaris_fmadm.faulty()
Display list of faulty resources
CLI Example:
salt '*' fmadm.faulty

salt.modules.solaris_fmadm.flush(fmri)
Flush cached state for resource
fmri: string fmri
CLI Example:
salt '*' fmadm.flush fmri

salt.modules.solaris_fmadm.healthy()
Return whether fmadm is reporting faults
CLI Example:
salt '*' fmadm.healthy

salt.modules.solaris_fmadm.list_records(after=None, before=None)
Display fault management logs
after [string] filter events after time, see man fmdump for format
before [string] filter events before time, see man fmdump for format
CLI Example:
salt '*' fmadm.list

---

25.7. execution modules
salt.modules.solaris_fmadm.load(path)
    Load specified fault manager module
    path: string  path of fault manager module
    CLI Example:
    
    salt '*' fmadm.load /module/path

salt.modules.solaris_fmadm.repaired(fmri)
    Notify fault manager that resource has been repaired
    fmri: string  fmri
    CLI Example:
    
    salt '*' fmadm.repaired fmri

salt.modules.solaris_fmadm.replaced(fmri)
    Notify fault manager that resource has been replaced
    fmri: string  fmri
    CLI Example:
    
    salt '*' fmadm.replaced fmri

salt.modules.solaris_fmadm.reset(module, serd=None)
    Reset module or sub-component
    module: string  module to unload
    serd [string] serd sub module
    CLI Example:
    
    salt '*' fmadm.reset software-response

salt.modules.solaris_fmadm.show(uuid)
    Display log details
    uuid: string  uuid of fault
    CLI Example:
    
    salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1

salt.modules.solaris_fmadm.unload(module)
    Unload specified fault manager module
    module: string  module to unload
    CLI Example:
    
    salt '*' fmadm.unload software-response

25.7.421  salt.modules.solaris_group

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

salt.modules.solaris_group.add(name, gid=None, **kwargs)
    Add the specified group
    CLI Example:
Salt Documentation, Release 3006.4

salt 'salt '*' group.add foo 3456

salt.modules.solaris_group.chgid(name, gid)
    Change the gid for a named group
    CLI Example:
    salt 'salt '*' group.chgid foo 4376

salt.modules.solaris_group.delete(name)
    Remove the named group
    CLI Example:
    salt 'salt '*' group.delete foo

salt.modules.solaris_group.getent(refresh=False)
    Return info on all groups
    CLI Example:
    salt 'salt '*' group.getent

salt.modules.solaris_group.info(name)
    Return information about a group
    CLI Example:
    salt 'salt '*' group.info foo

25.7.422 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a
different module (or gives an error similar to 'shadow.info' is not available), see here.

salt.modules.solaris_shadow.default_hash()
    Returns the default hash used for unset passwords
    CLI Example:
    salt 'salt '*' shadow.default_hash

salt.modules.solaris_shadow.del_password(name)
    Delete the password from name user
    CLI Example:
    salt 'salt '*' shadow.del_password username

salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')
    Generate hashed password

25.7. execution modules
**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

**password**  Plaintext password to be hashed.
**crypt_salt**  Cryptographic salt. If not given, a random 8-character salt will be generated.
**algorithm**  The following hash algorithms are supported:
- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:
```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
```
```
→ algorithm=sha256
```

salt.modules.solaris_shadow.info(name)

Return information for the specified user

CLI Example:
```
salt '*' shadow.info root
```

salt.modules.solaris_shadow.set_maxdays(name, maxdays)

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:
```
salt '*' shadow.set_maxdays username 90
```

salt.modules.solaris_shadow.set_mindays(name, mindays)

Set the minimum number of days between password changes. See man passwd.

CLI Example:
```
salt '*' shadow.set_mindays username 7
```

salt.modules.solaris_shadow.set_password(name, password)

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: openssl passwd -1 <plaintext password>

CLI Example:
```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

salt.modules.solaris_shadow.set_warndays(name, warndays)

Set the number of days of warning before a password change is required. See man passwd.

CLI Example:
```
salt '*' shadow.set_warndays username 7
```
25.7.423 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.halt()
    Halt a running system
    
    CLI Example:
    
    ```
    salt '*' system.halt
    ```

salt.modules.solaris_system.init(state)
    Change the system runlevel on sysV compatible systems
    
    CLI Example:
    state [string] Init state
    
    ```
    salt '*' system.init 3
    ```

salt.modules.solaris_system.poweroff()
    Poweroff a running system
    
    CLI Example:
    
    ```
    salt '*' system.poweroff
    ```

salt.modules.solaris_system.reboot(delay=0, message=None)
    Reboot the system
    delay [int] Optional wait time in seconds before the system will be rebooted.
    message [string] Optional message to broadcast before rebooting.
    
    CLI Example:
    
    ```
    salt '*' system.reboot
    salt '*' system.reboot 60 "=== system upgraded ==="
    ```

salt.modules.solaris_system.shutdown(delay=0, message=None)
    Shutdown a running system
    delay [int] Optional wait time in seconds before the system will be shutdown.
    message [string] Optional message to broadcast before rebooting.
    
    CLI Example:
    
    ```
    salt '*' system.shutdown
    salt '*' system.shutdown 60 "=== disk replacement ==="
    ```
25.7.424 salt.modules.solaris_user

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

```python
salt.modules.solaris_user.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname='', roomnumber='', workphone='', homephone='', createhome=True, **kwargs)
```

Add a user to the minion

CLI Example:

```bash
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.solaris_user.chfullname(name, fullname)
```

Change the user's Full Name

CLI Example:

```bash
salt '*' user.chfullname foo "Foo Bar"
```

```python
salt.modules.solaris_user.chgid(name, gid)
```

Change the default group of the user

CLI Example:

```bash
salt '*' user.chgid foo 4376
```

```python
salt.modules.solaris_user.chgroups(name, groups, append=False)
```

Change the groups to which a user belongs

name Username to modify

```python
groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.
append [False] Set to True to append these groups to the user’s existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.
```

CLI Example:

```bash
salt '*' user.chgroups foo wheel,root True
```

```python
salt.modules.solaris_user.chhome(name, home, persist=False)
```

Set a new home directory for an existing user

name Username to modify

```python
home New home directory to set
persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.
```

CLI Example:

```bash
salt '*' user.chhome foo /home/users/foo True
```

```python
salt.modules.solaris_user.chhomephone(name, homephone)
```

Change the user's Home Phone

CLI Example:

```bash
salt '*' user.chhomephone foo "7735551234"
```
salt.modules.solaris_user.chroomnumber(name, roomnumber)
    Change the user's Room Number
    CLI Example:
    ```shell
    salt '*' user.chroomnumber foo 123
    ```

salt.modules.solaris_user.chshell(name, shell)
    Change the default shell of the user
    CLI Example:
    ```shell
    salt '*' user.chshell foo /bin/zsh
    ```

salt.modules.solaris_user.chuid(name, uid)
    Change the uid for a named user
    CLI Example:
    ```shell
    salt '*' user.chuid foo 4376
    ```

salt.modules.solaris_user.chworkphone(name, workphone)
    Change the user's Work Phone
    CLI Example:
    ```shell
    salt '*' user.chworkphone foo "7735550123"
    ```

salt.modules.solaris_user.delete(name, remove=False, force=False)
    Remove a user from the minion
    CLI Example:
    ```shell
    salt '*' user.delete name remove=True force=True
    ```

salt.modules.solaris_user.getent(refresh=False)
    Return the list of all info for all users
    CLI Example:
    ```shell
    salt '*' user.getent
    ```

salt.modules.solaris_user.info(name)
    Return user information
    CLI Example:
    ```shell
    salt '*' user.info root
    ```

salt.modules.solaris_user.list_groups(name)
    Return a list of groups the named user belongs to
    CLI Example:
    ```shell
    salt '*' user.list_groups foo
    ```

salt.modules.solaris_user.list_users()
    Return a list of all users
    CLI Example:
salt '*' user.list_users

salt.modules.solaris_user.rename(name, new_name)
Change the username for a named user

CLI Example:
salt '*' user.rename name new_name

25.7.425 salt.modules.solarisipspkg

IPS pkg support for Solaris

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
    pkg.installed:
        - provider: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
    pkg: pkgutil
```

Or you can override it globally by setting the `providers` parameter in your Minion config file like this:

```
providers:
    pkg: pkgutil
```

salt.modules.solarisipspkg.available_version("names", **kwargs)
This function is an alias of `latest_version`.
The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:

```
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail
```
salt.modules.solarisipspkg.get_fmri(name, **kwargs)
Returns FMRI from partial name. Returns empty string ('') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:
salt '*' pkg.get_fmri bash

salt.modules.solarisipspkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)
Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```py
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

Multiple Package Installation Options:
- **pkgs** A list of packages to install. Must be passed as a python list.

CLI Example:
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'

salt.modules.solarisipspkg.is_installed(name, **kwargs)
Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:
salt '*' pkg.is_installed bash

salt.modules.solarisipspkg.latest_version(*names, **kwargs)
The available version of packages in the repository. Accepts full or partial FMRI. Partial FMRI is returned if the full FMRI could not be resolved.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Please use pkg.latest_version as pkg.available_version is being deprecated.

Changed in version 2019.2.0: Support for multiple package names added.

CLI Example:
salt '*' pkg.latest_version bash
salt '*' pkg.latest_version pkg://solaris/entire
salt '*' pkg.latest_version postfix sendmail

salt.modules.solarisipspkg.list_pkgs(versions_as_list=False, **kwargs)
List the currently installed packages as a dict:

```py
{ '<package_name>': '<version>' }
```

CLI Example:
salt '*' pkg.list_pkgs
salt.modules.solarisipspkg.list_upgrades(refresh=True, **kwargs)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than pkg update -vn, because pkg update hides packages that require newer version of pkg://solaris/entire (which means that they can be upgraded only from the global zone). If pkg://solaris/entire is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use refresh=True to refresh the package database.

refresh [True] Runs a full package database refresh before listing. Set to False to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, refresh defaulted to False. This was changed to default to True in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to True.

CLI Example:

```bash
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

salt.modules.solarisipspkg.normalize_name(name, **kwargs)

Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```bash
salt '*' pkg.normalize_name vim
```

salt.modules.solarisipspkg.purge(name, **kwargs)

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```bash
salt '*' pkg.purge <package name>
```

salt.modules.solarisipspkg.refresh_db(full=False, **kwargs)

Updates the remote repos database.

full : False

Set to True to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```bash
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

salt.modules.solarisipspkg.remove(name=None, pkgs=None, **kwargs)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

name  The name of the package to be deleted.

Multiple Package Options:

pkgs  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:
salt 'x' pkg.remove <package name>
salt 'x' pkg.remove tcsh
salt 'x' pkg.remove pkg://solaris/shell/tcsh
salt 'x' pkg.remove pkgs='["foo", "bar"]'

salt.modules.solarisipspkg.search(name, versions_as_list=False, **kwargs)
Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

salt 'x' pkg.search bash

salt.modules.solarisipspkg.upgrade(refresh=False, **kwargs)
Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the pkg upgrade command.

CLI Example:

salt 'x' pkg.upgrade

salt.modules.solarisipspkg.upgrade_available(name, **kwargs)
Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

salt 'x' pkg.upgrade_available apache-22

salt.modules.solarisipspkg.version(*names, **kwargs)
Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required. Partial FMRI is returned if the package is not installed.

CLI Example:

salt 'x' pkg.version vim
salt 'x' pkg.version foo bar baz
salt 'x' pkg_resource.version pkg://solaris/entire

25.7. execution modules 2743
25.7.426 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

salt.modules.solarispkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

salt.modules.solarispkg.install(name=None, sources=None, saltenv='base', **kwargs)

Install the passed package. Can install packages from the following sources:
- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Examples:

# Installing a data stream pkg that already exists on the minion
```bash
salt '*' pkg.install sources='["<pkg name>": "/dir/on/minion/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-sparc-local.pkg"]'
```

# Installing a data stream pkg that exists on the salt master
```bash
salt '*' pkg.install sources='["<pkg name>": "salt://pkgs/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-local.pkg"]'
```

CLI Example:

# Installing a data stream pkg that exists on a HTTP server
```bash
salt '*' pkg.install sources='["<pkg name>": "http://packages.server.com/<pkg filename>"]'
salt '*' pkg.install sources='["SMClgcc346": "http://packages.server.com/gcc-3.4.6-sol10-sparc-local.pkg"]'
```
Salt Documentation, Release 3006.4

If working with solaris zones and you want to install a package only in the global zone you can pass 'current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is
passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install
it in all zones. This overrides that and installs the package only in the global.
CLI Example:
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6,→sol10-sparc-local.pkg"}]' current_zone_only=True

By default salt automatically provides an adminfile, to automate package installation, with these options set:
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default

You can override any of these options in two ways. First you can optionally pass any of the options as a
kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option
providing your own adminfile to the minions.
Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:
man -s 4 admin

CLI Example:
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
,→instance="overwrite"

SLS Example:
# Overriding the 'instance' adminfile option when used in a state
SMClgcc346:
pkg.installed:
- sources:
- SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
- instance: overwrite

Note: The ID declaration is ignored, as the package name is read from the sources parameter.
CLI Example:
# Providing your own adminfile when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
,→admin_source='salt://pkgs/<adminfile filename>'

(continues on next page)

25.7. execution modules

2745


# Providing your own adminfile when using states

```yaml
<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
      - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the sources parameter.

### salt.modules.solarispkg.latest_version('names, **kwargs')

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

### salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed as a dict:

```bash
{'<package_name>': '<version>'}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

### salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)

Package purges are not supported, this function is identical to remove().

**name** The name of the package to be deleted

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

### salt.modules.solarispkg.remove(name=None, pkgs=None, saltenv='base', **kwargs)

Remove packages with pkgrm

**name** The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='"["foo", "bar"]'
```

salt.modules.solarispkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.solarispkg.version(**names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
**25.7.427 salt.modules.solr**

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

**Coming Features in 0.3**

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

**Override these in the minion config**

- **solr.cores** A list of core names e.g. ['core1', 'core2']. An empty list indicates non-multicore setup.
- **solr.baseurl** The root level URL to access solr via HTTP
- **solr.request_timeout** The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.
- **solr.type** Possible values are 'master' or 'slave'
- **solr.backup_path** The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.
- **solr.num_backups** For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.
- **solr.init_script** The full path to your init script with start/stop options
- **solr.dih.options** A list of options to pass to the DIH.

**Required Options for DIH**

- **clean** [False] Clear the index before importing
- **commit** [True] Commit the documents to the index upon completion
- **optimize** [True] Optimize the index after commit is complete
- **verbose** [True] Get verbose output

**salt.modules.solr.abort_import(handler, host=None, core_name=None, verbose=False)**

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

- **handler** [str] The name of the data import handler.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core** [str (None)] The core the handler belongs to.
- **verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.abort_import dataimport None music {'clean':True}

salt.modules.solr.backup(host=None, core_name=None, append_core_to_path=False)
Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
append_core_to_path [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return: dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.backup music

salt.modules.solr.core_status(host=None, core_name=None)
MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str] The name of the core to reload

Return: dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.core_status None music

salt.modules.solr.delta_import(handler, host=None, core_name=None, options=None, extra=None)
Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. Leave blank to use __opts__ defaults. options will be merged with __opts__
extra [dict ({} )] Extra name value pairs to pass to the handler. e.g. ['"name=value"']

Return: dict<str,obj>:

{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.delta_import dataimport None music {'clean':True}

salt.modules.solr.full_import(handler, host=None, core_name=None, options=None, extra=None)
MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication.
leave blank to use __opts__ defaults. options will be merged with __opts__
extra [dict ([])] Extra name value pairs to pass to the handler. e.g. "name=value"

Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.full_import dataimport None music {'clean':True}

salt.modules.solr.import_status (handler, host=None, core_name=None, verbose=False)
Submit an import command to the specified handler using specified options. This command can only be run
if the minion is configured with solr.type: 'master'
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. __opts__['host'] is default.
core [str (None)] The core the handler belongs to.
verbose [boolean (False)] Specifies verbose output

Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.import_status dataimport None music False

salt.modules.solr.is_replication_enabled (host=None, core_name=None)
SLAVE CALL Check for errors, and determine if a slave is replicating or not.
host [str (None)] The solr host to query. __opts__['host'] is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.

Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.is_replication_enabled music

salt.modules.solr.lucene_version (core_name=None)
Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name
since all the cores run under the same servlet container, they will all have the same version.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.

Return : dict<str,obj>:
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}

CLI Example:
salt '*' solr.lucene_version

salt.modules.solr.match_index_versions (host=None, core_name=None)
SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version.
you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

### salt.modules.solr.optimize (host=None, core_name=None)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

### salt.modules.solr.ping (host=None, core_name=None)

Does a health check on solr, makes sure solr can talk to the indexes.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

### salt.modules.solr.reload_core (host=None, core_name=None)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

**host** [str (None)] The solr host to query. __opts__['host'] is default.

**core_name** [str] The name of the core to reload

Return : dict<str,obj>:

```python
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:
salt '*' solr.reload_import_config None music

Return data is in the following format:

```json
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

salt.modules.solr.reload_import_config(handler, host=None, core_name=None, verbose=False)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

- **handler** [str] The name of the data import handler.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core** [str (None)] The core the handler belongs to.
- **verbose** [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

salt.modules.solr.replication_details(host=None, core_name=None)

Get the full replication details.

- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

salt.modules.solr.set_is_polling(polling, host=None, core_name=None)

SLAVE CALL Prevent the slaves from polling the master for updates.

- **polling** [boolean] True will enable polling. False will disable it.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```json
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

salt.modules.solr.set_replication_enabled(status, host=None, core_name=None)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

- **status** [boolean] Sets the replication status to the specified state.
- **host** [str (None)] The solr host to query. __opts__['host'] is default.
- **core_name** [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.
Return : dict<str,obj>:

{
'success':boolean, 'data':dict, 'errors':list, 'warnings':list
}

CLI Example:
salt '*' solr.set_replication_enabled false, None, music

salt.modules.solr.signal(signal=signal=None)
Stores Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the
solr host. Additionally Solr doesn't ship with an init script so one must be created.
signal [str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'
CLI Example:
salt '*' solr.signal restart

salt.modules.solr.version(core_name=None)
Gets the solr version for the core specified. You should specify a core here as all the cores will run under the
same servlet container and so will all have the same version.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores
or if you want to check all cores.
Return : dict<str,obj>:

{
'success':boolean, 'data':dict, 'errors':list, 'warnings':list
}

CLI Example:
salt '*' solr.version

25.7.428 salt.modules.solrcloud

Module for solrcloud configuration
New in version 2017.7.0.
For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli
salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']
Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+
API#CollectionsAPI-api1
salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']
Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+
API#CollectionsAPI-modifycoll
salt.modules.solrcloud.alias_exists(alias_name, **kwargs)
Check alias existence
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.alias_exists my_alias

salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)
Get collection list for an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query
Salt Documentation, Release 3006.4

CLI Example:
```
salt '*' solrcloud.alias_get my_alias
```

```
salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)
Define an alias
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]
```

```
salt.modules.solrcloud.cluster_status(**kwargs)
Get cluster status
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.cluster_status
```

```
salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)
Create a backup for a collection.
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

```
salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)
Create a backup for all collection present on the server.
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

```
salt.modules.solrcloud.collection_check_options(options)
Check collections options
CLI Example:
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}"
```

```
salt.modules.solrcloud.collection_create(collection_name, options=None, **kwargs)
Create a collection,
Additional parameters (kwargs) may be passed, they will be proxied to http.query
CLI Example:
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"
```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}
```
Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":"/srv/solr/hugePartitionCollection"}}
```

```
salt.modules.solrcloud.collection_creation_options()
```
Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

```
salt.modules.solrcloud.collection_exists(collection_name, **kwargs)
```
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

```
salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)
```
Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

```
salt.modules.solrcloud.collection_list(**kwargs)
```
List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

```
salt.modules.solrcloud.collection_reload(collection, **kwargs)
```
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

```
salt.modules.solrcloud.collection_set_options(collection_name, options, **kwargs)
```
Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={"replicationFactor":4}
```
25.7.429 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0.

depends

• splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```plaintext
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

salt.modules.splunk.create_user(email, profile='splunk', **kwargs)

create a splunk user by name/email

CLI Example:

```bash
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser
```

salt.modules.splunk.delete_user(email, profile='splunk')

Delete a splunk user by email

CLI Example:

```bash
salt myminion splunk_user.delete 'user@example.com'
```

salt.modules.splunk.get_user(email, profile='splunk', **kwargs)

Get a splunk user by name/email

CLI Example:

```bash
salt myminion splunk.get_user 'user@example.com' user_details=false
salt myminion splunk.get_user 'user@example.com' user_details=true
```

salt.modules.splunk.list_users(profile='splunk')

List all users in the splunk DB

CLI Example:

```bash
salt myminion splunk.list_users
```

salt.modules.splunk.update_user(email, profile='splunk', **kwargs)

Create a splunk user by email

CLI Example:
25.7.430 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends
- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

salt.modules.splunk_search.create(name, profile='splunk', **kwargs)
Create a splunk search

CLI Example:
```
splunk_search.create 'my search name' search='error msg'
```

salt.modules.splunk_search.delete(name, profile='splunk')
Delete a splunk search

CLI Example:
```
splunk_search.delete 'my search name'
```

salt.modules.splunk_search.get(name, profile='splunk')
Get a splunk search

CLI Example:
```
splunk_search.get 'my search name'
```

salt.modules.splunk_search.list_(profile='splunk')
List splunk searches (names only)

CLI Example:
```
splunk_search.list
```

salt.modules.splunk_search.list_all(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')
Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where "description_contains in description" is true if name_not_contains is specified, results will be limited to those where "name_not_contains not in name" is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:
CLI Example:

1. Make a "backup" of all existing searches
   $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > legacy_searches.sls

2. Get all searches with new prefixed names
   $ salt-call splunk_search.list_all "prefix=""MANAGED BY SALT""" --out=txt | sed "s/local: //" > managed_searches.sls

3. Insert the managed searches into splunk
   $ salt-call state.sls managed_searches.sls

4. Manually verify that the new searches look right

5. Delete the original searches
   $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls
   $ salt-call state.sls remove_legacy_searches.sls

6. Get all searches again, verify no changes
   $ salt-call splunk_search.list_all --out=txt | sed "s/local: //" > final_searches.sls
   $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.update(name, profile='splunk', **kwargs)
Update a splunk search

CLI Example:

   splunk_search.update 'my search name' sharing=app

25.7.431 salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.fetch(db=None, sql=None)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

   salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'

salt.modules.sqlite3.indexes(db=None)
Show all indices in the database, for people with poor spelling skills

CLI Example:

   salt '*' sqlite3.indexes /root/test.db

salt.modules.sqlite3.indices(db=None)
Show all indices in the database

CLI Example:

   salt '*' sqlite3.indices /root/test.db

salt.modules.sqlite3.modify(db=None, sql=None)
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

   salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'

salt.modules.sqlite3.sqlite_version()
Return version of sqlite

CLI Example:

   salt '*' sqlite3.sqlite_version
salt.modules.sqlite3.tables(db=None)
Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

salt.modules.sqlite3.version()
Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

25.7.432  salt.modules.ssh

Manage client ssh components

**Note:** This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.auth_keys(user=None, config='~/.ssh/authorized_keys', fingerprint_hash_type=None)
Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

salt.modules.ssh.check_key(user, key, enc, comment, options, config='~/.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

salt.modules.ssh.check_key_file(user, source, config='~/.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

salt.modules.ssh.check_known_host(user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None)
Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.
CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

**salt.modules.ssh.get_known_host_entries**

```
salt.modules.ssh.get_known_host_entries(user, hostname, config=None, port=None, fingerprint_hash_type=None)
```

New in version 2018.3.0.

Return information about known host entries from the config file, if any. If there are no entries for a matching hostname, return None.

CLI Example:

```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

**salt.modules.ssh.hash_known_hosts**

```
salt.modules.ssh.hash_known_hosts(user=None, config=None)
```

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

- **user** hash known hosts of this user
- **config** path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

**salt.modules.ssh.host_keys**

```
salt.modules.ssh.host_keys(keydir=None, private=True, certs=True)
```

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

**salt.modules.ssh.key_is_encrypted**

```
salt.modules.ssh.key_is_encrypted(key)
```

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a **Proc-Type** header with **ENCRYPTED** in the value. If found, returns **True**, otherwise returns **False**.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

**salt.modules.ssh.recv_known_host_entries**

```
salt.modules.ssh.recv_known_host_entries(hostname, enc=None, port=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)
```

New in version 2018.3.0.

Retrieve information about host public keys from remote server

- **hostname** The name of the remote host (e.g. "github.com")
- **enc** Defines what type of key is being used, can be ed25519, ecdsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.
- **port** Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.
- **hash_known_hosts** [True] Hash all hostnames and addresses in the known hosts file.
timeout  [int]  Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

fingerprint_hash_type  The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

```
salt.modules.ssh.rm_auth_key( user, key, config='.ssh/authorized_keys', fingerprint_hash_type=None)
```

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

```
salt.modules.ssh.rm_auth_key_from_file( user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
```

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

```
salt.modules.ssh.rm_known_host( user=None, hostname=None, config=None, port=None)
```

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

```
salt.modules.ssh.set_auth_key( user, key, enc='ssh-rsa', comment='', options=None, config='.ssh/authorized_keys', cache_keys=None, fingerprint_hash_type=None)
```

Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

```
salt.modules.ssh.set_auth_key_from_file(user, source, config='.ssh/authorized_keys', saltenv='base', fingerprint_hash_type=None)
```

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

```
salt.modules.ssh.set_known_host( user=None, hostname=None, fingerprint=None, key=None, port=None, enc=None, config=None, hash_known_hosts=True, timeout=5, fingerprint_hash_type=None)
```

Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.
If such a record does already exists in there, do nothing.

user  The user who owns the ssh authorized keys file to modify
hostname  The name of the remote host (e.g. "github.com")
fingerprint  The fingerprint of the key which must be present in the known_hosts file (optional if key specified)
key  The public key which must be presented in the known_hosts file (optional if fingerprint specified)
port  optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.
enc  Defines what type of key is being used, can be ed25519, edsa, ssh-rsa, ssh-dss or any other type as of openssh server version 8.7.
config  The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.
hash_known_hosts  [True] Hash all hostnames and addresses in the known hosts file.
timeout  [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.
fingerprint_hash_type  The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config='~/.ssh/known_hosts'
```

salt.modules.ssh.user_keys(user=None, pubfile=None, prvfile=None)
Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/~home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user="[\'user1\',\'user2\']" pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

25.7.433  salt.modules.ssh_pkg

Service support for the REST example

salt.modules.ssh_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)
salt.modules.ssh_pkg.list_pkgs(versions_as_list=False, **kwargs)
salt.modules.ssh_pkg.remove(name=None, pkgs=None, **kwargs)
25.7.434  **salt.modules.ssh_service**

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

**salt.modules.ssh_service.enabled(name, sig=None)**

Only the 'redbull' service is 'enabled' in the test

**salt.modules.ssh_service.get_all()**

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.ssh_service.list_()**

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

**salt.modules.ssh_service.restart(name, sig=None)**

Restart the specified service on the ssh_sample

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.ssh_service.running(name, sig=None)**

Return whether this service is running.

**salt.modules.ssh_service.start(name, sig=None)**

Start the specified service on the ssh_sample

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.ssh_service.status(name, sig=None)**

Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**

- **name (str)** -- The name of the service to check
- **sig (str)** -- Not implemented

**Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type** bool

CLI Example:

```
salt '*' service.status <service name>
```

**salt.modules.ssh_service.stop(name, sig=None)**

Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```
Salt Documentation, Release 3006.4

25.7.435 salt.modules.state
Control the state system on the minion.
State Caching
When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate
with cache=True it will use that cached highdata and won't hit the fileserver except for salt:// links in the states
themselves.
salt.modules.state.apply_(mods=None, **kwargs)
New in version 2015.5.0.
This function will call state.highstate or state.sls based on the arguments passed to this function.
It exists as a more intuitive way of applying states.
APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)
To apply all configured states, simply run state.apply:
salt '*' state.apply

The following additional arguments are also accepted when applying all states configured in top.sls:
test Run states in test-only (dry-run) mode
mock The mock option allows for the state run to execute without actually calling any states. This then returns
a mocked return which will show the requisite ordering as well as fully validate the state run.
New in version 2015.8.4.
pillar Custom Pillar values, passed as a dictionary of key-value pairs
salt '*' state.apply stuff pillar='{"foo": "bar"}'

Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar
source.
exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls
names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple
states.
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
,→exclude'}]"

queue [False] Instead of failing immediately when another state run is in progress, a value of True will queue
the new state run to begin running once the other has finished.
This option starts a new thread for each queued state run, so use this option sparingly.
Changed in version 3006.0: This parameter can also be set via the state_queue configuration option.
Additionally, it can now be set to an integer representing the maximum queue size which can be attained
before the state runs will fail to be queued. This can prevent runaway conditions where new threads are
started until system performance is hampered.
localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this
argument, and then merge them with the options from the minion config. This functionality allows

2764

Chapter 25. Salt Module Reference


for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

**state_events** The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

### APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff

# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs

# Run the states configured in a more deeply nested directory such as salt://my/organized/stuff.sls (or salt://my/organized/stuff/init.sls)
salt '*' state.apply my.organized.stuff
```

The following additional arguments are also accepted when applying individual SLS files:

- **test** Run states in test-only (dry-run) mode
- **mock** The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

- **pillar** Custom Pillar values, passed as a dictionary of key-value pairs
  
  ```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
  ```

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

- **queue** [False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.

  This option starts a new thread for each queued state run, so use this option sparingly.

  Changed in version 3006.0: This parameter can also be set via the state_queue configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

- **concurrent** [False] Execute state runs concurrently instead of serially

  **Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

- **saltenv** Specify a salt fileserver environment to be used when applying states

  Changed in version 0.17.0: Argument name changed from env to saltenv
Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillowrenv option. When neither the pillowrenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

**sync_mods** If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

**Note:** This option is ignored when no SLS files are specified, as a highstate automatically syncs all custom module types.

New in version 2017.7.8,2018.3.3,2019.2.0.

**state_events** The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

salt.modules.state.check_request(name=None)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

salt.modules.state.clear_cache()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

CLI Example:

```
salt '*' state.clear_cache
```

salt.modules.state.clear_request(name=None)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

salt.modules.state.disable(states)

Disable state runs.
CLI Example:

```bash
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes
```

**Note:** To disable a state file from running provide the same name that would be passed in a state.sls call.

```bash
salt '*' state.disable bind.config
```

**salt.modules.state.enable** *(states)*

Enable state function or sls run

CLI Example:

```bash
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

**Note:** To enable a state file from running provide the same name that would be passed in a state.sls call.

```bash
salt '*' state.disable bind.config
```

**salt.modules.state.event** *(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')*

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

Changed in version 2019.2.0: *tagmatch* can now be either a glob or regular expression.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

**Parameters**

- **tagmatch** -- the event is written to stdout for each tag that matches this glob or regular expression.
- **count** -- this number is decremented for each event that matches the *tagmatch* parameter; pass -1 to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if False (useful for shell tools); pretty-print the JSON output if True.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```bash
salt-call --local state.event pretty=True
```

**salt.modules.state.get_pauses** *(jid=None)*

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

**salt.modules.state.high** *(data, test=None, queue=None, **kwargs)*

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.
CLI Example:
```
salt '*/' state.high '{"vim": {"pkg": ["installed"]}}'
```

```python
salt.modules.state.highstate(test=None, queue=None, state_events=None, **kwargs)
```
Retrieve the state data from the salt master for this minion and execute it

**test** Run states in test-only (dry-run) mode

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs
```
salt '*/' state.highstate stuff pillar='{"foo": "bar"}"
```

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](link) for details.

**pillar_enc** Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

**exclude** Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.
```
salt '*/' state.highstate exclude=bar,baz
salt '*/' state.highstate exclude=foo*
```

**saltenv** Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a saltenv parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

**queue** [False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the state_queue configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

**concurrent** [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

**localconfig** Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows
for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock  The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

state_events The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

```
salt '*' state.highstate
salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.id_exists(ids, mods, test=None, queue=None, **kwargs)
Tests for the existence of a specific ID or list of IDs within the specified SLS file(s). Similar to state.sls_exists, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.

saltenv Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument

```
salt '*' state.id_exists create_myfile,update_template filestate saltenv=dev
```

salt.modules.state.list_disabled()
List the states which are currently disabled

```
salt '*' state.list_disabled
```

salt.modules.state.low(data, queue=None, **kwargs)
Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.orchestrate(mods, saltenv='base', test=None, exclude=None, pillar=None, pillarenv=None)
Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation
  • Full Orchestrate Tutorial
  • Docs for the salt state module salt.states.saltmod
**CLI Examples:**

```shell
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

**salt.modules.state.pause(jid, state_id=None, duration=None)**

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to `pause` is *vim*

**CLI Examples:**

```shell
salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20
```

**salt.modules.state.pkg(pkg_path, pkg_sum, hash_type, test=None, **kwargs)**

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

**CLI Example:**

```shell
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

**salt.modules.state.request(mods=None, **kwargs)**

New in version 2015.5.0.

Request that the local admin execute a state run via `salt-call state.run_request`. All arguments match those of `state.apply`.

**CLI Example:**

```shell
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff,pkgs
```

**salt.modules.state.resume(jid, state_id=None)**

Remove a pause from a jid, allowing it to continue. If the state_id is not specified then the a general pause will be resumed.

The given state_id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The state_id to pass to `rm_pause` is *vim*

**CLI Examples:**

```shell
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```
salt.modules.state.run_request(name='default', **kwargs)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

salt.modules.state.running(concurrent=False)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

salt.modules.state.show_highstate(queue=None, **kwargs)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

salt.modules.state.show_low_sls(mods, test=None, queue=None, **kwargs)

Display the low data from a specific sls. The default environment is base, use saltenv to specify a different environment.

**saltenv** Specify a salt fileserver environment to be used when applying states

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

salt.modules.state.show_lowstate(queue=None, **kwargs)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

salt.modules.state.show_sls(mods, test=None, queue=None, **kwargs)

Display the state data from a specific sls or list of sls files on the master. The default environment is base, use saltenv to specify a different environment.

This function does not support topfiles. For top.sls please use show_top instead.

Custom Pillar data can be passed with the pillar kwarg.
Saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```bash
classic '* state.show_sls core,edit.vim saltenv=dev
```

salt.modules.state.show_state_usage(queue=None, **kwargs)
Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the pillar kwarg.

CLI Example:

```bash
classic '* state.show_state_usage
```

salt.modules.state.show_states(queue=None, **kwargs)
Returns the list of states that will be applied on highstate.

CLI Example:

```bash
classic '* state.show_states
```

New in version 2019.2.0.

salt.modules.state.show_top(queue=None, **kwargs)
Return the top data that the minion will use for a highstate

CLI Example:

```bash
classic '* state.show_top
```

salt.modules.state.single(fun, name, test=None, queue=None, **kwargs)
Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```bash
classic '* state.single pkg.installed name=vim
```

salt.modules.state.sls(mods, test=None, exclude=None, queue=None, sync_mods=None, state_events=None, **kwargs)
Execute the states in one or more SLS files

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```bash
classic '* state.sls stuff pillar='{"foo": "bar"}'
```

**Note:** Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.
pillar_enc Specify which renderer to use to decrypt encrypted data located within the pillar value. Currently, only gpg is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

```plaintext
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {'sls': \"sls_to_exclude\"}]"
```

queue [False] Instead of failing immediately when another state run is in progress, a value of True will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the state_queue configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

concurrent [False] Execute state runs concurrently instead of serially

**Warning:** This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do not use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from env to saltenv.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an environment parameter and if found, it will be used. If none is found, base will be used. In prior releases, the minion config was not checked and base would always be assumed when the saltenv was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

sync_mods If specified, the desired custom module types will be synced prior to running the SLS files:

```plaintext
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8, 2018.3.3, 2019.2.0.

state_events The state_events option sends progress events as each function in a state run completes execution.

New in version 3006.0.

CLI Example:
# Run the states configured in salt://example.sls (or salt://example/init.sls)
salt '*' state.apply example

# Run the states configured in salt://core.sls (or salt://core/init.sls)
# and salt://edit/vim.sls (or salt://edit/vim/init.sls)
salt '*' state.sls core,edit.vim

# Run the states configured in a more deeply nested directory such as salt://my/
# nested/state.sls (or salt://my/nested/state/init.sls)
salt '*' state.sls my.nested.state

salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'}]"
salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"

salt.modules.state.sls_exists(mods, test=None, queue=None, **kwargs)
Tests for the existence the of a specific SLS or list of SLS files on the master. Similar to state.show_sls, rather than returning state details, returns True or False. The default environment is base, use saltenv to specify a different environment.

New in version 2019.2.0.
saltenv Specify a salt fileserver environment from which to look for the SLS files specified in the mods argument

CLI Example:
salt '*' state.sls_exists core,edit.vim saltenv=dev

salt.modules.state.sls_id(id_, mods, test=None, queue=None, state_events=None, **kwargs)
Call a single ID from the named module(s) and handle all requisites

The state ID comes before the module ID(s) on the command line.
id ID to call
mods Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.
saltenv [base] Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
pillar Custom Pillar values, passed as a dictionary of key-value pairs

Note: Values passed this way will override existing Pillar values set via pillar_roots or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.

CLI Example:
salt '*' state.sls_id my_state my_module

salt.modules.state.soft_kill(jid, state_id=None)
Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given
state id. This needs to pass in the jid of the running state. If a state_id is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```vim:
  pkg.installed: []
```

The state_id to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

`salt.modules.state.template` *(tem, queue=\None, **kwargs)*

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.template_str` *(tem, queue=\None, **kwargs)*

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.test` *(\*args, **kwargs)*

New in version 3001.

Alias for `state.apply` with the kwarg `test` forced to `True`.

This is a nicety to avoid the need to type out `test=True` and the possibility of a typo causing changes you do not intend.

`salt.modules.state.top` *(topfn, test=\None, queue=\None, **kwargs)*

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

`queue` [False] Instead of failing immediately when another state run is in progress, a value of `True` will queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

Changed in version 3006.0: This parameter can also be set via the `state_queue` configuration option. Additionally, it can now be set to an integer representing the maximum queue size which can be attained before the state runs will fail to be queued. This can prevent runaway conditions where new threads are started until system performance is hampered.

`saltenv` Specify a salt fileserver environment to be used when applying states

`pillarenv` Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:
25.7.436 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

salt.modules.status.all_status()
   Return a composite of all status data and info for this minion. Warning: There is a LOT here!
   CLI Example:
   ```shell
   salt '*' status.all_status
   ```

salt.modules.status.cpuinfo()
   Changed in version 2016.3.2: Return the CPU info for this minion
   Changed in version 2016.11.4: Added support for AIX
   Changed in version 2018.3.0: Added support for NetBSD and OpenBSD
   CLI Example:
   ```shell
   salt '*' status.cpuinfo
   ```

salt.modules.status.cpustats()
   Return the CPU stats for this minion
   Changed in version 2016.11.4: Added support for AIX
   Changed in version 2018.3.0: Added support for OpenBSD
   CLI Example:
   ```shell
   salt '*' status.cpustats
   ```

salt.modules.status.custom()
   Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:
   ```python
   status.cpustats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
   ```
   Where status refers to status.py, cpustats is the function where we get our data, and custom is this function. It is followed by a list of keys that we want returned.
   This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.
   By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!
   CLI Example:
   ```shell
   salt '*' status.custom
   ```

salt.modules.status.diskstats()
   Changed in version 2016.3.2: Return the disk stats for this minion
   Changed in version 2016.11.4: Added support for AIX
CLI Example:

```bash
salt '*' status.diskstats
```

**salt.modules.status.diskusage(**args**)**

Return the disk usage for this minion

Usage:

```bash
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```bash
salt '*' status.diskusage # usage for all filesystems
salt '*' status.diskusage /tmp # usage for / and /tmp
salt '*' status.diskusage ext? # usage for ext[234] filesystems
salt '*' status.diskusage / ext? # usage for / and all ext filesystems
```

**salt.modules.status.loadavg()**

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

**salt.modules.status.master(**master=None, connected=True **)**

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.master
```

**salt.modules.status.meminfo()**

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```bash
salt '*' status.meminfo
```

**salt.modules.status.netdev()**

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```bash
salt '*' status.netdev
```
salt.modules.status.netstats()
    Return the network stats for this minion
    Changed in version 2016.11.4: Added support for AIX
    Changed in version 2018.3.0: Added support for OpenBSD
    CLI Example:
    
    salt '*' status.netstats

salt.modules.status.nproc()
    Return the number of processing units available on this system
    Changed in version 2016.11.4: Added support for AIX
    Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD
    CLI Example:
    
    salt '*' status.nproc

salt.modules.status.pid(sig)
    Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process
    via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the
    regexp.
    Changed in version 2016.11.4: Added support for AIX
    CLI Example:
    
    salt '*' status.pid <sig>

salt.modules.status.ping_master(master)
    New in version 2016.3.0.
    Sends ping request to the given master. Fires '__master_failback' event on success. Returns bool result.
    CLI Example:
    
    salt '*' status.ping_master localhost

salt.modules.status.procs()
    Return the process data
    Changed in version 2016.11.4: Added support for AIX
    CLI Example:
    
    salt '*' status.procs

salt.modules.status.proxy_reconnect(proxy_name, opts=None)
    Forces proxy minion reconnection when not alive.
    proxy_name The virtual name of the proxy module.
    opts: None Optns dictionary. Not intended for CLI usage.
    CLI Example:
    
    salt '*' status.proxy_reconnect rest_sample

salt.modules.status.time_(format=\"%A, %d. %B %Y %I:%M%p\")
    New in version 2016.3.0.
Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time
salt '*' status.time '%s'
```

salt.modules.status.uptime()

Return the uptime for this system.

- Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.
- Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris
- Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

salt.modules.status.version()

Return the system version for this minion

- Changed in version 2016.11.4: Added support for AIX
- Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.version
```

salt.modules.status.vmstats()

Return the virtual memory stats for this minion

- Changed in version 2016.3.2: Return the virtual memory stats for this minion
- Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

salt.modules.status.w()

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```
25.7.437 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

```
salt.modules.statuspage.create(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)
```

Insert a new entry under a specific endpoint.

- **endpoint**: `incidents` Insert under this specific endpoint.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_id='993vgplshj12'
```

Example output:

```
minion:        
  comment:     
  out:         
                    created_at: 2017-01-05T19:35:27.135Z
                    description: None
                    group_id: 993vgplshj12
                    id: mjkmtt5lhdgc
                    name: my component
                    page_id: ksdhgfyiuhaa
                    position: 7
                    status: operational
                    updated_at: 2017-01-05T19:35:27.135Z
  result: True
```

```
salt.modules.statuspage.delete(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None)
```

Remove an entry from an endpoint.
endpoint: incidents  Request a specific endpoint.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'

Example output:

```
minion:  --------
   comment:  
     out:  
       None
    result:  True
```

salt.modules.statuspage.retrieve(endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None)
Retrieve a specific endpoint from the Statuspage API.

endpoint: incidents  Request a specific endpoint.
page_id  Page ID. Can also be specified in the config file.
api_key  API key. Can also be specified in the config file.
api_version: 1  API version. Can also be specified in the config file.
api_url  Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:
salt 'minion' statuspage.retrieve components

Example output:

```
minion:  --------
   comment:  
     out:  
       |
         --------
        backfilled:  False
        created_at:  2015-01-26T20:25:02.702Z
        id:  kh2qwjbeqd36
        impact:  major
        impact_override:  None

salt.modules.statuspage.update(endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs)

Update attribute(s) of a specific endpoint.

- **id** The unique ID of the endpoint entry.
- **endpoint**: incidents Endpoint name.
- **page_id**: Page ID. Can also be specified in the config file.
- **api_key**: API key. Can also be specified in the config file.
- **api_version**: 1 API version. Can also be specified in the config file.
- **api_url**: Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```
minion:
    comment: 
    out: 
        created_at: 2017-01-03T15:25:30.718Z
        description: None

        position: 11
        status: resolved
        updated_at: 2017-01-05T15:34:27.676Z
    result: True
```

25.7.438 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.add(name, user=None, conf_file=None, bin_env=None)

Activates any updates in config for process/group.

- **user**: user to run supervisorctl as
- **conf_file**: path to supervisord config file
- **bin_env**: path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

salt.modules.supervisord.custom(command, user=None, conf_file=None, bin_env=None)

Run any custom supervisord command

25.7. execution modules
user  user to run supervisorctl as
conf_file  path to supervisord config file
bin_env  path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

salt '*' supervisord.custom "mstop '*gunicorn*'"

salt.modules.supervisord.options(name, conf_file=None)

New in version 2014.1.0.

Read the config file and return the config options for a given process

CLI Example:

salt '*' supervisord.options foo

salt.modules.supervisord.remove(name, user=None, conf_file=None, bin_env=None)

Removes process/group from active config

CLI Example:

salt '*' supervisord.remove <name>

salt.modules.supervisord.reread(user=None, conf_file=None, bin_env=None)

Reload the daemon's configuration files

CLI Example:

salt '*' supervisord.reread

salt.modules.supervisord.restart(name='all', user=None, conf_file=None, bin_env=None)

Restart the named service. Process group names should not include a trailing asterisk.

CLI Example:

salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:

salt.modules.supervisord.start(name='all', user=None, conf_file=None, bin_env=None)

Start the named service. Process group names should not include a trailing asterisk.

CLI Example:

salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:

salt.modules.supervisord.status(name=None, user=None, conf_file=None, bin_env=None)

List programs and its state
**user** user to run supervisorctl as
**conf_file** path to supervisord config file
**bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*'
```

**salt.modules.supervisord.status_bool** *(name, expected_state=None, user=None, conf_file=None, bin_env=None)*

Check for status of a specific supervisord process and return boolean result.
**name** name of the process to check
**expected_state** search for a specific process state. If set to `None` - any process state will match.
**user** user to run supervisorctl as
**conf_file** path to supervisord config file
**bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*'
```

**salt.modules.supervisord.status_raw** *(name=None, user=None, conf_file=None, bin_env=None)*

Display the raw output of status
**user** user to run supervisorctl as
**conf_file** path to supervisord config file
**bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*'
```

**salt.modules.supervisord.stop** *(name='all', user=None, conf_file=None, bin_env=None)*

Stop the named service. Process group names should not include a trailing asterisk.
**user** user to run supervisorctl as
**conf_file** path to supervisord config file
**bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:
```
salt '*'
```

**salt.modules.supervisord.update** *(user=None, conf_file=None, bin_env=None, name=None)*

Reload config and add/remove/update as necessary
**user** user to run supervisorctl as
**conf_file** path to supervisord config file
**bin_env** path to supervisorctl bin or path to virtualenv with supervisor installed
**name** name of the process group to update. if none then update any process group that has changes

CLI Example:
```
salt '*'
```
25.7.439 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

salt.modules.suse_apache.a2dismod(mod)
Runs a2dismod for the given mod.

CLI Example:
```
salt '*' apache.a2dismod vhost_alias
```

salt.modules.suse_apache.a2enmod(mod)
Runs a2enmod for the given mod.

CLI Example:
```
salt '*' apache.a2enmod vhost_alias
```

salt.modules.suse_apache.check_mod_enabled(mod)
Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:
```
salt '*' apache.check_mod_enabled status
```

25.7.440 salt.modules.suse_ip

The networking module for SUSE based distros

New in version 3005.

salt.modules.suse_ip.apply_network_settings(**settings)
Apply global network configuration.

:param [param settings:] The network settings to apply

Returns The result of `service.reload` for network service

CLI Example:
```
salt '*' ip.apply_network_settings
```

salt.modules.suse_ip.build_interface(iface, iface_type, enabled, **settings)
Build an interface script for a network interface.

:param [param iface:] The name of the interface to build the configuration for
:param [param iface_type:] The type of the interface. The following types are possible:
  - eth
  - bond
  - alias
  - clone
  - ipsec
  - dialup
  - bridge
  - slave
• vlan
• ipip
• ib
:param [param enabled:] Build the interface enabled or disabled
:param [param settings:] The settings for the interface

Returns A dictionary of file/content
Return type  dict

CLI Example:
```
salt '*' ip.build_interface eth0 eth <settings>
```

```
salt.modules.suse_ip.build_network_settings(**settings)
Build the global network script.
:param [param settings:] The network settings

Returns A dictionary of file/content
Return type  dict

CLI Example:
```
salt '*' ip.build_network_settings <settings>
```

```
salt.modules.suse_ip.build_routes(iface, **settings)
Build a route script for a network interface.
:param [param iface:] The name of the interface to build the routes for
:param [param settings:] The settings for the routes

Returns A dictionary of file/content
Return type  dict

CLI Example:
```
salt '*' ip.build_routes eth0 <settings>
```

```
salt.modules.suse_ip.down(iface, iface_type=None)
Shutdown a network interface
:param [param iface:] The name of the interface to shutdown
:param [param iface_type:] The type of the interface If slave is specified, no any action is performing
Default is None

Returns The result of ifdown command or None if slave iface_type was specified
Return type  str

CLI Example:
```
salt '*' ip.down eth0
```

```
salt.modules.suse_ip.get_interface(iface)
Return the contents of an interface script
:param [param iface:] The name of the interface to get settings for

Returns A dictionary of file/content
Return type  dict

CLI Example:
```
salt '*' ip.get_interface eth0
```
**Salt Documentation, Release 3006.4**

```python
salt.modules.suse_ip.get_network_settings()
```

Return the contents of the global network script.

**param** [param iface:] The name of the interface to start up

**param** [param iface_type:] The type of the interface If slave is specified, no any action is performing

Default is None

**Returns** A dictionary of file/content

**Return type** dict

CLI Example:

```
salt '*' ip.get_network_settings
```

```python
salt.modules.suse_ip.get_routes(iface)
```

Return the contents of the interface routes script.

**param** [param iface:] The name of the interface to get the routes for

**Returns** A dictionary of file/content

**Return type** dict

CLI Example:

```
salt '*' ip.get_routes eth0
```

```python
salt.modules.suse_ip.up(iface, iface_type=None)
```

Start up a network interface

**param** [param iface:] The name of the interface to start up

**param** [param iface_type:] The type of the interface If slave is specified, no any action is performing

Default is None

**Returns** The result of ifup command or None if slave iface_type was specified

**Return type** str

CLI Example:

```
salt '*' ip.up eth0
```

### 25.7.441 salt.modules.svn

**Subversion SCM**

```python
salt.modules.svn.add(cwd, targets, user=None, username=None, password=None, *opts)
```

Add files to be tracked by the Subversion working-copy checkout

**cwd** The path to the Subversion repository

**targets** [None] files and directories to pass to the command as arguments

**user** [None] Run svn as a user other than what the minion runs as

**username** [None] Connect to the Subversion server as another user

**password** [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

```python
salt.modules.svn.checkout(cwd, remote, target=None, user=None, username=None, password=None, *opts)
```

Download a working copy of the remote Subversion repository directory or file

**cwd** The path to the Subversion repository
remote  [None] URL to checkout

target  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

      New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

```
salt.modules.svn.commit(cwd, targets=None, msg=None, user=None, username=None, password=None, *opts)
```

Commit the current directory, files, or directories to the remote Subversion repository

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments Default: svn uses ':

msg  [None] Message to attach to the commit log

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

      New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

```
salt.modules.svn.diff(cwd, targets=None, user=None, username=None, password=None, *opts)
```

Return the diff of the current directory, files, or directories from the remote Subversion repository

cwd  The path to the Subversion repository

targets  [None] files and directories to pass to the command as arguments Default: svn uses ':

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

      New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

```
salt.modules.svn.export(cwd, remote, target=None, user=None, username=None, password=None, revision='HEAD', *opts)
```

Create an unversioned copy of a tree.

cwd  The path to the Subversion repository

remote  [None] URL and path to file or directory checkout

target  [None] The name to give the file or directory working copy Default: svn uses the remote basename

user  [None] Run svn as a user other than what the minion runs as

username  [None] Connect to the Subversion server as another user

password  [None] Connect to the Subversion server with this password

      New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

```
salt.modules.svn.info(cwd, targets=None, user=None, username=None, password=None, fmt='str')
```

Display the Subversion information from the checkout.

cwd  The path to the Subversion repository

25.7. execution modules
targets [None] files, directories, and URLs to pass to the command as arguments svn uses '.' by default
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.
fmt [str] How to fmt the output from info. (str, xml, list, dict)
CLI Example:

```bash
salt '*' svn.info /path/to/svn/repo
```

salt.modules.svn.remove(cwd, targets, msg=None, user=None, username=None, password=None, *opts)
Remove files and directories from the Subversion repository
cwd The path to the Subversion repository
targets [None] files, directories, and URLs to pass to the command as arguments
msg [None] Message to attach to the commit log
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.
CLI Example:

```bash
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

salt.modules.svn.status(cwd, targets=None, user=None, username=None, password=None, *opts)
Display the status of the current directory, files, or directories in the Subversion repository
cwd The path to the Subversion repository
targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses '.'
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.
CLI Example:

```bash
salt '*' svn.status /path/to/repo
```

salt.modules.svn.switch(cwd, remote, target=None, user=None, username=None, password=None, *opts)
New in version 2014.1.0.
Switch a working copy of a remote Subversion repository directory
cwd The path to the Subversion repository
remote [None] URL to switch
target [None] The name to give the file or directory working copy Default: svn uses the remote basename
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password
CLI Example:

```bash
salt '*' svn.switch /path/to/repo svn://remote/repo
```

salt.modules.svn.update(cwd, targets=None, user=None, username=None, password=None, *opts)
Update the current directory, files, or directories from the remote Subversion repository
cwd The path to the Subversion repository
targets  [None] files and directories to pass to the command as arguments Default: svn uses '
user  [None] Run svn as a user other than what the minion runs as
password  [None] Connect to the Subversion server with this password

New in version 0.17.0.
username  [None] Connect to the Subversion server as another user

CLI Example:

```
salt '*' svn.update /path/to/repo
```

25.7.442  salt.modules.swarm

Docker Swarm Module using Docker's Python SDK

codeauthor  Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.
The Docker Swarm Module is used to manage and create Docker Swarms.

Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

Docker Python SDK

```
pip install -U docker
```

```
salt.modules.swarm.joinswarm(remote_addr=<class 'int'>, listen_addr=<class 'int'>, token=<class 'str'>)
```

Join a Swarm Worker to the cluster
remote_addr The manager node you want to connect to for the swarm
listen_addr Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)
token Either the manager join token or the worker join token. You can get the worker or manager token via salt 'master' swarm.swarm_tokens

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0' token='SWMTKN-1-64tux2g0701r84ofq93zppcih0pe081akq45owe9ts61f30x4t-06trjugdu7x2z47j938s54il'
```

```
salt.modules.swarm.leave_swarm(force=<class 'bool'>)
```

Force the minion to leave the swarm
force Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

25.7. execution modules 2791
salt.modules.swarm.node_ls(server=<class 'str'>)
Displays Information about Swarm Nodes with passing in the server
server The minion/server name
CLI Example:
```
salt '*' swarm.node_ls server=minion1
```

salt.modules.swarm.remove_node(node_id=<class 'str'>, force=<class 'bool'>)
Remove a node from a swarm and the target needs to be a swarm manager
node_id The node id from the return of swarm.node_ls
force Forcefully remove the node/minion from the service
CLI Example:
```
salt '*' swarm.remove_node node_id=z4gjbe9rwmqahc2a91snvolm5 force=false
```

salt.modules.swarm.remove_service(service=<class 'str'>)
Remove Swarm Service
service The name of the service
CLI Example:
```
salt '*' swarm.remove_service service=Test_Service
```

salt.modules.swarm.service_create(image=<class 'str'>, name=<class 'str'>, command=<class 'str'>, hostname=<class 'str'>, replicas=<class 'int'>, target_port=<class 'int'>, published_port=<class 'int'>)
Create Docker Swarm Service Create
image The docker image
name Is the service name
command The docker command to run in the container at launch
hostname The hostname of the containers
replicas How many replicas you want running in the swarm
target_port The target port on the container
published_port port that's published on the host/os
CLI Example:
```
salt '*' swarm.service_create image=httpd name=Test_Service command=None hostname=salthttpd replicas=6 target_port=80 published_port=80
```

salt.modules.swarm.swarm_init(advertise_addr=<class 'str'>, listen_addr=<class 'int'>, force_new_cluster=<class 'bool'>)
Initialize Docker on Minion as a Swarm Manager
advertise_addr The ip of the manager
listen_addr Listen address used for inter-manager communication, as well as determining the networking
interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination
in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567
force_new_cluster Force a new cluster if True is passed
CLI Example:
```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0' force_new_cluster=False
```

salt.modules.swarm.swarm_service_info(service_name=<class 'str'>)
Swarm Service Information
service_name The name of the service that you want information on about the service
CLI Example:
salt 'salt '*' swarm.swarm_service_info service_name=Test_Service

salt.modules.swarm.swarm_tokens()
    Get the Docker Swarm Manager or Worker join tokens
    CLI Example:
    salt '*' swarm.swarm_tokens

salt.modules.swarm.update_node(availability=<class 'str'>, node_name=<class 'str'>, role=<class 'str'>, node_id=<class 'str'>, version=<class 'int'>)
    Updates docker swarm nodes/needs to target a manager node/minion
    availability Drain or Active
    node_name minion/node
    role role of manager or worker
    node_id The Id and that can be obtained via swarm.node_ls
    version Is obtained by swarm.node_ls
    CLI Example:
    salt '*' swarm.update_node availability=drain node_name=minion2 role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19

25.7.443 salt.modules.swift

Module for handling OpenStack Swift calls  
Author: Anthony Stanton <anthony.stanton@gmail.com>
Inspired by the S3 and Nova modules

depends
    • swiftclient Python module

configuration This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion's config file. For example:

  keyston..user: admin
  keyston..tenant: admin
  keyston..auth_url: 'http://127.0.0.1:5000/v2.0/
  keyston..password: verybadpass
    # or
  keyston..auth_key: 203802934809284k2j34lkj2l3kj43k

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

  openstack1:
    keyston..user: admin
    keyston..tenant: admin
    keyston..auth_url: 'http://127.0.0.1:5000/v2.0/
    keyston..password: verybadpass
    # or
    keyston..auth_key: 203802934809284k2j34lkj2l3kj43k

  openstack2:
    keyston..user: admin
    keyston..tenant: admin

(continues on next page)
With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

```
salt.modules.swift.delete(cont, path=None, profile=None)
Delete a container, or delete an object from a container.

CLI Example to delete a container:
```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:
```
salt myminion swift.delete mycontainer remotepath
```

```
salt.modules.swift.get(cont=None, path=None, local_file=None, return_bin=False, profile=None)
List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:
```
salt myminion swift.get
```

CLI Example to list the contents of a container:
```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:
```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:
```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

```
salt.modules.swift.head()
```

```
salt.modules.swift.put(cont, path=None, local_file=None, profile=None)
Create a new container, or upload an object to a container.

CLI Example to create a container:
```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:
```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```
25.7.444 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

salt.modules.sysbench.cpu()
Tests for the CPU performance of minions.

 CLI Examples:

```bash
salt '*' sysbench.cpu
```

salt.modules.sysbench.fileio()
This tests for the file read and write operations. Various modes of operations are
• sequential write
• sequential rewrite
• sequential read
• random read
• random write
• random read and write

The test works with 32 files with each file being 1Gb in size. The test consumes a lot of time. Be patient!

 CLI Examples:

```bash
salt '*' sysbench.fileio
```

salt.modules.sysbench.memory()
This tests the memory for read and write operations.

 CLI Examples:

```bash
salt '*' sysbench.memory
```

salt.modules.sysbench.mutex()
Tests the implementation of mutex

 CLI Examples:

```bash
salt '*' sysbench.mutex
```

salt.modules.sysbench.ping()

salt.modules.sysbench.threads()
This tests the performance of the processor's scheduler

 CLI Example:

```bash
salt '*' sysbench.threads
```
25.7.445 salt.modules.sysfs

Module for interfacing with SysFS

See also:
https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

salt.modules.sysfs.attr(key, value=None)
Access/write a SysFS attribute. If the attribute is a symlink, its destination is returned

Returns value or bool

CLI Example:
```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

salt.modules.sysfs.interfaces(root)
Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI Example:
```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:
```
{
  "r": [
    "state",
    "partial_stripes_expensive",
    "writeback_rate_debug",
    "stripe_size",
    "dirty_data",
    "stats_total/cache_hits",
    "stats_total/cache_bypass_misses",
    "stats_total/bypassed",
    "stats_total/cache_readaheads",
    "stats_total/cache_hit_ratio",
    "stats_total/cache_miss_collisions",
    "stats_total/cache_misses",
    "stats_total/cache_bypass_hits",
  ],
  "rw": [
    "writeback_rate",
    "writeback_rate_update_seconds",
    "cache_mode",
    "writeback_delay",
    "label",
    "writeback_running",
    "writeback_metadata",
    "running",
    "writeback_rate_p_term_inverse",
    "sequential_cutoff",
    "writeback_percent",
    "writeback_rate_d_term",
    "readahead"
  ],
  "w": [
    "stop",
  ]
}
```
(continues on next page)

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

```python
class salt.modules.syslog_ng.Argument(value='')
    A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.
    Does not need examples.

    build()

class salt.modules.syslog_ng.Buildable(iterable, join_body_on='', append_extra_newline=True)
    Base class of most classes, which have a build method.
    It contains a common build function.
    Does not need examples.

    build()
        Builds the textual representation of the whole configuration object with its children.

    build_body()
        Builds the body of a syslog-ng configuration object.

    build_header()
        Builds the header of a syslog-ng configuration object.

    build_tail()
        Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.GivenStatement(value, add_newline=True)
    This statement returns a string without modification. It can be used to use existing configuration snippets.
    Does not need examples.

    build()
        Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.NamedStatement(type='', id='', options=None)
    It represents a configuration statement, which has a name, e.g. a source.
    Does not need examples.

class salt.modules.syslog_ng.Option(type='', params=None)
    A Statement class contains Option instances.
    An instance of Option can represent a file(), tcp(), udp(), etc. option.
    Does not need examples.

    add_parameter(param)

    build()
        Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ng.Parameter(iterable=None, join_body_on='')
    An Option has one or more Parameter instances.
    Does not need examples.

class salt.modules.syslog_ng.ParameterValue(iterable=None, join_body_on='')
    A TypedParameter can have one or more values.
```
Does not need examples.

```python
class salt.modules.syslog_ng.SimpleParameter(value='')
A Parameter is a SimpleParameter, if it's just a simple type, like a string.
For example:

destination d_file {
    file(
        '/var/log/messages'
    );
}

'/var/log/messages' is a SimpleParameter.
Does not need examples.

build()
    Builds the textual representation of the whole configuration object with its children.
```

```python
class salt.modules.syslog_ng.SimpleParameterValue(value='')
A ParameterValue which holds a simple type, like a string or a number.
For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.
Does not need examples.

build()
    Builds the textual representation of the whole configuration object with its children.
```

```python
class salt.modules.syslog_ng.Statement(type='', id='', options=None, has_name=True)
It represents a syslog-ng configuration statement, e.g. source, destination, filter.
Does not need examples.

add_child(option)
build_header()
    Builds the header of a syslog-ng configuration object.
build_tail()
    Builds the tail of a syslog-ng configuration object.
```

```python
exception salt.modules.syslog_ng.SyslogNgError
```

```python
class salt.modules.syslog_ng.TypedParameter(type='', values=None)
A Parameter, which has a type:

destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
}

ip(127.0.0.1) is a TypedParameter.
Does not need examples.

add_value(value)
build()
    Builds the textual representation of the whole configuration object with its children.
```
class salt.modules.syslog_ng.TypedParameterValue(type='', arguments=None)

We have to go deeper...

A TypedParameter can have a ‘parameter’, which also have a type. For example key_file and cert_file:

```yaml
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
}
```

Does not need examples.

add_argument(arg)

build()

Builds the textual representation of the whole configuration object with its children.

class salt.modules.syslog_ngUnnamedStatement(type, options=None)

It represents a configuration statement, which doesn’t have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog_ng.config(name, config, write=True)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{'tcp': [{'ip': '127.0.0.1'}, {'port': 1233}]}]
```

salt.modules.syslog_ng.config_test(syslog_ng_sbin_dir=None, cfgfile=None)

Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/ →syslog-ng.conf
```

salt.modules.syslog_ng.get_config_file()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

salt.modules.syslog_ng.modules(syslog_ng_sbin_dir=None)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:
salt 'syslog_ng.modules'
salt 'syslog_ng.modules /home/user/install/syslog-ng/sbin'

salt.modules.syslog_ng.reload_(name)
Reloads syslog-ng. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:
salt 'syslog_ng.reload'

salt.modules.syslog_ng.set_binary_path(name)
Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:
salt 'syslog_ng.set_binary_path name=/usr/sbin'

salt.modules.syslog_ng.set_config_file(name)
Sets the configuration’s name. This function is intended to be used from states.

CLI Example:
salt 'syslog_ng.set_config_file name=/etc/syslog-ng'

salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)
Sets variables.

CLI Example:
salt 'syslog_ng.set_parameters version='3.6''
salt 'syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf'

salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None)
Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:
salt 'syslog_ng.start'

salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)
Returns statistics from the running syslog-ng instance. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:
salt 'syslog_ng.stats'
salt 'syslog_ng.stats /home/user/install/syslog-ng/sbin'

25.7. execution modules
**salt.modules.syslog_ng**

**stop(name=None)**

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

**version(syslog_ng_sbin_dir=None)**

Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

**write_config(config, newlines=2)**

Writes the given parameter config into the config file. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

**write_version(name)**

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name='3.6'
```

### 25.7.447 salt.modules.sysmod

The sys module provides information about the available functions on the minion

**argspec(module=”)**

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

**doc(**args)**

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.
The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

```
salt.modules.sysmod.list_functions(*args, **kwargs)
List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

New in version 0.12.0.

```
salt '*' sys.list_functions 'module.specific_function'
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

```
salt.modules.sysmod.list_modules(*args)
List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

```
salt.modules.sysmod.list_renderers(*args)
List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.
salt 'sys.list_returners 'yaml''

salt.modules.sysmod.list_returner_functions(*args, **kwargs)
List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

salt.modules.sysmod.list_returners(*args)
List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

salt.modules.sysmod.list_runner_functions(*args, **kwargs)
List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

salt.modules.sysmod.list_runners(*args)
List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```
Runner names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_runners 'm*' 
```

```python
salt.modules.sysmod.list_state_functions('args', **kwargs)
```

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```python
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version 2016.9.0.

```python
salt '*' sys.list_state_functions 'module.specific_function'
```

```python
salt.modules.sysmod.list_state_modules('args')
```

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```python
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```python
salt '*' sys.list_state_modules 'mysql_*'
```

```python
salt.modules.sysmod.reload_modules()
```

Tell the minion to reload the execution modules

CLI Example:

```python
salt '*' sys.reload_modules
```

```python
salt.modules.sysmod.renderer_doc('args')
```

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:
Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.renderer_doc` *(module='')*

Return the argument specification of functions in Salt renderer modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc xmpp
salt '*' sys.renderer_doc xmpp smtp
salt '*' sys.renderer_doc
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

`salt.modules.sysmod.returner_argspec` *(module='')*

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

`salt.modules.sysmod.returner_doc` *(args)*

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returner_doc 'sqlite3.get_*'
```

`salt.modules.sysmod.runner_argspec` *(module='')*

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```
salt.modules.sysmod.runner_doc(*args)

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

salt.modules.sysmod.state_argspec(module="")

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

salt.modules.sysmod.state_doc(*args)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

salt.modules.sysmod.state_schema(module="")

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

25.7. execution modules
CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

### 25.7.448 salt.modules.sysrc

sysrc module for FreeBSD

**salt.modules.sysrc.get(**kwargs**)

Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

**salt.modules.sysrc.remove**(name, **kwargs**)

Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

**salt.modules.sysrc.set**(name, value, **kwargs**)

Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

### 25.7.449 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

**Note:** If you have configured a wrapper such as molly-guard to intercept interactive shutdown commands, be aware that calling system.halt, system.poweroff, system.reboot, and system.shutdown with salt-call will hang indefinitely while the wrapper script waits for user input. Calling them with salt will work as expected.

**salt.modules.system.get_computer_desc()**

Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

- **Returns** Value of PRETTY_HOSTNAME if this does not exist False.
- **Return type** str

CLI Example:

```
salt '*' system.get_computer_desc
```

**salt.modules.system.get_computer_name()**

Get hostname.

CLI Example:
salt 'HOSTS' network.get_hostname

salt.modules.system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

Returns True if the a reboot request was witnessed, False otherwise

Return type bool

CLI Example:
salt 'HOSTS' system.get_reboot_required_witnessed

salt.modules.system.get_system_date(utc_offset=None)
Get the system date

Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system date.

Return type str

CLI Example:
salt 'HOSTS' system.get_system_date

salt.modules.system.get_system_date_time(utc_offset=None)
Get the system date/time.

Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in YYYY-MM-DD hh:mm:ss format.

Return type str

CLI Example:
salt 'HOSTS' system.get_system_date_time "-0500"

salt.modules.system.get_system_time(utc_offset=None)
Get the system time.

Parameters utc_offset (str) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type str

CLI Example:
salt 'HOSTS' system.get_system_time

salt.modules.system.halt()
Halt a running system

CLI Example:
salt 'HOSTS' system.halt

salt.modules.system.has_settable_hwclock()
Returns True if the system has a hardware clock capable of being set from software.
CLI Example:

```
salt '*' system.has_settable_hwclock
```

salt.modules.system.init(runlevel)
Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

salt.modules.system.poweroff()
Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

salt.modules.system.reboot(at_time=None)
Reboot the system

```
salt '*' system.reboot
```

salt.modules.system.set_computer_desc(desc)
Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

Parameters desc (str) -- The computer description

Returns False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

salt.modules.system.set_computer_name(hostname)
Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

salt.modules.system.set_reboot_required_witnessed()
This function is used to remember that an event indicating that a reboot is required was witnessed. This function writes to a temporary filesystem so the event gets cleared upon reboot.

Returns True if successful, otherwise False

Return type bool

```
salt '*' system.set_reboot_required_witnessed
```

salt.modules.system.set_system_date(newdate, utc_offset=None)
Set the system date. Use <mm-dd-yy> format for the date.

Parameters newdate (str) -- The date to set. Can be any of the following formats:
- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-Y
- MM/DD/YYYY
- MM/DD/Y

```
salt '*' system.set_system_date
```
CLI Example:
```
salt '*' system.set_system_date '03-28-13'
```

```
salt.modules.system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None)
```

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Updates hardware clock, if present, in addition to software (kernel) clock.

**Parameters**

- `years (int)` -- Years digit, ie: 2015
- `months (int)` -- Months digit: 1 - 12
- `days (int)` -- Days digit: 1 - 31
- `hours (int)` -- Hours digit: 0 - 23
- `minutes (int)` -- Minutes digit: 0 - 59
- `seconds (int)` -- Seconds digit: 0 - 59
- `utc_offset (str)` -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns**

True if successful. Otherwise False.

**Return type** bool

CLI Example:
```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 '-0500'
```

```
salt.modules.system.set_system_time(newtime, utc_offset=None)
```

Set the system time.

**Parameters**

- `newtime (str)` -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

- `utc_offset (str)` -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "'0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

**Returns**

Returns True if successful. Otherwise False.

**Return type** bool

CLI Example:
```
salt '*' system.set_system_time '**11:20**'
```

```
salt.modules.system.shutdown(at_time=None)
```

Shutdown a running system

**at_time** The wait time in minutes before the system will be shutdown.

CLI Example:
```
salt '*' system.shutdown 5
```
25.7.450 salt.modules.system_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

salt.modules.system_profiler.applications()

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

salt.modules.system_profiler.receipts()

Return the results of a call to `system_profiler -xml -detail full SPIInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

25.7.451 salt.modules.systemd_service

Provides the service module for systemd

New in version 0.10.0.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `service.start is not available`), see [here](https://docs.saltstack.com/en/latest/).

Important: This is an implementation of virtual 'service' module. As such, you must call it under the name 'service' and NOT 'systemd'. You can see that also in the examples below.

salt.modules.systemd_service.available(name)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd_service.disable(name, no_block=False, root=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, `systemd-run()` is now used to isolate commands run by this function from the salt-minion daemon's control group. This is
done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Disable the named service to not start when the system boots

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

root Enable/disable/mask unit files in the specified root directory

CLI Example:

<table>
<thead>
<tr>
<th>Salt</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' service.disable &lt;service name&gt;</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.systemd_service.disabled(name, root=None)
Return if the named service is disabled from starting on boot

root Enable/disable/mask unit files in the specified root directory

CLI Example:

<table>
<thead>
<tr>
<th>Salt</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' service.disabled &lt;service name&gt;</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.systemd_service.enable(name, no_block=False, unmask=False, unmask_runtime=False, root=None, **kwargs)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Enable the named service to start when the system boots

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

root Enable/disable/mask unit files in the specified root directory

CLI Example:

<table>
<thead>
<tr>
<th>Salt</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' service.enable &lt;service name&gt;</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.systemd_service.enabled(name, root=None, **kwargs)
Return if the named service is enabled to start on boot

root Enable/disable/mask unit files in the specified root directory

CLI Example:

<table>
<thead>
<tr>
<th>Salt</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' service.enabled &lt;service name&gt;</td>
<td></td>
</tr>
</tbody>
</table>

salt.modules.systemd_service.execs(root=None)
New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

root Enable/disable/mask unit files in the specified root directory

CLI Example:
salt service.execs

salt.modules.systemd_service.firstboot(locale=None, locale_message=None, keymap=None, timezone=None, hostname=None, machine_id=None, root=None)
New in version 3001.
Call systemd-firstboot to configure basic settings of the system
locale Set primary locale (LANG=)
locale_message Set message locale (LC_MESSAGES=)
keymap Set keymap
timezone Set timezone
hostname Set host name
machine_id Set machine ID
root Operate on an alternative filesystem root
CLI Example:
salt '*' service.firstboot keymap=ja locale=ja_JP.UTF-8

salt.modules.systemd_service.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)
Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run() can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).
New in version 0.12.0.
Force-reload the specified service with systemd
no_block [False] Set to True to start the service using --no-block.
New in version 2017.7.0.
unmask [False] Set to True to remove an indefinite mask before attempting to force-reload the service.
New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.
unmask_runtime [False] Set to True to remove a runtime mask before attempting to force-reload the service.
New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.
CLI Example:
salt '*' service.force_reload <service name>

salt.modules.systemd_service.get_all(root=None)
Return a list of all available services
root Enable/disable/mask unit files in the specified root directory
CLI Example:
salt '*' service.get_all

salt.modules.systemd_service.get_disabled(root=None)
Return a list of all disabled services
root Enable/disable/mask unit files in the specified root directory
CLI Example:
salt '.*' service.get_disabled

```
salt.modules.systemd_service.get_enabled(root=None)
```

Return a list of all enabled services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '.*' service.get_enabled
```

salt.modules.systemd_service.get_running()

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '.*' service.get_running
```

salt.modules.systemd_service.get_static(root=None)

New in version 2015.8.5.

Return a list of all static services

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '.*' service.get_static
```

salt.modules.systemd_service.mask(name, runtime=False, root=None)

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Mask the specified service with systemd

**runtime** [False] Set to True to mask this service only until the next reboot

New in version 2015.8.5.

**root** Enable/disable/mask unit files in the specified root directory

CLI Example:

```
salt '.*' service.mask foo
salt '.*' service.mask foo runtime=True
```

salt.modules.systemd_service.masked(name, runtime=False, root=None)

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the systemctl is-enabled command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then False will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new runtime argument is set. If runtime is False, this function will return True if an indefinite mask is set for the named service (otherwise False will be returned). If runtime is False, this function will return True if a runtime mask is set, otherwise False.

Check whether or not a service is masked

25.7. execution modules 2815
runtime  [False] Set to True to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of systemctl is-enabled when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to True. Otherwise, it will check for an indefinite mask.

root  Enable/disable/mask unit files in the specified root directory

CLI Examples:

salt '*' service.masked foo
salt '*' service.masked foo runtime=True

salt.modules.systemd_service.missing(name)

New in version 2014.1.0.

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

salt '*' service.missing sshd

salt.modules.systemd_service.offline()

New in version 3004.

Check if systemd is working in offline mode, where is not possible to talk with PID 1.

CLI Example:

salt '*' service.offline

salt.modules.systemd_service.reload_(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Reload the specified service with systemd

no_block  [False] Set to True to reload the service using --no-block.

New in version 2017.7.0.

unmask  [False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime  [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

salt '*' service.reload <service name>

salt.modules.systemd_service.restart(name, no_block=False, unmask=False, unmask_runtime=False)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is...
done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Restart the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

   New in version 2017.7.0.
unmask [False] Set to True to remove an indefinite mask before attempting to restart the service.

   New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.
unmask_runtime [False] Set to True to remove a runtime mask before attempting to restart the service.

   New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

    salt '*' service.restart <service name>

salt.modules.systemd_service.show(name, root=None)

   New in version 2014.7.0.

   Show properties of one or more units/jobs or the manager
root  Enable/disable/mask unit files in the specified root directory

CLI Example:

    salt '*' service.show <service name>

salt.modules.systemd_service.start(name, no_block=False, unmask=False, unmask_runtime=False)

   Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon’s control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Start the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

   New in version 2017.7.0.
unmask [False] Set to True to remove an indefinite mask before attempting to start the service.

   New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.
unmask_runtime [False] Set to True to remove a runtime mask before attempting to start the service.

   New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

    salt '*' service.start <service name>

salt.modules.systemd_service.status(name, sig=None)

   Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

   Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

   - name (str) -- The name of the service to check
• sig(str) -- Not implemented

Returns True if running, False otherwise.

dict: Maps service name to True if running, False otherwise.

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.systemd_service.stop(name, no_block=False)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Stop the specified service with systemd.

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

salt.modules.systemd_service.systemctl_reload()

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

salt.modules.systemd_service.unmask_(name, runtime=False, root=None)

New in version 2015.5.0.

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Unmask the specified service with systemd.

runtime [False] Set to True to unmask this service only until the next reboot.

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running systemctl is-enabled on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to True, and otherwise removes an indefinite mask.

root Enable/disable/mask unit files in the specified root directory.

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```
25.7.452 salt.modules.telegram

Module for sending messages via Telegram.

configuration In order to send a message via the Telegram, certain configuration is required in 
/etc/salt/minion on the relevant minions or in the pillar. Some sample configs might look like:

```plaintext
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxx'
```

salt.modules.telegram.post_message(message, chat_id=None, token=None)

Send a message to a Telegram chat.

Parameters
- **message** -- The message to send to the Telegram chat.
- **chat_id** -- (optional) The Telegram chat id.
- **token** -- (optional) The Telegram API token.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

25.7.453 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

configuration This module accepts explicit telemetry credentials or can also read api key credentials

In the minion's config file:

```plaintext
telemetry.telemetry_api_keys:
  - abc123  # Key 1
  - efg321  # Backup Key 1

# https://telemetry-api.mongolab.com/v0
```

depends requests

salt.modules.telemetry.create_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

salt.modules.telemetry.delete_alarms(deployment_id, alert_id=None, metric_name=None, api_key=None, profile='telemetry')

delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alarms(deployment_id, profile='telemetry')
get all the alarms set up against the current deployment
Returns dictionary of alarm information
CLI Example:
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.get_alert_config(deployment_id, metric_name=None, api_key=None, profile='telemetry')
Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config
Returns dictionary or list of dictionaries.
CLI Example:
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections

salt.modules.telemetry.get_notification_channel_id(notify_channel, profile='telemetry')
Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.
notify_channel Email escalation policy
profile A dict of telemetry config information.
CLI Example:
salt myminion telemetry.get_notification_channel_id userx@company.com

salt.modules.telemetry.update_alarm(deployment_id, metric_name, data, api_key=None, profile='telemetry')
update an telemetry alarms. data is a dict of alert configuration data.
Returns (bool success, str message) tuple.
CLI Example:
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry

25.7.454 salt.modules.temp

Simple module for creating temporary directories and files
This is a thin wrapper around Pythons tempfile module
New in version 2015.8.0.
salt.modules.temp.dir(suffix='', prefix='tmp', parent=None)
Create a temporary directory
CLI Example:
salt.modules.temp.file(suffix='', prefix='tmp', parent=None)

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/
```

25.7.455 salt.modules.test

Module for running arbitrary tests

salt.modules.test.arg(*args, **kwargs)

Print out the data passed into the function *args and **kwargs, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns {'args': args, 'kwargs': kwargs}

Return type dict

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_clean(*args, **kwargs)

Like test.arg but cleans **kwargs of the __pub* items

CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_repr(*args, **kwargs)

Print out the data passed into the function *args and **kwargs, this is used to both test the publication data and CLI argument passing, but also to display the information available within the publication data.

Returns {'args': repr(args), 'kwargs': repr(**kwargs)}

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.arg_type(*args, **kwargs)

Print out the types of the *args and **kwargs. This is used to test the types of the args and kwargs passed down to the Minion

Return type dict

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

salt.modules.test.assertion(assertion)

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

salt.modules.test.attr_call()

Call grains.items via the attribute
salt.modules.test\_collatz\(start\)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

salt.modules.test\_conf\_test()

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf\_test
```

salt.modules.test\_cross\_test\(func, args=None\)

Execute a minion function via the \_\_salt\_\_ object in the test module, used to verify that the Minion functions can be called via the \_\_salt\_\_ module.

CLI Example:

```
salt '*' test.cross\_test file.gid\_to\_group 0
```

salt.modules.test\_deprecation\_warning()

Return True, but also produce two DeprecationWarnings. One by date, the other by the codename - release Oganesson, which should correspond to Salt 3108.

CLI Example:

```
salt '*' test.deprecation\_warning
```

salt.modules.test\_echo\(text\)

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

salt.modules.test\_exception\(message='Test Exception'\)

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

salt.modules.test\_false\_()

Always return False

CLI Example:

```
salt '*' test.false
```

salt.modules.test\_fib\(num\)

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.
This function is designed to have terrible performance.

CLI Example:
```
salt '*' test.fib 3
```

salt.modules.test.get_opts()
Return the configuration options passed to this minion

CLI Example:
```
salt '*' test.get_opts
```

salt.modules.test.kwarg(**kwargs)
Print out the data passed into the function **kwargs, this is used to both test the publication data and CLI kwarg passing, but also to display the information available within the publication data.

CLI Example:
```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'}
```

salt.modules.test.missing_func()

salt.modules.test.module_report()
Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:
```
salt '*' test.module_report
```

salt.modules.test.not_loaded()
List the modules that were not loaded by the salt loader system

CLI Example:
```
salt '*' test.not_loaded
```

salt.modules.test.opts_pkg()
Return an opts package with the grains and opts for this Minion. This is primarily used to create the options used for Master side state compiling routines

CLI Example:
```
salt '*' test.opts_pkg
```

salt.modules.test.outputter(data)
Test the outputter, pass in data to return

CLI Example:
```
salt '*' test.outputter foobar
```

salt.modules.test.ping()
Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:
salt '!' test.ping

salt.modules.test.provider(module)
Pass in a function name to discover what provider is being used

CLI Example:

salt '!' test.provider service

salt.modules.test.providers()
Return a dict of the provider names and the files that provided them

CLI Example:

salt '!' test.providers

salt.modules.test.raise_exception(name, *args, **kwargs)
Raise an exception. Built-in exceptions and those in salt.exceptions can be raised by this test function. If no matching exception is found, then no exception will be raised and this function will return False.

This function is designed to test Salt's exception and return code handling.

CLI Example:

salt '!' test.raise_exception TypeError "An integer is required"
salt '!' test.raise_exception salt.exceptions.CommandExecutionError "Something went wrong"

salt.modules.test.rand_sleep(max=60)
Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

salt '!' test.rand_sleep 60

salt.modules.test.rand_str(size=9999999999, hash_type=None)
This function has been renamed to test.random_hash. This function will stay to ensure backwards compatibility, but please switch to using the preferred name test.random_hash.

salt.modules.test.random_hash(size=9999999999, hash_type=None)
New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from test.rand_str to test.random_hash

Generates a random number between 1 and size, then returns a hash of that number. If no hash_type is passed, the hash_type specified by the Minion's hash_type config option is used.

CLI Example:

salt '!' test.random_hash
salt '!' test.random_hash hash_type=sha512

salt.modules.test.recode(code=42)
Test that the returncode system is functioning correctly

CLI Example:

salt '!' test.recode 42
salt.modules.test.sleep(length)
Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:
```
salt '*' test.sleep 20
```

salt.modules.test.stack()
Return the current stack trace

CLI Example:
```
salt '*' test.stack
```

salt.modules.test.true_()
Always return True

CLI Example:
```
salt '*' test.true
```

salt.modules.test.try_(module, return_try_exception=False, **kwargs)
Try to run a module command. On an exception return None. If return_try_exception is set to True, return the exception. This can be helpful in templates where running a module might fail as expected.

Jinja Example:
```
{% for i in range(0,230) %}
  {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.{{i}})'yaml(False)}
{% endfor %}
```

salt.modules.test.tty(*args, **kwargs)
Deprecated! Moved to cmd.tty

CLI Example:
```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.version()
Return the version of salt on the minion

CLI Example:
```
salt '*' test.version
```

salt.modules.test.versions()
This function is an alias of versions_report.
Returns versions of components used by salt

CLI Example:
```
salt '*' test.versions_report
```

salt.modules.test.versions_information()
Report the versions of dependent and system software

CLI Example:
salt 'salt' test.versions_information

salt.modules.test.versions_report()
Returns versions of components used by salt
CLI Example:
salt 'salt' test.versions_report

25.7.456 salt.modules.test_virtual
Module for testing that a __virtual__ function returning False will not be available via the Salt Loader.
salt.modules.test_virtual.ping()

25.7.457 salt.modules.testinframod
This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the __all__ variable exposed by the testinfra.modules namespace.

exception salt.modules.testinframod.InvalidArgumentError

salt.modules.testinframod.camel_to_snake_case(camel_input)
Converts camelCase (or CamelCase) to snake_case. From https://codereview.stackexchange.com/questions/185966/functions-to-convert-camelcase-strings-to-snake-case
Parameters camel_input(str) -- The camelcase or CamelCase string to convert to snake_case
:returns str

salt.modules.testinframod.snake_to_camel_case(snake_input, uppcercamel=False)
Converts snake_case to camelCase (or CamelCase if uppcercamel is True). Inspired by https://codereview.stackexchange.com/questions/85311/transform-snake-case-to-camelcase

Parameters

• snake_input(str) -- The input snake_case string to convert to camelCase
• uppcercamel(bool) -- Whether or not to convert to CamelCase instead
:returns str

25.7.458 salt.modules.textfsm_mod

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

depends

• textfsm Python library

Note: Install textfsm library: pip install textfsm.
salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

**template_path** The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:
- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**raw_text** The unstructured text to be parsed.

**raw_text_file** The text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the template_path argument.

**saltenv** Salt fileserver environment from which to retrieve the file. Ignored if template_path is not a `salt://` URL.

CLI Example:

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_text='Hostname: router.abc ... snip ...'
```

Jinja template example:

```jinja
{% set raw_text = 'Hostname: router.abc ... snip ...' %}
{% set textfsm_extract = salt.textfsm.extract('https://some-server/textfsm/juniper_version_template', raw_text) %}
```

Raw text example:

```
Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]
```

TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.*)
Value Base (.*)
Value Kernel (.*)
Value Crypto (.*)
Value Documentation (.*)
Value Routing (.*)

Start
# Support multiple chassis systems.
\$\S+$$ -> Continue.Record
^\$(Chassis):$$
```

(continues on next page)
Output example:

```json
{
    "comment": "",
    "result": true,
    "out": [
        {
            "kernel": "9.1S3.5",
            "documentation": "9.1S3.5",
            "boot": "9.1S3.5",
            "crypto": "9.1S3.5",
            "chassis": "",
            "routing": "9.1S3.5",
            "base": "9.1S3.5",
            "model": "mx960"
        }
    ]
}
```

`salt.modules.textfsm_mod.index(command, platform=None, platform_grain_name=None, platform_column_name=None, output=None, output_file=None, textfsm_path=None, index_file=None, saltenv='base', include_empty=False, include_pat=None, exclude_pat=None)`

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

- **command** The command executed on the device, to get the output.
- **platform** The platform name, as defined in the TextFSM index file.

**Note:** For ease of use, it is recommended to define the TextFSM index file with values that can be matched using the grains.

- **platform_grain_name** The name of the grain used to identify the platform name in the TextFSM index file.

  **Note:** This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

  **Note:** This option is ignored when `platform` is specified.

- **platform_column_name**: Platform The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: Platform.
output  The raw output from the device, to be parsed and extract the structured data.

output_file  The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

textfsm_path  The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

index_file: index  The name of the TextFSM index file, under the textfsm_path. Default: index.

saltenv: base  Salt fileserver environment from which to retrieve the file. Ignored if textfsm_path is not a salt:// URL.

include_empty: False  Include empty files under the textfsm_path.

include_pat  Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

exclude_pat  Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/
  →juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
  →example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
  →example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor
  →platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```
The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usage inside a Jinja template:

```
{% set command = 'sh ver' %}
{% set output = salt.net.cli(command) %}
{% set textfsm_extract = salt.textfsm.index(command, output=output) %}
```

---

**25.7.459 salt.modules.timezone**

Module for managing timezone on POSIX-like systems.

`salt.modules.timezone.get_hwclock()`  
Get current hardware clock setting (UTC or localtime)  

CLI Example:  
```
salt '*' timezone.get_hwclock
```

`salt.modules.timezone.get_offset()`  
Get current numeric timezone offset from UTC (i.e. -0700)  

CLI Example:  
```
salt '*' timezone.get_offset
```

`salt.modules.timezone.get_zone()`  
Get current timezone (i.e. America/Denver)  

Changed in version 2016.11.4.  

**Note:** On AIX operating systems, Posix values can also be returned ‘CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00’

CLI Example:  
```
salt '*' timezone.get_zone
```

`salt.modules.timezone.get_zonecode()`  
Get current timezone (i.e. PST, MDT, etc)  

CLI Example:
salt '*' timezone.get_zonecode

salt.modules.timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

CLI Example:
salt '*' timezone.set_hwclock UTC

salt.modules.timezone.set_zone(timezone)
Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:
salt '*' timezone.set_zone 'America/Denver'

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

salt.modules.timezone.zone_compare(timezone)
Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-like operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:
25.7.460 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

**depends** PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

**configuration** Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \
days=5 \
CN='My Little CA' \
C=US \
ST=Utah \
L=Salt Lake City \
O=Saltstack \
emailAddress=pleasedontemail@example.com
```

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"

Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

```
# salt-call tls.create_csr my_little CN=www.example.com
```

Created Private Key: "/etc/pki/my_little/certs/www.example.com.key"

Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

```
# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
```

Created Certificate for "www.example.com": "/etc/pki/my_little/certs/www.example.com.crt"

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
```

Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key"

Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr"

```
# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
```

Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
cert_type=client
```

Created Private Key: "/etc/pki/my_little/certs//MasterDBReplica_No.2.key"

Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr"

```
# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
```

Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.crt"

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
```

(continues on next page)
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr"

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
  cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/MasterDBReplica_No.2_server.crt"

CLI Example #4: Create a server req + cert with non-CN filename for the cert

# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
  cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key"
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_\n  server.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.anothersometh.ing \
  cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_\n  completely_different.crt

salt.modules.tls.ca_exists (ca_name, cacert_path=None, ca_filename=None)

Verify whether a Certificate Authority (CA) already exists
ca_name name of the CA
cacert_path absolute path to ca certificates root directory
ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

salt '*' tls.ca_exists test_ca /etc/certs

salt.modules.tls.cert_base_path (cacert_path=None)

Return the base path for certs from CLI or from options
cacert_path absolute path to ca certificates root directory

CLI Example:

salt '*' tls.cert_base_path

salt.modules.tls.cert_info (cert, digest='sha256')

Return information for a particular certificate
cert path to the certificate PEM file or string

digest what digest to use for fingerprinting

Changed in version 2018.3.4.
CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

salt.modules.tls.create_ca(ca_name, bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, fix_mode=False, cacert_path=None, ca_filename=None, digest='sha256', on lyif=None, unless=None, replace=False)

Create a Certificate Authority (CA)

ca_name name of the CA
bits number of RSA key bits, default is 2048
days number of days the CA will be valid, default is 365
CN common name in the request, default is "localhost"
C country, default is "US"
ST state, default is "Utah"
L locality, default is "Centerville", the city where SaltStack originated
O organization, default is "SaltStack"
OU organizational unit, default is None
eemailAddress email address for the CA owner, default is None
cacert_path absolute path to ca certificates root directory
c_filename alternative filename for the CA

New in version 2015.5.3.
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'
replace Replace this certificate even if it exists

New in version 2015.5.1.
Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, digest='sha256', cert_type=None, type_ext=False, replace=False)

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN must match an existing CSR generated by create_csr. If it does not, this method does nothing.

ca_name name of the CA
CN common name matching the certificate signing request
days number of days certificate is valid, default is 365 (1 year)
**cacert_path** absolute path to ca certificates root directory

**ca_filename** alternative filename for the CA

New in version 2015.5.3.

**cert_path** full path to the certificates directory

**cert_filename** alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of *cert_type*, *type_ext* will be completely overridden.

New in version 2015.5.3.

**digest** The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by *EVP_get_digestbyname*, specifically). For example, "md5" or "sha1". Default: 'sha256'

**replace** Replace this certificate even if it exists

New in version 2015.5.1.

**cert_type** string. Either 'server' or 'client' (see create_csr() for details).

If create_csr(type_ext=True) this function must be called with the same cert_type so it can find the CSR file.

**Note:** create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

**type_ext** bool. If set True, use *cert_type* as an extension to the CN when formatting the filename.

*e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt*

This facilitates the context where both types are required for the same subject

If *cert_filename* is *not* *None*, setting *type_ext* has no effect

If the following values were set:

```python
can.cert_base_path='/etc/pki'
can_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, subjectAltName=None, cacert_path=None, ca_filename=None, csr_path=None, csr_filename=None, digest='sha256', type_ext=False, cert_type='server', replace=False)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

**ca_name** name of the CA

**bits** number of RSA key bits, default is 2048

**CN** common name in the request, default is "localhost"

**C** country, default is "US"

**ST** state, default is "Utah"

**L** locality, default is "Centerville", the city where SaltStack originated

**O** organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

**OU** organizational unit, default is None
emailAddress  email address for the request, default is None
subjectAltName  valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:
examples: ['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51', 'email:me@i.like.pie.com']

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to https://1.2.3.4 will fail from python’s requests library w/out the second entry in the above list

New in version 2015.8.0.
cert_type  Specify the general certificate type. Can be either server or client. Indicates the set of common extensions added to the CSR.

```
server: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'serverAuth',
    'keyUsage': 'digitalSignature, keyEncipherment'
}
client: {
    'basicConstraints': 'CA:FALSE',
    'extendedKeyUsage': 'clientAuth',
    'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```
type_ext  boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved
replace  Replace this signing request even if it exists

New in version 2015.5.1.
Writess out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path="/etc/pki"
ca_name="koji"
CN="test.egavas.org"
```

the resulting CSR, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

salt.modules.tls.create_empty_crl(ca_name, cacert_path=None, ca_filename=None, crl_file=None, digest='sha256')
Create an empty Certificate Revocation List.
New in version 2015.8.0.

ca_name  name of the CA

ca_cert_path  absolute path to ca certificates root directory

ca_filename  alternative filename for the CA

New in version 2015.5.3.

crl_file  full path to the CRL file
digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'  
crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.create_pkcs12(ca_name, CN, passphrase=None, cacert_path=None, replace=False)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

ca_name  name of the CA

CN  common name matching the certificate signing request

passphrase  used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path  absolute path to ca certificates root directory

replace  Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
cache_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/coji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost', C='US', ST='Utah', L='Salt Lake City', O='SaltStack', OU=None, emailAddress=None, cacert_path=None, cert_filename=None, digest='sha256', replace=False)

Create a Self-Signed Certificate (CERT)

tls_dir  location appended to the ca.cert_base_path, default is 'tls'

bits  number of RSA key bits, default is 2048

CN  common name in the request, default is "localhost"

C  country, default is "US"

ST  state, default is "Utah"

L  locality, default is "Centerville", the city where SaltStack originated

O  organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU  organizational unit, default is None

emailAddress  email address for the request, default is None

cacert_path  absolute path to ca certificates root directory

digest  The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace  Replace this certificate even if it exists

25.7. execution modules
New in version 2015.5.1.
Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```py
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location with appropriate permissions:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

```
salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)
```
Get the certificate path or content

- **ca_name** name of the CA
- **as_text** if true, return the certificate content instead of the path
- **cacert_path** absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

```
salt.modules.tls.get_ca_signed_cert(ca_name, CN='localhost', as_text=False, cacert_path=None, cert_filename=None)
```
Get the certificate path or content

- **ca_name** name of the CA
- **CN** common name of the certificate
- **as_text** if true, return the certificate content instead of the path
- **cacert_path** absolute path to certificates root directory
- **cert_filename** alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/etc/certs
```

```
salt.modules.tls.get_ca_signed_key(ca_name, CN='localhost', as_text=False, cacert_path=None, key_filename=None)
```
Get the certificate path or content

- **ca_name** name of the CA
- **CN** common name of the certificate
- **as_text** if true, return the certificate content instead of the path
- **cacert_path** absolute path to certificates root directory
- **key_filename** alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN
CLI Example:

```python
salt '*' tls.get_ca_signed_key test_ca CN=localhost
← as_text=False cacert_path=/etc/certs
```

salt.modules.tls.get_expiration_date(`cert, date_format=\"%Y-%m-%d\"\`)  
New in version 2019.2.0.  
Get a certificate’s expiration date  
cert Full path to the certificate  
date_format By default this will return the expiration date in YYYY-MM-DD format, use this to specify a different strftime format string. Note that the expiration time will be in UTC.  
CLI Examples:

```python
salt '*' tls.get_expiration_date /path/to/foo.crt
salt '*' tls.get_expiration_date /path/to/foo.crt date_format='\%d/\%m/\%Y'
```

salt.modules.tls.get_extensions(`cert_type`)  
Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.  
New in version 2015.8.0.  
cert_type: The type of certificate such as server or client.  
CLI Example:

```python
salt '*' tls.get_extensions client
```

salt.modules.tls.maybe_fix_ssl_version(`ca_name, cacert_path=None, ca_filename=None`)  
Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.  
ca_name ca authority name  
cacert_path absolute path to ca certificates root directory  
ca_filename alternative filename for the CA  
New in version 2015.5.3.  
CLI Example:

```python
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

salt.modules.tls.revoke_cert(`ca_name, CN, cacert_path=None, ca_filename=None, cert_path=None, cert_filename=None, crl_file=None, digest='sha256'\`)  
Revoke a certificate.  
New in version 2015.8.0.  
ca_name Name of the CA.  
CN Common name matching the certificate signing request.  
cacert_path Absolute path to ca certificates root directory.  
ca_filename Alternative filename for the CA.  
cert_path Path to the cert file.  
cert_filename Alternative filename for the certificate, useful when using special characters in the CN.  
crl_file Full path to the CRL file.  
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'  
CLI Example:
salt '('*' tls.revoke_cert ca_name='koji' ca_filename='ca' )
crl_file='/etc/openvpn/team1/crl.pem"

salt.modules.tls.set_ca_path(cacert_path)
 If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations

   CLI Example:
   salt '('*' tls.set_ca_path /etc/certs

salt.modules.tls.validate(cert, ca_name, crl_file)
 New in version 3000.
 Validate a certificate against a given CA/CRL.

   cert  path to the certificate PEM file or string
   ca_name  name of the CA
   crl_file  full path to the CRL file

25.7.461 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won’t work.

   configuration

   • Java bin path should be in default path
   • If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:0:1"
   • If you are using tomcat.tar.gz it has to be installed or symlinked under /opt, preferably using name tomcat
   • "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

<tomcat-manager:>
  user: <username>
  passwd: <password>
</tomcat-manager:

or the old format:

<tomcat-manager.user: <username>
tomcat-manager.passwd: <password>

Also configure a user in the conf/tomcat-users.xml file:

<?xml version='1.0' encoding='utf-8'?><tomcat-users>
  <role rolename="manager-script"/>
  <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>

Note:

if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access

Tested on:
- JVM Vendor: Sun Microsystems Inc.
- JVM Version: 1.6.0_43-b01
- OS Architecture: amd64
- OS Name: Linux
- OS Version: 2.6.32-358.el6.x86_64
- Tomcat Version: Apache Tomcat/7.0.37

salt.modules.tomcat.deploy_war(
    war, # absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function
    context, # the context path to deploy
    force='no', # set True to deploy the webapp even one is deployed in the context
    url='http://localhost:8080/manager', # the URL of the server manager webapp
    saltenv='base', # the environment for WAR file in used by salt.modules.cp.get_url function
    timeout=180, # timeout for HTTP request
    temp_war_location=None, # use another location to temporarily copy to war file by default the system's temp directory is used
    version=True # Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.
)

Examples:

salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6

CLI Examples:

<table>
<thead>
<tr>
<th>cp module</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' tomcat.deploy_war salt://application.war /api</td>
</tr>
<tr>
<td>salt '*' tomcat.deploy_war salt://application.war /api no</td>
</tr>
<tr>
<td>salt '*' tomcat.deploy_war salt://application.war /api yes <a href="http://localhost:8080/">http://localhost:8080/</a> → manager</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>minion local file system</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt '*' tomcat.deploy_war /tmp/application.war /api</td>
</tr>
<tr>
<td>salt '*' tomcat.deploy_war /tmp/application.war /api no</td>
</tr>
<tr>
<td>salt '*' tomcat.deploy_war /tmp/application.war /api yes <a href="http://localhost:8080/">http://localhost:8080/</a> → manager</td>
</tr>
</tbody>
</table>

salt.modules.tomcat.extract_war_version(war)

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:
salt.modules.tomcat.fullversion()
Return all server information from catalina.sh version
CLI Example:
```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)
Find memory leaks in tomcat
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```
salt '*' tomcat.leaks
```

salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)
list all the deployed webapps
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

salt.modules.tomcat.passwd(passwd, user='', alg='sha1', realm=None)
This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the
$CATALINA_BASE/conf/tomcat-users.xml format
CLI Examples:
```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

salt.modules.tomcat.reload_(app, url='http://localhost:8080/manager', timeout=180)
Reload the webapp
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.serverinfo(url='http://localhost:8080/manager', timeout=180)
return details about the server
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:
```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```
salt.modules.tomcat.sessions(app, url='http://localhost:8080/manager', timeout=180)
return the status of the webapp sessions
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager

salt.modules.tomcat.signal(signal=None)
Signals catalina to start, stop, securestart, forcestop.

CLI Example:
salt '*' tomcat.signal start

salt.modules.tomcat.start(app, url='http://localhost:8080/manager', timeout=180)
Start the webapp
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout timeout for HTTP request

CLI Examples:
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager

salt.modules.tomcat.status(url='http://localhost:8080/manager', timeout=180)
Used to test if the tomcat manager is up
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager

salt.modules.tomcat.status_webapp(app, url='http://localhost:8080/manager', timeout=180)
return the status of the webapp (stopped | running | missing)
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager

salt.modules.tomcat.stop(app, url='http://localhost:8080/manager', timeout=180)
Stop the webapp
  app  the webapp context path
  url [http://localhost:8080/manager] the URL of the server manager webapp
  timeout [180] timeout for HTTP request

CLI Examples:
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
salt.modules.tomcat.undeploy\(app, url='http://localhost:8080/manager', timeout=180\)
Undeploy a webapp
  \texttt{app}\ the webapp context path
  \texttt{url}\ the URL of the server manager webapp
  \texttt{timeout}\ [180] timeout for HTTP request

CLI Examples:

\begin{verbatim}
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
\end{verbatim}

salt.modules.tomcat.version()
Return server version from catalina.sh version

CLI Example:

\begin{verbatim}
salt '*' tomcat.version
\end{verbatim}

\section*{25.7.462 \texttt{salt.modules.trafficserver}}

Apache Traffic Server execution module.

New in version 2015.8.0.
traffic_ctl is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.alarms()
List all alarm events that have not been acknowledged (cleared).

\begin{verbatim}
salt '*' trafficserver.alarms
\end{verbatim}

salt.modules.trafficserver.bounce_cluster()

\begin{verbatim}
salt '*' trafficserver.bounce_cluster
\end{verbatim}

salt.modules.trafficserver.bounce_local\(drain=False\)
  \texttt{drain}\ This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

\begin{verbatim}
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
\end{verbatim}

salt.modules.trafficserver.clear_alarms\(alarm\)
Clear (acknowledge) an alarm event. The arguments are "all" for all current alarms, a specific alarm number (e.g. "1"), or an alarm string identifier (e.g. "MGMT_ALARM_PROXY_CONFIG_ERROR").

\begin{verbatim}
salt '*' trafficserver.clear_alarms [all | #event | name]
\end{verbatim}

salt.modules.trafficserver.clear_cluster()
Clears accumulated statistics on all nodes in the cluster.

\begin{verbatim}
salt '*' trafficserver.clear_cluster
\end{verbatim}
salt.modules.trafficserver.clear_node()
Cleared accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

salt.modules.trafficserver.match_config(regex)
Display the current values of all configuration variables whose names match the given regular expression.
New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

salt.modules.trafficserver.match_metric(regex)
Display the current values of all metrics whose names match the given regular expression.
New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

salt.modules.trafficserver.offline(path)
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```
salt '*' trafficserver.offline /path/to/cache
```

salt.modules.trafficserver.read_config(*args)
Read Traffic Server configuration variable definitions.
New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

salt.modules.trafficserver.read_metric(*args)
Read Traffic Server one or more metrics.
New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

salt.modules.trafficserver.refresh()
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```
salt '*' trafficserver.refresh
```

salt.modules.trafficserver.restart_cluster()
Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

salt.modules.trafficserver.restart_local(drain=False)
Restart the traffic_manager and traffic_server processes on the local node.
**drain** This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.

active_client_threshold configuration variable.

```python
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

**salt.modules.trafficserver.set_config**(variable, value)
Set the value of a Traffic Server configuration variable.

*variable* Name of a Traffic Server configuration variable.

*value* The new value to set.

New in version 2016.11.0.

```python
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

**salt.modules.trafficserver.shutdown()**
Shut down Traffic Server on the local node.

```python
salt '*' trafficserver.shutdown
```

**salt.modules.trafficserver.start()**
Start Traffic Server on the local node.

```python
salt '*' trafficserver.start
```

**salt.modules.trafficserver.status()**
Show the current proxy server status, indicating if we're running or not.

```python
salt '*' trafficserver.status
```

**salt.modules.trafficserver.zero_cluster()**
Reset performance statistics to zero across the cluster.

```python
salt '*' trafficserver.zero_cluster
```

**salt.modules.trafficserver.zero_node()**
Reset performance statistics to zero on the local node.

```python
salt '*' trafficserver.zero_cluster
```

---

**25.7.463  salt.modules.transactional_update module**

**Transactional update**

New in version 3004.

A transactional system, like MicroOS, can present some challenges when the user decided to manage it via Salt.

MicroOS provide a read-only rootfs and a tool, transactional-update, that takes care of the management of the system (updating, upgrading, installation or reboot, among others) in an atomic way.

Atomicity is the main feature of MicroOS, and to guarantee this property, this model leverages snapper, zypper, btrfs and overlayfs to create snapshots that will be updated independently of the currently running system, and that are activated after the reboot. This implies, for example, that some changes made on the system are not visible until the next reboot, as those changes are living in a different snapshot of the file system.
This model presents a lot of problems with the traditional Salt model, where the inspections (like 'is this package installed?') are executed in order to determine if a subsequent action is required (like 'install this package').

Let's consider this use case, to see how it works on a traditional system, and in a transactional system:

1) Check if `apache` is installed
2) If it is not installed, install it
3) Check that a `vhost` is configured for `apache`
4) Make sure that `apache2.service` is enabled
5) If the configuration changes, restart `apache2.service`

In the traditional system everything will work as expected. The system can see if the package is present or not, install it if it isn't, and a re-check will show that it is already present. The same will happen to the configuration file in `/etc/apache2`, that will be available as soon the package gets installed. Salt can inspect the current form of this file, and add the missing bits if required. Salt can annotate that a change is present, and restart the service.

In a transactional system we will have multiple issues. The first one is that Salt can only see the content of the snapshot where the system booted from. Later snapshots may contain different content, including the presence of `apache`. If Salt decides to install `apache` calling `zypper`, it will fail, as this will try to write into the read-only rootfs. Even if Salt would call `transactional-update pkg install`, the package would only be present in the new transaction (snapshot), and will not be found in the currently running system when later Salt tries to validate the presence of the package in the current one.

Any change in `/etc` alone will have also problems, as the changes will be alive in a different overlay, only visible after the reboot. And, finally, the service can only be enabled and restarted if the service file is already present in the current `/etc`.

**General strategy**

`transactional-update` is the reference tool used for the administration of transactional systems. Newer versions of this tool support the execution of random commands in the new transaction, the continuation of a transaction, the automatic detection of changes in new transactions and the merge of `/etc` overlays.

**Continue a transaction**

One prerequisite already present is the support for branching from a different snapshot than the current one in `snapper`.

With this feature we can represent in `transactional-update` the action of creating a transaction snapshot based on one that is planned to be the active one after the reboot. This feature removes a lot of user complains (like, for example, losing changes that are stored in a transaction not yet activated), but also provide a more simple model to work with.

So, for example, if the user have this scenario:

```
-+-------+ *======* +---V---+
  | T.1 | --| T.2 | --| T.3 |
  +-------+ *======* +---A---+
```

where T.2 is the current active one, and T.3 is a snapshot generated from T.2 with a new package (`apache2`), and is marked to be the active after the reboot.

Previously, if the user (that is still on T.2) created a new transaction, maybe for adding a new package (`tomcat`, for example), the new T.4 will be based on the content of T.2 again, and not T.3, so the new T.4 will have lost the changes of T.3 (i.e. `apache2` will not be present in T.4).
With the `--continue` parameter, `transactional-update` will create T.4 based on T.3, and nothing will be lost.

**Command execution inside a new transaction**

With `transactional-update run` we will create a new transaction based on the current one (T.2), where we can send interactive commands that can modify the new transaction, and as commented, with `transactional-update --continue run`, we will create a new transaction based on the last created (T.3)

The `run` command can execute any application inside the new transaction namespace. This module uses this feature to execute the different Salt execution modules, via `call()`. Or even the full `salt-thin` or `salt-call` via `sls()`, `apply()`, `single()` or `highstate`.

`transactional-update` will drop empty snapshots

The option `--drop-if-no-change` is used to detect whether there is any change in the file system on the read-only subvolume of the new transaction will be added. If a change is present, the new transaction will remain, if not it will be discarded.

For example:

```
transactional-update --continue --drop-if-no-change run zypper in apache2
```

If we are in the scenario described before, `apache2` is already present in T.3. In this case a new transaction, T.4, will be created based on T.3, `zypper` will detect that the package is already present and no change will be produced on T.4. At the end of the execution, `transactional-update` will validate that T.3 and T.4 are equivalent and T.4 will be discarded.

If the command is:

```
transactional-update --continue --drop-if-no-change run zypper in tomcat
```

the new T.4 will be indeed different from T.3, and will remain after the transaction is closed.

With this feature, every time that we call any function of this execution module, we will minimize the amount of transaction, while maintaining the idempotence so some operations.

**Report for pending transaction**

A change in the system will create a new transaction, that needs to be activated via a reboot. With `pending_transaction()` we can check if a reboot is needed. We can execute the reboot using the `reboot()` function, that will follow the plan established by the functions of the `rebootmgr` execution module.

**/etc overlay merge when no new transaction is created**

In a transactional model, `/etc` is an overlay file system. Changes done during the update are only present in the new transaction, and so will only be available after the reboot. Or worse, if the transaction gets dropped, because there is no change in the `rootfs`, the changes in `/etc` will be dropped too! This is designed like that in order to make the configuration files for the new package available only when new package is also available to the user. So, after the reboot.
This makes sense for the case when, for example, `apache2` is not present in the current transaction, but we installed it. The new snapshot contains the `apache2` service, and the configuration files in `/etc` will be accessible only after the reboot.

But this model presents an issue. If we use `transactional-update --continue --drop-if-no-change run <command>`, where `<command>` does not make any change in the read-only subvolume, but only in `/etc` (which is also read-write in the running system), the new overlay with the changes in `/etc` will be dropped together with the transaction.

To fix this, `transactional-update` will detect that when no change has been made on the read-only subvolume, but done in the overlay, the transaction will be dropped and the changes in the overlay will be merged back into `/etc` overlay of the current transaction.

**Using the execution module**

With this module we can create states that leverage Salt into this kind of systems:

```bash
# Install apache (low-level API)
salt-call transactional_update.pkg_install apache2

# We can call any execution module
salt-call transactional_update.call pkg.install apache2

# Or via a state
salt-call transactional_update.single pkg.installed name=apache2

# We can also execute a zypper directly
salt-call transactional_update.run "zypper in apache2" snapshot="continue"

# We can reuse SLS states
salt-call transactional_update.apply install_and_configure_apache

# Or apply the full highstate
salt-call transactional_update.highstate

# Is there any change done in the system?
salt-call transactional_update.pending_transaction

# If so, reboot via rebootmgr
salt-call transactional_update.run reboot

# We can enable the service
salt-call service.enable apache2

# If apache2 is available, this will work too
salt-call service.restart apache2
```
Fixing some expectations

This module alone is an improvement over the current state, but is easy to see some limitations and problems:

Is not a fully transparent approach

The user needs to know if the system is transactional or not, as not everything can be expressed inside a transaction (for example, restarting a service inside transaction is not allowed).

Two step for service restart

In the `apache2` example from the beginning we can observe the biggest drawback. If the package `apache2` is missing, the new module will create a new transaction, will execute `pkg.install` inside the transaction (creating the salt-thin, moving it inside and delegating the execution to `transactional-update` CLI as part of the full state). Inside the transaction we can do too the required changes in `/etc` for adding the new `vhost`, and we can enable the service via `systemctl` inside the same transaction.

At this point we will not merge the `/etc` overlay into the current one, and we expect from the user call the `reboot` function inside this module, in order to activate the new transaction and start the `apache2` service.

In the case that the package is already there, but the configuration for the `vhost` is required, the new transaction will be dropped and the `/etc` overlay will be visible in the live system. Then from outside the transaction, via a different call to Salt, we can command a restart of the `apache2` service.

We can see that in both cases we break the user expectation, where a change on the configuration will trigger automatically the restart of the associated service. In a transactional scenario we need two different steps: or a reboot, or a restart from outside of the transaction.

```
maintainer  Alberto Planas <aplanas@suse.com>

maturity  new

depends  None

platform  Linux
```

```
salt.modules.transactional_update.apply_(mods=None, **kwargs)

Apply an state inside a transaction.

This function will call `transactional_update.highstate` or `transactional_update.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

For a formal description of the possible parameters accepted in this function, check `state.apply_` documentation.

activate_transaction  If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)
```

CLI Example:

```
salt microos transactional_update.apply
salt microos transactional_update.apply stuff pillar='{"foo": "bar"}"
salt microos transactional_update.apply stuff activate_transaction=True
```

```
salt.modules.transactional_update.bootloader(self_update=False, snapshot=None)

Reinstall the bootloader

Same as `grub.cfg`, but will also rewrite the bootloader itself.

self_update  Check for newer transactional-update versions.
```
**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update bootloader snapshot="continue"
```

`salt.modules.transactional_update.call(function, "args", **"kwargs")`

Executes a Salt function inside a transaction.

The chroot does not need to have Salt installed, but Python is required.

**function** Salt execution module function

**activate_transaction** If at the end of the transaction there is a pending activation (i.e. there is a new snapshot in the system), a new reboot will be scheduled (default False)

CLI Example:

```
salt microos transactional_update.call test.ping
salt microos transactional_update.call ssh.set_auth_key user key=mykey
salt microos transactional_update.call pkg.install emacs activate_transaction=True
```

`salt.modules.transactional_update.cleanup(self_update=False)`

Run both cleanup-snapshots and cleanup-overlays.

Identical to calling both cleanup-snapshots and cleanup-overlays.

**self_update** Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup
```

`salt.modules.transactional_update.cleanup_overlays(self_update=False)`

Remove unused overlay layers.

Removes all unreferenced (and thus unused) /etc overlay directories in /var/lib/overlay.

**self_update** Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup_overlays
```

`salt.modules.transactional_update.cleanup_snapshots(self_update=False)`

Mark unused snapshots for snapper removal.

If the current root filesystem is identical to the active root filesystem (means after a reboot, before transactional-update creates a new snapshot with updates), all old snapshots without a cleanup algorithm get a cleanup algorithm set. This is to make sure, that old snapshots will be deleted by snapper. See the section about cleanup algorithms in snapper(8).

**self_update** Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update cleanup_snapshots
```

`salt.modules.transactional_update.dup(self_update=False, snapshot=None)`

Call 'zypper dup'

If new updates are available, a new snapshot is created and zypper dup --no-allow-vendor-change is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

**self_update** Check for newer transactional-update versions.

**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:

```
salt microos transactional_update dup snapshot="continue"
```

```
salt.modules.transactional_update.grub_cfg(self_update=False, snapshot=None)
```

Regenerate grub.cfg

grub2-mkconfig(8) is called to create a new /boot/grub2/grub.cfg configuration file for the bootloader.

**self_update** Check for newer transactional-update versions.

**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next
snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update grub_cfg snapshot="continue"
```

```
salt.modules.transactional_update.highstate(activate_transaction=False, queue=False, **kwargs)
```

Retrieve the state data from the salt master for this minion and execute it inside a transaction.

For a formal description of the possible parameters accepted in this function, check state.highstate documenta-
tion.

**activate_transaction** If at the end of the transaction there is a pending activation (i.e there is a new snapshot
in the system), a new reboot will be scheduled (default False)

**queue** Instead of failing immediately when another state run is in progress, queue the new state run to begin
running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly. (Default: False)

CLI Example:

```
salt microos transactional_update.highstate
salt microos transactional_update.highstate pillar='{"foo": "bar"}'
salt microos transactional_update.highstate activate_transaction=True
```

```
salt.modules.transactional_update.in_transaction()
```

Check if Salt is executing while in a transaction

CLI Example:

```
salt microos transactional_update.in_transaction
```

```
salt.modules.transactional_update.initrd(self_update=False, snapshot=None)
```

Regenerate initrd

A new initrd is created in a snapshot.

**self_update** Check for newer transactional-update versions.

**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next
snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update initrd snapshot="continue"
```

```
salt.modules.transactional_update.kdump(self_update=False, snapshot=None)
```

Regenerate kdump initrd

A new initrd for kdump is created in a snapshot.

**self_update** Check for newer transactional-update versions.

**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next
snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:
salt.microos.transactional_update.kdump snapshot="continue"

salt.modules.transactional_update.migration(self_update=False, snapshot=None)
Updates systems registered via SCC / SMT
On systems which are registered against the SUSE Customer Center (SCC) or SMT, a migration to a new version of the installed products can be made with this option.
self_update Check for newer transactional-update versions.
snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:
salt.microos.transactional_update.migration snapshot="continue"

salt.modules.transactional_update.patch(self_update=False, snapshot=None)
Call 'zypper patch'
If new updates are available, a new snapshot is created and zypper patch is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.
self_update Check for newer transactional-update versions.
snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:
salt.microos.transactional_update.patch snapshot="continue"

salt.modules.transactional_update.pending_transaction()
Check if there is a pending transaction
CLI Example:
salt.microos.transactional_update.pending_transaction

salt.modules.transactional_update.pkg_install(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)
Install individual packages
Installs additional software. See the install description in the "Package Management Commands" section of zypper's man page for all available arguments.
pkg Package name to install
pkgs List of packages names to install
args String or list of extra parameters for zypper
self_update Check for newer transactional-update versions.
snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.
CLI Example:
salt.microos.transactional_update.pkg_install pkg=emacs snapshot="continue"

salt.modules.transactional_update.pkg_remove(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)
Remove individual packages
Removes installed software. See the remove description in the "Package Management Commands" section of zypper's man page for all available arguments.
pkg Package name to install
pkgs List of packages names to install
args String or list of extra parameters for zypper

self_update Check for newer transactional-update versions.

snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_remove pkg=vim snapshot="continue"
```

```
salt.modules.transactional_update.pkg_update(pkg=None, pkgs=None, args=None, self_update=False, snapshot=None)
```

Updates individual packages

Update selected software. See the update description in the "Update Management Commands" section of zypper's man page for all available arguments.

pkg Package name to install

pkgs List of packages names to install

args String or list of extra parameters for zypper

self_update Check for newer transactional-update versions.

snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update pkg_update pkg=emacs snapshot="continue"
```

```
salt.modules.transactional_update.reboot(self_update=False)
```

Reboot after update

Trigger a reboot after updating the system.

Several different reboot methods are supported, configurable via the REBOOT_METHOD configuration option in transactional-update.conf(5). By default rebootmgrd(8) will be used to reboot the system according to the configured policies if the service is running, otherwise systemctl reboot will be called.

self_update Check for newer transactional-update versions.

CLI Example:

```
salt microos transactional_update reboot
```

```
salt.modules.transactional_update.rollback(snapshot=None)
```

Set the current, given or last working snapshot as default snapshot

Sets the default root file system. On a read-only system the root file system is set directly using btrfs. On read-write systems snapper(8) rollback is called.

If no snapshot number is given, the current root file system is set as the new default root file system. Otherwise number can either be a snapshot number (as displayed by snapper list) or the word last. last will try to reset to the latest working snapshot.

snapshot Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "last" to indicate the last working snapshot done.

CLI Example:

```
salt microos transactional_update rollback
```

```
salt.modules.transactional_update.run(command, self_update=False, snapshot=None)
```

Run a command in a new snapshot

Execute the command inside a new snapshot. By default this snapshot will remain, but if --drop-if-no-change is set, the new snapshot will be dropped if there is no change in the file system.

command Command with parameters that will be executed (as string or array)
**self_update**  Check for newer transactional-update versions.

**snapshot**  Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update run "mkdir /tmp/dir" snapshot="continue"
```

salt.modules.transactional_update.single(fun, name, activate_transaction=False, queue=False, **kwargs)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command.

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

**activate_transaction**  If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

**queue**  Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly. (Default: False)

CLI Example:

```
salt microos transactional_update.single pkg.installed name=emacs
```

salt.modules.transactional_update.sls(mods, activate_transaction=False, queue=False, **kwargs)

Execute the states in one or more SLS files inside a transaction.

**saltenv**  Specify a salt fileserver environment to be used when applying states

**mods**  List of states to execute

**test**  Run states in test-only (dry-run) mode

**exclude**  Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

**activate_transaction**  If at the end of the transaction there is a pending activation (i.e there is a new snapshot in the system), a new reboot will be scheduled (default False)

**queue**  Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly. (Default: False)

For a formal description of the possible parameters accepted in this function, check state.sls documentation.

CLI Example:

```
salt microos transactional_update.sls stuff pillar='{"foo": "bar"}'
salt microos transactional_update.sls stuff activate_transaction=True
```

salt.modules.transactional_update.transactional()

Check if the system is a transactional system

CLI Example:

```
salt microos transactional_update transactional
```

salt.modules.transactional_update.up(self_update=False, snapshot=None)

Call 'zypper up'
If new updates are available, a new snapshot is created and zypper up is used to update the snapshot. Afterwards, the snapshot is activated and will be used as the new root filesystem during next boot.

**self_update** Check for newer transactional-update versions.

**snapshot** Use the given snapshot or, if no number is given, the current default snapshot as a base for the next snapshot. Use "continue" to indicate the last snapshot done.

CLI Example:

```
salt microos transactional_update up snapshot="continue"
```

## 25.7.464 salt.modules.travisci

Commands for working with travisci.

**depends** pyOpenSSL >= 16.0.0

**salt.modules.travisci.verify_webhook**(signature, body)

Verify the webhook signature from travisci

*signature* The signature header from the webhook header

*body* The full payload body from the webhook post

**Note:** The body needs to be the urlencoded version of the body.

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
→%3A183791261%2C%22repository...'
```

## 25.7.465 salt.modules.tuned

Interface to Red Hat tuned-adm module

**maintainer** Syed Ali <alicsyed@gmail.com>

**maturity** new

**depends** tuned-adm

**platform** Linux

**salt.modules.tuned.active()**

Return current active profile

CLI Example:

```
salt '*' tuned.active
```

**salt.modules.tuned.list()**

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

**salt.modules.tuned.off()**

Turn off all profiles

CLI Example:
salt '×' tuned.off

```python
salt.modules.tuned.profile(profile_name)
```
Activate specified profile

CLI Example:
```bash
salt '×' tuned.profile virtual-guest
```

### 25.7.466 salt.modules.twilio_notify

Module for notifications via Twilio

New in version 2014.7.0.

**depends**

- twilio python module

**configuration** Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config (with `pillar_opts` set to True).

For example:

```
my-twilio-account:
    twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
    twilio.auth_token: mytoken
```

```python
salt.modules.twilio_notify.send_sms(profile, body, to, from_)
```
Send an sms

CLI Example:
```bash
twilio.send_sms my-twilio-account 'Test sms' '+18019999999' '+18011111111'
```

### 25.7.467 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

```python
salt.modules.udev.env(dev)
```
Return all environment variables udev has for dev

CLI Example:
```bash
salt '×' udev.env /dev/sda
salt '×' udev.env /sys/class/net/eth0
```

```python
salt.modules.udev.exportdb()
```
Return all the udev database

CLI Example:
```bash
salt '×' udev.exportdb
```

```python
salt.modules.udev.info(dev)
```
Extract all info delivered by udevadm

CLI Example:
25.7.468 salt.modules.upstart_service

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to ‘service.start’ is not available), see here.

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of “initctl show-config” to determine if all service dependencies are enabled to start on boot. For example, see the “start on” condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[2] example upstart configuration file:

```
lighdm
emits login-session-start
emits desktop-session-start
```
emits desktop-shutdown
start on (((filesystem and runlevel [!06]) and started dbus) and (drm-device-added→card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel→PREVLEVEL=S)
stop on runlevel [016]

Warning: This module should not be used on Red Hat systems. For these, the `rh_service` module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

salt.modules.upstart_service.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
```
salt '*' service.available sshd
```

salt.modules.upstart_service.disable(name, **kwargs)
Disable the named service from starting on boot

CLI Example:
```
salt '*' service.disable <service name>
```

salt.modules.upstart_service.disabled(name)
Check to see if the named service is disabled to start on boot

CLI Example:
```
salt '*' service.disabled <service name>
```

salt.modules.upstart_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
```
salt '*' service.enable <service name>
```

salt.modules.upstart_service.enabled(name, **kwargs)
Check to see if the named service is enabled to start on boot

CLI Example:
```
salt '*' service.enabled <service name>
```

salt.modules.upstart_service.force_reload(name)
Force-reload the named service

CLI Example:
```
salt '*' service.force_reload <service name>
```

salt.modules.upstart_service.full_restart(name)
Do a full restart (stop/start) of the named service

CLI Example:
```python
salt '*' service.full_restart <service name>
```

**salt.modules.upstart_service.get_all()**

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

**salt.modules.upstart_service.get_disabled()**

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

**salt.modules.upstart_service.get_enabled()**

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

**salt.modules.upstart_service.missing(name)**

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

**salt.modules.upstart_service.reload_(name)**

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

**salt.modules.upstart_service.restart(name)**

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

**salt.modules.upstart_service.start(name)**

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

**salt.modules.upstart_service.status(name, sig=None)**

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**

- `name (str)` -- The name of the service to check
- **sig**(str) -- Signature to use to find the service via ps

  **Returns** True if running, False otherwise dict: Maps service name to True if running, False otherwise

  **Return type** bool

  CLI Example:

  ```
salt '*' service.status <service name> [service signature]
  ```

salt.modules.upstart_service.**stop**(name)

  Stop the specified service

  CLI Example:

  ```
salt '*' service.stop <service name>
  ```

25.7.469  **salt.modules.uptime**

Wrapper around uptime API

salt.modules.uptime.**check_exists**(name)

  Check if a given URL is in being monitored by uptime

  CLI Example:

  ```
salt '*' uptime.check_exists http://example.org
  ```

salt.modules.uptime.**checks_list**(())

  List URL checked by uptime

  CLI Example:

  ```
salt '*' uptime.checks_list
  ```

salt.modules.uptime.**create**(name, **params)

  Create a check on a given URL.

  Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation [https://github.com/fzaninotto/uptime](https://github.com/fzaninotto/uptime) for a full list of the parameters.

  CLI Example:

  ```
salt '*' uptime.create http://example.org
  ```

salt.modules.uptime.**delete**(name)

  Delete a check on a given URL

  CLI Example:

  ```
salt '*' uptime.delete http://example.org
  ```
25.7.470 salt.modules.useradd

Manage users with the useradd command

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to ‘user.info’ is not available), see here.

```python
salt.modules.useradd.add(name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, system=False, fullname='', roomnumber='', workphone='', homephone='', other='', createhome=True, loginclass=None, nologinit=False, root=None, usergroup=None)
```

Add a user to the minion
- **name** Username LOGIN to add
- **uid** User ID of the new account
- **gid** Name or ID of the primary group of the new account
- **groups** List of supplementary groups of the new account
- **home** Home directory of the new account
- **shell** Login shell of the new account
- **unique** If not True, the user account can have a non-unique UID
- **system** Create a system account
- **fullname** GECOS field for the full name
- **roomnumber** GECOS field for the room number
- **workphone** GECOS field for the work phone
- **homephone** GECOS field for the home phone
- **other** GECOS field for other information
- **createhome** Create the user's home directory
- **loginclass** Login class for the new account (OpenBSD)
- **nologinit** Do not add the user to the lastlog and faillog databases
- **root** Directory to chroot into
- **usergroup** Create and add the user to a new primary group of the same name

**CLI Example:**
```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

```python
salt.modules.useradd.chfullname(name, fullname, root=None)
```

Change the user's Full Name
- **name** User to modify
- **fullname** GECOS field for the full name
- **root** Directory to chroot into

**CLI Example:**
```
salt '*' user.chfullname foo "Foo Bar"
```

```python
salt.modules.useradd.chgid(name, gid, root=None)
```

Change the default group of the user
- **name** User to modify
- **gid** Force use GID as new primary group
- **root** Directory to chroot into

**CLI Example:**
```
salt '*' user.chgid foo 4376
```

```python
salt.modules.useradd.chgroups(name, groups, append=False, root=None)
```

Change the groups to which this user belongs

**CLI Example:**
```
salt '*' user.chgroups foo [groups]
```
name  User to modify

groups  Groups to set for the user

append  [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

root  Directory to chroot into

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

salt.modules.useradd.chhome(name, home, persist=False, root=None)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

name  User to modify

home  New home directory for the user account

persist  Move contents of the home directory to the new location

root  Directory to chroot into

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.useradd.chhomephone(name, homephone, root=None)

Change the user's Home Phone

name  User to modify

homephone  GECOS field for the home phone

root  Directory to chroot into

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

salt.modules.useradd.chloginclass(name, loginclass, root=None)

Change the default login class of the user

name  User to modify

loginclass  Login class for the new account

root  Directory to chroot into

Note:  This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

salt.modules.useradd.chother(name, other, root=None)

Change the user's other GECOS attribute

name  User to modify

other  GECOS field for other information

root  Directory to chroot into

CLI Example:

```
salt '*' user.chother foobar
```

salt.modules.useradd.chroomnumber(name, roomnumber, root=None)

Change the user's Room Number

CLI Example:
salt '*' user.chroomnumber foo 123

salt.modules.useradd.chshell(name, shell, root=None)
    Change the default shell of the user
    name User to modify
    shell New login shell for the user account
    root Directory to chroot into
    CLI Example:
    salt '*' user.chshell foo /bin/zsh

salt.modules.useradd.chuid(name, uid, root=None)
    Change the uid for a named user
    name User to modify
    uid New UID for the user account
    root Directory to chroot into
    CLI Example:
    salt '*' user.chuid foo 4376

salt.modules.useradd.chworkphone(name, workphone, root=None)
    Change the user's Work Phone
    name User to modify
    workphone GECOS field for the work phone
    root Directory to chroot into
    CLI Example:
    salt '*' user.chworkphone foo 7735550123

salt.modules.useradd.delete(name, remove=False, force=False, root=None)
    Remove a user from the minion
    name Username to delete
    remove Remove home directory and mail spool
    force Force some actions that would fail otherwise
    root Directory to chroot into
    CLI Example:
    salt '*' user.delete name remove=True force=True

salt.modules.useradd.get_loginclass(name)
    Get the login class of the user
    name User to get the information

    Note: This function only applies to OpenBSD systems.

    CLI Example:
    salt '*' user.get_loginclass foo

salt.modules.useradd.getent(refresh=False, root=None)
    Return the list of all info for all users
    refresh Force a refresh of user information
    root Directory to chroot into
    CLI Example:
salt '*' user.getent

salt.modules.useradd.info(name, root=None)
    Return user information
    name  User to get the information
    root  Directory to chroot into
    CLI Example:

    salt '*' user.info root

salt.modules.useradd.list_groups(name)
    Return a list of groups the named user belongs to
    name  User to get the information
    CLI Example:

    salt '*' user.list_groups foo

salt.modules.useradd.list_users(root=None)
    Return a list of all users
    root  Directory to chroot into
    CLI Example:

    salt '*' user.list_users

salt.modules.useradd.primary_group(name)
    Return the primary group of the named user
    New in version 2016.3.0.
    name  User to get the information
    CLI Example:

    salt '*' user.primary_group saltadmin

salt.modules.useradd.rename(name, new_name, root=None)
    Change the username for a named user
    name  User to modify
    new_name  New value of the login name
    root  Directory to chroot into
    CLI Example:

    salt '*' user.rename name new_name

25.7.471  salt.modules.uwsgi

    maintainer  Peter Baumgartner <pete@lincolnloop.com>
    maturity  new
    platform  all

salt.modules.uwsgi.stats(socket)
    Return the data from uwsgi --connect-and-read as a dictionary.
    socket  The socket the uWSGI stats server is listening on
    CLI Example:
25.7.472 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

**requirements:**

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for sdb://vagrant_sdb_data

**Configuration example:**

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
database: /var/cache/salt/vagrant.sqilite
table: sdb
create_table: True
```

**salt.modules.vagrant.destroy(name)**

Destroy and delete a virtual machine. (vagrant destroy -f)

This also removes the salt_id name defined by vagrant.init.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

**salt.modules.vagrant.get_machine_id(machine, cwd)**

returns the salt_id name of the Vagrant VM

**Parameters**

- `machine` -- the Vagrant machine name
- `cwd` -- the path to Vagrantfile

**Returns** salt_id name

**salt.modules.vagrant.get_ssh_config(name, network_mask=' ', get_private_key=False)**

Retrieve hints of how you might connect to a Vagrant VM.

**Parameters**

- `name` -- the salt_id of the machine
- `network_mask` -- a CIDR mask to search for the VM's address
- `get_private_key` -- (default: False) return the key used for ssh login

**Returns** a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail network_mask=10.0.0.0/8 get_private_key=True
```
The returned dictionary contains:

- key_filename: the name of the private key file on the VM host computer
- ssh_username: the username to be used to log in to the VM
- ssh_host: the IP address used to log in to the VM. (This will usually be 127.0.0.1)
- ssh_port: the TCP port used to log in to the VM. (This will often be 2222)
- [ip_address:] (if network_mask is defined. see below)
- [private_key:] (if get_private_key is True) the private key for ssh_username

About network_mask:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a config.vm.network "public_network" statement in your Vagrantfile.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ifconfig" command to the VM (using ssh to ssh_host:ssh_port) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.get_vm_info(name)
get the information for a VM.

Parameters
name -- salt_id name

Returns
dictionary of {'machine': x, 'cwd': y, ...}.

salt.modules.vagrant.init(name, cwd=None, machine='', runas=None, start=False, vagrant_provider='', vm=None)
Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters
• name -- The salt_id name you will use to control this VM
• cwd -- The path to the directory where the Vagrantfile is located
• machine -- The machine name in the Vagrantfile. If blank, the primary machine will be used.
• runas -- The username on the host who owns the Vagrant work files.
• start -- (default: False) Start the virtual machine now.
• vagrant_provider -- The name of a Vagrant VM provider (if not the default).
• vm -- Optionally, all the above information may be supplied in this dictionary.

Returns
A string indicating success, or False.

CLI Example:
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1

salt.modules.vagrant.list_active_vms(cwd=None)
Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:
salt '*' vagrant.list_active_vms cwd=/projects/project_1

salt.modules.vagrant.list_domains()
Return a list of the salt_id names of all available Vagrant VMs on this host without regard to the path where
they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

**salt.modules.vagrant.list_inactive_vms(cwd=None)**

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

**salt.modules.vagrant.pause(name)**

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

**salt.modules.vagrant.reboot(name, provision=False)**

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

**Parameters**

- **name** -- The salt_id name you will use to control this VM
- **provision** -- (False) also re-run the Vagrant provisioning scripts.

**salt.modules.vagrant.shutdown(name)**

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as vagrant.stop. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

**salt.modules.vagrant.start(name)**

Start (vagrant up) a virtual machine defined by salt_id name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

**salt.modules.vagrant.stop(name)**

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```
salt.modules.vagrant.version()
Return the version of Vagrant on the minion

CLI Example:
```
salt '*' vagrant.version
```

salt.modules.vagrant.vm_state(name='', cwd=None)
Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will
return all VMs defined by the Vagrantfile in the cwd directory.

CLI Example:
```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': _, # Vagrant machine name,
         'state': _, # string indicating machine state, like 'running'
         'provider': _, # the Vagrant VM provider
         'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the primary
machine, which you defined by leaving the machine parameter blank, then you may receive the status of all
of them. Please specify the actual machine name for each VM if there are more than one.

25.7.473 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.ban(ban_expression)
Add ban to the varnish cache

CLI Example:
```
salt '*' varnish.ban ban_expression
```

salt.modules.varnish.ban_list()
List varnish cache current bans

CLI Example:
```
salt '*' varnish.ban_list
```

salt.modules.varnish.param_set(param, value)
Set a param in varnish cache

CLI Example:
```
salt '*' varnish.param_set param value
```
salt.modules.varnish.param_show(param=None)
Show params of varnish cache

CLI Example:
salt '*' varnish.param_show param

salt.modules.varnish.purge()
Purge the varnish cache

CLI Example:
salt '*' varnish.purge

salt.modules.varnish.version()
Return server version from varnishd -V

CLI Example:
salt '*' varnish.version

25.7.474 salt.modules.vault

Functions to interact with Hashicorp Vault.

maintainer SaltStack
maturity new
platform all
note If you see the following error, you'll need to upgrade requests to at least 2.4.2

configuration The salt-master must be configured to allow peer-runner configuration, as well as con-
figuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

```yaml
vault:
  url: https://vault.service.domain:8200
  verify: /etc/ssl/certs/ca-certificates.crt
  role_name: minion_role
  namespace: vault_enterprice_namespace
  auth:
    method: approle
    role_id: 11111111-2222-3333-4444-1111111111111
    secret_id: 11111111-1111-1111-1111-1111111111111
  policies:
  - saltstack/minions
  - saltstack/minion/{minion}
  .. more policies
  keys:
  - n63/TbrQuL3xaIW7Z9puXj/tIfnK1/MbVxO4vT3wVD2A
  - S90wCvMRhErEA4NvVELYBs6w/Me6+urgUr24xGK44Uy3
  - F1j4b73Kq850NS6Gkboiy5laJ0xY8dW3cW+3raYl
```
(continues on next page)
url  Url to your Vault installation. Required.

verify  For details please see https://requests.readthedocs.io/en/master/user/advanced/
#ssl-cert-verification

New in version 2018.3.0.

namespaces  Optional Vault Namespace. Used with Vault enterprice

For detail please see: https://www.vaultproject.io/docs/enterprise/namespaces

New in version 3004.

role_name  Role name for minion tokens created. If omitted, minion tokens will be created without any role, thus being able to inherit any master token policy (including token creation capabilities). Optional.

For details please see: https://www.vaultproject.io/api/auth/token/index.html#create-token

Example configuration: https://www.nomadproject.io/docs/vault-integration/index.html#vault-token-role-configuration

auth  Currently only token and approle auth types are supported. Required.

Approle is the preferred way to authenticate with Vault as it provide some advanced options to control authentication process. Please visit Vault documentation for more info: https://www.vaultproject.io/docs/auth/approle.html

The token must be able to create tokens with the policies that should be assigned to minions. You can still use the token auth via a OS environment variable via this config example:

```
vault:
  url: https://vault.service.domain:8200
  auth:
    method: token
    token: sdb://osenv/VAULT_TOKEN
  osenv:
    driver: env
```

And then export the VAULT_TOKEN variable in your OS:

```
export VAULT_TOKEN=11111111-1111-1111-1111-11111111111111
```

Configuration keys uses or ttl may also be specified under auth to configure the tokens generated on behalf of minions to be reused for the defined number of uses or length of time in seconds. These settings may also be configured on the minion when allow_minion_override is set to True in the master config.

Defining uses will cause the salt master to generate a token with that number of uses rather than a single use token. This multi-use token will be cached on the minion. The type of minion cache can be specified with token_backend: session or token_backend: disk. The value of session is the default, and will store the vault information in memory only for that session. The value of disk will write to an on disk file, and persist between state runs (most helpful for multi-use tokens).
policies Policies that are assigned to minions when requesting a token. These can either be static, e.g. saltstack/minions, or templated with grain values, e.g. my-policies/{grains[os]}.{minion} is shorthand for grains[id], e.g. saltstack/minion/{minion}.

New in version 3006.0: Policies can be templated with pillar values as well: salt_role_{pillar[roles]} Make sure to only reference pillars that are not sourced from Vault since the latter ones might be unavailable during policy rendering.

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template saltstack/by-role/{grains[roles]}, and a minion having these grains:

```
grains:
  roles:
    - web
    - database
```

The minion will have the policies saltstack/by-role/web and saltstack/by-role/database.

Note: List members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

Optional. If policies is not configured, saltstack/minions and saltstack/{minion} are used as defaults.

policies_refresh_pillar Whether to refresh the pillar data when rendering templated policies. When unset (=null/None), will only refresh when the cached data is unavailable, boolean values force one behavior always.

Note: Using cached pillar data only (policies_refresh_pillar=False) might cause the policies to be out of sync. If there is no cached pillar data available for the minion, pillar templates will fail to render at all.

If you use pillar values for templating policies and do not disable refreshing pillar data, make sure the relevant values are not sourced from Vault (ext_pillar, sdb) or from a pillar sls file that uses the vault execution module. Although this will often work when cached pillar data
is available, if the master needs to compile the pillar data during policy rendering, all Vault modules will be broken to prevent an infinite loop.

**policies_cache_time** Policy computation can be heavy in case pillar data is used in templated policies and it has not been cached. Therefore, a short-lived cache specifically for rendered policies is used. This specifies the expiration timeout in seconds. Defaults to 60.

**keys** List of keys to use to unseal vault server with the vault.unseal runner.

**config_location** Where to get the connection details for calling vault. By default, vault will try to determine if it needs to request the connection details from the master or from the local config. This optional option will force vault to use the connection details from the master or the local config. Can only be either master or local.

New in version 3006.0.

Add this segment to the master configuration file, or /etc/salt/master.d/peer_run.conf:

```yaml
peer_run:
  .*:
    - vault.generate_token
```

**salt.modules.vault.clear_token_cache()**

Changed in version 3001.

Delete minion Vault token cache file

CLI Example:

```bash
salt '*' vault.clear_token_cache
```

**salt.modules.vault.delete_secret(path)**

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```bash
salt '*' vault.delete_secret "secret/my/secret"
```

**salt.modules.vault.destroy_secret(path, *args)**

New in version 3001.

Destroy specified secret version at the path in vault. The vault policy used must allow this. Only supported on Vault KV version 2

CLI Example:

```bash
salt '*' vault.destroy_secret "secret/my/secret" 1 2
```

**salt.modules.vault.list_secrets(path, default=<Constant.NOT_SET>)**

Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```bash
salt '*' vault.list_secrets "secret/my/"
```
salt.modules.vault.read_secret(path, key=None, metadata=False, default=Constant.NOT_SET)

Changed in version 3001: The default argument has been added. When the path or path/key combination is not found, an exception will be raised, unless a default is provided.

Return the value of key at path in vault, or entire secret

Parameters
metadata -- Optional - If using KV v2 backend, display full results, including metadata

New in version 3001.

Jinja Example:

```python
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}

{{ salt['vault'].read_secret('/secret/my/secret', 'some-key', metadata=True)['data'] }}

{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}

secrets:
  first: {{ supersecret.first }}
  second: {{ supersecret.second }}
```

salt.modules.vault.write_raw(path, raw)

Set raw data at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_raw "secret/my/secret" '{"user":"foo","password": "bar"}'
```

salt.modules.vault.write_secret(path, **kwargs)

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password= "bar"
```

25.7.475  salt.modules.vbox_guest

VirtualBox Guest Additions installer

salt.modules.vbox_guest.additions_install(**kwargs)

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters
- **reboot**(bool) -- reboot computer to complete installation
- **upgrade_os**(bool) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns version of VirtualBox Guest Additions or string with error
salt.modules.vbox_guest.additions_mount()
Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press ‘Host+D’ (‘Host’ is usually ‘Right Ctrl’).

CLI Example:
```
salt '*' vbox_guest.additions_mount
```

**Returns** True or OSError exception

salt.modules.vbox_guest.additions_remove(**kwargs)
Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:
```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

**Parameters** force (bool) -- force VirtualBox Guest Additions removing

**Returns** True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.additions_umount(mount_point)
Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:
```
salt '*' vbox_guest.additions_umount
```

**Parameters** mount_point -- directory VirtualBox Guest Additions is mounted to

**Returns** True or an string with error

salt.modules.vbox_guest.additions_version()
Check VirtualBox Guest Additions version.

CLI Example:
```
salt '*' vbox_guest.additions_version
```

**Returns** version of VirtualBox Guest Additions or False if they are not installed

salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)
Grant access to auto-mounted shared folders to the users.

User is specified by its name. To grant access for several users use argument users. Access will be denied to the users not listed in users argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:
```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

**Parameters**
- name (str) -- name of the user to grant access to auto-mounted shared folders to
- users (list of str) -- list of names of users to grant access to auto-mounted shared folders to (if specified, name will not be taken into account)
Returns  list of users who have access to auto-mounted shared folders

`salt.modules.vbox_guest.list_shared_folders_users()`
List users who have access to auto-mounted shared folders.
See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.
CLI Example:
```
salt '*' vbox_guest.list_shared_folders_users
```

Returns  list of users who have access to auto-mounted shared folders

25.7.476  `salt.modules.vboxmanage`

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.
If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:
```
autoLoad_vboxdrv: True
```
The default for this setting is `False`.

depends  virtualbox

`salt.modules.vboxmanage.clonemedium(medium, uuid_in=None, file_in=None, uuid_out=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs)`
Clone a new VM from an existing VM
CLI Example:
```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

`salt.modules.vboxmanage.clonevm(name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs)`
Clone a new VM from an existing VM
CLI Example:
```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

`salt.modules.vboxmanage.create(name, groups=None, ostype=None, register=True, basefolder=None, new_uuid=None, **kwargs)`
Create a new VM
CLI Example:
```
salt 'hypervisor' vboxmanage.create <name>
```

`salt.modules.vboxmanage.destroy(name)`
Unregister and destroy a VM
CLI Example:
salt 'vboxmanage.destroy my_vm

salt.modules.vboxmanage.list_items(item, details=False, group_by='UUID')
Return a list of a specific type of item. The following items are available:
  vms running vms ostypes hostdvs hostfloppies innets bridgedifs hostonlyifs natnets dhcpservers
  hostinfo hostcpuids hddbackends vhds dhsv vds floppies ush guest usbfilters systemproperties extpacks
  groups webcams screenshotformats

CLI Example:
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name

Some items do not display well, or at all, unless details is set to True. By default, items are grouped by
the UUID field, but not all items contain that field. In those cases, another field must be specified.

salt.modules.vboxmanage.list_nodes()
Return a list of registered VMs

CLI Example:
salt '*' vboxmanage.list_nodes

salt.modules.vboxmanage.list_nodes_full()
Return a list of registered VMs, with detailed information

CLI Example:
salt '*' vboxmanage.list_nodes_full

salt.modules.vboxmanage.list_nodes_min()
Return a list of registered VMs, with minimal information

CLI Example:
salt '*' vboxmanage.list_nodes_min

salt.modules.vboxmanage.list_ostypes()
List the available OS Types

CLI Example:
salt '*' vboxmanage.list_ostypes

salt.modules.vboxmanage.register(filename)
Register a VM

CLI Example:
salt '*' vboxmanage.register my_vm_filename

salt.modules.vboxmanage.start(name)
Start a VM

CLI Example:
salt '*' vboxmanage.start my_vm
salt.modules.vboxmanage.stop(name)
    Stop a VM
    CLI Example:
    ```
salt '*' vboxmanage.stop my_vm
    ```

salt.modules.vboxmanage.unregister(name, delete=False)
    Unregister a VM
    CLI Example:
    ```
salt '*' vboxmanage.unregister my_vm_filename
    ```

salt.modules.vboxmanage.vboxcmd()
    Return the location of the VBoxManage command
    CLI Example:
    ```
salt '*' vboxmanage.vboxcmd
    ```

25.7.477 salt.modules.vcenter

Module used to access the vcenter proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the vCenter module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

salt.modules.vcenter.get_details()

25.7.478 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

```
victorops:
  api_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

salt.modules.victorops.create_event(message_type=info, routing_key='everybody', **kwargs)
    Create an event in VictorOps. Designed for use in states.

    The following parameters are required:
    **Parameters** message_type -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.
    The following parameters are optional:
    **Parameters**
    - routing_key -- The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp_fmt The date format for the timestamp parameter.

**Parameters**

- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.
- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

**Returns** A dictionary with result, entity_id, and message if result was failure.

**CLI Example:**

```bash
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone
entity_id='hostname/diskspace'
```

```bash
salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key='everyone
entity_id='hostname/diskspace' ack_message='Acknowledged' ack_author='username'
```

```bash
salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone
entity_id='hostname/diskspace'
```

The following parameters are required: message_type

### 25.7.479 salt.modules.virt

Work with virtual machines managed by libvirt

**depends**

- libvirt Python module
- libvirt client
- qemu-img
- grep

**Connection**

The connection to the virtualization host can be either setup in the minion configuration, pillar data or overridden for each individual call.

By default, the libvirt connection URL will be guessed: the first available libvirt hypervisor driver will be used. This can be overridden like this:

```
virt:
  connection:
    uri: lxc:///
```

25.7. execution modules
If the connection requires an authentication like for ESXi, this can be defined in the minion pillar data like this:

```yaml
virt:
  connection:
    uri: esx://10.1.1.101/?no_verify=1&auto_answer=1
    auth:
      username: user
      password: secret
```

Connecting with SSH protocol

Libvirt can connect to remote hosts using SSH using one of the `ssh`, `libssh` and `libssh2` transports. Note that `libssh2` is likely to fail as it doesn’t read the `known_hosts` file. Libvirt may also have been built without `libssh` or `libssh2` support.

To use the SSH transport, on the minion setup an SSH agent with a key authorized on the remote libvirt machine.

Per call connection setup

New in version 2019.2.0.

All the calls requiring the libvirt connection configuration as mentioned above can override this configuration using `connection`, `username` and `password` parameters.

This means that the following will list the domains on the local LXC libvirt driver, whatever the `virt:connection` is.

```
salt 'hypervisor' virt.list_domains connection=lxc:///```

The calls not using the libvirt connection setup are:

- `seed_non_shared_migrate`
- `virt_type`
- `is_*hyper`
- all migration functions
- `libvirt ESX URI format`
- `libvirt URI format`
- `libvirt authentication configuration`

Units

Units specification

New in version 3002.

The string should contain a number optionally followed by a unit. The number may have a decimal fraction. If the unit is not given then MiB are set by default. Units can optionally be given in IEC style (such as MiB), although the standard single letter style (such as M) is more convenient.

Valid units include:
<table>
<thead>
<tr>
<th>Standard</th>
<th>IEC Standard</th>
<th>IEC Name</th>
<th>IEC Name</th>
<th>IEC Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit</td>
<td>Unit</td>
<td>Name</td>
<td>Name</td>
<td>Factor</td>
</tr>
<tr>
<td>B</td>
<td></td>
<td>Bytes</td>
<td>1</td>
<td>2**10</td>
</tr>
<tr>
<td>K</td>
<td>KiB</td>
<td>Kilobytes</td>
<td>Kibibytes</td>
<td>2**20</td>
</tr>
<tr>
<td>M</td>
<td>MiB</td>
<td>Megabytes</td>
<td>Mebibytes</td>
<td>2**30</td>
</tr>
<tr>
<td>G</td>
<td>GiB</td>
<td>Gigabytes</td>
<td>Gibibytes</td>
<td>2**40</td>
</tr>
<tr>
<td>T</td>
<td>TiB</td>
<td>Terabytes</td>
<td>Tebibytes</td>
<td>2**50</td>
</tr>
<tr>
<td>P</td>
<td>PiB</td>
<td>Petabytes</td>
<td>Pebibytes</td>
<td>2**60</td>
</tr>
<tr>
<td>E</td>
<td>EiB</td>
<td>Exabytes</td>
<td>Exbibytes</td>
<td>2**70</td>
</tr>
<tr>
<td>Z</td>
<td>ZiB</td>
<td>Zettabytes</td>
<td>Zebibytes</td>
<td>2**80</td>
</tr>
</tbody>
</table>

Additional decimal based units:

<table>
<thead>
<tr>
<th>Unit</th>
<th>Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>KB</td>
<td>10**3</td>
</tr>
<tr>
<td>MB</td>
<td>10**6</td>
</tr>
<tr>
<td>GB</td>
<td>10**9</td>
</tr>
<tr>
<td>TB</td>
<td>10**12</td>
</tr>
<tr>
<td>PB</td>
<td>10**15</td>
</tr>
<tr>
<td>EB</td>
<td>10**18</td>
</tr>
<tr>
<td>ZB</td>
<td>10**21</td>
</tr>
<tr>
<td>YB</td>
<td>10**24</td>
</tr>
</tbody>
</table>

`salt.modules.virt.all_capabilities(**kwargs)`
Return the host and domain capabilities in a single call.

New in version 3001.

Parameters

- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

CLI Example:

```
salt '*' virt.all_capabilities
```

`salt.modules.virt.capabilities(**kwargs)`
Return the hypervisor connection capabilities.

Parameters

- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.capabilities
```

`salt.modules.virt.cpu_baseline(full=False, migratable=False, out='libvirt', **kwargs)`
Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters

- `full` -- Return all CPU features rather than the ones on top of the closest CPU model
- `migratable` -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- `out` -- 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.cpu_baseline
```

```
salt.modules.virt.create_xml_path(path, **kwargs)
```
Start a transient domain based on the XML-file path passed to the function
Parameters
- `path` -- path to a file containing the libvirt XML definition of the domain
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.create_xml_path <path to XML file on the node>
```

```
salt.modules.virt.create_xml_str(xml, **kwargs)
```
Start a transient domain based on the XML passed to the function
Parameters
- `xml` -- libvirt XML definition of the domain
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.create_xml_str <XML in string format>
```

```
salt.modules.virt.ctrl_alt_del(vm_, **kwargs)
```
Sends CTRL+ALT+DEL to a VM
Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

salt.modules.virt.**define_vol_xml_path**(path, pool=None, **kwargs)
Define a volume based on the XML-file path passed to the function

**Parameters**

• **path** -- path to a file containing the libvirt XML definition of the volume
• **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.
  New in version 3001.
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virtue.define_vol_xml_path <path to XML file on the node>
```

salt.modules.virt.**define_vol_xml_str**(xml, pool=None, **kwargs)
Define a volume based on the XML passed to the function

**Parameters**

• **xml** -- libvirt XML definition of the storage volume
• **pool** -- storage pool name to define the volume in. If defined, this parameter will override the configuration setting.
  New in version 3001.
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:

```
salt '*' virtue.define_vol_xml_str <XML in string format>
```

The storage pool where the disk image will be defined is **default** unless changed with the pool parameter or a configuration like this:

```yaml
virt:
  storagepool: mine
```

salt.modules.virt.**define_xml_path**(path, **kwargs)
Define a persistent domain based on the XML-file path passed to the function

**Parameters**

• **path** -- path to a file containing the libvirt XML definition of the domain

25.7. execution modules
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.define_xml_path <path to XML file on the node>
```

salt.modules.virt.define_xml_str(xml, **kwargs)

Define a persistent domain based on the XML passed to the function

Parameters

- **xml** -- libvirt XML definition of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.define_xml_str <XML in string format>
```

salt.modules.virt.delete_snapshots(name, *names, **kwargs)

Delete one or more snapshots of the given VM.

Parameters

- **name** -- domain name
- **names** -- names of the snapshots to remove
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

salt.modules.virt.domain_capabilities(emulator=None, arch=None, machine=None, domain=None, **kwargs)

Return the domain capabilities given an emulator, architecture, machine or virtualization type.

New in version 2019.2.0.

Parameters

- **emulator** -- return the capabilities for the given emulator binary
- **arch** -- return the capabilities for the given CPU architecture
- **machine** -- return the capabilities for the given emulated machine type
• **domain** -- return the capabilities for the given virtualization type.
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

The list of the possible emulator, arch, machine and domain can be found in the host capabilities output.

If none of the parameters is provided, the libvirt default one is returned.

CLI Example:

```bash
salt '*' virt.domain_capabilities arch='x86_64' domain='kvm'
```

---

salt.modules.virt.freecpu(**kwargs)

Return an int representing the number of unallocated cpus on this hypervisor

**Parameters**

• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.freecpu
```

---

salt.modules.virt.freemem(**kwargs)

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

**Parameters**

• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.freemem
```

---

salt.modules.virt.full_info(**kwargs)

Return the node_info, vm_info and freemem

**Parameters**

• **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.

• **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.

• **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
salt '*' virt.full_info

salt.modules.virt.get_disks (vm_, **kwargs)
Return the disks of a named vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
- username -- username to connect with, overriding defaults

New in version 2019.2.0.
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

    salt '*' virt.get_disks <domain>

salt.modules.virt.get_graphics (vm_, **kwargs)
Returns the information on vnc for a given vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
- username -- username to connect with, overriding defaults

New in version 2019.2.0.
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

    salt '*' virt.get_graphics <domain>

salt.modules.virt.get_hypervisor()
Returns the name of the hypervisor running on this node or None.

Detected hypervisors:
- kvm
- xen
- bhyve

CLI Example:

    salt '*' virt.get_hypervisor

New in version 2019.2.0: the function and the kvm, xen and bhyve hypervisors support

salt.modules.virt.get_loader (vm_, **kwargs)
Returns the information on the loader for a given vm

Parameters
- vm -- name of the domain
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

CLI Example:
salt '*' virt.get_loader <domain>

New in version 2019.2.0.
salt.modules.virt.get_macs(vm_, **kwargs)
Return a list off MAC addresses from the named vm

Parameters
• vm -- name of the domain
  • connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  • password -- password to connect with, overriding defaults
    New in version 2019.2.0.

CLI Example:
salt '*' virt.get_macs <domain>

salt.modules.virt.get_nics(vm_, **kwargs)
Return info about the network interfaces of a named vm

Parameters
• vm -- name of the domain
  • connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  • password -- password to connect with, overriding defaults
    New in version 2019.2.0.

CLI Example:
salt '*' virt.get_nics <domain>

salt.modules.virt.get_profiles(hypervisor=None, **kwargs)
Return the virt profiles for hypervisor.

Currently there are profiles for:
• nic
• disk

Parameters
• hypervisor -- override the default machine type.
  • connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  • password -- password to connect with, overriding defaults
    New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=vmware
```

salt.modules.virt.get_xml(vm_, **kwargs)
Returns the XML for a given vm

Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.get_xml <domain>
```

salt.modules.virt.init(name, cpu, mem, nic='default', interfaces=None, hypervisor=None, start=True, disk='default', disks=None, saltenv='base', seed=True, install=True, pub_key=None, priv_key=None, seed_cmd='seed.apply', graphics=None, os_type=None, arch=None, boot=None, boot_dev=None, numatune=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, **kwargs)
Initialize a new vm

Parameters
- `name` -- name of the virtual machine to create
- `cpu` -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iotthreads allocation. The structure of the dictionary is documented in `cpu parameters definition`.

```python
cpu:
    placement: static
    cpuset: 0-11
    current: 5
    maximum: 12
    vcpus:
      0:
        enabled: True
        hotpluggable: False
        order: 1
      1:
        enabled: False
        hotpluggable: True
    match: minimum
    mode: custom
    check: full
    vendor: Intel
    model:
      name: core2duo
      fallback: allow
      vendor_id: GenuineIntel
    topology:
      sockets: 1
```

(continues on next page)
cores: 12
threads: 1
cache:
  level: 3
  mode: emulate
features:
  lahf: optional
  pcid: require

New in version 3003.

- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are `boot`, `current`, `max`, `slots`, `hard_limit`, `soft_limit`, `swap_hard_limit`, `min Guarantee`, `hugepages`, `nosharepages`, `locked`, `source`, `access`, `allocation` and `discard`. The structure of the dictionary is documented in `Memory parameter definition`. Both decimal and binary base are supported. Detail unit specification is documented in `Units specification`. Please note that the value for `slots` must be an integer.

```python
{
    'boot': 1g,
    'current': 1g,
    'max': 1g,
    'slots': 10,
    'hard_limit': '1024',
    'soft_limit': '512m',
    'swap Hard_limit': '1g',
    'min Guarantee': '512mib',
    'hugepages': [{"nodeset": '0-3', "size": '1g'}, {  
        "nodeset": '2', "size": '2m'}],
    'nosharepages': True,
    'locked': True,
    'source': 'file',
    'access': 'shared',
    'allocation': 'immediate',
    'discard': True
}
```

Changed in version 3002.
- **nic** -- NIC profile to use (Default: 'default'). The profile interfaces can be customized / extended with the interfaces parameter. If set to `None`, no profile will be used.

- **interfaces** -- List of dictionaries providing details on the network interfaces to create. These data are merged with the ones from the nic profile. The structure of each dictionary is documented in *Network Interfaces Definitions*.

  New in version 2019.2.0.

- **hypervisor** -- the virtual machine type. By default the value will be computed according to the virtual host capabilities.

- **start** -- `True` to start the virtual machine after having defined it (Default: `True`)

- **disk** -- Disk profile to use (Default: 'default'). If set to `None`, no profile will be used.

- **disks** -- List of dictionaries providing details on the disk devices to create. These data are merged with the ones from the disk profile. The structure of each dictionary is documented in *Disks Definitions*.

  New in version 2019.2.0.

- **saltenv** -- Fileserver environment (Default: 'base'). See *cp module for more details*

- **seed** -- `True` to seed the disk image. Only used when the `image` parameter is provided. (Default: `True`)

- **install** -- install salt minion if absent (Default: `True`)

- **pub_key** -- public key to seed with (Default: `None`)

- **priv_key** -- public key to seed with (Default: `None`)

- **seed_cmd** -- Salt command to execute to seed the image. (Default: 'seed.apply')

- **graphics** -- Dictionary providing details on the graphics device to create. (Default: `None`) See *Graphics Definition* for more details on the possible values.

  New in version 2019.2.0.

- **os_type** -- type of virtualization as found in the `//os/type` element of the libvirt definition. The default value is taken from the host capabilities, with a preference for `hvm`.

  New in version 2019.2.0.

- **arch** -- architecture of the virtual machine. The default value is taken from the host capabilities, but `x86_64` is preferred over `i686`.

  New in version 2019.2.0.

- **config** -- minion configuration to use when seeding. See *seed module for more details*

- **boot_dev** -- String of space-separated devices to boot from (Default: 'hd')

- **connection** -- libvirt connection URI, overriding defaults

  New in version 2019.2.0.

- **username** -- username to connect with, overriding defaults

  New in version 2019.2.0.

- **password** -- password to connect with, overriding defaults

  New in version 2019.2.0.

- **stop_on_reboot** -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

  New in version 3003.
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary. The structure of the dictionary is documented in *Boot parameters definition*. If a remote path is provided to kernel or initrd, salt will handle the downloading of the specified remote file and modify the XML accordingly. To boot VM with UEFI, specify `loader` and `nvram` path or specify `efi`: `True` if your libvirtd version is >= 5.2.0 and QEMU >= 3.0.0.

New in version 3000.

```
{  
    'kernel': '/root/f8-i386-vmlinuz',  
    'initrd': '/root/f8-i386-initrd',  
    'cmdline': 'console=ttyS0 ks=http://example.com/f8-i386/os/ ',  
    'loader': '/usr/share/OVMF/OVMF_CODE.fd',  
    'nvram': '/usr/share/OVMF/OVMF_VARS.ms.fd'  
}
```

- **boot_dev** -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will "hd".

- **numatune** -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional memory element specifies how to allocate memory for the domain process on a NUMA host. memnode elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at *cpu parameters definition*.

New in version 3003.

```
{  
    'memory': {  
        'mode': 'strict',  
        'nodeset': '0-11'  
    },  
    'memnodes': {  
        0: {  
            'mode': 'strict',  
            'nodeset': '1'  
        },  
        1: {  
            'mode': 'preferred',  
            'nodeset': '2'  
        }  
    }  
}
```

- **hypervisor_features** -- Enable or disable hypervisor-specific features on the virtual machine.

New in version 3003.

```
hypervisor_features:
   kvm-hint-dedicated: True
```

- **clock** -- Configure the guest clock. The value is a dictionary with the following keys:
  - `adjustment` time adjustment in seconds or `reset`
  - `utc` set to `False` to use the host local time as the guest clock. Defaults to `True`.
  - `timezone` synchronize the guest to the corresponding timezone
  - `timers` a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties track, tickpolicy, catchup, frequency, mode, present, slew, threshold and limit. See *libvirt time keeping documentation* for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds .. code-block:: yaml

```
clock: adjustment: 3600 utc: False
```

Set the clock to a specific time zone:
clock:
  timezone: CEST

Tweak guest timers:

clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False

- **serials** -- Dictionary providing details on the serials connection to create. (Default: None) See Serials and Consoles Definitions for more details on the possible values.

  New in version 3003.

- **consoles** -- Dictionary providing details on the consoles device to create. (Default: None) See Serials and Consoles Definitions for more details on the possible values.

  New in version 3003.

- **host_devices** -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the `node_devices()` function. (Default: None)

  New in version 3003.

**cpu parameters definition**

The cpu parameters dictionary can contain the following properties:

- **cpuset** a comma-separated list of physical CPU numbers that domain process and virtual CPUs can be pinned to by default. eg. 1-4, ^3 cpuset 3 is excluded.
- **current** the number of virtual cpus available at startup
- **placement** indicate the CPU placement mode for domain process. the value can be either static or auto
- **vcpus** specify the state of individual vcpu. Possible attribute for each individual vcpu include: id, enabled, hotpluggable and order. Valid ids are from 0 to the maximum vCPU count minus 1. enabled takes boolean values which controls the state of the vcpu. hotpluggable take boolean value which controls whether given vCPU can be hotplugged and hotunplugged. order takes an integer value which specifies the order to add the online vCPUs.

**match** The cpu attribute match attribute specifies how strictly the virtual CPU provided to the guest matches the CPU requirements, possible values are minimum, exact or strict.

- **check** Optional cpu attribute check attribute can be used to request a specific way of checking whether the virtual CPU matches the specification, possible values are none, partial and full.
- **mode** Optional cpu attribute mode attribute may be used to make it easier to configure a guest CPU to be as close to host CPU as possible, possible values are custom, host-model and host-passthrough.

**model** specifies CPU model requested by the guest. An optional fallback attribute can be used to forbid libvirt falls back to the closest model supported by the hypervisor, possible values are allow or forbid. vendor_id attribute can be used to set the vendor id seen by the guest, the length must be exactly 12 characters long.

**vendor** specifies CPU vendor requested by the guest.
- **topology** specifies requested topology of virtual CPU provided to the guest. Four possible attributes, sockets, dies, cores, and threads, accept non-zero positive integer values. They refer to the
number of CPU sockets per NUMA node, number of dies per socket, number of cores per die, and number of threads per core, respectively.

**features** A dictionary contains a set of cpu features to fine-tune features provided by the selected CPU model. Use cpu feature name as the key and the policy as the value. policy Attribute takes force, require, optional, disable or forbid.

cache describes the virtual CPU cache. Optional attribute level takes an integer value which describes cache level mode attribute supported three possible values: emulate, passthrough, disable

numa specify the guest numa topology. cell element specifies a NUMA cell or a NUMA node, cpus specifies the CPU or range of CPUs that are part of the node, memory specifies the size of the node memory. All cells should have id attribute in case referring to some cell is necessary in the code. optional attribute memAccess control whether the memory is to be mapped as shared or private, discard attribute which fine tunes the discard feature for given numa node, possible values are True or False. distances element define the distance between NUMA cells and sibling sub-element is used to specify the distance value between sibling NUMA cells.

vcpupin The optional vcpupin element specifies which of host’s physical CPUs the domain vCPU will be pinned to.

emulatorpin The optional emulatorpin element specifies which of host physical CPUs the ”emulator”, a subset of a domain not including vCPU or iothreads will be pinned to.

iothreadpin The optional iothreadpin element specifies which of host physical CPUs the IOThreads will be pinned to.

shares The optional shares element specifies the proportional weighted share for the domain.

period The optional period element specifies the enforcement interval (unit: microseconds).

quota The optional quota element specifies the maximum allowed bandwidth (unit: microseconds).

global_period The optional global_period element specifies the enforcement CFS scheduler interval (unit: microseconds) for the whole domain in contrast with period which enforces the interval per vCPU.

global_quota The optional global_quota element specifies the maximum allowed bandwidth (unit: microseconds) within a period for the whole domain.

emulator_period The optional emulator_period element specifies the enforcement interval (unit: microseconds).

emulator_quota The optional emulator_quota element specifies the maximum allowed bandwidth (unit: microseconds) for domain’s emulator threads (those excluding vCPUs).

iothread_period The optional iothread_period element specifies the enforcement interval (unit: microseconds) for IOThreads.

iothread_quota The optional iothread_quota element specifies the maximum allowed bandwidth (unit: microseconds) for IOThreads.

vcpusched specify the scheduler type for vCPUs. The value is a list of dictionaries with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer and the vcpus value is a cpu set like 1-4,^3,6 or simply the vcpu id.

iothreadsched specify the scheduler type for IO threads. The value is a list of dictionaries with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer and the vcpus value is a cpu set like 1-4,^3,6 or simply the vcpu id.

emulatorsched specify the scheduler type (values batch, idle, fifo, rr) for particular the emulator. The value is a dictionary with the scheduler key (values batch, idle, fifo, rr) and the optional priority and vcpus keys. The priority value usually is a positive integer.

cachetune Optional cachetune element can control allocations for CPU caches using the resctrl on the host.

monitor The optional element monitor creates the cache monitor(s) for current cache allocation.

memorytune Optional memorytune element can control allocations for memory bandwidth using the resctrl on the host.

iothreads Number of threads for supported disk devices to perform I/O requests. iothread id will be numbered from 1 to the provided number (Default: None).
**Boot parameters definition**

The boot parameters dictionary can contain the following properties:

- **kernel** The URL or path to the kernel to run the virtual machine with.
- **initrd** The URL or path to the initrd file to run the virtual machine with.
- **cmdline** The parameters to pass to the kernel provided in the kernel property.
- **loader** The path to the UEFI binary loader to use.

  New in version 3001.

- **nvram** The path to the UEFI data template. The file will be copied when creating the virtual machine.

  New in version 3001.

- **efi** A boolean value.

  New in version 3001.

**Memory parameter definition**

Memory parameter can contain the following properties:

- **boot** The maximum allocation of memory for the guest at boot time
- **current** The actual allocation of memory for the guest
- **max** The run time maximum memory allocation of the guest
- **slots** specifies the number of slots available for adding memory to the guest
- **hard_limit** the maximum memory the guest can use
- **soft_limit** memory limit to enforce during memory contention
- **swap_hard_limit** the maximum memory plus swap the guest can use
- **min_guarantee** the guaranteed minimum memory allocation for the guest
- **hugepages** memory allocated using hugepages instead of the normal native page size. It takes a list of dictionaries with nodeset and size keys. For example "hugepages": [{"nodeset": "1-4, ^3", "size": "2m"}, {"nodeset": "3", "size": "1g"}].
- **nosharepages** boolean value to instruct hypervisor to disable shared pages (memory merge, KSM) for this domain
- **locked** boolean value that allows memory pages belonging to the domain will be locked in host's memory and the host will not be allowed to swap them out, which might be required for some workloads such as real-time.
- **source** possible values are file which utilizes file memorybacking, anonymous by default and memfd backing. (QEMU/KVM only)
- **access** specify if the memory is to be shared or private. This can be overridden per numa node by memAccess.
- **allocation** specify when to allocate the memory by supplying either immediate or ondemand.
- **discard** boolean value to ensure the memory content is discarded just before guest shuts down (or when DIMM module is unplugged). Please note that this is just an optimization and is not guaranteed to work in all cases (e.g. when hypervisor crashes). (QEMU/KVM only)

**Network Interfaces Definitions**

Network interfaces dictionaries can contain the following properties:

- **name** Name of the network interface. This is only used as a key to merge with the profile data
- **type** Network type. One of 'bridge', 'network'
- **source** The network source, typically the bridge or network name
- **mac** The desired mac address, computed if None (Default: None).
- **model** The network card model (Default: depends on the hypervisor)
Disks Definitions

Disk dictionaries can contain the following properties:

**name** Name of the disk. This is mostly used in the name of the disk image and as a key to merge with the profile data.

**format** Format of the disk image, like 'qcow2', 'raw', 'vmdk'. (Default: depends on the hypervisor)

**size** Disk size in MiB

**pool** Path to the folder or name of the pool where disks should be created. (Default: depends on hypervisor and the virt:storagepool configuration)

Changed in version 3001.

If the value contains no '/', it is considered a pool name where to create a volume. Using volumes will be mandatory for some pools types like rdb, iscsi, etc.

**model** One of the disk busses allowed by libvirt (Default: depends on hypervisor)

See the libvirt disk element documentation for the allowed bus types.

**image** Path to the image to use for the disk. If no image is provided, an empty disk will be created (Default: None)

Note that some pool types do not support uploading an image. This list can evolve with libvirt versions.

**overlay_image** True to create a QCOW2 disk image with `image` as backing file. If False the file pointed to by the `image` property will simply be copied. (Default: False)

Changed in version 3001.

This property is only valid on path-based disks, not on volumes. To create a volume with a backing store, set the `backing_store_path` and `backing_store_format` properties.

**backing_store_path** Path to the backing store image to use. This can also be the name of a volume to use as backing store within the same pool.

New in version 3001.

**backing_store_format** Image format of the disk or volume to use as backing store. This property is mandatory when using `backing_store_path` to avoid problems

New in version 3001.

**source_file** Absolute path to the disk image to use. Not to be confused with `image` parameter. This parameter is useful to use disk images that are created outside of this module. Can also be None for devices that have no associated image like cdroms.

Changed in version 3001.

For volume disks, this can be the name of a volume already existing in the storage pool.

**device** Type of device of the disk. Can be one of 'disk', 'cdrom', 'floppy' or 'lun'. (Default: 'disk')

**hostname_property** When using ZFS volumes, setting this value to a ZFS property ID will make Salt store the name of the virtual machine inside this property. (Default: None)

**sparse_volume** Boolean to specify whether to use a thin provisioned ZFS volume.

Example profile for a bhyve VM with two ZFS disks. The first is cloned from the specified image. The second disk is a thin provisioned volume.

```yaml
virt:
  disk:
    two_zvols:
      - system:
          image: zroot/bhyve/CentOS-7-x86_64-v1@v1.0.5
          hostname_property: virt:hostname
          pool: zroot/bhyve/guests
          - data:
```

(continues on next page)
io  I/O control policy. String value amongst native, threads and io_uring. (Default: native)

    New in version 3003.

iothread_id  I/O thread id to assign the disk to. (Default: none assigned)

    New in version 3003.

Graphics Definition

The graphics dictionary can have the following properties:

type  Graphics type. The possible values are none, 'spice', 'vnc' and other values allowed as a libvirt
      graphics type (Default: None)

    See the libvirt graphics element documentation for more details on the possible types.

port  Port to export the graphics on for vnc, spice and rdp types.

tls_port  Port to export the graphics over a secured connection for spice type.

listen  Dictionary defining on what address to listen on for vnc, spice and rdp. It has a type property
      with address and None as possible values, and an address property holding the IP or hostname to
      listen on.

    By default, not setting the listen part of the dictionary will default to listen on all addresses.

Serials and Consoles Definitions

Serial dictionaries can contain the following properties:

type  Type of the serial connection, like 'tcp', 'pty', 'file', 'udp', 'dev', 'pipe', 'unix'.

path  Path to the source device. Can be a log file, a host character device to pass through, a unix socket, a
      named pipe path.

host  The serial UDP or TCP host name. (Default: 23023)

port  The serial UDP or TCP port number. (Default: 23023)

protocol  Name of the TCP connection protocol. (Default: telnet)

tls  Boolean value indicating whether to use hypervisor TLS certificates environment for TCP devices.

target_port  The guest device port number starting from 0

target_type  The guest device type. Common values are serial, virtio or usb-serial, but more are
      documented in the libvirt documentation.

CLI Example

salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile

The disk images will be created in an image folder within the directory defined by the virt:images option.
Its default value is /srv/salt-images/ but this can changed with such a configuration:

salt.modules.virt.is_hyper()
    Returns a bool whether or not this node is a hypervisor of any kind
CLI Example:
```
salt '*' virt.is_hyper
```

```
salt.modules.virt.list_active_vms(**kwargs)
Return a list of names for active virtual machine on the minion

Parameters
  • connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  • password -- password to connect with, overriding defaults
    New in version 2019.2.0.
```

CLI Example:
```
salt '*' virt.list_active_vms
```

```
salt.modules.virt.list_domains(**kwargs)
Return a list of available domains.

Parameters
  • connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  • password -- password to connect with, overriding defaults
    New in version 2019.2.0.
```

CLI Example:
```
salt '*' virt.list_domains
```

```
salt.modules.virt.list_inactive_vms(**kwargs)
Return a list of names for inactive virtual machine on the minion

Parameters
  • connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  • username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  • password -- password to connect with, overriding defaults
    New in version 2019.2.0.
```

CLI Example:
```
salt '*' virt.list_inactive_vms
```

```
salt.modules.virt.list_networks(**kwargs)
List all virtual networks.

Parameters
  • connection -- libvirt connection URI, overriding defaults
  • username -- username to connect with, overriding defaults
  • password -- password to connect with, overriding defaults
```

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_networks
```

```python
salt.modules.virt.list_pools(**kwargs)
```

List all storage pools.

**Parameters**

- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_pools
```

```python
salt.modules.virt.list_snapshots(domain=None, **kwargs)
```

List available snapshots for certain vm or for all.

**Parameters**

- `domain` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:

```
salt '*' virt.list_snapshots
dsalt '*' virt.list_snapshots <domain>
```

```python
salt.modules.virt.migrate(vm, target, **kwargs)
```

Shared storage migration

**Parameters**

- `vm` -- domain name
- `target` -- target libvirt URI or host name
- `kwargs` --
  - `live`: Use live migration. Default value is True.
  - `persistent`: Leave the domain persistent on destination host. Default value is True.
  - `undefinesource`: Undefine the domain on the source host. Default value is True.
  - `offline`: If set to True it will migrate the domain definition without starting the domain on destination and without stopping it on source host. Default value is False.
  - `max_bandwidth`: The maximum bandwidth (in MiB/s) that will be used.
  - `max_downtime`: Set maximum tolerable downtime for live-migration. The value represents a number of milliseconds the guest is allowed to be down at the end of live migration.
  - `parallel_connections`: Specify a number of parallel network connections to be used to send memory pages to the destination host.
- compressed: Activate compression.
- comp_methods: A comma-separated list of compression methods. Supported methods are "mt" and "xbzrle" and can be used in any combination. QEMU defaults to "xbzrle".
- comp_mt_level: Set compression level. Values are in range from 0 to 9, where 1 is maximum speed and 9 is maximum compression.
- comp_mt_threads: Set number of compress threads on source host.
- comp_xbzrle_cache: Set the size of page cache for xbzrle compression in bytes.
- copy_storage: Migrate non-shared storage. It must be one of the following values: all (full disk copy) or incremental (Incremental copy)
- postcopy: Enable the use of post-copy migration.
- postcopy_bandwidth: The maximum bandwidth allowed in post-copy phase. (MiB/s)
- username: Username to connect with target host
- password: Password to connect with target host

New in version 3002.

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor URI>
salt src virt.migrate guest qemu+ssh://dst/system
salt src virt.migrate guest qemu+tls://dst/system
salt src virt.migrate guest qemu+tcp://dst/system
```

A tunnel data migration can be performed by setting this in the configuration:

```
virt:
  tunnel: True
```

For more details on tunnelled data migrations, report to https://libvirt.org/migration.html#transporttunnel

```
salt.modules.virt.migrate_start_postcopy(vm_)
```

Starts post-copy migration. This function has to be called while live migration is in progress and it has been initiated with the postcopy=True option.

CLI Example:

```
salt '*' virt.migrate_start_postcopy <domain>
```

```
salt.modules.virt.nesthash(value=None)
```

create default dict that allows arbitrary level of nesting

```
salt.modules.virt.network_define(name, bridge, forward, ipv4_config=None, ipv6_config=None, vport=None, tag=None, autostart=True, start=True, mtu=None, domain=None, nat=None, interfaces=None, addresses=None, physical_function=None, dns=None, **kwargs)
```

Create libvirt network.

Parameters

- name -- Network name.
- bridge -- Bridge name.
- forward -- Forward mode (bridge, router, nat).

Changed in version 3003: a None value creates an isolated network with no forwarding at all

- vport -- Virtualport type. The value can also be a dictionary with type and parameters keys. The parameters value is a dictionary of virtual port parameters.
- vport:
  type: openvswitch
  parameters:
    interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aaa4f

Changed in version 3003: possible dictionary value
- **tag** -- Vlan tag. The value can also be a dictionary with the **tags** and optional **trunk** keys. **trunk** is a boolean value indicating whether to use VLAN trunking. **tags** is a list of dictionaries with keys **id** and **nativeMode**. The **nativeMode** value can be one of **tagged** or **untagged**.

- **tag**:
  trunk: True
  tags:
    - id: 42
      nativeMode: untagged
    - id: 47

Changed in version 3003: possible dictionary value
- **autostart** -- Network autostart (default True).
- **start** -- Network start (default True).
- **ipv4_config** *(dict or None)* -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.
  
  New in version 3000.
- **ipv6_config** *(dict or None)* -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in *net-define-ip*.
  
  New in version 3000.
- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default None)
  
  New in version 3003.
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory **name** property and an optional **localOnly** boolean one. (default None)

- **domain**:
  name: lab.acme.org
  localOnly: True

New in version 3003.
- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys **address** and **port**. Both values are a dictionary with **start** and **end** values. (default None)

- **forward**: nat
  - nat:
    address:
      start: 1.2.3.4
      end: 1.2.3.10
    port:
      start: 500
      end: 1000
New in version 3003.

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)

  ```
  - forward: passthrough
  - interfaces: "eth10 eth11 eth12"
  ```

New in version 3003.

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in *hostdev* forward mode. (default None)

  ```
  - forward: hostdev
  - interfaces: "0000:04:00.1 0000:e3:01.2"
  ```

New in version 3003.

- **physical_function** -- device name of the physical interface to use in *hostdev* forward mode. (default None)

  ```
  - forward: hostdev
  - physical_function: "eth0"
  ```

New in version 3003.

- **dns** -- virtual network DNS configuration. The value is a dictionary described in *net-define-dns*. (default None)

  ```
  - dns:
    - forwarders:
      - domain: example.com
        addr: 192.168.1.1
      - addr: 8.8.8.8
        domain: www.example.com
      txt:
        example.com: "v=spf1 a -all"
        _http.tcp.example.com: "name=value,paper=A4"
    hosts:
      192.168.1.2:
        mirror.acme.lab
        test.acme.lab
    srvs:
      name: ldap
      protocol: tcp
      domain: ldapserver.example.com
      target: .
      port: 389
      priority: 1
      weight: 10
  ```
**IP configuration definition**

Both the IPv4 and IPv6 configuration dictionaries can contain the following properties:

- `cidr`  CIDR notation for the network. For example '192.168.124.0/24'
- `dhcp_ranges`  A list of dictionaries with 'start' and 'end' properties.
- `hosts`  A list of dictionaries with 'ip' property and optional 'name', 'mac' and 'id' properties.

  New in version 3003.

- `bootp`  A dictionary with a 'file' property and an optional 'server' one.

  New in version 3003.

- `tftp`  The path to the TFTP root directory to serve.

  New in version 3003.

**DNS configuration definition**

The DNS configuration dictionary contains the following optional properties:

- `forwarders`  List of alternate DNS forwarders to use. Each item is a dictionary with the optional 'domain' and 'addr' keys. If both are provided, the requests to the domain are forwarded to the server at the 'addr'. If only 'domain' is provided the requests matching this domain will be resolved locally. If only 'addr' is provided all requests will be forwarded to this DNS server.

- `txt`  Dictionary of TXT fields to set.

- `hosts`  Dictionary of host DNS entries. The key is the IP of the host, and the value is a list of hostnames for it.

- `srvs`  List of SRV DNS entries. Each entry is a dictionary with the mandatory 'name' and 'protocol' keys. Entries can also have 'target', 'port', 'priority', 'domain' and 'weight' optional properties.

CLI Example:

```
salt '*' virt.network_define network main bridge openvswitch
```

New in version 2019.2.0.

**salt.modules.virt.network_get_xml(name, **kwargs)**

Return the XML definition of a virtual network

**Parameters**

- `name` -- libvirt network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 3000.

CLI Example:

```
salt '*' virt.network_get_xml default
```

**salt.modules.virt.network_info(name=Name, **kwargs)**

Return information on a virtual network provided its name.

**Parameters**

- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined virtual networks.

New in version 2019.2.0.

CLI Example:
salt '*' virt.network_info default

```
salt.modules.virt.network_set_autostart(name, state='on', **kwargs)
```
Set the autostart flag on a virtual network so that the network will start with the host system on reboot.

**Parameters**
- `name` -- virtual network name
- `state` -- 'on' to auto start the network, anything else to mark the virtual network not to be started when the host boots
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_set_autostart <pool> <on | off>
```

```
salt.modules.virt.network_start(name, **kwargs)
```
Start a defined virtual network.

**Parameters**
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_start default
```

```
salt.modules.virt.network_stop(name, **kwargs)
```
Stop a defined virtual network.

**Parameters**
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_stop default
```

```
salt.modules.virt.network_undefine(name, **kwargs)
```
Remove a defined virtual network. This does not stop the virtual network.

**Parameters**
- `name` -- virtual network name
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.network_undefine default
```
salt.modules.virt.network_update(name, bridge, forward, ipv4_config=None, ipv6_config=None, vport=None, tag=None, mtu=None, domain=None, nat=None, interfaces=None, addresses=None, physical_function=None, dns=None, test=False, **kwargs)

Update a virtual network if needed.

Parameters

- **name** -- Network name.
- **bridge** -- Bridge name.
- **forward** -- Forward mode (bridge, router, nat). A `None` value creates an isolated network with no forwarding at all.
- **vport** -- Virtualport type. The value can also be a dictionary with `type` and `parameters` keys. The `parameters` value is a dictionary of virtual port parameters.

  ```
  - vport:
    type: openvswitch
    parameters:
      interfaceid: 09b11c53-8b5c-4eeb-8f00-d84eaa0aaa4f
  ```

- **tag** -- Vlan tag. The value can also be a dictionary with the `tags` and optional `trunk` keys. `trunk` is a boolean value indicating whether to use VLAN trunking. `tags` is a list of dictionaries with keys `id` and `nativeMode`. The `nativeMode` value can be one of `tagged` or `untagged`.

  ```
  - tag:
    trunk: True
    tags:
      - id: 42
        nativeMode: untagged
      - id: 47
  ```

- **ipv4_config** *(dict or None)* -- IP v4 configuration. Dictionary describing the IP v4 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.

- **ipv6_config** *(dict or None)* -- IP v6 configuration. Dictionary describing the IP v6 setup like IP range and a possible DHCP configuration. The structure is documented in `net-define-ip`.

- **connection** -- libvirt connection URI, overriding defaults.
- **username** -- username to connect with, overriding defaults.
- **password** -- password to connect with, overriding defaults.
- **mtu** -- size of the Maximum Transmission Unit (MTU) of the network. (default `None`)
- **domain** -- DNS domain name of the DHCP server. The value is a dictionary with a mandatory `name` property and an optional `localOnly` boolean one. (default `None`)

  ```
  - domain:
    name: lab.acme.org
    localOnly: True
  ```

- **nat** -- addresses and ports to route in NAT forward mode. The value is a dictionary with optional keys `address` and `port`. Both values are a dictionary with `start` and `end` values. (default `None`)

  ```
  - forward: nat
    nat:
      address:
        start: 1.2.3.4
        end: 1.2.3.10
  ```

(continues on next page)
port:
  start: 500
  end: 1000

- **interfaces** -- whitespace separated list of network interfaces devices that can be used for this network. (default None)
  - forward: passthrough
  - interfaces: "eth0 eth11 eth12"

- **addresses** -- whitespace separated list of addresses of PCI devices that can be used for this network in hostdev forward mode. (default None)
  - forward: hostdev
  - interfaces: "0000:04:00.1 0000:e3:01.2"

- **physical_function** -- device name of the physical interface to use in hostdev forward mode. (default None)
  - forward: hostdev
  - physical_function: "eth0"

- **dns** -- virtual network DNS configuration. The value is a dictionary described in net-define-dns. (default None)
  - dns:
    - forwarders:
      - domain: example.com
        addr: 192.168.1.1
      - addr: 8.8.8.8
      - domain: www.example.com
    - txt:
      - example.com: "$=spf1 a -all"
      - _http.tcp.example.com: "name=value,paper=A4"
    - hosts:
      192.168.1.2:
        - mirror.acme.lab
        - test.acme.lab
    - srvs:
      - name: ldap
        protocol: tcp
        domain: ldapserver.example.com
        target: .
        port: 389
        priority: 1
        weight: 10

New in version 3003.

salt.modules.virt.node_devices(**kwargs)**
List the host available devices.

Parameters

- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 3003.

salt.modules.virt.node_info(**kwargs)**
Return a dict with information about this node

Parameters
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.node_info
```

salt.modules.virt.pause(vm_, **kwargs)
Pause the named vm

Parameters
• **vm** -- domain name
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pause <domain>
```

salt.modules.virt.pool_build(name, **kwargs)
Build a defined libvirt storage pool.

Parameters
• **name** -- libvirt storage pool name
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt '*' virt.pool_build default
```

salt.modules.virt.pool_capabilities(**kwargs)
Return the hypervisor connection storage pool capabilities.

The returned data are either directly extracted from libvirt or computed. In the latter case some pool types could be listed as supported while they are not. To distinguish between the two cases, check the value of the `computed` property.

Parameters
• **connection** -- libvirt connection URI, overriding defaults
• **username** -- username to connect with, overriding defaults
• **password** -- password to connect with, overriding defaults

New in version 3000.

CLI Example:
```
salt '*' virt.pool_capabilities
```
salt.modules.virt.pool_define(name, ptype, target=None, permissions=None, source_devices=None, source_dir=None, source_adapter=None, source_initiator=None, source_hosts=None, source_auth=None, source_name=None, source_format=None, transient=False, start=True, **kwargs)

Create libvirt pool.

Parameters

- **name** -- Pool name
- **ptype** -- Pool type. See libvirt documentation for the possible values.
- **target** -- Pool full path target
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **source_devices** -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with path and optionally part_separator keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of part_separator
- **source_dir** -- Path to the source directory for pools of type dir, netfs or gluster. (Default: None)
- **source_initiator** -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
- **source_adapter** -- SCSI source definition. The value is a dictionary with type, name, parent, managed, parent_wwnn, parent_wwpn, parent_fabric_wwn, wwnn, wwpn and parent_address keys.

The parent_address value is a dictionary with unique_id and address keys. The address represents a PCI address and is itself a dictionary with domain, bus, slot and function properties. Report to this libvirt page for the meaning and possible values of these properties.
- **source_hosts** -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- **source_auth** -- Source authentication details. (Default: None)

The value is a dictionary with type, username and secret keys. The type can be one of ceph for Ceph RBD or chap for iSCSI sources.

The secret value links to a libvirt secret object. It is a dictionary with type and value keys. The type value can be either uuid or usage.

Examples:

```python
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

```python
source_auth={
    'type': 'chap',
    'username': 'myname',
    'secret': {
        'type': 'uuid',
        'value': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

(continues on next page)
Since 3000, instead the source authentication can only contain username and password properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- **source_name** -- Identifier of name-based sources.
- **source_format** -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- **start** -- Pool start (default True)
- **transient** -- When True, the pool will be automatically undefined after being stopped. Note that a transient pool will force start to True. (Default: False)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

**Permissions definition**

The permissions are described by a dictionary containing the following keys:

- **mode** The octal representation of the permissions. (Default: 0711)
- **owner** the numeric user ID of the owner. (Default: from the parent folder)
- **group** the numeric ID of the group. (Default: from the parent folder)
- **label** the SELinux label. (Default: None)

**CLI Example:**

Local folder pool:

```bash
salt '*' virt.pool_define somepool dir target=/srv/mypool
  → permissions="{'mode': '0744' 'owner': 107, 'group': 107 }
```

CIFS backed pool:

```bash
salt '*' virt.pool_define myshare netfs source_format=cifs
  → source_dir=samba_share source_hosts="['example.com']" target=/mnt/
```

New in version 2019.2.0.

```python
salt.modules.virt.pool_delete(name, **kwargs)
```
Delete the resources of a defined libvirt storage pool.

**Parameters**

- **name** -- libvirt storage pool name
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**
salt '*' virt.pool_delete default

```python
salt.modules.virt.pool_get_xml(name, **kwargs)
Return the XML definition of a virtual storage pool

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 3000.

CLI Example:
salt '*' virt.pool_get_xml default
```

```python
salt.modules.virt.pool_info(name=None, **kwargs)
Return information on a storage pool provided its name.

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

If no name is provided, return the infos for all defined storage pools.

New in version 2019.2.0.

CLI Example:
salt '*' virt.pool_info default
```

```python
salt.modules.virt.pool_list_volumes(name, **kwargs)
List the volumes contained in a defined libvirt storage pool.

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt "*" virt.pool_list_volumes <pool>
```

```python
salt.modules.virt.pool_refresh(name, **kwargs)
Refresh a defined libvirt storage pool.

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt '*' virt.pool_refresh default
```
salt.modules.virt.pool_set_autostart(name, state='on', **kwargs)
Set the autostart flag on a libvirt storage pool so that the storage pool will start with the host system on reboot.

Parameters
- name -- libvirt storage pool name
- state -- 'on' to auto start the pool, anything else to mark the pool not to be started when the host boots
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*" virt.pool_set_autostart <pool> <on | off>
```

salt.modules.virt.pool_start(name, **kwargs)
Start a defined libvirt storage pool.

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*" virt.pool_start default
```

salt.modules.virt.pool_stop(name, **kwargs)
Stop a defined libvirt storage pool.

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*" virt.pool_stop default
```

salt.modules.virt.pool_undefine(name, **kwargs)
Remove a defined libvirt storage pool. The pool needs to be stopped before calling.

Parameters
- name -- libvirt storage pool name
- connection -- libvirt connection URI, overriding defaults
- username -- username to connect with, overriding defaults
- password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
```
salt "*" virt.pool_undefine default
```
salt.modules.virt.pool_update\( name,\ ptype,\ target=\text{None},\ permissions=\text{None},\ source_devices=\text{None},\ source\_dir=\text{None},\ source\_initiator=\text{None},\ source\_adapter=\text{None},\ source\_hosts=\text{None},\ source\_auth=\text{None},\ source\_name=\text{None},\ source\_format=\text{None},\ test=Fals e, **\text{kwargs} \)\)

Update a libvirt storage pool if needed. If called with test=True, this is also reporting whether an update would be performed.

**Parameters**

- `name` -- Pool name
- `ptype` -- Pool type. See libvirt documentation for the possible values.
- `target` -- Pool full path target
- `permissions` -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- `source_devices` -- List of source devices for pools backed by physical devices. (Default: None)

Each item in the list is a dictionary with `path` and optionally `part_separator` keys. The path is the qualified name for iSCSI devices.

Report to this libvirt page for more information on the use of `part_separator`
- `source_dir` -- Path to the source directory for pools of type `dir`, `netfs` or `gluster`. (Default: None)
- `source_initiator` -- Initiator IQN for libiscsi-direct pool types. (Default: None)

New in version 3000.
- `source_adapter` -- SCSI source definition. The value is a dictionary with `type`, `name`, `managed`, `parent_wwn`, `parent_wwpn`, `parent_fabric_wwn`, `wwnn`, `wwpn` and `parent_address` keys.

The `parent_address` value is a dictionary with `unique_id` and `address` keys. The address represents a PCI address and is itself a dictionary with `domain`, `bus`, `slot` and `function` properties. Report to this libvirt page for the meaning and possible values of these properties.
- `source_hosts` -- List of source for pools backed by storage from remote servers. Each item is the hostname optionally followed by the port separated by a colon. (Default: None)
- `source_auth` -- Source authentication details. (Default: None)

The value is a dictionary with `type`, `username` and `secret` keys. The type can be one of `ceph` for Ceph RBD or `chap` for iSCSI sources.

The `secret` value links to a libvirt secret object. It is a dictionary with `type` and `value` keys. The type value can be either `uuid` or `usage`.

Examples:

```python
source_auth={
    'type': 'ceph',
    'username': 'admin',
    'secret': {
        'type': 'uuid',
        'uuid': '2ec115d7-3a88-3ceb-bc12-0ac909a6fd87'
    }
}
```

```python
source_auth={
    'type': 'chap',
    'username': 'myname',
```

(continues on next page)
Since 3000, instead the source authentication can only contain `username` and `password` properties. In this case the libvirt secret will be defined and used. For Ceph authentications a base64 encoded key is expected.

- `source_name` -- Identifier of name-based sources.
- `source_format` -- String representing the source format. The possible values are depending on the source type. See libvirt documentation for the possible values.
- `test` -- run in dry-run mode if set to True
- `connection` -- libvirt connection URI, overriding defaults
- `username` -- username to connect with, overriding defaults
- `password` -- password to connect with, overriding defaults

**Example:**

Local folder pool:

```bash
salt '*' virt.pool_update somepool dir target=/srv/mypool
    permissions="\{'mode': '0744', 'owner': 107, 'group': 107\}" |
```

CIFS backed pool:

```bash
salt '*' virt.pool_update myshare netfs source_format=cifs
    source_dir=samba_share source_hosts="[\'example.com\']" target=/mnt/cifs
```

New in version 3000.

**salt.modules.virt.purge**(*vm_, dirs=False, removables=False, **kwargs*)

Recursively destroy and delete a persistent virtual machine, pass True for dir’s to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

**Parameters**

- `vm` -- domain name
- `dirs` -- pass True to remove containing directories
- `removables` -- pass True to remove removable devices

New in version 2019.2.0.

- `connection` -- libvirt connection URI, overriding defaults

New in version 2019.2.0.

- `username` -- username to connect with, overriding defaults

New in version 2019.2.0.

- `password` -- password to connect with, overriding defaults

New in version 2019.2.0.

**CLI Example:**

```bash
salt '*' virt.purge <domain>
```

**salt.modules.virt.reboot**(*name, **kwargs*)

Reboot a domain via ACPI request
Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reboot <domain>
```

salt.modules.virt.reset(*vm_, **kwargs)

Reset a VM by emulating the reset button on a physical machine

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.reset <domain>
```

salt.modules.virt.resume(*vm_, **kwargs)

Resume the named vm

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```
salt '*' virt.resume <domain>
```

salt.modules.virt.revert_snapshot(name, vm_snapshot=None, cleanup=False, **kwargs)

Revert snapshot to the previous from current (if available) or to the specific.

Parameters

- **name** -- domain name
- **vm_snapshot** -- name of the snapshot to revert
- **cleanup** -- Remove all newer than reverted snapshots. Values: True or False (default False).
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

New in version 2016.3.0.

CLI Example:
```bash
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

```
salt.modules.virt.seed_non_shared_migrate(disks, force=False)
Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

Parameters
• **disks** -- the list of disk data as provided by virt.get_disks
• **force** -- skip checking the compatibility of source and target disk images if True.
  (default: False)

CLI Example:
```bash
salt '*' virt.seed_non_shared_migrate <disks>
```

```
salt.modules.virt.set_autostart(vm_, state='on', **kwargs)
Set the autostart flag on a VM so that the VM will start with the host system on reboot.

Parameters
• **vm** -- domain name
• **state** -- 'on' to auto start the VM, 'off' to mark the VM not to be started when the host boots
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
```bash
salt "*" virt.set_autostart <domain> <on | off>
```

```
salt.modules.virt.setmem(vm_, memory, config=False, **kwargs)
Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

Parameters
• **vm** -- name of the domain
• **memory** -- memory amount to set in MB
• **config** -- if True then libvirt will be asked to modify the config as well
• **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
• **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
• **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

CLI Example:
salt 'salt.sqrt' virt.setmem <domain> <size>
salt 'salt.sqrt' virt.setmem my_domain 768

salt.modules.virt.setvcpus(vm_, vcpus, config=False, **kwargs)
Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.
If config is True then we ask libvirt to modify the config as well
Parameters

• vm -- name of the domain
• vcpus -- integer representing the number of CPUs to be assigned
• config -- if True then libvirt will be asked to modify the config as well
• connection -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
• username -- username to connect with, overriding defaults

New in version 2019.2.0.
• password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt 'salt.sqrt' virt.setvcpus <domain> <amount>
salt 'salt.sqrt' virt.setvcpus my_domain 4

salt.modules.virt.shutdown(vm_, **kwargs)
Send a soft shutdown signal to the named vm
Parameters

• vm -- domain name
• connection -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
• username -- username to connect with, overriding defaults

New in version 2019.2.0.
• password -- password to connect with, overriding defaults

New in version 2019.2.0.

CLI Example:
salt 'salt.sqrt' virt.shutdown <domain>

salt.modules.virt.snapshot(domain, name=None, suffix=None, **kwargs)
Create a snapshot of a VM.
Parameters

• domain -- domain name
• name -- Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
• suffix -- Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.
• connection -- libvirt connection URI, overriding defaults

New in version 2019.2.0.
• username -- username to connect with, overriding defaults

New in version 2019.2.0.
• password -- password to connect with, overriding defaults

New in version 2019.2.0.
New in version 2016.3.0.

CLI Example:
```
salt '*' virt.snapshot <domain>
```

```
salt.modules.virt.start(name, **kwargs)
```

Start a defined domain

Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.start <domain>
```

```
salt.modules.virt.stop(name, **kwargs)
```

Hard power down the virtual machine, this is equivalent to pulling the power.

Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.stop <domain>
```

```
salt.modules.virt.undefine(vm_, **kwargs)
```

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

Parameters
- `vm` -- domain name
- `connection` -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- `username` -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- `password` -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:
```
salt '*' virt.undefine <domain>
```
salt.modules.virt.update(name, cpu=0, mem=0, disk_profile=None, disks=None, nic_profile=None, interfaces=None, graphics=None, live=True, boot=None, numatune=None, test=False, boot_dev=None, hypervisor_features=None, clock=None, serials=None, consoles=None, stop_on_reboot=False, host_devices=None, autostart=False, **kwargs)

Update the definition of an existing domain.

Parameters

- **name** -- Name of the domain to update
- **cpu** -- Number of virtual CPUs to assign to the virtual machine or a dictionary with detailed information to configure cpu model and topology, numa node tuning, cpu tuning and iothreads allocation. The structure of the dictionary is documented in cpu parameters definition.

To update any cpu parameters specify the new values to the corresponding tag. To remove any element or attribute, specify None object. Please note that None object is mapped to null in yaml, use null in sls file instead.

- **mem** -- Amount of memory to allocate to the virtual machine in MiB. Since 3002, a dictionary can be used to contain detailed configuration which support memory allocation or tuning. Supported parameters are boot, current, max, slots, hard_limit, soft_limit, swap_hard_limit, min_guarantee, hugepages, nosharepages, locked, source, access, allocation and discard. The structure of the dictionary is documented in Memory parameter definition. Both decimal and binary base are supported. Detail unit specification is documented in Units specification. Please note that the value for slots must be an integer.

To remove any parameters, pass a None object, for instance: 'soft_limit': None. Please note that None is mapped to null in sls file, pass null in sls file instead.

```yaml
- mem:
    hard_limit: null
    soft_limit: null
```

Changed in version 3002.

- **disk_profile** -- disk profile to use
- **disks** -- Disk definitions as documented in the init() function. If neither the profile nor this parameter are defined, the disk devices will not be changed. However to clear disks set this parameter to empty list.
- **nic_profile** -- network interfaces profile to use
- **interfaces** -- Network interface definitions as documented in the init() function. If neither the profile nor this parameter are defined, the interface devices will not be changed. However to clear network interfaces set this parameter to empty list.
- **graphics** -- The new graphics definition as defined in Graphics Definition. If not set, the graphics will not be changed. To remove a graphics device, set this parameter to {'type': 'none'}.
- **live** -- False to avoid trying to live update the definition. In such a case, the new definition is applied at the next start of the virtual machine. If True, not all aspects of the definition can be live updated, but as much as possible will be attempted. (Default: True)
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
- **boot** -- Specifies kernel, initial ramdisk and kernel command line parameters for the virtual machine. This is an optional parameter, all of the keys are optional within the dictionary.

Refer to Boot parameters definition for the complete boot parameter description.
To update any boot parameters, specify the new path for each. To remove any boot parameters, pass `None` object, for instance: 'kernel':`None`. To switch back to BIOS boot, specify ('loader': `None` and 'nvram': `None`) or 'efi': `False`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

SLS file Example:

```
- boot:
  loader: null
  nvram: null
```

New in version 3000.

- `boot_dev` -- Space separated list of devices to boot from sorted by decreasing priority. Values can be `hd`, `fd`, `cdrom` or `network`.

By default, the value will "hd".

New in version 3002.

- `numatune` -- The optional numatune element provides details of how to tune the performance of a NUMA host via controlling NUMA policy for domain process. The optional `memory` element specifies how to allocate memory for the domain process on a NUMA host. `memnode` elements can specify memory allocation policies per each guest NUMA node. The definition used in the dictionary can be found at `cpu parameters definition`.

   To update any numatune parameters, specify the new value. To remove any numatune parameters, pass a `None` object, for instance: 'numatune': `None`. Please note that `None` is mapped to `null` in sls file, pass `null` in sls file instead.

New in version 3003.

- `serials` -- Dictionary providing details on the serials connection to create. (Default: `None`) See `Serials and Consoles Definitions` for more details on the possible values.

New in version 3003.

- `consoles` -- Dictionary providing details on the consoles device to create. (Default: `None`) See `Serials and Consoles Definitions` for more details on the possible values.

New in version 3003.

- `stop_on_reboot` -- If set to `True` the guest will stop instead of rebooting. This is specially useful when creating a virtual machine with an installation cdrom or an autoinstallation needing a special first boot configuration. Defaults to `False`

New in version 3003.

- `test` -- run in dry-run mode if set to `True`

New in version 3001.

- `hypervisor_features` -- Enable or disable hypervisor-specific features on the virtual machine.

New in version 3003.

```
hypervisor_features:
  kvm-hint-dedicated: True
```

- `clock` -- Configure the guest clock. The value is a dictionary with the following keys:

  adjustment time adjustment in seconds or `reset`

  utc set to `False` to use the host local time as the guest clock. Defaults to `True`.

  timezone synchronize the guest to the corresponding timezone
timers a dictionary associating the timer name with its configuration. This configuration is a dictionary with the properties track, tickpolicy, catchup, frequency, mode, present, slew, threshold and limit. See libvirt time keeping documentation for the possible values.

New in version 3003.

Set the clock to local time using an offset in seconds .. code-block:: yaml
clock:
  adjustment: 3600 utc: False
Set the clock to a specific time zone:

clock:
  timezone: CEST

Tweak guest timers:

clock:
  timers:
    tsc:
      frequency: 3504000000
      mode: native
    rtc:
      track: wall
      tickpolicy: catchup
      slew: 4636
      threshold: 123
      limit: 2342
    hpet:
      present: False

- host_devices -- List of host devices to passthrough to the guest. The value is a list of device names as provided by the node_devices() function. (Default: None)

New in version 3003.

- autostart -- If set to True the host will start the guest after boot. (Default: False)

Returns

Returns a dictionary indicating the status of what has been done. It is structured in the following way:

{  
  'definition': True,  
  'cpu': True,  
  'mem': True,  
  'disks': {'attached': [list of actually attached disks],  
             'detached': [list of actually detached disks]},  
  'nics': {'attached': [list of actually attached nics],  
            'detached': [list of actually detached nics]},  
  'errors': ['error messages for failures']
}

New in version 2019.2.0.

CLI Example:

salt '*' virt.update domain cpu=2 mem=1024

salt.modules.virt.virt_type()

Returns the virtual machine type as a string

CLI Example:
salt '*' virt.virt_type

```
salt.modules.virt.vm_cputime(vm_=None, **kwargs)

  Return cputime used by the vms on this hypervisor in a list of dicts:

  Parameters

  * vm -- domain name
  * connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  * username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  * password -- password to connect with, overriding defaults
    New in version 2019.2.0.

  [  
    'your-vm': {  
      'cputime' <int>,  
      'cputime_percent' <int>  
    },  
    ...  
  ]

  If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

  CLI Example:

  salt '*' virt_virt_cputime
```

salt.modules.virt.vm_diskstats(vm_=None, **kwargs)

  Return disk usage counters used by the vms on this hypervisor in a list of dicts:

  Parameters

  * vm -- domain name
  * connection -- libvirt connection URI, overriding defaults
    New in version 2019.2.0.
  * username -- username to connect with, overriding defaults
    New in version 2019.2.0.
  * password -- password to connect with, overriding defaults
    New in version 2019.2.0.

  [  
    'your-vm': {  
      'rd_req' : 0,  
      'rd_bytes' : 0,  
      'wr_req' : 0,  
      'wr_bytes' : 0,  
      'errs' : 0  
    },  
    ...  
  ]

  If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

  CLI Example:
salt '*' virt.vm_blockstats

salt.modules.virt.vm_info(vm_=None, **kwargs)
Return detailed information about the vms on this hyper in a list of dicts:

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

\[
[
  'your-vm': {
    'cpu': <int>,
    'maxMem': <int>,
    'mem': <int>,
    'state': '<state>',
    'cputime': <int>
  },
  ...
]
\]

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

salt '*' virt.vm_info

salt.modules.virt.vm_netstats(vm_=None, **kwargs)
Return combined network counters used by the vms on this hyper in a list of dicts:

Parameters

- **vm** -- domain name
- **connection** -- libvirt connection URI, overriding defaults
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  New in version 2019.2.0.

\[
[
  'your-vm': {
    'rx_bytes' : 0,
    'rx_packets' : 0,
    'rx_errs' : 0,
    'rx_drop' : 0,
    'tx_bytes' : 0,
    'tx_packets' : 0,
    'tx_errs' : 0,
    'tx_drop' : 0
  },
  ...
]
\]

(continues on next page)
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```bash
salt '*' virt.vm_netstats
```

```
salt.modules.virt.vm_state(vm_=None, **kwargs)
```

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

Parameters

- **vm** -- name of the domain
- **connection** -- libvirt connection URI, overriding defaults
  
  New in version 2019.2.0.
- **username** -- username to connect with, overriding defaults
  
  New in version 2019.2.0.
- **password** -- password to connect with, overriding defaults
  
  New in version 2019.2.0.

CLI Example:

```bash
salt '*' virt.vm_state <domain>
```

```
salt.modules.virt.volume_define(pool, name, size, allocation=0, format=None, type=None, permissions=None, backing_store=None, nocow=False, **kwargs)
```

Create libvirt volume.

Parameters

- **pool** -- name of the pool to create the volume in
- **name** -- name of the volume to define
- **size** -- capacity of the volume to define in MiB
- **allocation** -- allocated size of the volume in MiB. Defaults to 0.
- **format** -- volume format. The allowed values are depending on the pool type. Check the virt.pool_capabilities output for the possible values and the default.
- **type** -- type of the volume. One of file, block, dir, network, netdiri, ploop or None. By default, the type is guessed by libvirt from the pool type.
- **permissions** -- Permissions to set on the target folder. This is mostly used for filesystem-based pool types. See Permissions definition for more details on this structure.
- **backing_store** -- dictionary describing a backing file for the volume. It must contain a path property pointing to the base volume and a format property defining the format of the base volume.

The base volume format will not be guessed for security reasons and is thus mandatory.
- **nocow** -- disable COW for the volume.
- **connection** -- libvirt connection URI, overriding defaults
- **username** -- username to connect with, overriding defaults
- **password** -- password to connect with, overriding defaults
**CLI Example:**

Volume on ESX:

```text
salt '*' virt.volume_define "[local-storage]" myvm/myvm.vmdk vmdk 8192
```

QCow2 volume with backing file:

```text
salt '*' virt.volume_define default myvm.qcow2 qcow2 8192
→ permissions="{"mode": '0775', 'owner': '123', 'group': '345"}"
→ backing_store="{"path": '/path/to/base.img', 'format': 'raw'}"
→ nocow=True
```

New in version 3001.

```
salt.modules.virt.volume_delete(pool, volume, **kwargs)
Delete a libvirt managed volume.

Parameters
• pool -- libvirt storage pool name
• volume -- name of the volume to delete
• connection -- libvirt connection URI, overriding defaults
• username -- username to connect with, overriding defaults
• password -- password to connect with, overriding defaults
```

New in version 3000.

```
salt.modules.virt.volume_infos(pool=None, volume=None, **kwargs)
Provide details on a storage volume. If no volume name is provided, the infos all the volumes contained in the pool are provided. If no pool is provided, the infos of the volumes of all pools are output.

Parameters
• pool -- libvirt storage pool name (default: None)
• volume -- name of the volume to get infos from (default: None)
• connection -- libvirt connection URI, overriding defaults
• username -- username to connect with, overriding defaults
• password -- password to connect with, overriding defaults
```

New in version 3000.

```
salt.modules.virt.volume_upload(pool, volume, file, offset=0, length=0, sparse=False, **kwargs)
Create libvirt volume.

Parameters
• pool -- name of the pool to create the volume in
• name -- name of the volume to define
• file -- the file to upload to the volume
• offset -- where to start writing the data in the volume
• length -- amount of bytes to transfer to the volume
• sparse -- set to True to preserve data sparseness.
• connection -- libvirt connection URI, overriding defaults
• username -- username to connect with, overriding defaults
• password -- password to connect with, overriding defaults
```
CLI Example:

```
salt '*' virt.volume_upload default myvm.qcow2 /path/to/disk.qcow2
```

New in version 3001.

### 25.7.480 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

```python
salt.modules.virtualenv_mod.create(path, venv_bin=None, system_site_packages=False, distribute=False, clear=False, python=None, extra_search_dir=None, never_download=None, prompt=None, pip=False, symlinks=None, upgrade=None, user=None, use_vt=False, saltenv='base', **kwargs)
```

Create a virtualenv

- **path**: The path to the virtualenv to be created
- **venv_bin**: The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.
- **system_site_packages**: [False] Passthrough argument given to virtualenv or pyvenv
- **distribute**: [False] Passthrough argument given to virtualenv
- **pip**: [False] Install pip after creating a virtual environment. Implies `distribute=True`
- **clear**: [False] Passthrough argument given to virtualenv or pyvenv
- **python**: [None (default)] Passthrough argument given to virtualenv
- **extra_search_dir**: [None (default)] Passthrough argument given to virtualenv
- **never_download**: [None (default)] Passthrough argument given to virtualenv if True
- **prompt**: [None (default)] Passthrough argument given to virtualenv if not None
- **symlinks**: [None] Passthrough argument given to pyvenv if True
- **upgrade**: [None] Passthrough argument given to pyvenv if True
- **user**: [None] Set ownership for the virtualenv

**Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

- **runas**: [None] Set ownership for the virtualenv
  
  Deprecated since version 2014.1.0: `user` should be used instead

- **use_vt**: [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

- **saltenv**: ['base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

**Note:** The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

Example of using `--always-copy` environment variable (in case your fs doesn't support symlinks).

(continues on next page)
This will copy files into the virtualenv instead of symlinking them.

.. code-block:: yaml

   - env:
     - VIRTUALENV_ALWAYS_COPY: 1

salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv  Path to the virtualenv.

distribution  Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

venv  Path to the virtualenv

package  Name of the package in which the resource resides

   New in version 2016.3.0.

resource  Name of the resource of which the content is to be returned

   New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.xml
```

salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv  Path to the virtualenv

package  Name of the package in which the resource resides

   New in version 2016.3.0.

resource  Name of the resource of which the path is to be returned

   New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

salt.modules.virtualenv_mod.get_site_packages(venv)

Return the path to the site-packages directory of a virtualenv

venv  Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

salt.modules.virtualenv_mod.virtualenv_ver(venv_bin, user=None, **kwargs)

return virtualenv version if exists
25.7.481  salt.modules.vmctl

Manage vms running on the OpenBSD VMM hypervisor using vmctl(8).
New in version 2019.2.0.

codeauthor Jasper Lievisse Adriaanse <jasper@openbsd.org>

Note: This module requires the vmd service to be running on the OpenBSD target machine.

salt.modules.vmctl.create_disk(name, size)
Create a VMM disk with the specified name and size.
size: Size in megabytes, or use a specifier such as M, G, T.
CLI Example:

```
salt '*' vmctl.create_disk /path/to/disk.img size=10G
```

salt.modules.vmctl.load(path)
Load additional configuration from the specified file.
path: Path to the configuration file.
CLI Example:

```
salt '*' vmctl.load path=/etc/vm.switches.conf
```

salt.modules.vmctl.reload()
Remove all stopped VMs and reload configuration from the default configuration file.
CLI Example:

```
salt '*' vmctl.reload
```

salt.modules.vmctl.reset(all=False, vms=False, switches=False)
Reset the running state of VMM or a subsystem.
all: Reset the running state.
switches: Reset the configured switches.
vms: Reset and terminate all VMs.
CLI Example:

```
salt '*' vmctl.reset all=True
```

salt.modules.vmctl.start(name=None, id=None, bootpath=None, disk=None, disks=None, local_iface=False, memory=None, nics=0, switch=None)
Starts a VM defined by the specified parameters. When both a name and id are provided, the id is ignored.
name: Name of the defined VM.
id: VM id.
bootpath: Path to a kernel or BIOS image to load.
disk: Path to a single disk to use.
disks: List of multiple disks to use.
local_iface: Whether to add a local network interface. See "LOCAL INTERFACES" in the vmctl(8) manual page for more information.
memory: Memory size of the VM specified in megabytes.
switch: Add a network interface that is attached to the specified virtual switch on the host.
CLI Example:
salt '*/' vmctl.start 2  # start VM with id 2
salt '*/' vmctl.start name=web1 bootpath='/bsd.rd' nics=2 memory=512M disk='disk.img'

salt.modules.vmctl.status(name=None, id=None)
    List VMs running on the host, or only the VM specified by id. When both a name and id are provided, the id is ignored.
    name: Name of the defined VM.
    id: VM id.
    CLI Example:

    salt '*/' vmctl.status          # to list all VMs
    salt '*/' vmctl.status name=web1 # to get a single VM

salt.modules.vmctl.stop(name=None, id=None)
    Stop (terminate) the VM identified by the given id or name. When both a name and id are provided, the id is ignored.
    name: Name of the defined VM.
    id: VM id.
    CLI Example:

    salt '*/' vmctl.stop name=alpine

25.7.482 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

codeauthor Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:
pip install pyVmomi==5.5.0.2014.1.1

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

**vSphere Automation SDK**

vSphere Automation SDK can be installed via pip:

```
pip install --upgrade pip setuptools
pip install --upgrade git+https://github.com/vmware/vsphere-automation-sdk-python.git
```

**Note:** The SDK also requires OpenSSL 1.0.1+ if you want to connect to vSphere 6.5+ in order to support TLS1.1 & 1.2.

In order to use the tagging functions in this module, vSphere Automation SDK is necessary to install.

The module is currently in version 1.0.3 (as of 8/26/2019)

**ESXCLI**

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

**Note:** Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The **ntpd** service is restricted to an Enterprise Plus license, while **ssh** is available via the Standard license.

Please see the **vSphere Comparison** page for more information.
About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a host location, username, and password. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you’ll get a list of hosts associated with that vCenter Server:

```bash
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host’s coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you’re using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the host_names or esxi_host kwarg. For example:

```bash
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user> <vcenter-password> esxi_hosts=['esxi-1.example.com, esxi-2.example.com']
my-minion:
-----------
esxi-1.example.com:
-----------
Coredump Config:
-----------
enabled: False
esxi-2.example.com:
-----------
Coredump Config:
-----------
enabled: True
host_vnic: vmk0
ip: coredump-location.example.com
port: 6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host’s location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the host_names and esxi_hosts arguments are not needed.

```bash
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-password>
local:
----------
10.4.28.150:
----------
Coredump Config:
----------
```
enabled: True
host_vnic: vmk0
ip: coredump-location.example.com
port: 6500

salt.modules.vsphere.add_capacity_to_diskgroup(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Adds capacity disks to the disk group with the specified cache disk.
cache_disk_id The canonical name of the cache disk.
capacity_disk_ids A list containing canonical names of the capacity disks to add.
safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.add_capacity_to_diskgroup
  cache_disk_id='naa.000000000000001'
capacity_disk_ids=['naa.000000000000002', 'naa.000000000000003']

salt.modules.vsphere.add_host_to_dvs(host, username, password, vmknic_name, vmnic_name, dvs_name, target_portgroup_name, uplink_portgroup_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Adds an ESXi host to a vSphere Distributed Virtual Switch and migrates the desired adapters to the DVS from the standard switch.
host The location of the vCenter server.
username The username used to login to the vCenter server.
password The password used to login to the vCenter server.
vmknic_name The name of the virtual NIC to migrate.
vmnic_name The name of the physical NIC to migrate.
dvs_name The name of the Distributed Virtual Switch.
target_portgroup_name The name of the distributed portgroup in which to migrate the virtual NIC.
uplink_portgroup_name The name of the uplink portgroup in which to migrate the physical NIC.
protocol Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.
host_names: An array of VMware host names to migrate
verify_ssl Verify the SSL certificate. Default: True

CLI Example:
salt some_host vsphere.add_host_to_dvs host='vsphere.corp.com'
  username='administrator@vsphere.corp.com' password='vsphere_password'
  vmknic_name='vmk0' vmnic_name='vmnic0' dvs_name='DSwitch'
  target_portgroup_name='DPortGroup' uplink_portgroup_name='DSwitch1-DVUplinks-181'
  protocol='https' port='443', host_names=['esxi1.corp.com', 'esxi2.corp.com', 'esxi3.corp.com']

Return Example:
somehost:
----------
esxi1.corp.com:
----------
dvs:
  DSwitch
portgroup:
    DPortGroup
status:
  True
uplink:
    DSwitch-DVUplinks-181
vmknic:
  vmk@
vmnic:
  vmnic0

esxi2.corp.com:
----------
dvs:
  DSwitch
portgroup:
    DPortGroup
status:
  True
uplink:
    DSwitch-DVUplinks-181
vmknic:
  vmk@
vmnic:
  vmnic0

esxi3.corp.com:
----------
dvs:
  DSwitch
portgroup:
    DPortGroup
status:
  True
uplink:
    DSwitch-DVUplinks-181
vmknic:
  vmk@
vmnic:
  vmnic0

message:
success:
True

This was very difficult to figure out. VMware's PyVmomi documentation at
https://github.com/vmware/pyvmomi/blob/master/docs/vim/DistributedVirtualSwitch.rst (which is a copy
of the official documentation here: https://www.vmware.com/support/developer/converter-sdk/conv60_
apireference/vim.DistributedVirtualSwitch.html)
says to create the DVS, create distributed portgroups, and then add the host to the DVS specifying which
physical NIC to use as the port backing. However, if the physical NIC is in use as the only link from the host
to vSphere, this will fail with an unhelpful "busy" error.

There is, however, a Powershell PowerCLI cmdlet called Add-VDSwitchPhysicalNetworkAdapter that does
what we want. I used Onyx (https://labs.vmware.com/flings/onyx) to sniff the SOAP stream from Powershell to our vSphere server and got this snippet out:

```xml
<UpdateNetworkConfig xmlns="urn:vim25">
  <_this type="HostNetworkSystem">networkSystem-187</_this>
  <config>
    <vswitch>
      <changeOperation>edit</changeOperation>
      <name>vSwitch0</name>
      <spec>
        <numPorts>7812</numPorts>
      </spec>
    </vswitch>
    <proxySwitch>
      <changeOperation>edit</changeOperation>
      <uuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</uuid>
      <spec>
        <backing xsi:type="DistributedVirtualSwitchHostMemberPnicBackign">
          <pnicSpec><pnicDevice>vmnic0</pnicDevice></pnicSpec>
        </backing>
      </spec>
    </proxySwitch>
    <portgroup>
      <changeOperation>remove</changeOperation>
      <spec>
        <name>Management Network</name><vlanId>-1</vlanId><vswitchName />
      </spec>
    </portgroup>
    <vnic>
      <changeOperation>edit</changeOperation>
      <device>vmk0</device>
      <portgroup />
      <spec>
        <distributedVirtualPort>
          <switchUuid>73 a4 05 50 b0 d2 7e b9-38 80 5d 24 65 8f da 70</switchUuid>
          <portgroupKey>dvportgroup-191</portgroupKey>
        </distributedVirtualPort>
      </spec>
    </vnic>
  </config>
</UpdateNetworkConfig>
```

The SOAP API maps closely to PyVmomi, so from there it was (relatively) easy to figure out what Python to write.

`salt.modules.vsphere.add_license(key, description, safety_checks=True, service_instance=None)`

Adds a license to the vCenter or ESXi host

- **key** License key.
- **description** License description added in as a label.
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```bash
salt '*' vsphere.add_license key=<license_key> desc='License desc'
```
salt.modules.vsphere.assign_default_storage_policy_to_datastore(policy, datastore, service_instance=None)

Assigns a storage policy as the default policy to a datastore.

- **policy** Name of the policy to assign.
- **datastore** Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```bash
salt '*' vsphere.assign_storage_policy_to_datastore
  policy='policy name' datastore=ds1
```

salt.modules.vsphere.assign_license(license_key, license_name, entity, entity_display_name, safety_checks=True, service_instance=None)

Assigns a license to an entity

- **license_key** Key of the license to assign. See _get_entity docstrings for format.
- **license_name** Display name of the license.
- **entity** Dictionary representation of an entity.
- **entity_display_name** Entity name used in logging.
- **safety_checks** Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```bash
salt '*' vsphere.assign_license license_key=AAAAA-11111-AAAAA-11111-AAAAA
  license_name=test entity={
    type:cluster,
    datacenter:dc,cluster:cl
  }
```

salt.modules.vsphere.attach_tag(object_id, tag_id, managed_obj='ClusterComputeResource', server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Attach an existing tag to an input object.

The tag needs to meet the cardinality (CategoryModel.cardinality) and associability (CategoryModel.associable_types) criteria in order to be eligible for attachment. If the tag is already attached to the object, then this method is a no-op and an error will not be thrown. To invoke this method, you need the attach tag privilege on the tag and the read privilege on the object.

CLI Example:

```bash
salt vm_minion vsphere.attach_tag domain-c2283
  → urn:vmomi:InventoryServiceTag:b55ecc77-f4a5-49f8-ab52-38865467cfbe:GLOBAL
```

**Parameters**

- **object_id (str)** -- The identifier of the input object.
- **tag_id (str)** -- The identifier of the tag object.
- **managed_obj (str)** -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server (basestring)** -- Target DNS or IP of vCenter center.
- **username (basestring)** -- Username associated with the vCenter center.
- **password (basestring)** -- Password associated with the vCenter center.
- **verify_ssl (boolean)** -- Verify the SSL certificate. Default: True
- **ca_bundle (basestring)** -- Path to the ca bundle to use when verifying SSL certificates.

**Returns** The list of all tag identifiers that correspond to the tags attached to the given object.

**Return type** list of tags
Raise Unauthorized if you do not have the privilege to read the object.
Raise Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.compare_vm_configs(new_config, current_config)

Compares virtual machine current and new configuration, the current is the one which is deployed now, and
the new is the target config. Returns the differences between the objects in a dictionary, the keys are the
configuration parameter keys and the values are differences objects: either list or recursive difference

new_config: New config dictionary with every available parameter
current_config: Currently deployed configuration

salt.modules.vsphere.configure_host_cache(enabled, datastore=None, swap_size_MiB=None, service_instance=None)

Configures the host cache on the selected host.

enabled: Boolean flag specifying whether the host cache is enabled.
datastore: Name of the datastore that contains the host cache. Must be set if enabled is true.
swap_size_MiB: Swap size in Mibibytes. Needs to be set if enabled is true. Must be smaller than the datastore
size.

service_instance: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

salt '*' vsphere.configure_host_cache enabled=False
salt '*' vsphere.configure_host_cache enabled=True datastore=ds1 swap_size_MiB=1024

salt.modules.vsphere.coredump_network_enable(host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None)

Enable or disable ESXi core dump collection. Returns True if coredump is enabled and returns False if core
dump is not enabled. If there was an error, the error will be the value printed in the Error key dictionary for
the given host.

host: The location of the host.
username: The username used to login to the host, such as root.
password: The password used to login to the host.
enabled: Python True or False to enable or disable coredumps.
protocol: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
port: Optionally set to alternate port if the host is not using the default port. Default port is 443.
esxi_hosts: If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more
ESXi machines.
credstore: Optionally set to path to the credential store file.

CLI Example:

# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.create_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Creates a cluster.

Note: cluster_dict['name'] will be overridden by the cluster param value
config_dict: Dictionary with the config values of the new cluster.
datacenter: Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default
value is None.

cluster  Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1
# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

**salt.modules.vsphere.create_datacenter**(datacenter_name, service_instance=None)

Creates a datacenter.

Supported proxies: esxdatacenter
datacenter_name  The datacenter name
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_datacenter dc1
```

**salt.modules.vsphere.create_diskgroup**(cache_disk_id, capacity_disk_ids, safety_checks=True, service_instance=None)

Creates disk group on an ESXi host with the specified cache and capacity disks.
cache_disk_id  The canonical name of the disk to be used as a cache. The disk must be ssd.
capacity_disk_ids  A list containing canonical names of the capacity disks. Must contain at least one id. Default is True.
safety_checks  Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.000000000000001' capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'
```

**salt.modules.vsphere.create_dvportgroup**(portgroup_dict, portgroup_name, dvs, service_instance=None)

Creates a distributed virtual portgroup.

Note: The portgroup_name param will override any name already set in portgroup_dict.
portgroup_dict  Dictionary with the config values the portgroup should be created with (example in salt.states.dvs).
portgroup_name  Name of the portgroup to be created.
dvs  Name of the DVS that will contain the portgroup.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict> portgroup_name=pg1 dvs=dvs1
```

**salt.modules.vsphere.create_dvs**(dvs_dict, dvs_name, service_instance=None)

Creates a distributed virtual switch (DVS).

Note: The dvs_name param will override any name set in dvs_dict.
dvs_dict  Dict representation of the new DVS (example in salt.states.dvs)
dvs_name  Name of the DVS to be created.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:
```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

```
salt.modules.vsphere.create_storage_policy(policy_name, policy_dict, service_instance=None)
```

Creates a storage policy.

Supported capability types: scalar, set, range.

- **policy_name** Name of the policy to create. The value of the argument will override any existing name in **policy_dict**.
- **policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.create_storage_policy policy_name='policy name'
policy_dict="$policy_dict"
```

```
salt.modules.vsphere.create_tag(name, description, category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

Create a tag under a category with given description.

CLI Example:
```
salt vm_minion vsphere.create_tag
```

### Parameters
- **server** *(basestring)* -- Target DNS or IP of vCenter client.
- **username** *(basestring)* -- Username associated with the vCenter client.
- **password** *(basestring)* -- Password associated with the vCenter client.
- **name** *(str)* -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
- **description** *(str)* -- Given description of tag category.
- **category_id** *(str)* -- Value of category_id representative of the category created previously.
- **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
- **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

### Returns
The identifier of the created tag.

### Return type
str

### Raise
- **AlreadyExists** if the name provided in the create_spec is the name of an already existing tag in the input category.
- **InvalidArgument** if any of the input information in the create_spec is invalid.
- **NotFound** if the category for in the given create_spec does not exist in the system.
- **Unauthorized** if you do not have the privilege to create tag.

```
salt.modules.vsphere.create_tag_category(name, description, cardinality, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

Create a category with given cardinality.

CLI Example:
```
salt vm_minion vsphere.create_tag_category
```

### Parameters
- **name** *(str)* -- Name of tag category to create (ex. Machine, OS, Availability, etc.)
• **description** *(str)* -- Given description of tag category.
• **cardinality** *(str)* -- The associated cardinality (SINGLE, MULTIPLE) of the category.
• **server** *(basestring)* -- Target DNS or IP of vCenter center.
• **username** *(basestring)* -- Username associated with the vCenter center.
• **password** *(basestring)* -- Password associated with the vCenter center.
• **verify_ssl** *(boolean)* -- Verify the SSL certificate. Default: True
• **ca_bundle** *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**
Identifier of the created category.

**Return type** *str*

**Raise**
*AlreadyExists* if the name` provided in the create_spec is the name of an already existing category.

*InvalidArgument* if any of the information in the create_spec is invalid.

*Unauthorized* if you do not have the privilege to create a category.

```
salt.modules.vsphere.create_vm(vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None)
```

Creates a virtual machine container.

CLI Example:
```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ...
```

---

**vm_name** Name of the virtual machine

**cpu** Properties of CPUs for freshly created machines

**memory** Memory size for freshly created machines

**image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

**version** Virtual machine container hardware version

**datacenter** Datacenter where the virtual machine will be deployed (mandatory)

**datastore** Datastore where the virtual machine files will be placed

**placement** Resource pool or cluster or host or folder where the virtual machine will be deployed

**devices**

```
interfaces:
    adapter: 'Network adapter 1'
    name: vlan100
    switch_type: distributed or standard
    adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
    mac: '00:11:22:33:44:55'
    connectable:
        allow_guest_control: True
        connected: True
        start_connected: True
```

```
disks:
    adapter: 'Hard disk 1'

    unit: GB
    address: '0:0'
    controller: 'SCSI controller 0'
    thin_provision: False
```

(continues on next page)
Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore(datastore_name, disk_id, vmfs_major_version, safety_checks=True, service_instance=None)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name The name of the datastore to be created.
disk_id The disk id (canonical name) on which the datastore is created.
vmfs_major_version The VMFS major version.
safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```bash
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id= 
vmfs_major_version=5
```

salt.modules.vsphere.delete_advanced_configs(vm_name, datacenter, advanced_configs, service_instance=None)

Removes extra config parameters from a virtual machine
vm_name Virtual machine name
datacenter Datacenter name where the virtual machine is available
advanced_configs List of advanced config values to be removed
service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.delete_tag(tag_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Delete a tag.

CLI Example:

```
salt vm_minion vsphere.delete_tag
```

Parameters
- **tag_id (str)** -- The identifier of tag to be deleted. The parameter must be an identifier for the resource type: com.vmware.cis.tagging.Tag.
- **server (basestring)** -- Target DNS or IP of vCenter center.
- **username (basestring)** -- Username associated with the vCenter center.
- **password (basestring)** -- Password associated with the vCenter center.
- **verify_ssl (boolean)** -- Verify the SSL certificate. Default: True
- **ca_bundle (basestring)** -- Path to the ca bundle to use when verifying SSL certificates.

Raise AlreadyExists if the name provided in the create_spec is the name of an already existing category.
Raise InvalidArgument if any of the information in the create_spec is invalid.
Raise Unauthorized if you do not have the privilege to create a category.

salt.modules.vsphere.delete_tag_category(category_id, server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)

Delete a category.

CLI Example:

```
salt vm_minion vsphere.delete_tag_category
```

Parameters
- **category_id (str)** -- The identifier of category to be deleted. The parameter must be an identifier for the resource type: com.vmware.cis.tagging.Category.
- **server (basestring)** -- Target DNS or IP of vCenter center.
- **username (basestring)** -- Username associated with the vCenter center.
- **password (basestring)** -- Password associated with the vCenter center.
- **verify_ssl (boolean)** -- Verify the SSL certificate. Default: True
- **ca_bundle (basestring)** -- Path to the ca bundle to use when verifying SSL certificates.

Raise NotFound if the tag for the given tag_id does not exist in the system.
Raise Unauthorized if you do not have the privilege to delete the tag.
Raise Unauthenticated if the user can not be authenticated.

salt.modules.vsphere.delete_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Deletes a virtual machine defined by name and placement

name Name of the virtual machine
datacenter Datacenter of the virtual machine
placement Placement information of the virtual machine
service_instance vCenter service instance for connection and configuration

CLI Example:
salt 'vsphere.delete_vm name=my_vm datacenter=my_datacenter'

`salt.modules.vsphere.disconnect(service_instance)`
Disconnects from a vCenter or ESXi host

**Note:** Should be used by state functions, not invoked directly.

- `service_instance` Service instance (vim.ServiceInstance)
  
  CLI Example:
  
  See note above.

`salt.modules.vsphere.enable_firewall_ruleset(host, username, password, ruleset_enable, ruleset_name, protocol=None, port=None, esxi_hosts=None, credstore=None)`

Enable or disable an ESXi firewall rule set.

- `host` The location of the host.
- `username` The username used to login to the host, such as `root`.
- `password` The password used to login to the host.
- `ruleset_enable` True to enable the ruleset, false to disable.
- `ruleset_name` Name of ruleset to target.
- `protocol` Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- `port` Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- `esxi_hosts` If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.
- `credstore` Optionally set to path to the credential store file.

**Returns** A standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt 'vsphere.enable_firewall_ruleset my.esxi.host root bad-password True →'syslog'

# Used for connecting to a vCenter Server
salt 'vsphere.enable_firewall_ruleset my.vcenter.location root bad-password →True 'syslog' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.erase_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)`

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.

- `disk_id` Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (disk_id supersedes scsi_address).
- `scsi_address` Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (disk_id supersedes scsi_address).
- `service_instance` Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.erase_disk_partitions scsi_address='vmhaba0:C0:T0:L0'
salt '*' vsphere.erase_disk_partitions disk_id='naa.000000000000001'
```

`salt.modules.vsphere.esxcli_cmd(cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None)`

25.7. execution modules
Run an ESXCLI command directly on the host or list of hosts.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **cmd_str**: The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **esxi_hosts**: If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.
- **credstore**: Optionally set to path to the credential store file.

**CLI Example:**

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password
  → 'system coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
  → 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_advanced_configs(**vm_name**, **datacenter**, **service_instance=None**)  
Returns extra config parameters from a virtual machine advanced config list

- **vm_name**: Virtual machine name
- **datacenter**: Datacenter name where the virtual machine is available
- **service_instance**: vCenter service instance for connection and configuration

salt.modules.vsphere.get_coredump_network_config(**host**, **username**, **password**,  
  **protocol=None**, **port=None**,  
  **esxi_hosts=None**, **credstore=None**)  
Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **esxi_hosts**: If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.
- **credstore**: Optionally set to path to the credential store file.

**Returns**: A dictionary with the network configuration, or, if getting the network config failed, an error message retrieved from the standard cmd.run_all dictionary, per host.

**CLI Example:**

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-password
  → esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'  
```

salt.modules.vsphere.get_firewall_status(**host**, **username**, **password**,  
  **protocol=None**,  
  **port=None**, **esxi_hosts=None**, **credstore=None**)
Show status of all firewall rule sets.

**host**  The location of the host.

**username**  The username used to login to the host, such as `root`.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi_hosts**  If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**credstore**  Optionally set to path to the credential store file.

**Returns**  Nested dictionary with two toplevel keys `rulesets` and `success`. `success` will be True or False depending on query success. `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
  →
  esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.get_host_cache(service_instance=None)
```

Returns the host cache configuration on the proxy host.

**service_instance**  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:

```bash
salt '*' vsphere.get_host_cache
```

```python
salt.modules.vsphere.get_host_datetime(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Get the date/time information for a given host or list of host_names.

**host**  The location of the host.

**username**  The username used to login to the host, such as `root`.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to get date/time information.

If `host_names` is not provided, the date/time information will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**  Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_host_datetime my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_host_datetime my.vcenter.location root bad-password
  →
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```python
salt.modules.vsphere.get_ntp_config(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
```

25.7. execution modules
Get the NTP configuration information for a given host or list of host_names.

**host**  The location of the host.

**username**  The username used to login to the host, such as **root**.

**password**  The password used to login to the host.

**protocol**  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is **https**.

**port**  Optionally set to alternate port if the host is not using the default port. Default port is **443**.

**host_names**  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get ntp configuration information.

If host_names is not provided, the NTP configuration will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl**  Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.get_ntp_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_ntp_config my.vcenter.location root bad-password
\n←host_names='[esxi-1.host.com, esxi-2.host.com]'\n```

**salt.modules.vsphere.get_proxy_type()**

Returns the proxy type retrieved either from the pillar of from the proxy minion's config. Returns `<undefined>` otherwise.

**CLI Example:**

```
salt '*' vsphere.get_proxy_type
```

**salt.modules.vsphere.get_service_instance_via_proxy(service_instance=None)**

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

**service_instance**  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

**Note:**  Should be used by state functions not invoked directly.

**CLI Example:**

See note above

**salt.modules.vsphere.get_service_policy**

Get the service name's policy for a given host or list of hosts.

**host**  The location of the host.

**username**  The username used to login to the host, such as **root**.

**password**  The password used to login to the host.

**service_name**

The name of the service for which to retrieve the policy. Supported service names are:

-  DCUI
-  TSM
-  SSH
-  lbtd
-  lsassd
-  lwiod
-  netlogond
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get service policy information.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.get_service_policy my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_policy my.vcenter.location root bad-password 'ntpd' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_service_running(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the service name's running state for a given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

service_name The name of the service for which to retrieve the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to get the service's running state.

If host_names is not provided, the service's running state will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_service_running my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.get_service_running my.vcenter.location root bad-password 'ntpd'
```

```
host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_ssh_key(  host,  username,  password,  protocol=None,  port=None, certificate_verify=None)

Retrieve the authorized_keys entry for root. This function only works for ESXi, not vCenter.

Parameters

- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate. Default: True

Returns  True if upload is successful

CLI Example:

```
salt '*' vsphere.get_ssh_key my.esxi.host root bad-password certificate_verify=True
```

salt.modules.vsphere.get_syslog_config(  host,  username,  password,  protocol=None,  port=None, esxi_hosts=None, credstore=None)

Retrieve the syslog configuration.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- **credstore** Optionally set to path to the credential store file.

Returns  Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
```

```
esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.get_vm(  name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None)

Returns vm object properties.

- **name**  Name of the virtual machine.
- **datacenter**  Datacenter name
- **vm_properties**  List of vm properties.
traversal_spec  Traversal Spec object(s) for searching.
parent_ref Container Reference object for searching under a given object.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vm_config(name, datacenter=None, objects=True, service_instance=None)
Queries and converts the virtual machine properties to the available format from the schema. If the objects attribute is True the config objects will have extra properties, like 'object' which will include the vim.vm.device.VirtualDevice, this is necessary for deletion and update actions.
name Name of the virtual machine
datacenter Datacenter's name where the virtual machine is available
objects Indicates whether to return the vmware object properties (eg. object, key) or just the properties which can be set
service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.get_vm_config_file(name, datacenter, placement, datastore, service_instance=None)
Queries the virtual machine config file and returns vim.host.DatastoreBrowser.SearchResults object on success None on failure
name Name of the virtual machine
datacenter Datacenter name
datastore Datastore where the virtual machine files are stored
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
Returns a list of VSAN-eligible disks for a given host or list of host_names.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VMotion is enabled.

If host_names is not provided, the VMotion status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vmotion_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vmotion_enabled my.vcenter.location root bad-password
   → host_names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.get_vsan_eligible_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
Returns a list of VSAN-eligible disks for a given host or list of host_names.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if any VSAN-eligible disks are available.

If host_names is not provided, the VSAN-eligible disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_eligible_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_eligible_disks my.vcenter.location root bad-password
  → host_names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.get_vsan_enabled(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Get the VSAN enabled status for a given host or a list of host_names. Returns True if VSAN is enabled, False if it is not enabled, and None if a VSAN Host Config is unset, per host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to check if VSAN enabled.

If host_names is not provided, the VSAN status will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```
# Used for single ESXi host connection information
salt '*' vsphere.get_vsan_enabled my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_vsan_enabled my.vcenter.location root bad-password
  → host_names=['esxi-1.host.com, esxi-2.host.com']
```

salt.modules.vsphere.list_assigned_licenses(entity, entity_display_name, license_keys=None, service_instance=None)

Lists the licenses assigned to an entity

**entity** Dictionary representation of an entity. See _get_entity docstrings for format.

**entity_display_name** Entity name used in logging

**license_keys** List of license keys to be retrieved. Default is None.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

**CLI Example:**

```
salt '*' vsphere.list_assigned_licenses
  entity={type:cluster,datacenter:dc,cluster:cl}
  entity_display_name=cl
```
List existing tags a user has access to.

CLI Example:

```
salt vm_minion vsphere.list_attached_tags domain-c2283
```

Parameters

- **object_id (str)** -- The identifier of the input object.
- **managed_obj (str)** -- Classes that contain methods for creating and deleting resources typically contain a class attribute specifying the resource type for the resources being created and deleted.
- **server (basestring)** -- Target DNS or IP of vCenter center.
- **username (basestring)** -- Username associated with the vCenter center.
- **password (basestring)** -- Password associated with the vCenter center.
- **verify_ssl (boolean)** -- Verify the SSL certificate. Default: True
- **ca_bundle (basestring)** -- Path to the ca bundle to use when verifying SSL certificates.

Returns

- list of tags
- Unauthorized if you do not have the privilege to read the object.
- Unauthenticated if the user can not be authenticated.

Returns a list of the metadata of all capabilities in the vCenter.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_capabilities
```

Returns a dict representation of an ESX cluster.

**datacenter** Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

**cluster** Name of cluster. Ignored if already contained by proxy details. Default value is None.

**service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt '*' vsphere.list_cluster
```

Returns a list of clusters for the specified host.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.
protocol

Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port

Optionally set to alternate port if the host is not using the default port. Default port is 443.

verify_ssl

Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_clusters 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_datacenters(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of datacenters for the specified host.

```
salt '*' vsphere.list_datacenters 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_datacenters_via_proxy(datacenter_names=None, service_instance=None)
```

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter

datacenter_names List of datacenter names. Default is None.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```
salt '*' vsphere.list_datacenters_via_proxy
dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

```
salt.modules.vsphere.list_datastore_clusters(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of datastore clusters for the specified host.

```
salt '*' vsphere.list_datastore_clusters 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_datastores(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of datastores for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:
```
salt '*' vsphere.list_datastores 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_datastores_via_proxy(datastore_names=None, backing_disk_ids=None, backing_disk_scsi_addresses=None, service_instance=None)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter
datastore_names List of the names of datastores to filter on
backing_disk_ids List of canonical names of the backing disks of the datastores to filer. Default is None.
backing_disk_scsi_addresses List of scsi addresses of the backing disks of the datastores to filter. Default is None.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
```
salt '*' vsphere.list_datastores_via_proxy
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

salt.modules.vsphere.list_default_storage_policy_of_datastore(datastore, service_instance=None)

Returns a list of datastores assign the storage policies.
datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

salt.modules.vsphere.list_default_vsan_policy(service_instance=None)

Returns the default vsan storage policy.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.list_default_vsan_policy
```

salt.modules.vsphere.list_disk_partitions(disk_id=None, scsi_address=None, service_instance=None)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the scsi_address.
disk_id Canonical name of the disk. Either disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
scsi_address Scsi address of the disk. disk_id or scsi_address needs to be specified (disk_id supersedes scsi_address).
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.list_disk_partitions scsi_address='vmhba0:C0:T0:L0'
salt '*' vsphere.list_disk_partitions disk_id='naa.000000000000001'

salt.modules.vsphere.list_diskgroups(
    cache_disk_ids=None, service_instance=None)
Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the
cache_disk_ids: List of cache disk canonical names of the disk groups to be retrieved. Default is None.
use_proxy_details Specify whether to use the proxy minion's details instead of the arguments
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
CLI Example:
salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.000000000000001]'

salt.modules.vsphere.list_disks(
    disk_ids=None, scsi_addresses=None, service_instance=None)
Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk
canonical names or scsi addresses.
disk_ids: List of disk canonical names to be retrieved. Default is None.
scsi_addresses List of scsi addresses of disks to be retrieved. Default is None
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.
CLI Example:
salt '*' vsphere.list_disks
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks
    scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'

salt.modules.vsphere.list_dvportgroups(
    dvs=None, portgroup_names=None, service_instance=None)
Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.
dvs Name of the DVS containing the portgroups. Default value is None.
portgroup_names List of portgroup names to look for. If None, all portgroups are returned. Default value is
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.
CLI Example:
salt '*' vsphere.list_dvportgroups
salt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]

salt.modules.vsphere.list_dvs(
    host, username, password, protocol=None, port=None, verify_ssl=True)
Returns a list of distributed virtual switches for the specified host.
host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:
```
salt '*' vsphere.list_dvs 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_dvss(datacenter=None, dvs_names=None, service_instance=None)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

datacenter The datacenter to look for DVSs in. Default value is None.
dvs_names List of DVS names to look for. If None, all DVSs are returned. Default value is None.

CLI Example:
```
salt '*' vsphere.list_dvss
```
```
salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

salt.modules.vsphere.list_folders(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of folders for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:
```
salt '*' vsphere.list_folders 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_hosts(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of hosts for the specified VMware environment.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:
```
salt '*' vsphere.list_hosts 1.2.3.4 root bad-password
```

salt.modules.vsphere.list_hosts_via_proxy(hostnames=None, datacenter=None, cluster=None, service_instance=None)

Returns a list of hosts for the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

hostnames Hostnames to filter on.
datacenter_name Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.
cluster_name Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.
service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.list_hosts_via_proxy
salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]
salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1

salt.modules.vsphere.list_licenses(service_instance=None)
Lists all licenses on a vCenter.

CLI Example:
salt '*' vsphere.list_licenses

salt.modules.vsphere.list_networks(host, username, password, protocol=None, port=None, verify_ssl=True)
Returns a list of networks for the specified host.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
verify_ssl Verify the SSL certificate. Default: True

CLI Example:
salt '*' vsphere.list_networks 1.2.3.4 root bad-password

salt.modules.vsphere.list_non_ssds(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
Returns a list of Non-SSD disks for the given host or list of host_names.

Note: In the pyVmomi StorageSystem, ScsiDisks may, or may not have an ssd attribute. This attribute indicates if the ScsiDisk is SSD backed. As this option is optional, if a relevant disk in the StorageSystem does not have ssd = true, it will end up in the non_ssds list here.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.
protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to retrieve Non-SSD disks.

If host_names is not provided, Non-SSD disks will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

# Used for single ESXi host connection information
salt '*' vsphere.list_non_ssds my.esxi.host root bad-password

(continues on next page)
Used for connecting to a vCenter Server

```
salt '*' vsphere.list_non_ssds my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.list_resourcepools(host, username, password, protocol=None, port=None, verify_ssl=True)
```

Returns a list of resource pools for the specified host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```
salt '*' vsphere.list_resourcepools 1.2.3.4 root bad-password
```

```
salt.modules.vsphere.list_ssds(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)
```

Returns a list of SSDs for the given host or list of host_names.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names**: List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to retrieve SSDs.

If `host_names` is not provided, SSDs will be retrieved for the `host` location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl**: Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.list_ssds my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.list_ssds my.vcenter.location root bad-password host_names='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.list_storage_policies(policy_names=None, service_instance=None)
```

Returns a list of storage policies.

- **policy_names**: Names of policies to list. If `None`, all policies are listed. Default is `None`.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is `None`.

CLI Example:

```
salt '*' vsphere.list_storage_policies

salt '*' vsphere.list_storage_policies policy_names=[policy_name]
```

```
salt.modules.vsphere.list_tag_categories(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)
```

25.7. execution modules 2955
List existing categories a user has access to.

CLI Example:
```
salt vm_minion vsphere.list_tag_categories
```

**Parameters**
- `server` *(basestring)* -- Target DNS or IP of vCenter center.
- `username` *(basestring)* -- Username associated with the vCenter center.
- `password` *(basestring)* -- Password associated with the vCenter center.
- `verify_ssl` *(boolean)* -- Verify the SSL certificate. Default: True
- `ca_bundle` *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**  Value(s) of category_id.

**Return type**  list of str

`salt.modules.vsphere.list_tags` *(server=None, username=None, password=None, service_instance=None, verify_ssl=None, ca_bundle=None)*

List existing tags a user has access to.

CLI Example:
```
salt vm_minion vsphere.list_tags
```

**Parameters**
- `server` *(basestring)* -- Target DNS or IP of vCenter center.
- `username` *(basestring)* -- Username associated with the vCenter center.
- `password` *(basestring)* -- Password associated with the vCenter center.
- `verify_ssl` *(boolean)* -- Verify the SSL certificate. Default: True
- `ca_bundle` *(basestring)* -- Path to the ca bundle to use when verifying SSL certificates.

**Returns**  Value(s) of tag_id.

**Return type**  list of str

`salt.modules.vsphere.list_uplink_dvportgroup` *(dvs, service_instance=None)*

Returns the uplink portgroup of a distributed virtual switch.

- `dvs`  Name of the DVS containing the portgroup.
- `service_instance`  Service instance *(vim.ServiceInstance)* of the vCenter. Default is None.

CLI Example:
```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

`salt.modules.vsphere.list_vapps` *(host, username, password, protocol=None, port=None, verify_ssl=True)*

Returns a list of vApps for the specified host.

- `host`  The location of the host.
- `username`  The username used to login to the host, such as root.
- `password`  The password used to login to the host.
- `protocol`  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- `port`  Optionally set to alternate port if the host is not using the default port. Default port is 443.
- `verify_ssl`  Verify the SSL certificate. Default: True

CLI Example:
```
# List vapps from all minions
salt '*' vsphere.list_vapps 1.2.3.4 root bad-password
```
salt.modules.vsphere.list_vms(host, username, password, protocol=None, port=None, verify_ssl=True)

Returns a list of VMs for the specified host.

- **host**: The location of the host.
- **username**: The username used to login to the host, such as `root`.
- **password**: The password used to login to the host.
- **protocol**: Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port**: Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **verify_ssl**: Verify the SSL certificate. Default: `True`

CLI Example:

```bash
salt '*' vsphere.list_vms 1.2.3.4 root bad-password
```

salt.modules.vsphere.power_off_vm(name, datacenter=None, service_instance=None)

Powers off a virtual machine specified by its name.

- **name**: Name of the virtual machine
- **datacenter**: Datacenter of the virtual machine
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```bash
salt '*' vsphere.power_off_vm name=my_vm
```

salt.modules.vsphere.power_on_vm(name, datacenter=None, service_instance=None)

Powers on a virtual machine specified by its name.

- **name**: Name of the virtual machine
- **datacenter**: Datacenter of the virtual machine
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

```bash
salt '*' vsphere.power_on_vm name=my_vm
```

salt.modules.vsphere.register_vm(name, datacenter, placement, vmx_path, service_instance=None)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list

- **name**: Name of the virtual machine
- **datacenter**: Datacenter of the virtual machine
- **placement**: Placement dictionary of the virtual machine, host or cluster
- **vmx_path**: Full path to the vmx file, datastore name should be included
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter. Default is None.

salt.modules.vsphere.remove_capacity_from_diskgroup(cache_disk_id, capacity_disk_ids, data_evacuation=True, safety_checks=True, service_instance=None)

Remove capacity disks from the disk group with the specified cache disk.

- **cache_disk_id**: The canonical name of the cache disk.
- **capacity_disk_ids**: A list containing canonical names of the capacity disks to add.
- **data_evacuation**: Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is `True`.
- **safety_checks**: Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is `True`.
- **service_instance**: Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt 'vsphere.remove_capacity_from_diskgroup
    cache_disk_id='naa.000000000000001'
capacity_disk_ids='[naa.000000000000002, naa.000000000000003]'

salt.modules.vsphere.remove_datastore(datastore, service_instance=None)
Removes a datastore. If multiple datastores an error is raised.

datastore  Datastore name
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.remove_datastore ds_name

salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, service_instance=None)
Remove the diskgroup with the specified cache disk.

cache_disk_id  The canonical name of the cache disk.
data_accessibility  Specifies whether to ensure data accessibility. Default value is True.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.000000000000001'

salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)
Removes a distributed virtual portgroup.

portgroup  Name of the portgroup to be removed.
dvs  Name of the DVS containing the portgroups.
service_instance  Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1

salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, service_instance=None)
Renames a datastore. The datastore needs to be visible to the proxy.

datastore_name  Current datastore name.
new_datastore_name  New datastore name.
service_instance  Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

CLI Example:
salt '*' vsphere.rename_datastore old_name new_name

salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None, port=None, syslog_config=None, esxi_hosts=None, credstore=None)
Reset the syslog service to its default settings.

Valid syslog config values are logdir, loghost, logdir-unique, default-rotate, default-size, default-timeout, or all for all of these.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
syslog_config  List of parameters to reset, provided as a comma-delimited string, or 'all' to reset all syslog configuration parameters. Required.
**esxi_hosts** If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

**credstore** Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

---

**Note:** syslog_config can be passed as a quoted, comma-separated string. See CLI Example for details.

---

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
  → syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
  → syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.service_restart(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)**

Restart the named service for the given host or list of hosts.

**host** The location of the host.

**username** The username used to login to the host, such as root.

**password** The password used to login to the host.

**service_name**

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to restart the service.

If host_names is not provided, the service will be restarted for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
```

(continues on next page)
salt '*' vsphere.service_restart my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_restart my.vcenter.location root bad-password 'ntpd'
← host_names='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.service_start(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Start the named service for the given host or list of hosts.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
- lwiod
- netlogond
- ntpd
- sfcbd-watchdog
- snmpd
- vprobed
- vpxa
- xorg

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to start the service.

If host_names is not provided, the service will be started for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

# Used for single ESXi host connection information
salt '*' vsphere.service_start my.esxi.host root bad-password 'ntpd'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_start my.vcenter.location root bad-password 'ntpd'
← host_names='[esxi-1.host.com, esxi-2.host.com]'

salt.modules.vsphere.service_stop(host, username, password, service_name, protocol=None, port=None, host_names=None, verify_ssl=True)

Stop the named service for the given host or list of hosts.

host The location of the host.
username The username used to login to the host, such as root.
password The password used to login to the host.

service_name

The name of the service for which to set the policy. Supported service names are:

- DCUI
• TSM
• SSH
• lbtd
• lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the `host_names` argument is required to tell vCenter the hosts for which to stop the service.

If `host_names` is not provided, the service will be stopped for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.service_stop my.esxi.host root bad-password 'ssh'

# Used for connecting to a vCenter Server
salt '*' vsphere.service_stop my.vcenter.location root bad-password 'ssh'

#<host_names='[esxi-1.host.com, esxi-2.host.com]'>
```

**salt.modules.vsphere.set_advanced_configs**

```python
salt.modules.vsphere.set_advanced_configs(vm_name, datacenter, advanced_configs, service_instance=None)
```

**salt.modules.vsphere.set_coredump_network_config**

```python
salt.modules.vsphere.set_coredump_network_config(host, username, password, dump_ip, protocol=None, port=None, host_vnic='vmk0', dump_port=6500, esxi_hosts=None, credstore=None)
```

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see `coredump_network_enable`) before these parameters may be set.

**host** The location of the host.

**username** The username used to login to the host, such as `root`.

**password** The password used to login to the host.

**dump_ip** IP address of host that will accept the dump.

**protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

**port** Optionally set to alternate port if the host is not using the default port. Default port is 443.

**esxi_hosts** If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

**host_vnic** Host VNic port through which to communicate. Defaults to `vmk0`.

**dump_port** TCP port to use for the dump, defaults to 6500.
credstore Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary with a success key added, per host. success will be True if the set succeeded, False otherwise.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_ntp_config(host, username, password, ntp_servers, protocol=None, port=None, host_names=None, verify_ssl=True)
Set NTP configuration for a given host or list of host_names.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

ntp_servers A list of servers that should be added to and configured for the specified host’s NTP configuration.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

host_names List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts to configure ntp servers.

If host_names is not provided, the NTP servers will be configured for the host location instead. This is useful when service instance connection information is used for a single ESXi host.

verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.ntp_configure my.esxi.host root bad-password '[192.174.1.100, 192.174.1.200]'

# Used for connecting to a vCenter Server
salt '*' vsphere.ntp_configure my.vcenter.location root bad-password '[192.174.1.100, 192.174.1.200]' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_service_policy(host, username, password, service_name, service_policy, protocol=None, port=None, host_names=None, verify_ssl=True)
Set the service name’s policy for a given host or list of hosts.

host The location of the host.

username The username used to login to the host, such as root.

password The password used to login to the host.

service_name The name of the service for which to set the policy. Supported service names are:

- DCUI
- TSM
- SSH
- lbtd
- lsassd
• lwiod
• netlogond
• ntpd
• sfcbd-watchdog
• snmpd
• vprobed
• vpxa
• xorg

service_policy  The policy to set for the service. For example, 'automatic'.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter the hosts for which to set the service policy.

If host_names is not provided, the service policy information will be retrieved for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.set_service_policy my.esxi.host root bad-password 'ntpd' → 'automatic'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_service_policy my.vcenter.location root bad-password 'ntpd' → 'automatic' host_names='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.set_syslog_config(host, username, password, syslog_config, config_value, protocol=None, port=None, firewall=True, reset_service=True, esxi_hosts=None, credstore=None)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.
host  ESXi or vCenter host to connect to.
username  User to connect as, usually root.
password  Password to connect with.
syslog_config  Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (-))

Valid syslog_config values are logdir, loghost, default-rotate`, `default-size, default-timeout, and logdir-unique.
config_value  Value for the above parameter. For loghost, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
firewall  Enable the firewall rule set for syslog. Defaults to True.
reset_service  After a successful parameter set, reset the service. Defaults to True.
esxi_hosts  If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
credstore  Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
    -loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
    -loghost ssl://localhost:5432,tcp://10.1.0.1:1514
    esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.syslog_service_reload(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)

Reload the syslog service so it will pick up any changes.

- host The location of the host.
- username The username used to login to the host, such as root.
- password The password used to login to the host.
- protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- port Optionally set to alternate port if the host is not using the default port. Default port is 443.
- esxi_hosts If host is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.
- credstore Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary. This dictionary will at least have a retcode key. If retcode is 0 the command was successful.

CLI Example:

```bash
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
    esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.system_info(host, username, password, protocol=None, port=None, verify_ssl=True)

Return system information about a VMware environment.

- host The location of the host.
- username The username used to login to the host, such as root.
- password The password used to login to the host.
- protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- port Optionally set to alternate port if the host is not using the default port. Default port is 443.
- verify_ssl Verify the SSL certificate. Default: True

CLI Example:

```bash
salt '*' vsphere.system_info 1.2.3.4 root bad-password
```

salt.modules.vsphere.test_vcenter_connection(service_instance=None)

Checks if a connection is to a vCenter

CLI Example:
salt 'vs*'.vsphere.test_vcenter_connection

salt.modules.vsphere.unregister_vm(name, datacenter, placement=None, power_off=False, service_instance=None)

Unregisters a virtual machine defined by name and placement
name Name of the virtual machine
datacenter Datacenter of the virtual machine
placement Placement information of the virtual machine
service_instance vCenter service instance for connection and configuration

CLI Example:
salt 'vs*'.vsphere.unregister_vm name=my_vm datacenter=my_datacenter

salt.modules.vsphere.update_cluster(cluster_dict, datacenter=None, cluster=None, service_instance=None)

Updates a cluster.

config_dict Dictionary with the config values of the new cluster.
datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.
cluster Name of cluster. Ignored if already contained by proxy details. Default value is None.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

# esxdatacenter proxy
salt 'vs*'.vsphere.update_cluster cluster_dict=\${cluster_dict} cluster=cl1

# esxcluster proxy
salt 'vs*'.vsphere.update_cluster cluster_dict=\${cluster_dict}

salt.modules.vsphere.update_dvportgroup(portgroup_dict, portgroup, dvs, service_instance=True)

Updates a distributed virtual portgroup.

portgroup_dict Dictionary with the values the portgroup should be update with (example in salt.states.dvs).
portgroup Name of the portgroup to be updated.
dvs Name of the DVS containing the portgroups.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

salt 'vs*'.vsphere.update_dvportgroup portgroup_dict=<dict>
portgroup=pg1

salt 'vs*'.vsphere.update_dvportgroup portgroup_dict=<dict>
portgroup=pg1 dvs=dvs1

salt.modules.vsphere.update_dvs(dvs_dict, dvs, service_instance=None)

Updates a distributed virtual switch (DVS).

Note: Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in dvs_dict will be ignored.
dvs_dict Dictionary with the values the DVS should be update with (example in salt.states.dvs)
dvs Name of the DVS to be updated.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:

salt 'vs*'.vsphere.update_dvs dvs_dict=\${dvs_dict} dvs=dvs1
salt.modules.vsphere.update_host_datetime(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Update the date/time on the given host or list of host_names. This function should be used with caution since network delays and execution delays can result in time skews.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should update their date/time.

If host_names is not provided, the date/time will be updated for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```bash
# Used for single ESXi host connection information
salt '*' vsphere.update_date_time my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.update_date_time my.vcenter.location root bad-password
```

salt.modules.vsphere.update_host_password(host, username, password, new_password, protocol=None, port=None, verify_ssl=True)

Update the password for a given host.

---

**Note**: Currently only works with connections to ESXi hosts. Does not work with vCenter servers.

- **host** The location of the ESXi host.
- **username** The username used to login to the ESXi host, such as root.
- **password** The password used to login to the ESXi host.
- **new_password** The new password that will be updated for the provided username on the ESXi host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is 443.
- **verify_ssl** Verify the SSL certificate. Default: True

CLI Example:

```bash
salt '*' vsphere.update_host_password my.esxi.host root original-bad-password new-bad-password
```

salt.modules.vsphere.update_storage_policy(policy, policy_dict, service_instance=None)

Updates a storage policy.

- **policy** Name of the policy to update.
- **policy_dict** Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)
- **service_instance** Service instance (vim.ServiceInstance) of the vCenter. Default is None.

CLI Example:
salt 'vsphere.update_storage_policy policy='policy name'
policy_dict="$policy_dict"

salt.modules.vsphere.update_vm(vm_name, cpu=None, memory=None, image=None, version=None, interfaces=None, disks=None, scsi_devices=None, serial_ports=None, datacenter=None, datastore=None, cd_dvd_drives=None, sata_controllers=None, advanced_configs=None, service_instance=None)

Updates the configuration of the virtual machine if the config differs

- **vm_name** Virtual Machine name to be updated
- **cpu** CPU configuration options
- **memory** Memory configuration options
- **version** Virtual machine container hardware version
- **image** Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
- **interfaces** Network interfaces configuration options
- **disks** Disks configuration options
- **scsi_devices** SCSI devices configuration options
- **serial_ports** Serial ports configuration options
- **datacenter** Datacenter where the virtual machine is available
- **datastore** Datastore where the virtual machine config files are available
- **cd_dvd_drives** CD/DVD drives configuration options
- **advanced_config** Advanced config parameters to be set for the virtual machine
- **service_instance** vCenter service instance for connection and configuration

salt.modules.vsphere.upload_ssh_key(host, username, password, ssh_key=None, ssh_key_file=None, protocol=None, port=None, certificate_verify=None)

Upload an ssh key for root to an ESXi host via http PUT. This function only works for ESXi, not vCenter. Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**Parameters**
- **host** -- The location of the ESXi Host
- **username** -- Username to connect as
- **password** -- Password for the ESXi web endpoint
- **ssh_key** -- Public SSH key, will be added to authorized_keys on ESXi
- **ssh_key_file** -- File containing the SSH key. Use 'ssh_key' or ssh_key_file, but not both.
- **protocol** -- defaults to https, can be http if ssl is disabled on ESXi
- **port** -- defaults to 443 for https
- **certificate_verify** -- If true require that the SSL connection present a valid certificate. Default: True

**Returns** Dictionary with a 'status' key, True if upload is successful. If upload is unsuccessful, 'status' key will be False and an 'Error' key will have an informative message.

CLI Example:
salt '*' vsphere.upload_ssh_key my.esxi.host root bad-password ssh_key_file="/etc/salt/my_keys/my_key.pub"

salt.modules.vsphere.vmotion_disable(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Disable vMotion for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as root.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is https.

25.7. execution modules
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names List of ESXi host names. When the host, username, and password credentials are provided for a
vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VMotion.

If host_names is not provided, VMotion will be disabled for the host location instead. This is useful for
when service instance connection information is used for a single ESXi host.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_disable my.vcenter.location root bad-password
  host_names=''[esxi-1.host.com, esxi-2.host.com]''
```

salt.modules.vsphere.vmotion_enable(host, username, password, protocol=None, port=None, host_names=None, device='vmk0', verify_ssl=True)

Enable vMotion for a given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a
vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VMotion.

If host_names is not provided, VMotion will be enabled for the host location instead. This is useful for
when service instance connection information is used for a single ESXi host.
device  The device that uniquely identifies the VirtualNic that will be used for VMotion for each host. Defaults
to vmk0.
verify_ssl  Verify the SSL certificate. Default: True

CLI Example:

```
# Used for single ESXi host connection information
salt '*' vsphere.vmotion_enable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vmotion_enable my.vcenter.location root bad-password
  host_names=''[esxi-1.host.com, esxi-2.host.com]''
```

salt.modules.vsphere.vsan_add_disks(host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True)

Add any VSAN-eligible disks to the VSAN System for the given host or list of host_names.

host  The location of the host.
username  The username used to login to the host, such as root.
password  The password used to login to the host.
protocol  Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is
https.
port  Optionally set to alternate port if the host is not using the default port. Default port is 443.
host_names  List of ESXi host names. When the host, username, and password credentials are provided for a
vCenter Server, the host_names argument is required to tell vCenter which hosts need to add any
VSAN-eligible disks to the host's VSAN system.

If host_names is not provided, VSAN-eligible disks will be added to the hosts's VSAN system for the
host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_add_disks my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_add_disks my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.vsan_disable**

```python
( host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True )
```

Disable VSAN for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should disable VSAN. If host_names is not provided, VSAN will be disabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_disable my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_disable my.vcenter.location root bad-password
  host_names='[esxi-1.host.com, esxi-2.host.com]'
```

**salt.modules.vsphere.vsan_enable**

```python
( host, username, password, protocol=None, port=None, host_names=None, verify_ssl=True )
```

Enable VSAN for a given host or list of host_names.

- **host** The location of the host.
- **username** The username used to login to the host, such as `root`.
- **password** The password used to login to the host.
- **protocol** Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.
- **port** Optionally set to alternate port if the host is not using the default port. Default port is `443`.
- **host_names** List of ESXi host names. When the host, username, and password credentials are provided for a vCenter Server, the host_names argument is required to tell vCenter which hosts should enable VSAN. If host_names is not provided, VSAN will be enabled for the host location instead. This is useful for when service instance connection information is used for a single ESXi host.

**verify_ssl** Verify the SSL certificate. Default: True

**CLI Example:**

```bash
# Used for single ESXi host connection information
salt '*' vsphere.vsan_enable my.esxi.host root bad-password

(continues on next page)
# Used for connecting to a vCenter Server
salt '*' vsphere.vsan_enable my.vcenter.location root bad-password host_\n   names='[esxi-1.host.com, esxi-2.host.com]'

## 25.7.483 salt.modules.webutil

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don’t use htpasswd to use
the webutil module name.

salt.modules.webutil.useradd(pwfile, user, password, opts='', runas=None)
    Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.
    pwfile Path to htpasswd file
    user User name
    password User password
    opts Valid options that can be passed are:
    • n Don’t update file; display results on stdout.
    • m Force MD5 encryption of the password (default).
    • d Force CRYPT encryption of the password.
    • p Do not encrypt the password (plaintext).
    • s Force SHA encryption of the password.
    runas The system user to run htpasswd command with

    CLI Examples:

    salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
    salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns

salt.modules.webutil.userdel(pwfile, user, runas=None, all_results=False)
    Delete a user from the specified htpasswd file.
    pwfile Path to htpasswd file
    user User name
    runas The system user to run htpasswd command with
    all_results Return stdout, stderr, and retcode, not just stdout

    CLI Examples:

    salt '*' webutil.userdel /etc/httpd/htpasswd larry

salt.modules.webutil.verify(pwfile, user, password, opts='', runas=None)
    Return True if the htpasswd file exists, the user has an entry, and their password matches.
    pwfile Fully qualified path to htpasswd file
    user User name
    password User password
    opts Valid options that can be passed are:
    • m Force MD5 encryption of the password (default).
    • d Force CRYPT encryption of the password.
    • p Do not encrypt the password (plaintext).
    • s Force SHA encryption of the password.
    runas The system user to run htpasswd command with

    CLI Examples:
25.7.484 salt.modules.win_auditpol

A salt module for modifying the audit policies on the machine

Though this module does not set group policy for auditing, it displays how all auditing configuration is applied on the machine, either set directly or via local or domain group policy.

New in version 2018.3.4.

New in version 2019.2.1.

This module allows you to view and modify the audit settings as they are applied on the machine. The audit settings are broken down into nine categories:

- Account Logon
- Account Management
- Detailed Tracking
- DS Access
- Logon/Logoff
- Object Access
- Policy Change
- Privilege Use
- System

The `get_settings` function will return the subcategories for all nine of the above categories in one dictionary along with their auditing status.

To modify a setting you only need to specify the subcategory name and the value you wish to set. Valid settings are:

- No Auditing
- Success
- Failure
- Success and Failure

CLI Example:

```python
# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon" category
salt * auditpol.get_settings category="Account Logon"

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting name="Credential Validation"

# Set the state of the "Credential Validation" setting to Success and Failure
salt * auditpol.set_setting name="Credential Validation" value="Success and Failure"
```
# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting name="Credential Validation" value="No Auditing"

salt.modules.win_auditpol.get_setting(name)
Get the current configuration for the named audit setting
Parameters name (str) -- The name of the setting to retrieve
Returns The current configuration for the named setting
Return type str
Raises
• KeyError -- On invalid setting name
• CommandExecutionError -- If an error is encountered retrieving the settings

CLI Example:

# Get current state of the "Credential Validation" setting
salt * auditpol.get_setting "Credential Validation"

salt.modules.win_auditpol.get_settings(category='All')
Get the current configuration for all audit settings specified in the category
Parameters category (str) -- One of the nine categories to return. Can also be All to return
the settings for all categories. Valid options are:
• Account Logon
• Account Management
• Detailed Tracking
• DS Access
• Logon/Logoff
• Object Access
• Policy Change
• Privilege Use
• System
• All
Default value is All
Returns A dictionary containing all subcategories for the specified category along with their current configuration
Return type dict
Raises
• KeyError -- On invalid category
• CommandExecutionError -- If an error is encountered retrieving the settings

CLI Example:

# Get current state of all audit settings
salt * auditpol.get_settings

# Get the current state of all audit settings in the "Account Logon" category
salt * auditpol.get_settings "Account Logon"

salt.modules.win_auditpol.set_setting(name, value)
Set the configuration for the named audit setting
Parameters
• name (str) -- The name of the setting to configure
• value (str) -- The configuration for the named value. Valid options are:
  – No Auditing
- Success
- Failure
- Success and Failure

Returns True if successful
Return type bool

Raises
  - KeyError -- On invalid name or value
  - CommandExecutionError -- If an error is encountered modifying the setting

CLI Example:

```
# Set the state of the "Credential Validation" setting to Success and Failure
salt * auditpol.set_setting "Credential Validation" "Success and Failure"

# Set the state of the "Credential Validation" setting to No Auditing
salt * auditpol.set_setting "Credential Validation" "No Auditing"
```

25.7.485 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

```
salt.modules.win_autoruns.list_()
Get a list of automatically running programs
```

CLI Example:

```
salt '*' autoruns.list
```

25.7.486 salt.modules.win_certutil

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

```
salt.modules.win_certutil.add_store(source, store, retcode=False, saltenv='base')
Add the cert to the given Certificate Store

source (str): The source certificate file. This is either the path to a local file or a file from the file server in the form of salt://path/to/file

store (str): The certificate store to add the certificate to

retcode (bool): If True, return the retcode instead of stdout. Default is False

saltenv (str): The salt environment to use. This is ignored if the path is local
```

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
salt '*' certutil.add_store C:\path\to\local.cer TrustedPublisher
```

```
salt.modules.win_certutil.del_store(source, store, retcode=False, saltenv='base')
Delete the cert from the given Certificate Store

source (str): The source certificate file. This is either the path to a local file or a file from the file server in the form of salt://path/to/file

store (str): The certificate store to delete the certificate from

retcode (bool): If True, return the retcode instead of stdout. Default is False

saltenv (str): The salt environment to use. This is ignored if the path is local
```
### CLI Example:
```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
salt '*' certutil.del_store C:\path\to\local.cer TrustedPublisher
```

```
salt.modules.win_certutil.get_cert_serial(cert_file, saltenv='base')
  Get the serial number of a certificate file
  cert_file (str): The certificate file to find the serial for. Can be a local file or a file on the file server (salt://)
  Returns: The serial number of the certificate if found, otherwise None
  Return type: str
```

```
salt.modules.win_certutil.get_stored_cert_serials(store)
  Get all of the certificate serials in the specified store
  store (str): The store to get all the certificate serials from
  Returns: A list of serial numbers found, or an empty list if none found
  Return type: list
```

### 25.7.487 salt.modules.win_dacl

Manage DACLs on Windows

**depends**
- winreg Python module

```
salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)
  add an ace to an object
  path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to add permission: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)
```

**CLI Example:**
```
allow domain\fakeuser full control on HKLM\SOFTWARE\somekey, propagate to this\key and subkeys
salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' '\Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

```
salt.modules.win_dacl.check_ace(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)
  Checks a path to verify the ACE (access control entry) specified exists
  Parameters
  - path -- path to the file/reg key
  - objectType -- The type of object (FILE, DIRECTORY, REGISTRY)
  - user -- user that the ACL is for
  - permission -- permission to test for (READ, FULLCONTROL, etc)
  - acetype -- the type of ACE (ALLOW or DENY)
```
• **propagation** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
• **exactPermissionMatch** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:
```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

salt.modules.win_dacl.check_inheritance(*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

Parameters
- **path** -- path of the registry key or file system object to check
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:
```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

class salt.modules.win_dacl.daclConstants

DACL constants used throughout the module

**getAceTypeBit**(*t*)
returns the acetype bit of a text value

**getAceTypeText**(*t*)
returns the textual representation of a acetype bit

**getObjectTypeBit**(*t*)
returns the bit value of the string object type

**getPermissionBit**(*t*, *m*)
returns a permission bit of the string permission value for the specified object type

**getPermissionText**(*t*, *m*)
returns the permission textual representation of a specified permission bit/object type

**getPropagationBit**(*t*, *p*)
returns the propagation bit of a text value

**getPropagationText**(*t*, *p*)
returns the textual representation of a propagation bit

**getSecurityHkey**(*s*)
returns the necessary string value for an HKEY for the win32security module

**processPath**(*path*, *objectType*)
processes a path/object type combo and returns: registry types with the correct HKEY text represen-
tation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(*path*, *objectType*, *copy=True*)

Disable inheritance on an object

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** -- True will copy the Inherited ACEs to the DACL before disabling inheritance
Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

`salt.modules.win_dacl.enable_inheritance(path, objectType, clear=False)`

enable/disable inheritance on an object

Parameters

- `path` -- The path to the object
- `objectType` -- The type of object (FILE, DIRECTORY, REGISTRY)
- `clear` -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

`salt.modules.win_dacl.get(path, objectType, user=None)`

Get the ACL of an object. Will filter by user if one is provided.

Parameters

- `path` -- The path to the object
- `objectType` -- The type of object (FILE, DIRECTORY, REGISTRY)
- `user` -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

`salt.modules.win_dacl.rm_ace(path, objectType, user, permission=None, acetype=None, propagation=None)`

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories (KEY, KEY\SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated\to this key and subkeys

salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY\SUBKEYS'
```
25.7.488 salt.modules.win_disk

Module for gathering disk information on Windows

depends

• win32api Python module

salt.modules.win_disk.usage()
Return usage information for volumes mounted on this minion

CLI Example:
salt '*' disk.usage

25.7.489 salt.modules.win_dism

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.add_capability(capability, source=None, limit_access=False, image=None, restart=False)

Install a capability

Parameters

• capability (str) -- The capability to install

• source (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update.

• limit_access (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package

• image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

• restart (Optional[bool]) -- Reboot the machine if required by the install

Raises

• NotImplementededError -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0

salt.modules.win_dism.add_feature(feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False)

Install a feature using DISM

Parameters

• feature (str) -- The feature to install

• package (Optional[str]) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature

• source (Optional[str]) -- The optional source of the capability. Default is set by group policy and can be Windows Update

• limit_access (Optional[bool]) -- Prevent DISM from contacting Windows Update for the source package

• enable_parent (Optional[bool]) -- True will enable all parent features of the specified feature
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns: A dictionary containing the results of the command
Return type: dict

CLI Example:
```
salt '*' dism.add_feature NetFx3
```

**salt.modules.win_dism.add_package** *(package, ignore_check=False, prevent_pending=False, image=None, restart=False)*

Install a package using DISM

Parameters:
- **package** *(str)* -- The package to install. Can be a .cab file, a .msu file, or a folder

Note: An .msu package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** *(Optional [bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent_pending** *(Optional [bool]*) -- Skip the installation of the package if there are pending online actions
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** *(Optional [bool]*) -- Reboot the machine if required by the install

Returns: A dictionary containing the results of the command
Return type: dict

CLI Example:
```
salt '*' dism.add_package C:\Packages\package.cab
```

**salt.modules.win_dism.available_capabilities** *(image=None)*

List the capabilities available on the system

Parameters:
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Raises:
- **NotImplementedError** -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns: A list of available capabilities
Return type: list

CLI Example:
```
salt '*' dism.installed_capabilities
```

**salt.modules.win_dism.available_features** *(image=None)*

List the features available on the system

Parameters:
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns: A list of available features
Return type: list

CLI Example:
```
salt '*' dism.available_features
```
salt.modules.win_dism.get_capabilities(image=None)

List all capabilities on the system

Parameters
image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Raises
• NotImplementedError -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns
A list of capabilities

Return type list

CLI Example:
salt '*' dism.get_capabilities

salt.modules.win_dism.get_features(package=None, image=None)

List features on the system or in a package

Parameters
• package (Optional[str]) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

This can also be the name of a package as listed in dism.installed_packages
• image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns
A list of features

Return type list

CLI Example:

# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~,→x86~en~1.0.0.0

salt.modules.win_dism.get_kb_package_name(kb, image=None)

Get the actual package name on the system based on the KB name

New in version 3006.0.

Parameters
• kb (str) -- The name of the KB to remove. Can also be just the KB number
• image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

Returns
The name of the package found on the system None: If the package is not installed on the system

Return type str

CLI Example:

# Get the package name for KB1231231
salt '*' dism.get_kb_package_name KB1231231

# Get the package name for KB1231231 using just the number

(continues on next page)
salt.modules.win_dism.installed_capabilities(image=None)
List the capabilities installed on the system

Parameters
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises
- *NotImplementedError* -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns A list of installed capabilities
Return type *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.installed_features(image=None)
List the features installed on the system

Parameters
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of installed features
Return type *list*

CLI Example:

```
salt '*' dism.installed_features
```

salt.modules.win_dism.installed_packages(image=None)
List the packages installed on the system

Parameters
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of installed packages
Return type *list*

CLI Example:

```
salt '*' dism.installed_packages
```

salt.modules.win_dism.package_info(package, image=None)
Display information about a package

Parameters
- **package** *(str)* -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image** *(Optional [str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A dictionary containing the results of the command
Return type *dict*

CLI Example:

```
salt '*' dism. package_info C:\packages\package.cab
```

salt.modules.win_dism.remove_capability(capability, image=None, restart=False)
Uninstall a capability

Parameters
- **capability** *(str)* -- The capability to be removed
...image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

• restart (Optional[bool]) -- Reboot the machine if required by the install

Raises

• NotImplementedError -- For all versions of Windows that are not Windows 10 and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0

salt.modules.win_dism.remove_feature (feature, remove_payload=False, image=None, restart=False)

Disables the feature.

Parameters

• feature (str) -- The feature to uninstall

• remove_payload (Optional[bool]) -- Remove the feature's payload. Must supply source when enabling in the future.

• image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

• restart (Optional[bool]) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

salt '*' dism.remove_feature NetFx3

salt.modules.win_dism.remove_kb (kb, image=None, restart=False)

Remove a package by passing a KB number. This searches the installed packages to get the full package name of the KB. It then calls the dism.remove_package function to remove the package.

New in version 3006.0.

Parameters

• kb (str) -- The name of the KB to remove. Can also be just the KB number

• image (Optional[str]) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.

• restart (Optional[bool]) -- Reboot the machine if required by the uninstall

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

# Remove the KB5007575 just passing the number
salt '*' dism.remove_kb 5007575

# Remove the KB5007575 just passing the full name
salt '*' dism.remove_kb KB5007575

salt.modules.win_dism.remove_package (package, image=None, restart=False)

Uninstall a package

Parameters

• package (str) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in dism.installed_packages

25.7. execution modules  2981
salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.add_dns(ip, interface='Local Area Connection', index=1)
Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:
salt '*' win_dns_client.add_dns <ip> <interface> <index>

salt.modules.win_dns_client.dns_dhcp(interface='Local Area Connection')
Configure the interface to get its DNS servers from the DHCP server

CLI Example:
salt '*' win_dns_client.dns_dhcp <interface>

salt.modules.win_dns_client.get_dns_config(interface='Local Area Connection')
Get the type of DNS configuration (dhcp / static).

Parameters

- **interface (str)** -- The name of the network interface. This is the
  * in the Network Connection Details for the device
  (Description) --

Returns True if DNS is configured, otherwise False

Return type bool

CLI Example:
salt '*' win_dns_client.get_dns_config 'Local Area Connection'

salt.modules.win_dns_client.get_dns_servers(interface='Local Area Connection')
Return a list of the configured DNS servers of the specified interface

Parameters

- **interface (str)** -- The name of the network interface. This is the name as
  * appears in the Control Panel under Network Connections (it)

Returns A list of dns servers

Return type list

CLI Example:
salt ' '*' win_dns_client.get_dns_servers 'Local Area Connection'

salt.modules.win_dns_client.rm_dns(ip, interface='Local Area Connection')
Remove the DNS server from the network interface

CLI Example:

salt ' '*' win_dns_client.rm_dns <ip> <interface>

25.7.491 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the psget module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

depends
• PowerShell 5.0

salt.modules.win_dsc.apply_config(path, source=None, salt_env='base')
Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the source option.

Parameters
• path (str) -- Local path to the directory that contains the .mof configuration file to apply. Required.
• source (str) -- Path to the directory that contains the .mof file on the file_roots. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at path will be applied. Optional.
• salt_env (str) -- The salt environment to use when copying your source. Default is 'base'

Returns True if successful, otherwise False

Return type bool

CLI Example:
To apply a config that already exists on the system

salt ' '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration

To cache a configuration from the master and apply it:

salt ' '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/...WebSiteConfiguration

salt.modules.win_dsc.compile_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')

Compile a config from a PowerShell script (.ps1)

Parameters
• path (str) -- Path (local) to the script that will create the .mof configuration file. If no source is passed, the file must exist locally. Required.
• **source** *(str)* -- Path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.

• **config_name** *(str)* -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.

• **config_data** *(str)* -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

• **config_data_source** *(str)* -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table.

New in version 2017.7.0.

• **script_parameters** *(str)* -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

• **salt_env** *(str)* -- The salt environment to use when copying the source. Default is 'base'

Returns A dictionary containing the results of the compilation

Return type dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\DSC\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

salt.modules.win_dsc.get_config()
Get the current DSC Configuration

Returns A dictionary representing the DSC Configuration on the machine

Return type dict

Raises **CommandExecutionError** -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

salt.modules.win_dsc.get_config_status()
Get the status of the current DSC Configuration

Returns A dictionary representing the status of the current DSC Configuration on the machine

Return type dict

CLI Example:

```
salt '*' dsc.get_config_status
```

salt.modules.win_dsc.get_lcm_config()
Get the current Local Configuration Manager settings
Returns
A dictionary representing the Local Configuration Manager settings on the machine

Return type  dict

CLI Example:
salt '*' dsc.get_lcm_config

salt.modules.win_dsc.remove_config(reset=False)
Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters reset (bool) -- Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:
• File: DSCStatusHistory.mof
• File: DSCEngineCache.mof
• Dir: ConfigurationStatus

Default is False

Warning: remove_config may fail to reset the DSC environment if any of the files in the ConfigurationStatus directory are in use. If you wait a few minutes and run again, it may complete successfully.

Returns  True if successful
Return type  bool

Raises  CommandExecutionError -- On failure

CLI Example:
salt '*' dsc.remove_config True

salt.modules.win_dsc.restore_config()
Reapplies the previous configuration.

New in version 2017.7.5.

Note:  The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

Returns  True if successfully restored
Return type  bool

Raises  CommandExecutionError -- On failure

CLI Example:
salt '*' dsc.restore_config

salt.modules.win_dsc.run_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the source option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the config option.

This command would be the equivalent of running dsc.compile_config followed by dsc.apply_config.

Parameters
- **path** (*str*) -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (*str*) -- The path to the script on file_roots to cache at the location specified by path. The source file will be cached locally and then executed. If source is not passed, the config script located at path will be compiled. Optional.
- **config_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a config_name must be specified. If the config_name is not specified, the name of the file will be used as the config_name to run. Optional.
- **config_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the ConfigurationData parameter when the config_name is compiled. This can be the path to a .psd1 file containing the proper hash table or the PowerShell code to create the hash table. New in version 2017.7.0.
- **config_data_source** (*str*) -- The path to the .psd1 file on file_roots to cache at the location specified by config_data. If this is specified, config_data must be a local path instead of a hash table. New in version 2017.7.0.
- **script_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself. Note that these are passed to the script (the outermost scope), and not to the dsc configuration inside the script (the inner scope). New in version 2017.7.0.
- **salt_env** (*str*) -- The salt environment to use when copying the source. Default is 'base'

Returns True if successfully compiled and applied, otherwise False

Return type **bool**

**CLI Example:**

To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it, passing in `script_parameters`:

```
salt '*' dsc.run_config path=C:\\DSC\\WebsiteConfig.ps1 source=salt://dsc/configs/WebsiteConfig.ps1 script_parameters='-hostname 'my-computer' -ip '192.168.1.10'\n-\n-DnsArray '192.168.1.3','192.168.1.4','1.1.1.1'"
```

For detailed descriptions of the parameters see: [https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig](https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig)

`config_mode` (*str*): How the LCM applies the configuration. Valid values are:

- **ApplyOnly**
ApplyAndMonitor
ApplyAndAutoCorrect

config_mode_freq (int): How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.

refresh_mode (str): How the LCM gets configurations. Valid values are:
- Disabled
- Push
- Pull

refresh_freq (int): How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.

reboot_if_needed (bool): Reboot the machine if needed after a configuration is applied. Default is False.

action_after_reboot (str): Action to take after reboot. Valid values are:
- ContinueConfiguration
- StopConfiguration

certificate_id (guid): A GUID that specifies a certificate used to access the configuration: (pull mode)

configuration_id (guid): A GUID that identifies the config file to get from a pull server. (pull mode)

allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:
- None
- ForceModuleImport
- All

status_retention_days (int): Number of days to keep status of the current config.

Note: Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documentation on MSDN for more details.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' dsc.set_lcm_config ApplyOnly
```

salt.modules.win_dsc.test_config()
Tests the current applied DSC Configuration
Returns True if successfully applied, otherwise False
Return type bool

CLI Example:
```
salt '*' dsc.test_config
```

25.7.492 salt.modules.win_event

A module for working with the Windows Event log system. .. versionadded:: 3006.0

salt.modules.win_event.add(log_name, event_id, event_category=0, event_type=None, event_strings=None, event_data=None, event_sid=None)
Adds an event to the application event log.
Parameters
- log_name (str) -- The name of the application or source
- event_id (int) -- The event ID
- event_category (int) -- The event category

25.7. execution modules
**event_type** *(str)* -- The event category. Must be one of:
- Success
- Error
- Warning
- Information
- AuditSuccess
- AuditFailure
**event_strings** *(list)* -- A list of strings
**event_data** *(bytes)* -- Event data. Strings will be converted to bytes
**event_sid** *(sid)* -- The SID for the event

Raises

- **CommandExecutionError** -- event_id is not an integer
- **CommandExecutionError** -- event_category is not an integer
- **CommandExecutionError** -- event_type is not one of the valid event types
- **CommandExecutionError** -- event_strings is not a list or string

CLI Example:

```bash
# A simple Application event log warning entry
salt '*' win_event.add Application 1234 12 Warning

# A more complex System event log information entry
salt '*' win_event.add System 1234 12 Information ":['Event string data 1', 'Event string data 2']" "Some event data"

# Log to the System Event log with the source "Service Control Manager"
salt '*' win_event.add "Service Control Manager" 1234 12 Warning ":['Event string data 1', 'Event string data 2']" "Some event data"

# Log to the PowerShell event log with the source "PowerShell (PowerShell)"
 salt-call --local win_event.add "PowerShell" 6969 12 Warning
```

salt.modules.win_event.clear *(log_name, backup=None)*

Clears the specified event log.

**Note:** A clear log event will be added to the log after it is cleared.

Parameters

- **log_name** *(str)* -- The name of the log to clear
- **backup** *(str)* -- Path to backup file

CLI Example:

```bash
salt '*' win_event.clear Application
```

salt.modules.win_event.count *(log_name)*

Gets the number of events in the specified.

Parameters

- **log_name** *(str)* -- The name of the log

Returns

The number of events the log contains

Return type

int

CLI Example:

```bash
salt '*' win_event.count Application
```

salt.modules.win_event.get *(log_name)*

Get events from the specified log. Get a list of available logs using the `win_event.get_log_names`
function.

**Warning:** Running this command on a log with thousands of events, such as the Applications log, can take a long time.

**Parameters**

- `log_name (str)` -- The name of the log to retrieve.

**Returns**

tuple: A tuple of events as dictionaries

CLI Example:

goto {**} win_event.get Application

**salt.modules.win_event.get_filtered(log_name, all_requirements=True, **kwargs)**

Will find events that match the fields and values specified in the kwargs. Kwargs can be any item in the return for the event.

**Warning:** Running this command on a log with thousands of events, such as the Applications log, can take a long time.

**Parameters**

- `log_name (str)` -- The name of the log to retrieve
- `all_requirements (bool)` -- True matches all requirements. False matches any requirement. Default is True

**Kwargs:**

- `eventID (int)`: The event ID number
- `eventType (int)`: The event type number. Valid options and their corresponding meaning are:
  - 0: Success
  - 1: Error
  - 2: Warning
  - 4: Information
  - 8: Audit Success
  - 10: Audit Failure
- `year (int)`: The year
- `month (int)`: The month
- `day (int)`: The day of the month
- `hour (int)`: The hour
- `minute (int)`: The minute
- `second (int)`: The second
- `eventCategory (int)`: The event category number
- `sid (sid)`: The SID of the user that created the event
- `sourceName (str)`: The name of the event source

**Returns**

A tuple of dicts of each filtered event

**Return type**
tuple

CLI Example:
# Return all events from the Security log with an ID of 1100
salt "*" win_event.get_filtered Security eventID=1100

# Return all events from the System log with an Error (1) event type
salt "*" win_event.get_filtered System eventType=1

# Return all events from System log with an Error (1) type, source is Service Control Manager, and data is netprofm
salt "*" win_event.get_filtered System eventType=1 sourceName="Service Control Manager" data="netprofm"

# Return events from the System log that match any of the kwargs below
salt "*" win_event.get_filtered System eventType=1 sourceName="Service Control Manager" data="netprofm" all_requirements=False

salt.modules.win_event.get_log_names()
Get a list of event logs available on the system
Returns A list of event logs available on the system
Return type list
CLI Example:
salt "*" win_event.get_log_names

salt.modules.win_event.query(log_name, query_text=None, records=20, latest=True, raw=False)
Query a log for a specific event_id. Return the top number of records specified. Use the win_event.get_log_names to see a list of available logs on the system.

Note: You can use the Windows Event Viewer to create the XPath query for the query_text parameter. Click on Filter Current Log, configure the filter, then click on the XML tab. Copy the text between the two <Select> tags. This will be the contents of the query_text parameter. You will have to convert some codes. For example, &gt; becomes >, &lt; becomes <. Additionally, you'll need to put spaces between comparison operators. For example: this >= that.

Parameters
- log_name (str) -- The name of the log to query
- query_text (str) -- The filter to apply to the log
- records (int) -- The number of records to return
- latest (bool) -- True will return the newest events. False will return the oldest events. Default is True
- raw (bool) -- True will return the raw xml results. False will return the xml converted to a dictionary. Default is False

Returns A list of dict objects that contain information about the event
Return type list

CLI Example:

# Return the 20 most recent events from the Application log with an event ID of 22
salt 'x' win_event.query Application "*[System[(EventID=22)]]"

# Return the 20 most recent events from the Application log with an event ID of 22
# Return raw xml
salt 'x' win_event.query Application "*[System[(EventID=22)]]" raw=True

# Return the 20 oldest events from the Application log with an event ID of 22
(continues on next page)
salt '*' win_event.query Application "*[System[(EventID=22)]]'' latest=False

# Return the 20 most recent Critical (1) events from the Application log in the last 12 hours
salt '*' win_event.query Application "*[System[(Level=1) and TimeCreated[timediff(@SystemTime) <= 43200000)]]"

# Return the 5 most recent Error (2) events from the application log
salt '*' win_event.query Application "*[System[(Level=2)]]" records=5

# Return the 20 most recent Warning (3) events from the Windows PowerShell log where the Event Source is PowerShell
salt '*' win_event.query "Windows PowerShell" "*[System[Provider[@Name='PowerShell'] and (Level=3)]]"

# Return the 20 most recent Information (0 or 4) events from the Microsoft-Windows-PowerShell/Operational on 2022-08-24 with an Event ID of 4103
salt 'win_event.query "Microsoft-Windows-PowerShell/Operational" <=*[System[(Level=4 or Level=0) and (EventID=4103) and TimeCreated[@SystemTime > '2022-08-24T06:00:00.000Z']]]"

# Return the 20 most recent Information (0 or 4) events from the Microsoft-Windows-PowerShell/Operational within the last hour
salt 'win_event.query "Microsoft-Windows-PowerShell/Operational" <=*[System[(Level=4 or Level=0) and TimeCreated[timediff(@SystemTime) <= 3600000)]]"

25.7.493  salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends

- win32api
- win32file
- win32con
- salt.utils.win_dacl

salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made. Used by the file state to populate the return dict

Parameters

- **path**(str) -- The full path to the directory.
- **ret**(dict) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- **owner**(str) -- The owner to set for the directory.
- **grant_perms**(dict) -- A dictionary containing the user/group and the basic permissions to check/grant, ie: {'user': {'perms': 'basic_permission'}}. Default is None.
- **deny_perms**(dict) -- A dictionary containing the user/group and permissions to check/deny. Default is None.
• inheritance (bool) -- True will check if inheritance is enabled and enable it. False will check if inheritance is disabled and disable it. Default is True.
• reset (bool) -- True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

Returns A dictionary of changes that have been made
Return type dict

CLI Example:

```
# To see changes to "C:\Temp" if the 'Users' group is given 'read & execute'
salt '*' file.check_perms C:\Temp \ { } Administrators "{'Users': {'perms': 'read_ 
->execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp \ { } Administrators "{'Users': {'perms': 'read_ 
->execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp \ { } Administrators "{'jsnuffy': {'perms': [ 
->'read_attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

salt.modules.win_file.chgrp(path, group)
Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the ‘primary group’ of a file, use file.chpgrp.

To set group permissions use file.set_perms

Parameters
• path (str) -- The path to the file or directory
• group (str) -- The group (unused)

Returns None

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

salt.modules.win_file.chown(path, user, group=None, pgroup=None, follow_symlinks=True)
Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a ‘primary group’ property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the ‘primary group’ property and understand the implications, pass the Windows only parameter, pgroup, instead.

Parameters
• path (str) -- The path to the file or directory
• **user** *(str)* -- The name of the user to own the file
• **group** *(str)* -- The group (not used)
• **pgroup** *(str)* -- The primary group to assign
• **follow_symlinks** *(bool)* -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** True if successful, otherwise error
**Return type** bool

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

**salt.modules.win_file.chpgrp**(path, group)
Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**

- **path** *(str)* -- The path to the file or directory
- **pgroup** *(str)* -- The primary group to assign

**Returns** True if successful, otherwise error
**Return type** bool

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt 'None'
```

**salt.modules.win_file.get_attributes**(path)
Return a dictionary object with the Windows file attributes for a file.

**Parameters**

- **path** *(str)* -- The path to the file or directory

**Returns** A dictionary of file attributes
**Return type** dict

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

**salt.modules.win_file.get_gid**(path, follow_symlinks=True)
Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a ‘primary group’, this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the ‘primary group’ of a file, use file.get_pgid.

**Parameters**

- **path** *(str)* -- The path to the file or directory
- **follow_symlinks** *(bool)* -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True
Returns The gid of the owner
Return type str

**CLI Example:**
salt '*' file.get_gid c:\temp\test.txt

salt.modules.win_file.get_group(path, follow_symlinks=True)
Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use file.get_pgroup.

**Parameters**
- `path (str)` -- The path to the file or directory
- `follow_symlinks (bool)` -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The name of the owner
**Return type** str

**CLI Example:**
salt '*' file.get_group c:\temp\test.txt

salt.modules.win_file.get_mode(path)
Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

**Parameters** `path (str)` -- The path to the file or directory

**Returns** None

**CLI Example:**
salt '*' file.get_mode /etc/passwd

salt.modules.win_file.get_pgid(path, follow_symlinks=True)
Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

**Parameters**
- `path (str)` -- The path to the file or directory
- `follow_symlinks (bool)` -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

**Returns** The gid of the primary group
**Return type** str

**CLI Example:**
salt '*' file.get_pgid c:\temp\test.txt
salt.modules.win_file.get_pgroup(path, follow_symlinks=True)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the get_pgid function which will return the SID, including for the system 'None' group.

Parameters
- path (str) -- The path to the file or directory
- follow_symlinks (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the primary group
Return type str

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

salt.modules.win_file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters
- path (str) -- The path to the file or directory
- follow_symlinks (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The uid of the owner
Return type str

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.get_user(path, follow_symlinks=True)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify follow_symlinks=False to turn off this behavior.

Parameters
- path (str) -- The path to the file or directory
- follow_symlinks (bool) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner
Return type str

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.gid_to_group(gid)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.
For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

**Parameters**
- **gid** *(str)* -- The gid of the group

**Returns**
- The name of the group

**Return type**
- str

**CLI Example:**
```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

**salt.modules.win_file.group_to_gid** *(group)*
Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, '' is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

**Parameters**
- **group** *(str)* -- The name of the group

**Returns**
- The gid of the group

**Return type**
- str

**CLI Example:**
```
salt '*' file.group_to_gid administrators
```

**salt.modules.win_file.is_link** *(path)*
Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

**Parameters**
- **path** *(str)* -- The path to a file or directory

**Returns**
- True if path is a symlink, otherwise False

**Return type**
- bool

**CLI Example:**
```
salt '*' file.is_link /path/to/link
```

**salt.modules.win_file.lchown** *(path, user=None, group=None, pgroup=None)*
Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

**Parameters**
- **path** *(str)* -- The path to the file or directory
- **user** *(str)* -- The name of the user to own the file
- **group** *(str)* -- The group (not used)
- **pgroup** *(str)* -- The primary group to assign
Retruns: True if successful, otherwise error
Return type: bool

CLI Example:
```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

salt.modules.win_file.makedirs(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the parent directory containing this path is available.

Parameters
- **path** *(str)* -- The full path to the directory.

  Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

  To set advanced permissions use a list for the **perms** parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
  ```

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the **grant_perms** parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

Retruns: True if successful
Return type: bool

Raises: **CommandExecutionError** -- If unsuccessful

CLI Example:
```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"
```
# Locally using salt call
```
salt-call file.makedirs C:\Temp \ Administrators "{'Users': {'perms': 'read_execute ...
", 'applies_to': 'this_folder_only'}}"
```

# Specify advanced attributes with a list
```
salt '*' file.makedirs C:\Temp \ Administrators "{'jsnuffy': {'perms': ...
", 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.makedirs_perms(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=True)

Set owner and permissions for each directory created.

Parameters

- **path** *(str)* -- The full path to the directory.
- **owner** *(str)* -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user`: `{perms`: `basic_permission'}`}. You can also set the applies_to setting here. The default is `this_folder_subfolders_files`. Specify another applies_to setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
  ```

  To set advanced permissions use a list for the **perms** parameter, ie:

  ```
  {'user': {'perms': [read_attributes, read_ea], 'applies_to': 'this_folder'}
  ```

- **deny_perms** *(dict)* -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the **grant_perms** parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** *(bool)* -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** *(bool)* -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

**Returns**

True if successful, otherwise raises an error

**Return type** *bool*

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp \ Administrators "{'Users': {'perms': 'read_execute ...
", 'applies_to': 'this_folder_only'}}"
```

```
# Locally using salt call
salt-call file.makedirs_perms C:\Temp \ Administrators "{'Users': {'perms': 'read ...
", 'applies_to': 'this_folder_only'}}"
```

```
# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp \ Administrators "{'jsnuffy': {'perms': [
", 'read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```
salt.modules.win_file.mkdir(path, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Ensure that the directory is available and permissions are set.

Parameters

- **path (str)** -- The full path to the directory.
- **owner (str)** -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms (dict)** -- A dictionary containing the user/group and the basic permissions to grant, ie: `{user: {'perms': 'basic_permission'}`. You can also set the applies_to setting here. The default is this_folder_subfolders_files. Specify another applies_to setting like this:

  ```python
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

To set advanced permissions use a list for the perms parameter, ie:

  ```python
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
  ```

- **deny_perms (dict)** -- A dictionary containing the user/group and permissions to deny along with the applies_to setting. Use the same format used for the grant_perms parameter. Remember, deny permissions supersede grant permissions.
- **inheritance (bool)** -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset (bool)** -- If True the existing DACL will be cleared and replaced with the settings defined in this function. If False, new entries will be appended to the existing DACL. Default is False.

New in version 2018.3.0.

**Returns**  True if successful

**Return type**  bool

**Raises**  CommandExecutionError -- If unsuccessful

**CLI Example:**

```bash
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\Administrators "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\Administrators "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.remove(path, force=False)

Remove the named file or directory

Parameters

- **path (str)** -- The path to the file or directory to remove.
- **force (bool)** -- Remove even if marked Read-Only. Default is False

**Returns**  True if successful, False if unsuccessful

**Return type**  bool

**CLI Example:**
salt '*' file.remove C:\Temp

salt.modules.win_file.set_attributes(path, archive=None, hidden=None, normal=None, notIndexed=None, readonly=None, system=None, temporary=None)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters

- **path** *(str)* -- The path to the file or directory
- **archive** *(bool)* -- Sets the archive attribute. Default is None
- **hidden** *(bool)* -- Sets the hidden attribute. Default is None
- **normal** *(bool)* -- Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- **notIndexed** *(bool)* -- Sets the indexed attribute. Default is None
- **readonly** *(bool)* -- Sets the readonly attribute. Default is None
- **system** *(bool)* -- Sets the system attribute. Default is None
- **temporary** *(bool)* -- Sets the temporary attribute. Default is None

Returns True if successful, otherwise False

Return type bool

CLI Example:

salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True

salt.modules.win_file.set_mode(path, mode)

Set the mode of a file

This just calls get_mode, which returns None because we don’t use mode on Windows

Parameters

- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

Returns None

CLI Example:

salt '*' file.set_mode /etc/passwd 0644

salt.modules.win_file.set_perms(path, grant_perms=None, deny_perms=None, inheritance=True, reset=False)

Set permissions for the given path

Parameters

- **path** *(str)* -- The full path to the directory.
- **grant_perms** *(dict)* -- A dictionary containing the user/group and the basic permissions to grant, ie: {'user': {'perms': 'basic_permission'}}. You can also set the applies_to setting here for directories. The default for applies_to is this_folder_subfolders_files. Specify another applies_to setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
```

To set advanced permissions use a list for the **perms** parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```
To see a list of available attributes and applies to settings see the documentation for
salt.utils.win_dacl.

A value of None will make no changes to the grant portion of the DACL. Default
is None.

- deny_perms (dict) -- A dictionary containing the user/group and permissions
to deny along with the applies_to setting. Use the same format used for the
grant_perms parameter. Remember, deny permissions supersede grant permis-
sions.

A value of None will make no changes to the deny portion of the DACL. Default is
None.

- inheritance (bool) -- If True the object will inherit permissions from the parent,
if False, inheritance will be disabled. Inheritance setting will not apply to parent
directories if they must be created. Default is False.

- reset (bool) -- If True the existing DCL will be cleared and replaced with the set-
tings defined in this function. If False, new entries will be appended to the existing
DACL. Default is False.

New in version 2018.3.0.

Returns True if successful
Return type bool
Raises CommandExecutionError -- If unsuccessful

CLI Example:

```python
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:\Temp "{'Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp "{'jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.stats(path, hash_type='sha256', follow_symlinks=True)

Return a dict containing the stats about a given file

Under Windows, gid will equal uid and group will equal user.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing
on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g.
Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary
group' is required, it can be accessed in the pgroup and pgid properties.

Parameters

- path (str) -- The path to the file or directory
- hash_type (str) -- The type of hash to return
- follow_symlinks (bool) -- If the object specified by path is a symlink, get-
attributes of the linked file instead of the symlink itself. Default is True

Returns A dictionary of file/directory stats
Return type dict

CLI Example:

```bash
salt '*' file.stats /etc/passwd
```
salt.modules.win_file.symlink(src, link, force=False, atomic=False)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn’t, an error will be raised.

Parameters
• src (str) -- The path to a file or directory
• link (str) -- The path to the link. Must be an absolute path
• force (bool) -- Overwrite an existing symlink with the same name. versionadded:: 3005
• atomic (bool) -- Use atomic file operations to create the symlink. versionadded:: 3006.0

Returns True if successful, otherwise raises CommandExecutionError

Return type bool

CLI Example:
```bash
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.win_file.uid_to_user(uid)

Convert a uid to a user name

Parameters uid (str) -- The user id to lookup

Returns The name of the user

Return type str

CLI Example:
```bash
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.user_to_uid(user)

Convert user name to a uid

Parameters user (str) -- The user to lookup

Returns The user id of the user

Return type str

CLI Example:
```bash
salt '*' file.user_to_uid myusername
```

salt.modules.win_file.version(path)

New in version 3005.

Get the version of a file.

Note: Not all files have version information. The following are common file types that contain version information:
• .exe
• .dll
• .sys

Parameters path (str) -- The path to the file.

Returns The version of the file if the file contains it. Otherwise, an empty string will be returned.

Return type str

Raises
- `CommandExecutionError` -- If the file does not exist
- `CommandExecutionError` -- If the path is not a file

CLI Example:
```
salt * file.version C:\Windows\notepad.exe
```

```
salt.modules.win_file.version_details(path)
```

New in version 3005.

Get file details for a file. Similar to what's in the details tab on the file properties.

**Note:** Not all files have version information. The following are common file types that contain version information:
- .exe
- .dll
- .sys

**Parameters**
- `path (str)` -- The path to the file.

**Returns**
A dictionary containing details about the file related to version. An empty dictionary if the file contains no version information.

**Return type**
`dict`

**Raises**
- `CommandExecutionError` -- If the file does not exist
- `CommandExecutionError` -- If the path is not a file

CLI Example:
```
salt * file.version_details C:\Windows\notepad.exe
```

### 25.7.494 salt.modules.win_firewall

Module for configuring Windows Firewall using `netsh`

```
salt.modules.win_firewall.add_rule(name, localport=\'tcp\', protocol=\'tcp\', action=\'allow\', dir=\'in\', remoteip=\'any\')
```

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

**Parameters**
- `name (str)` -- The name of the rule. Must be unique and cannot be "all". Required.
- `localport (int)` -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- `protocol (Optional[str])` -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- `action (Optional[str])` -- The action the rule performs. Can be any of the following:
  - allow
  - block
- bypass
- **dir** (Optional [str]) -- The direction. Can be in or out.
- **remoteip** (Optional [str]) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

Can be combinations of the above separated by commas.

Returns True if successful
Return type bool
Raises **CommandExecutionError** -- If the command fails

CLI Example:
```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

salt.modules.win_firewall.delete_rule(name=None, localport=None, protocol=None, dir=None, remoteip=None)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters
- **name** (str) -- The name of the rule to delete. If the name all is used you must specify additional parameters.
- **localport** (Optional [str]) -- The port of the rule. If protocol is not specified, protocol will be set to tcp
- **protocol** (Optional [str]) -- The protocol of the rule. Default is tcp when localport is specified
- **dir** (Optional [str]) -- The direction of the rule.
- **remoteip** (Optional [str]) -- The remote IP of the rule.

Returns True if successful
Return type bool
Raises **CommandExecutionError** -- If the command fails

CLI Example:
```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```
salt.modules.win_firewall.disable(profile='allprofiles')
    Disable firewall profile
    Parameters profile (Optional[str]) -- The name of the profile to disable. Default is allprofiles. Valid options are:
    • allprofiles
    • domainprofile
    • privateprofile
    • publicprofile
    Returns True if successful
    Return type bool
    Raises CommandExecutionError -- If the command fails
    CLI Example:
    salt '*' firewall.disable

salt.modules.win_firewall.enable(profile='allprofiles')
    Enable firewall profile
    Parameters profile (Optional[str]) -- The name of the profile to enable. Default is allprofiles. Valid options are:
    • allprofiles
    • domainprofile
    • privateprofile
    • publicprofile
    Returns True if successful
    Return type bool
    Raises CommandExecutionError -- If the command fails
    CLI Example:
    salt '*' firewall.enable

salt.modules.win_firewall.get_all_profiles(store='local')
    Gets all properties for all profiles in the specified store
    New in version 2018.3.4.
    New in version 2019.2.0.
    Parameters store (str) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
    • lgpo
    • local
    Default is local
    Returns A dictionary containing the specified settings for each profile
    Return type dict
    CLI Example:
    # Get all firewall settings for all profiles
    salt * firewall.get_all_settings
    # Get all firewall settings for all profiles as defined by local group policy
    salt * firewall.get_all_settings lgpo
New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private

- **store** (*str*) -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is *local*

Returns A dictionary containing the specified settings

Return type *dict*

CLI Example:

```bash
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

```python
salt.modules.win_firewall.get_config()
```

Get the status of all the firewall profiles

Returns A dictionary of all profiles on the system

Return type *dict*

Raises *CommandExecutionError* -- If the command fails

CLI Example:

```bash
salt '*' firewall.get_config
```

```python
salt.modules.win_firewall.get_rule(name='all')
```

New in version 2015.5.0.

Display all matching rules as specified by name

Parameters **name** *(Optional[*str]*) -- The full name of the rule. all will return all rules.

Default is all

Returns A dictionary of all rules or rules that match the name exactly

Return type *dict*

Raises *CommandExecutionError* -- If the command fails

CLI Example:

```bash
salt '*' firewall.get_rule 'MyAppPort'
```

```python
salt.modules.win_firewall.get_settings(profile, section, store='local')
```

Get the firewall property from the specified profile in the specified store as returned by netsh advfirewall.

New in version 2018.3.4.

New in version 2019.2.0.

Parameters

- **profile** (*str*) -- The firewall profile to query. Valid options are:
  - domain
  - public
- private

- **section** *(str)* -- The property to query within the selected profile. Valid options are:
  - firewallpolicy: inbound/outbound behavior
  - logging: firewall logging settings
  - settings: firewall properties
  - state: firewalls state (on | off)

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local

Default is local

**Returns** A dictionary containing the properties for the specified profile

**Return type** *dict*

**Raises**
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

**CLI Example:**

```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

salt.modules.win_firewall.rule_exists *(name)*

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

**Parameters**
- **name** *(str)* -- The name of the rule

**Returns** True if exists, otherwise False

**Return type** *bool*

**CLI Example:**

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

salt.modules.win_firewall.set_firewall_settings *(profile, inbound=None, outbound=None, store='local')*

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**
- **profile** *(str)* -- The firewall profile to query. Valid options are:
  - domain
  - public
  - private
- **inbound** *(str)* -- The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - blockinbound
  - blockinboundalways
  - allowinbound
  - notconfigured
Default is None

- **outbound** *(str)* -- The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
  - allowoutbound
  - blockoutbound
  - notconfigured
  Default is None

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local

**Returns** True if successful

**Return type** `bool`

**Raises**

- `CommandExecutionError` -- If an error occurs
- `ValueError` -- If the parameters are incorrect

**CLI Example:**

```bash
# Set the inbound setting for the domain profile to block inbound # connections
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound # connections
salt * firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group # policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound' outbound='allowoutbound' store='lgpo'
```

**salt.modules.win_firewall.set_logging_settings** *(profile, setting, value, store='local')*

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version 2019.2.0.

**Parameters**

- **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private

- **setting** *(str)* -- The logging setting to configure. Valid options are:
  - allowedconnections
  - droppedconnections
  - filename
  - maxfilesize

- **value** *(str)* -- The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

  allowedconnections:
  - enable
  - disable
  - notconfigured
  droppedconnections:
  - enable
-- disable
-- notconfigured
filename:
-- Full path and name of the firewall log file
-- notconfigured
maxfilesize:
-- 1 - 32767
-- notconfigured

Note: notconfigured can only be used when using the lgpo store

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
  Default is local

Returns True if successful
Return type bool
Raises
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don’t log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot%\system32\LogFiles\Firewall\p\firewall.log

# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

---

salt.modules.win_firewall.set_settings *(profile, setting, value, store='local')*

Configure firewall settings.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters

- **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **setting** *(str)* -- The firewall setting to configure. Valid options are:
  - localfirewallrules
  - localconsecrules
  - inboundusernotification
  - remotemanagement
unicastresponse to multicast

- **value** *(str)* -- The value to apply to the setting. Valid options are:
  - enable
  - disable
  - notconfigured

Note: **notconfigured** can only be used when using the **lgpo** store

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
Default is **local**

Returns **True** if successful
Return type **bool**

Raises
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:

```bash
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

salt.modules.win_firewall.set_state*(profile, state, store='local')*
Configure the firewall state.

New in version 2018.3.4.
New in version 2019.2.0.

Parameters
- **profile** *(str)* -- The firewall profile to configure. Valid options are:
  - domain
  - public
  - private
- **state** *(str)* -- The firewall state. Valid options are:
  - on
  - off
  - notconfigured

Note: **notconfigured** can only be used when using the **lgpo** store

- **store** *(str)* -- The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
  - lgpo
  - local
Default is **local**

Returns **True** if successful
Return type **bool**

Raises
- **CommandExecutionError** -- If an error occurs
- **ValueError** -- If the parameters are incorrect

CLI Example:
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo

25.7.495 salt.modules.win_groupadd

Manage groups on Windows

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see here.

salt.modules.win_groupadd.add(name, **kwargs)
Add the specified group
- **Parameters**
  - name (str) -- The name of the group to add
  - **Returns**
    - True if successful, otherwise False
  - **Return type**
    - bool

CLI Example:
```
salt '*' group.add foo
```

salt.modules.win_groupadd.adduser(name, username, **kwargs)
Add a user to a group
- **Parameters**
  - name (str) -- The name of the group to modify
  - username (str) -- The name of the user to add to the group
  - **Returns**
    - True if successful, otherwise False
  - **Return type**
    - bool

CLI Example:
```
salt '*' group.adduser foo username
```

salt.modules.win_groupadd.delete(name, **kwargs)
Remove the named group
- **Parameters**
  - name (str) -- The name of the group to remove
  - **Returns**
    - True if successful, otherwise False
  - **Return type**
    - bool

CLI Example:
```
salt '*' group.delete foo
```

salt.modules.win_groupadd.deluser(name, username, **kwargs)
Remove a user from a group
- **Parameters**
  - name (str) -- The name of the group to modify
  - username (str) -- The name of the user to remove from the group
  - **Returns**
    - True if successful, otherwise False
  - **Return type**
    - bool

CLI Example:
salt '*' group.deluser foo username

salt.modules.win_groupadd.getent(refresh=False)
    Return info on all groups
    Parameters refresh (bool) -- Refresh the info for all groups in __context__. If False only
    the groups in __context__ will be returned. If True the __context__ will be refreshed
    with current data and returned. Default is False
    Returns A list of groups and their information
    CLI Example:
    salt '*' group.getent

salt.modules.win_groupadd.info(name)
    Return information about a group
    Parameters name (str) -- The name of the group for which to get information
    Returns A dictionary of information about the group
    Return type dict
    CLI Example:
    salt '*' group.info foo

salt.modules.win_groupadd.list_groups(refresh=False)
    Return a list of groups
    Parameters refresh (bool) -- Refresh the info for all groups in __context__. If False only
    the groups in __context__ will be returned. If True, the __context__ will be re-
    freshed with current data and returned. Default is False
    Returns A list of groups on the machine
    Return type list
    CLI Example:
    salt '*' group.list_groups

salt.modules.win_groupadd.members(name, members_list, **kwargs)
    Ensure a group contains only the members in the list
    Parameters
        • name (str) -- The name of the group to modify
        • members_list (str) -- A single user or a comma separated list of users. The group
          will contain only the users specified in this list.
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    salt '*' group.members foo 'user1,user2,user3'
25.7.496 salt.modules.win_iis

Microsoft IIS site management via WebAdministration powershell module

maintainer  Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>
platform  Windows
depends  PowerShell
depends  WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

salt.modules.win_iis.create_app(name, site, sourcepath, apppool=None)
Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters
- **name** (str) -- The IIS application.
- **site** (str) -- The IIS site name.
- **sourcepath** (str) -- The physical path.
- **apppool** (str) -- The name of the IIS application pool.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:

```bash
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
apppool='site0'
```

salt.modules.win_iis.create_apppool(name)
Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters **name** (str) -- The name of the IIS application pool.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:

```bash
salt '*' win_iis.create_apppool name='MyTestPool'
```

salt.modules.win_iis.create_backup(name)
Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the $env:Windir\System32\inetsrv\backup folder.

Parameters **name** (str) -- The name to give the backup
Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt 'localhost' win_iis.create_backup good_config_20170209
```

salt.modules.win_iis.create_binding(
    site, hostheader='', ipaddress='', port=80, protocol='http',
    sslflags=None)

Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters
- **site** (str) -- The IIS site name.
- **hostheader** (str) -- The host header of the binding. Usually a hostname.
- **ipaddress** (str) -- The IP address of the binding.
- **port** (int) -- The TCP port of the binding.
- **protocol** (str) -- The application protocol of the binding.
- **sslflags** (str) -- The flags representing certificate type and storage of the binding.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt 'localhost' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.create_cert_binding(
    name, site, hostheader='', ipaddress='', port=443,
    sslflags=0)

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters
- **name** (str) -- The thumbprint of the certificate.
- **site** (str) -- The IIS site name.
- **hostheader** (str) -- The host header of the binding.
- **ipaddress** (str) -- The IP address of the binding.
- **port** (int) -- The TCP port of the binding.
- **sslflags** (int) -- Flags representing certificate type and certificate storage of the binding.

Returns  True if successful, otherwise False
Return type  bool

CLI Example:
```
salt 'localhost' win_iis.create_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```
salt.modules.win_iis.create_site(name, sourcepath, apppool='', hostheader='', ipaddress='', port=80, protocol='http')

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters
- **name** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path of the IIS site.
- **apppool** *(str)* -- The name of the IIS application pool.
- **hostheader** *(str)* -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **protocol** *(str)* -- The application protocol of the binding. (http, https, etc.)

Returns True if successful, otherwise False.
Return type **bool**

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:
```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool='TestPool'
```

salt.modules.win_iis.create_vdir(name, site, sourcepath, app='/')

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters
- **name** *(str)* -- The virtual directory name.
- **site** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path.
- **app** *(str)* -- The IIS application.

Returns True if successful, otherwise False.
Return type **bool**

CLI Example:
```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:\inetpub\vdirs\vd0'
```

salt.modules.win_iis.get_container_setting(name, container, settings)

Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters
- **name** *(str)* -- The name of the IIS container.
**container (str)** -- The type of IIS container. The container types are: AppPools, Sites, SslBindings

**settings (dict)** -- A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools' settings='["processModel.identityType"]'
```

### salt.modules.win_iis.get_webapp_settings(name, site, settings)

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

**Note:** Params are case sensitive

**Parameters**

- **name (str)** -- The name of the IIS web application.
- **site (str)** -- The site name contains the web application. Example: Default Web Site
- **settings (str)** -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site' settings='["physicalPath","applicationPool"]'
```

### salt.modules.win_iis.get_webconfiguration_settings(name, settings)

Get the webconfiguration settings for the IIS PSPath.

**Parameters**

- **name (str)** -- The PSPath of the IIS webconfiguration settings.
- **settings (list)** -- A list of dictionaries containing setting name and filter.

Returns A list of dictionaries containing setting name, filter and value.

Return type dict

CLI Example:

```
salt '*' win_iis.get_webconfiguration_settings name='IIS:' settings='[{"name": ➔ 'enabled', 'filter': 'system.webServer/security/authentication/anonymousAuthentication'}]'
```

### salt.modules.win_iis.list_apppools()

List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.

Return type dict

CLI Example:

```
salt '*' win_iis.list_apppools
```

### salt.modules.win_iis.list_apps(site)

Get all configured IIS applications for the specified site.

**Parameters**

- **site (str)** -- The IIS site name.
Returns: A dictionary of the application names and properties.

CLI Example:
```
salt '*' win_iis.list_apps site
```

salt.modules.win_iis.list_backups()
List the IIS Configuration Backups on the System.

New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the $env:WinDir\System32\inetsrv\backup folder.

Returns A dictionary of IIS Configurations backed up on the system.

Return type dict

CLI Example:
```
salt '*' win_iis.list_backups
```

salt.modules.win_iis.list_bindings(site)
Get all configured IIS bindings for the specified site.

Parameters site (str) -- The name of the IIS Site

Returns A dictionary of the binding names and properties.

Return type dict

CLI Example:
```
salt '*' win_iis.list_bindings site
```

salt.modules.win_iis.list_cert_bindings(site)
List certificate bindings for an IIS site.

New in version 2016.11.0.

Parameters site (str) -- The IIS site name.

Returns A dictionary of the binding names and properties.

Return type dict

CLI Example:
```
salt '*' win_iis.list_cert_bindings site
```

salt.modules.win_iis.list_sites()
List all the currently deployed websites.

Returns A dictionary of the IIS sites and their properties.

Return type dict

CLI Example:
```
salt '*' win_iis.list_sites
```

salt.modules.win_iis.list_vdirs(site, app='/
Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters
- site (str) -- The IIS site name.
- app (str) -- The IIS application.

Returns A dictionary of the virtual directory names and properties.

Return type dict
CLI Example:

```python
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.list_worker_processes(apppool)`
Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

Parameters

- **apppool** *(str)* -- The application pool to query

Returns

A dictionary of worker processes with their process IDs

Return type

`dict`

CLI Example:

```python
salt '*' win_iis.list_worker_processes 'My App Pool'
```

`salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)`
Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

Parameters

- **site** *(str)* -- The IIS site name.
- **binding** *(str)* -- The binding to edit. This is a combination of the IP address, port, and host header. It is in the following format: `ipaddress:port:hostheader`. For example, `*:80:` or `*:80:salt.com`
- **hostheader** *(str)* -- The host header of the binding. Usually the hostname.
- **ipaddress** *(str)* -- The IP address of the binding.
- **port** *(int)* -- The TCP port of the binding.
- **sslflags** *(str)* -- The flags representing certificate type and storage of the binding.

Returns

True if successful, otherwise False

Return type

`bool`

CLI Example:

The following will set the host header of binding `*:80:` for `site0` to example.com

```python
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.com'
```

`salt.modules.win_iis.modify_site(name, sourcepath=None, apppool=None)`
Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name** *(str)* -- The IIS site name.
- **sourcepath** *(str)* -- The physical path of the IIS site.
- **apppool** *(str)* -- The name of the IIS application pool.

Returns

True if successful, otherwise False.

Return type

`bool`

Note:
If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```python
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool='NewTestPool'
```
salt.modules.win_iis.remove_app(name, site)
Remove an IIS application.
Parameters
- **name** (str) -- The application name.
- **site** (str) -- The IIS site name.
Returns True if successful, otherwise False
Return type bool
CLI Example:
```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.remove_apppool(name)
Remove an IIS application pool.
Parameters **name** (str) -- The name of the IIS application pool.
Returns True if successful, otherwise False
Return type bool
CLI Example:
```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

salt.modules.win_iis.remove_backup(name)
Remove an IIS Configuration backup from the System.
New in version 2017.7.0.
Parameters **name** (str) -- The name of the backup to remove
Returns True if successful, otherwise False
Return type bool
CLI Example:
```
salt '*' win_iis.remove_backup backup_20170209
```

salt.modules.win_iis.remove_binding(site, hostheader='', ipaddress='*', port=80)
Remove an IIS binding.
Parameters
- **site** (str) -- The IIS site name.
- **hostheader** (str) -- The host header of the binding.
- **ipaddress** (str) -- The IP address of the binding.
- **port** (int) -- The TCP port of the binding.
Returns True if successful, otherwise False
Return type bool
CLI Example:
```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*' port='80'
```

salt.modules.win_iis.remove_cert_binding(name, site, hostheader='', ipaddress='*', port=443)
Remove a certificate from an IIS Web Binding.
New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters
- **name** (str) -- The thumbprint of the certificate.
- **site** (**str**) -- The IIS site name.
- **hostheader** (**str**) -- The host header of the binding.
- **ipaddress** (**str**) -- The IP address of the binding.
- **port** (**int**) -- The TCP port of the binding.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader='example.com' ipaddress='*' port='443'
```

---

**salt.modules.win_iis.remove_site**(name)
Delete a website from IIS.

**Parameters**
- **name** (**str**) -- The IIS site name.

**Returns** True if successful, otherwise False

**Return type** bool

**Note:** This will not remove the application pool used by the site.

**CLI Example:**
```
salt '*' win_iis.remove_site name='My Test Site'
```

---

**salt.modules.win_iis.remove_vdir**(name, site, app='/')
Remove an IIS virtual directory.

**Parameters**
- **name** (**str**) -- The virtual directory name.
- **site** (**str**) -- The IIS site name.
- **app** (**str**) -- The IIS application.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

---

**salt.modules.win_iis.restart_apppool**(name)
Restart an IIS application pool.

**New in version 2016.11.0.**

**Parameters**
- **name** (**str**) -- The name of the IIS application pool.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' win_iis.restart_apppool name='MyTestPool'
```

---

**salt.modules.win_iis.restart_site**(name)
Restart a Web Site in IIS.

**New in version 2017.7.0.**

**Parameters**
- **name** (**str**) -- The name of the website to restart.

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
```
salt '*' win_iis.restart_site name='My Test Site'

salt.modules.win_iis.set_container_setting(name, container, settings)
Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

• name (str) -- The name of the IIS container.
• container (str) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
• settings (dict) -- A dictionary of the setting names and their values.

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools' settings="{'managedPipeLineMode': 'Integrated'}"

salt.modules.win_iis.set_webapp_settings(name, site, settings)
Configure an IIS application.

New in version 2017.7.0.

Note: This function only configures an existing app. Params are case sensitive.

Parameters

• name (str) -- The IIS application.
• site (str) -- The IIS site name.
• settings (str) -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{ 'physicalPath': 'C:\site0', 'apppool': 'site0'}"

salt.modules.win_iis.set_webconfiguration_settings(name, settings)
Set the value of the setting for an IIS container.

Parameters

• name (str) -- The PSPath of the IIS webconfiguration settings.
• settings (list) -- A list of dictionaries containing setting name, filter and value.

Returns True if successful, otherwise False

Return type bool

CLI Example:
salt '*' win_iis.set_webconfiguration_settings name='IIS:\' settings="[['name': 'enabled', 'filter': 'system.webServer/security/authentication/anonymousAuthentication', 'value': False]]"

salt.modules.win_iis.start_apppool(name)
Start an IIS application pool.
New in version 2017.7.0.

Parameters name (str) -- The name of the App Pool to start.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.start_site(name)
Start a Web Site in IIS.

New in version 2017.7.0.

Parameters name (str) -- The name of the website to start.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.stop_apppool(name)
Stop an IIS application pool.

New in version 2017.7.0.

Parameters name (str) -- The name of the App Pool to stop.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.stop_site(name)
Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters name (str) -- The name of the website to stop.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

25.7.497 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.disable(iface)
Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.enable(iface)
Enable an interface

CLI Example:
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'

salt.modules.win_ip.get_all_interfaces()
Return configs for all interfaces
CLI Example:
    salt -G 'os_family:Windows' ip.get_all_interfaces

salt.modules.win_ip.get_default_gateway()
Set DNS source to DHCP on Windows
CLI Example:
    salt -G 'os_family:Windows' ip.get_default_gateway

salt.modules.win_ip.get_interface(iface)
Return the configuration of a network interface
CLI Example:
    salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'

salt.modules.win_ip.get_subnet_length(mask)
Convenience function to convert the netmask to the CIDR subnet length
CLI Example:
    salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0

salt.modules.win_ip.is_disabled(iface)
Returns True if interface is disabled, otherwise False
CLI Example:
    salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'

salt.modules.win_ip.is_enabled(iface)
Returns True if interface is enabled, otherwise False
CLI Example:
    salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'

salt.modules.win_ip.raw_interface_configs()
Return raw configs for all interfaces
CLI Example:
    salt -G 'os_family:Windows' ip.raw_interface_configs

salt.modules.win_ip.set_dhcp_all(iface)
Set both IP Address and DNS to DHCP
CLI Example:
    salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
salt.modules.win_ip.set_dhcp_dns(iface)
Set DNS source to DHCP on Windows

CLI Example:
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'

salt.modules.win_ip.set_dhcp_ip(iface)
Set Windows NIC to get IP from DHCP

CLI Example:
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'

salt.modules.win_ip.set_static_dns(iface, *addrs)
Set static DNS configuration on a Windows NIC

Parameters
• iface (str) -- The name of the interface to set
• addrs -- One or more DNS servers to be added. To clear the list of DNS servers pass an empty list ([]). If undefined or None no changes will be made.

Returns A dictionary containing the new DNS settings

Return type dict

CLI Example:
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.252' '192.168.1.253'

salt.modules.win_ip.set_static_ip(iface, addr, gateway=None, append=False)
Set static IP configuration on a Windows NIC

iface The name of the interface to manage
addr IP address with subnet length (ex. 10.1.2.3/24). The ip.get_subnet_length function can be used to calculate the subnet length from a netmask.
gateway [None] If specified, the default gateway will be set to this value.
append [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets addr as the only address on the interface.

CLI Example:
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
  → gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
  → append=True

25.7.498 salt.modules.win_lgpo
Manage Local Policy on Windows

This module allows configuring local group policy (i.e. gedit.msc) on a Windows machine.

New in version 2016.11.0.

Warning: Local Group Policy will always be superseded by Domain Group policy. If policies are configured with Local Group Policy that are also configured with Domain Group policy, the Domain Group policy will take precedence.
Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings

Policies contained in the "Windows Settings" section of the gpedit.msc GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module’s _policy_info class. The _policy_info class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the _policy_info class

depends

- pywin32 Python module
- lxml
- uuid
- struct
- salt.utils.win_reg

salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)

Get a policy value

Parameters

- **policy_class** *(str)* -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return_full_policy_names** *(bool)* -- True/False to return the policy name as it is seen in the gpedit.msc GUI or to only return the policy key/id.
- **hierarchical_return** *(bool)* -- True/False to return the policy data in the hierarchy as seen in the gpedit.msc GUI. The default of False will return data split only into User/Computer configuration sections
- **adml_language** *(str)* -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return_not_configured** *(bool)* -- Include Administrative Template policies that are 'Not Configured' in the return data

Returns A dictionary containing the policy values for the specified class

Return type **dict**

CLI Example:

```bash
salt '*' lgpo.get machine return_full_policy_names=True
```
salt.modules.win_lgpo.get_policy

Get the current settings for a single policy on the machine

Parameters

- **policy_name (str)** -- The name of the policy to retrieve. Can be any of the names or alises returned by lgpo.get_policy_info
- **policy_class (str)** -- The policy class. Must be one of machine or user
- **adml_language (str)** -- The language code for the adml file to use for localization. The default is en-US
- **return_value_only (bool)** -- True will return only the value for the policy, without the name of the policy. return_full_policy_names and hierarchical_return will be ignored. Default is True
- **return_full_policy_names (bool)** -- Returns the full policy name regardless of what was passed in policy_name

- **hierarchical_return (bool)** -- Returns a hierarchical view of the policy showing its parents

Returns A dictionary containing the policy settings

Return type dict

CLI Example:

```bash
# Using the policy id
salt '*' lgpo.get_policy LockoutDuration machine
salt '*' lgpo.get_policy AutoUpdateCfg machine

# Using the full name
salt '*' lgpo.get_policy "Account lockout duration" machine
salt '*' lgpo.get_policy "Configure Automatic Updates" machine

# Using full path and name
salt '*' lgpo.get_policy "Windows Components\Windows Update\Configure Automatic Updates" machine
```

salt.modules.win_lgpo.get_policy_info

Returns information about a specified policy

Parameters

- **policy_name (str)** -- The name of the policy to lookup
- **policy_class (str)** -- The class of policy, i.e. machine, user, both
- **adml_language (str)** -- The ADML language to use for Administrative Template data lookup

Returns Information about the specified policy

Return type dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use lgpo.get_policy_info to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the gpeedit.msc gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, Access data sources across domains exists in ~10 different paths. If you put that through get_policy_info
you’ll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```bash
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine
```

```
local:  
    -------
    message:
    policy_aliases:
      - Turn off the "Order Prints" picture task
      - ShellRemoveOrderPrints_2
      - System\Internet Communication Management\Internet Communication\settings\Turn off the "Order Prints" picture task
    policy_class:
      machine
    policy_elements:
      policy_found:
        True
    policy_name:
      ShellRemoveOrderPrints_2
    rights_assignment:
      False
```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```powershell
PS>salt-call --local lgpo.get_policy_info "Turn off the 'Order Prints' picture task" machine
```

```
local:  
    -------
    message:
    policy_aliases:
      - Turn off the "Order Prints" picture task
      - ShellRemoveOrderPrints_2
      - System\Internet Communication Management\Internet Communication\settings\Turn off the "Order Prints" picture task
    policy_class:
      machine
    policy_elements:
      policy_found:
        True
    policy_name:
      ShellRemoveOrderPrints_2
    rights_assignment:
      False
```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```yaml
internet_communications_settings:
  lgpo.set:
    # computer_policy:
    # Turn off the "Order Prints" picture task: Enabled
```

```yaml
internet_communications_settings:
  lgpo.set:
```

(continues on next page)
When using the full path, it might be a good idea to use single quotes around the path:

```plaintext
- computer_policy:
  'System\Internet Communication Management\Internet Communication settings\Turn off the "Order Prints" picture task': 'Enabled'
```

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the .admx files. If you know nothing about .admx/.adml relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml | %
  Select-String "Order Prints"
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```powershell
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx | %
  Select-String "ShellRemoveOrderPrints"
```

Now we have two to pick from. And if you notice the class="Machine" and class="User" (which details if it is a computer policy or user policy respectively) the ShellRemoveOrderPrints_2 is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.

```python
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a local server policy.

Parameters:

- **computer_policy (dict)** -- A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the gpedit GUI, i.e. if a
setting can be 'Enabled'/'Disabled', then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:
These policies can be specified using the GUI display name or the key name from the _policy_info class in this module.
The GUI display name is also contained in the _policy_info class in this module.

Administrative Template Policies:
These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.

- **user_policy** (dict) -- The same setup as the computer_policy, except with data to configure the local user policy.
- **cumulative_rights_assignments** (bool) -- Determine how user rights assignment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy

  If False, only the users specified will get the right (any existing will have the right revoked)

- **adml_language** (str) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

  Returns True is successful, otherwise False

  Return type bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{'LockoutDuration': 2, 'RestrictAnonymous': 'Enabled', 'AuditProcessTracking': 'Success, Failure'}"
```

salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True, adml_language='en-US')

Set a single computer policy

Parameters

- **name** (str) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **cumulative_rights_assignments** (*bool*) -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

salt.modules.win_lgpo.set_user_policy(*name*, *setting*, *adml_language='en-US'*)

Set a single user policy

**Parameters**

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

**Returns** True if successful, Otherwise False

**Return type** bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control Panel" Enabled
```

### 25.7.499 salt.modules.win_lgpo_reg

**LGPO - Registry.pol**

New in version 3006.0.

A module for working with registry based policies in Windows Local Group Policy (LGPO). This module contains functions for working with the Registry.pol file. The Registry.pol file is the source of truth for registry settings and LGPO.

Group Policy is refreshed every 90 seconds by default. During that refresh the contents of the Registry.pol file are applied to the Registry. If the setting is changed outside of Group Policy to something other than what is contained in the Registry.pol file, it will be changed back during the next refresh.

In the Group Policy Editor (gpedit.msc) these policies can be set to three states:

- Not Configured
- Enabled
- Disabled

A policy that is "Not Configured" does not have an entry in the Registry.pol file. A Group Policy refresh will not make any changes to key/value pairs in the registry that are not specified in the Registry.pol file.

An "Enabled" policy will have an entry in the Registry.pol files that contains its key path, value name, value type, value size, and value data. When Group Policy is refreshed, existing values will be overwritten with those contained in the Registry.pol file.
A "Disabled" policy will have an entry in the Registry.pol file with the key path and the value name, but the value name will be prepended with **del:. When Group Policy is refreshed the key/value will be deleted from the registry. If the key contains no values, it will also be deleted.

**Working with LGPO Reg**

The easiest way to figure out the values needed for this module is to set the policy using the Group Policy Editor (gpedit.msc) and then run the lgpo_reg.read_reg_pol function. This function will display a dictionary of all registry-based policies in the Registry.pol file. From its return you can get the key, v_name, v_type, and v_data required to "enable" that policy. Use those values to set/disable/delete policies using this module. The same values can also be used to create states for setting these policies.

Note: Not all policies in the Group Policy Editor (gpedit.msc) that write to the registry make that change in the Registry.pol file. Those policies could still be enforced via the Registry.pol file... theoretically. But you will have to find the values needed to set them with this module using a different method.

```python
salt.modules.win_lgpo_reg.delete_value(key, v_name, policy_class='Machine')
```
Delete a key/value pair from the Registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to Not Configured.

**Parameters**
- `key (str)` -- The registry key path
- `v_name (str)` -- The registry value name within the key
- `policy_class (str)` -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User
  Default is Machine

**Raises**
- `SaltInvocationError` -- Invalid policy_class
- `CommandExecutionError` -- On failure

**Returns**
- True if successful, otherwise False
- None: Key/value not present

**Return type** bool

**CLI Example:**
```
# Delete all values under a key
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

```python
salt.modules.win_lgpo_reg.disable_value(key, v_name, policy_class='machine')
```
Mark a registry value for deletion in the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting the policy to Disabled in the Group Policy editor (gpedit.msc)

**Parameters**
- `key (str)` -- The registry key path
- `v_name (str)` -- The registry value name within the key
- `policy_class (str)` -- The registry class to write to. Can be one of the following:
  - Computer
  - Machine
  - User
  Default is Machine

**Raises**
- `SaltInvocationError` -- Invalid policy_class
- `CommandExecutionError` -- On failure

**Returns**
- True if successful, otherwise False
- None: If already disabled
Return type  bool

CLI Example:

```bash
# Delete a value
salt '*' lgpo_reg.delete_value "SOFTWARE\MyKey" "MyValue"
```

salt.modules.win_lgpo_reg.get_key(key, policy_class='Machine')
Get all the values set in a key in the Registry.pol file.

Parameters

- **key** *(str)* -- The registry key where the values reside
- **policy_class** *(str)* -- The registry class to read from. Can be one of the following:

  Raises **SaltInvocationError** -- Invalid policy class

  Returns A dictionary containing the value data and the value type

Return type  dict

CLI Example:

```bash
# Get all values from a key
salt '*' lgpo_reg.get_key "SOFTWARE\MyKey"
```

salt.modules.win_lgpo_reg.get_value(key, v_name, policy_class='Machine')
Get the value of a single value pair as set in the Registry.pol file.

Parameters

- **key** *(str)* -- The registry key where the value name resides
- **v_name** *(str)* -- The value name to retrieve
- **policy_class** *(str)* -- The registry class to read from. Can be one of the following:

  Raises **SaltInvocationError** -- Invalid policy class

  Returns A dictionary containing the value data and the value type found

Return type  dict

CLI Example:

```bash
# Get a value
salt '*' lgpo_reg.get_value "SOFTWARE\MyKey" "MyValue"
```

salt.modules.win_lgpo_reg.read_reg_pol(policy_class='Machine')
Read the contents of the Registry.pol file. Display the contents as a human-readable dictionary.

Parameters **policy_class** *(str)* -- The registry class to retrieve. Can be one of the following:

- Computer
- Machine
- User

  Default is Machine

  Raises **SaltInvocationError** -- Invalid policy class

  Returns A dictionary representing the contents of the Registry.pol file

Return type  dict

CLI Example:

```bash
# Read the machine Registry.pol
salt '*' lgpo_reg.read_reg_pol
```

salt.modules.win_lgpo_reg.set_value(key, v_name, v_data, v_type='REG_DWORD', policy_class='Machine')
Add a key/value pair to the registry.pol file. This bypasses the admx/adml style policies. This is the equivalent of setting a policy to Enabled

Parameters

- **key** *(str)* -- The registry key path
• **v_name**(str) -- The registry value name within the key
• **v_data**(str) -- The registry value
• **v_type**(str) -- The registry value type. Must be one of the following:
  – REG_BINARY
  – REG_DWORD
  – REG_EXPAND_SZ
  – REG_MULTI_SZ
  – REG_QWORD
  – REG_SZ
  Default is REG_DWORD
• **policy_class**(str) -- The registry class to write to. Can be one of the following:
  – Computer
  – Machine
  – User
  Default is Machine

**Raises**
• **SaltInvocationError** -- Invalid policy_class
• **SaltInvocationError** -- Invalid v_type
• **SaltInvocationError** -- v_data doesn't match v_type

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```bash
# Set REG_DWORD value (default)
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" 1

# Set REG_SZ value
salt '*' lgpo_reg.set_value "SOFTWARE\MyKey" "MyValue" "string value" "REG_SZ"
```

salt.modules.win_lgpo_reg.write_reg_pol**(data, policy_class='Machine')**

Write data to the Registry.pol file. The data is a dictionary that is then converted to the appropriate bytes format expected by Registry.pol

**Parameters**
• **data**(dict) -- A dictionary containing Registry.pol data
• **policy_class**(str) -- The registry class to write to. Can be one of the following:
  – Computer
  – Machine
  – User
  Default is Machine

**Raises**
• **SaltInvocationError** -- Invalid policy_class
• **CommandExecutionError** -- On failure

**Returns** True if successful

**Return type** bool

**CLI Example:**
```bash
# Write to Machine Registry.pol
salt '*' lgpo_reg.write_reg_pol "{'SOFTWARE\MyKey': {'MyValue': 'data': 1, 'type': 'REG_DWORD'}}"
```
25.7.500  salt.modules.win_license

This module allows you to manage windows licensing via slmgr.vbs

salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX

salt.modules.win_license.activate()
   Attempt to activate the current machine via Windows Activation

   CLI Example:
   salt '*' license.activate

salt.modules.win_license.info()
   Return information about the license, if the license is not correctly activated this will return None.

   CLI Example:
   salt '*' license.info

salt.modules.win_license.install(product_key)
   Install the given product key

   CLI Example:
   salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX

salt.modules.win_license.installed(product_key)
   Check to see if the product key is already installed.
   Note: This is not 100% accurate as we can only see the last 5 digits of the license.

   CLI Example:
   salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX

salt.modules.win_license.licensed()
   Return true if the current machine is licensed correctly

   CLI Example:
   salt '*' license.licensed

salt.modules.win_license.uninstall()
   Uninstall the current product key

   CLI Example:
   salt '*' license.uninstall
25.7.501 salt.modules.win_network

Module for gathering and managing network information

salt.modules.win_network.connect(host, port=None, **kwargs)
Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80
salt '*' network.connect archlinux.org 80 timeout=3
salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4
salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp family=ipv4
```

salt.modules.win_network.dig(host)
Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.win_network.get_route(ip)
Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.win_network.hw_addr(iface)
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.hwaddr(iface)
This function is an alias of hw_addr.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hwaddr 'Wireless Connection #1'
```

salt.modules.win_network.in_subnet(cidr)
Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```
salt.modules.win_network.interfaces()
    Return a dictionary of information about all the interfaces on the minion

    CLI Example:
    ```
salt '*' network.interfaces
    ```

salt.modules.win_network.interfaces_names()
    Return a list of all the interfaces names

    CLI Example:
    ```
salt '*' network.interfaces_names
    ```

salt.modules.win_network.ip_addrs(interface=None, include_loopback=False, cidr=None, type=None)
    Returns a list of IPv4 addresses assigned to the host.
    interface  Only IP addresses from that interface will be returned.
    include_loopback  [False] Include loopback 127.0.0.1 IPv4 address.
    cidr  Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

    Changed in version 2019.2.0.
    type  If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

    Changed in version 2019.2.0.

    CLI Example:
    ```
salt '*' network.ip_addrs
salt '*' network.ip_addrs cidr=10.0.0.0/8
salt '*' network.ip_addrs cidr=192.168.0.0/16 type=private
    ```

salt.modules.win_network.ip_addrs6(interface=None, include_loopback=False, cidr=None)
    Returns a list of IPv6 addresses assigned to the host.
    interface  Only IP addresses from that interface will be returned.
    include_loopback  [False] Include loopback ::1 IPv6 address.
    cidr  Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

    Changed in version 2019.2.0.

    CLI Example:
    ```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
    ```

salt.modules.win_network.ipaddrs(interface=None, include_loopback=False, cidr=None, type=None)
    This function is an alias of ip_addrs.
    Returns a list of IPv4 addresses assigned to the host.
    interface  Only IP addresses from that interface will be returned.
    include_loopback  [False] Include loopback 127.0.0.1 IPv4 address.
    cidr  Describes subnet using CIDR notation and only IPv4 addresses that belong to this subnet will be returned.

    Changed in version 2019.2.0.
    type  If option set to 'public' then only public addresses will be returned. Ditto for 'private'.

    Changed in version 2019.2.0.

    CLI Example:
salt.modules.win_network.ipaddrs6(interface=None, include_loopback=False, cidr=None)

This function is an alias of ip_addrs6.

Returns a list of IPv6 addresses assigned to the host.

- **interface**: Only IP addresses from that interface will be returned.
- **include_loopback**: [False] Include loopback ::1 IPv6 address.
- **cidr**: Describes subnet using CIDR notation and only IPv6 addresses that belong to this subnet will be returned.

Changed in version 2019.2.0.

CLI Example:

```
salt '*' network.ip_addrs6
salt '*' network.ip_addrs6 cidr=2000::/3
```

salt.modules.win_network.is_private(ip_addr)

Check if the given IP address is a private address

New in version 2019.2.0.

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.win_network.netstat()

Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

salt.modules.win_network.nslookup(host)

Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

salt.modules.win_network.ping(host, timeout=False, return_boolean=False)

Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```
**salt.modules.win_network**

**subnets()**
Returns a list of subnets to which the host belongs

CLI Example:
```python
click '*' network.subnets
```

**traceroute(host)**
Performs a traceroute to a 3rd party host

CLI Example:
```python
click '*' network.traceroute archlinux.org
```

**25.7.502 salt.modules.win_ntp**

Management of NTP servers on Windows

New in version 2014.1.0.

**get_servers()**
Get list of configured NTP servers

CLI Example:
```python
click '*' ntp.get_servers
```

**set_servers(servers)**
Set Windows to use a list of NTP servers

CLI Example:
```python
click '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

**25.7.503 salt.modules.win_path**

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message [http://support.microsoft.com/kb/104011](http://support.microsoft.com/kb/104011)

**add(path, index=None, **kwargs)**
Add the directory to the SYSTEM path in the index location. Returns `True` if successful, otherwise `False`.

- **path** Directory to add to path
- **index** Optionally specify an index at which to insert the directory
- **rehash** `[True]` If the registry was updated, and this value is set to `True`, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to `False` to skip this broadcast.

CLI Examples:
```python
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

**exists(path)**
Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash
**Returns**  boolean True if path exists, False if not

CLI Example:

```bash
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

**salt.modules.win_path.get_path()**

Returns a list of items in the SYSTEM path

CLI Example:

```bash
salt '*' win_path.get_path
```

**salt.modules.win_path.rehash()**

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

**Note:** This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation

CLI Example:

```bash
salt '*' win_path.rehash
```

**salt.modules.win_path.remove(path, \*
**kwargs)**

Remove the directory from the SYSTEM path

**Returns**  boolean True if successful, False if unsuccessful

**rehash** [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:

```bash
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

---

25.7.504  **salt.modules.win_pkg**

A module to manage software on Windows

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

The following functions require the existence of a windows repository metadata DB, typically created by running pkg.refresh_db:

- pkg.get_repo_data
- pkg.install
- pkg.latest_version
- pkg.list_available
• **pkg.list_pkgs**
• **pkg.list_upgrades**
• **pkg.remove**

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the **winrepo_cache_expire_min** minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

**Note:** Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

```
salt.modules.win_pkg.compare_versions( ver1='', oper='==', ver2='' )
```

Compare software package versions. Made public for use with Jinja

**Parameters**
- **ver1** (str) -- A software version to compare
- **oper** (str) -- The operand to use to compare
- **ver2** (str) -- A software version to compare

**Returns** True if the comparison is valid, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

```
salt.modules.win_pkg.genrepo(**kwargs)
```

Generate package metadata db based on files within the winrepo_source_dir

**Kwargs:**
- **saltenv** (str): Salt environment. Default: base
- **verbose** (bool): Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default False.
- **failhard** (bool): If True, an error will be raised if any repo SLS files failed to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

**Note:** Hidden directories (directories beginning with '.', such as '.git') will be ignored.

**Returns** A dictionary of the results of the command

**Return type** dict

**CLI Example:**
```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

```
salt.modules.win_pkg.get_package_info( name, saltenv='base')
```

Return package info. Returns empty map if package not available.

```
salt.modules.win_pkg.get_repo_data(saltenv='base')
```

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

**Parameters**
- **saltenv** (str) -- Salt environment. Default base
Returns

A dict containing contents of metadata db.

Return type
dict

CLI Example:

```
salt '*' pkg.get_repo_data
```

salt.modules.win_pkg.install(name=None, refresh=False, pkgs=None, **kwargs)

Install the passed package(s) on the system using winrepo

Parameters

- **name** *(str)* -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** *(bool)* -- Boolean value representing whether or not to refresh the winrepo db. Default False.
- **pkgs** *(list)* -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:

```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs='["foo", "bar"]'

# will install the latest version of foo and version 1.2.3 of bar
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Kwargs:

- **version** *(str)*: The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the pkgs parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs='["foo", "bar"]' version=1.2.3
```

If passed with a comma separated list in the name parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

- **extra_install_flags** *(str)*: Additional install flags that will be appended to the install_flags defined in the software definition file. Only applies when single package is passed.

- **saltenv** *(str)*: Salt environment. Default 'base'

- **report_reboot_exit_codes** *(bool)*: If the installer exits with a recognized exit code indicating that a reboot is required, the module function `win_system.set_reboot_required_witnessed` will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

  New in version 2016.11.0.

Returns
Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'))
```

**Return type** dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip, filezilla
salt '*' pkg.install pkgs=['"7zip","filezilla"]'
```

**WinRepo Definition File Examples:**

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
 4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\\-ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
 4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\\-ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

salt.modules.win_pkg.latest_version(*)names**, **kwargs**)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.
Note: Since this is looking for the latest version available, a refresh_db will be triggered by default. This can take some time. To avoid this set refresh to False.

Parameters

`names (str)` -- A single or multiple names to lookup

Kwargs:
- `saltenv (str)`: Salt environment. Default `base`
- `refresh (bool)`: Refresh package metadata. Default `True`

Returns A dictionary of packages with the latest version available

Return type `dict`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.win_pkg.list_available('names', **kwargs)

Return a list of available versions of the specified package.

Parameters

`names (str)` -- One or more package names

Kwargs:
- `saltenv (str)`: The salt environment to use. Default `base`
- `refresh (bool)`: Refresh package metadata. Default `False`
- `return_dict_always (bool)`: Default `False` dict when a single package name is queried.

Returns The package name with its available versions

Return type `dict`

```
{"<package name>": ["<version>", "<version>"],}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

salt.modules.win_pkg.list_pkgs(versions_as_list=False, include_components=True, include_updates=True, **kwargs)

List the packages currently installed.

Note: To view installed software as displayed in the Add/Remove Programs, set `include_components` and `include_updates` to False.

Parameters

- `versions_as_list (bool)` -- Returns the versions as a list
- `include_components (bool)` -- Include sub components of installed software. Default is `True`
- `include_updates (bool)` -- Include software updates and Windows updates. Default is `True`

Kwargs:
- `saltenv (str)`: The salt environment to use. Default `base`
- `refresh (bool)`: Refresh package metadata. Default `False`

Returns A dictionary of installed software with versions installed

Return type `dict`
['<package_name>': '<version>']

CLI Example:
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs  versions_as_list=True

salt.modules.win_pkg.list_upgrades(refresh=True, **kwargs)
List all available package upgrades on this system

Parameters
refresh (bool) -- Refresh package metadata. Default True

Kwargs:
saltenv (str): Salt environment. Default base

Returns
A dictionary of packages with available upgrades

Return type
dict

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.win_pkg.normalize_name(name)
Nothing to do on Windows. We need this function so that Salt doesn't go through every module looking for pkg.normalize_name.

New in version 3006.0.

Parameters
name (str) -- The name of the package

Returns
The name of the package

Return type
str

CLI Example:
salt '*' pkg.normalize_name git

salt.modules.win_pkg.purge(name=None, pkgs=None, **kwargs)
Package purges are not supported on Windows, this function is identical to remove().

Note: At some point in the future, pkg.purge may direct the installer to remove all configs and settings for software packages that support that option.

New in version 0.16.0.

Parameters

- name (str) -- The name of the package to be deleted.
- version (str) -- The version of the package to be deleted. If this option is used in combination with the pkgs option below, then this version will be applied to all targeted packages.
- pkgs (list) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:

Returns
A dict containing the changes.

Return type
dict

CLI Example:
salt.modules.win_pkg.refresh_db(**kwargs)
Generates the local software metadata database (winrepo.p) on the minion. The database is stored in a serialized format located by default at the following location:
C:\salt\var\cache\salt\minion\files\base\win\repo-ng\winrepo.p

This module performs the following steps to generate the software metadata database:
• Fetch the package definition files (.sls) from winrepo_source_dir (default salt://win/repo-ng) and cache them in <cachedir>\files\<saltenv>\<winrepo_source_dir> (default: C:\salt\var\cache\salt\minion\files\base\win\repo-ng)
• Call pkg.genrepo to parse the package definition files and generate the repository metadata database file (winrepo.p)
• Return the report received from pkg.genrepo

The default winrepo directory on the master is /srv/salt/win/repo-ng. All files that end with .sls in this and all subdirectories will be used to generate the repository metadata database (winrepo.p).

Note:
• Hidden directories (directories beginning with '.', such as '.git') will be ignored.

Note: There is no need to call pkg.refresh_db every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:
• winrepo_cache_expire_min
• winrepo_cache_expire_max

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

Warning: Directories and files fetched from <winrepo_source_dir> (/srv/salt/win/repo-ng) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see Windows Software Repository

Arguments:
saltenv (str): Salt environment. Default: base
verbose (bool): Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'
failhard (bool): If True, an error will be raised if any repo SLS files fails to process. If False, no error will be raised, and a dictionary containing the full results will be returned.

Returns A dictionary containing the results of the database refresh.
Return type dict

Note: A result with a total: 0 generally means that the files are in the wrong location on the master. Try running the following command on the minion: salt-call -l debug pkg.refresh saltenv=base
Warning: When calling this command from a state using `module.run` be sure to pass `failhard: False`. Otherwise the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

```
salt.modules.win_pkg.remove(name=None, pkgs=None, **kwargs)
```
Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **name** (str) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs** (list) -- A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:

- **version** (str): The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.
- **saltenv** (str): Salt environment. Default `base`
- **refresh** (bool): Refresh package metadata. Default `False`

Returns

Returns a dict containing the changes.

If the package is removed by `pkg.remove`:

```
{"<package>": {"old": '<old-version>', 'new': '<new-version>'}}
```

If the package is already uninstalled:

```
{"<package>": {"current": 'not installed'}}
```

**Return type** dict

CLI Example:

```
salt '*' pkg.remove <package_name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

```
salt.modules.win_pkg.upgrade(**kwargs)
```
Upgrade all software. Currently not implemented

**Note:** This feature is not yet implemented for Windows.

**Returns** Empty dict, until implemented

**Return type** dict

CLI Example:

```
salt '*' pkg.upgrade
```
salt.modules.win_pkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

Parameters
name (str) -- The name of a single package

Kwargs:
refresh (bool): Refresh package metadata. Default True
saltenv (str): The salt environment. Default base

Returns: True if new version available, otherwise False
Return type: bool

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.win_pkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters
name (str) -- One or more package names

Kwargs:

Returns: version string when a single package is specified. dict: The package name(s) with the installed versions.
Return type: str

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>

25.7.505 salt.modules.win_pki

platform: Windows

depends:
- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password='')

Export the certificate to a file from the given certificate store.

Parameters
- name (str) -- The destination path for the exported certificate file.
- thumbprint (str) -- The thumbprint value of the target certificate.
- cert_format (str) -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
• **context** *(str)* -- The name of the certificate store location context.
• **store** *(str)* -- The name of the certificate store.
• **password** *(str)* -- The password of the certificate. Only applicable to pfx format.
  Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns** A boolean representing whether all changes succeeded.

**Return type** `bool`

**CLI Example:**
```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

salt.modules.win_pki.get_cert_file *(name, cert_format='cer', password='')*

Get the details of the certificate file.

**Parameters**
- **name** *(str)* -- The filesystem path of the certificate file.
- **cert_format** *(str)* -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **password** *(str)* -- The password of the certificate. Only applicable to pfx format.
  Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

**Returns** A dictionary of the certificate thumbprints and properties.

**Return type** `dict`

**CLI Example:**
```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.get_certs *(context='LocalMachine', store='My')*

Get the available certificates in the given store.

**Parameters**
- **context** *(str)* -- The name of the certificate store location context.
- **store** *(str)* -- The name of the certificate store.

**Returns** A dictionary of the certificate thumbprints and properties.

**Return type** `dict`

**CLI Example:**
```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.get_stores *

Get the certificate location contexts and their corresponding stores.

**Returns** A dictionary of the certificate location contexts and stores.

**Return type** `dict`

**CLI Example:**
```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.import_cert *(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password='', saltenv='base')*

Import the certificate file into the given certificate store.

**Parameters**
- **name** *(str)* -- The path of the certificate file to import.
- **cert_format** *(str)* -- The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** *(str)* -- The name of the certificate store location context.
- **store** *(str)* -- The name of the certificate store.
- **exportable** *(bool)* -- Mark the certificate as exportable. Only applicable to pfx
• **password** *(str)* -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

• **saltenv** *(str)* -- The environment the file resides in.

Returns A boolean representing whether all changes succeeded.

RETURN type `bool`

CLI Example:

```bash
salt '*' win_pki.import_cert name='salt://cert.cer'
```

salt.modules.win_pki.remove_cert *(thumbprint, context='LocalMachine', store='My')*

Remove the certificate from the given certificate store.

Parameters

• **thumbprint** *(str)* -- The thumbprint value of the target certificate.

• **context** *(str)* -- The name of the certificate store location context.

• **store** *(str)* -- The name of the certificate store.

Returns A boolean representing whether all changes succeeded.

RETURN type `bool`

CLI Example:

```bash
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

salt.modules.win_pki.test_cert *(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name='', eku='')*

Check the certificate for validity.

Parameters

• **thumbprint** *(str)* -- The thumbprint value of the target certificate.

• **context** *(str)* -- The name of the certificate store location context.

• **store** *(str)* -- The name of the certificate store.

• **untrusted_root** *(bool)* -- Whether the root certificate is required to be trusted in chain building.

• **dns_name** *(str)* -- The DNS name to verify as valid for the certificate.

• **eku** *(str)* -- The enhanced key usage object identifiers to verify for the certificate chain.

Returns A boolean representing whether the certificate was considered valid.

RETURN type `bool`

CLI Example:

```bash
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

25.7.506 **salt.modules.win_powercfg**

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```bash
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

salt.modules.win_powercfg.get_disk_timeout *(scheme=None)*

Get the current disk timeout of the given scheme
Parameters `scheme` *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

```
salt.modules.win_powercfg.get_hibernate_timeout(scheme=None)
```

Get the current hibernate timeout of the given scheme

Parameters `scheme` *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

```
salt.modules.win_powercfg.get_monitor_timeout(scheme=None)
```

Get the current monitor timeout of the given scheme

Parameters `scheme` *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

```
salt.modules.win_powercfg.get_standby_timeout(scheme=None)
```

Get the current standby timeout of the given scheme

Parameters `scheme` *(str)* -- The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

```
salt.modules.win_powercfg.set_disk_timeout(timeout, power='ac', scheme=None)
```

Set the disk timeout in minutes for the given power scheme

Parameters
**timeout (int)** -- The amount of time in minutes before the disk will timeout

**power (str)** -- Set the value for AC or DC power. Default is ac. Valid options are:
- ac (AC Power)
- dc (Battery)

**scheme (str)** -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

salt.modules.win_powercfg.set_hibernate_timeout(\timeout, \power='ac', \scheme=None)\n
Set the hibernate timeout in minutes for the given power scheme

Parameters

**timeout (int)** -- The amount of time in minutes before the computer hibernates

**power (str)** -- Set the value for AC or DC power. Default is ac. Valid options are:
- ac (AC Power)
- dc (Battery)

**scheme (str)** -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

salt.modules.win_powercfg.set_monitor_timeout(\timeout, \power='ac', \scheme=None)\n
Set the monitor timeout in minutes for the given power scheme

Parameters

**timeout (int)** -- The amount of time in minutes before the monitor will timeout

**power (str)** -- Set the value for AC or DC power. Default is ac. Valid options are:
- ac (AC Power)
- dc (Battery)

**scheme (str)** -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

salt.modules.win_powercfg.set_standby_timeout(\timeout, \power='ac', \scheme=None)
Set the standby timeout in minutes for the given power scheme

Parameters

- **timeout** *(int)* -- The amount of time in minutes before the computer sleeps
- **power** *(str)* -- Set the value for AC or DC power. Default is ac. Valid options are:
  - ac (AC Power)
  - dc (Battery)
- **scheme** *(str)* -- The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
  - SCHEME_BALANCED - Balanced
  - SCHEME_MAX - Power saver
  - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type **bool**

CLI Example:

```bash
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

## 25.7.507 salt.modules.win_psget

Module for managing PowerShell through PowerShellGet (PSGet)

**depends**

- PowerShell 5.0
- PSGet

Support for PowerShell

salt.modules.win_psget.avail_modules *(desc=False)*

List available modules in registered Powershell module repositories.

Parameters **desc** *(bool)* -- If True, the verbose description will be returned.

CLI Example:

```bash
salt 'win01' psget.avail_modules
tsalt 'win01' psget.avail_modules desc=True
```

salt.modules.win_psget.bootstrap()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```bash
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.get_repository *(name)*

Get the details of a local PSGet repository

Parameters **name** *(str)* -- Name of the repository

CLI Example:

```bash
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.install *(name, minimum_version=None, required_version=None, scope=None, repository=None)*

Install a Powershell module from powershell gallery on the system.

Parameters
- **name** (str) -- Name of a Powershell module
- **minimum_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required_version** (str) -- Install a specific version
- **scope** (str) -- The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:

```bash
salt 'win01' psget.install PowerPlan
```

salt.modules.win_psget.list_modules(desc=False)

List currently installed PSGet Modules on the system.

Parameters **desc** (bool) -- If True, the verbose description will be returned.

CLI Example:

```bash
salt 'win01' psget.list_modules
dsalt 'win01' psget.list_modules desc=True
```

salt.modules.win_psget.register_repository(name, location, installation_policy=None)

Register a PSGet repository on the local machine

Parameters

- **name** (str) -- The name for the repository
- **location** (str) -- The URI for the repository
- **installation_policy** (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```bash
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
```

salt.modules.win_psget.remove(name)

Remove a Powershell DSC module from the system.

Parameters **name** (str) -- Name of a Powershell DSC module

CLI Example:

```bash
salt 'win01' psget.remove PowerPlan
```

salt.modules.win_psget.update(name, maximum_version=None, required_version=None)

Update a PowerShell module to a specific version, or the newest

Parameters

- **name** (str) -- Name of a Powershell module
- **maximum_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required_version** (str) -- Install a specific version

CLI Example:

```bash
salt 'win01' psget.update PowerPlan
```
25.7.508  salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

maintainer Shane Lee <slee@saltstack.com>

platform  Windows Server 2008R2 or greater

depends  PowerShell module ServerManager

salt.modules.win_servermanager.install( feature, recurse=False, restart=False, source=None, exclude=None )

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

• feature (str, list) -- The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
  
  New in version 2018.3.0: Added the ability to pass a list of features to be installed.

• recurse (Optional[bool]) -- Install all sub-features. Default is False

• restart (Optional[bool]) -- Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in exclude requires a reboot to be properly removed. Default is False

• source (Optional[str]) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None

• exclude (Optional[str]) -- The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

Warning: As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in exclude will be installed with other sub-features and will then be removed. If the feature named in `"exclude` is not a sub-feature of one of the installed items it will still be removed.

Returns  A dictionary containing the results of the install

Return type  dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '.*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited string. Install all sub-features
salt '.*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True
```

(continues on next page)
# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a # list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install "['XPS-Viewer', 'SNMP-Service', 'RemoteAccess']
    True recurse=True exclude="Web-Server"

salt.modules.win_servermanager.list_available()
List available features to install
    Returns A list of available features as returned by the Get-WindowsFeature PowerShell command
    Return type str
CLI Example:
salt '*' win_servermanager.list_available

salt.modules.win_servermanager.list_installed()
List installed features. Supported on Windows Server 2008 and Windows 8 and newer.
    Returns A dictionary of installed features
    Return type dict
CLI Example:
salt '*' win_servermanager.list_installed

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)
Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the -t option to set a longer timeout.

Parameters
    • feature (str, list)-- The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
    New in version 2018.3.0: Added the ability to pass a list of features to be removed.
    • remove_payload (Optional[bool])-- True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
    • restart (Optional[bool])-- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

    Returns A dictionary containing the results of the uninstall
    Return type dict
CLI Example:
salt -t 600 '*' win_servermanager.remove Telnet-Client
25.7.509 **salt.modules.win_service**

Windows Service module.

Changed in version 2016.11.0: Rewritten to use PyWin32

**salt.modules.win_service.available**(name)

Check if a service is available on the system.

Parameters
- **name**(str) -- The name of the service to check

Returns True if the service is available, False otherwise

Return type bool

CLI Example:

```bash
salt '*' service.available <service name>
```

**salt.modules.win_service.create**(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)

Create the named service.

New in version 2015.8.0.

Parameters
- **name**(str) -- Specifies the service name. This is not the display_name
- **bin_path**(str) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe_args**(str) -- Any additional arguments required by the service binary.
- **display_name**(str) -- The name to be displayed in the service manager. If not passed, the name will be used
- **description**(str) -- A description of the service
- **service_type**(str) -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type**(str) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started
- **start_delayed**(bool) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to Auto. If service_type is not passed, but the service is already set to Auto, then the flag will be set. Default is False
- **error_control**(str) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
- ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group**(str) -- The name of the load order group to which this service belongs
- **dependencies**(list) -- A list of services or load ordering groups that must start before this service
- **account_name**(str) -- The name of the account under which the service should run. For own type services this should be in the domain\username format. The following are examples of valid built-in service accounts:
  - NT AuthorityLocalService
  - NT AuthorityNetworkService
  - NT AuthorityLocalSystem
  - .LocalSystem
- **account_password**(str) -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive**(bool) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** A dictionary containing information about the new service

**Return type** dict

**CLI Example:**
```
salt '*' service.create <service name> <path to exe> display_name='display name'
```

**salt.modules.win_service.create_win_salt_restart_task()**
Create a task in Windows task scheduler to enable restarting the salt-minion

**Returns** True if successful, otherwise False

**Return type** bool

**CLI Example:**
```
salt '*' service.create_win_salt_restart_task()
```

**salt.modules.win_service.delete**(name, timeout=90)
Delete the named service

**Parameters**
- **name**(str) -- The name of the service to delete
- **timeout**(int) -- The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

**New in version** 2017.7.9, 2018.3.4.

**Returns** True if successful, otherwise False. Also returns True if the service is not present

**Return type** bool

**CLI Example:**
```
salt '*' service.delete <service name>
```

**salt.modules.win_service.disable**(name, **kwargs)
Disable the named service to start at boot

**Parameters**
- **name**(str) -- The name of the service to disable

**Returns** True if disabled, False otherwise

**Return type** bool

**CLI Example:**
salt '*' service.disable <service name>

```
salt.modules.win_service.disabled(name)
    Check to see if the named service is disabled to start on boot
    Parameters name (str) -- The name of the service to check
    Returns True if the service is disabled
    Return type bool
    CLI Example:
    
    salt '*' service.disabled <service name>
```

salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)
    Enable the named service to start at boot
    Parameters
    • name (str) -- The name of the service to enable.
    • start_type (str) -- Specifies the service start type. Valid options are as follows:
      – boot: Device driver that is loaded by the boot loader
      – system: Device driver that is started during kernel initialization
      – auto: Service that automatically starts
      – manual: Service must be started manually
      – disabled: Service cannot be started
    • start_delayed (bool) -- Set the service to Auto(Delayed Start). Only valid if the
      start_type is set to Auto. If service_type is not passed, but the service is already set
      to Auto, then the flag will be set.
    Returns True if successful, False otherwise
    Return type bool
    CLI Example:
    
    salt '*' service.enable <service name>
```

salt.modules.win_service.enabled(name, **kwargs)
    Check to see if the named service is enabled to start on boot
    Parameters name (str) -- The name of the service to check
    Returns True if the service is set to start
    Return type bool
    CLI Example:
    
    salt '*' service.enabled <service name>
```

salt.modules.win_service.execute_salt_restart_task()
    Run the Windows Salt restart task
    Returns True if successful, otherwise False
    Return type bool
    CLI Example:
    
    salt '*' service.execute_salt_restart_task()
```

salt.modules.win_service.get_all()
    Return all installed services
    Returns Returns a list of all services on the system.
    Return type list
    CLI Example:
    
    salt '*' service.get_all
salt.modules.win_service.get_disabled()
Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.
Returns A list of disabled services.
Return type list
CLI Example:
salt '*' service.get_disabled

salt.modules.win_service.get_enabled()
Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.
Returns A list of enabled services
Return type list
CLI Example:
salt '*' service.get_enabled

salt.modules.win_service.get_service_name(*args)
The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has
an associated Service Name which is the actual name of the service. This function allows you to discover the
Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments
of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values
are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names
Returns A dictionary of display names and service names
Return type dict
CLI Examples:
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'

salt.modules.win_service.getsid(name)
Return the SID for this windows service
Parameters name (str) -- The name of the service for which to return the SID
Returns A string representing the SID for the service
Return type str
CLI Example:
salt '*' service.getsid <service name>

salt.modules.win_service.info(name)
Get information about a service on the system
Parameters name (str) -- The name of the service. This is not the display name. Use
get_service_name to find the service name.
Returns A dictionary containing information about the service.
Return type dict
CLI Example:
salt '*' service.info spooler

salt.modules.win_service.missing(name)
The inverse of service.available.
Parameters name (str) -- The name of the service to check
Returns True if the service is missing, False otherwise
Return type \texttt{bool}

CLI Example:

```
salt '*' service.missing <service name>
```

\begin{verbatim}
salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)
\end{verbatim}

Modify a service’s parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- \texttt{name (str)} -- The name of the service. Can be found using the \texttt{service.get_service_name} function
- \texttt{bin_path (str)} -- The path to the service executable. Backslashes must be escaped, eg: C:\path\to\binary.exe
- \texttt{exe_args (str)} -- Any arguments required by the service executable
- \texttt{display_name (str)} -- The name to display in the service manager
- \texttt{description (str)} -- The description to display for the service
- \texttt{service_type (str)} -- Specifies the service type. Default is \texttt{own}. Valid options are as follows:
  - \texttt{kernel}: Driver service
  - \texttt{filesystem}: File system driver service
  - \texttt{adapter}: Adapter driver service (reserved)
  - \texttt{recognizer}: Recognizer driver service (reserved)
  - \texttt{own} (default): Service runs in its own process
  - \texttt{share}: Service shares a process with one or more other services
- \texttt{start_type (str)} -- Specifies the service start type. Valid options are as follows:
  - \texttt{boot}: Device driver that is loaded by the boot loader
  - \texttt{system}: Device driver that is started during kernel initialization
  - \texttt{auto}: Service that automatically starts
  - \texttt{manual}: Service must be started manually
  - \texttt{disabled}: Service cannot be started
- \texttt{start_delayed (bool)} -- Set the service to \texttt{Auto(Delayed Start)}. Only valid if the \texttt{start_type} is set to \texttt{Auto}. If \texttt{service_type} is not passed, but the service is already set to \texttt{Auto}, then the flag will be set.
- \texttt{error_control (str)} -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - \texttt{normal}: Error is logged and a message box is displayed
  - \texttt{severe}: Error is logged and computer attempts a restart with the last known good configuration
  - \texttt{critical}: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - \texttt{ignore}: Error is logged and startup continues, no notification is given to the user
- \texttt{load_order_group (str)} -- The name of the load order group to which this service belongs
- \texttt{dependencies (list)} -- A list of services or load ordering groups that must start before this service
- \texttt{account_name (str)} -- The name of the account under which the service should run. For \texttt{own} type services this should be in the \texttt{domain\username} format. The following are examples of valid built-in service accounts:
- NT AuthorityLocalService
- NT AuthorityNetworkService
- NT AuthorityLocalSystem
- LocalSystem

- **account_password (str)** -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive (bool)** -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

**Returns** a dictionary of changes made

**Return type** `dict`

**CLI Example:**
```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.restart(name, timeout=90)`
Restart the named service. This issues a stop command followed by a start.

**Parameters**

- **name** -- The name of the service to restart.

**Note:** If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

- **timeout (int)** -- The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

**Note:** The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

**New in version 2017.7.9, 2018.3.4.**

**Returns** `True` if successful, otherwise `False`

**Return type** `bool`

**CLI Example:**
```
salt '*' service.restart <service name>
```

`salt.modules.win_service.start(name, timeout=90)`
Start the specified service.

**Warning:** You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

**Parameters**

- **name (str)** -- The name of the service to start
- **timeout (int)** -- The time in seconds to wait for the service to start before returning. Default is 90 seconds

**New in version 2017.7.9, 2018.3.4.**

**Returns** `True` if successful, otherwise `False`. Also returns `True` if the service is already started

**Return type** `bool`
CLI Example:

```
salt '*' service.start <service name>
```

```
salt.modules.win_service.status(name, *args, **kwargs)
```

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Changed in version 306.0: Returns "Not Found" if the service is not found on the system

Parameters  
**name** (str) -- The name of the service to check

Returns  
True if running, False otherwise dict: Maps service name to True if running, False otherwise str: Not Found if the service is not found on the system

Return type  
bool

CLI Example:

```
salt '*' service.status <service name>
```

```
salt.modules.win_service.stop(name, timeout=90)
```

Stop the specified service

Parameters  
**name** (str) -- The name of the service to stop

* timeout (int) -- The time in seconds to wait for the service to stop before returning.
  Default is 90 seconds

    New in version 2017.7.9, 2018.3.4.

Returns  
True if successful, otherwise False. Also returns True if the service is already stopped

Return type  
bool

CLI Example:

```
salt '*' service.stop <service name>
```

### 25.7.510 salt.modules.win_shadow

Manage the shadow file

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

```
salt.modules.win_shadow.info(name)
```

Return information for the specified user This is just returns dummy data so that salt states can work.

Parameters  
**name** (str) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

```
salt.modules.win_shadow.require_password_change(name)
```

Require the user to change their password the next time they log in.

Parameters  
**name** -- The name of the user account to require a password change.

Returns  
True if successful. False if unsuccessful.

Return type  
bool
CLI Example:

```bash
salt '*' shadow.require_password_change <username>
```

salt.modules.win_shadow.set_expire(name, expire)
Set the expiration date for a user account.

Parameters
- **name** -- The name of the user account to edit.
- **expire** -- The date the account will expire.

Returns True if successful. False if unsuccessful.
Return type bool

CLI Example:

```bash
salt '*' shadow.set_expire <username> 2016/7/1
```

salt.modules.win_shadow.set_password(name, password)
Set the password for a named user.

Parameters
- **name** *(str)* -- The name of the user account
- **password** *(str)* -- The new password

Returns True if successful. False if unsuccessful.
Return type bool

CLI Example:

```bash
salt '*' shadow.set_password root mysecretpassword
```

salt.modules.win_shadow.unlock_account(name)
Unlocks a user account.

Parameters **name** -- The name of the user account to unlock.

Returns True if successful. False if unsuccessful.
Return type bool

CLI Example:

```bash
salt '*' shadow.unlock_account <username>
```

### 25.7.511 salt.modules.win_shortcut

Execution module for creating shortcuts on Windows. Handles file shortcuts (.lnk) and url shortcuts (.url). Allows for the configuration of icons and hot keys on file shortcuts. Changing the icon and hot keys are unsupported for url shortcuts.

New in version 3005.

salt.modules.win_shortcut.create(path, target, arguments='', description='', hot_key='', icon_index=0, icon_location='', window_style='Normal', working_dir='', backup=False, force=False, make_dirs=False, user=None)
Create a new shortcut. This can be a file shortcut (.lnk) or a url shortcut (.url).

Parameters
- **path** *(str)* -- The full path to the shortcut. Must have a .lnk or .url file extension.
- **target** *(str)* -- The full path to the target
- **arguments** *(str, optional)* -- Any arguments to be passed to the target
- **description** *(str, optional)* -- The description for the shortcut. This is shown in the Comment field of the dialog box. Default is an empty string
• **hot_key** (**str**, **optional**) -- A combination of hot Keys to trigger this shortcut. This is something like Ctrl+Alt+D. This is shown in the Shortcut key field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext

• **icon_index** (**int**, **optional**) -- The index for the icon to use in files that contain multiple icons. Default is 0

• **icon_location** (**str**, **optional**) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string

• **window_style** (**str**, **optional**) -- The window style the program should start in. This is shown in the Run field of the dialog box. Default is Normal. Valid options are:
  - Normal
  - Minimized
  - Maximized

• **working_dir** (**str**, **optional**) -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.

• **backup** (**bool**, **optional**) -- If there is already a shortcut with the same name, set this value to True to backup the existing shortcut and continue creating the new shortcut. Default is False

• **force** (**bool**, **optional**) -- If there is already a shortcut with the same name and you aren't backing up the shortcut, set this value to True to remove the existing shortcut and create a new with these settings. Default is False

• **make_dirs** (**bool**, **optional**) -- If the parent directory structure does not exist for the new shortcut, create it. Default is False

• **user** (**str**, **optional**) -- The user to be the owner of any directories created by setting make_dirs to True. If no value is passed Salt will use the user account that it is running under. Default is an empty string.

**Returns** True if successful

**Return type** bool

** Raises **

- **CommandExecutionError** -- If the path is not a .lnk or .url file extension.
- **CommandExecutionError** -- If there is an existing shortcut with the same name and backup and force are both False
- **CommandExecutionError** -- If the parent directory is not created and make_dirs is False
- **CommandExecutionError** -- If there was an error creating the parent directories

**CLI Example:**

```bash
# Create a shortcut and set the "Shortcut key" ("hot_key")
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe" hot_key="Ctrl+Alt+N"

# Create a shortcut and change the icon to the 3rd one in the icon file
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe" icon_location="C:\path\to\icon.ico" icon_index=2

# Create a shortcut and change the startup mode to full screen
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe" window_style="Maximized"
```

(continues on next page)
# Create a shortcut and change the icon
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe" icon_
→location="C:\path\to\icon.ico"

# Create a shortcut and force it to overwrite an existing shortcut
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe" force=True

# Create a shortcut and create any parent directories if they are missing
salt * shortcut.create "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe" make_
dirs=True

salt.modules.win_shortcut.get(path)
Gets the properties for a shortcut
Parameters path (str) -- The path to the shortcut. Must have a .lnk or .url file extension.
Returns
A dictionary containing all available properties for the specified shortcut
Return type dict
CLI Example:
salt * shortcut.get path="C:\path\to\shortcut.lnk"

salt.modules.win_shortcut.modify(path, target='', arguments='', description='', hot_key='',
icon_index=0, icon_location='', window_style='Normal', working_dir='')
Modify an existing shortcut. This can be a file shortcut (.lnk) or a url shortcut (.url).
Parameters
- path (str) -- The full path to the shortcut. Must have a .lnk or .url file extension.
- target (str, optional) -- The full path to the target
- arguments (str, optional) -- Any arguments to be passed to the target
- description (str, optional) -- The description for the shortcut. This is shown in the Comment field of the dialog box. Default is an empty string
- hot_key (str, optional) -- A combination of hot Keys to trigger this shortcut. This is something like Ctrl+Alt+D. This is shown in the Shortcut key field in the dialog box. Default is an empty string. Available options are:
  - Ctrl
  - Alt
  - Shift
  - Ext
- icon_index (int, optional) -- The index for the icon to use in files that contain multiple icons. Default is 0
- icon_location (str, optional) -- The full path to a file containing icons. This is shown in the Change Icon dialog box by clicking the Change Icon button. If no file is specified and a binary is passed as the target, Windows will attempt to get the icon from the binary file. Default is an empty string
- window_style (str, optional) -- The window style the program should start in. This is shown in the Run field of the dialog box. Default is Normal. Valid options are:
  - Normal
  - Minimized
  - Maximized
- working_dir (str, optional) -- The full path to the working directory for the program to run in. This is shown in the Start in field of the dialog box.
Returns True if successful
Return type bool

CLI Example:

```bash
# Modify an existing shortcut. Set it to target notepad.exe
salt * shortcut.modify "C:\path\to\shortcut.lnk" "C:\Windows\notepad.exe"
```

25.7.512 salt.modules.win_smtp_server

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

depends wmi

salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False, server='SmtpSvc/1')

Get the IPGrant list for the SMTP virtual server.

Parameters

- **as_wmi_format (bool)** -- Returns the connection IPs as a list in the format WMI expects.
- **server (str)** -- The SMTP server name.

Returns A dictionary of the IP and subnet pairs.
Return type dict

CLI Example:

```bash
salt '*' win_smtp_server.get_connection_ip_list
```

salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')

Get the active log format for the SMTP virtual server.

Parameters **server (str)** -- The SMTP server name.

Returns A string of the log format name.
Return type str

CLI Example:

```bash
salt '*' win_smtp_server.get_log_format
```

salt.modules.win_smtp_server.get_log_format_types()

Get all available log format names and ids.

Returns A dictionary of the log format names and ids.
Return type dict

CLI Example:

```bash
salt '*' win_smtp_server.get_log_format_types
```

salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')

Get the RelayIpList list for the SMTP virtual server.

Parameters **server (str)** -- The SMTP server name.

Returns A list of the relay IPs.
Return type list

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:
salt '*$' win_smtp_server.get_relay_ip_list

salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')
Get the value of the setting for the SMTP virtual server.
Parameters
  - settings (str) -- A list of the setting names.
  - server (str) -- The SMTP server name.
Returns A dictionary of the provided settings and their values.
Return type dict
CLI Example:

salt '*$' win_smtp_server.get_server_setting settings="['MaxRecipients']"

salt.modules.win_smtp_server.get_servers()
Get the SMTP virtual server names.
Returns A list of the SMTP virtual servers.
Return type list
CLI Example:

salt '*$' win_smtp_server.get_servers

salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')
Set the IPGrant list for the SMTP virtual server.
Parameters
  - addresses (str) -- A dictionary of IP + subnet pairs.
  - grant_by_default (bool) -- Whether the addresses should be a blacklist or whitelist.
  - server (str) -- The SMTP server name.
Returns A boolean representing whether the change succeeded.
Return type bool
CLI Example:

salt '*$' win_smtp_server.set_connection_ip_list addresses="{'127.0.0.1': '255.255.255.255'}"

salt.modules.win_smtp_server.set_log_format(log_format, server='SmtpSvc/1')
Set the active log format for the SMTP virtual server.
Parameters
  - log_format (str) -- The log format name.
  - server (str) -- The SMTP server name.
Returns A boolean representing whether the change succeeded.
Return type bool
CLI Example:

salt '*$' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'

salt.modules.win_smtp_server.set_relay_ip_list(addresses=None, server='SmtpSvc/1')
Set the RelayIpList list for the SMTP virtual server.
Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.
For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:
Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses** *(str)* -- A list of the relay IPs. The order of the list is important.
- **server** *(str)* -- The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1', '192.168.1.1']"
```

salt.modules.win_smtp_server.set_server_setting*(settings, server='SmtpSvc/1')*

Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters

- **settings** *(str)* -- A dictionary of the setting names and their values.
- **server** *(str)* -- The SMTP server name.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{'MaxRecipients': '500'}"
```

25.7.513 salt.modules.win_snmp

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

salt.modules.win_snmp.get_agent_service_types()

Get the sysServices types that can be configured.

Returns A list of service types.

Return type list

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

salt.modules.win_snmp.get_agent_settings()

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns A dictionary of the agent settings.

Return type dict
CLI Example:

```python
salt '*' win_snmp.get_agent_settings
```

```python
salt.modules.win_snmp.get_auth_traps_enabled()

Determine whether the host is configured to send authentication traps.

Returns  True if traps are enabled, otherwise False

Return type  bool
```

CLI Example:

```python
salt '*' win_snmp.get_auth_traps_enabled
```

```python
salt.modules.win_snmp.get_community_names()

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
    Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
    Read Only
```

Returns  A dictionary of community names and permissions.

Return type  dict

CLI Example:

```python
salt '*' win_snmp.get_community_names
```

```python
salt.modules.win_snmp.get_permission_types()

Get the permission types that can be configured for communities.

Returns  A list of permission types.

Return type  list
```

CLI Example:

```python
salt '*' win_snmp.get_permission_types
```

```python
salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **contact**(str, optional) -- The SNMP contact.
- **location**(str, optional) -- The SNMP location.
- **services**(list, optional) -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: `['None']`

Returns  True if successful, otherwise False

Return type  bool
```

CLI Example:

```python
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'

services='["Physical"]'
```

```python
salt.modules.win_snmp.set_auth_traps_enabled(status=True)

Manage the sending of authentication traps.
```
**Parameters**

*status* *(bool)* -- True to enable traps. False to disable.

*Returns* True if successful, otherwise False

*Return type* bool

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

**salt.modules.win_snmp.set_community_names**(communities)

Manage the SNMP accepted community names and their permissions.

*Parameters* communities *(dict)* -- A dictionary of SNMP community names and permissions.

The possible permissions can be found via `win_snmp.get_permission_types`.

*Returns* True if successful, otherwise False

*Return type* bool

*Raises* CommandExecutionError -- If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{\'TestCommunity\': \'Read Only\'}"
```

### 25.7.514 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

*depends*

- wmi

*class* salt.modules.win_status.SYSTEM_PERFORMANCE_INFORMATION

salt.modules.win_status.cpuload()
New in version 2015.8.0.
Return the processor load as a percentage

CLI Example:
```
salt '*' status.cpuload
```

salt.modules.win_status.cpustats()
Return information about the CPU.
**Returns**
dict: A dictionary containing information about the CPU stats

CLI Example:
```
salt * status.cpustats
```

salt.modules.win_status.diskusage(human_readable=False, path=None)
New in version 2015.8.0.
Return the disk usage for this minion
**human_readable** [False] If True, usage will be in KB/MB/GB etc.

CLI Example:
```
salt '*' status.diskusage path=c:/salt
```

salt.modules.win_status.loadavg()
Returns counter information related to the load of the machine
**Returns**
A dictionary of counters

**Return type**
dict

CLI Example:
```
salt * status.loadavg
```

salt.modules.win_status.master(master=None, connected=True)
New in version 2015.5.0.
Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.win_status.meminfo()`
Return information about physical and virtual memory on the system

Returns A dictionary of information about memory on the system

Return type dict

CLI Example:

```
salt * status.meminfo
```

`salt.modules.win_status.procs(count=False)`
Return the process data

count [False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

`salt.modules.win_status.saltmem(human_readable=False)`
Returns the amount of memory that salt is using

human_readable [False] return the value in a nicely formatted number

New in version 2015.8.0.

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

`salt.modules.win_status.uptime(human_readable=False)`
Return the system uptime for the machine

Parameters human_readable (bool) -- Return uptime in human readable format if True, otherwise return seconds. Default is False

Note: Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

Returns The uptime in seconds or human readable format depending on the value of human_readable

Return type str

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

`salt.modules.win_status.vmstats()`
Return information about the virtual memory on the machine

Returns A dictionary of virtual memory stats

Return type dict
CLI Example:

```bash
salt * status.vmstats
```

### 25.7.515 salt.modules.win_system

Module for managing Windows systems and getting Windows system information. Support for reboot, shutdown, join domain, rename

```
depends
```

• pywintypes
• win32api
• win32con
• win32net
• wmi

```python
salt.modules.win_system.get_computer_desc()
```
Get the Windows computer description

Returns: Returns the computer description if found. Otherwise returns False.

Return type: str

CLI Example:

```bash
salt 'minion-id' system.get_computer_desc
```

```python
salt.modules.win_system.get_computer_description()
```
This function is an alias of `get_computer_desc`.

Get the Windows computer description

Returns: str: Returns the computer description if found. Otherwise returns False.

CLI Example:

```bash
salt 'minion-id' system.get_computer_desc
```

```python
salt.modules.win_system.get_computer_name()
```
Get the Windows computer name

Returns: Returns the computer name if found. Otherwise returns False.

Return type: str

CLI Example:

```bash
salt 'minion-id' system.get_computer_name
```

```python
salt.modules.win_system.get_domain_workgroup()
```
Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

Returns: The name of the domain or workgroup

Return type: str

CLI Example:

```bash
salt 'minion-id' system.get_domain_workgroup
```
salt.modules.win_system.get_hostname()
Get the hostname of the windows minion

New in version 2016.3.0.

Returns
Returns the hostname of the windows minion

Return type str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

salt.modules.win_system.get_pending_component_servicing()
Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns True if there are pending Component Based Servicing tasks, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

salt.modules.win_system.get_pending_computer_name()
Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was an error retrieving the pending computer name, False will be returned, and an error message will be logged to the minion log.

Returns Returns the pending name if pending restart. Returns None if not pending restart.

Return type str

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

salt.modules.win_system.get_pending_domain_join()
Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns True if there is a pending domain join action, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_domain_join
```

salt.modules.win_system.get_pending_file_rename()
Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

Returns True if there are pending file rename operations, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_file_rename
```

salt.modules.win_system.get_pending_reboot()
Determine whether there is a reboot pending.

New in version 2016.11.0.

Returns True if the system is pending reboot, otherwise False

Return type bool

CLI Example:
salt '*' system.get_pending_reboot

salt.modules.win_system.get_pending_reboot_details()
Determine which check is signalling that the system is pending a reboot. Useful in determining why your
system is signalling that it needs a reboot.

New in version 3001.

    Returns  A dictionary of the results of each system that would indicate a pending reboot
    Return type  dict

    CLI Example:

    salt '*' system.get_pending_reboot_details

salt.modules.win_system.get_pending_servermanager()
Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

    Returns  True if there are pending Server Manager tasks, otherwise False
    Return type  bool

    CLI Example:

    salt '*' system.get_pending_servermanager

salt.modules.win_system.get_pending_update()
Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

    Returns  True if there are pending updates, otherwise False
    Return type  bool

    CLI Example:

    salt '*' system.get_pending_update

salt.modules.win_system.get_pending_windows_update()
Check the Windows Update system for a pending reboot state.

This leverages the Windows Update System to determine if the system is pending a reboot.

New in version 3001.

    Returns  True if the Windows Update system reports a pending update, otherwise False
    Return type  bool

    CLI Example:

    salt '*' system.get_pending_windows_update

salt.modules.win_system.get_reboot_required_witnessed()
Determine if at any time during the current boot session the salt minion witnessed an event indicating that a
reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and
can be extended where appropriate in the future.

New in version 2016.11.0.

    Returns  True if the Requires reboot registry flag is set to 1, otherwise False
    Return type  bool

    CLI Example:
salt ' Minion ID ' system . get _ reboot _ required _ witnessed

salt . modules . win _ system . get _ system _ date ()
Get the Windows system date
    Returns  Returns the system date
    Return  type  str
CLI Example:
salt ' Minion ID ' system . get _ system _ date

salt . modules . win _ system . get _ system _ info ()
Get system information.

    Note:  Not all system info is available across all versions of Windows. If it is not available on an older version, it will be skipped

    Returns  Dictionary containing information about the system to include name, description, version, etc...
    Return  type  dict
CLI Example:
salt ' Minion ID ' system . get _ system _ info

salt . modules . win _ system . get _ system _ time ()
Get the system time.
    Returns  Returns the system time in HH:MM:SS AM/PM format.
    Return  type  str
CLI Example:
salt ' Minion ID ' system . get _ system _ time

salt . modules . win _ system . halt ( timeout = 5 , in _ seconds = False )
Halt a running system.
    Parameters
    •  timeout ( int ) -- Number of seconds before halting the system. Default is 5 seconds.
    •  in _ seconds ( bool ) -- Whether to treat timeout as seconds or minutes.
    New in version 2015.8.0.
    Returns True if successful, otherwise False
    Return  type  bool
CLI Example:
salt ' Minion ID ' system . halt 5 True

salt . modules . win _ system . init ( runlevel )
Change the system runlevel on sysV compatible systems. Not applicable to Windows
CLI Example:
salt ' Minion ID ' system . init 3

salt . modules . win _ system . join _ domain ( domain , username = None , password = None , account _ ou = None , account _ exists = False , restart = False )
Join a computer to an Active Directory domain. Requires a reboot.
    Parameters
• **domain** *(str)* -- The domain to which the computer should be joined, e.g. example.com
• **username** *(str)* -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
• **password** *(str)* -- Password of the specified user
• **account_ou** *(str)* -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432,dc=my-company,dc=com
• **account_exists** *(bool)* -- If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
• **restart** *(bool)* -- True will restart the computer after a successful join. Default is False

Returns a dictionary if successful, otherwise False
Return type *dict*

CLI Example:

```bash
salt 'minion-id' system.join_domain domain='domain.tld' \ 
    username='joinuser' password='joinpassword' \ 
    account_ou='ou=clients,ou=org,dc=domain,dc=tld' \ 
    account_exists=False, restart=True
```

**salt.modules.win_system.lock()**

Lock the workstation.

Returns True if successful, otherwise False
Return type *bool*

CLI Example:

```bash
salt 'minion-id' system.lock
```

**salt.modules.win_system.poweroff**(timeout=5, *in_seconds=False*)

Power off a running system.

Parameters

• **timeout** *(int)* -- Number of seconds before powering off the system. Default is 5 seconds.
• **in_seconds** *(bool)* -- Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns True if successful, otherwise False
Return type *bool*

CLI Example:

```bash
salt '*' system.poweroff 5
```

**salt.modules.win_system.reboot**(timeout=5, *in_seconds=False*, *wait_for_reboot=False*, only_on_pending_reboot=False)

Reboot a running system.

Parameters

• **timeout** *(int)* -- The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of *in_seconds*. Default is 5 minutes.
• **in_seconds** *(bool)* --

  True will cause the timeout parameter to be in seconds. False will be in minutes. Default is False.
New in version 2015.8.0.

- **wait_for_reboot** *(bool)* -- True will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is False.

New in version 2015.8.0.

- **only_on_pending_reboot** *(bool)* -- If this is set to True, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to True could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using order: last). Default is False.

Returns True if successful (a reboot will occur), otherwise False

Return type bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
    - name: system.reboot
    - only_on_pending_reboot: True
    - order: last
```

```
salt.modules.win_system.set_computer_desc(desc=None)
Set the Windows computer description

Parameters desc (str) -- The computer description

Returns Description if successful, otherwise False

Return type str

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

salt.modules.win_system.set_computer_description(desc=None)
This function is an alias of set_computer_desc.

Set the Windows computer description

Args:

desc (str): The computer description

Returns: str: Description if successful, otherwise False

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!' →
```

salt.modules.win_system.set_computer_name(name)
Set the Windows computer name

Parameters name (str) -- The new name to give the computer. Requires a reboot to take effect.

Returns Returns a dictionary containing the old and new names if successful. False if not.

Return type dict

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```
salt.modules.win_system.set_domain_workgroup(workgroup)
Set the domain or workgroup the computer belongs to.

New in version 3001.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' system.set_domain_workgroup LOCAL
```

salt.modules.win_system.set_hostname(hostname)
Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters hostname (str) -- The hostname to set

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' system.set_hostname newhostname
```

salt.modules.win_system.set_reboot_required_witnessed()
This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the HKLM hive:

```
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
```

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name 'Reboot required' will be assigned the value of 1.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '* system.set_reboot_required_witnessed
```

salt.modules.win_system.set_system_date(newdate)
Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters newdate (str) -- The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.win_system.set_system_date_time(years=None, months=None, days=None, hours=None, minutes=None, seconds=None)
Set the system date and time. Each argument is an element of the date, but not required. If an element is not
passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

**Parameters**

- **years** *(int)* -- Years digit, ie: 2015
- **months** *(int)* -- Months digit: 1 - 12
- **days** *(int)* -- Days digit: 1 - 31
- **hours** *(int)* -- Hours digit: 0 - 23
- **minutes** *(int)* -- Minutes digit: 0 - 59
- **seconds** *(int)* -- Seconds digit: 0 - 59

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```bash
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

**salt.modules.win_system.set_system_time(newtime)**

Set the system time.

**Parameters** **newtime** *(str)* -- The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

**Returns** True if successful, otherwise False

**Return type** bool

CLI Example:

```bash
salt 'minion-id' system.set_system_time 12:01
```

**salt.modules.win_system.shutdown(message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False)**

Shutdown a running system.

**Parameters**

- **message** *(str)* -- The message to display to the user before shutting down.
- **timeout** *(int)* -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the system.shutdown_abort function.

If timeout is not zero, InitiateSystemShutdown displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the lpMessage parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by system.shutdown_abort.

Default is 5 minutes

- **in_seconds** *(bool)* -- True will cause the timeout parameter to be in seconds. False will be in minutes. Default is False.

New in version 2015.8.0.

- **force_close** *(bool)* -- True will force close all open applications. False will display a dialog box instructing the user to close open applications. Default is True.
- **reboot** *(bool)* -- True restarts the computer immediately after shutdown. False powers down the system. Default is False.
- **only_on_pending_reboot** *(bool)* -- If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.

- **only_on_pending_reboot** -- If True the shutdown will only proceed if there is a reboot pending. False will shutdown the system. Default is False.

  *Returns* True if successful (a shutdown or reboot will occur), otherwise False

  *Return type* bool

  *CLI Example:*

```shell
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

salt.modules.win_system.shutdown_abort()
Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

  *Returns* True if successful, otherwise False

  *Return type* bool

  *CLI Example:*

```shell
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.shutdown_hard()
Shutdown a running system with no timeout or warning.

  *Returns* True if successful, otherwise False

  *Return type* bool

  *CLI Example:*

```shell
salt '*' system.shutdown_hard
```

salt.modules.win_system.start_time_service()
Start the Windows time service

  *Returns* True if successful, otherwise False

  *Return type* bool

  *CLI Example:*

```shell
salt '*' system.start_time_service
```

salt.modules.win_system.stop_time_service()
Stop the Windows time service

  *Returns* True if successful, otherwise False

  *Return type* bool

  *CLI Example:*

```shell
salt '*' system.stop_time_service
```

salt.modules.win_system.unjoin_domain(*username=None*, *password=None*, *domain=None*, *workgroup='WORKGROUP'*, *disable=False*, *restart=False*)
Unjoin a computer from an Active Directory Domain. Requires a restart.

  *Parameters*

  - **username**(str) -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like user@domain.tld or domain.tld\user. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be None.
  - **password**(str) -- The password of the specified user
  - **domain**(str) -- The domain from which to unjoin the computer. Can be None

  *CLI Example:*
• **workgroup** (*str*) -- The workgroup to join the computer to. Default is WORKGROUP

• **disable** (*bool*) -- True to disable the computer account in Active Directory. Default is False

• **restart** (*bool*) -- True will restart the computer after successful unjoin. Default is False

**Returns**

Returns a dictionary if successful, otherwise False

**Return type**

dict

**CLI Example:**

```bash
salt 'minion-id' system.unjoin_domain restart=True
salt 'minion-id' system.unjoin_domain username='unjoinuser' \ password='unjoinpassword' disable=True \ restart=True
```

25.7.516 salt.modules.win_task

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

**salt.modules.win_task.add_action**(*name=None, location='\', action_type='Execute', **kwargs*)

Add an action to a task.

**Parameters**

- **name** (*str*) -- The name of the task to which to add the action.
- **location** (*str*) -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **action_type** (*str*) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each action_type:

**Execute**

Execute a command or an executable

- **cmd** (*str*): (required) The command or executable to run.
- **arguments** (*str*): (optional) Arguments to be passed to the command or executable. To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass `cscript.exe` in the cmd parameter and pass the script in the arguments parameter as follows:
  - `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

  Batch files do not need an interpreter and may be passed to the cmd parameter directly.

  - **start_in** (*str*): (optional) The current working directory for the command.

**Email**

Send and email. Requires `server`, `from`, and `to` or `cc`.

- **from** (*str*): The sender
- **reply_to** (*str*): Who to reply to
to (str): The recipient
cc (str): The CC recipient
bcc (str): The BCC recipient
subject (str): The subject of the email
body (str): The Message Body of the email
server (str): The server used to send the email

**attachments** (list): A list of attachments. These will be the paths to the files to attach. ie: attachments="['C:\attachment1.txt', 'C:\attachment2.txt']"

**Message**
Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.
- title (str): The dialog box title.
- message (str): The dialog box message body

**Returns** A dictionary containing the task configuration
**Return type** dict

**CLI Example:**
```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```python
salt.modules.win_task.add_trigger(name=None, location=None, trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, delay=None, **kwargs)
```

Add a trigger to a Windows Scheduled task

**Note:** Arguments are parsed by the YAML loader and are subject to yaml’s idiosyncrasies. Therefore, time values in some formats (e.g. %H:%M:%S and %H:%M) should to be quoted. See YAML IDIOSYNCRASIES for more details.

**Parameters**
- **name (str)** -- The name of the task to which to add the trigger.
- **location (str)** -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
- **trigger_type (str)** -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:
  - Event
  - Once
  - Daily
  - Weekly
  - Monthly
  - MonthlyDay
  - OnIdle
  - OnTaskCreation
  - OnBoot
  - OnLogon
  - OnSessionChange
- **trigger_enabled (bool)** -- Boolean value that indicates whether the trigger is enabled.
- **start_date (str)** -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%Y
  - %m-%d-%y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **start_time (str)** -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **end_date (str)** -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:
  - %Y-%m-%d
  - %m-%d-%y
  - %m-%d-%Y
  - %m/%d/%y
  - %m/%d/%Y
  - %Y/%m/%d
- **end_time (str)** -- The time when the trigger is deactivated. If this is not passed with end_date it will be set to midnight. Can be one of the following formats:
  - %I:%M:%S %p
  - %I:%M %p
  - %H:%M:%S
  - %H:%M
- **random_delay (str)** -- The delay time that is randomly added to the start time of the trigger. Valid values are:
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

**Note:** This parameter applies to the following trigger types
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay

- **repeat_interval (str)** -- The amount of time between each restart of the task. Valid values are:
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **repeat_duration (str)** -- How long the pattern is repeated. Valid values are:
Salt Documentation, Release 3006.4

- Indefinitely
- 15 minutes
- 30 minutes
- 1 hour
- 12 hours
- 1 day

• **repeat_stop_at_duration_end (bool)** -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.

• **execution_time_limit (str)** -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:
  - 30 minutes
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days (default)

• **delay (str)** -- The time the trigger waits after its activation to start the task. Valid values are:
  - 15 seconds
  - 30 seconds
  - 1 minute
  - 30 minutes
  - 1 hour
  - 8 hours
  - 1 day

**Note:** This parameter applies to the following trigger types:
- OnLogon
- OnBoot
- Event
- OnTaskCreation
- OnSessionChange

**kwargs**

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

**Event**

The trigger will be fired by an event.

**subscription (str):** An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in Windows Task Scheduler and then copy the xml text.

**Once**

No special parameters required.

**Daily**

The task will run daily.

**days_interval (int):** The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

**Weekly**

The task will run weekly.

**weeks_interval (int):** The interval between weeks in the schedule. An interval of 1
produces a weekly schedule. An interval of 2 produces an every-other-week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

days_of_week (list): Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

Monthly
The task will run monthly.

months_of_year (list): Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

days_of_month (list): Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.

last_day_of_month (bool): Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

Note: You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.

MonthlyDay
The task will run monthly on the specified day.

months_of_year (list): Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.

weeks_of_month (list): Sets the weeks of the month during which the task runs. Should be a list. ie: ['First', 'Third']. Valid options are:
- First
- Second
- Third
- Fourth

last_week_of_month (bool): Boolean value that indicates that the task runs on the last week of the month.

days_of_week (list): Sets the days of the week during which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

OnIdle
No special parameters required.

OnTaskCreation
No special parameters required.

OnBoot
No special parameters required.

OnLogon
No special parameters required.

OnSessionChange
The task will be triggered by a session change.

session_user_name (str): Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.

state_change (str): Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
- ConsoleConnect: When you connect to a user session (switch users)
- ConsoleDisconnect: When you disconnect a user session (switch users)
• RemoteConnect: When a user connects via Remote Desktop
• RemoteDisconnect: When a user disconnects via Remote Desktop
• SessionLock: When the workstation is locked
• SessionUnlock: When the workstation is unlocked

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_ 
  →enabled=True start_date=2016/12/1 start_time="12:01"
```

salt.modules.win_task.clear_triggers(name, location='\')
Remove all triggers from the task.

Parameters
• name (str) -- The name of the task from which to clear all triggers.
• location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' task.clear_trigger <task_name>
```

salt.modules.win_task.create_folder(name, location='\')
Create a folder in which to create tasks.

Parameters
• name (str) -- The name of the folder. This will be displayed in the task scheduler.
• location (str) -- A string value representing the location in which to create the folder. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns True if successful, otherwise False
Return type bool

CLI Example:
```
salt 'minion-id' task.create_folder <folder_name>
```

salt.modules.win_task.create_task(name, location='\', user_name='System', password=None, 
  force=False, **kwargs)
Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:
• edit_task()
• add_action()
• add_trigger()

Parameters
• name (str) -- The name of the task. This will be displayed in the task scheduler.
• location (str) -- A string value representing the location in which to create the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).
• user_name (str) -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
• password (str) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
• force (bool) -- If the task exists, overwrite the existing task.

Returns True if successful, otherwise False
Return type \texttt{bool}\hfill \texttt{CLI Example:}

\begin{verbatim}
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-10 start_time="01:00"
\end{verbatim}

\begin{verbatim}
salt.modules.win_task.create_task_from_xml(name, location='\\', xml_text=None, xml_path=None, user_name='System', password=None)
\end{verbatim}

Create a task based on XML. Source can be a file or a string of XML.

\textbf{Parameters}
\begin{itemize}
  \item \texttt{name (str)} -- The name of the task. This will be displayed in the task scheduler.
  \item \texttt{location (str)} -- A string value representing the location in which to create the task. Default is \texttt{\\} which is the root for the task scheduler (C:\Windows\System32\tasks).
  \item \texttt{xml_text (str)} -- A string of xml representing the task to be created. This will be overridden by \texttt{xml_path} if passed.
  \item \texttt{xml_path (str)} -- The path to an XML file on the local system containing the xml that defines the task. This will override \texttt{xml_text}
  \item \texttt{user_name (str)} -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
  \item \texttt{password (str)} -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
\end{itemize}

\textbf{Returns} \texttt{True} if successful, otherwise \texttt{False}

\textbf{Return type} \texttt{bool}

\textbf{Raises}
\begin{itemize}
  \item \texttt{ArgumentValueError} -- If arguments are invalid
  \item \texttt{CommandExecutionError} --
\end{itemize}

\textbf{CLI Example:}

\begin{verbatim}
salt '*' task.create_task_from_xml <task_name> xml_path=C:\\task.xml
\end{verbatim}

\begin{verbatim}
salt.modules.win_task.delete_folder(name, location='\\')
\end{verbatim}

Delete a folder from the task scheduler.

\textbf{Parameters}
\begin{itemize}
  \item \texttt{name (str)} -- The name of the folder to delete.
  \item \texttt{location (str)} -- A string value representing the location of the folder. Default is \texttt{\\} which is the root for the task scheduler (C:\Windows\System32\tasks).
\end{itemize}

\textbf{Returns} \texttt{True} if successful, otherwise \texttt{False}

\textbf{Return type} \texttt{bool}

\textbf{CLI Example:}

\begin{verbatim}
salt 'minion-id' task.delete_folder <folder_name>
\end{verbatim}

\begin{verbatim}
salt.modules.win_task.delete_task(name, location='\\')
\end{verbatim}

Delete a task from the task scheduler.

\textbf{Parameters}
\begin{itemize}
  \item \texttt{name (str)} -- The name of the task to delete.
  \item \texttt{location (str)} -- A string value representing the location of the task. Default is \texttt{\\} which is the root for the task scheduler (C:\Windows\System32\tasks).
\end{itemize}

\textbf{Returns} \texttt{True} if successful, otherwise \texttt{False}

\textbf{Return type} \texttt{bool}

\textbf{CLI Example:}
salt 'minion-id' task.delete_task <task_name>

salt.modules.win_task.edit_task(name=None, location='\', user_name=None, password=None, description=None, enabled=None, hidden=None, run_if_idle=None, idle_duration=None, idle_wait_timeout=None, idle_stop_on_end=None, idle_restart=None, ac_only=None, stop_if_on_batteries=None, wake_to_run=None, run_if_network=None, network_id=None, network_name=None, allow_demand_start=None, start_when_available=None, restart_every=None, restart_count=3, execution_time_limit=None, force_stop=None, delete_after=None, multiple_instances=None, **kwargs)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name** *(str)* -- The name of the task. This will be displayed in the task scheduler.
- **location** *(str)* -- A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:\Windows\System32\tasks).
- **user_name** *(str)* -- The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** *(str)* -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

- **description** *(str)* -- A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled** *(bool)* -- A boolean value representing whether or not the task is enabled.
- **hidden** *(bool)* -- A boolean value representing whether or not the task is hidden.
- **run_if_idle** *(bool)* -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration** *(str)* -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
- **idle_wait_timeout** *(str)* -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:
  - Do not wait
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours

Chapter 25. Salt Module Reference
- **idle_stop_on_end** *(bool)* -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.
- **idle_restart** *(bool)* -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
- **ac_only** *(bool)* -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
- **stop_if_on_batteries** *(bool)* -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
- **wake_to_run** *(bool)* -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
- **run_if_network** *(bool)* -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
- **network_id** *(guid)* -- GUID value that identifies a network profile.
- **network_name** *(str)* -- Sets the name of a network profile. The name is used for display purposes.
- **allow_demand_start** *(bool)* -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
- **start_when_available** *(bool)* -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
- **restart_every** *(str)* -- A value that specifies the interval between task restart attempts. Valid values are:
  - False (to disable)
  - 1 minute
  - 5 minutes
  - 10 minutes
  - 15 minutes
  - 30 minutes
  - 1 hour
  - 2 hours
- **restart_count** *(int)* -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
- **execution_time_limit** *(bool, str)* -- The amount of time allowed to complete the task. Valid values are:
  - False (to disable)
  - 1 hour
  - 2 hours
  - 4 hours
  - 8 hours
  - 12 hours
  - 1 day
  - 3 days
- **force_stop** *(bool)* -- Boolean value that indicates that the task may be terminated by using TerminateProcess.
- **delete_after** *(bool, str)* -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:
  - False (to disable)
  - Immediately
  - 30 days
  - 90 days
  - 180 days
  - 365 days
- **multiple_instances** *(str)* -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:
Salt Documentation, Release 3006.4

- Parallel
- Queue
- No New Instance
- Stop Existing

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' task.edit_task <task_name> description='This task is awesome'
```

salt.modules.win_task.info(name, location='\')
Get the details about a task in the task scheduler.

Parameters

- name (str) -- The name of the task for which to return the status
- location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns A dictionary containing the task configuration

Return type dict

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

salt.modules.win_task.list_actions(name, location='\')
List all actions that pertain to a task in the specified location.

Parameters

- name (str) -- The name of the task for which list actions.
- location (str) -- A string value representing the location of the task from which to list actions. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns Returns a list of actions.

Return type list

CLI Example:

```
# List all actions for a task in the default location
salt 'minion-id' task.list_actions <task_name>

# List all actions for the XblGameSaveTask in the Microsoft\XblGameSave location
salt 'minion-id' task.list_actions XblGameSaveTask Microsoft\XblGameSave
```

salt.modules.win_task.list_folders(location='\')
List all folders located in a specific location in the task scheduler.

Parameters location (str) -- A string value representing the folder from which you want to list tasks. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

Returns Returns a list of folders.

Return type list

CLI Example:

```
# List all folders in the default location
salt 'minion-id' task.list_folders

# List all folders in the Microsoft directory
salt 'minion-id' task.list_folders Microsoft
```

salt.modules.win_task.list_tasks(location='\')
List all tasks located in a specific location in the task scheduler.

Parameters

**location** *(str)* -- A string value representing the folder from which you want to list tasks. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

Returns a list of tasks

Return type: list

CLI Example:

```bash
# List all tasks in the default location
salt 'minion-id' task.list_tasks

# List all tasks in the Microsoft\XblGameSave Directory
salt 'minion-id' task.list_tasks Microsoft\XblGameSave
```

salt.modules.win_task.list_triggers(*name, location='\'*)

List all triggers that pertain to a task in the specified location.

Parameters

- **name** *(str)* -- The name of the task for which list triggers.
- **location** *(str)* -- A string value representing the location of the task from which to list triggers. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

Returns a list of triggers.

Return type: list

CLI Example:

```bash
# List all triggers for a task in the default location
salt 'minion-id' task.list_triggers <task_name>

# List all triggers for the XblGameSaveTask in the Microsoft\XblGameSave location
salt '*' task.list_triggers XblGameSaveTask Microsoft\XblGameSave
```

salt.modules.win_task.run(*name, location='\'*)

Run a scheduled task manually.

Parameters

- **name** *(str)* -- The name of the task to run.
- **location** *(str)* -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

True if successful, otherwise False.

Return type: bool

CLI Example:

```bash
salt 'minion-id' task.run <task_name>
```

salt.modules.win_task.run_wait(*name, location='\'*)

Run a scheduled task and return when the task finishes.

Parameters

- **name** *(str)* -- The name of the task to run.
- **location** *(str)* -- A string value representing the location of the task. Default is `\` which is the root for the task scheduler (`C:\Windows\System32\tasks`).

Returns

True if successful, otherwise False.

Return type: bool

CLI Example:

```bash
salt 'minion-id' task.run_wait <task_name>
```
salt.modules.win_task.status (name, location='\\')
 Deline the status of a task. Is it Running, Queued, Ready, etc.

 Parameters
   - name (str) -- The name of the task for which to return the status
   - location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

 Returns
   The current status of the task. Will be one of the following:
     - Unknown
     - Disabled
     - Queued
     - Ready
     - Running

 Return type str

 CLI Example:

    salt 'minion-id' task.list_status <task_name>

salt.modules.win_task.stop (name, location='\\')
Stop a scheduled task.

 Parameters
   - name (str) -- The name of the task to stop.
   - location (str) -- A string value representing the location of the task. Default is \ which is the root for the task scheduler (C:\Windows\System32\tasks).

 Returns True if successful, otherwise False

 Return type bool

 CLI Example:

    salt 'minion-id' task.list_stop <task_name>

25.7.517  salt.modules.win_timezone

Module for managing timezone on Windows systems.

class salt.modules.win_timezone.TzMapper (unix_to_win)

   add (k, v)
   get_unix (key, default=None)
   get_win (key, default=None)
   list_unix ()
   list_win ()
   remove (k)

salt.modules.win_timezone.get_hwclock ()
Get current hardware clock setting (UTC or localtime)

 Note:  The hardware clock is always local time on Windows so this will always return "localtime"

 CLI Example:
```python
salt '*' timezone.get_hwclock

salt.modules.win_timezone.get_offset()
Get current numeric timezone offset from UTC (i.e. -0700)
    Returns  Offset from UTC
    Return type  str
CLI Example:
    salt '*' timezone.get_offset

salt.modules.win_timezone.get_zone()
Get current timezone (i.e. America/Denver)
    Returns  Timezone in unix format
    Return type  str
    Raises  CommandExecutionError -- If timezone could not be gathered
CLI Example:
    salt '*' timezone.get_zone

salt.modules.win_timezone.get_zonecode()
Get current timezone (i.e. PST, MDT, etc)
    Returns  An abbreviated timezone code
    Return type  str
CLI Example:
    salt '*' timezone.get_zonecode

salt.modules.win_timezone.list(unix_style=True)
Return a list of Timezones that this module supports. These can be in either Unix or Windows format.
New in version 2018.3.3.
    Parameters  unix_style (bool) -- True returns Unix-style timezones. False returns Windows-style timezones. Default is True
    Returns  A list of supported timezones
    Return type  list
CLI Example:
    # Unix-style timezones
    salt '*' timezone.list
    # Windows-style timezones
    salt '*' timezone.list unix_style=False

salt.modules.win_timezone.set_hwclock(clock)
Sets the hardware clock to be either UTC or localtime

    Note:  The hardware clock is always local time on Windows so this will always return False
CLI Example:
    salt '*' timezone.set_hwclock UTC

salt.modules.win_timezone.set_zone(timezone)
Sets the timezone using the tzutil.
    Parameters  timezone (str) -- A valid timezone
```
Returns True if successful, otherwise False
Return type bool
Raises CommandExecutionError -- If invalid timezone is passed

CLI Example:
```
salt '*' timezone.set_zone 'America/Denver'
```

```
salt.modules.win_timezone.zone_compare(timezone)
```

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

Parameters timezone (str) -- The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the timezone.list function

Returns True if they match, otherwise False
Return type bool

Example:
```
salt '*' timezone.zone_compare 'America/Denver'
```

25.7.518 salt.modules.win_useradd

Module for managing Windows Users.

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see here.

depends

• pywintypes
• win32api
• win32con
• win32net
• win32netcon
• win32profile
• win32security
• win32ts
• wmi

Note: This currently only works with local user accounts, not domain accounts

```
salt.modules.win_useradd.add(name, password=None, fullname=None, description=None, groups=None, home=None, homedrive=None, profile=None, logonscript=None)
```

Add a user to the minion.

Parameters

• name (str) -- User name
• password (str, optional) -- User's password in plain text.
• fullname (str, optional) -- The user's full name.
• description (str, optional) -- A brief description of the user account.
• groups (str, optional) -- A list of groups to add the user to. (see chgroups)
**salt Documentation, Release 3006.4**

- **home**(str, optional) -- The path to the user’s home directory.
- **homedrive**(str, optional) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile**(str, optional) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses its default profile directory.
- **logonscript**(str, optional) -- Path to a login script to run when the user logs on.

Returns  True if successful. False is unsuccessful.
Return type  bool

**CLI Example:**
salt '***' user.add name password

salt.modules.win_useradd.addgroup(name, group)
Add user to a group
Parameters
  - **name**(str) -- The user name to add to the group
  - **group**(str) -- The name of the group to which to add the user

Returns  True if successful, otherwise False
Return type  bool

**CLI Example:**
salt '***' user.addgroup jsnuffy 'Power Users'

salt.modules.win_useradd.chfullname(name, fullname)
Change the full name of the user
Parameters
  - **name**(str) -- The user name for which to change the full name
  - **fullname**(str) -- The new value for the full name

Returns  True if successful, otherwise False
Return type  bool

**CLI Example:**
salt '***' user.chfullname user 'First Last'

salt.modules.win_useradd.chgroups(name, groups, append=True)
Change the groups this user belongs to, add append=False to make the user a member of only the specified groups
Parameters
  - **name**(str) -- The user name for which to change groups
  - **groups**(str, list) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
  - **append**(bool, optional) -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns  True if successful, otherwise False
Return type  bool

**CLI Example:**
salt '***' user.chgroups jsnuffy Administrators,Users True

salt.modules.win_useradd.chhome(name, home, **kwargs)
Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.
Parameters
  - **name**(str) -- The name of the user whose home directory you wish to change
• **home** (*str*) -- The new location of the home directory
  
  **Returns**  True if successful, otherwise False
  
  **Return type**  bool

  **CLI Example:**
  
  ```
  salt '*' user.chhome foo \fileserver\home\foo True
  ```

**salt.modules.win_useradd.chprofile(name, profile)**

Change the profile directory of the user

**Parameters**

- **name** (*str*) -- The name of the user whose profile you wish to change
- **profile** (*str*) -- The new location of the profile

**Returns**  True if successful, otherwise False

**Return type**  bool

**CLI Example:**

```
salt '*' user.chprofile foo \fileserver\profiles\foo
```

**salt.modules.win_useradd.current(sam=False)**

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

**Parameters**  
- **sam** (*bool*, optional) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

  **Returns**  Returns username

  **Return type**  str

  **CLI Example:**
  
  ```
  salt '*' user.current
  ```

**salt.modules.win_useradd.delete(name, purge=False, force=False)**

Remove a user from the minion

**Parameters**

- **name** (*str*) -- The name of the user to delete
- **purge** (*bool*, optional) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** (*bool*, optional) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

  **Returns**  True if successful, otherwise False

  **Return type**  bool

  **CLI Example:**
  
  ```
  salt '*' user.delete name
  ```

**salt.modules.win_useradd.getUserSid(username)**

Get the Security ID for the user

**Parameters**  
- **username** (*str*) -- The user name for which to look up the SID

  **Returns**  The user SID

  **Return type**  str

  **CLI Example:**
  
  ```
  ```
salt '*' user.getUserSid jsnuffy

```python
salt.modules.win_useradd.getent(refresh=False)
```

Return the list of all info for all users

**Parameters**
- `refresh` *(bool, optional)* -- Refresh the cached user information. Useful when used from within a state function. Default is False.

**Returns**
A dictionary containing information about all users on the system

**Return type** `dict`

**CLI Example:**
```
salt '*' user.getent
```

```python
salt.modules.win_useradd.info(name)
```

Return user information

**Parameters**
- `name` *(str)* -- Username for which to display information

**Returns**
A dictionary containing user information

- `fullname`
- `username`
- `SID`
- `passwd` (will always return None)
- `comment` (same as description, left here for backwards compatibility)
- `description`
- `active`
- `logonscript`
- `profile`
- `home`
- `homedrive`
- `groups`
- `password_changed`
- `successful_logon_attempts`
- `failed_logon_attempts`
- `last_logon`
- `account_disabled`
- `account_locked`
- `password_never_expires`
- `disallow_change_password`
- `gid`

**Return type** `dict`

**CLI Example:**
```
salt '*' user.info jsnuffy
```

```python
salt.modules.win_useradd.list_groups(name)
```

Return a list of groups the named user belongs to

**Parameters**
- `name` *(str)* -- The user name for which to list groups

**Returns**
A list of groups to which the user belongs

**Return type** `list`

**CLI Example:**
```
salt '*' user.list_groups foo
```

```python
salt.modules.win_useradd.list_users()
```

Return a list of all users on Windows
Returns A list of all users on the system
Return type list
CLI Example:
salt '*' user.list_users

salt.modules.win_useradd.removegroup(name, group)
Remove user from a group
Parameters
- name (str) -- The user name to remove from the group
- group (str) -- The name of the group from which to remove the user
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' user.removegroup jsnuffy 'Power Users'

salt.modules.win_useradd.rename(name, new_name)
Change the username for a named user
Parameters
- name (str) -- The user name to change
- new_name (str) -- The new name for the current user
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' user.rename jsnuffy jshmoe

salt.modules.win_useradd.setpassword(name, password)
Set the user's password
Parameters
- name (str) -- The user name for which to set the password
- password (str) -- The new password
Returns True if successful, otherwise False
Return type bool
CLI Example:
salt '*' user.setpassword jsnuffy sup3rs3cr3t

salt.modules.win_useradd.update(name, password=None, fullname=None, description=None, home=None, homedrive=None, logonscript=None, profile=None, expiration_date=None, expired=None, account_disabled=None, unlock_account=None, password_never_expires=None, disallow_change_password=None)
Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.
New in version 2015.8.0.
Parameters
- name (str) -- The user name to update.
- password (str, optional) -- New user password in plain text.
- fullname (str, optional) -- The user's full name.
- description (str, optional) -- A brief description of the user account.
- home (str, optional) -- The path to the user's home directory.
- homedrive (str, optional) -- The drive letter to assign to the home directory.
  Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** *(str, optional)* -- The path to the logon script.
- **profile** *(str, optional)* -- The path to the user's profile directory.
- **expiration_date** *(date, optional)* -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired** *(bool, optional)* -- Pass True to expire the account. The user will be prompted to change their password at the next logon. Pass False to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the expiration_date as well.
- **account_disabled** *(bool, optional)* -- True disables the account. False enables the account.
- **unlock_account** *(bool, optional)* -- True unlocks a locked user account. False is ignored.
- **password_never_expires** *(bool, optional)* -- True sets the password to never expire. False allows the password to expire.
- **disallow_change_password** *(bool, optional)* -- True blocks the user from changing the password. False allows the user to change the password.

Returns True if successful. False is unsuccessful.

Return type *bool*

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob home=\server\homeshare\bob homedrive=U:
```

### 25.7.519 *salt.modules.win_wua*

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- **win_wua.available**
- **win_wua.list**

This is an easy way to find additional information about updates available to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- **win_wua.get**
- **win_wua.download**
- **win_wua.install**
- **win_wua.uninstall**

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The **win_wua.list** and **win_wua.get** functions are utility functions. In addition to returning information about updates they can also download and install updates by setting download=True or install=True. So, with py:func:`win_wua.list <salt.modules.win_wua.list>` for example, you could run the function with the filters you want to see what is available. Then just add install=True to install everything on that list.

If you want to download, install, or uninstall specific updates, use **win_wua.download**, **win_wua.install**, or **win_wua.uninstall**. To update your system with the latest updates use **win_wua.list** and set install=True.
You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

```python
depends  salt.utils.win_update

salt.modules.win_wua.available(software=True, drivers=True, summary=False,
    skip_installed=True, skip_hidden=True, skip_mandatory=False,
    skip_reboot=False, categories=None, severities=None, online=True)
```

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

Parameters

- **software** *(bool)* -- Include software updates in the results. Default is **True**
- **drivers** *(bool)* -- Include driver updates in the results. Default is **True**
- **summary** *(bool)* --
  - **True**: Return a summary of updates available for each category.
  - **False** (default): Return a detailed list of available updates.
- **skip_installed** *(bool)* -- Skip updates that are already installed. Default is **True**
- **skip_hidden** *(bool)* -- Skip updates that have been hidden. Default is **True**
- **skip_mandatory** *(bool)* -- Skip mandatory updates. Default is **False**
- **skip_reboot** *(bool)* -- Skip updates that require a reboot. Default is **False**
- **categories** *(list)* -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** *(list)* -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important
• **online** *(bool)* -- Tells the Windows Update Agent go online to update its local update database. **True** will go online. **False** will use the local update database as is. Default is **True**

New in version 3001.

**Returns**

Returns a dict containing either a summary or a list of updates:

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [
        '<category 1>',
        '<category 2>',
        ...
    ]
}}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': {
    <category 1>: <total for that category>,
    <category 2>: <total for category 2>,
    ...
 }}
```

**Return type** *dict*

**CLI Examples:**

```
# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.available categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.available severities=['Critical']

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
```

(continues on next page)
salt.modules.win_wua.download(names)

New in version 2017.7.0.
Downloads updates that match the list of passed identifiers. It's easier to use this function by using list_updates and setting download=True.

Parameters names (str, list) -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns A dictionary containing the details about the downloaded updates
Return type dict

CLI Example:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab', 'KB2131233']
```

salt.modules.win_wua.get(name, download=False, install=False, online=True)

New in version 2017.7.0.
Returns details for the named update

Parameters

- **name (str)** -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run list to get the GUID for the update you're looking for.
- **download (bool)** -- Download the update returned by this function. Run this function first to see if the update exists, then set download=True to download the update.
- **install (bool)** -- Install the update returned by this function. Run this function first to see if the update exists, then set install=True to install the update.
- **online (bool)** -- Tells the Windows Update Agent go online to update its local update database. True will go online. False will use the local update database as is. Default is True

New in version 3001.

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
Dict of Updates:
{'<GUID>': {
    'Title': <title>,
    'KB': <KB>,
    'GUID': <the globally unique identifier for the update>,
    'Description': <description>,
    'Downloaded': <has the update been downloaded>,
    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
}
```

(continues on next page)
'UserInput': <is user input required>,
'EULAAccepted': <has the EULA been accepted>,
'Severity': <update severity>,
'NeedsReboot': <is the update installed and awaiting reboot>,
'RebootBehavior': <will the update require a reboot>,
'Categories': [
    '<category 1>',
    '<category 2>',
    ...
}

Return type: dict

CLI Examples:

# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'

salt.modules.win_wua.get_needs_reboot()
Determines if the system needs to be rebooted.
Returns True if the system requires a reboot, otherwise False
Return type: bool

CLI Examples:

salt '*' win_wua.get_needs_reboot

salt.modules.win_wua.get_wu_settings()
Get current Windows Update settings.
Returns

A dictionary of Windows Update settings:
Featured Updates: Boolean value that indicates whether to display notifications for featured updates.
Group Policy Required (Read-only): Boolean value that indicates whether Group Policy requires the Automatic Updates service.
Microsoft Update: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products
Needs Reboot: Boolean value that indicates whether the machine is in a reboot pending state.
Non Admins Elevated: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
Notification Level:
Number 1 to 4 indicating the update level:
1. Never check for updates
2. Check for updates but let me choose whether to download and install

25.7. execution modules
3. Download updates but let me choose whether to install them
4. Install updates automatically

**Read Only (Read-only):** Boolean value that indicates whether the Automatic Update settings are read-only.

**Recommended Updates:** Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

**Scheduled Day:** Days of the week on which Automatic Updates installs or uninstalls updates.

**Scheduled Time:** Time at which Automatic Updates installs or uninstalls updates.

**Return type** `dict`

**CLI Examples:**
```
salt '*' win_wua.get_wu_settings
```

```python
salt.modules.win_wua.install(names)
```
New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

**Parameters**
- `names (str, list)` -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

**Note:** An error will be raised if there are more results than there are items in the names parameter

**Returns**
A dictionary containing the details about the installed updates.

**Return type** `dict`

**CLI Examples:**
```
# Normal Usage
salt '*' win_wua.install KB12323211
```

```python
salt.modules.win_wua.installed(summary=False, kbs_only=False)
```
New in version 3001.

Get a list of all updates that are currently installed on the system.

**Note:** This list may not necessarily match the Update History on the machine. This will only show the updates that apply to the current build of Windows. So, for example, the system may have shipped with Windows 10 Build 1607. That machine received updates to the 1607 build. Later the machine was upgraded to a newer feature release, 1803 for example. Then more updates were applied. This will only return the updates applied to the 1803 build and not those applied when the system was at the 1607 build.

**Parameters**
- `summary (bool)` -- Return a summary instead of a detailed list of updates. `True` will return a Summary, `False` will return a detailed list of installed updates. Default is `False`
- `kbs_only (bool)` -- Only return a list of KBs installed on the system. If this parameter is passed, the summary parameter will be ignored. Default is `False`

**Returns**
Returns a dictionary of either a Summary or a detailed list of updates installed on the system when kbs_only=False
list: Returns a list of KBs installed on the system when kbs_only=True

Return type: dict

CLI Examples:

```
# Get a detailed list of all applicable updates installed on the system
salt '*' win_wua.installed

# Get a summary of all applicable updates installed on the system
salt '*' win_wua.installed summary=True

# Get a simple list of KBs installed on the system
salt '*' win_wua.installed kbs_only=True
```

salt.modules.win_wua.list(software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False, online=True)

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software** (bool) -- Include software updates in the results. Default is True
- **drivers** (bool) -- Include driver updates in the results. Default is False
- **summary** (bool) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed** (bool) -- Skip installed updates in the results. Default is True
- **download** (bool) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with download=False to see what will be downloaded, then set download=True to download the updates. Default is False
- **install** (bool) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with install=False to see what will be installed, then set install=True to install the updates. Default is False
- **categories** (list) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set drivers=True)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender

- **severities** (list) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important
  - **online** *(bool)* -- Tells the Windows Update Agent go online to update its local update database. **True** will go online. **False** will use the local update database as is. Default is **True**

  New in version 3001.

**Returns**

Returns a dict containing either a summary or a list of updates:

```python
Dict of Updates:
{
    '<GUID>': {
        'Title': <title>,
        'KB': <KB>,
        'GUID': <the globally unique identifier for the update>,
        'Description': <description>,
        'Downloaded': <has the update been downloaded>,
        'Installed': <has the update been installed>,
        'Mandatory': <is the update mandatory>,
        'UserInput': <is user input required>,
        'EULAAccepted': <has the EULA been accepted>,
        'Severity': <update severity>,
        'NeedsReboot': <is the update installed and awaiting reboot>,
        'RebootBehavior': <will the update require a reboot>,
        'Categories': [
            '<category 1>',
            '<category 2>',
            ...
        ]
    }
}

Summary of Updates:
{
    'Total': <total number of updates returned>,
    'Available': <updates that are not downloaded or installed>,
    'Downloaded': <updates that are downloaded but not installed>,
    'Installed': <updates installed (usually 0 unless installed=True)>,
    'Categories': {
        <category 1>: <total for that category>,
        <category 2>: <total for category 2>,
        ...
    }
}
```

**Return type** *dict*

**CLI Examples:**

```bash
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True
```

(continues on next page)
# A summary of all Feature Packs and Windows 8.1 Updates

```bash
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True
```

```py
salt.modules.win_wua.set_wu_settings(level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None)
```

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:
- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters
- **level** *(int)* -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** *(bool)* -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** *(bool)* -- Boolean value that indicates whether to display notifications for featured updates.
- **elevated** *(bool)* -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** *(bool)* -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products.
- **day** *(str)* -- Days of the week on which Automatic Updates installs or uninstalls updates. Accepted values:
  - Everyday
  - Monday
  - Tuesday
  - Wednesday
  - Thursday
  - Friday
  - Saturday
- **time** *(str)* -- Time at which Automatic Updates installs or uninstalls updates. Must be in the #:# 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns
Returns a dictionary containing the results.

Return type
`dict`

CLI Examples:
```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

```py
salt.modules.win_wua.uninstall(names)
```
New in version 2017.7.0.

Uninstall updates.

Parameters
**names** *(str, list)* -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns
A dictionary containing the details about the uninstalled updates.

Return type
`dict`

CLI Examples:
# Normal Usage

```
salt '*' win_wuau.uninstall KB3121212
```

# As a list

```
salt '*' win_wuau.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab', --'KB1231231']
```

## 25.7.520 salt.modules.win_wusa

Microsoft Update files management via wusa.exe

- maintainer: Thomas Lemarchand
- platform: Windows
- depends: PowerShell

New in version 2018.3.4.

### salt.modules.win_wusa.install(path, restart=False)

Install a KB from a .msu file.

- **path** (str) -- The full path to the msu file to install
- **restart** (bool) -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

- **Returns**: True if successful, otherwise False
- **Return type**: bool
- **Raises** CommandExecutionError -- If the package is already installed or an error is encountered

CLI Example:

```
salt '*' wusa.install C:/temp/KB123456.msu
```

### salt.modules.win_wusa.is_installed(name)

Check if a specific KB is installed.

- **Parameters** **name** (str) -- The name of the KB to check
- **Returns**: True if installed, otherwise False
- **Return type**: bool

CLI Example:

```
salt '*' wusa.is_installed KB123456
```

### salt.modules.win_wusa.list()

Get a list of updates installed on the machine

- **Returns**: A list of installed updates
- **Return type**: list

CLI Example:

```
salt '*' wusa.list
```

### salt.modules.win_wusa.uninstall(path, restart=False)

Uninstall a specific KB.

- **Parameters** **path** (str) -- The full path to the msu file to uninstall. This can also be just the name of the KB to uninstall

CLI Example:
Salt Documentation, Release 3006.4

- **restart (bool)** -- True to force a restart if required by the installation. Adds the /forcerestart switch to the wusa.exe command. False will add the /norestart switch instead. Default is False

  Returns True if successful, otherwise False

Return type bool

Rases **CommandExecutionError** -- If an error is encountered

CLI Example:

```
salt '*' wusa.uninstall KB123456
```

25.7.521 salt.modules.winrepo

Module to manage Windows software repo on a Standalone Minion

file_client: local must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see here.

salt.modules.winrepo.genrepo()

Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:

```
salt-call winrepo.genrepo
```

salt.modules.winrepo.show_sls(name, saltenv='base')

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified in name

Parameters

- **str (saltenv)** -- The name/path of the package you want to view. This can be the
- **path to a file on the minion file system or a file on the local (full)** --
- **cache. (minion)** --
- **str** -- The default environment is base

Returns Returns a dictionary containing the rendered data structure

Return type dict

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

25.7. execution modules
CLI Example:

```
salt '* winrepo.show_sls gvim
salt '* winrepo.show_sls test.npp
salt '* winrepo.show_sls C:\test\gvim.sls
```

salt.modules.winrepo.update_git_repos(clean=False)

Checkout git repos containing *Windows Software Package Definitions*.

**Important:** This function requires *Git for Windows* to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

**clean** [False] Clean repo cachedirs which are not configured under *winrepo_remotes*.

**Note:** This option only applies if either *pygit2* or *GitPython* is installed into Salt's bundled Python.

**Warning:** This argument should not be set to *True* if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

### 25.7.522 salt.modules.wordpress

This module is used to manage Wordpress installations

**depends** wp binary from *http://wp-cli.org/*

**class** salt.modules.wordpress.Plugin(name, status, update, versino)

- **name**
  - Alias for field number 0
- **status**
  - Alias for field number 1
- **update**
  - Alias for field number 2
- **versino**
  - Alias for field number 3

salt.modules.wordpress.activate(name, path, user)

Activate a wordpress plugin

**name** Wordpress plugin name

**path** path to wordpress install location

**user** user to run the command as

CLI Example:
salt '...' wordpress.activate HyperDB /var/www/html apache

salt.modules.wordpress.deactivate(name, path, user)
Deactivate a wordpress plugin
name  Wordpress plugin name
path  path to wordpress install location
user  user to run the command as
CLI Example:
salt '...' wordpress.deactivate HyperDB /var/www/html apache

salt.modules.wordpress.install(path, user, admin_user, admin_password, admin_email, title, url)
Run the initial setup functions for a wordpress install
path  path to wordpress install location
user  user to run the command as
admin_user  Username for the Administrative user for the wordpress install
admin_password  Initial Password for the Administrative user for the wordpress install
admin_email  Email for the Administrative user for the wordpress install
title  Title of the wordpress website for the wordpress install
url  Url for the wordpress install
CLI Example:
salt '...' wordpress.install /var/www/html apache dwallace password123 → dwallace@example.com "Daniel's Awesome Blog" https://blog.dwallace.com

salt.modules.wordpress.is_installed(path, user=None)
Check if wordpress is installed and setup
path  path to wordpress install location
user  user to run the command as
CLI Example:
salt '...' wordpress.is_installed /var/www/html apache

salt.modules.wordpress.list_plugins(path, user)
List plugins in an installed wordpress path
path  path to wordpress install location
user  user to run the command as
CLI Example:
salt '...' wordpress.list_plugins /var/www/html apache

salt.modules.wordpress.show_plugin(name, path, user)
Show a plugin in a wordpress install and check if it is installed
name  Wordpress plugin name
path  path to wordpress install location
user  user to run the command as
CLI Example:
25.7.523 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

**depends** M2Crypto

Deprecated since version 3006.0.

**Warning:** This module has been deprecated and will be removed in Salt 3009 (Potassium). Please migrate to the replacement modules. For breaking changes between both versions, you can refer to the x509_v2 execution module docs.

They will become the default x509 modules in Salt 3008 (Argon). You can explicitly switch to the new modules before that release by setting features: {x509_v2: true} in your minion configuration.

```python
salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)
```

Create an X509 certificate.

**path:** Path to write the certificate to.

**text:** If True, return the PEM text without writing to a file. Default False.

**overwrite:** If True (default), create_certificate will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.

**kwargs:** Any of the properties below can be included as additional keyword arguments.

**ca_server:** Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See signing_policy for details. Also, the salt master must permit peers to call the sign_remote_certificate function.

Example:

```
/etc/salt/master.d/peer.conf
```

```
peer:
  .*:
    - x509.sign_remote_certificate
```

**subject properties:** Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

- **C:** 2 letter Country code
- **CN:** Certificate common name, typically the FQDN.
- **Email:** Email address
- **GN:** Given Name
- **L:** Locality
- **O:** Organization
- **OU:** Organization Unit
- **SN:** SurName
- **ST:** State or Province

**signing_private_key:** A path or string of the private key in PEM format that will be used to sign this certificate. If neither signing_cert, public_key, or csr are included, it will be assumed that this is a self-signed certificate, and the public key matching signing_private_key will be used to create the certificate.

**signing_private_key_passphrase:** Passphrase used to decrypt the signing_private_key.
**signing_cert**: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

**public_key**: The public key to be included in this certificate. This can be sourced from a public key, certificate, CSR or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your public_key and only the public key will be sent across the network to the CA. If neither public_key or csr are specified, it will be assumed that this is a self-signed certificate, and the public key derived from signing_private_key will be used. Specify either public_key or csr, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

**public_key_passphrase**: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

**csr**: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

**basicConstraints**: X509v3 Basic Constraints extension.

**extensions**: The following arguments set X509v3 Extension values. If the value starts with critical, the extension will be marked as critical.

Some special extensions are subjectKeyIdentifier and authorityKeyIdentifier.

- subjectKeyIdentifier can be an explicit value or it can be the special string hash. hash will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

- authorityKeyIdentifier Use values acceptable to the openssl CLI tools. This will automatically populate authorityKeyIdentifier with the subjectKeyIdentifier of signing_cert. If this is a self-signed cert these values will be the same.

**basicConstraints**: X509v3 Basic Constraints

**keyUsage**: X509v3 Key Usage

**extendedKeyUsage**: X509v3 Extended Key Usage

**subjectKeyIdentifier**: X509v3 Subject Key Identifier

**issuerAltName**: X509v3 Issuer Alternative Name

**subjectAltName**: X509v3 Subject Alternative Name

**crlDistributionPoints**: X509v3 CRL Distribution Points

**issuingDistributionPoint**: X509v3 Issuing Distribution Point

**certificatePolicies**: X509v3 Certificate Policies

**policyConstraints**: X509v3 Policy Constraints

**inhibitAnyPolicy**: X509v3 Inhibit Any Policy

**nameConstraints**: X509v3 Name Constraints

**noCheck**: X509v3 OCSP No Check

**nsComment**: Netscape Comment

**nsCertType**: Netscape Certificate Type

**days_valid**: The number of days this certificate should be valid. This sets the notAfter property of the certificate. Defaults to 365.

**version**: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so version=3 sets the certificate version field to 0x2.

**serial_number**: The serial number to assign to this certificate. If omitted a random serial number of size serial_bits is generated.

**serial_bits**: The number of bits to use when randomly generating a serial number. Defaults to 64.

**algorithm**: The hashing algorithm to be used for signing this certificate. Defaults to sha256.

**copypath**: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.
prepend_cn: If set to True, the CN and a dash will be prepended to the copypath's filename.
Example: /etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt

signing_policy: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a YAML formatted list of arguments which will override any arguments passed to this function. If the minions key is included in the signing policy, only minions matching that pattern (see match.glob and match.compound) will be permitted to remotely request certificates from that policy. In order to match.compound to work salt master must peers permit peers to call it.

Example:
/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - match.compound
```

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with signing_policy=www

not_before: Initial validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.
New in version 3001.

not_after: Final validity date for the certificate. This date must be specified in the format '%Y-%m-%d %H:%M:%S'.
New in version 3001.

CLI Example:
```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key="/etc/pki/myca.key" csr="/etc/pki/myca.csr"
```

salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, signing_private_key_passphrase=None, signing_cert=None, revoked=None, include_expired=False, days_valid=100, digest="")

Create a CRL

Depends

- PyOpenSSL Python module

path: Path to write the CRL to.
text: If True, return the PEM text without writing to a file. Default False.
signing_private_key: A path or string of the private key in PEM format that will be used to sign the CRL. This is required.
Salt Documentation, Release 3006.4

signing_private_key_passphrase: Passphrase to decrypt the private key.
signing_cert: A certificate matching the private key that will be used to sign the CRL. This is required.
revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A
dict must contain either the key serial_number with the value of the serial number to revoke, or
certificate with either the PEM encoded text of the certificate, or a path to the certificate to revoke.
The dict can optionally contain the revocation_date key. If this key is omitted the revocation date
will be set to now. If should be a string in the format ”%Y-%m-%d %H:%M:%S”.
The dict can also optionally contain the not_after key. This is redundant if the certificate
key is included. If the Certificate key is not included, this can be used for the logic behind the
include_expired parameter. If should be a string in the format ”%Y-%m-%d %H:%M:%S”.
The dict can also optionally contain the reason key. This is the reason code for the revocation. Available choices are unspecified, keyCompromise, CACompromise, affiliationChanged,
superseded, cessationOfOperation and certificateHold.
include_expired: Include expired certificates in the CRL. Default is False.
days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.
digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14
CLI Example:
salt '*' x509.create_crl path=/etc/pki/mykey.key \
signing_private_key=/etc/pki/ca.key \
signing_cert=/etc/pki/ca.crt \
revoked="{'compromized-web-key': {'certificate': '/etc/pki/certs/www1.crt
,→', 'revocation_date': '2015-03-01 00:00:00'}}"

salt.modules.x509.create_csr(path=None, text=False, **kwargs)
Create a certificate signing request.
path: Path to write the certificate to.
text: If True, return the PEM text without writing to a file. Default False.
algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.
kwargs: The subject, extension and version arguments from x509.create_certificate can be used.
CLI Example:
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN=
,→'My Cert'

salt.modules.x509.create_private_key(path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True)
Creates a private key in PEM format.
path: The path to write the file to, either path or text are required.
text: If True, return the PEM text without writing to a file. Default False.
bits: Length of the private key in bits. Default 2048
passphrase: Passphrase for encrypting the private key
cipher: Cipher for encrypting the private key. Has no effect if passphrase is None.
verbose: Provide visual feedback on stdout. Default True
New in version 2016.11.0.
CLI Example:
salt '*' x509.create_private_key path=/etc/pki/mykey.key

salt.modules.x509.expired(certificate)
Returns a dict containing limited details of a certificate and whether the certificate has expired.
New in version 2016.11.0.

25.7. execution modules

3119


**Certificate Module Documentation**

- **certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.
  
  CLI Example:
  ```
salt '*' x509.expired "/etc/pki/mycert.crt"
  ```

- **salt.modules.x509.get_pem_entries(glob_path)**
  Returns a dict containing PEM entries in files matching a glob
  
  **glob_path**: A path to certificates to be read and returned.
  
  CLI Example:
  ```
salt '*' x509.get_pem_entries "/etc/pki/.*.crt"
  ```

- **salt.modules.x509.get_pem_entry(text, pem_type=None)**
  Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues
  
  **text**: Text containing the X509 PEM entry to be returned or path to a file containing the text.
  
  **pem_type**: If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.
  
  CLI Example:
  ```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI.. →
              ----END CERTIFICATE REQUEST"
  ```

- **salt.modules.x509.get_private_key_size(private_key, passphrase=None)**
  Returns the bit length of a private key in PEM format.
  
  **private_key**: A path or PEM encoded string containing a private key.
  
  CLI Example:
  ```
salt '*' x509.get_private_key_size "/etc/pki/mycert.key"
  ```

- **salt.modules.x509.get_public_key(key, passphrase=None, asObj=False)**
  Returns a string containing the public key in PEM format.
  
  **key**: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.
  
  CLI Example:
  ```
salt '*' x509.get_public_key "/etc/pki/mycert.cer"
  ```

- **salt.modules.x509.get_signing_policy(signing_policy_name)**
  Returns the details of a names signing policy, including the text of the public key that will be used to sign it.
  
  Does not return the private key.
  
  CLI Example:
  ```
salt '*' x509.get_signing_policy www
  ```

- **salt.modules.x509.read_certificate(certificate)**
  Returns a dict containing details of a certificate. Input can be a PEM string or file path.
  
  **certificate**: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.
  
  CLI Example:
  ```
salt '*' x509.read_certificate "/etc/pki/mycert.crt"
  ```

- **salt.modules.x509.read_certificates(glob_path)**
  Returns a dict containing details of all certificates matching a glob
  
  **glob_path**: A path to certificates to be read and returned.
CLI Example:

```shell
salt '*' x509.read_certificates "/etc/pki/*/crt"
```

salt.modules.x509.read_crl(crl)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

- **Depends**
  - OpenSSL command line tool

crl: A path or PEM encoded string containing the CRL to read.

CLI Example:

```shell
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

salt.modules.x509.read_csr(csr)

Returns a dict containing details of a certificate request.

- **Depends**
  - OpenSSL command line tool

csr: A path or PEM encoded string containing the CSR to read.

CLI Example:

```shell
salt '*' x509.read_csr /etc/pki/mycert.csr
```

salt.modules.x509.sign_remote_certificate(argdic, **kwargs)

Request a certificate to be remotely signed according to a signing policy.

- **argdic**:
  - A dict containing all the arguments to be passed into the create_certificate function. This will become `kwargs` when passed to `create_certificate`.

- **kwargs**:
  - kwargs delivered from `publish.publish`

CLI Example:

```shell
salt '*' x509.sign_remote_certificate argdic="{'public_key': '/etc/pki/www.key',  
    'signing_policy': 'www'}" __pub_id='www1'
```

salt.modules.x509.verify_crl(crl, cert)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl: The CRL to verify

cert: The certificate to verify the CRL against

CLI Example:

```shell
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)

Verify that 'private_key' matches 'public_key'

- **private_key**: The private key to verify, can be a string or path to a private key in PEM format.

- **public_key**: The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or another private key.

- **passphrase**: Passphrase to decrypt the private key.

CLI Example:

```shell
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key  
    public_key=/etc/pki/myca.crt
```
salt.modules.x509.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)

Verify that certificate has been signed by signing_pub_key

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.
signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, CSR, or private key.
signing_pub_key_passphrase: Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:
```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
    signing_pub_key=/etc/pki/myca.crt
```

salt.modules.x509.will_expire(certificate, days)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.
certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:
```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

salt.modules.x509.write_pem(text, path, overwrite=True, pem_type=None)

Writes out a PEM string fixing any formatting or whitespace issues before writing.
text: PEM string input to be written out.
path: Path of the file to write the PEM out to.
overwrite: If True (default), write_pem will overwrite the entire PEM file. Set False to preserve existing private keys and dh params that may exist in the PEM file.
pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

CLI Example:
```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```

25.7.524 salt.modules.x509_v2

Manage X.509 certificates

depends cryptography

New in version 3006.0: This module represents a complete rewrite of the original x509 modules and is named x509_v2 since it introduces breaking changes.

Note:

- PKCS12-related operations require at least cryptography release 36.
- PKCS12-related operations with Edwards-curve keys require at least cryptography release 37.
- PKCS7-related operations require at least cryptography release 37.
Configuration

Explicit activation

Since this module uses the same virtualname as the previous x509 modules, but is incompatible with them, it needs to be explicitly activated on each minion by including the following line in the minion configuration:

```
# /etc/salt/minion.d/x509.conf
features:
  x509_v2: true
```

Peer communication

To be able to remotely sign certificates, it is required to configure the Salt master to allow Peer Communication:

```
# /etc/salt/master.d/peer.conf
peer:
  .*:
    - x509.sign_remote_certificate
```

In order for the Compound Matcher to work with restricting signing policies to a subset of minions, in addition calls to `match.compound` by the minion acting as the CA must be permitted:

```
# /etc/salt/master.d/peer.conf
peer:
  .*:
    - x509.sign_remote_certificate
  ca_server:
    - match.compound
```

Note: Compound matching in signing policies currently has security tradeoffs since the CA server queries the requesting minion itself if it matches, not the Salt master. It is recommended to rely on glob matching only.

Signing policies

In addition, the minion representing the CA needs to have at least one signing policy configured, remote calls not referencing one are always rejected.

The parameters specified in this signing policy override any parameters passed from the minion requesting the certificate. It can be configured in the CA minion’s pillar, which takes precedence, or any location `config.get` looks up in. Signing policies are defined under `x509_signing_policies`.

You can restrict which minions can request a certificate under a configured signing policy by specifying a matcher in minions. This can be a glob or compound matcher (for the latter, see the notes above).

```
x509_signing_policies:
  www:
```

(continues on next page)
- **minions**: `'www*'`
- **signing_private_key**: `/etc/pki/ca.key`
- **signing_cert**: `/etc/pki/ca.crt`
- **C**: US
- **ST**: Utah
- **L**: Salt Lake City
- **basicConstraints**: "critical, CA:false"
- **keyUsage**: "critical, cRLSign, keyCertSign"
- **subjectKeyIdentifier**: hash
- **authorityKeyIdentifier**: keyid,issuer:always
- **days_valid**: 90
- **copypath**: `/etc/pki/issued_certs/`

**Note:** The following semantics are applied regarding the order of preference for specifying the subject name:

- If neither **subject** nor any name attributes (like CN) are part of the policy, issued certificates can contain any requested ones.
- If any name attributes are specified in the signing policy, **subject** contained in requests is ignored.
- If **subject** is specified in the signing policy, any name attributes are ignored. If the request contains the same data type for **subject** as the signing policy (for dicts and lists, and only then), merging is performed, otherwise **subject** is taken from the signing policy. Dicts are merged and list items are appended, with the items taken from the signing policy having priority.

**Breaking changes versus the previous x509 modules**

- The output format has changed for all `read_*` functions as well as the state return dict.
- The formatting of some extension definitions might have changed, but should be stable for most basic use cases.
- The default ordering of RDNs/Name Attributes in the subject's Distinguished Name has been adapted to industry standards. This might cause a reissuance during the first state run.
- For `x509.private_key_managed`, the file mode defaults to 0400. This should be considered a bug fix because writing private keys with world-readable permissions by default is a security issue.

Note that when a **ca_server** is involved, both peers must use the updated module version.

```python
salt.modules.x509_v2.create_certificate(ca_server=None, signing_policy=None, encoding='pem', append_certs=None, pkcs12_passphrase=None, pkcs12_encryption_compat=False, pkcs12_friendlyname=None, path=None, overwrite=True, raw=False, **kwargs)
```

Create an X.509 certificate and return an encoded version of it.

**Note:** All parameters that take a public key, private key or certificate can be specified either as a PEM/hex/base64 string or a path to a local file encoded in all supported formats for the type.

**CLI Example:**
ca_server: Request a remotely signed certificate from ca_server. For this to work, a signing_policy must be specified, and that same policy must be configured on the ca_server. See Signing policies for details. Also, the Salt master must permit peers to call the sign_remote_certificate function, see Peer communication.

signing_policy: The name of a configured signing policy. Parameters specified in there are hardcoded and cannot be overridden. This is required for remote signing, otherwise optional. See Signing policies for details.

encoding: Specify the encoding of the resulting certificate. It can be returned as a pem (or pkcs7_pem) string or several (base64-encoded) binary formats (der, pkcs7_der, pkcs12). Defaults to pem.

append_certs: A list of additional certificates to append to the new one, e.g. to create a CA chain.

Note: Mind that when der encoding is in use, appending certificatees is prohibited.

copy_path: Create a copy of the issued certificate in PEM format in this directory. The file will be named <serial_number>.crt if prepend_cn is False.

prepend_cn: When copy_path is set, prepend the common name of the certificate to the file name like so: <CN>-<serial_number>.crt. Defaults to false.

pkcs12_passphrase: When encoding a certificate as pkcs12, encrypt it with this passphrase.

Note: PKCS12 encryption is very weak and should not be relied on for security.

pkcs12_encryption_compat: OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

pkcs12_friendlyname: When encoding a certificate as pkcs12, a name for the certificate can be included.

path: Instead of returning the certificate, write it to this file path.

overwrite: If path is specified and the file exists, do not overwrite it. Defaults to false.

raw: Return the encoded raw bytes instead of a string. Defaults to false.

digest: The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to sha256. This will be ignored for ed25519 and ed448 key types.

private_key: The private key corresponding to the public key the certificate should be issued for. This is one way of specifying the public key that will be included in the certificate, the other ones being public_key and csr.

private_key_passphrase: If private_key is specified and encrypted, the passphrase to decrypt it.

public_key: The public key the certificate should be issued for. Other ways of passing the required information are public_key and csr. If neither are set, the public key of the signing_private_key will be included, i.e. a self-signed certificate is generated.

csr: A certificate signing request to use as a base for generating the certificate. The following information will be respected, depending on configuration: * public key * extensions, if not otherwise specified (arguments, signing_policy)

signing_cert: The CA certificate to be used for signing the issued certificate.

signing_private_key: The private key corresponding to the public key in signing_cert. Required.

signing_private_key_passphrase: If signing_private_key is encrypted, the passphrase to decrypt it.

serial_number: A serial number to be embedded in the certificate. If unspecified, will autogenerate one. This should be an integer, either in decimal or hexadecimal notation.

not_before: Set a specific date the certificate should not be valid before. The format should follow %Y-%m-%d %H:%M:%S and will be interpreted as GMT/UTC. Defaults to the time of issuance.

not_after: Set a specific date the certificate should not be valid after. The format should follow %Y-%m-%d
%H:%M:%S and will be interpreted as GMT/UTC. If unspecified, defaults to the current time plus days_valid days.

days_valid If not_after is unspecified, the number of days from the time of issuance the certificate should be valid for. Defaults to 30.

subject The subject's distinguished name embedded in the certificate. This is one way of passing this information (see kwargs below for the other). This argument will be preferred and allows to control the order of RDNs in the DN as well as to embed RDNs with multiple attributes. This can be specified as an RFC4514-encoded string (CN=example.com,O=Example Inc,C=US, mind that the rendered order is reversed from what is embedded), a list of RDNs encoded as in RFC4514 (["C=US", "O=Example Inc", "CN=example.com"] or a dictionary ({"CN": "example.com", "C": "US", "O": "Example Inc"}), default ordering). Multiple name attributes per RDN are concatenated with a +.

**Note:** Parsing of RFC4514 strings requires at least cryptography release 37.

**kwargs** Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See the following for an overview.

**Subject properties in kwargs** C, ST, L, STREET, O, OU, CN, MAIL, SN, GN, UID, SERIALNUMBER

**X.509v3 extensions in kwargs** Most extensions can be configured using the same string format as OpenSSL, while some require adjustments. In general, since the strings are parsed to dicts/lists, you can always use the latter formats directly. Marking an extension as critical is done by including it at the beginning of the configuration string, in the list or as a key in the dictionary with the value true.

Examples (some showcase dict/list correspondence):

```python
basicConstraints critical, CA:TRUE, pathlen:1 or

- basicConstraints:
  - critical: true
  - ca: true
  - pathlen: 1

keyUsage critical, cRLSign, keyCertSign or

- keyUsage:
  - critical
  - cRLSign
  - keyCertSign

subjectKeyIdentifier This can be an explicit value or hash, in which case the value will be set to the SHA1 hash of some encoding of the associated public key, depending on the underlying algorithm (RSA/ECDSA/EdDSA).

authorityKeyIdentifier keyid:always, issuer

subjectAltName There is support for all OpenSSL-defined types except otherName.

email:me@example.com,DNS:example.com or

# mind this being a list, not a dict

- subjectAltName:
  - email:me@example.com
  - DNS:example.com

issuerAltName The syntax is the same as for subjectAltName, except that the additional value issuer:copy is supported, which will copy the values of subjectAltName in the issuer's certificate.

authorityInfoAccess OCSP;URI:http://ocsp.example.com/,caIssuers;URI:http://myca.example.com/ca.cer

crlDistributionPoints When set to a string value, items are interpreted as fullnames:
There is also support for more attributes using the full form:

\[
\begin{aligned}
- \text{crlDistributionPoints:} \\
&- \text{fullname: URI:http://example.com/myca.crl} \\
&\text{crlissuer: DNS:example.org} \\
&\text{reasons:} \\
&- \text{keyCompromise} \\
&- \text{URI:http://example.org/my.crl}
\end{aligned}
\]

\[\text{crlDistributionPoints}\]

\[\text{certificatePolicies}\] critical, 1.2.4.5, 1.1.3.4

Again, there is support for more attributes using the full form:

\[
\begin{aligned}
- \text{certificatePolicies:} \\
&\text{critical: true} \\
&1.2.3.4.5: https://my.ca.com/practice_statement \\
&1.2.4.5.6: \\
&- https://my.ca.com/practice_statement \\
&\text{organization: myorg} \\
&\text{noticeNumbers: } [1, 2, 3] \\
&\text{text: mytext}
\end{aligned}
\]

\[\text{certificatePolicies}\]

\[\text{policyConstraints}\] requireExplicitPolicy:3,inhibitPolicyMapping:1

\[\text{inhibitAnyPolicy}\] The value is just an integer: - inhibitAnyPolicy: 1

\[\text{nameConstraints}\] critical,permitted;IP:192.168.0.0/255.255.0.0,permitted;email:.example.com,excluded;email:.com

\[\text{nameConstraints}\]

\[\text{noCheck}\] This extension does not take any values, except critical. Just the presence in the keyword args will include it.

\[\text{tlsfeature}\] status_request

For more information, visit the OpenSSL docs.

\[\text{salt.modules.x509_v2.create_crl}\]

Create a certificate revocation list.

CLI Example:

```
salt '*' x509.create_crl signing_cert=/etc/pki/ca.crt signing_private_key=/etc/pki/ca.key revoked="[['certificate': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-01 00:00:00']]"
```

\[\text{signing_private_key}\] Your certificate authority’s private key. It will be used to sign the CRL. Required.

\[\text{revoked}\] A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key serial_number with the value of the serial number to revoke, or certificate with some reference to the certificate to revoke.

The dict can optionally contain the revocation_date key. If this key is omitted, the revocation date will be set to now. It should be a string in the format "%Y-%m-%d %H:%M:%S".
The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included, since it will be sourced from the certificate. If the `certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. It should be a string in the format "%Y-%m-%d %H:%M:%S".

The dict can also optionally contain the `extensions` key, which allows to set CRL entry-specific extensions. The following extensions are supported:

- **certificateIssuer** Identifies the certificate issuer associated with an entry in an indirect CRL. The format is the same as for `subjectAltName`.
- **CRLReason** Identifies the reason for certificate revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation`, `certificateHold`, `privilegeWithdrawn`, `aACompromise` and `removeFromCRL`.
- **invalidityDate** Provides the date on which the certificate likely became invalid. The value should be a string in the same format as `revocation_date`.
- **signing_cert** The CA certificate to be used for signing the CRL.
- **signing_private_key_passphrase** If `signing_private_key` is encrypted, the passphrase to decrypt it.
- **include_expired** Also include already expired certificates in the CRL. Defaults to false.
- **days_valid** The number of days the CRL should be valid for. This sets the `Next Update` field. Defaults to 100 (until v3009) or 7 (from v3009 onwards).
- **digest** The hashing algorithm to use for the signature. Valid values are: `sha1`, `sha224`, `sha256`, `sha384`, `sha512`, `sha512_224`, `sha512_256`, `sha3_224`, `sha3_256`, `sha3_384`, `sha3_512`. Defaults to `sha256`. This will be ignored for `ed25519` and `ed448` key types.
- **encoding** Specify the encoding of the resulting certificate revocation list. It can be returned as a `pem` string or `base64-encoded` der. Defaults to `pem`.
- **extensions** Add CRL extensions. The following are available:
  - **authorityKeyIdentifier** See `x509.create_certificate`.
  - **authorityInfoAccess** See `x509.create_certificate`.
  - **cRLNumber** Specifies a sequential number for each CRL issued by a CA. Values must be integers.
  - **deltaCRLIndicator** If the CRL is a delta CRL, this value points to the cRLNumber of the base CRL. Values must be integers.
  - **freshestCRL** Identifies how delta CRL information is obtained. The format is the same as `crlDistributionPoints`.
  - **issuerAltName** See `x509.create_certificate`.
  - **issuingDistributionPoint** Identifies the CRL distribution point for a particular CRL and indicates what kinds of revocation it covers. The format is comparable to `crlDistributionPoints`. Specify as follows:

```
issuingDistributionPoint:
    fullname: # or relativename with RDN
    - URI:http://example.com/myca.crl
    onlySomereasons:
    - keyCompromise
    onlyuser: true
    onlyCA: true
    onlyAA: true
    indirectCRL: false
```

- **path** Instead of returning the CRL, write it to this file path.
- **raw** Return the encoded raw bytes instead of a string. Defaults to false.

```
salt.modules.x509_v2.create_csr(private_key, private_key_passphrase=None, digest='sha256', encoding='pem', path=None, raw=False, **kwargs)
```

Create a certificate signing request.

CLI Example:
salt '*' x509.create_csr private_key='/etc/pki/myca.key' CN='My Cert'

**private_key**  The private key corresponding to the public key the certificate should be issued for. The CSR will be signed by it. Required.

**private_key_passphrase**  If **private_key** is encrypted, the passphrase to decrypt it.

**digest**  The hashing algorithm to use for the signature. Valid values are: sha1, sha224, sha256, sha384, sha512, sha512_224, sha512_256, sha3_224, sha3_256, sha3_384, sha3_512. Defaults to sha256. This will be ignored for ed25519 and ed448 key types.

**encoding**  Specify the encoding of the resulting certificate signing request. It can be returned as a pem string or base64-encoded der. Defaults to pem.

**path**  Instead of returning the CSR, write it to this file path.

**raw**  Return the encoded raw bytes instead of a string. Defaults to false.

**kwargs**  Embedded X.509v3 extensions and the subject's distinguished name can be controlled via supplemental keyword arguments. See `x509.create_certificate` for an overview. Mind that some extensions are not available for CSR (authorityInfoAccess, authorityKeyIdentifier, issuerAltName, crlDistributionPoints).

salt.modules.x509_v2.create_private_key(*algo='rsa', keysize=None, passphrase=None, encoding='pem', pkcs12_encryption_compat=False, path=None, raw=False, **kwargs*)

Create a private key.

CLI Example:

```
salt '*' x509.create_private_key algo='ec' keysize=384
```

**algo**  The digital signature scheme the private key should be based on. Available: rsa, ec, ed25519, ed448. Defaults to rsa.

**keysize**  For rsa, specifies the bitlength of the private key (2048, 3072, 4096). For ec, specifies the NIST curve to use (256, 384, 521). Irrelevant for Edwards-curve schemes (ed25519, ed448). Defaults to 2048 for RSA and 256 for EC.

**passphrase**  If this is specified, the private key will be encrypted using this passphrase. The encryption algorithm cannot be selected, it will be determined automatically as the best available one.

**encoding**  Specify the encoding of the resulting private key. It can be returned as a pem string, base64-encoded der or base64-encoded pkcs12. Defaults to pem.

**pkcs12_encryption_compat**  Some operating systems are incompatible with the encryption defaults for PKCS12 used since OpenSSL v3. This switch triggers a fallback to PBESv1SHA1And3KeyTripleDESCBC. Please consider the notes on PKCS12 encryption.

**path**  Instead of returning the private key, write it to this file path. Note that this does not use safe permissions and should be avoided.

**raw**  Return the encoded raw bytes instead of a string. Defaults to false.

salt.modules.x509_v2.encode_certificate(*certificate, encoding='pem', append_certs=None, private_key=None, private_key_passphrase=None, pkcs12_passphrase=None, pkcs12_encryption_compat=False, pkcs12_friendlyname=None, raw=False*)

Create an encoded representation of a certificate, optionally including other structures. This can be used to create certificate chains, convert a certificate into a different encoding or embed the corresponding private key (for pkcs12).

CLI Example:

```
salt '*' x509.encode_certificate /etc/pki/my.crt pem /etc/pki/ca.crt
```

**certificate**  The certificate to encode.

---

25.7. execution modules
**encoding** Specify the encoding of the resulting certificate. It can be returned as a **pem** (or **pkcs7_pem**) string or several (base64-encoded) binary formats (**der**, **pkcs7_der**, **pkcs12**). Defaults to **pem**.

**append_certs** A list of additional certificates to encode with the new one, e.g. to create a CA chain.

---

**Note:** Mind that when **der** encoding is in use, appending certificates is prohibited.

**private_key** For **pkcs12**, the private key corresponding to the public key of the certificate to be embedded.

**private_key_passphrase** For **pkcs12**, if the private key to embed is encrypted, specify the corresponding passphrase.

**pkcs12_passphrase** For **pkcs12**, the container can be encrypted. Specify the passphrase to use here. Mind that PKCS12 encryption should not be relied on for security purposes, see note above in x509.

**pkcs12_encryption_compat** OpenSSL 3 and cryptography v37 switched to a much more secure default encryption for PKCS12, which might be incompatible with some systems. This forces the legacy encryption. Defaults to False.

**pkcs12_friendlyname** When encoding a certificate as **pkcs12**, a name for the certificate can be included.

**raw** Return the encoded raw bytes instead of a string. Defaults to false.

**salt.modules.x509_v2.encode_crl(crl, encoding='pem', raw=False)**

Create an encoded representation of a certificate revocation list.

CLI Example:

```
salt '*' x509.encode_crl /etc/pki/my.crl der
```

crl The certificate revocation list to encode.

**encoding** Specify the encoding of the resulting certificate revocation list. It can be returned as a **pem** string or base64-encoded **der**. Defaults to **pem**.

**raw** Return the encoded raw bytes instead of a string. Defaults to false.

**salt.modules.x509_v2.encode_csr(csr, encoding='pem', raw=False)**

Create an encoded representation of a certificate signing request.

CLI Example:

```
salt '*' x509.encode_csr /etc/pki/my.csr der
```

csr The certificate signing request to encode.

**encoding** Specify the encoding of the resulting certificate signing request. It can be returned as a **pem** string or base64-encoded **der**. Defaults to **pem**.

**raw** Return the encoded raw bytes instead of a string. Defaults to false.

**salt.modules.x509_v2.encode_private_key(private_key, encoding='pem', passphrase=None, pkcs12_encryption_compat=False, raw=False)**

Create an encoded representation of a private key.

CLI Example:

```
salt '*' x509.encode_private_key /etc/pki/my.key der
```

csr The private key to encode.

**encoding** Specify the encoding of the resulting private key. It can be returned as a **pem** string, base64-encoded **der** and base64-encoded **pkcs12**. Defaults to **pem**.

**raw** Return the encoded raw bytes instead of a string. Defaults to false.

**salt.modules.x509_v2.expired(certificate)**

Returns a dict containing limited details of a certificate and whether the certificate has expired.
CLI Example:
```
salt '*' x509.expired /etc/pki/mycert.crt
```

certificate  The certificate to check.

salt.modules.x509_v2.expires(certificate, days=0)
Determine whether a certificate will expire or has expired already. Returns a boolean only.

CLI Example:
```
salt '*' x509.expires /etc/pki/my.crt days=7
```

certificate  The certificate to check.
days  If specified, determine expiration x days in the future. Defaults to 0, which checks for the current time.

salt.modules.x509_v2.get_pem_entries(glob_path)
Returns a dict containing PEM entries in files matching a glob.

CLI Example:
```
salt '*' x509.get_pem_entries */etc/pki/*.crt"
```

glob_path  A path representing certificates to be read and returned.

salt.modules.x509_v2.get_pem_entry(text, pem_type=None)
Returns a properly formatted PEM string from the input text, fixing any whitespace or line-break issues.

CLI Example:
```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI..
→,-----END CERTIFICATE REQUEST"
```

text  Text containing the X509 PEM entry to be returned or path to a file containing the text.
pem_type  If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

salt.modules.x509_v2.get_private_key_size(private_key, passphrase=None)
Return information about the keysize of a private key (RSA/EC).

CLI Example:
```
salt '*' x509.get_private_key_size /etc/pki/my.key
```

private_key  The private key to check.
passphrase  If private_key is encrypted, the passphrase to decrypt it.

salt.modules.x509_v2.get_public_key(key, passphrase=None, asObj=None)
Returns a PEM-encoded public key derived from some reference. The reference should be a public key, certificate, private key or CSR.

CLI Example:
```
salt '*' x509.get_public_key /etc/pki/my.key
```

key  A reference to the structure to look the public key up for.
passphrase  If key is encrypted, the passphrase to decrypt it.

salt.modules.x509_v2.get_signing_policy(signing_policy, ca_server=None)
Returns the specified named signing policy.

CLI Example:
salt '*' x509.get_signing_policy www

signing_policy  The name of the signing policy to return.
ca_server     If this is set, the CA server will be queried for the signing policy instead of looking it up locally.

salt.modules.x509_v2.read_certificate(certificate)
Returns a dict containing details of a certificate.

   CLI Example:

   salt '*' x509.read_certificate /etc/pki/mycert.crt

certificate  The certificate to read.

salt.modules.x509_v2.read_certificates(glob_path)
Returns a dict containing details of all certificates matching a glob.

   CLI Example:

   salt '*' x509.read_certificates "/etc/pki/*.crt"

glob_path  A path to certificates to be read and returned.

salt.modules.x509_v2.read_crl(crl)
Returns a dict containing details of a certificate revocation list.

   CLI Example:

   salt '*' x509.read_crl /etc/pki/my.crl
crl  The certificate revocation list to read.

salt.modules.x509_v2.read_csr(csr)
Returns a dict containing details of a certificate signing request.

   CLI Example:

   salt '*' x509.read_csr /etc/pki/mycert.csr
csr  The certificate signing request to read.

salt.modules.x509_v2.sign_remote_certificate(signing_policy,
   get_signing_policy_only=False,
   **more_kwargs)
Request a certificate to be remotely signed according to a signing policy. This is mostly for internal use and does not make much sense on the CLI.

   CLI Example:

   salt '*' x509.sign_remote_certificate www kwargs="\{'public_key': '/etc/pki/www.key\}"

   signing_policy  The name of the signing policy to use. Required.
   kwargs  A dict containing all the arguments to be passed into the x509.create_certificate function.
   get_signing_policy_only  Only return the named signing policy. Defaults to false.

salt.modules.x509_v2.verify_crl(crl, cert)
Verify that a signature on a certificate revocation list was made by the private key corresponding to the public key associated with the specified certificate.

   CLI Example:
The certificate revocation list to check the signature on.
cert The certificate (or any reference that can be passed to get_public_key) to retrieve the public key from.

```
salt '*' x509.verify_crl /etc/pki/my.crl /etc/pki/my.crt
```

x509.verify_crl /etc/pki/my.crl /etc/pki/my.crt

crl The certificate revocation list to check the signature on.
cert The certificate (or any reference that can be passed to get_public_key) to retrieve the public key from.

salt.modules.x509_v2.verify_private_key(private_key, public_key, passphrase=None)

Verify that a private key belongs to the specified public key.

```
salt '*' x509.verify_private_key /etc/pki/my.key /etc/pki/my.crt
```

```
private_key The private key to check.
public_key The certificate (or any reference that can be passed to get_public_key) to retrieve the public key from.
passphrase If private_key is encrypted, the passphrase to decrypt it.
```

```
salt.modules.x509_v2.verify_signature(certificate, signing_pub_key=None, signing_pub_key_passphrase=None)
```

Verify that a signature on a certificate was made by the private key corresponding to the public key associated with the specified certificate.

```
salt '*' x509.verify_signature /etc/pki/my.key /etc/pki/my.crt
```

```
certificate The certificate to check the signature on.
signing_pub_key Any reference that can be passed to get_public_key to retrieve the public key of the signing entity from. If unspecified, will take the public key of certificate, i.e. verify a self-signed certificate.

signing_pub_key_passphrase
If signing_pub_key is encrypted, the passphrase to decrypt it.
```

```
salt.modules.x509_v2.will_expire(certificate, days)
```

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days.

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

```
certificate The certificate to check.
days The number of days in the future to check the validity for.
```

```
salt.modules.x509_v2.write_pem(text, path, overwrite=True, pem_type=None)
```

Writes out a PEM string, fixing any formatting or whitespace issues before writing.

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/pki/mycert.crt
```

```
text PEM string input to be written out.
path Path of the file to write the PEM out to.
overwrite If True (default), write_pem will overwrite the entire PEM file. Set to False to preserve existing private keys and DH params that may exist in the PEM file.
```

25.7. execution modules 3133
pem_type The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple PEM types.

25.7.525 salt.modules.xapi_virt

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it will fail under those platforms. From what I’ve read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

- http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/
- https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python
- http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD

salt.modules.xapi_virt.freecpu()
Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.xapi_virt.freemem()
Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.xapi_virt.full_info()
Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.xapi_virt.get_disks(vm_)
Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

salt.modules.xapi_virt.get_macs(vm_)
Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

salt.modules.xapi_virt.get_nics(vm_)
Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```
salt.modules.xapi_virt.is_hyper()
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:
```
salt '*' virt.is_hyper
```

salt.modules.xapi_virt.list_domains()
Return a list of virtual machine names on the minion

CLI Example:
```
salt '*' virt.list_domains
```

salt.modules.xapi_virt.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)
Migrates the virtual machine to another hypervisor

CLI Example:
```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl] [change_home_server]
```

Optional values:
live Use live migration
port Use a specified port
node Use specified NUMA node on target
ssl Use ssl connection for migration
change_home_server change home server for managed domains

salt.modules.xapi_virt.node_info()
Return a dict with information about this node

CLI Example:
```
salt '*' virt.node_info
```

salt.modules.xapi_virt.pause(vm_)
Pause the named vm

CLI Example:
```
salt '*' virt.pause <vm name>
```

salt.modules.xapi_virt.reboot(vm_)
Reboot a domain via ACPI request

CLI Example:
```
salt '*' virt.reboot <vm name>
```

salt.modules.xapi_virt.reset(vm_)
Reset a VM by emulating the reset button on a physical machine

CLI Example:
```
salt '*' virt.reset <vm name>
```

salt.modules.xapi_virt.resume(vm_)
Resume the named vm
CLI Example:

```bash
salt '*' virt.resume <vm name>
```

```python
salt.modules.xapi_virt.setmem(vm_, memory)
Changes the amount of memory allocated to VM.
Memory is to be specified in MB
CLI Example:

```bash
salt '*' virt.setmem myvm 768
```

```python
salt.modules.xapi_virt.setvcpus(vm_, vcpus)
Changes the amount of vcpus allocated to VM.
vcpus is an int representing the number to be assigned
CLI Example:

```bash
salt '*' virt.setvcpus myvm 2
```

```python
salt.modules.xapi_virt.shutdown(vm_)
Send a soft shutdown signal to the named vm
CLI Example:

```bash
salt '*' virt.shutdown <vm name>
```

```python
salt.modules.xapi_virt.start(config_)
Start a defined domain
CLI Example:

```bash
salt '*' virt.start <path to Xen cfg file>
```

```python
salt.modules.xapi_virt.stop(vm_)
Hard power down the virtual machine, this is equivalent to pulling the power
CLI Example:

```bash
salt '*' virt.stop <vm name>
```

```python
salt.modules.xapi_virt.vcpu_pin(vm_, vcpu, cpus)
Set which CPUs a VCPU can use.
CLI Example:

```bash
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

```python
salt.modules.xapi_virt.vm_cputime(vm_=None)
Return cputime used by the vms on this hyper in a list of dicts:

```python
[
  
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },

  ...
]
```
If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

**CLI Example:**

```bash
salt '*' virt.vm_cputime
```

**salt.modules.xapi_virt.vm_diskstats**(vm=None)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```python
[
    'your-vm': {
        'io_read_kbs' : 0,
        'io_write_kbs' : 0,
        },
    ...]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

**CLI Example:**

```bash
salt '*' virt.vm_diskstats
```

**salt.modules.xapi_virt.vm_info**(vm=None)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

**CLI Example:**

```bash
salt '*' virt.vm_info
```

**salt.modules.xapi_virt.vm_netstats**(vm=None)

Return combined network counters used by the vms on this hyper in a list of dicts:

```python
[
    'your-vm': {
        'io_read_kbs' : 0,
        'io_total_read_kbs' : 0,
        'io_total_write_kbs' : 0,
        'io_write_kbs' : 0,
        },
    ...]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

**CLI Example:**

```bash
salt '*' virt.vm_netstats
```

**salt.modules.xapi_virt.vm_state**(vm=None)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.
25.7.526 salt.modules.xbpspkg

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

salt.modules.xbpspkg.add_repo(repo, conffile='/usr/share/xbps.d/15-saltstack.conf')
Add an XBPS repository to the system.

repo url of repo to add (persistent).
conffile path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

salt.modules.xbpspkg.available_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.del_repo(repo, **kwargs)

Remove an XBPS repository from the system.

repo url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

salt.modules.xbpspkg.get_repo(repo, **kwargs)

Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install the passed package

name The name of the package to be installed.
refresh Whether or not to refresh the package database before installing.
fromrepo Specify a package repository (url) to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```
Salt Documentation, Release 3006.4

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and
the values being the source URI or local path to the package.
CLI Example:
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
,→deb"}]'

Return a dict containing the new package names and versions:
{'<package>': {'old': '<old-version>',
'new': '<new-version>'}}

CLI Example:
salt '*' pkg.install <package name>

salt.modules.xbpspkg.latest_version(*names, **kwargs)
Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.
If the latest version of a given package is already installed, an empty string will be returned for that package.
CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

salt.modules.xbpspkg.list_pkgs(versions_as_list=False, **kwargs)
List the packages currently installed as a dict:
{'<package_name>': '<version>'}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.xbpspkg.list_repos(**kwargs)
List all repos known by XBPS
CLI Example:
salt '*' pkg.list_repos

salt.modules.xbpspkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages
CLI Example:
salt '*' pkg.list_upgrades

salt.modules.xbpspkg.refresh_db(**kwargs)
Update list of available packages from installed repos
CLI Example:
salt '*' pkg.refresh_db

salt.modules.xbpspkg.remove(name=None, pkgs=None, recursive=True, **kwargs)
name The name of the package to be deleted.
25.7. execution modules

3139


**recursive**  Also remove dependent packages (not required elsewhere). Default mode: enabled.

**Multiple Package Options:**

- **pkgs**  A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

  Returns a list containing the removed packages.

  **CLI Example:**

  ```
  salt '*' pkg.remove <package name> [recursive=False]
  salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
  salt '*' pkg.remove pkgs=['foo', 'bar'] [recursive=False]
  ```

```

**salt.modules.xbpspkg.upgrade** *(refresh=True, **kwargs)*

Run a full system upgrade

- **refresh**  Whether or not to refresh the package database before installing. Default is True.

  Returns a dictionary containing the changes:

  ```
  {'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
  ```

  **CLI Example:**

  ```
  salt '*' pkg.upgrade
  ```

```

**salt.modules.xbpspkg.upgrade_available** *(name, **kwargs)*

Check whether or not an upgrade is available for a given package

**CLI Example:**

```
salt '*' pkg.upgrade_available <package name>
```

```

**salt.modules.xbpspkg.version** *(names, **kwargs)*

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```
salt 'x' xfs.devices

salt.modules.xfs.dump(device, destination, level=0, label=None, noerase=None)
Dump filesystem device to the media (file, tape etc).

Required parameters:
- device: XFS device, content of which to be dumped.
- destination: Specifies a dump destination.

Valid options are:
- label: Label of the dump. Otherwise automatically generated label is used.
- level: Specifies a dump level of 0 to 9.
- noerase: Pre-erase media.

Other options are not used in order to let xfsdump use its default values, as they are most optimal. See the xfsdump(8) manpage for a more complete description of these options.

CLI Example:
```bash
salt '*' xfs.dump /dev/sda1 /destination/on/the/client
salt '*' xfs.dump /dev/sda1 /destination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /destination/on/the/client noerase=True
```

salt.modules.xfs.estimate(path)
Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:
```bash
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.info(device)
Get filesystem geometry information.

CLI Example:
```bash
salt '*' xfs.info /dev/sda1
```

salt.modules.xfs.inventory()
Display XFS dump inventory without restoration.

CLI Example:
```bash
salt '*' xfs.inventory
```

salt.modules.xfs.mkfs(device, label=None, ssize=None, noforce=None, bso=None, gmo=None, ino=None, lso=None, rso=None, nmo=None, dso=None)
Create a file system on the specified device. By default wipes out with force.

General options:
- label: Specify volume label.
- ssize: Specify the fundamental sector size of the filesystem.
- noforce: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:
- bso: Block size options.
- gmo: Global metadata options.
- dso: Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.
- ino: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.

25.7. execution modules
• **Is so**: Log section options.
• **nno**: Naming options.
• **rsso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```bash
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' nsoforce=force
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

**salt.modules.xfs.modify** *(device, label=None, lazy_counting=None, uuid=None)*

Modify parameters of an XFS filesystem.

CLI Example:

```bash
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

**salt.modules.xfs.prune_dump** *(sessionid)*

Prunes the dump session identified by the given session id.

CLI Example:

```bash
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

### 25.7.528 salt.modules.xml

XML file manager

New in version 3000.

**salt.modules.xml.get_attribute** *(file, element)*

Return the attributes of the matched xpath element.

CLI Example:

```bash
salt '*' xml.get_attribute /tmp/test.xml ".//element[@id='3']"
```

**salt.modules.xml.get_value** *(file, element)*

Returns the value of the matched xpath element

CLI Example:

```bash
salt '*' xml.get_value /tmp/test.xml ".//element"
```

**salt.modules.xml.set_attribute** *(file, element, key, value)*

Set the requested attribute key and value for matched xpath element.

CLI Example:

```bash
salt '*' xml.set_attribute /tmp/test.xml ".//element[@id='3']" editedby "gal"
```

**salt.modules.xml.set_value** *(file, element, value)*

Sets the value of the matched xpath element

CLI Example:
25.7.529 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

depends

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

configuration This module can be used by either passing a jid and password directly to send_message,
or by specifying the name of a configuration profile in the minion config, minion pillar, or master
config.

For example:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourcename
  xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and op-
tional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

class salt.modules.xmpp.SendMsgBot(jid, password, recipient, msg)

classmethod create_multi(jid, password, msg, recipients=None, rooms=None, nick='SaltStack
Bot')

Alternate constructor that accept multiple recipients and rooms

start(event)

class salt.modules.xmpp.SleekXMPPMUC(name='')

classmethod filter(record)

Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record
may be modified in-place.

salt.modules.xmpp.send_msg(recipient, message, jid=None, password=None, profile=None)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:
salt.modules.xmpp.send_msg_multi(message, recipients=None, rooms=None, jid=None, password=None, nick='SaltStack Bot', profile=None)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```python
xmpp.send_msg recipients=['admins@xmpp.example.com']
  rooms=['secret@conference.xmpp.example.com']
  'This is a salt module test' #
  → profile='my-xmpp-account'
```

25.7.530 salt.modules.yaml

Yaml helper module for troubleshooting yaml

New in version 3005.

```python
depends yamllint >= 1.20.0
```

salt.modules.yaml.lint(source, saltenv=None, pre_render=None, **kwargs)

lint the output after detecting a successful render.

Parameters

- **source** (str) -- managed source file
- **saltenv** (str) -- the saltenv to use, defaults to minions enviroment or base if not set
- **pre_render** (str) -- The render options passed to slsutil.renderer other wise file is cached and loaded as stream

CLI Example:

```bash
salt '*' yaml.lint salt://example/bad_yaml.sls
```

25.7.531 salt.modules.yumpkg

Support for YUM/DNF

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

**Note:** DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

New in version 3003: Support for tdnf on Photon OS.

```python
class salt.modules.yumpkg.AvailablePackages(*args, **kwargs)
```

```python
class salt.modules.yumpkg.AvailablePackages(*args, **kwargs)
```
salt.modules.yumpkg.available_version(*names, **kwargs)
This function is an alias of latest_version.
  Return the latest version of the named package available for upgrade or installation. If more than
  one package name is specified, a dict of name/version pairs is returned.
  If the latest version of a given package is already installed, an empty string will be returned for
  that package.
  A specific repo can be requested using the fromrepo keyword argument, and the
disableexcludes option is also supported.
New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.yumpkg.clean_metadata(**kwargs)
New in version 2014.1.0.
  Cleans local yum metadata. Functionally identical to refresh_db().

CLI Example:

```bash
salt '*' pkg.clean_metadata
```

salt.modules.yumpkg.del_repo(repo, basedir=None, **kwargs)
Delete a repo from <basedir> (default basedir: all dirs in
reposdir yum option).
  If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be
deleted.
  Strict parsing of configuration files is the default, this can be disabled using the strict_config keyword
argument set to False

CLI Examples:

```bash
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir strict_config=False
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.diff(*paths, **kwargs)
Return a formatted diff between current files and original in a package. NOTE: this function includes all files
(configuration and not), but does not work on binary content.

Parameters path -- Full path to the installed file
Returns Difference string or raises and exception if examined file is binary.

CLI Example:

```bash
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.yumpkg.download(*packages, **kwargs)
New in version 2015.5.0.
  Download packages to the local disk. Requires yumdownloader from yum-utils package.
Note: yum-utils will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI Example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

salt.modules.yumpkg.file_dict(*packages, **kwargs)
New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.file_list(*packages, **kwargs)
New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.yumpkg.get_locked_packages(pattern='[\w+\[-\][-]+]+(?:\[.-\][^\-]+)*', full=True)
This function is an alias of list_holds.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.

List information on locked packages

Note: Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

pattern [w+\[-\][-]+]+ Regular expression used to match the package name
full [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

salt.modules.yumpkg.get_repo(repo, basedir=None, **kwargs)
Display a repo from <basedir> (default basedir: all dirs in reposdir yum option).

CLI Examples:
salt.modules.yumpkg.group_diff(name, **kwargs)

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0: Environment groups are now supported. The key names have been renamed, similar to the changes made in pkg.group_info.

Changed in version 3006.2: Support for fromrepo, enablerepo, and disablerepo (as used in pkg.install) has been added.

Lists which of a group’s packages are installed and which are not installed

name The name of the group to check
fromrepo Restrict yum groupinfo to the specified repo(s). (e.g., yum --disablerepo='*' --enablerepo='somerepo')

New in version 3006.2.

enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 3006.2.

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 3006.2.

CLI Example:
salt '*' pkg.group_diff 'Perl Support'
salt '*' pkg.group_diff 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_diff 'Perl Support' enablerepo=somerepo

salt.modules.yumpkg.group_info(name, expand=False, ignore_groups=None, **kwargs)

New in version 2014.1.0.

Changed in version 2015.5.10,2015.8.4,2016.3.0,3001: The return data has changed. A new key type has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory packages, optional packages, and default packages keys have been renamed to mandatory, optional, and default for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Changed in version 3006.2: Support for fromrepo, enablerepo, and disablerepo (as used in pkg.install) has been added.

Lists packages belonging to a certain group

name Name of the group to query
expand [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

ignore_groups [None] This parameter can be used to pass a list of groups to ignore when expanding subgroups. It is used during recursion in order to prevent expanding the same group multiple times.

New in version 3001.

fromrepo Restrict yum groupinfo to the specified repo(s). (e.g., yum --disablerepo='*' --enablerepo='somerepo')

New in version 3006.2.
enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 3006.2.

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 3006.2.

CLI Example:

```bash
salt '*' pkg.group_info 'Perl Support'
salt '*' pkg.group_info 'Perl Support' fromrepo=base,updates
salt '*' pkg.group_info 'Perl Support' enablerepo=somerepo
```

salt.modules.yumpkg.group_install(name, skip=(), include=(), **kwargs)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around pkg.install, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install ['"Group 1", "Group 2"]'
```

skip Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

include Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```bash
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```

Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

salt.modules.yumpkg.group_list()

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```bash
salt '*' pkg.group_list
```
salt.modules.yumpkg.groupinstall(name, skip=(), include=(), **kwargs)

This function is an alias of group_install.
New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around pkg.install, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```sh
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

skip Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```sh
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip=['"foo", "bar"]'
```

include Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```sh
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include=['"foo", "bar"]'
```

Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)

New in version 2014.7.0.

Version-lock packages

Note: Requires the appropriate versionlock plugin package to be installed:
• On RHEL 5: yum-versionlock
• On RHEL 6 & 7: yum-plugin-versionlock
• On Fedora: python-dnf-plugins-extras-versionlock

name The name of the package to be held.

Multiple Package Options:
pkgs A list of packages to hold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```sh
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['"foo", "bar"]'
```
salt.modules.yumpkg.info_installed(*names, **kwargs)

Return the information of the named package(s), installed on the system.

Parameters

- all_versions -- Include information for all versions of the packages installed on the minion.

CLI Example:

```text
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> <package2> <package3> all_versions=True
```

salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package(s), add refresh=True to clean the yum database before package is installed.

- name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

CLI Example:

```text
salt '*' pkg.install <package name>
```

- refresh Whether or not to update the yum database before executing.

- reinstall Specifying reinstall=True will use yum reinstall rather than yum install for requested packages that are already installed.

  If a version is specified with the requested package, then yum reinstall will only be used if the installed version matches the requested version.

  Works with sources when the package header of the source can be matched to the name and version of an installed package.

  New in version 2014.7.0.

- skip_verify Skip the GPG verification check (e.g., --nodepgcheck)

- downloadonly Only download the packages, do not install.

- version Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

  Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

- update_holds [False] If True, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

  New in version 2016.11.0.

- setopt A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

CLI Example:
salt '*/' pkg.install foo setopt='obsoletes=0,plugins=0'

New in version 2019.2.0.

Repository Options:

**fromrepo** Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

**enablerepo** (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

**disablerepo** (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

**disableexcludes** Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

**ignore_epoch** [False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

**pkgs** A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*/' pkg.install pkgs='["foo", "bar"]'
salt '*/' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

**sources** A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*/' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm"}]'
```

**normalize** [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfsgplbin-2.6.32-279.31.1.el6.x86_64
   normalize=False
```

New in version 2014.7.0.

**split_arch** [True] If set to False it prevents package name normalization more strict way than normalize set to False does.

New in version 3006.0.

**diff_attr**: If a list of package attributes is specified, returned value will contain them, eg:

```
{ '<package>' : { 'old' : { 'version' : '<old-version>', 'arch' : '<old-arch>' } ,
    'new' : { 'version' : '<new-version>', 'arch' : '<new-arch>' } } }
```
Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```python
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

If an attribute list in diff_attr is specified, the dict will also contain any specified attribute, eg.:

```python
{ '<package>': { 'old': { 'version': '<old-version>', 'arch': '<old-arch>' }, 'new': { 'version': '<new-version>', 'arch': '<new-arch>' } }}
```

**salt.modules.yumpkg.latest_version(names, **kwargs)**

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

**salt.modules.yumpkg.list_downloaded(**kwargs)**

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI Example:

```bash
salt '*' pkg.list_downloaded
```

**salt.modules.yumpkg.list_holds(pattern='[^\w+]+(?:[\w-]+)*?', full=True)**

Changed in version 2015.5.10, 2015.8.4, 2016.3.0: Function renamed from pkg.get_locked_pkgs to pkg.list_holds.

List information on locked packages

**Note:** Requires the appropriate versionlock plugin package to be installed:
- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock
**pattern** \[w+\(\?:\-\:\-\:+\)] Regular expression used to match the package name

**full** [True] Show the full hold definition including version and epoch. Set to False to return just the name of the package(s) being held.

CLI Example:
```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

```shell
salt.modules.yumpkg.list_installed_patches(**kwargs)
```
New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:
```
salt '*' pkg.list_installed_patches
```

```shell
salt.modules.yumpkg.list_patches(refresh=False, **kwargs)
```
New in version 2017.7.0.

List all known advisory patches from available repos.

**refresh** force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:
```
salt '*' pkg.list_patches
```

```shell
salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)
```
List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```json
{
    '<package_name>': '<version>[,<version>...]'
}
```

**versions_as_list**: If set to true, the versions are provided as a list

```json
{
    '<package_name>': ['<version>','<version>']
}
```

**attr**: If a list of package attributes is specified, returned value will contain them in addition to version, eg.:

```json
{
    '<package_name>': [{'version': 'version', 'arch': 'arch'}]
}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:
```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['"version", "arch"]
```

```shell
salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)
```
New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using pkg.hold will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.
Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

**Warning:** Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```python
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1', '4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.29.2.el6', '2.6.32-431.23.3.el6', '2.6.32-431.20.5.el6', '2.6.32-431.20.3.el6', '2.6.32-431.17.1.el6', '2.6.32-431.11.2.el6', '2.6.32-431.5.1.el6', '2.6.32-431.3.1.el6', '2.6.32-431.1.2.0.1.el6', '2.6.32-431.el6']
}

# With byrepo=True
{
    'base': {
        'bash': ['4.1.2-15.el6_4'],
        'kernel': ['2.6.32-431.el6']
    },
    'updates': {
        'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
        'kernel': ['2.6.32-431.29.2.el6', '2.6.32-431.23.3.el6', '2.6.32-431.20.5.el6', '2.6.32-431.20.3.el6', '2.6.32-431.17.1.el6', '2.6.32-431.11.2.el6', '2.6.32-431.5.1.el6', '2.6.32-431.3.1.el6', '2.6.32-431.1.2.0.1.el6']
    }
}
```

`fromrepo` [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.
enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 2017.7.0.

disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 2017.7.0.

byrepo [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

setopt A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

salt.modules.yumpkg.list_repos(basedir=None, **kwargs)
Lists all repos in <basedir> (default: all dirs in reposdir yum option).

Strict parsing of configuration files is the default, this can be disabled using the strict_config keyword argument set to False

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir strict_config=False
```

salt.modules.yumpkg.list_updates(refresh=True, **kwargs)
This function is an alias of list_upgrades.

Check whether or not an upgrade is available for all packages

The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.yumpkg.list_upgrades(refresh=True, **kwargs)
Check whether or not an upgrade is available for all packages

The fromrepo, enablerepo, and disablerepo arguments are supported, as used in pkg states, and the disableexcludes option is also supported.

New in version 2014.7.0: Support for the disableexcludes option

CLI Example:
salt modules.yumpkg.mod_repo(repo, basedir=None, **kwargs)
Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:
- **repo**: name by which the yum refers to the repo
- **name**: a human-readable name for the repo
- **baseurl**: the URL for yum to reference
- **mirrorlist**: the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

Strict parsing of configuration files is the default, this can be disabled using the **strict_config** keyword argument set to **False**

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1 strict_config=False
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

salt modules.yumpkg.modified(*packages, **flags)
List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):
- **size**: Include only files where size changed.
- **mode**: Include only files which file's mode has been changed.
- **checksum**: Include only files which MD5 checksum has been changed.
- **device**: Include only files which major and minor numbers has been changed.
- **symlink**: Include only files which are symbolic link contents.
- **owner**: Include only files where owner has been changed.
- **group**: Include only files where group has been changed.
- **time**: Include only files where modification time of the file has been changed.
- **capabilities**: Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

salt modules.yumpkg.normalize_name(name)
Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:
- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is **noarch**.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

salt modules.yumpkg.owner(*paths, **kwargs)
New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like **pkg.version**, if
a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

```
salt.modules.yumpkg.parse_arch(name)
```

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh.x86_64
```

```
salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

name The name of the package to be purged

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```
salt.modules.yumpkg.refresh_db(**kwargs)
```

Check the yum repos for updated packages

Returns:

- True: Updates are available
- False: An error occurred
- None: No updates are available

repo Refresh just the specified repo
disablerepo Do not refresh the specified repo
enablerepo Refresh a disabled repo using this option
branch Add the specified branch when refreshing
disableexcludes Disable the excludes defined in your config files. Takes one of three options: - all - disable all excludes - main - disable excludes defined in [main] in yum.conf - repo id - disable excludes defined for that repo

setopt A comma-separated or Python list of key=value options. This list will be expanded and `--setopt` prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.
Salt Documentation, Release 3006.4

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.yumpkg.remove(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Remove packages

**name** The name of the package to be removed

Multiple Package Options:

**pkgs** A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

**split_arch** [True] If set to False it prevents package name normalization by removing arch.

New in version 3006.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.services_need_restart(**kwargs)

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires systemd.

CLI Examples:

```
salt '*' pkg.services_need_restart
```

salt.modules.yumpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)

New in version 2014.7.0.

Remove version locks

Note: Requires the appropriate versionlock plugin package to be installed:

- On RHEL 5: yum-versionlock
- On RHEL 6 & 7: yum-plugin-versionlock
- On Fedora: python-dnf-plugins-extras-versionlock

**name** The name of the package to be unheld

Multiple Package Options:

**pkgs** A list of packages to unhold. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:
salt.modules.yumpkg.update(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=False, **kwargs)

New in version 2019.2.0.

Calls pkg.upgrade with obsoletes=False. Mirrors the CLI behavior of yum update. See pkg.upgrade for further documentation.

CLI Example:

```
salt '*' pkg.update
```

salt.modules.yumpkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, minimal=False, obsoletes=True, diff_attr=None, **kwargs)

Run a full system upgrade (a yum upgrade or dnf upgrade), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Changed in version 2019.2.0: Added obsoletes and minimal arguments

Returns a dictionary containing the changes:

```
{ '<package>': { 'old': '<old-version>', 'new': '<new-version>' }}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., yum --disablerepo='*' --enablerepo='somerepo')
enablerepo (ignored if fromrepo is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')
disablerepo (ignored if fromrepo is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')
disableexcludes Disable exclude from main, for a repo or for everything. (e.g., yum --disableexcludes='main')

New in version 2014.7.0.

name The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

Warning: if you forget 'name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:
New in version 2016.3.0.

**pkgs**
A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```bash
salt '*' pkg.upgrade pkgs=['"foo", "bar"]
salt '*' pkg.upgrade pkgs=['"foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

**normalize** [True]
Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```bash
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
--normalize=False
```

New in version 2016.3.0.

**minimal** [False]
Use upgrade-minimal instead of upgrade (e.g., yum upgrade-minimal) Goes to the 'newest' package match which fixes a problem that affects your system.

```bash
salt '*' pkg.upgrade minimal=True
```

New in version 2019.2.0.

**obsoletes** [True]
Controls whether yum/dnf should take obsoletes into account and remove them. If set to False yum will use update instead of upgrade and dnf will be run with --obsoletes=False

```bash
salt '*' pkg.upgrade obsoletes=False
```

New in version 2019.2.0.

**setopt**
A comma-separated or Python list of key=value options. This list will be expanded and --setopt prepended to each in the yum/dnf command that is run.

New in version 2019.2.0.

**diff_attr**
If a list of package attributes is specified, returned value will contain them, eg:

```json
{"<package>": {
  "old": {
    "version": '"old-version"',
    "arch": '"old-arch"'},
  "new": {
    "version": '"new-version"',
    "arch": '"new-arch"'}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 3006.0.

**Note:** To add extra arguments to the yum upgrade command, pass them as key word arguments. For arguments without assignments, pass True
salt 'salt '*' pkg.upgrade  security=True exclude='kernel*'"

```
salt.modules.yumpkg.upgrade_available(name, **kwargs)
    Check whether or not an upgrade is available for a given package
    CLI Example:
    salt 'salt '*' pkg.upgrade_available <package name>
```

```
salt.modules.yumpkg.verify('names', **kwargs)
    New in version 2014.1.0.
    Runs an rpm -Va on a system, and returns the results in a dict
    Pass options to modify rpm verify behavior using the verify_options keyword argument
    Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the
ignore_types keyword argument
    CLI Example:
    salt 'salt '*' pkg.verify
    salt 'salt '*' pkg.verify httpd
    salt 'salt '*' pkg.verify 'httpd postfix'
    salt 'salt '*' pkg.verify 'httpd postfix' ignore_types=['config', 'doc']
    salt 'salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps', 'nosize']
```

```
salt.modules.yumpkg.version('names', **kwargs)
    Returns a string representing the package version or an empty string if not installed. If more than one package
name is specified, a dict of name/version pairs is returned.
    CLI Example:
    salt 'salt '*' pkg.version <package name>
    salt 'salt '*' pkg.version <package1> <package2> <package3> ...
```

```
salt.modules.yumpkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
    New in version 2015.5.4.
    Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 >
pkg2. Return None if there was a problem making the comparison.
    ignore_epoch [False] Set to True to ignore the epoch when comparing versions
    New in version 2015.8.10,2016.3.2.
    CLI Example:
    salt 'salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

### 25.7.532 salt.modules.zabbix

Support for Zabbix

**optdepends**

- zabbix server

**configuration** This module is not usable until the zabbix user and zabbix password are specified either
  in a pillar or in the minion’s config file. Zabbix url should be also specified.
Connection arguments from the minion config file can be overridden on the CLI by using arguments with _connection_ prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_password=zabbix _connection_url=http://host/zabbix/
```

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

**salt.modules.zabbix.apiinfo_version(\*connection_args)**

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

**Parameters**

- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**

On success string with Zabbix API version, False on failure.

**CLI Example:**

```
salt '*' zabbix.apiinfo_version
```

**salt.modules.zabbix.compare_params(defined, existing, return_old_value=False)**

New in version 2017.7.0.

Compares Zabbix object definition against existing Zabbix object.

**Parameters**

- defined -- Zabbix object definition taken from sls file.
- existing -- Existing Zabbix object taken from result of an API call.
- return_old_value -- Default False. If True, returns dict("old"=old_val, "new"=new_val) for rollback purpose.

**Returns**

Params that are different from existing object. Result extended by object ID can be passed directly to Zabbix API update method.

**CLI Example:**

```
salt '*' zabbix.compare_params new_zabbix_object_dict existing_zabbix_object_dict
```

**salt.modules.zabbix.configuration_import(config_file, rules=None, file_format='xml', \*\*connection_args)**

New in version 2017.7.0.

Imports Zabbix configuration specified in file to Zabbix server.

**Parameters**

- config_file -- File with Zabbix config (local or remote)
- rules -- Optional - Rules that have to be different from default (defaults are the same as in Zabbix web UI)
- file_format -- Config file format (default: xml)
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

CLI Example:

```sh
delivery 'salt://zabbix/config/zabbix_templates.xml' {'screens': {'createMissing': True, 'updateExisting': True}}
```

salt.modules.zabbix.

- **get_object_id_by_params** *(obj, params=None, **connection_args)*

New in version 2017.7.0.

Get ID of single Zabbix object specified by its name.

**Parameters**

- `obj` -- Zabbix object type
- `params` -- Parameters by which object is uniquely identified
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** object ID

CLI Example:

```sh
delivery 'salt://zabbix/get_object_id_by_params object_type params=zabbix_api_query parameters_dict'
```

salt.modules.zabbix.

- **get_zabbix_id_mapper** ()

New in version 2017.7.0.

Make ZABBIX_ID_MAPPER constant available to state modules.

**Returns** ZABBIX_ID_MAPPER

CLI Example:

```sh
delivery 'salt://zabbix/get_zabbix_id_mapper'
```

salt.modules.zabbix.

- **host_create** *(host, groups, interfaces, **connection_args)*

New in version 2016.3.0.

Create new host

**Note:** This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**

- `host` -- technical name of the host
- `groups` -- groupids of host groups to add the host to
- `interfaces` -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- `visible_name` -- string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.
return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces="{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: ",", port: 10050}'
visible_name='Host Visible Name' inventory_mode=0 inventory='{"alias": "something...
```

```
salt.modules.zabbix.host_delete(hostids, **connection_args)
```

Delete hosts.

New in version 2016.3.0.

Parameters

- **hostids** -- Hosts (hostids) to delete.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts.

CLI Example:

```
salt '*' zabbix.host_delete 10106
```

```
salt.modules.zabbix.host_exists(host=None, hostid=None, name=None, node=None, nodeids=None, **connection_args)
```

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **hostids** -- Hosts (hostids) to delete.
- **name** -- visible name of the host
- **node** -- name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the node the hosts must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts, False on failure.

CLI Example:

```
salt '*' zabbix.host_exists 'Zabbix server'
```

```
salt.modules.zabbix.host_get(host=None, name=None, hostids=None, **connection_args)
```

Retrieve hosts according to the given parameters

Note: This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see [here](#).
Parameters

- **host** -- technical name of the host
- **name** -- visible name of the host
- **hostids** -- ids of the hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient hosts details, False if no host found or on failure.

CLI Example:
```
salt '*' zabbix.host_get 'Zabbix server'
```

salt.modules.zabbix.host_inventory_get(hostids, **connection_args)
Retrieve host inventory according to the given parameters. See: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters

- **hostids** -- ID of the host to query
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host inventory fields, populated or not, False if host inventory is disabled or on failure.

CLI Example:
```
salt '*' zabbix.host_inventory_get 101054
```

salt.modules.zabbix.host_inventory_set(hostid, **connection_args)
Update host inventory items NOTE: This function accepts all standard host: keyword argument names for inventory see: https://www.zabbix.com/documentation/2.4/manual/api/reference/host/object#host_inventory

New in version 2019.2.0.

Parameters

- **hostid** -- ID of the host to update
- **clear_old** -- Set to True in order to remove all existing inventory items before setting the specified items
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host, False on failure.

CLI Example:
```
salt '*' zabbix.host_inventory_set 101054 asset_tag=jml3322 type=vm clear_old=True
```

salt.modules.zabbix.host_list(**connection_args)
Retrieve all hosts.

New in version 2016.3.0.

Parameters

- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see
  module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or
  pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module's docstring)

Returns Array with details about hosts, False on failure.

CLI Example:

```
salt '*' zabbix.host_list
```

salt.modules.zabbix.host_update(hostid, **connection_args)

New in version 2016.3.0.

Update existing hosts

Note: This function accepts all standard host and host.update properties: keyword argument names differ
depending on your zabbix version, see the documentation for host objects and the documentation for updating
hosts.

Parameters

- `hostid` -- ID of the host to update
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see
  module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or
  pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts,
  pillar, see module's docstring)
- `visible_name` -- string with visible name of the host, use 'visible_name' instead
  of 'name' parameter to not mess with value supplied from Salt sls file.

Returns ID of the updated host.

CLI Example:

```
salt '*' zabbix.host_update 10084 name='Zabbix server2'
```

salt.modules.zabbix.hostgroup_create(name, **connection_args)

New in version 2016.3.0.

Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending
on your zabbix version, see here.

Parameters

- `name` -- name of the host group
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see
  module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or
  pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

  **Returns** ID of the created host group.

CLIP Example:
```
salt '*' zabbix.hostgroup_create MyNewGroup
```

salt.modules.zabbix.hostgroup_delete(hostgroupids, **connection_args)
Delete the host group.
New in version 2016.3.0.

**Parameters**

- **hostgroupids** -- IDs of the host groups to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** ID of the deleted host groups, False on failure.

CLIP Example:
```
salt '*' zabbix.hostgroup_delete 23
```

salt.modules.zabbix.hostgroup_exists(name=None, groupid=None, node=None, nodeids=None, **connection_args)
Checks if at least one host group that matches the given filter criteria exists.
New in version 2016.3.0.

**Parameters**

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** True if at least one host group exists, False if not or on failure.

CLIP Example:
```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None, **connection_args)
Retrieve host groups according to the given parameters

**Note:** This function accepts all standard hostgroup.get properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**
- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with host groups details, False if no convenient host group found or on failure.

**CLI Example:**

```bash
salt '*' zabbix.hostgroup_get MyNewGroup
```

salt.modules.zabbix.hostgroup_list(**connection_args)

Retrieve all host groups.

New in version 2016.3.0.

**Parameters**

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with details about host groups, False on failure.

**CLI Example:**

```bash
salt '*' zabbix.hostgroup_list
```

salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)

Update existing hosts group

**Note:** This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

**Parameters**

- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of updated host groups.

**CLI Example:**

```bash
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```
salt.modules.zabbix.hostinterface_create(hostid, ip, dns='', main=1, if_type=1, useip=1, port=None, **connection_args)

New in version 2016.3.0.

Create new host interface

**Note:** This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**
- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
ID of the created host interface, False on failure.

**CLI Example:**
```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

salt.modules.zabbix.hostinterface_delete(interfaceids, **connection_args)

Delete host interface

New in version 2016.3.0.

**Parameters**
- **interfaceids** -- IDs of the host interfaces to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**
ID of deleted host interfaces, False on failure.

**CLI Example:**
```
salt '*' zabbix.hostinterface_delete 50
```

salt.modules.zabbix.hostinterface_get(hostids, **connection_args)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

**Note:** This function accepts all standard hostinterface.get properties: keyword argument names differ depending on your zabbix version, see [here](#).
Parameters

- **hostids** -- Return only host interfaces used by the given hosts.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example:

```sh
salt '*' zabbix.hostinterface_get 101054
```

salt.modules.zabbix.hostinterface_update(interfaceid, **connection_args)

New in version 2016.3.0.

Update host interface

Note: This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **interfaceid** -- ID of the hostinterface to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host interface, False on failure.

CLI Example:

```sh
salt '*' zabbix.hostinterface_update 6 ip_=0.0.0.2
```

salt.modules.zabbix.mediatype_create(name, mediatype, **connection_args)

Create new mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **mediatype** -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec_path** -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm_modem** -- exec path - Required for sms type, see Zabbix API docs
- **smtp_email** -- email address from which notifications will be sent, required for email type
- **smtp_helo** -- SMTP HELO, required for email type
- **smtp_server** -- SMTP server, required for email type
- **status** -- whether the media type is enabled - 0: enabled, 1: disabled
- **username** -- authentication user, required for Jabber and Ez Texting types
- `passwd` -- authentication password, required for Jabber and Ez Texting types
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

```
return: ID of the created mediatype.
```

CLI Example:
```
salt '*' zabbix.mediatype_create 'Email' smtp_email='noreply@example.com'
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

```
salt.modules.zabbix.mediatype_delete(mediatypeids, **connection_args)
Delete mediatype
Parameters
- `interfaceids` -- IDs of the mediatypes to delete
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted mediatype, False on failure.
CLI Example:
```
salt '*' zabbix.mediatype_delete 3
```

```
salt.modules.zabbix.mediatype_get(name=None, mediatypeids=None, **connection_args)
Retrieve mediatypes according to the given parameters.
Parameters
- `name` -- Name or description of the mediatype
- `mediatypeids` -- ids of the mediatypes
- `connection_args` (optional) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional mediatype.get parameters: keyword argument names depends on your zabbix version, see:
https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get

Returns Array with mediatype details, False if no mediatype found or on failure.
CLI Example:
```
salt '*' zabbix.mediatype_get name='Email'
salt '*' zabbix.mediatype_get mediatypeids="['1', '2', '3']"
```

```
salt.modules.zabbix.mediatype_update(mediatypeid, name=False, mediatype=False, **connection_args)
Update existing mediatype
```

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.
Parameters
- `mediatypeid` -- ID of the mediatype to update
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
IDs of the updated mediatypes, False on failure.

CLI Example:
```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

salt.modules.zabbix.run_query(method, params, **connection_args)
Send Zabbix API call

Parameters
- `method` -- actual operation to perform via the API
- `params` -- parameters required for specific method
- `connection_args (optional)` -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring)_connection_password: zabbix password (can also be set in opts or pillar, see module's docstring)_connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

Returns
Response from Zabbix API

CLI Example:
```
salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", "status": 5}''
```

salt.modules.zabbix.substitute_params(input_object, extend_params=None, filter_key='name', **kwargs)
New in version 2017.7.0.
Go through Zabbix object params specification and if needed get given object ID from Zabbix API and put it back as a value. Definition of the object is done via dict with keys "query_object" and "query_name".

Parameters
- `input_object` -- Zabbix object type specified in state file
- `extend_params` -- Specify query with params
- `filter_key` -- Custom filtering key (default: name)
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns
Params structure with values converted to string for further comparison purposes

CLI Example:
```
salt '*' zabbix.substitute_params '{"query_object": "object_name", "query_name": "specific_object_name"}''
```
salt.modules.zabbix.template_get(name=None, host=None, templateids=None, **connection_args)

Retrieve templates according to the given parameters.

Parameters

- **host** -- technical name of the template
- **name** -- visible name of the template
- **hostids** -- ids of the templates
- **connection_args** *(optional)* -- _connection_user: zabbix user (can also be set in opts or pillar, see module’s docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module’s docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional template.get parameters: keyword argument names depends on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns

Array with convenient template details, False if no template found or on failure.

CLI Example:

```
salt '*' zabbix.template_get name='Template OS Linux'
salt '*' zabbix.template_get templateids=['10050', '10001']
```

salt.modules.zabbix.user_addmedia(userids, active, mediatypeid, period, sendto, severity, **connection_args)

Add new media to multiple users. Available only for Zabbix version 3.4 or older.

New in version 2016.3.0.

Parameters

- **userids** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns

IDs of the created media.

CLI Example:

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00' sendto='support2@example.com' severity=63
```

salt.modules.zabbix.user_create(alias, passwd, usgrps, **connection_args)

New in version 2016.3.0.

Create new zabbix user

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
• **alias** -- user alias
• **passwd** -- user's password
• **usrgrps** -- user groups to add the user to
• **connection_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
• **connection_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
• **connection_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
• **firstname** -- string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

**Returns**  On success string with id of the created user.

**CLI Example:**

```bash
salt '*' zabbix.user_create james password007 '[[7, 12]]' firstname='James Bond'
```

salt.modules.zabbix.user_delete(**users**, **connection_args**)  
Delete zabbix users.  

New in version 2016.3.0.  

**Parameters**  
- **users** -- array of users (userids) to delete  
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)  
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)  
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**  On success array with userids of deleted users.

**CLI Example:**

```bash
salt '*' zabbix.user_delete 15
```

salt.modules.zabbix.user_deletemedia(**mediaids**, **connection_args**)  
Delete media by id. Available only for Zabbix version 3.4 or older.  

New in version 2016.3.0.  

**Parameters**  
- **mediaids** -- IDs of the media to delete  
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)  
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)  
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns**  IDs of the deleted media, False on failure.

**CLI Example:**

```bash
salt '*' zabbix.user_deletemedia 27
```

salt.modules.zabbix.user_exists(**alias**, **connection_args**)  
Checks if user with given alias exists.  

New in version 2016.3.0.  

**Parameters**  
- **alias** -- user alias
• _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
• _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
• _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if user exists, else False.

CLI Example:
```
salt '*' zabbix.user_exists james
```

salt.modules.zabbix.user_get(alias=None, userids=None, **connection_args)
Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters
- alias -- user alias
- userids -- return only users with the given IDs
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details of convenient users, False on failure of if no user found.

CLI Example:
```
salt '*' zabbix.user_get james
```

salt.modules.zabbix.user_getmedia(userids=None, **connection_args)
Retrieve media according to the given parameters

New in version 2016.3.0.

Parameters
- userids -- return only media that are used by the given users
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns List of retrieved media, False on failure.

CLI Example:
```
salt '*' zabbix.user_getmedia
```

salt.modules.zabbix.user_list(**connection_args)
Retrieve all of the configured users.

New in version 2016.3.0.

Parameters
Salt Documentation, Release 3006.4

- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with user details.

CLI Example:
```
salt '*' zabbix.user_list
```

```
salt.modules.zabbix.user_update(userid, **connection_args)
```
New in version 2016.3.0.

Update existing users

**Note:** This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- `userid` -- id of the user to update
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Id of the updated user on success.

CLI Example:
```
salt '*' zabbix.user_update 16 visible_name='James Brown'
```

```
salt.modules.zabbix.usergroup_create(name, **connection_args)
```
New in version 2016.3.0.

Create new user group

**Note:** This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- `name` -- name of the user group
- `_connection_user` -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- `_connection_password` -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- `_connection_url` -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created user groups.

CLI Example:
```
salt '*' zabbix.usergroup_create GroupName
```
salt.modules.zabbix.usergroup_delete(usergroupids, **connection_args)
New in version 2016.3.0.
Parameters
- usergroupids -- IDs of the user groups to delete
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Returns IDs of the deleted user groups.

CLI Example:
```sh
salt '*' zabbix.usergroup_delete 28
```

salt.modules.zabbix.usergroup_exists(name=None, node=None, nodeids=None, **connection_args)
Checks if at least one user group that matches the given filter criteria exists
New in version 2016.3.0.
Parameters
- name -- names of the user groups
- node -- name of the node the user groups must belong to (This will override the nodeids parameter.)
- nodeids -- IDs of the nodes the user groups must belong to
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example:
```sh
salt '*' zabbix.usergroup_exists Guests
```

salt.modules.zabbix.usergroup_get(name=None, usrgpids=None, userids=None, **connection_args)
New in version 2016.3.0.
Retrieve user groups according to the given parameters

Note: This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters
- name -- names of the user groups
- usrgpids -- return only user groups with the given IDs
- userids -- return only user groups that contain the given users
- _connection_user -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- _connection_password -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- _connection_url -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
**Return**s Array with convenient user groups details, False if no user group found or on failure.

CLI Example:
```
salt '*' zabbix.usergroup_get Guests
```

salt.modules.zabbix.usergroup_list(**connection_args)
Retrieve all enabled user groups.
New in version 2016.3.0.

**Parameters**
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** Array with enabled user groups details, False on failure.

CLI Example:
```
salt '*' zabbix.usergroup_list
```

salt.modules.zabbix.usergroup_update(usrgrpid, **connection_args)
Update existing user group

*Note:* This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

**Parameters**
- **usrgrpid** -- ID of the user group to update.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

**Returns** IDs of the updated user group, False on failure.

CLI Example:
```
salt '*' zabbix.usergroup_update 8 name=guestsRenamed
```

salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)
Create new host usermacro.

**Parameters**
- **macro** -- name of the host usermacro
- **value** -- value of the host usermacro
- **hostid** -- hostid or templateid
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
return: ID of the created host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_create '${SNMP_COMMUNITY}' 'public' 1
```

```
salt.modules.zabbix.usermacro_createglobal(macro, value, **connection_args)
```
Create new global usermacro.

**Parameters**

- **macro** -- name of the global usermacro
- **value** -- value of the global usermacro
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_createglobal '${SNMP_COMMUNITY}' 'public'
```

```
salt.modules.zabbix.usermacro_delete(macroids, **connection_args)
```
Delete host usermacros.

**Parameters**

- **macroids** -- macroids of the host usermacros
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_delete 21
```

```
salt.modules.zabbix.usermacro_deleteglobal(macroids, **connection_args)
```
Delete global usermacros.

**Parameters**

- **macroids** -- macroids of the global usermacros
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_deleteglobal 21
```
salt.modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, hostmacroids=None, globalmacroids=None, globalmacro=False, **connection_args)

Retrieve user macros according to the given parameters.

**Parameters**

- **macro** -- name of the usermacro
- **hostids** -- Return macros for the given hostids
- **templateids** -- Return macros for the given templateids
- **hostmacroids** -- Return macros with the given hostmacroids
- **globalmacroids** -- Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** -- if True, returns only global macros
- **connection_args** *(optional)* -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

**Returns** Array with usermacro details, False if no usermacro found or on failure.

CLI Example:

```
salt '*' zabbix.usermacro_get macro='{$SNMP_COMMUNITY}'
```

salt.modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)

Update existing host usermacro.

**Parameters**

- **hostmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_update 1 'public'
```

salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)

Update existing global usermacro.

**Parameters**

- **globalmacroid** -- id of the host usermacro
- **value** -- new value of the host usermacro
- **connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_updateglobal 1 'public'
```
25.7.533 salt.modules.zcbuildout

Management of zc.buildout
New in version 2014.1.0.
This module is inspired by minitage's buildout maker

Note: The zc.buildout integration is still in beta; the API is subject to change

General notes

You have those following methods:

- upgrade_bootstrap
- bootstrap
- run_buildout
- buildout

salt.modules.zcbuildout.bootstrap(*a, **kw)
Run the buildout bootstrap dance (python bootstrap.py).

directory directory to execute in
config alternative buildout configuration file to use
runas User used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
offline are we executing buildout in offline mode
distribute Forcing use of distribute
new_st Forcing use of setuptools >= 0.7
python path to a python executable to use in place of default (salt one)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
use_vt Use the new salt VT to stream output [experimental]

CLI Example:
salt '*' buildout.bootstrap /srv/mybuildout

salt.modules.zcbuildout.buildout(*a, **kw)
Run buildout in a directory.

directory directory to execute in
config buildout config to use
parts specific buildout parts to run
runas user used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible
offline does buildout run offline
python python to use
debug run buildout with -D debug flag

25.7. execution modules
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```bash
salt '.*' buildout.buildout /srv/mybuildout
```

`salt.modules.zcbuildout.run_buildout('a,**kw')`

Run a buildout in a directory.
directory directory to execute in
cfg alternative buildout configuration file to use
offline are we executing buildout in offline mode
runas user used to run buildout as
env environment variables to set when running
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
force run buildout unconditionally
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```bash
salt '.*' buildout.run_buildout /srv/mybuildout
```

`salt.modules.zcbuildout.upgrade_bootstrap('a,**kw')`

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy
directory directory to execute in
offline are we executing buildout in offline mode
buildout_ver forcing to use a specific buildout version (1 | 2)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0

CLI Example:

```bash
salt '.*' buildout.upgrade_bootstrap /srv/mybuildout
```

25.7.534 `salt.modules.zenoss`

Module for working with the Zenoss API
New in version 2016.3.0.

configuration This module requires a 'zenoss' entry in the master/minion config.

For example:

```yaml
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
  verify_ssl: True
  ca_bundle: /etc/ssl/certs/ca-certificates.crt
```
salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost', prod_state=1000)

A function to connect to a zenoss server and add a new device entry.

Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default.
- **device_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example:

```
salt '*' zenoss.add_device
```

salt.modules.zenoss.device_exists(device=None)

Check to see if a device already exists in Zenoss.

Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt '*' zenoss.device_exists
```

salt.modules.zenoss.find_device(device=None)

Find a device in Zenoss. If device not found, returns None.

Parameters

- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt '*' zenoss.find_device
```

salt.modules.zenoss.set_prod_state(prod_state, device=None)

A function to set the prod_state in zenoss.

Parameters

- **prod_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain 'fqdn' by default

CLI Example:

```
salt zenoss.set_prod_state 1000 hostname
```

25.7.535 salt.modules.zfs

Module for running ZFS command

- **codeauthor** Nitin Madhok <nmadhok@g.clemson.edu>, Jorge Schrauwen <sjorge@blackdot.be>
- **maintainer** Jorge Schrauwen <sjorge@blackdot.be>
- **maturity** new
- **depends** salt.utils.zfs
- **platform** illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

salt.modules.zfsbookmark(snapshot, bookmark)

Creates a bookmark of the given snapshot
Salt Documentation, Release 3006.4

Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

**snapshot** [string] name of snapshot to bookmark

**bookmark** [string] name of bookmark

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

salt.modules.zfs.clone(name_a, name_b, **kwargs)

Creates a clone of the given snapshot.

**name_a** [string] name of snapshot

**name_b** [string] name of filesystem or volume

**create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**properties** [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

salt.modules.zfs.create(name, **kwargs)

Create a ZFS File System.

**name** [string] name of dataset or volume

**volume_size** [string] if specified, a zvol will be created instead of a dataset

**sparse** [boolean] create sparse volume

**create_parent** [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.

**properties** [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

New in version 2015.5.0.

CLI Example:
Salt Documentation, Release 3006.4

```bash
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{'mountpoint': '/export/zfs', 'sharenfs': 'on'}"
salt '*' zfs.create myzpool/mydataset volume volume_size=1G [sparse=True|False]
salt '*' zfs.create myzpool/mydataset volume volume_size=1G properties="{'volblocksize': '512'}" [sparse=True|False]
```

salt.modules.zfs.destroy(name, **kwargs)

Destroy a ZFS File System.
- **name** [string] name of dataset, volume, or snapshot
- **force** [boolean] force an unmount of any file systems using the unmount -f command.
- **recursive** [boolean] recursively destroy all children. (-r)
- **recursive_all** [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

**Warning:** watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

salt.modules.zfs.diff(name_a, name_b=None, **kwargs)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.
- **name_a** [string] name of snapshot
- **name_b** [string] (optional) name of snapshot or filesystem
- **show_changetime** [boolean] display the path's inode change time as the first column of output. (default = True)
- **show_indication** [boolean] display an indication of the type of file. (default = True)
- **parsable** [boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

salt.modules.zfs.exists(name, **kwargs)

Check if a ZFS filesystem or volume or snapshot exists.
- **name** [string] name of dataset
- **type** [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

salt.modules.zfs.get('dataset', **kwargs)

Displays properties for the given datasets.
- **dataset** [string] name of snapshot(s), filesystem(s), or volume(s)
- **properties** [string] comma-separated list of properties to list, defaults to all
- **recursive** [boolean] recursively list children

25.7. execution modules
**depth** [int] recursively list children to depth

**fields** [string] comma-separated list of fields to include, the name and property field will always be added

**type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

Changed in version 3004.

type is ignored on Solaris 10 and 11 since not a valid parameter on those platforms

**source** [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.

**parsable** [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

**Note:** If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:

```text
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint"

salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available

salt.modules.zfs.hold(tag, *snapshot, **kwargs)

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

**Note:** Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

**tag** [string] name of tag

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```text
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/myotherdataset@myothersnapshot

salt.modules.zfs.holds(snapshot, **kwargs)

Lists all existing user references for the given snapshot or snapshots.

**snapshot** [string] name of snapshot

**recursive** [boolean] lists the holds that are set on the named descendent snapshots also.
New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.holds myzpool/mydataset@baseline
```

**salt.modules.zfs.inherit(prop, name, **kwargs)**

Clears the specified property.

- **prop** [string] name of property
- **name** [string] name of the filesystem, volume, or snapshot
- **recursive** [boolean] recursively inherit the given property for all children.
- **revert** [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:

```bash
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

**salt.modules.zfs.list_(name=None, **kwargs)**

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

- **name** [string] name of dataset, volume, or snapshot
- **recursive** [boolean] recursively list children
- **depth** [int] limit recursion to depth
- **properties** [string] comma-separated list of properties to list, the name property will always be added
- **type** [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
- **sort** [string] property to sort on (default = name)
- **order** [string  [ascending|descending]] sort order (default = ascending)
- **parsable** [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0

New in version 2015.5.0.

CLI Example:

```bash
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"
```

**salt.modules.zfs.list_mount()**

List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:

```bash
salt '*' zfs.list_mount
```

**salt.modules.zfs.mount(name=None, **kwargs)**

Mounts ZFS file systems.

- **name** [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)
- **overlay** [boolean] perform an overlay mount.
- **options** [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.
Warning: Passing `-a' as name is deprecated and will be removed in 3001.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

### salt.modules.zfs.promote(name)

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

**Note:** This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

**name** [string] name of clone-filesystem

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

### salt.modules.zfs.release(tag, *snapshot, **kwargs)

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

**Note:** The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

**tag** [string] name of tag

**snapshot** [string] name of snapshot(s)

**recursive** [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

**Warning:** As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
    → mydataset@myothersnapshot
```
**salt.modules.zfs.rename** *(name, new_name, **kwargs)*  
Rename or Relocate a ZFS File System.  
- **name** [string] name of dataset, volume, or snapshot  
- **new_name** [string] new name of dataset, volume, or snapshot  
- **force** [boolean] force unmount any filesystems that need to be unmounted in the process.  
- **create_parent** [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.  
- **recursive** [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.  
New in version 2015.5.0.  

```bash  
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset  
```

**salt.modules.zfs.rollback** *(name, **kwargs)*  
Roll back the given dataset to a previous snapshot.  
- **name** [string] name of snapshot  
- **recursive** [boolean] destroy any snapshots and bookmarks more recent than the one specified.  
- **recursive_all** [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.  
- **force** [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.  

**Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.  
In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.  

New in version 2016.3.0.  

```bash  
salt '*' zfs.rollback myzpool/mydataset@yesterday  
```

**salt.modules.zfs.set** *(dataset, **kwargs)*  
Sets the property or list of properties to the given value(s) for each dataset.  
- **dataset** [string] name of snapshot(s), filesystem(s), or volume(s)  
- **properties** [string] additional zfs properties pairs  

**Note:** properties are passed as key-value pairs. e.g.  
- compression=off  

**Note:** Only some properties can be edited.  
See the Properties section for more information on what properties can be set and acceptable values.  
Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).  

New in version 2016.3.0.  

```bash  
```
salt '//' zfs.set myzpool/mydataset compression=off
salt '//' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '//' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
→ canmount=off

salt.modules.zfs.snapshot("snapshot", "**kwargs")
    Creates snapshots with the given names.
    snapshot [string] name of snapshot(s)
    recursive [boolean] recursively create snapshots of all descendent datasets.
    properties [dict] additional zfs properties (-o)

    Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

    properties="{'property1': 'value1', 'property2': 'value2'}"

New in version 2016.3.0.

CLI Example:

salt '//' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '//' zfs.snapshot myzpool/mydataset@yesterday myzpool/
→ myotherdataset@yesterday [recursive=True]

salt.modules.zfs.unmount(name, "**kwargs")
    Unmounts ZFS file systems
    name [string] name of the filesystem, you can use None to unmount all mounted filesystems.
    force [boolean] forcefully unmount the file system, even if it is currently in use.

    Warning: Using -a for the name parameter will probably break your system, unless your rootfs is not on zfs.

New in version 2016.3.0.

Changed in version 2018.3.1.

    Warning: Passing '-a' as name is deprecated and will be removed in 3001.

CLI Example:

salt '//' zfs.unmount myzpool/mydataset [force=True|False]
25.7.536 salt.modules.zk_concurrency

Concurrency controls in zookeeper

depends kazoo

configuration See salt.modules.zookeeper for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get lock (with optional timeout)
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to the hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeeper should be ephemeral
force Forcibly acquire the lock regardless of available slots
Example:

```
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.lock_holders(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Return an un-ordered list of lock holders
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeeper should be ephemeral
Example:

```
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234
```

salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, blocking=False, profile=None, scheme=None, username=None, password=None, default_acl=None)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
min_nodes The minimum number of nodes expected to be present in the party
blocking The boolean indicating if we need to block until min_nodes are available
Example:
salt.minion zk_concurrency.party_members /lock/path host1:1234,host2:1234
salt.minion zk_concurrency.party_members /lock/path host1:1234,host2:1234

```
mintnodes=3 blocking=True
```

```
salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1, ephemeral_lease=False, scheme=None, profile=None, username=None, password=None, default_acl=None)
```

Remove lease from semaphore
- **path** The path in zookeeper where the lock is
- **zk_hosts** zookeeper connect string
- **identifier** Name to identify this minion, if unspecified defaults to hostname
- **max_concurrency** Maximum number of lock holders
- **timeout** timeout to wait for the lock. A None timeout will block forever
- **ephemeral_lease** Whether the locks in zookeeper should be ephemeral

Example:
```
salt.minion zk_concurrency.unlock /lock/path host1:1234,host2:1234
```

### 25.7.537 salt.modules.znc

znc - An advanced IRC bouncer

*New in version 2014.7.0.*

Provides an interface to basic ZNC functionality

```
salt.modules.znc.buildmod("modules")
```

Build module using znc-buildmod

CLI Example:
```
salt '*' znc.buildmod module.cpp [...] 
```

```
salt.modules.znc.dumpconf()
```

Write the active configuration state to config file

CLI Example:
```
salt '*' znc.dumpconf 
```

```
salt.modules.znc.rehashconf()
```

Rehash the active configuration state from config file

CLI Example:
```
salt '*' znc.rehashconf 
```

```
salt.modules.znc.version()
```

Return server version from znc --version

CLI Example:
```
salt '*' znc.version 
```
25.7.538 salt.modules.zoneadm

Module for Solaris 10’s zoneadm

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform OmniOS, OpenIndiana, SmartOS, OpenSolaris, Solaris 10

New in version 2017.7.0.

Warning: Oracle Solaris 11’s zoneadm is not supported by this module!

salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)
Attach the specified zone.

zone [string] name of the zone
force [boolean] force the zone into the "installed" state with no validation
brand_opts [string] brand specific options to pass

CLI Example:

salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True

salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)
Boot (or activate) the specified zone.

zone [string] name or uuid of the zone
single [boolean] boots only to milestone svc:/milestone/single-user:default.
altinit [string] valid path to an alternative executable to be the primordial process.
smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose

salt.modules.zoneadm.clone(zone, source, snapshot=None)
Install a zone by copying an existing installed zone.

zone [string] name of the zone
source [string] zone to clone from
snapshot [string] optional name of snapshot to use as source

CLI Example:

salt '*' zoneadm.clone clementine dolores

salt.modules.zoneadm.detach(zone)
Detach the specified zone.

zone [string] name or uuid of the zone

CLI Example:

salt '*' zoneadm.detach kissy

salt.modules.zoneadm.halt(zone)
Halt the specified zone.

zone [string] name or uuid of the zone
Note: To cleanly shutdown the zone use the shutdown function.

CLI Example:

```bash
salt '*' zoneadm.halt hector
```

```python
salt.modules.zoneadm.install(zone, nodataset=False, brand_opts=None)
```

Install the specified zone from the system.

- **zone** [string] name of the zone
- **nodataset** [boolean] do not create a ZFS file system
- **brand_opts** [string] brand specific options to pass

CLI Example:

```bash
salt '*' zoneadm.install dolores
