sudo salt-cloud -f create_ssh_key my-oneandone-config name='SaltTest' description='SaltTestDescription'
```

Create a block storage

```bash
sudo salt-cloud -f create_block_storage my-oneandone-config name='SaltTest2' description='SaltTestDescription' size=50 datacenter_id= '5091F6D8C6CBFEF9C562ACE957C65D5D49'
```

salt.cloud.clouds.oneandone.avail_images(conn=None, call=None)
    Return a list of the server appliances that are on the provider

salt.cloud.clouds.oneandone.avail_locations(conn=None, call=None)
    List available locations/datacenters for 1&1

salt.cloud.clouds.oneandone.avail_sizes(call=None)
    Return a dict of all available VM sizes on the cloud provider with relevant data.

salt.cloud.clouds.oneandone.create(vm_)
    Create a single VM from a data dict

salt.cloud.clouds.oneandone.create_block_storage(kwargs=None, call=None)
    Create a block storage

salt.cloud.clouds.oneandone.create_ssh_key(kwargs=None, call=None)
    Create an ssh key

salt.cloud.clouds.oneandone.destroy(name, call=None)
    Destroy a server by name

    Parameters
    • name -- name given to the server
    • call -- call value in this case is 'action'

    Returns
    array of booleans , true if successfully stopped and true if successfully removed

    CLI Example:

```
salt-cloud -d vm_name
```

salt.cloud.clouds.oneandone.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.oneandone.get_conn()
    Return a conn object for the passed VM data

salt.cloud.clouds.oneandone.get_dependencies()
    Warn if dependencies are not met.
salt.cloud.clouds.oneandone.get_image(vm_)
    Return the image object to use
salt.cloud.clouds.oneandone.get_key_filename(vm_)
    Check SSH private key file and return absolute path if exists.
salt.cloud.clouds.oneandone.get_node(conn, name)
    Return a node for the named VM
salt.cloud.clouds.oneandone.get_size(vm_)
    Return the VM's size object
salt.cloud.clouds.oneandone.get_wait_timeout(vm_)
    Return the wait_for_timeout for resource provisioning.
salt.cloud.clouds.oneandone.list_nodes(conn=None, call=None)
    Return a list of VMs that are on the provider
salt.cloud.clouds.oneandone.list_nodes_full(conn=None, call=None)
    Return a list of the VMs that are on the provider, with all fields
salt.cloud.clouds.oneandone.list_nodes_select(conn=None, call=None)
    Return a list of the VMs that are on the provider, with select fields
salt.cloud.clouds.oneandone.load_public_key(vm_)
    Load the public key file if exists.
salt.cloud.clouds.oneandone.reboot(name, call=None)
    reboot a server by name
    :param name: name given to the machine
    :param call: call value in this case is 'action'
    :return: true if successful
    CLI Example:
    salt-cloud -a reboot vm_name
salt.cloud.clouds.oneandone.script(vm_)
    Return the script deployment object
salt.cloud.clouds.oneandone.show_instance(name, call=None)
    Show the details from the provider concerning an instance
salt.cloud.clouds.oneandone.start(name, call=None)
    start a server by name
    :param name: name given to the machine
    :param call: call value in this case is 'action'
    :return: true if successful
    CLI Example:
    salt-cloud -a start vm_name
salt.cloud.clouds.oneandone.stop(name, call=None)
    stop a server by name
    :param name: name given to the machine
    :param call: call value in this case is 'action'
    :return: true if successful
    CLI Example:
    salt-cloud -a stop vm_name
26.4.15 salt.cloud.clouds.opennebula

OpenNebula Cloud Module

The OpenNebula cloud module is used to control access to an OpenNebula cloud.

New in version 2014.7.0.

```
depends
  lxml

depends
  OpenNebula installation running version 4.14 or later.
```

Use of this module requires the `xml_rpc`, `user`, and `password` parameters to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/opennebula.conf`:

```
my-opennebula-config:
  xml_rpc: http://localhost:2633/RPC2
  user: oneadmin
  password: JHGhgsayu32jsa
  driver: opennebula
```

This driver supports accessing new VM instances via DNS entry instead of IP address. To enable this feature, in the provider or profile file add `fqdn_base` with a value matching the base of your fully-qualified domain name. Example:

```
my-opennebula-config:
  [...]
  fqdn_base: <my.basedomain.com>
  [...]
```

The driver will prepend the hostname to the `fqdn_base` and do a DNS lookup to find the IP of the new VM.

```
salt-cloud -f image_allocate opennebula datastore_name=default \ data="NAME="My New Image" DESCRIPTION="Description of the image." \ PATH=/home/one_user/images/image_name.img"
salt-cloud -f secgroup_allocate opennebula \ data="Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \ RANGE = 1000:2000]"
```

**salt.cloud.clouds.opennebula.avail_images** *(call=None)*

Return available OpenNebula images.

CLI Example:

```
salt-cloud --list-images opennebula
salt-cloud --function avail_images opennebula
salt-cloud -f avail_images opennebula
```

**salt.cloud.clouds.opennebula.avail_locations** *(call=None)*

Return available OpenNebula locations.

CLI Example:
salt.cloud.clouds.opennebula.avail_sizes(call=None)
Because sizes are built into templates with OpenNebula, there will be no sizes to return here.
salt.cloud.clouds.opennebula.create(vm_)
Create a single VM from a data dict.

vm_
   The dictionary use to create a VM.

Optional vm_ dict options for overwriting template:

region_id
   Optional - OpenNebula Zone ID

memory
   Optional - In MB

cpu
   Optional - Percent of host CPU to allocate

cpu
   Optional - Amount of vCPUs to allocate

CLI Example:
salt-cloud -p my-opennebula-profile vm_name
salt-cloud -p my-opennebula-profile vm_name memory=16384 cpu=2.5
   vcpu=16

salt.cloud.clouds.opennebula.destroy(name, call=None)
Destroy a node. Will check termination protection and warn if enabled.

name
   The name of the vm to be destroyed.

CLI Example:
salt-cloud --destroy vm_name
salt-cloud -d vm_name
salt-cloud --action destroy vm_name
salt-cloud -a destroy vm_name

salt.cloud.clouds.opennebula.get_cluster_id(kwars=None, call=None)
Returns a cluster's ID from the given cluster name.

New in version 2016.3.0.

CLI Example:
salt-cloud -f get_cluster_id opennebula name=my-cluster-name

salt.cloud.clouds.opennebula.get_configured_provider()
Return the first configured instance.
salt.cloud.clouds.opennebula.get_datastore_id(kwargs=None, call=None)
Returns a data store's ID from the given data store name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_datastore_id opennebula name=my-datastore-name
```

salt.cloud.clouds.opennebula.get_dependencies()
Warn if dependencies aren't met.

salt.cloud.clouds.opennebula.get_host_id(kwargs=None, call=None)
Returns a host's ID from the given host name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_host_id opennebula name=my-host-name
```

salt.cloud.clouds.opennebula.get_image(vm_)
Return the image object to use.

```
v_  The VM dictionary for which to obtain an image.
```

salt.cloud.clouds.opennebula.get_image_id(kwargs=None, call=None)
Returns an image's ID from the given image name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_image_id opennebula name=my-image-name
```

salt.cloud.clouds.opennebula.get_location(vm_)
Return the VM's location.

```
v_  The VM dictionary for which to obtain a location.
```

salt.cloud.clouds.opennebula.get_one_version(kwargs=None, call=None)
Returns the OpenNebula version.
New in version 2016.3.5.
CLI Example:
```
salt-cloud -f get_one_version one_provider_name
```

salt.cloud.clouds.opennebula.get_secgroup_id(kwargs=None, call=None)
Returns a security group's ID from the given security group name.
New in version 2016.3.0.
CLI Example:
```
salt-cloud -f get_secgroup_id opennebula name=my-secgroup-name
```
salt.cloud.clouds.opennebula.get_template(vm_)

Return the template id for a VM.

New in version 2016.11.0.

vm_

    The VM dictionary for which to obtain a template.

salt.cloud.clouds.opennebula.get_template_id(**kwargs=None, call=None)

Returns a template's ID from the given template name.

New in version 2016.3.0.

CLI Example:

    salt-cloud -f get_template_id opennebula name=my-template-name

salt.cloud.clouds.opennebula.get_template_image(**kwargs=None, call=None)

Returns a template's image from the given template name.

New in version 2018.3.0.

CLI Example:

    salt-cloud -f get_template_image opennebula name=my-template-name

salt.cloud.clouds.opennebula.get_vm_id(**kwargs=None, call=None)

Returns a virtual machine's ID from the given virtual machine's name.

New in version 2016.3.0.

CLI Example:

    salt-cloud -f get_vm_id opennebula name=my-vm

salt.cloud.clouds.opennebula.get_vn_id(**kwargs=None, call=None)

Returns a virtual network's ID from the given virtual network's name.

New in version 2016.3.0.

CLI Example:

    salt-cloud -f get_vn_id opennebula name=my-vn-name

salt.cloud.clouds.opennebula.image_allocate(call=None, **kwargs=None)

Allocates a new image in OpenNebula.

New in version 2016.3.0.

path

    The path to a file containing the template of the image to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data

    The data containing the template of the image to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of path.

datastore_id

    The ID of the data-store to be used for the new image. Can be used instead of datastore_name.

datastore_name

    The name of the data-store to be used for the new image. Can be used instead of datastore_id.
CLI Example:

```
salt-cloud -f image_allocate opennebula path=/path/to/image_file.txt
  datastore_id=1
salt-cloud -f image_allocate opennebula datastore_name=default \
  data='NAME="Ubuntu 14.04" PATH="/home/one_user/images/ubuntu_desktop.\ 
  img" \
  DESCRIPTION="Ubuntu 14.04 for development."'
```

salt.cloud.clouds.opennebula.image_clone(call=None, kwargs=None)

Clones an existing image.

New in version 2016.3.0.

name

The name of the new image.

image_id

The ID of the image to be cloned. Can be used instead of image_name.

image_name

The name of the image to be cloned. Can be used instead of image_id.

CLI Example:

```
salt-cloud -f image_clone opennebula name=my-new-image image_id=10 
salt-cloud -f image_clone opennebula name=my-new-image image_name=my- \n  image-to-clone 
```

salt.cloud.clouds.opennebula.image_delete(call=None, kwargs=None)

Deletes the given image from OpenNebula. Either a name or an image_id must be supplied.

New in version 2016.3.0.

name

The name of the image to delete. Can be used instead of image_id.

image_id

The ID of the image to delete. Can be used instead of name.

CLI Example:

```
salt-cloud -f image_delete opennebula name=my-image 
salt-cloud --function image_delete opennebula image_id=100 
```

salt.cloud.clouds.opennebula.image_info(call=None, kwargs=None)

Retrieves information for a given image. Either a name or an image_id must be supplied.

New in version 2016.3.0.

name

The name of the image for which to gather information. Can be used instead of image_id.

image_id

The ID of the image for which to gather information. Can be used instead of name.

CLI Example:

```
salt-cloud -f image_info opennebula name=my-image 
salt-cloud --function image_info opennebula image_id=5 
```
salt.cloud.clouds.opennebula.image_persistent(*call=None, kwargs=None*)

Sets the Image as persistent or not persistent.

New in version 2016.3.0.

**name**

The name of the image to set. Can be used instead of `image_id`.

**image_id**

The ID of the image to set. Can be used instead of `name`.

**persist**

A boolean value to set the image as persistent or not. Set to true for persistent, false for non-persistent.

CLI Example:

```
salt-cloud -f image_persistent opennebula name=my-image persist=True
salt-cloud --function image_persistent opennebula image_id=5 persist=False
```

salt.cloud.clouds.opennebula.image_snapshot_delete(*call=None, kwargs=None*)

Deletes a snapshot from the image.

New in version 2016.3.0.

**image_id**

The ID of the image from which to delete the snapshot. Can be used instead of `image_name`.

**image_name**

The name of the image from which to delete the snapshot. Can be used instead of `image_id`.

**snapshot_id**

The ID of the snapshot to delete.

CLI Example:

```
salt-cloud -f image_snapshot_delete vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_delete vm_name=my-vm snapshot_id=111
```

salt.cloud.clouds.opennebula.image_snapshot_flatten(*call=None, kwargs=None*)

Flattens the snapshot of an image and discards others.

New in version 2016.3.0.

**image_id**

The ID of the image. Can be used instead of `image_name`.

**image_name**

The name of the image. Can be used instead of `image_id`.

**snapshot_id**

The ID of the snapshot to flatten.

CLI Example:

```
salt-cloud -f image_snapshot_flatten vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_flatten vm_name=my-vm snapshot_id=45
```

salt.cloud.clouds.opennebula.image_snapshot_revert(*call=None, kwargs=None*)

Reverts an image state to a previous snapshot.

New in version 2016.3.0.
image_id
The ID of the image to revert. Can be used instead of `image_name`.

image_name
The name of the image to revert. Can be used instead of `image_id`.

snapshot_id
The ID of the snapshot to which the image will be reverted.

CLI Example:
```
salt-cloud -f image_snapshot_revert vm_id=106 snapshot_id=45
salt-cloud -f image_snapshot_revert vm_name=my-vm snapshot_id=120
```

salt.cloud.clouds.opennebula.image_update(call=None, kwargs=None)
Replaces the image template contents.

New in version 2016.3.0.

image_id
The ID of the image to update. Can be used instead of `image_name`.

image_name
The name of the image to update. Can be used instead of `image_id`.

path
The path to a file containing the template of the image. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

data
Contains the template of the image. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

update_type
There are two ways to update an image: replace the whole template or merge the new template with the existing one.

CLI Example:
```
salt-cloud -f image_update opennebula image_id=0 file=/path/to/image_update_file.txt update_type=replace
salt-cloud -f image_update opennebula image_name="Ubuntu 14.04" update_type=merge \
  data='NAME="Ubuntu Dev" PATH="/home/one_user/images/ubuntu_desktop.img"' \
  DESCRIPTION = "Ubuntu 14.04 for development."
```

salt.cloud.clouds.opennebula.list_clusters(call=None)
Returns a list of clusters in OpenNebula.

New in version 2016.3.0.

CLI Example:
```
salt-cloud -f list_clusters opennebula
```

salt.cloud.clouds.opennebula.list_datastores(call=None)
Returns a list of data stores on OpenNebula.

New in version 2016.3.0.
Salt Documentation, Release 3007.1

CLI Example:

```
salt-cloud -f list_datastores opennebula
```

salt.cloud.clouds.opennebula.list_hosts(call=None)
Returns a list of hosts on OpenNebula.
New in version 2016.3.0.
CLI Example:

```
salt-cloud -f list_hosts opennebula
```

salt.cloud.clouds.opennebula.list_nodes(call=None)
Return a list of VMs on OpenNebula.
CLI Example:

```
salt-cloud -Q
salt-cloud --query
salt-cloud --function list_nodes opennebula
salt-cloud -f list_nodes opennebula
```

salt.cloud.clouds.opennebula.list_nodes_full(call=None)
Return a list of the VMs on OpenNebula.
CLI Example:

```
salt-cloud -F
salt-cloud --full-query
salt-cloud --function list_nodes_full opennebula
salt-cloud -f list_nodes_full opennebula
```

salt.cloud.clouds.opennebula.list_security_groups(call=None)
Lists all security groups available to the user and the user's groups.
New in version 2016.3.0.
CLI Example:

```
salt-cloud -f list_security_groups opennebula
```

salt.cloud.clouds.opennebula.list_templates(call=None)
Lists all templates available to the user and the user's groups.
New in version 2016.3.0.
CLI Example:

```
salt-cloud -f list_templates opennebula
```

salt.cloud.clouds.opennebula.list_vns(call=None)
Lists all virtual networks available to the user and the user's groups.
New in version 2016.3.0.
CLI Example:
salt-doc -f list_vns opennebula

salt.cloud.clouds.opennebula.reboot(name, call=None)

Reboot a VM.

New in version 2016.3.0.

name

The name of the VM to reboot.

CLI Example:
salt-cloud -a reboot my-vm

salt.cloud.clouds.opennebula.secgroupp_allocate(call=None, kwargs=None)

Allocates a new security group in OpenNebula.

New in version 2016.3.0.

path

The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data

The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:
salt-cloud -f secgroupp_allocate opennebula path=/path/to/secgroup_file.txt
salt-cloud -f secgroupp_allocate opennebula  
data="NAME = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, \  RANGE = 1000:2000]"

salt.cloud.clouds.opennebula.secgroupp_clone(call=None, kwargs=None)

Clones an existing security group.

New in version 2016.3.0.

name

The name of the new template.

secgroup_id

The ID of the security group to be cloned. Can be used instead of secgroupp_name.

secgroupp_name

The name of the security group to be cloned. Can be used instead of secgroupp_id.

CLI Example:
salt-cloud -f secgroupp_clone opennebula name=my-cloned-secgroup secgroupp_id=0
salt-cloud -f secgroupp_clone opennebula name=my-cloned-secgroup secgroupp_name=my-secgroup

salt.cloud.clouds.opennebula.secgroupp_delete(call=None, kwargs=None)

Deletes the given security group from OpenNebula. Either a name or a secgroupp_id must be supplied.

New in version 2016.3.0.
name
   The name of the security group to delete. Can be used instead of secgroup_id.

secgroup_id
   The ID of the security group to delete. Can be used instead of name.

CLI Example:

salt-cloud -f secgroup_delete opennebula name=my-secgroup
salt-cloud --function secgroup_delete opennebula secgroup_id=100

salt.cloud.clouds.opennebula.secgoup_info(call=None, kwargs=None)
Retrieves information for the given security group. Either a name or a secgroup_id must be supplied.

New in version 2016.3.0.

name
   The name of the security group for which to gather information. Can be used instead of secgroup_id.

secgroup_id
   The ID of the security group for which to gather information. Can be used instead of name.

CLI Example:

salt-cloud -f secgroup_info opennebula name=my-secgroup
salt-cloud --function secgroup_info opennebula secgroup_id=5

salt.cloud.clouds.opennebula.secgoup_update(call=None, kwargs=None)
Replaces the security group template contents.

New in version 2016.3.0.

secgroup_id
   The ID of the security group to update. Can be used instead of secgroup_name.

secgroup_name
   The name of the security group to update. Can be used instead of secgroup_id.

path
   The path to a file containing the template of the security group. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data
   The template data of the security group. Syntax can be the usual attribute=value or XML. Can be used instead of path.

update_type
   There are two ways to update a security group: replace the whole template or merge the new template with the existing one.

CLI Example:

salt-cloud --function secgroup_update opennebula secgroup_id=100 \
   path=/path/to/secgroup_update_file.txt \
   update_type=replace
salt-cloud -f secgroup_update opennebula secgroup_name=my-secgroup update_ \
   type=merge \
   data=""Name = test RULE = [PROTOCOL = TCP, RULE_TYPE = inbound, RANGE \
   = 1000:2000]""
salt.cloud.clouds.opennebula.show_instance(name, call=None)
Show the details from OpenNebula concerning a named VM.

name
The name of the VM for which to display details.

call
Type of call to use with this function such as function.

CLI Example:

```
salt-cloud --action show_instance vm_name
salt-cloud -a show_instance vm_name
```

salt.cloud.clouds.opennebula.start(name, call=None)
Start a VM.
New in version 2016.3.0.

name
The name of the VM to start.

CLI Example:

```
salt-cloud -a start my-vm
```

salt.cloud.clouds.opennebula.stop(name, call=None)
Stop a VM.
New in version 2016.3.0.

name
The name of the VM to stop.

CLI Example:

```
salt-cloud -a stop my-vm
```

salt.cloud.clouds.opennebula.template_allocate(call=None, kwargs=None)
Allocates a new template in OpenNebula.
New in version 2016.3.0.

path
The path to a file containing the elements of the template to be allocated. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data
Contains the elements of the template to be allocated. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:

```
salt-cloud -f template_allocate opennebula path=/path/to/template_file.txt
salt-cloud -f template_allocate opennebula \data='CPU="1.0" DISK=[IMAGE="Ubuntu-14.04"] GRAPHICS=[LISTEN="0.0.0.0\" TYPE="vnc"] \MEMORY="1024" NETWORK="yes" NIC=[NETWORK="192net",NETWORK_UNAME="oneadmin"]' \```

(continues on next page)
salt.cloud.clouds.opennebula.template_clone(call=None, kwargs=None)
Clones an existing virtual machine template.
New in version 2016.3.0.

name
The name of the new template.

template_id
The ID of the template to be cloned. Can be used instead of template_name.

template_name
The name of the template to be cloned. Can be used instead of template_id.

clone_images
Optional, defaults to False. Indicates if the images attached to the template should be cloned as well.

CLI Example:
```
salt-cloud -f template_clone opennebula name=my-new-template template_id=0
salt-cloud -f template_clone opennebula name=my-new-template template_name=my-template
```

salt.cloud.clouds.opennebula.template_delete(call=None, kwargs=None)
Deletes the given template from OpenNebula. Either a name or a template_id must be supplied.
New in version 2016.3.0.

name
The name of the template to delete. Can be used instead of template_id.

template_id
The ID of the template to delete. Can be used instead of name.

CLI Example:
```
salt-cloud -f template_delete opennebula name=my-template
salt-cloud --function template_delete opennebula template_id=5
```

salt.cloud.clouds.opennebula.templateInstantiate(call=None, kwargs=None)
Instantiates a new virtual machine from a template.
New in version 2016.3.0.

Note: templateInstantiate creates a VM on OpenNebula from a template, but it does not install Salt on the new VM. Use the create function for that functionality: salt-cloud -p opennebula-profile vm-name.

vm_name
Name for the new VM instance.

template_id
The ID of the template from which the VM will be created. Can be used instead of template_name.
### template_name

The name of the template from which the VM will be created. Can be used instead of template_id.

**CLI Example:**

```bash
salt-cloud -f template_instantiate opennebula vm_name=my-new-vm template_id=0
```

salt.cloud.clouds.opennebula.template_update(call=None, kwargs=None)

Replaces the template contents.

New in version 2016.3.0.

- **template_id**
  - The ID of the template to update. Can be used instead of template_name.

- **template_name**
  - The name of the template to update. Can be used instead of template_id.

- **path**
  - The path to a file containing the elements of the template to be updated. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

- **data**
  - Contains the elements of the template to be updated. Syntax can be the usual attribute=value or XML. Can be used instead of path.

- **update_type**
  - There are two ways to update a template: replace the whole template or merge the new template with the existing one.

**CLI Example:**

```bash
salt-cloud --function template_update opennebula template_id=1 update_,type=replace path=/path/to/template_update_file.txt
salt-cloud -f template_update opennebula template_name=my-template update_,type=merge data='CPU="1.0" DISK=[[IMAGE="Ubuntu-14.04"] GRAPHICS=[[LISTEN="0.0.0.0:0",TYPE="vnc"] MEMORY="1024" NETWORK="yes" NIC=[[NETWORK="192net",NETWORK_UNAME="oneadmin"] OS=[[ARCH="x86_64"] SUNSTONE_CAPACITY_SELECT="YES" SUNSTONE_NETWORK_SELECT="YES" VCPU="1"]'
```

salt.cloud.clouds.opennebula.vm_action(name, kwargs=None, call=None)

Submits an action to be performed on a given virtual machine.

New in version 2016.3.0.

- **name**
  - The name of the VM to action.

- **action**
  - The action to be performed on the VM. Available options include:
    - boot
• delete
• delete-recreate
• hold
• poweroff
• poweroff-hard
• reboot
• reboot-hard
• release
• resched
• resume
• shutdown
• shutdown-hard
• stop
• suspend
• undeploy
• undeploy-hard
• unresched

CLI Example:
```
salt-cloud -a vm_action my-vm action='release'
```

salt.cloud.clouds.opennebula.vm_allocate(call=None, kwargs=None)
Allocates a new virtual machine in OpenNebula.

New in version 2016.3.0.

path
The path to a file defining the template of the VM to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data
Contains the template definitions of the VM to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of path.

hold
If this parameter is set to True, the VM will be created in the HOLD state. If not set, the VM is created in the PENDING state. Default is False.

CLI Example:
```
salt-cloud -f vmAllocate path=/path/to/vm_template.txt
salt-cloud --function vmAllocate path=/path/to/vm_template.txt hold=True
```

salt.cloud.clouds.opennebula.vm_attach(name, kwargs=None, call=None)
Attaches a new disk to the given virtual machine.

New in version 2016.3.0.
name
The name of the VM for which to attach the new disk.

path
The path to a file containing a single disk vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data
Contains the data needed to attach a single disk vector attribute. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:
```
salt-cloud -a vm_attach my-vm path=/path/to/disk_file.txt
salt-cloud -a vm_attach my-vm data="DISK=[DISK_ID=1]"
```

salt.cloud.clouds.opennebula.vm_attach_nic(name, kwargs=None, call=None)
Attaches a new network interface to the given virtual machine.

New in version 2016.3.0.

name
The name of the VM for which to attach the new network interface.

path
The path to a file containing a single NIC vector attribute. Syntax within the file can be the usual attribute=value or XML. Can be used instead of data.

data
Contains the single NIC vector attribute to attach to the VM. Syntax can be the usual attribute=value or XML. Can be used instead of path.

CLI Example:
```
salt-cloud -a vm_attach_nic my-vm path=/path/to/nic_file.txt
salt-cloud -a vm_attach_nic my-vm data="NIC=[NETWORK_ID=1]"
```

salt.cloud.clouds.opennebula.vm_deploy(name, kwargs=None, call=None)
Initiates the instance of the given VM on the target host.

New in version 2016.3.0.

name
The name of the VM to deploy.

host_id
The ID of the target host where the VM will be deployed. Can be used instead of host_name.

host_name
The name of the target host where the VM will be deployed. Can be used instead of host_id.

capacity_maintained
True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the oneadmin group. Host capacity will be always enforced for regular users.

datastore_id
The ID of the target system data-store where the VM will be deployed. Optional and can be used instead of datastore_name. If neither datastore_id nor datastore_name are set, OpenNebula will choose the data-store.
datastore_name

The name of the target system data-store where the VM will be deployed. Optional, and can be used instead of datastore_id. If neither datastore_id nor datastore_name are set, OpenNebula will choose the data-store.

CLI Example:

```
salt-cloud -a vm_deploy my-vm host_id=0
dsalt-cloud -a vm_deploy my-vm host_id=1 capacity_maintained=False
dsalt-cloud -a vm_deploy my-vm host_name=host01 datastore_id=1
dsalt-cloud -a vm_deploy my-vm host_name=host01 datastore_name=default
```

salt.cloud.clouds.opennebula.vm_detach(name, kwargs=None, call=None)

Detaches a disk from a virtual machine.

New in version 2016.3.0.

name

The name of the VM from which to detach the disk.

disk_id

The ID of the disk to detach.

CLI Example:

```
salt-cloud -a vm_detach my-vm disk_id=1
```

salt.cloud.clouds.opennebula.vm_detach_nic(name, kwargs=None, call=None)

Detaches a disk from a virtual machine.

New in version 2016.3.0.

name

The name of the VM from which to detach the network interface.

nic_id

The ID of the nic to detach.

CLI Example:

```
salt-cloud -a vm_detach_nic my-vm nic_id=1
```

salt.cloud.clouds.opennebula.vm_disk_save(name, kwargs=None, call=None)

Sets the disk to be saved in the given image.

New in version 2016.3.0.

name

The name of the VM containing the disk to save.

disk_id

The ID of the disk to save.

image_name

The name of the new image where the disk will be saved.

image_type

The type for the new image. If not set, then the default ONED Configuration will be used. Other valid types include: OS, CDROM, DATABLOCK, KERNEL, RAMDISK, and CONTEXT.
**snapshot_id**

The ID of the snapshot to export. If not set, the current image state will be used.

CLI Example:

```bash
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image
salt-cloud -a vm_disk_save my-vm disk_id=1 image_name=my-new-image image_type=CONTEXT snapshot_id=10
```

`salt.cloud.clouds.opennebula.vm_disk_snapshot_create(name, kwargs=None, call=None)`

Takes a new snapshot of the disk image.

New in version 2016.3.0.

**name**

The name of the VM of which to take the snapshot.

**disk_id**

The ID of the disk to save.

**description**

The description for the snapshot.

CLI Example:

```bash
salt-cloud -a vm_disk_snapshot_create my-vm disk_id=0 description="My Snapshot Description"
```

`salt.cloud.clouds.opennebula.vm_disk_snapshot_delete(name, kwargs=None, call=None)`

Deletes a disk snapshot based on the given VM and the disk_id.

New in version 2016.3.0.

**name**

The name of the VM containing the snapshot to delete.

**disk_id**

The ID of the disk to save.

**snapshot_id**

The ID of the snapshot to be deleted.

CLI Example:

```bash
salt-cloud -a vm_disk_snapshot_delete my-vm disk_id=0 snapshot_id=6
```

`salt.cloud.clouds.opennebula.vm_disk_snapshot_revert(name, kwargs=None, call=None)`

Reverts a disk state to a previously taken snapshot.

New in version 2016.3.0.

**name**

The name of the VM containing the snapshot.

**disk_id**

The ID of the disk to revert its state.

**snapshot_id**

The ID of the snapshot to which the snapshot should be reverted.

CLI Example:
salt.cloud -a vm_disk_snapshot_revert my-vm disk_id=0 snapshot_id=6

salt.cloud.clouds.opennebula.vm_info(name, call=call)
Retrieves information for a given virtual machine. A VM name must be supplied.

name
The name of the VM for which to gather information.

CLI Example:
salt-cloud -a vm_info my-vm

salt.cloud.clouds.opennebula.vm_migrate(name, kwargs=kwargs, call=call)
Migrates the specified virtual machine to the specified target host.

name
The name of the VM to migrate.

host_id
The ID of the host to which the VM will be migrated. Can be used instead of host_name.

host_name
The name of the host to which the VM will be migrated. Can be used instead of host_id.

live_migration
If set to True, a live-migration will be performed. Default is False.

capacity_maintained
True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the oneadmin group. Host capacity will be always enforced for regular users.

datastore_id
The target system data-store ID where the VM will be migrated. Can be used instead of datastore_name.

datastore_name
The name of the data-store target system where the VM will be migrated. Can be used instead of datastore_id.

CLI Example:
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1
salt-cloud -a vm_migrate my-vm host_id=0 datastore_id=1 live_migration=True
salt-cloud -a vm_migrate my-vm host_name=host01 datastore_name=default

salt.cloud.clouds.opennebula.vm_monitoring(name, call=call)
Returns the monitoring records for a given virtual machine. A VM name must be supplied.

The monitoring information returned is a list of VM elements. Each VM element contains the complete dictionary of the VM with the updated information returned by the poll action.

New in version 2016.3.0.

name
The name of the VM for which to gather monitoring records.
Salt Documentation, Release 3007.1

CLI Example:

```
salt-cloud -a vm_monitoring my-vm
```

salt.cloud.clouds.opennebula.vm_resize(name, kwargs=None, call=None)

Changes the capacity of the virtual machine.

New in version 2016.3.0.

- **name**
  The name of the VM to resize.

- **path**
  The path to a file containing new capacity elements CPU, VCPU, MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

- **data**
  Contains the new capacity elements CPU, VCPU, and MEMORY. If one of them is not present, or its value is 0, the VM will not be re-sized. Can be used instead of `path`.

- **capacity_maintained**
  True to enforce the Host capacity is not over-committed. This parameter is only acknowledged for users in the `oneadmin` group. Host capacity will be always enforced for regular users.

CLI Example:

```
salt-cloud -a vm_resize my-vm path=/path/to/capacity_template.txt
salt-cloud -a vm_resize my-vm path=/path/to/capacity_template.txt var(capacity_maintained=False
salt-cloud -a vm_resize my-vm data="CPU=1 VCPU=1 MEMORY=1024"
```

salt.cloud.clouds.opennebula.vm_snapshot_create(vm_name, kwargs=None, call=None)

Creates a new virtual machine snapshot from the provided VM.

New in version 2016.3.0.

- **vm_name**
  The name of the VM from which to create the snapshot.

- **snapshot_name**
  The name of the snapshot to be created.

CLI Example:

```
salt-cloud -a vm_snapshot_create my-vm snapshot_name=my-new-snapshot
```

salt.cloud.clouds.opennebula.vm_snapshot_delete(vm_name, kwargs=None, call=None)

Deletes a virtual machine snapshot from the provided VM.

New in version 2016.3.0.

- **vm_name**
  The name of the VM from which to delete the snapshot.

- **snapshot_id**
  The ID of the snapshot to be deleted.

CLI Example:
salt-cloud -a vm_snapshot_delete my-vm snapshot_id=8

```
salt.cloud.clouds.opennebula.vm_snapshot_revert(vm_name, kwargs=None, call=None)
```
Reverts a virtual machine to a snapshot
New in version 2016.3.0.

- **vm_name**
  The name of the VM to revert.

- **snapshot_id**
  The snapshot ID.

CLI Example:
```
salt-cloud -a vm_snapshot_revert my-vm snapshot_id=42
```

```
salt.cloud.clouds.opennebula.vm_update(name, kwargs=None, call=None)
```
Replaces the user template contents.
New in version 2016.3.0.

- **name**
  The name of the VM to update.

- **path**
  The path to a file containing new user template contents. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

- **data**
  Contains the new user template contents. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

- **update_type**
  There are two ways to update a VM: `replace` the whole template or `merge` the new template with the existing one.

CLI Example:
```
salt-cloud -a vm_update my-vm path=/path/to/user_template_file.txt update_type='replace'
```

```
salt.cloud.clouds.opennebula.vn_add_ar(call=None, kwargs=None)
```
Adds address ranges to a given virtual network.
New in version 2016.3.0.

- **vn_id**
  The ID of the virtual network to add the address range. Can be used instead of `vn_name`.

- **vn_name**
  The name of the virtual network to add the address range. Can be used instead of `vn_id`.

- **path**
  The path to a file containing the template of the address range to add. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

- **data**
  Contains the template of the address range to add. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.
CLI Example:

```bash
salt-cloud -f vn_add_ar opennebula vn_id=3 path=/path/to/address_range.txt
salt-cloud -f vn_add_ar opennebula vn_name=my-vn \
data="AR=[TYPE=IP4, IP=192.168.0.5, SIZE=10]"
```

**salt.cloud.clouds.opennebula.vn_allocate**(*call=None, kwargs=None*)

Allocates a new virtual network in OpenNebula.

New in version 2016.3.0.

**path**

The path to a file containing the template of the virtual network to allocate. Syntax within the file can be the usual attribute=value or XML. Can be used instead of **data**.

**data**

Contains the template of the virtual network to allocate. Syntax can be the usual attribute=value or XML. Can be used instead of **path**.

**cluster_id**

The ID of the cluster for which to add the new virtual network. Can be used instead of **cluster_name**. If neither **cluster_id** nor **cluster_name** are provided, the virtual network won’t be added to any cluster.

**cluster_name**

The name of the cluster for which to add the new virtual network. Can be used instead of **cluster_id**. If neither **cluster_name** nor **cluster_id** are provided, the virtual network won’t be added to any cluster.

CLI Example:

```bash
salt-cloud -f vn_allocate opennebula path=/path/to/vn_file.txt
```

**salt.cloud.clouds.opennebula.vn_delete**(*call=None, kwargs=None*)

Deletes the given virtual network from OpenNebula. Either a name or a **vn_id** must be supplied.

New in version 2016.3.0.

**name**

The name of the virtual network to delete. Can be used instead of **vn_id**.

**vn_id**

The ID of the virtual network to delete. Can be used instead of **name**.

CLI Example:

```bash
salt-cloud -f vn_delete opennebula name=my-virtual-network
salt-cloud --function vn_delete opennebula vn_id=3
```

**salt.cloud.clouds.opennebula.vn_free_ar**(*call=None, kwargs=None*)

Frees a reserved address range from a virtual network.

New in version 2016.3.0.

**vn_id**

The ID of the virtual network from which to free an address range. Can be used instead of **vn_name**.

**vn_name**

The name of the virtual network from which to free an address range. Can be used instead of **vn_id**.
ar_id
   The ID of the address range to free.

CLI Example:

salt-cloud -f vn_free_ar opennebula vn_id=3 ar_id=1
salt-cloud -f vn_free_ar opennebula vn_name=my-vn ar_id=1

salt.cloud.clouds.opennebula.vn_hold(call=None, kwargs=None)
Holds a virtual network lease as used.

New in version 2016.3.0.

vn_id
   The ID of the virtual network from which to hold the lease. Can be used instead of vn_name.

vn_name
   The name of the virtual network from which to hold the lease. Can be used instead of vn_id.

path
   The path to a file defining the template of the lease to hold. Syntax within the file can be the usual
   attribute=value or XML. Can be used instead of data.

data
   Contains the template of the lease to hold. Syntax can be the usual attribute=value or XML. Can be used
   instead of path.

CLI Example:

salt-cloud -f vn_hold opennebula vn_id=3 path=/path/to/vn_hold_file.txt
salt-cloud -f vn_hold opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.
   →5]"

salt.cloud.clouds.opennebula.vn_info(call=None, kwargs=None)
   Retrieves information for the virtual network.

New in version 2016.3.0.

name
   The name of the virtual network for which to gather information. Can be used instead of vn_id.

vn_id
   The ID of the virtual network for which to gather information. Can be used instead of name.

CLI Example:

salt-cloud -f vn_info opennebula vn_id=3
salt-cloud --function vn_info opennebula name=public

salt.cloud.clouds.opennebula.vn_release(call=None, kwargs=None)
   Releases a virtual network lease that was previously on hold.

New in version 2016.3.0.

vn_id
   The ID of the virtual network from which to release the lease. Can be used instead of vn_name.

vn_name
   The name of the virtual network from which to release the lease. Can be used instead of vn_id.
**path**

The path to a file defining the template of the lease to release. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the template defining the lease to release. Syntax can be the usual attribute=value or XML. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_release opennebula vn_id=3 path=/path/to/vn_release_file.
salt-cloud -f vn_release opennebula vn_name=my-vn data="LEASES=[IP=192.168.0.5]"
```

salt.cloud.clouds.opennebula.vn_reserve(call=None, kwargs=None)

Reserve network addresses.

New in version 2016.3.0.

**vn_id**

The ID of the virtual network from which to reserve addresses. Can be used instead of vn_name.

**vn_name**

The name of the virtual network from which to reserve addresses. Can be used instead of vn_id.

**path**

The path to a file defining the template of the address reservation. Syntax within the file can be the usual attribute=value or XML. Can be used instead of `data`.

**data**

Contains the template defining the address reservation. Syntax can be the usual attribute=value or XML. Data provided must be wrapped in double quotes. Can be used instead of `path`.

CLI Example:

```
salt-cloud -f vn_reserve opennebula vn_id=3 path=/path/to/vn_reserve_file.
salt-cloud -f vn_reserve opennebula vn_name=my-vn data="SIZE=10 AR_ID=8 NETWORK_ID=1"
```

---

26.4.16 salt.cloud.clouds.openstack

Openstack Cloud Driver

**depends**

```
shade>=1.19.0
```

OpenStack is an open source project that is in use by a number a cloud providers, each of which have their own ways of using it.

This OpenStack driver uses a the shade python module which is managed by the OpenStack Infra team. This module is written to handle all the different versions of different OpenStack tools for salt, so most commands are just passed over to the module to handle everything.
Provider

There are two ways to configure providers for this driver. The first one is to just let shade handle everything, and configure using `os-client-config` and setting up `~/etc/openstack/clouds.yml`.

```yaml
clouds:
  democloud:
    region_name: RegionOne
    auth:
      username: 'demo'
      password: secret
      project_name: 'demo'
      auth_url: 'http://openstack/identity'
```

And then this can be referenced in the salt provider based on the `democloud` name.

```yaml
myopenstack:
  driver: openstack
  cloud: democloud
  region_name: RegionOne
```

This allows for just using one configuration for salt-cloud and for any other openstack tools which are all using `~/etc/openstack/clouds.yml`.

The other method allows for specifying everything in the provider config, instead of using the extra configuration file. This will allow for passing salt-cloud configs only through pillars for minions without having to write a clouds.yml file on each minion.abs

```yaml
myopenstack:
  driver: openstack
  region_name: RegionOne
  auth:
    username: 'demo'
    password: secret
    project_name: 'demo'
    user_domain_name: default,
    project_domain_name: default,
    auth_url: 'http://openstack/identity'
```

Or if you need to use a profile to setup some extra stuff, it can be passed as a `profile` to use any of the `vendor` config options.

```yaml
myrackspace:
  driver: openstack
  profile: rackspace
  auth:
    username: rackusername
    api_key: myapikey
    region_name: ORD
    auth_type: rackspace_apikey
```

And this will pull in the profile for rackspace and setup all the correct options for the auth_url and different api versions for services.
Profile

Most of the options for building servers are just passed on to the `create_server` function from shade. The salt specific ones are:

- `ssh_key_file`: The path to the ssh key that should be used to login to the machine to bootstrap it
- `ssh_key_file`: The name of the keypair in openstack
- `userdata_template`: The renderer to use if the userdata is a file that is templated. Default: False
- `ssh_interface`: The interface to use to login for bootstrapping: public_ips, private_ips, floating_ips, fixed_ips
- `ignore_cidr`: Specify a CIDR range of unreachable private addresses for salt to ignore when connecting

```python
centos:
    provider: myopenstack
    image: CentOS 7
    size: ds1G
    ssh_key_name: mykey
    ssh_key_file: /root/.ssh/id_rsa
```

This is the minimum setup required.

If metadata is set to make sure that the host has finished setting up the `wait_for_metadata` can be set.

```python
centos:
    provider: myopenstack
    image: CentOS 7
    size: ds1G
    ssh_key_name: mykey
    ssh_key_file: /root/.ssh/id_rsa
    meta:
        build_config: rack_user_only
        wait_for_metadata: 
            rax_service_level_automation: Complete
            rackconnect_automation_status: DEPLOYED
```

If your OpenStack instances only have private IP addresses and a CIDR range of private addresses are not reachable from the salt-master, you may set your preference to have Salt ignore it:

```python
my-openstack-config:
    ignore_cidr: 192.168.0.0/16
```

Anything else from the `create_server` docs can be passed through here.

- `image`: Image dict, name or ID to boot with. image is required unless boot_volume is given.
- `flavor`: Flavor dict, name or ID to boot onto.
- `auto_ip`: Whether to take actions to find a routable IP for the server. (defaults to True)
- `ips`: List of IPs to attach to the server (defaults to None)
- `ip_pool`: Name of the network or floating IP pool to get an address from. (defaults to None)
- `root_volume`: Name or ID of a volume to boot from (defaults to None - deprecated, use boot_volume)
- `boot_volume`: Name or ID of a volume to boot from (defaults to None)
- **terminate_volume**: If booting from a volume, whether it should be deleted when the server is destroyed. (defaults to False)
- **volumes**: (optional) A list of volumes to attach to the server
- **meta**: (optional) A dict of arbitrary key/value metadata to store for this server. Both keys and values must be <=255 characters.
- **files**: (optional, deprecated) A dict of files to overwrite on the server upon boot. Keys are file names (i.e. `etc/passwd`) and values are the file contents (either as a string or as a file-like object). A maximum of five entries is allowed, and each file must be 10k or less.
- **reservation_id**: a UUID for the set of servers being requested.
- **min_count**: (optional extension) The minimum number of servers to launch.
- **max_count**: (optional extension) The maximum number of servers to launch.
- **security_groups**: A list of security group names
- **userdata**: user data to pass to be exposed by the metadata server this can be a file type object as well or a string.
- **key_name**: (optional extension) name of previously created keypair to inject into the instance.
- **availability_zone**: Name of the availability zone for instance placement.
- **block_device_mapping**: (optional) A list of dictionaries representing legacy block device mappings for this server. See documentation for details.
- **block_device_mapping_v2**: (optional) A list of dictionaries representing block device mappings for this server. See v2 documentation for details.
- **nics**: (optional extension) an ordered list of nics to be added to this server, with information about connected networks, fixed IPs, port etc.
- **scheduler_hints**: (optional extension) arbitrary key-value pairs specified by the client to help boot an instance
- **config_drive**: (optional extension) value for config drive either boolean, or volume-id
- **disk_config**: (optional extension) control how the disk is partitioned when the server is created. possible values are 'AUTO' or 'MANUAL'.
- **admin_pass**: (optional extension) add a user supplied admin password.
- **timeout**: (optional) Seconds to wait, defaults to 60. See the wait parameter.
- **reuse_ips**: (optional) Whether to attempt to reuse pre-existing floating ips should a floating IP be needed (defaults to True)
- **network**: (optional) Network dict or name or ID to attach the server to. Mutually exclusive with the nics parameter. Can also be a list of network names or IDs or network dicts.
- **boot_from_volume**: Whether to boot from volume. 'boot_volume' implies True, but boot_from_volume=True with no boot_volume is valid and will create a volume from the image and use that.
- **volume_size**: When booting an image from volume, how big should the created volume be? Defaults to 50.
- **nat_destination**: Which network should a created floating IP be attached to, if it's not possible to infer from the cloud's configuration. (Optional, defaults to None)
- **group**: ServerGroup dict, name or id to boot the server in. If a group is provided in both scheduler_hints and in the group param, the group param will win. (Optional, defaults to None)
Note: If there is anything added, that is not in this list, it can be added to an extras dictionary for the profile, and that will be to the create_server function.

salt.cloud.clouds.openstack avail_images(conn=None, call=None)
List available images for OpenStack

CLI Example

```bash
salt-cloud -f avail_images myopenstack
salt-cloud --list-images myopenstack
```

salt.cloud.clouds.openstack avail_sizes(conn=None, call=None)
List available sizes for OpenStack

CLI Example

```bash
salt-cloud -f avail_sizes myopenstack
salt-cloud --list-sizes myopenstack
```

salt.cloud.clouds.openstack.call(conn=None, call=None, kwars=None)
Call function from shade.

func

function to call from shade.openstackcloud library

CLI Example

```bash
salt-cloud -f call myopenstack func=list_images
salt-cloud -f call myopenstack func=create_network name=mysubnet
```

salt.cloud.clouds.openstack.create(vm_)
Create a single VM from a data dict

salt.cloud.clouds.openstack.destroy(name, conn=None, call=None)
Delete a single VM

salt.cloud.clouds.openstack.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.openstack.get_conn()
Return a conn object for the passed VM data

salt.cloud.clouds.openstack.get_dependencies()
Warn if dependencies aren't met.

salt.cloud.clouds.openstack.ignore_cidr(vm_, ip)
Return True if we are to ignore the specified IP.

salt.cloud.clouds.openstack.list_networks(conn=None, call=None)
List networks for OpenStack

CLI Example

```bash
salt-cloud -f list_networks myopenstack
```
salt.cloud.clouds.openstack.list_nodes(conn=None, call=None)
    Return a list of VMs
    CLI Example
    
    ```
    salt-cloud -f list_nodes myopenstack
    ```

salt.cloud.clouds.openstack.list_nodes_full(conn=None, call=None)
    Return a list of VMs with all the information about them
    CLI Example
    
    ```
    salt-cloud -f list_nodes_full myopenstack
    ```

salt.cloud.clouds.openstack.list_nodes_min(conn=None, call=None)
    Return a list of VMs with minimal information
    CLI Example
    
    ```
    salt-cloud -f list_nodes_min myopenstack
    ```

salt.cloud.clouds.openstack.list_nodes_select(conn=None, call=None)
    Return a list of VMs with the fields from query.selection
    CLI Example
    
    ```
    salt-cloud -f list_nodes_full myopenstack
    ```

salt.cloud.clouds.openstack.list_subnets(conn=None, call=None, kwargs=None)
    List subnets in a virtual network
    network
    network to list subnets of
    
    ```
    salt-cloud -f list_subnets myopenstack network=salt-net
    ```

salt.cloud.clouds.openstack.preferred_ip(vm_, ips)
    Return either an ‘ipv4’ (default) or ‘ipv6’ address depending on ‘protocol’ option. The list of ‘ipv4’ IPs is filtered by ignore_cidr() to remove any unreachable private addresses.

salt.cloud.clouds.openstack.request_instance(vm_, conn=None, call=None)
    Request an instance to be built

salt.cloud.clouds.openstack.show_instance(name, conn=None, call=None)
    Get VM on this OpenStack account
    name
    name of the instance
    CLI Example
    
    ```
    salt-cloud -a show_instance myserver
    ```

salt.cloud.clouds.openstack.ssh_interface(vm_)
    Return the ssh_interface type to connect to. Either ‘public_ips’ (default) or ‘private_ips’.
26.4.17 salt.cloud.clouds.packet

Packet Cloud Module Using Packet’s Python API Client

The Packet cloud module is used to control access to the Packet VPS system.

Use of this module only requires the token parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/packet.conf`:

The Packet profile requires size, image, location, project_id

Optional profile parameters:

- `storage_size` - min value is 10, defines Gigabytes of storage that will be attached to device.
- `storage_tier` - storage_1 - Standard Plan, storage_2 - Performance Plan
- `snapshot_count` - int
- `snapshot_frequency` - string - possible values:
  - 1min
  - 15min
  - 1hour
  - 1day
  - 1week
  - 1month
  - 1year

This driver requires Packet’s client library: [https://pypi.python.org/pypi/packet-python](https://pypi.python.org/pypi/packet-python)

```
packet-provider:
  minion:
    master: 192.168.50.10
  driver: packet
  token: ewr23rdf35wC8oNjJrhmHa87rjSXzJyi
  private_key: /root/.ssh/id_rsa

packet-profile:
  provider: packet-provider
  size: baremetal_0
  image: ubuntu_16_04_image
  location: ewr1
  project_id: a64d000b-d47c-4d26-9870-46aac43010a6
  storage_size: 10
  storage_tier: storage_1
  storage_snapshot_count: 1
  storage_snapshot_frequency: 15min
```

salt.cloud.clouds.packet.avail_images(
    call=None)

Return available Packet os images.

CLI Example:
salt-cloud --list-images packet-provider
salt-cloud -f avail_images packet-provider

salt.cloud.clouds.packet.avail_locations(call=None)
Return available Packet datacenter locations.

CLI Example:

salt-cloud --list-locations packet-provider
salt-cloud -f avail_locations packet-provider

salt.cloud.clouds.packet.avail_projects(call=None)
Return available Packet projects.

CLI Example:

salt-cloud -f avail_projects packet-provider

salt.cloud.clouds.packet.avail_sizes(call=None)
Return available Packet sizes.

CLI Example:

salt-cloud --list-sizes packet-provider
salt-cloud -f avail_sizes packet-provider

salt.cloud.clouds.packet.create(vm_)
Create a single Packet VM.

salt.cloud.clouds.packet.destroy(name, call=None)
Destroys a Packet device by name.

name
    The hostname of VM to be be destroyed.

CLI Example:

salt-cloud -d name

salt.cloud.clouds.packet.get_configured_provider() 
Return the first configured instance.

salt.cloud.clouds.packet.get_devices_by_token()

salt.cloud.clouds.packet.get_image(conn, vm_)
Return the image object to use

salt.cloud.clouds.packet.get_size(conn, vm_)
Return the VM's size object

salt.cloud.clouds.packet.is_profile_configured(vm_)

salt.cloud.clouds.packet.list_nodes(call=None)
Returns a list of devices, keeping only a brief listing.

CLI Example:
salt-cloud -Q
salt-cloud --query
salt-cloud -f list_nodes packet-provider

salt.cloud.clouds.packet.list_nodes_full(call=None)
List devices, with all available information.

CLI Example:
salt-cloud -F
salt-cloud --full-query
salt-cloud -f list_nodes_full packet-provider

salt.cloud.clouds.packet.list_nodes_min(call=None)
Return a list of the VMs that are on the provider. Only a list of VM names and their state is returned. This is the minimum amount of information needed to check for existing VMs.

New in version 2015.8.0.

CLI Example:
salt-cloud -f list_nodes_min packet-provider
salt-cloud --function list_nodes_min packet-provider

salt.cloud.clouds.packet.list_nodes_select(call=None)
Return a list of the VMs that are on the provider, with select fields.

salt.cloud.clouds.packet.script(vm_)
Return the script deployment object

salt.cloud.clouds.packet.show_instance(name, call=None)
Show the details from the provider concerning an instance

26.4.18 salt.cloud.clouds.parallels

Parallels Cloud Module

The Parallels cloud module is used to control access to cloud providers using the Parallels VPS system.

Set up the cloud configuration at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/parallels.conf:

my-parallels-config:
    # Parallels account information
    user: myuser
    password: mypassword
    url: https://api.cloud.xmission.com:4465/paci/v1.0/
    driver: parallels

salt.cloud.clouds.parallels.avail_images(call=None)
Return a list of the images that are on the provider

salt.cloud.clouds.parallels.create(vm_)
Create a single VM from a data dict
salt.cloud.clouds.parallels.create_node

Build and submit the XML to create a node

salt.cloud.clouds.parallels.destroy(name, call=None)

Destroy a node.

CLI Example:

```bash
given-dev --destroy mymachine
```

salt.cloud.clouds.parallels.get_configured_provider()

Return the first configured instance.

salt.cloud.clouds.parallels.get_image

Return the image object to use

salt.cloud.clouds.parallels.list_nodes(call=None)

Return a list of the VMs that are on the provider

salt.cloud.clouds.parallels.list_nodes_full(call=None)

Return a list of the VMs that are on the provider

salt.cloud.clouds.parallels.list_nodes_select(call=None)

Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.parallels.query(action=None, command=None, args=None, method='GET',
data=None)

Make a web call to a Parallels provider

salt.cloud.clouds.parallels.script

Return the script deployment object

salt.cloud.clouds.parallels.show_image(kwargs, call=None)

Show the details from Parallels concerning an image

salt.cloud.clouds.parallels.show_instance(name, call=None)

Show the details from Parallels concerning an instance

salt.cloud.clouds.parallels.start(name, call=None)

Start a node.

CLI Example:

```bash
given-dev -a start mymachine
```

salt.cloud.clouds.parallels.stop(name, call=None)

Stop a node.

CLI Example:

```bash
given-dev -a stop mymachine
```

salt.cloud.clouds.parallels.wait_until(name, state, timeout=300)

Wait until a specific state has been reached on a node
26.4.19 salt.cloud.clouds.profitbricks

ProfitBricks Cloud Module

The ProfitBricks SaltStack cloud module allows a ProfitBricks server to be automatically deployed and bootstrapped with Salt.

    depends
    profitbrick >= 3.1.0

The module requires ProfitBricks credentials to be supplied along with an existing virtual datacenter UUID where the server resources will reside. The server should also be assigned a public LAN, a private LAN, or both along with SSH key pairs. ...

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/profitbricks.conf`:

```
my-profitbricks-config:
    driver: profitbricks
    # The ProfitBricks login username
    username: user@example.com
    # The ProfitBricks login password
    password: secretpassword
    # The ProfitBricks virtual datacenter UUID
    datacenter_id: <UUID>
    # SSH private key filename
    ssh_private_key: /path/to/private.key
    # SSH public key filename
    ssh_public_key: /path/to/public.key

my-profitbricks-profile:
    provider: my-profitbricks-config
    # Name of a predefined server size.
    size: Micro Instance
    # Assign CPU family to server.
    cpu_family: INTEL_XEON
    # Number of CPU cores to allocate to node (overrides server size).
    cores: 4
    # Amount of RAM in multiples of 256 MB (overrides server size).
    ram: 4096
    # The server availability zone.
    availability_zone: ZONE_1
    # Name or UUID of the HDD image to use.
    image: <UUID>
    # Image alias could be provided instead of image.
    # Example 'ubuntu:latest'
    #image_alias: <IMAGE_ALIAS>
    # Size of the node disk in GB (overrides server size).
    disk_size: 40
    # Type of disk (HDD or SSD).
    disk_type: SSD
    # Storage availability zone to use.
    disk_availability_zone: ZONE_2
    # Assign the server to the specified public LAN.
```

(continues on next page)
```yaml
public_lan: <ID>
# Assign firewall rules to the network interface.
public_firewall_rules:
  SSH:
    protocol: TCP
    port_range_start: 22
    port_range_end: 22
# Assign the server to the specified private LAN.
private_lan: <ID>
# Enable NAT on the private NIC.
nat: true
# Assign additional volumes to the server.
volumes:
  data-volume:
    disk_size: 500
    disk_availability_zone: ZONE_3
  log-volume:
    disk_size: 50
    disk_type: SSD
```

To use a private IP for connecting and bootstrapping node:

```yaml
my-profitbricks-profile:
  ssh_interface: private_lan
```

Set deploy to False if Salt should not be installed on the node.

```yaml
my-profitbricks-profile:
  deploy: False
```

salt.cloud.clouds.profitbricks.avail_images(call=None)
Return a list of the images that are on the provider

salt.cloud.clouds.profitbricks.avail_locations(call=None)
Return a dict of all available VM locations on the cloud provider with relevant data

salt.cloud.clouds.profitbricks.avail_sizes(call=None)
Return a dict of all available VM sizes on the cloud provider with relevant data. Latest version can be found at:

salt.cloud.clouds.profitbricks.create(vm_)
Create a single VM from a data dict

salt.cloud.clouds.profitbricks.create_datacenter(call=None, **kwargs=None)
Creates a virtual datacenter based on supplied parameters.

CLI Example:

```bash
salt-cloud -f create_datacenter profitbricks name=mydatacenter location=us/las description="my description"
```

salt.cloud.clouds.profitbricks.create_loadbalancer(call=None, **kwargs=None)
Creates a loadbalancer within the datacenter from the provider config.

CLI Example:
salt-cloud -f create_loadbalancer profitbricks name=mylb

salt.cloud.clouds.profitbricks.destroy(name, call=None)
de destroy a machine by name

Parameters

- **name** -- name given to the machine
- **call** -- call value in this case is 'action'

Returns

array of booleans, true if successfully stopped and true if successfully removed

CLI Example:

salt-cloud -d vm_name

salt.cloud.clouds.profitbricks.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.profitbricks.get_conn()
Return a conn object for the passed VM data

salt.cloud.clouds.profitbricks.get_datacenter(conn)
Return the datacenter from the config provider datacenter ID

salt.cloud.clouds.profitbricks.get_datacenter_id()
Return datacenter ID from provider configuration

salt.cloud.clouds.profitbricks.get_dependencies()
Warn if dependencies are not met.

salt.cloud.clouds.profitbricks.get_disk_type(vm_)
Return the type of disk to use. Either 'HDD' (default) or 'SSD'.

salt.cloud.clouds.profitbricks.get_image(vm_)
Return the image object to use

salt.cloud.clouds.profitbricks.get_key_filename(vm_)
Check SSH private key file and return absolute path if exists.

salt.cloud.clouds.profitbricks.get_node(conn, name)
Return a node for the named VM

salt.cloud.clouds.profitbricks.get_public_keys(vm_)
Retrieve list of SSH public keys.

salt.cloud.clouds.profitbricks.get_size(vm_)
Return the VM’s size object

salt.cloud.clouds.profitbricks.get_wait_timeout(vm_)
Return the wait_for_timeout for resource provisioning.

salt.cloud.clouds.profitbricks.list_datacenters(conn=None, call=None)
List all the data centers

CLI Example:
salt-cloud -f list_datacenters my-profitbricks-config

```
salt.cloud.clouds.profitbricks.list_images(call=None, kwargs=None)
List all the images with alias by location
```

CLI Example:
```
salt-cloud -f list_images my-profitbricks-config location=us/las
```

salt.cloud.clouds.profitbricks.list_loadbalancers(call=None)
Return a list of the loadbalancers that are on the provider

salt.cloud.clouds.profitbricks.list_nodes(conn=None, call=None)
Return a list of VMs that are on the provider

salt.cloud.clouds.profitbricks.list_nodes_full(conn=None, call=None)
Return a list of the VMs that are on the provider, with all fields

salt.cloud.clouds.profitbricks.reboot(name, call=None)
reboot a machine by name

```
:param name: name given to the machine
:param call: call value in this case is 'action'
:return: true if successful
```

CLI Example:
```
salt-cloud -a reboot vm_name
```

salt.cloud.clouds.profitbricks.reserve_ipblock(call=None, kwargs=None)
Reserve the IP Block

salt.cloud.clouds.profitbricks.set_public_lan(lan_id)
Enables public Internet access for the specified public_lan. If no public LAN is available, then a new public LAN is created.

salt.cloud.clouds.profitbricks.show_instance(name, call=None)
Show the details from the provider concerning an instance

salt.cloud.clouds.profitbricks.signal_event(vm_, event, description)

salt.cloud.clouds.profitbricks.ssh_interface(vm_)  
Return the ssh_interface type to connect to. Either 'public_ips' (default) or 'private_ips'.

salt.cloud.clouds.profitbricks.start(name, call=None)
start a machine by name

```
:param name: name given to the machine
:param call: call value in this case is 'action'
:return: true if successful
```

CLI Example:
```
salt-cloud -a start vm_name
```

salt.cloud.clouds.profitbricks.stop(name, call=None)
stop a machine by name

```
:param name: name given to the machine
:param call: call value in this case is 'action'
:return: true if successful
```

CLI Example:
```
salt-cloud -a stop vm_name
```
salt.cloud.clouds.profitbricks.version_compatible(version)
Checks profitbricks version

26.4.20 salt.cloud.clouds.proxmox

**Warning:** This module will be removed from Salt in version 3009 in favor of the proxmox Salt Extension.

Proxmox Cloud Module

New in version 2014.7.0.

The Proxmox cloud module is used to control access to cloud providers using the Proxmox system (KVM / OpenVZ / LXC).

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/proxmox.conf`:

```yaml
my-proxmox-config:
  # Proxmox account information
  user: myuser@pam or myuser@pve
  password: mypassword
  url: hypervisor.domain.tld
  port: 8006
  driver: proxmox
  verify_ssl: True
```

**Warning:** This cloud provider will be removed from Salt in version 3009.0 in favor of the saltext.proxmox Salt Extension

maintainer
Frank Klaassen <frank@cloudright.nl>

depends
requests >= 2.2.1

depends
IPy >= 0.81

salt.cloud.clouds.proxmox.avail_images(call=None, location='local')
Return a list of the images that are on the provider

CLI Example:

```
salt-cloud --list-images my-proxmox-config
```

salt.cloud.clouds.proxmox.avail_locations(call=None)
Return a list of the hypervisors (nodes) which this Proxmox PVE machine manages

CLI Example:

```
salt-cloud --list-locations my-proxmox-config
```
salt.cloud.clouds.proxmox.create(vm_)
    Create a single VM from a data dict
    CLI Example:
    
    ```
salt-cloud -p proxmox-ubuntu vmhostname
    ```

salt.cloud.clouds.proxmox.create_node(vm_, newid)
    Build and submit the requestdata to create a new node

salt.cloud.clouds.proxmox.destroy(name, call=None)
    Destroy a node.
    CLI Example:
    ```
salt-cloud --destroy mymachine
    ```

salt.cloud.clouds.proxmox.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.proxmox.get_dependencies()
    Warn if dependencies aren't met.

salt.cloud.clouds.proxmox.get_resources_nodes(call=None, resFilter=None)
    Retrieve all hypervisors (nodes) available on this environment
    CLI Example:
    ```
salt-cloud -f get_resources_nodes my-proxmox-config
    ```

salt.cloud.clouds.proxmox.get_resources_vms(call=None, resFilter=None, includeConfig=True)
    Retrieve all VMs available on this environment
    CLI Example:
    ```
salt-cloud -f get_resources_vms my-proxmox-config
    ```

salt.cloud.clouds.proxmox.get_vm_status(vmid=None, name=None)
    Get the status for a VM, either via the ID or the hostname

salt.cloud.clouds.proxmox.get_vmconfig(vmid, node=None, node_type='openvz')
    Get VM configuration

salt.cloud.clouds.proxmox.ignore_cidr(vm_, ip)
    Return True if we are to ignore the specified IP.

salt.cloud.clouds.proxmox.list_nodes(call=None)
    Return a list of the VMs that are managed by the provider
    CLI Example:
    ```
salt-cloud -Q my-proxmox-config
    ```

salt.cloud.clouds.proxmox.list_nodes_full(call=None)
    Return a list of the VMs that are on the provider
    CLI Example:
```
salt-cloud -F my-proxmox-config
```

```
salt.cloud.clouds.proxmox.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields
    CLI Example:
    `salt-cloud -S my-proxmox-config`
```

```
salt.cloud.clouds.proxmox.preferred_ip(vm_, ips)
    Return either an 'ipv4' (default) or 'ipv6' address depending on 'protocol' option. The list of 'ipv4' IPs is filtered by ignore_cidr() to remove any unreachable private addresses.
```

```
salt.cloud.clouds.proxmox.query(conn_type, option, post_data=None)
    Execute the HTTP request to the API
```

```
salt.cloud.clouds.proxmox.script(vm_)
    Return the script deployment object
```

```
salt.cloud.clouds.proxmox.set_vm_status(status, name=None, vmid=None)
    Convenience function for setting VM status
```

```
salt.cloud.clouds.proxmox.show_instance(name, call=None)
    Show the details from Proxmox concerning an instance
```

```
salt.cloud.clouds.proxmox.shutdown(name=None, vmid=None, call=None)
    Shutdown a node via ACPI.
    CLI Example:
    `salt-cloud -a shutdown mymachine`
```

```
salt.cloud.clouds.proxmox.start(name, vmid=None, call=None)
    Start a node.
    CLI Example:
    `salt-cloud -a start mymachine`
```

```
salt.cloud.clouds.proxmox.stop(name, vmid=None, call=None)
    Stop a node ("pulling the plug").
    CLI Example:
    `salt-cloud -a stop mymachine`
```

```
salt.cloud.clouds.proxmox.wait_for_created(upid, timeout=300)
    Wait until the vm has been created successfully
```

```
salt.cloud.clouds.proxmox.wait_for_state(vmid, state, timeout=300)
    Wait until a specific state has been reached on a node
```

26.4. cloud modules
26.4.21 salt.cloud.clouds.pyrax

Pyrax Cloud Module

PLEASE NOTE: This module is currently in early development, and considered to be experimental and unstable. It is not recommended for production use. Unless you are actively developing code in this module, you should use the OpenStack module instead.

```
salt.cloud.clouds.pyrax.get_configured_provider()
```

Return the first configured instance.

```
salt.cloud.clouds.pyrax.get_conn(conn_type)
```

Return a conn object for the passed VM data

```
salt.cloud.clouds.pyrax.get_dependencies()
```

Warn if dependencies aren’t met.

```
salt.cloud.clouds.pyrax.queues_create(call, kwargs)
salt.cloud.clouds.pyrax.queues_delete(call, kwargs)
salt.cloud.clouds.pyrax.queues_exists(call, kwargs)
salt.cloud.clouds.pyrax.queues_show(call, kwargs)
```

26.4.22 salt.cloud.clouds.qingcloud

QingCloud Cloud Module

New in version 2015.8.0.

The QingCloud cloud module is used to control access to the QingCloud. [http://www.qingcloud.com/](http://www.qingcloud.com/)

Use of this module requires the `access_key_id`, `secret_access_key`, `zone` and `key_filename` parameter to be set.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/qingcloud.conf`:

```
my-qingcloud:
    driver: qingcloud
    access_key_id: AKIDMRTGYONNLTFRRBQJ
    secret_access_key: clYwH21u5U0mcov4aNv2V2XocaHCG3JZGcxEc3Fu
    zone: pek2
    key_filename: /path/to/your.pem
```

```
salt.cloud.clouds.qingcloud.avail_images(kwargs=None, call=None)
```

Return a list of the images that are on the provider.

CLI Examples:

```
salt-cloud --list-images my-qingcloud
salt-cloud -f avail_images my-qingcloud zone=gd
```
salt.cloud.clouds.qingcloud.avail_locations(call=None)
Return a dict of all available locations on the provider with relevant data.
CLI Examples:
```
salt-cloud --list-locations my-qingcloud
```

salt.cloud.clouds.qingcloud.avail_sizes(kwargs=None, call=None)
Return a list of the instance sizes that are on the provider.
CLI Examples:
```
salt-cloud --list-sizes my-qingcloud
salt-cloud -f avail_sizes my-qingcloud zone=pek2
```

salt.cloud.clouds.qingcloud.create(vm_)
Create a single instance from a data dict.
CLI Examples:
```
salt-cloud -p qingcloud-ubuntu-c1m1 hostname1
salt-cloud -m /path/to/mymap.sls -P
```

salt.cloud.clouds.qingcloud.destroy(instance_id, call=None)
Destroy an instance.
CLI Example:
```
salt-cloud -a destroy i-2f733r5n
salt-cloud -d i-2f733r5n
```

salt.cloud.clouds.qingcloud.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.qingcloud.get_dependencies()
Warn if dependencies aren't met.

salt.cloud.clouds.qingcloud.list_nodes(call=None)
Return a list of the instances that are on the provider.
CLI Examples:
```
salt-cloud -Q my-qingcloud
```

salt.cloud.clouds.qingcloud.list_nodes_full(call=None)
Return a list of the instances that are on the provider.
CLI Examples:
```
salt-cloud -F my-qingcloud
```

salt.cloud.clouds.qingcloud.list_nodes_min(call=None)
Return a list of the instances that are on the provider. Only a list of instances names, and their state, is returned.
CLI Examples:
salt-cloud -f list_nodes_min my-qingcloud

\texttt{salt.cloud.clouds.qingcloud.list_nodes_select\(\text{call}=\text{None}\)}

Return a list of the instances that are on the provider, with selected fields.

\texttt{CLI Examples:}

\texttt{salt-cloud -S my-qingcloud}

\texttt{salt.cloud.clouds.qingcloud.query\(\text{params}=\text{None}\)}

Make a web call to QingCloud IaaS API.

\texttt{salt.cloud.clouds.qingcloud.reboot\(\text{instance}\_id, \text{call}=\text{None}\)}

Reboot an instance.

\texttt{CLI Examples:}

\texttt{salt-cloud -a reboot i-2f733r5n}

\texttt{salt.cloud.clouds.qingcloud.script\(\text{vm}\_\)}

Return the script deployment object.

\texttt{salt.cloud.clouds.qingcloud.show_image\(\text{kwargs}, \text{call}=\text{None}\)}

Show the details from QingCloud concerning an image.

\texttt{CLI Examples:}

\texttt{salt-cloud -f show_image my-qingcloud image=trustysrvx64c}
\texttt{salt-cloud -f show_image my-qingcloud image=trustysrvx64c,coreos4}
\texttt{salt-cloud -f show_image my-qingcloud image=trustysrvx64c \text{zone}=ap1}

\texttt{salt.cloud.clouds.qingcloud.show_instance\(\text{instance}\_id, \text{call}=\text{None}, \text{kwargs}=\text{None}\)}

Show the details from QingCloud concerning an instance.

\texttt{CLI Examples:}

\texttt{salt-cloud -a show_instance i-2f733r5n}

\texttt{salt.cloud.clouds.qingcloud.start\(\text{instance}\_id, \text{call}=\text{None}\)}

Start an instance.

\texttt{CLI Examples:}

\texttt{salt-cloud -a start i-2f733r5n}

\texttt{salt.cloud.clouds.qingcloud.stop\(\text{instance}\_id, \text{force}=\text{False}, \text{call}=\text{None}\)}

Stop an instance.

\texttt{CLI Examples:}

\texttt{salt-cloud -a stop i-2f733r5n}
\texttt{salt-cloud -a stop i-2f733r5n \text{force}=\text{True}}
### 26.4.23 salt.cloud.clouds.saltify

#### Saltify Module

The Saltify module is designed to install Salt on a remote machine, virtual or bare metal, using SSH. This module is useful for provisioning machines which are already installed, but not Salted.

Changed in version 2018.3.0: The wake_on_lan capability, and actions destroy, reboot, and query functions were added.

Use of this module requires some configuration in cloud profile and provider files as described in the *Getting Started with Saltify* documentation.

**salt.cloud.clouds.saltify.avail_images** *(call=None)*

This function returns a list of images available for this cloud provider.

```
salt-cloud --list-images saltify
```

returns a list of available profiles.

New in version 2018.3.0.

**salt.cloud.clouds.saltify.avail_locations** *(call=None)*

This function returns a list of locations available.

```
salt-cloud --list-locations my-cloud-provider
```

[ saltify will always return an empty dictionary ]

**salt.cloud.clouds.saltify.avail_sizes** *(call=None)*

This function returns a list of sizes available for this cloud provider.

```
salt-cloud --list-sizes saltify
```

[ saltify always returns an empty dictionary ]

**salt.cloud.clouds.saltify.create**(vm_)

if configuration parameter deploy is True,

Provision a single machine, adding its keys to the salt master

else,

Test ssh connections to the machine

- **Configuration parameters:**
  - deploy: (see above)
  - provider: name of entry in `salt/cloud.providers.d/??` file
  - ssh_host: IP address or DNS name of the new machine
  - ssh_username: name used to log in to the new machine
  - ssh_password: password to log in (unless key_filename is used)
  - key_filename: (optional) SSH private key for passwordless login
  - ssh_port: (default=22) TCP port for SSH connection
  - wake_on_lan_mac: (optional) hardware (MAC) address for wake on lan
- wol_sender_node: (optional) salt minion to send wake on lan command
- wol_boot_wait: (default=30) seconds to delay while client boots
- force_minion_config: (optional) replace the minion configuration files on the new machine

See also *Miscellaneous Salt Cloud Options* and *Getting Started with Saltify*

CLI Example:

```bash
salt-cloud -p mymachine my_new_id
```

salt.cloud.clouds.saltify.destroy(name, call=``None``)

Destroy a node.

New in version 2018.3.0.

Disconnect a minion from the master, and remove its keys.

**Optionally, (if remove_config_on_destroy is True),**

- disables salt-minion from running on the minion, and erases the Salt configuration files from it.

**Optionally, (if shutdown_on_destroy is True),**

- orders the minion to halt.

CLI Example:

```bash
salt-cloud --destroy mymachine
```

salt.cloud.clouds.saltify.get_configured_provider()

Return the first configured instance.

salt.cloud.clouds.saltify.list_nodes(call=``None``)

List the nodes which have salt-cloud:driver:saltify grains.

```bash
salt-cloud -Q
```

returns a list of dictionaries of defined standard fields.

New in version 2018.3.0.

salt.cloud.clouds.saltify.list_nodes_full(call=``None``)

Lists complete information for all nodes.

```bash
salt-cloud -F
```

returns a list of dictionaries.

for 'saltify' minions, returns dict of grains (enhanced).

New in version 2018.3.0.

salt.cloud.clouds.saltify.list_nodes_select(call=``None``)

Return a list of the minions that have salt-cloud grains, with select fields.

salt.cloud.clouds.saltify.reboot(name, call=``None``)

Reboot a saltify minion.

New in version 2018.3.0.

**name**

- The name of the VM to reboot.
CLI Example:

```
salt-cloud -a reboot vm_name
```

`salt.cloud.clouds.saltify.show_instance(name, call=None)`
List the a single node, return dict of grains.

**26.4.24 salt.cloud.clouds.scaleway**

Scaleway Cloud Module

New in version 2015.8.0.

The Scaleway cloud module is used to interact with your Scaleway BareMetal Servers.

Use of this module only requires the `api_key` parameter to be set. Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/scaleway.conf`:

```
scaleway-config:
    # Scaleway organization and token
    access_key: 0e604a2c-aea6-4081-acb2-e1d1258ef95c
token: be8fd96b-04eb-4d39-b6ba-a9edbcf17f12
driver: scaleway
```

`salt.cloud.clouds.scaleway.avail_images(call=None)`
Return a list of the images that are on the provider.

`salt.cloud.clouds.scaleway.create(server_)`
Create a single BareMetal server from a data dict.

`salt.cloud.clouds.scaleway.create_node(args)`
Create a node.

`salt.cloud.clouds.scaleway.destroy(name, call=None)`
Destroy a node. Will check termination protection and warn if enabled.

CLI Example:

```
salt-cloud --destroy mymachine
```

`salt.cloud.clouds.scaleway.get_configured_provider()`
Return the first configured instance.

`salt.cloud.clouds.scaleway.get_image(server_)`
Return the image object to use.

`salt.cloud.clouds.scaleway.list_nodes(call=None)`
Return a list of the BareMetal servers that are on the provider.

`salt.cloud.clouds.scaleway.list_nodes_full(call=None)`
Return a list of the BareMetal servers that are on the provider.

`salt.cloud.clouds.scaleway.list_nodes_select(call=None)`
Return a list of the BareMetal servers that are on the provider, with select fields.
salt.cloud.clouds.scaleway.query(method='servers', server_id=None, command=None, args=None, http_method='GET', root='api_root')

Make a call to the Scaleway API.
salt.cloud.clouds.scaleway.script(server_)

Return the script deployment object.
salt.cloud.clouds.scaleway.show_instance(name, call=None)

Show the details from a Scaleway BareMetal server.

26.4.25 salt.cloud.clouds.softlayer

SoftLayer Cloud Module

The SoftLayer cloud module is used to control access to the SoftLayer VPS system.
Use of this module only requires the apikey parameter. Set up the cloud configuration at:
/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/softlayer.conf:

```
my-softlayer-config:
  # SoftLayer account api key
  user: MYLOGIN
  apikey: JVkbS3DGHSDKUKSDJfhsdklfjgsjdkflhjlsdfffhgdgjkenrtuin
  driver: softlayer
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer salt.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

```
depends
  softlayer
```

salt.cloud.clouds.softlayer.avail_images(call=None)

Return a dict of all available VM images on the cloud provider.
salt.cloud.clouds.softlayer.avail_locations(call=None)

List all available locations
salt.cloud.clouds.softlayer.avail_sizes(call=None)

Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three dicts.
salt.cloud.clouds.softlayer.create(vm_)

Create a single VM from a data dict
salt.cloud.clouds.softlayer.destroy(name, call=None)

Destroy a node.

CLI Example:
```
salt-cloud --destroy mymachine
```
salt.cloud.clouds.softlayer.get_configured_provider()

Return the first configured instance.
salt.cloud.clouds.softlayer.get_conn(service='SoftLayer_Virtual_Guest')
    Return a conn object for the passed VM data

calendar.cloud.clouds.softlayer.get_dependencies()
    Warn if dependencies aren't met.

calendar.cloud.clouds.softlayer.get_location(vm_=None)
    Return the location to use, in this order:
    • CLI parameter
    • VM parameter
    • Cloud profile setting

calendar.cloud.clouds.softlayer.list_custom_images(call=None)
    Return a dict of all custom VM images on the cloud provider.

calendar.cloud.clouds.softlayer.list_nodes(call=None)
    Return a list of the VMs that are on the provider

calendar.cloud.clouds.softlayer.list_nodes_full(mask='mask[id]', call=None)
    Return a list of the VMs that are on the provider

calendar.cloud.clouds.softlayer.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields

calendar.cloud.clouds.softlayer.list_vlans(call=None)
    List all VLANs associated with the account

calendar.cloud.clouds.script(vm_)
    Return the script deployment object

calendar.cloud.clouds.softlayer.show_instance(name, call=None)
    Show the details from SoftLayer concerning a guest

26.4.26 calendar.cloud.clouds.softlayer_hw

SoftLayer HW Cloud Module

The SoftLayer HW cloud module is used to control access to the SoftLayer hardware cloud system
Use of this module only requires the apikey parameter. Set up the cloud configuration at:
/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/softlayer.conf:

```
my-softlayer-config:
    # SoftLayer account api key
    user: MYLOGIN
    apikey: JVkbSJDGHSDKUKSDJfhsdklfsjgzjekflhjlsdfffhgdgjkenrtuinv
    driver: softlayer_hw
```

The SoftLayer Python Library needs to be installed in order to use the SoftLayer calendar.cloud modules. See: https://pypi.python.org/pypi/SoftLayer

    depends
        softlayer
salt.cloud.clouds.softlayer_hw.avail_images(call=None)
    Return a dict of all available VM images on the cloud provider.

salt.cloud.clouds.softlayer_hw.avail_locations(call=None)
    List all available locations

salt.cloud.clouds.softlayer_hw.avail_sizes(call=None)
    Return a dict of all available VM sizes on the cloud provider with relevant data. This data is provided in three
dicts.

salt.cloud.clouds.softlayer_hw.create(vm_)
    Create a single VM from a data dict

salt.cloud.clouds.softlayer_hw.destroy(name, call=None)
    Destroy a node.

    CLI Example:
    ```
    salt-cloud --destroy mymachine
    ```

salt.cloud.clouds.softlayer_hw.get_configured_provider()
    Return the first configured instance.

salt.cloud.clouds.softlayer_hw.get_conn(service='SoftLayer_Hardware')
    Return a conn object for the passed VM data

salt.cloud.clouds.softlayer_hw.get_dependencies()
    Warn if dependencies aren’t met.

salt.cloud.clouds.softlayer_hw.get_location(vm_=None)
    Return the location to use, in this order:
    • CLI parameter
    • VM parameter
    • Cloud profile setting

salt.cloud.clouds.softlayer_hw.list_nodes(call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.softlayer_hw.list_nodes_full(mask='mask[id, hostname, 'primaryIpAddress, 'primaryBackendIpAddress, 'processorPhysicalCoreAmount, memoryCount]', call=None)
    Return a list of the VMs that are on the provider

salt.cloud.clouds.softlayer_hw.list_nodes_select(call=None)
    Return a list of the VMs that are on the provider, with select fields

salt.cloud.clouds.softlayer_hw.list_vlans(call=None)
    List all VLANs associated with the account

salt.cloud.clouds.softlayer_hw.script(vm_)
    Return the script deployment object
**salt.cloud.clouds.softlayer_hw**

**show_all_categories**(*call=None*)

Return a dict of all available categories on the cloud provider.

New in version 2016.3.0.

**show_all_prices**(*call=None, kwargs=None*)

Return a dict of all prices on the cloud provider.

**show_instance**(*name, call=None*)

Show the details from SoftLayer concerning a guest

**show_pricing**(*kwargs=None, call=None*)

Show pricing for a particular profile. This is only an estimate, based on unofficial pricing sources.

CLI Examples:

```
salt-cloud --f show_pricing my-softlayerhw-config profile=my-profile
```

If pricing sources have not been cached, they will be downloaded. Once they have been cached, they will not be updated automatically. To manually update all prices, use the following command:

```
salt-cloud --f update_pricing <provider>
```

New in version 2015.8.0.

---

**26.4.27 salt.cloud.clouds.tencentcloud**

Tencent Cloud Cloud Module

New in version 3000.

The Tencent Cloud Cloud Module is used to control access to the Tencent Cloud instance. [https://intl.cloud.tencent.com/](https://intl.cloud.tencent.com/)

To use this module, set up the cloud configuration at

/etc/salt/cloud.providers or /etc/salt/cloud.providers.d/*.conf:

```python
# my-tencentcloud-config:
driver: tencentcloud
# Tencent Cloud Secret Id
id: AKIDA64p0i09BMemkApz3evX0HS16954b750A
# Tencent Cloud Secret Key
key: 8r2xmPn0C5FDvRAJmCJimiTZKVRsk260
# Tencent Cloud Region
location: ap-guangzhou
```

depends
tencentcloud-sdk-python

**salt.cloud.clouds.tencentcloud**

**avail_images**(*call=None*)

Return Tencent Cloud available image

CLI Example:

```
salt-cloud --list-images my-tencentcloud-config
salt-cloud -f avail_images my-tencentcloud-config
```
salt.cloud.clouds.tencentcloud.

**avail_locations** *(call=None)*

Return Tencent Cloud available region

CLI Example:

```
salt-cloud --list-locations my-tencentcloud-config
salt-cloud -f avail_locations my-tencentcloud-config
```

**avail_sizes** *(call=None)*

Return Tencent Cloud available instance type

CLI Example:

```
salt-cloud --list-sizes my-tencentcloud-config
salt-cloud -f avail_sizes my-tencentcloud-config
```

**create** *(vm_)*

Create a single Tencent Cloud instance from a data dict.

Tencent Cloud profiles require a provider, availability_zone, image and size. Set up profile at /
```
/t/etc/salt/cloud.profiles or /etc/salt/cloud.profiles.d/*.conf:
tencentcloud-guangzhou-s1sm1:
  provider: my-tencentcloud-config
  availability_zone: ap-guangzhou-3
  image: img-31tjrtp
  size: S1.SMALL1
  allocate_public_ip: True
  internet_max_bandwidth_out: 1
  password: '153e41ec96140152'
  securitygroups:
    - sg-5e90804b
```

CLI Examples:

```
salt-cloud -p tencentcloud-guangzhou-s1 myinstance
```

**destroy** *(name, call=None)*

Destroy a Tencent Cloud instance

CLI Example:

```
salt-cloud -a destroy myinstance
salt-cloud -d myinstance
```

**get_configured_provider()**

Return the first configured instance.

**get_dependencies()**

Warn if dependencies aren’t met.

**get_provider_client**(name=None)

Return a new provider client

**list_availability_zones**(call=None)

Return all Tencent Cloud availability zones in current region

CLI Example:
### Salt.cloud clouds.tencentcloud.list_custom_images

Return all Tencent Cloud images in current region

**CLI Example:**

```
salt-cloud -f list_custom_images my-tencentcloud-config
```

### Salt.cloud clouds.tencentcloud.list_nodes

Return a list of instances that are on the provider

**CLI Examples:**

```
salt-cloud -Q
```

### Salt.cloud clouds.tencentcloud.list_nodes_full

Return a list of instances that are on the provider, with full details

**CLI Examples:**

```
salt-cloud -F
```

### Salt.cloud clouds.tencentcloud.list_nodes_min

Return a list of instances that are on the provider, only names, and their state, is returned.

**CLI Examples:**

```
salt-cloud -f list_nodes_min my-tencentcloud-config
```

### Salt.cloud clouds.tencentcloud.list_nodes_select

Return a list of instances that are on the provider, with select fields

**CLI Examples:**

```
salt-cloud -S
```

### Salt.cloud clouds.tencentcloud.list_securitygroups

Return all Tencent Cloud security groups in current region

**CLI Example:**

```
salt-cloud -f list_securitygroups my-tencentcloud-config
```

### Salt.cloud clouds.tencentcloud.reboot

Reboot a Tencent Cloud instance

**CLI Examples:**

```
salt-cloud -a reboot myinstance
```

### Salt.cloud clouds.tencentcloud.script

Return the script deployment object
salt.cloud.clouds.tencentcloud.show_disk(name, call=None)
Show the disk details of Tencent Cloud instance
CLI Examples:
```
salt-cloud -a show_disk myinstance
```

salt.cloud.clouds.tencentcloud.show_image(kwargs, call=None)
Show the details of Tencent Cloud image
CLI Examples:
```
salt-cloud -f show_image tencentcloud image=img-3ltjrtph
```

salt.cloud.clouds.tencentcloud.show_instance(name, call=None)
Show the details of Tencent Cloud instance
CLI Examples:
```
salt-cloud -a show_instance myinstance
```

salt.cloud.clouds.tencentcloud.start(name, call=None)
Start a Tencent Cloud instance Notice: the instance state must be stopped
CLI Examples:
```
salt-cloud -a start myinstance
```

salt.cloud.clouds.tencentcloud.stop(name, force=False, call=None)
Stop a Tencent Cloud running instance Note: use force=True to make force stop
CLI Examples:
```
salt-cloud -a stop myinstance
salt-cloud -a stop myinstance force=True
```

26.4.28  salt.cloud.clouds.vagrant

Vagrant Cloud Driver

The Vagrant cloud is designed to "vagrant up" a virtual machine as a Salt minion.
Use of this module requires some configuration in cloud profile and provider files as described in the Getting Started with Vagrant documentation.
New in version 2018.3.0.
salt.cloud.clouds.vagrant.avail_images(call=None)
This function returns a list of images available for this cloud provider. vagrant will return a list of profiles.
salt-cloud --list-images my-cloud-provider
salt.cloud.clouds.vagrant.avail_locations(call=None)
This function returns a list of locations available.
CLI Example:
salt-cloud --list-locations my-cloud-provider

# \[ vagrant will always returns an empty dictionary \]

salt.cloud.clouds.vagrant.avail_sizes(call=None)
This function returns a list of sizes available for this cloud provider.

CLI Example:
salt-cloud --list-sizes my-cloud-provider

# \[ vagrant always returns an empty dictionary \]

salt.cloud.clouds.vagrant.create(vm_)
Provision a single machine

CLI Example:
salt-cloud -p my_profile new_node_1

salt.cloud.clouds.vagrant.destroy(name, call=None)
Destroy a node.

CLI Example:
salt-cloud --destroy mymachine

salt.cloud.clouds.vagrant.get_configured_provider()
Return the first configured instance.

salt.cloud.clouds.vagrant.list_nodes(call=None)
List the nodes which have salt-cloud:driver:vagrant grains.

CLI Example:
salt-cloud -Q

salt.cloud.clouds.vagrant.list_nodes_full(call=None)
List the nodes, ask all 'vagrant' minions, return dict of grains (enhanced).

CLI Example:

salt-call -F

salt.cloud.clouds.vagrant.list_nodes_select(call=None)
Return a list of the minions that have salt-cloud grains, with select fields.

salt.cloud.clouds.vagrant.reboot(name, call=None)
Reboot a vagrant minion.

name
The name of the VM to reboot.

CLI Example:
salt-cloud -a reboot vm_name
salt.cloud.clouds.vagrant.show_instance(name, call=None)

List the a single node, return dict of grains.

26.4.29 salt.cloud.clouds.virtualbox

A salt cloud provider that lets you use virtualbox on your machine and act as a cloud.

depends
vboxapi

For now this will only clone existing VMs. It’s best to create a template from which we will clone.

Followed https://docs.saltproject.io/en/latest/topics/cloud/cloud.html#non-libcloud-based-modules to create this.

Dicts provided by salt:

__opts__
[contains the options used to run Salt Cloud,] as well as a set of configuration and environment variables

salt.cloud.clouds.virtualbox.create(vm_info)

Creates a virtual machine from the given VM information

This is what is used to request a virtual machine to be created by the cloud provider, wait for it to become available, and then (optionally) log in and install Salt on it.

Events fired:

This function fires the event salt/cloud/vm_name/creating, with the payload containing the names of the VM, profile, and provider.

@param vm_info

```
{
    name: <str>
    profile: <dict>
    driver: <provider>:<profile>
    clonefrom: <vm_name>
    clonemode: <mode> (default: state, choices: state, child, all)
}
```

@type vm_info dict @return dict of resulting vm. ‼!Passwords can and should be included‼!

salt.cloud.clouds.virtualbox.destroy(name, call=None)

This function irreversibly destroys a virtual machine on the cloud provider. Before doing so, it should fire an event on the Salt event bus.

The tag for this event is salt/cloud/<vm name>/destroying. Once the virtual machine has been destroyed, another event is fired. The tag for that event is salt/cloud/<vm name>/destroyed.

Dependencies:
list_nodes

@type name: @param name: str @param call: @type call: @return: True if all went well, otherwise an error message @rtype: bool|str

salt.cloud.clouds.virtualbox.get_configured_provider()

Return the first configured instance.
The VMware cloud module allows you to manage VMware ESX, ESXi, and vCenter. See *Getting started with VMware* to get started.

codeauthor
Nitin Madhok <nmadhok@g.clemson.edu>
Dependencies

- pyVmomi Python Module

**pyVmomi**

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original VMware cloud driver was developed against.

**Note:** Ensure python pyVmomi module is installed by running following one-liner check. The output should be 0.

```
python -c "import pyVmomi" ; echo $?
```

**Configuration**

To use this module, set up the vCenter or ESX/ESXi URL, username and password in the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`:

```
my-vmware-config:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: '10.20.30.40'

vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter01.domain.com'
  protocol: 'https'
  port: 443

vcenter02:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
```

(continues on next page)
url: 'vcenter02.domain.com'
protocol: 'http'
port: 80

esx01:
  driver: vmware
  user: 'admin'
  password: 'verybadpass'
  url: 'esx01.domain.com'

Note: Optionally, protocol and port can be specified if the vCenter server is not using the defaults. Default is protocol: https and port: 443.

Note: Changed in version 2015.8.0.

The provider parameter in cloud provider configuration was renamed to driver. This change was made to avoid confusion with the provider parameter that is used in cloud profile configuration. Cloud provider configuration now uses driver to refer to the salt-cloud driver that provides the underlying functionality to connect to a cloud provider, while cloud profile configuration continues to use provider to refer to the cloud provider configuration that you define.

To test the connection for my-vmware-config specified in the cloud configuration, run

test_vcenter_connection()
salt.cloud.clouds.vmware.add_host(kwars=None, call=None)

Add a host system to the specified cluster or datacenter in this VMware environment

Note: To use this function, you need to specify esxi_host_user and esxi_host_password under your provider configuration set up at /etc/salt/cloud.providers or /etc/salt/cloud.providers.d/vmware.conf:

vcenter01:
  driver: vmware
  user: 'DOMAIN\user'
  password: 'verybadpass'
  url: 'vcenter01.domain.com'

  # Required when adding a host system
  esxi_host_user: 'root'
  esxi_host_password: 'myhostpassword'
  # Optional fields that can be specified when adding a host system
  esxi_host_ssl_thumbprint:

The SSL thumbprint of the host system can be optionally specified by setting esxi_host_ssl_thumbprint under your provider configuration. To get the SSL thumbprint of the host system, execute the following command from a remote server:

echo -n | openssl s_client -connect <YOUR-HOSTSYSTEM-DNS/IP>:443 2>/dev/null | openssl x509 -noout -fingerprint -shal
CLI Example:
```
salt-cloud -f add_host my-vmware-config host="myHostSystemName" cluster="myClusterName"
salt-cloud -f add_host my-vmware-config host="myHostSystemName" datacenter="myDatacenterName"
```

salt.cloud.clouds.vmwareavail_images(call=None)
Return a list of all the templates present in this VMware environment with basic details

CLI Example:
```
salt-cloud --list-images my-vmware-config
```

salt.cloud.clouds.vmwareavail_locations(call=None)
Return a list of all the available locations/datacenters in this VMware environment

CLI Example:
```
salt-cloud --list-locations my-vmware-config
```

salt.cloud.clouds.vmwareavail_sizes(call=None)
Return a list of all the available sizes in this VMware environment.

CLI Example:
```
salt-cloud --list-sizes my-vmware-config
```

Note: Since sizes are built into templates, this function will return an empty dictionary.

salt.cloud.clouds.vmwarebuild_clonespec(config_spec, object_ref, reloc_spec, template)
Returns the clone spec

salt.cloud.clouds.vmwareconnect_host(kwargs=None, call=None)
Connect the specified host system in this VMware environment

CLI Example:
```
salt-cloud -f connect_host my-vmware-config host="myHostSystemName"
```

salt.cloud.clouds.vmwareconvert_to_template(name, kwargs=None, call=None)
Convert the specified virtual machine to template.

CLI Example:
```
salt-cloud -a convert_to_template vmname
```

salt.cloud.clouds.vmwarecreate(vm_)
To create a single VM in the VMware environment.

Sample profile and arguments that can be specified in it can be found here.

CLI Example:
salt.cloud -p vmware-centos6.5 vmname

salt.cloud.clouds.vmware.create_cluster(kwargs=None, call=None)
Create a new cluster under the specified datacenter in this VMware environment

CLI Example:

salt-cloud -f create_cluster my-vmware-config name="myNewCluster" datacenter="datacenterName"

salt.cloud.clouds.vmware.create_datacenter(kwargs=None, call=None)
Create a new data center in this VMware environment

CLI Example:

salt-cloud -f create_datacenter my-vmware-config name="MyNewDatacenter"

salt.cloud.clouds.vmware.create_datastore_cluster(kwargs=None, call=None)
Create a new datastore cluster for the specified datacenter in this VMware environment

CLI Example:

salt-cloud -f create_datastore_cluster my-vmware-config name="datastoreClusterName" datacenter="datacenterName"

salt.cloud.clouds.vmware.create_folder(kwargs=None, call=None)
Create the specified folder path in this VMware environment

Note: To create a Host and Cluster Folder under a Datacenter, specify path="/yourDatacenterName/host/yourFolderName"
To create a Network Folder under a Datacenter, specify path="/yourDatacenterName/network/yourFolderName"
To create a Storage Folder under a Datacenter, specify path="/yourDatacenterName/datastore/yourFolderName"
To create a VM and Template Folder under a Datacenter, specify path="/yourDatacenterName/vm/yourFolderName"

CLI Example:

salt-cloud -f create_folder my-vmware-config path="/Local/a/b/c" MyVMFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/vm/MyVMFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/host/MyHostFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/network/MyNetworkFolder"
salt-cloud -f create_folder my-vmware-config path="/MyDatacenter/storage/MyStorageFolder"

salt.cloud.clouds.vmware.create_snapshot(name, kwargs=None, call=None)
Create a snapshot of the specified virtual machine in this VMware environment
**Note:** If the VM is powered on, the internal state of the VM (memory dump) is included in the snapshot by default which will also set the power state of the snapshot to "powered on". You can set `memdump=False` to override this. This field is ignored if the virtual machine is powered off or if the VM does not support snapshots with memory dumps. Default is `memdump=True`

**Note:** If the VM is powered on when the snapshot is taken, VMware Tools can be used to quiesce the file system in the virtual machine by setting `quiesce=True`. This field is ignored if the virtual machine is powered off; if VMware Tools are not available or if `memdump=True`. Default is `quiesce=False`

**CLI Example:**

```bash
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot"
salt-cloud -a create_snapshot vmname snapshot_name="mySnapshot"
[description="My snapshot"] [memdump=False] [quiesce=True]
```

**salt.cloud.clouds.vmware.destroy** *(name, call=None)*

To destroy a VM from the VMware environment

**CLI Example:**

```bash
salt-cloud -d vmname
salt-cloud --destroy vmname
salt-cloud -a destroy vmname
```

**salt.cloud.clouds.vmware.disconnect_host** *(kwags=None, call=None)*

Disconnect the specified host system in this VMware environment

**CLI Example:**

```bash
salt-cloud -f disconnect_host my-vmware-config host="myHostSystemName"
```

**salt.cloud.clouds.vmware.enter_maintenance_mode** *(kwags=None, call=None)*

To put the specified host system in maintenance mode in this VMware environment

**CLI Example:**

```bash
salt-cloud -f enter_maintenance_mode my-vmware-config host="myHostSystemName"
```

**salt.cloud.clouds.vmware.exit_maintenance_mode** *(kwags=None, call=None)*

To take the specified host system out of maintenance mode in this VMware environment

**CLI Example:**

```bash
salt-cloud -f exit_maintenance_mode my-vmware-config host="myHostSystemName"
```

**salt.cloud.clouds.vmware.get_clonespec_for_valid_snapshot** *(config_spec, object_ref, reloc_spec, template, vm_)*

Return clonespec only if values are valid

**salt.cloud.clouds.vmware.get_configured_provider()**

Return the first configured instance.
salt.cloud.clouds.vmware.get_dependencies()
Warn if dependencies aren’t met.
salt.cloud.clouds.vmware.get_vcenter_version(kwargs=None, call=None)
Show the vCenter Server version with build number.
    CLI Example:
    ```
salt-cloud -f get_vcenter_version my-vmware-config
    ```
salt.cloud.clouds.vmware.handle_snapshot(config_spec, object_ref, reloc_spec, template, vm_)
Returns a clone spec for cloning from snapshots :rtype vim.vm.CloneSpec
salt.cloud.clouds.vmware.list_clusters(kwargs=None, call=None)
List all the clusters for this VMware environment
    CLI Example:
    ```
salt-cloud -f list_clusters my-vmware-config
    ```
salt.cloud.clouds.vmware.list_clusters_by_datacenter(kwargs=None, call=None)
List clusters for each datacenter; or clusters for a specified datacenter in this VMware environment
To list clusters for each datacenter:
    CLI Example:
    ```
salt-cloud -f list_clusters_by_datacenter my-vmware-config
    ```
To list clusters for a specified datacenter:
    CLI Example:
    ```
salt-cloud -f list_clusters_by_datacenter my-vmware-config datacenter= "datacenterName"
    ```
salt.cloud.clouds.vmware.list_datacenters(kwargs=None, call=None)
List all the data centers for this VMware environment
    CLI Example:
    ```
salt-cloud -f list_datacenters my-vmware-config
    ```
salt.cloud.clouds.vmware.list_datastore_clusters(kwargs=None, call=None)
List all the datastore clusters for this VMware environment
    CLI Example:
    ```
salt-cloud -f list_datastore_clusters my-vmware-config
    ```
salt.cloud.clouds.vmware.list_datastores(kwargs=None, call=None)
List all the datastores for this VMware environment
    CLI Example:
    ```
salt-cloud -f list_datastores my-vmware-config
    ```
salt.cloud.clouds.vmware.list_dvs(kwargs=None, call=None)
List all the distributed virtual switches for this VMware environment

CLI Example:
```
salt-cloud -f list_dvs my-vmware-config
```

salt.cloud.clouds.vmware.list_folders(kwargs=None, call=None)
List all the folders for this VMware environment

CLI Example:
```
salt-cloud -f list_folders my-vmware-config
```

salt.cloud.clouds.vmware.list_hbas(kwargs=None, call=None)
List all HBAs for each host system; or all HBAs for a specified host system; or HBAs of specified type for each host system; or HBAs of specified type for a specified host system in this VMware environment

**Note:** You can specify type as either parallel, iscsi, block or fibre.

To list all HBAs for each host system:
CLI Example:
```
salt-cloud -f list_hbas my-vmware-config
```

To list all HBAs for a specified host system:
CLI Example:
```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName"
```

To list HBAs of specified type for each host system:
CLI Example:
```
salt-cloud -f list_hbas my-vmware-config type="HBAType"
```

To list HBAs of specified type for a specified host system:
CLI Example:
```
salt-cloud -f list_hbas my-vmware-config host="hostSystemName" type=""HBAType"
```

salt.cloud.clouds.vmware.list_hosts(kwargs=None, call=None)
List all the hosts for this VMware environment

CLI Example:
```
salt-cloud -f list_hosts my-vmware-config
```

salt.cloud.clouds.vmware.list_hosts_by_cluster(kwargs=None, call=None)
List hosts for each cluster; or hosts for a specified cluster in this VMware environment

To list hosts for each cluster:

CLI Example:
To list hosts for a specified cluster:

```bash
salt-cloud -f list_hosts_by_cluster my-vmware-config
```

**CLI Example:**

```bash
salt-cloud -f list_hosts_by_cluster my-vmware-config cluster="clusterName"
```

**salt.cloud.clouds.vmware.list_hosts_by_datacenter**(kwargs=None, call=None)

List hosts for each datacenter; or hosts for a specified datacenter in this VMware environment

To list hosts for each datacenter:

```bash
salt-cloud -f list_hosts_by_datacenter my-vmware-config
```

**CLI Example:**

```bash
salt-cloud -f list_hosts_by_datacenter my-vmware-config
```

To list hosts for a specified datacenter:

**CLI Example:**

```bash
salt-cloud -f list_hosts_by_datacenter my-vmware-config datacenter="datacenterName"
```

**salt.cloud.clouds.vmware.list_networks**(kwargs=None, call=None)

List all the standard networks for this VMware environment

**CLI Example:**

```bash
salt-cloud -f list_networks my-vmware-config
```

**salt.cloud.clouds.vmware.list_nodes**(kwargs=None, call=None)

Return a list of all VMs and templates that are on the specified provider, with basic fields

**CLI Example:**

```bash
salt-cloud -f list_nodes my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with basic fields:

**CLI Example:**

```bash
salt-cloud -Q
```

**salt.cloud.clouds.vmware.list_nodes_full**(kwargs=None, call=None)

Return a list of all VMs and templates that are on the specified provider, with full details

**CLI Example:**

```bash
salt-cloud -f list_nodes_full my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with full details:

**CLI Example:**

```bash
salt-cloud -F
```
salt.cloud.clouds.vmware.list_nodes_min(kwargs=None, call=None)

Return a list of all VMs and templates that are on the specified provider, with no details

CLI Example:
```
salt-cloud -f list_nodes_min my-vmware-config
```

salt.cloud.clouds.vmware.list_nodes_select(call=None)

Return a list of all VMs and templates that are on the specified provider, with fields specified under query.

selection in /etc/salt/cloud

CLI Example:
```
salt-cloud -f list_nodes_select my-vmware-config
```

To return a list of all VMs and templates present on ALL configured providers, with fields specified under
query.selection in /etc/salt/cloud:

CLI Example:
```
salt-cloud -S
```

salt.cloud.clouds.vmware.list_portgroups(kwargs=None, call=None)

List all the distributed virtual portgroups for this VMware environment

CLI Example:
```
salt-cloud -f list_portgroups my-vmware-config
```

salt.cloud.clouds.vmware.list_resourcepools(kwargs=None, call=None)

List all the resource pools for this VMware environment

CLI Example:
```
salt-cloud -f list_resourcepools my-vmware-config
```

salt.cloud.clouds.vmware.list_snapshots(kwargs=None, call=None)

List snapshots either for all VMs and templates or for a specific VM/template in this VMware environment

To list snapshots for all VMs and templates:

CLI Example:
```
salt-cloud -f list_snapshots my-vmware-config
```

To list snapshots for a specific VM/template:

CLI Example:
```
salt-cloud -f list_snapshots my-vmware-config name="vmname"
```

salt.cloud.clouds.vmware.list_templates(kwargs=None, call=None)

List all the templates present in this VMware environment

CLI Example:
```
salt-cloud -f list_templates my-vmware-config
```
salt.cloud.clouds.vmware.list_vapps

List all the vApps for this VMware environment

CLI Example:

```
salt-cloud -f list_vapps my-vmware-config
```

salt.cloud.clouds.vmware.reboot_host

Reboot the specified host system in this VMware environment

**Note:** If the host system is not in maintenance mode, it will not be rebooted. If you want to reboot the host system regardless of whether it is in maintenance mode, set `force=True`. Default is `force=False`.

CLI Example:

```
salt-cloud -f reboot_host my-vmware-config host="myHostSystemName" [force=True]
```

salt.cloud.clouds.vmware.remove_all_snapshots

Remove all the snapshots present for the specified virtual machine.

**Note:** All the snapshots higher up in the hierarchy of the current snapshot tree are consolidated and their virtual disks are merged. To override this behavior and only remove all snapshots, set `merge_snapshots=False`. Default is `merge_snapshots=True`.

CLI Example:

```
salt-cloud -a remove_all_snapshots vmname [merge_snapshots=False]
```

salt.cloud.clouds.vmware.remove_host

Remove the specified host system from this VMware environment

CLI Example:

```
salt-cloud -f remove_host my-vmware-config host="myHostSystemName"
```

salt.cloud.clouds.vmware.remove_snapshot

Remove a snapshot of the specified virtual machine in this VMware environment

CLI Example:

```
salt-cloud -a remove_snapshot vmname snapshot_name="mySnapshot"
```

salt.cloud.clouds.vmware.rescan_hba

To rescan a specified HBA or all the HBAs on the Host System

CLI Example:

```
salt-cloud -f rescan_hba my-vmware-config host="hostSystemName"
```

```
salt-cloud -f rescan_hba my-vmware-config hba="hbaDeviceName" host="hostSystemName"
```

---

26.4. cloud modules 1251
salt.cloud.clouds.vmware.

**reset**(name, soft=False, call=None)

To reset a VM using its name

Note: If soft=True then issues a command to the guest operating system asking it to perform a reboot. Otherwise hypervisor will terminate VM and start it again. Default is soft=False

For soft=True vmtools should be installed on guest system.

CLI Example:

```
salt-cloud -a reset vmname
salt-cloud -a reset vmname soft=True
```

salt.cloud.clouds.vmware.

**revert_to_snapshot**(name, kwargs=None, call=None)

Revert virtual machine to its current snapshot. If no snapshot exists, the state of the virtual machine remains unchanged

Note: The virtual machine will be powered on if the power state of the snapshot when it was created was set to "Powered On". Set power_off=True so that the virtual machine stays powered off regardless of the power state of the snapshot when it was created. Default is power_off=False.

If the power state of the snapshot when it was created was "Powered On" and if power_off=True, the VM will be put in suspended state after it has been reverted to the snapshot.

CLI Example:

```
salt-cloud -a revert_to_snapshot vmname [power_off=True]
salt-cloud -a revert_to_snapshot vmname snapshot_name="selectedSnapshot" [power_off=True]
```

salt.cloud.clouds.vmware.

**script**(vm_)

Return the script deployment object

salt.cloud.clouds.vmware.

**show_instance**(name, call=None)

List all available details of the specified VM

CLI Example:

```
salt-cloud -a show_instance vmname
```

salt.cloud.clouds.vmware.

**shutdown_host**(kwargs=None, call=None)

Shut down the specified host system in this VMware environment

Note: If the host system is not in maintenance mode, it will not be shut down. If you want to shut down the host system regardless of whether it is in maintenance mode, set force=True. Default is force=False.

CLI Example:

```
salt-cloud -f shutdown_host my-vmware-config host="myHostSystemName" [force=True]
```
**salt.cloud.clouds.vmware.start** *(name, call=None)*

To start/power on a VM using its name

CLI Example:

```
salt-cloud -a start vmname
```

**salt.cloud.clouds.vmware.stop** *(name, soft=False, call=None)*

To stop/power off a VM using its name

Note: If `soft=True` then issues a command to the guest operating system asking it to perform a clean shutdown of all services. Default is `soft=False`

For `soft=True` vmtools should be installed on guest system.

CLI Example:

```
salt-cloud -a stop vmname
salt-cloud -a stop vmname soft=True
```

**salt.cloud.clouds.vmware.suspend** *(name, call=None)*

To suspend a VM using its name

CLI Example:

```
salt-cloud -a suspend vmname
```

**salt.cloud.clouds.vmware.terminate** *(name, call=None)*

To do an immediate power off of a VM using its name. A SIGKILL is issued to the vmx process of the VM

CLI Example:

```
salt-cloud -a terminate vmname
```

**salt.cloud.clouds.vmware.test_vcenter_connection** *(kwargs=None, call=None)*

Test if the connection can be made to the vCenter server using the specified credentials inside `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vmware.conf`

CLI Example:

```
salt-cloud -f test_vcenter_connection my-vmware-config
```

**salt.cloud.clouds.vmware.upgrade_tools** *(name, reboot=False, call=None)*

To upgrade VMware Tools on a specified virtual machine.

Note: If the virtual machine is running Windows OS, use `reboot=True` to reboot the virtual machine after VMware tools upgrade. Default is `reboot=False`

CLI Example:

```
salt-cloud -a upgrade_tools vmname
salt-cloud -a upgrade_tools vmname reboot=True
```
salt.cloud.clouds.vmware.**upgrade_tools_all**(call=None)

To upgrade VMware Tools on all virtual machines present in the specified provider

---

**Note:** If the virtual machine is running Windows OS, this function will attempt to suppress the automatic reboot caused by a VMware Tools upgrade.

---

**CLI Example:**

```
salt-cloud -f upgrade_tools_all my-vmware-config
```

### 26.4.31 salt.cloud.clouds.vultrpy

**Vultr Cloud Module using python-vultr bindings**

New in version 2016.3.0.

The Vultr cloud module is used to control access to the Vultr VPS system.

Use of this module only requires the `api_key` parameter.

Set up the cloud configuration at `/etc/salt/cloud.providers` or `/etc/salt/cloud.providers.d/vultr.conf`:

```yaml
my-vultr-config:
  # Vultr account api key
  api_key: <supersecretapi_key>
  driver: vultr
```

Set up the cloud profile at `/etc/salt/cloud.profiles` or `/etc/salt/cloud.profiles.d/vultr.conf`:

```yaml
nyc-4gb-4cpu-ubuntu-14-04:
  location: 1
  provider: my-vultr-config
  image: 160
  size: 95
  enable_private_network: True
```

This driver also supports Vultr's `startup script` feature. You can list startup scripts in your account with

```
salt-cloud -f list_scripts <name of vultr provider>
```

That list will include the IDs of the scripts in your account. Thus, if you have a script called 'setup-networking' with an ID of 493234 you can specify that startup script in a profile like so:

```yaml
nyc-2gb-1cpu-ubuntu-17-04:
  location: 1
  provider: my-vultr-config
  image: 223
  size: 13
  startup_script_id: 493234
```

Similarly you can also specify a firewall group ID using the option `firewall_group_id`. You can list firewall groups with
To specify SSH keys to be preinstalled on the server, use the `ssh_key_names` setting:

```plaintext
to-specify-ssh-keys
```

You can list SSH keys available on your account using:

```plaintext
to-list-ssh-keys
```

The available cloud modules for Vultr are:

```plaintext
import salt.cloud.clouds.vultrpy

salt.cloud.clouds.vultrpy.avail_firewall_groups(conn=None)
  return available firewall groups

salt.cloud.clouds.vultrpy.avail_images(conn=None)
  Return available images

salt.cloud.clouds.vultrpy.avail_keys(conn=None)
  return available SSH keys

salt.cloud.clouds.vultrpy.avail_locations(conn=None)
  return available datacenter locations

salt.cloud.clouds.vultrpy.avail_scripts(conn=None)
  return available startup scripts

salt.cloud.clouds.vultrpy.avail_sizes(conn=None)
  Return available sizes ("plans" in VultrSpeak)

salt.cloud.clouds.vultrpy.create(vm_)
  Create a single VM from a data dict

salt.cloud.clouds.vultrpy.destroy(name)
  Remove a node from Vultr

salt.cloud.clouds.vultrpy.get_configured_provider()
  Return the first configured instance

salt.cloud.clouds.vultrpy.list_firewall_groups(conn=None, call=None)
  return list of firewall groups

salt.cloud.clouds.vultrpy.list_keypairs(conn=None, call=None)
  return list of SSH keys

salt.cloud.clouds.vultrpy.list_nodes(**kwargs)
  Return basic data on nodes

salt.cloud.clouds.vultrpy.list_nodes_full(**kwargs)
  Return all data on nodes

salt.cloud.clouds.vultrpy.list_nodes_select(conn=None, call=None)
  Return a list of the VMs that are on the provider, with select fields
```
salt.cloud.clouds.vultrpy.list_scripts\(\text{conn=None, call=None}\)
return list of Startup Scripts

salt.cloud.clouds.vultrpy.show_instance\(\text{name, call=None}\)
Show the details from the provider concerning an instance

salt.cloud.clouds.vultrpy.show_keypair\(\text{kwargs=None, call=None}\)
return list of SSH keys

salt.cloud.clouds.vultrpy.start\(\text{"args, **kwargs}\)
Execute a "start" action on a VM

salt.cloud.clouds.vultrpy.stop\(\text{"args, **kwargs}\)
Execute a "stop" action on a VM

26.4.32 salt.cloud.clouds.xen

XenServer Cloud Driver

The XenServer driver is designed to work with a Citrix XenServer.

Requires XenServer SDK (can be downloaded from https://www.citrix.com/downloads/xenserver/product-software/)

Place a copy of the XenAPI.py in the Python site-packages folder.

depends
XenAPI

Example provider configuration:

```
# /etc/salt/cloud.providers.d/myxen.conf
myxen:
  driver: xen
  url: http://10.0.0.120
  user: root
  password: p@ssw0rd
```

Example profile configuration:

```
# /etc/salt/cloud.profiles.d/myxen.conf
suse:
  provider: myxen
  user: root
  password: p@ssw0rd
  image: opensuseleap42_2-template
  storage_repo: 'Local storage'
  resource_pool: default_pool
  clone: True
  minion:
    master: 10.0.0.18
sles:
  provider: myxen
  user: root
  clone: False
```

(continues on next page)
```
image: sles12sp2-template
deploy: False
w2k12:
    provider: myxen
    image: w2k12svr-template
    clone: True
userdata_file: /srv/salt/win/files/windows-firewall.ps1
win_installer: /srv/salt/win/files/Salt-Minion-2016.11.3-AMD64-
    → Setup.exe
    win_username: Administrator
    win_password: p@ssw0rd
    use_winrm: False
ipv4_cidr: 10.0.0.215/24
ipv4_gw: 10.0.0.1
```

salt.cloud.clouds.xen.avail_images(call=None)
Get a list of images from Xen
If called with the `--list-images` then it returns images with all details.

```
salt-cloud --list-images myxen
```

salt.cloud.clouds.xen.avail_locations(session=None, call=None)
Return available Xen locations (not implemented)

```
salt-cloud --list-locations myxen
```

salt.cloud.clouds.xen.avail_sizes(session=None, call=None)
Return a list of Xen template definitions

```
salt-cloud --list-sizes myxen
```

salt.cloud.clouds.xen.create(vm_)
Create a VM in Xen
The configuration for this function is read from the profile settings.

```
salt-cloud -p some_profile xenvm01
```

salt.cloud.clouds.xen.destroy(name=None, call=None)
Destroy Xen VM or template instance

```
salt-cloud -d xenvm01
```

salt.cloud.clouds.xen.destroy_template(name=None, call=None, kwargs=None)
Destroy Xen VM or template instance

```
salt-cloud -f destroy_template myxen name=testvm2
```

salt.cloud.clouds.xen.destroy_vm_vdis(name=None, session=None, call=None)
Get virtual block devices on VM
salt-cloud -a destroy_vm_vdis xenvm01

salt.cloud.clouds.xen.get_configured_provider()  
    Return the first configured instance.

salt.cloud.clouds.xen.get_pv_args(name, session=None, call=None)  
    Get PV arguments for a VM

salt-cloud -a get_pv_args xenvm01

salt.cloud.clouds.xen.get_vm_ip(name=None, session=None, call=None)  
    Get the IP address of the VM

salt-cloud -a get_vm_ip xenvm01

Note: Requires xen guest tools to be installed in VM

salt.cloud.clouds.xen.host_list(call=None)  
    Get a list of Xen Servers

salt-cloud -f host_list myxen

salt.cloud.clouds.xen.list_nodes()  
    List virtual machines

salt-cloud -Q

salt.cloud.clouds.xen.list_nodes_full(session=None)  
    List full virtual machines

salt-cloud -F

salt.cloud.clouds.xen.list_nodes_select(call=None)  
    Perform a select query on Xen VM instances

salt-cloud -S

salt.cloud.clouds.xen.pause(name, call=None, session=None)  
    Pause a vm

salt-cloud -a pause xenvm01

salt.cloud.clouds.xen.pif_list(call=None)  
    Get a list of Resource Pools

salt-cloud -f pool_list myxen

salt.cloud.clouds.xen.pool_list(call=None)  
    Get a list of Resource Pools

salt-cloud -f pool_list myxen
salt.cloud.clouds.xen.reboot(name, call=None, session=None)
Reboot a vm
```
salt-cloud -a reboot xenvm01
```

salt.cloud.clouds.xen.resume(name, call=None, session=None)
Resume a vm from disk
```
salt-cloud -a resume xenvm01
```

salt.cloud.clouds.xen.set_pv_args(name, kwargs=None, session=None, call=None)
Set PV arguments for a VM
```
salt-cloud -a set_pv_args xenvm01 pv_args="utf-8 graphical"
```

salt.cloud.clouds.xen.set_vm_ip(name=None, ipv4_cidr=None, ipv4_gw=None, session=None, call=None)
Set the IP address on a virtual interface (vif)

salt.cloud.clouds.xen.show_instance(name, session=None, call=None)
Show information about a specific VM or template
```
salt-cloud -a show_instance xenvm01
```

**Note:** memory is memory_dynamic_max

salt.cloud.clouds.xen.shutdown(name, call=None, session=None)
Shutdown a vm
```
salt-cloud -a shutdown xenvm01
```

salt.cloud.clouds.xen.sr_list(call=None)
Get a list of storage repositories
```
salt-cloud -f sr_list myxen
```

salt.cloud.clouds.xen.start(name, call=None, session=None)
Start a vm
```
salt-cloud -a start xenvm01
```

salt.cloud.clouds.xen.stop(name, call=None, session=None)
Stop a vm
```
salt-cloud -a stop xenvm01
```

salt.cloud.clouds.xen.suspend(name, call=None, session=None)
Suspend a vm to disk
```
salt-cloud -a suspend xenvm01
```
The `salt.cloud.clouds.xen.template_list` function

- **Function**: `template_list`
- **Callable**: `call=None`
- **Description**: Returns available Xen template information.
- **Example**:
  ```bash
  salt-cloud -f template_list myxen
  ```

The `salt.cloud.clouds.xen.unpause` function

- **Function**: `unpause`
- **Callable**: `name=None, call=None, session=None`
- **Description**: Unpauses a VM
- **Example**:
  ```bash
  salt-cloud -a unpause xenvm01
  ```

The `salt.cloud.clouds.xen.vbd_list` function

- **Function**: `vbd_list`
- **Callable**: `name=None, call=None`
- **Description**: Returns a list of VBDs on a VM.
- **Example**:
  ```bash
  salt-cloud -a vbd_list xenvm01
  ```

The `salt.cloud.clouds.xen.vdi_list` function

- **Function**: `vdi_list`
- **Callable**: `call=None, kwargs=None`
- **Description**: Returns available Xen VDI images.
- **Example**: (With `terse=True`)
  ```bash
  salt-cloud -f vdi_list myxen terse=True
  ```

The `salt.cloud.clouds.xen.vif_list` function

- **Function**: `vif_list`
- **Callable**: `name, call=None, kwargs=None`
- **Description**: Returns a list of virtual network interfaces on a VM.
- **Example**: (With `vbd_def=xenvm01`)
  ```bash
  salt-cloud -a vif_list xenvm01
  ```
26.5 engine modules

<table>
<thead>
<tr>
<th>Engine Module</th>

26.5.1 salt.engines.docker_events

**Warning:** This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](https://docs.saltstack.com/en/latest/ref/module/salt.engine.html).

Send events from Docker events  
 Depends: Docker API >= 1.22

```python
salt.engines.docker_events.start(docker_url='unix://var/run/docker.sock', timeout=60, tag='salt-engines/docker_events', filters=None)
```

Scan for Docker events and fire events

Example Config
The config above sets up engines to listen for events from the Docker daemon and publish them to the Salt event bus.

For filter reference, see https://docs.docker.com/engine/reference/commandline/events/

### 26.5.2 salt.engines.fluent

An engine that reads messages from the salt event bus and pushes them onto a fluent endpoint.

New in version 3000.

#### Configuration

All arguments are optional

Example configuration of default settings

```yaml
engines:
  - fluent:
      host: localhost
      port: 24224
      app: engine
```

Example fluentd configuration

```xml
<sourc>
  @type forward
  port 24224
</sourc>

<match saltstack.**>
  @type file
  path /var/log/td-agent/saltstack
</match>
```

depends
  fluent-logger

salt.engines.fluent.start( host='localhost', port=24224, app='engine' )

Listen to salt events and forward them to fluent

#### Parameters

- **host** (str) -- Host running fluentd agent. Default is localhost
- **port** (int) -- Port of fluentd agent. Default is 24224
• app (str) -- Text sent as fluentd tag. Default is "engine". This text is appended to "salt-stack." to form a fluentd tag, ex: "saltstack.engine"

### 26.5.3 salt.engines.http_logstash

**HTTP Logstash engine**

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint via HTTP requests. Changed in version 2018.3.0.

**Note:** By default, this engine take everything from the Salt bus and exports into Logstash. For a better selection of the events that you want to publish, you can use the tags and funs options.

**configuration**

```yaml
engines:
  - http_logstash:
      url: http://blabla.com/salt-stuff
      tags:
        - salt/job/*/new
        - salt/job/*/ret/*
      funs:
        - probes.results
        - bgp.config
```

**salt.engines.http_logstash.start** *(url, funs=\None, tags=\None)*

Listen to salt events and forward them to logstash.

- **url**
  The Logstash endpoint.

- **funs:** \None
  A list of functions to be compared against, looking into the fun field from the event data. This option helps to select the events generated by one or more functions. If an event does not have the fun field in the data section, it will be published. For a better selection, consider using the tags option. By default, this option accepts any event to be submitted to Logstash.

- **tags:** \None
  A list of pattern to compare the event tag against. By default, this option accepts any event to be submitted to Logstash.

### 26.5.4 salt.engines.ircbot

**IRC Bot engine**

New in version 2017.7.0.

**Example Configuration**

```yaml
engines:
  - ircbot:
```

(continues on next page)
**nick**: `<nick>`
**username**: `<username>`
**password**: `<password>`
**host**: `irc.oftc.net`
**port**: `7000`
**channels**:
- `salt-test`
- `##something`
**use_ssl**: `True`
**use_sasl**: `True`
**disable_query**: `True`
**allow_hosts**:
- `salt/engineer/.*`
**allow_nicks**:
- `gtmanfred`

Available commands on irc are:

**ping**
```
return pong
```

**echo** `<stuff>`
```
return <stuff> targeted at the user who sent the commands
```

**event** `<tag> [extra], <data>`
```
fine event on the master or minion event stream with the tag salt/engines/ircbot/<tag> and a data object with a list of everything else sent in the message
```

Example of usage
```
08:33:57 @gtmanfred > !ping
08:33:57 gtmanbot > gtmanfred: pong
08:34:02 @gtmanfred > !echo ping
08:34:02 gtmanbot > ping
08:34:17 @gtmanfred > !event test/tag/ircbot irc is useful
08:34:17 gtmanbot > gtmanfred: TaDa!
```

```
[DEBUG     ] Sending event: tag = salt/engines/ircbot/test/tag/ircbot; data = {
  → '_stamp': '2016-11-28T14:34:16.633623', 'data': ['irc', 'is', 'useful']}
```

```
class salt.engines.ircbot.Event(source, code, line)
  code
  Alias for field number 1
  line
  Alias for field number 2
  source
  Alias for field number 0
```

```
class salt.engines.ircbot.IRCClient(nick, host, port=6667, username=None, password=None,
  channels=None, use_ssl=False, use_sasl=False, char='!',
  allow_hosts=False, allow_nicks=False, disable_query=True)
```

1264 Chapter 26. Salt Module Reference
join_channel(channel)
on_closed()
on_connect()
read_messages()
send_message(line)

class salt.engines.ircbot.PrivEvent(source, nick, user, host, code, channel, command, line)

class channel
    Alias for field number 5
code
    Alias for field number 4
command
    Alias for field number 6
host
    Alias for field number 3
line
    Alias for field number 7
nick
    Alias for field number 1
source
    Alias for field number 0
user
    Alias for field number 2

salt.engines.ircbot.start(nick=..., host=..., port=6667, username=None, password=None, channels=None, use_ssl=False, use_sasl=False, char='!', allow_hosts=False, allow_nicks=False, disable_query=True)

IRC Bot for interacting with salt.
nick
    Nickname of the connected Bot.
host
    Irc server (example - irc.oftc.net).
port
    Irc port. Default: 6667
password
    Password for authenticating. If not provided, user will not authenticate on the irc server.
channels
    Channels to join.
use_ssl
    Connect to server using ssl. Default: False
use_sasl
authenticate using sasl, instead of messaging NickServ. Default: False

Note: This will allow the bot user to be fully authenticated before joining any channels

char
command character to look for. Default: !

allow_hosts
hostmasks allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching

allow_nicks
Nicks that are allowed to use commands on the bot. Default: False True to allow all False to allow none List of regexes to allow matching

disable_query
Disable commands from being sent through private queries. Require they be sent to a channel, so that all communication can be controlled by access to the channel. Default: True

Warning: Unauthenticated Access to event stream
This engine sends events calls to the event stream without authenticating them in salt. Authentication will need to be configured and enforced on the irc server or enforced in the irc channel. The engine only accepts commands from channels, so non authenticated users could be banned or quieted in the channel.

/mode +q $~a # quiet all users who are not authenticated /mode +r # do not allow unauthenticated users into the channel

It would also be possible to add a password to the irc channel, or only allow invited users to join.

26.5.5 salt.engines.junos_syslog

Junos Syslog Engine

New in version 2017.7.0.

depends
pyparsing, twisted

An engine that listens to syslog message from Junos devices, extract event information and generate message on SaltStack bus.

The event topic sent to salt is dynamically generated according to the topic title specified by the user. The incoming event data (from the junos device) consists of the following fields:

1. hostname
2. hostip
3. daemon
4. event
5. severity
6. priority
7. timestamp
8. message
9. pid
10. raw (the raw event data forwarded from the device)

The topic title can consist of any of the combination of above fields, but the topic has to start with 'jnpr/syslog'. So, we can have different combinations:

- jnpr/syslog/hostip/daemon/event
- jnpr/syslog/daemon/severity

The corresponding dynamic topic sent on salt event bus would look something like:

- jnpr/syslog/1.1.1.1/mgd/UI_COMMIT_COMPLETED
- jnpr/syslog/sshd/7

The default topic title is 'jnpr/syslog/hostname/event'.

The user can choose the type of data they want of the event bus. Like, if one wants only events pertaining to a particular daemon, they can specify that in the configuration file:

```yaml
daemon: mgd
```

One can even have a list of daemons like:

```yaml
daemon:
  - mgd
  - sshd
```

Example configuration (to be written in master config file)

```yaml
eengines:
  - junos_syslog:
      port: 9999
      topic: jnpr/syslog/hostip/daemon/event
      daemon:
        - mgd
        - sshd
```

For junos_syslog engine to receive events, syslog must be set on the junos device. This can be done via following configuration:

```bash
set system syslog host <ip-of-the-salt-device> port 516 any any
```

Below is a sample syslog event which is received from the junos device:

```bash
'<30>May 29 05:18:12 bng-ui-vm-9 mspd[1492]: No chassis configuration found'
```

The source for parsing the syslog messages is taken from: https://gist.github.com/leandrosilva/3651640#file-xlog-py

```python
class salt.engines.junos_syslog.DatagramProtocol
salt.engines.junos_syslog.start(port=516, **kwargs)
```
26.5.6  salt.engines.libvirt_events

An engine that listens for libvirt events and resends them to the salt event bus.

The minimal configuration is the following and will listen to all events on the local hypervisor and send them with a tag starting with salt/engines/libvirt_events:

```
engines:
  - libvirt_events
```

Note that the automatically-picked libvirt connection will depend on the value of uri_default in /etc/libvirt/libvirt.conf. To force using another connection like the local LXC libvirt driver, set the uri property as in the following example configuration.

```
engines:
  - libvirt_events:
    uri: lxc://
    tag_prefix: libvirt
    filters:
      - domain/lifecycle
      - domain/reboot
      - pool
```

Filters is a list of event types to relay to the event bus. Items in this list can be either one of the main types (domain, network, pool, nodedev, secret), all or a more precise filter. These can be done with values like <main_type>/<subtype>. The possible values are in the CALLBACK_DEFS constant. If the filters list contains all, all events will be relayed.

Be aware that the list of events increases with libvirt versions, for example network events have been added in libvirt 1.2.1 and storage events in 2.0.0.

Running the engine on non-root

Running this engine as non-root requires a special attention, which is surely the case for the master running as user salt. The engine is likely to fail to connect to libvirt with an error like this one:

```
[ERROR ] authentication unavailable: no polkit agent available to authenticate action 'org.libvirt.unix.monitor'
```

To fix this, the user running the engine, for example the salt-master, needs to have the rights to connect to libvirt in the machine polkit config. A polkit rule like the following one will allow salt user to connect to libvirt:

```
polkit.addRule(function(action, subject) {
  if (action.id.indexOf("org.libvirt") == 0 &&
      subject.user == "salt") {
    return polkit.Result.YES;
  }
});
```

```
depends
  libvirt 1.0.0+ python binding
```

New in version 2019.2.0.

```
salt.engines.libvirt_events.start(uri=None, tag_prefix='salt/engines/libvirt_events', filters=None)
```

Listen to libvirt events and forward them to salt.
Parameters

- **uri** -- libvirt URI to listen on. Defaults to None to pick the first available local hypervisor
- **tag_prefix** -- the beginning of the salt event tag to use. Defaults to 'salt/engines/libvirt_events'
- **filters** -- the list of event of listen on. Defaults to 'all'

26.5.7 salt.engines.logentries

An engine that sends events to the Logentries logging service.

**maintainer**

Jimmy Tang (jimmy_tang@rapid7.com)

**maturity**

New

**depends**

ssl, certifi

**platform**

all

New in version 2016.3.0.

To enable this engine the master and/or minion will need the following python libraries

ssl certifi

If you are running a new enough version of python then the ssl library will be present already.

You will also need the following values configured in the minion or master config.

**configuration**

Example configuration

```yaml
engines:
  - logentries:
      endpoint: data.logentries.com
      port: 10000
      token: 057af3e2-1c05-47c5-882a-5cd644655dbf
```

The 'token' can be obtained from the Logentries service.

To test this engine

```
salt '*' test.ping cmd.run uptime
```

**class** salt.engines.logentries.PlainTextSocketAppender(verbosen=True,

LE_API='data.logentries.com',

LE_PORT=80, LE_TLS_PORT=443)

- `close_connection()`
- `open_connection()`
- `put(data)`
reopen_connection()

salt.engines.logentries.SocketAppender
   alias of TLSSocketAppender

class salt.engines.logentries.TLSSocketAppender(verbos=True, LE_API='data.logentries.com',
   LE_PORT=80, LE_TLS_PORT=443)

open_connection()

salt.engines.logentries.event_bus_context(opts)

salt.engines.logentries.start(endpoint='data.logentries.com', port=10000, token=None,
   tag='salt/engines/logentries')

Listen to salt events and forward them to Logentries

26.5.8 salt.engines.logstash_engine

An engine that reads messages from the salt event bus and pushes them onto a logstash endpoint.
New in version 2015.8.0.

configuration
   Example configuration

   
   engines:
      - logstash:
         host: log.my_network.com
         port: 5959
         proto: tcp

depends
   logstash

salt.engines.logstash_engine.event_bus_context(opts)

salt.engines.logstash_engine.start(host, port=5959, tag='salt/engine/logstash', proto='udp')

Listen to salt events and forward them to logstash

26.5.9 salt.engines.napalm_syslog

NAPALM syslog engine

New in version 2017.7.0.

An engine that takes syslog messages structured in OpenConfig or IETF format and fires Salt events.
As there can be many messages pushed into the event bus, the user is able to filter based on the object structure.
Requirements

- napalm-logs

This engine transfers objects from the napalm-logs library into the event bus. The top dictionary has the following keys:

- ip
- host
- timestamp
- os: the network OS identified
- model_name: the OpenConfig or IETF model name
- error: the error name (consult the documentation)
- message_details: details extracted from the syslog message
- open_config: the OpenConfig model

The napalm-logs transfers the messages via widely used transport mechanisms such as: ZeroMQ (default), Kafka, etc.

The user can select the right transport using the transport option in the configuration.

configuration

Example configuration

```
engines:
- napalm_syslog:
  transport: zmq
  address: 1.2.3.4
  port: 49018
```

configuration

Configuration example, excluding messages from IOS-XR devices:

```
engines:
- napalm_syslog:
  transport: kafka
  address: 1.2.3.4
  port: 49018
  os_blacklist:
    - iosxr
```

Event example:

```
{
  "_stamp": "2017-05-26T10:03:18.653045",
  "error": "BGP_PREFIX_THRESH_EXCEEDED",
  "host": "vmx01",
  "ip": "192.168.140.252",
  "message_details": {
    "date": "May 25",
    "host": "vmx01",
    "message": "192.168.140.254 (External AS 65001): Configured maximum"}
```
To consume the events and eventually react and deploy a configuration changes on the device(s) firing the event, one is able to identify the minion ID, using one of the following alternatives, but not limited to:

- **Host grains** to match the event tag
- **Host DNS grain** to match the IP address in the event data
- **Hostname grains** to match the event tag
• Define static grains
• Write a grains module
• Targeting minions using pillar data - The user can configure certain information in the Pillar data and then use it to identify minions

Master configuration example, to match the event and react:

```yaml
reactor:
- 'napalm/syslog/*/BGP_PREFIX_THRESH_EXCEEDED/*':
  - salt://increase_prefix_limit_on_thresh_exceeded.sls
```

Which matches the events having the error code BGP_PREFIX_THRESH_EXCEEDED from any network operating system, from any host and reacts, executing the increase_prefix_limit_on_thresh_exceeded.sls reactor, found under one of the file_roots paths.

Reactor example:

```yaml
increase_prefix_limit_on_thresh_exceeded:
local.net.load_template:
  - tgt: "hostname:{{ data['host'] }}"
  - tgt_type: grain
  - kwarg:
    template_name: salt://increase_prefix_limit.jinja
    openconfig_structure: {{ data['open_config'] }}
```

The reactor in the example increases the BGP prefix limit when triggered by an event as above. The minion is matched using the host field from the data (which is the body of the event), compared to the hostname grain field. When the event occurs, the reactor will execute the net.load_template function, sending as arguments the template salt://increase_prefix_limit.jinja defined by the user in their environment and the complete OpenConfig object under the variable name openconfig_structure. Inside the Jinja template, the user can process the object from openconfig_structure and define the business logic as required.

```python
salt.engines.napalm_syslog.start(transport='zmq', address='0.0.0.0', port=49017, auth_address='0.0.0.0', auth_port=49018, disable_security=False, certificate=None, os_whitelist=None, os_blacklist=None, error_whitelist=None, error_blacklist=None, host_whitelist=None, host_blacklist=None)
```

Listen to napalm-logs and publish events into the Salt event bus.

- **transport:** zmq
  - Choose the desired transport.

  **Note:** Currently zmq is the only valid option.

  - **address:** 0.0.0.0
    - The address of the publisher, as configured on napalm-logs.
  - **port:** 49017
    - The port of the publisher, as configured on napalm-logs.
  - **auth_address:** 0.0.0.0
    - The address used for authentication when security is not disabled.
  - **auth_port:** 49018
    - Port used for authentication.
disable_security: **False**
Trust unencrypted messages. Strongly discouraged in production.

certificate: **None**
Absolute path to the SSL certificate.

os_whitelist: **None**
List of operating systems allowed. By default everything is allowed.

os_blacklist: **None**
List of operating system to be ignored. Nothing ignored by default.

error_whitelist: **None**
List of errors allowed.

error_blacklist: **None**
List of errors ignored.

host_whitelist: **None**
List of hosts or IPs to be allowed.

host_blacklist: **None**
List of hosts of IPs to be ignored.

### 26.5.10 salt.engines.reactor

**Setup Reactor**

Example Config in Master or Minion config

```yaml
engines:
  - reactor:
      refresh_interval: 60
      worker_threads: 10
      worker_hwm: 10000

reactor:  
  - 'salt/cloud/*/destroyed':
  - /srv/reactor/destroy/*.sls

salt.engines.reactor.start(refresh_interval=None, worker_threads=None, worker_hwm=None)
```

### 26.5.11 salt.engines.redis_sentinel

An engine that reads messages from the redis sentinel pubsub and sends reactor events based on the channels they are subscribed to.

New in version 2016.3.0.

**configuration**

Example configuration

```yaml
engines:
  - redis_sentinel:
      hosts:
        matching: 'board*'
      port: 26379
```

(continues on next page)
interface: eth2
channels:
  - '+switch-master'
  - '+odown'
  - '-odown'

depends
  redis

class salt.engines.redis_sentinel.Listener(host=None, port=None, channels=None, tag=None)
  run()
  work(item)

salt.engines.redis_sentinel.start(hosts, channels, tag=None)

26.5.12 salt.engines.script

Send events based on a script's stdout

Example Config

engines:
  - script:
    cmd: /some/script.py -a 1 -b 2
    output: json
    interval: 5
    onchange: false

Script engine configs:

cmd
  Script or command to execute

output
  Any available saltstack deserializer

interval
  How often in seconds to execute the command

onchange
  New in version 3006.0.
  Only fire an event if the tag-specific output changes. Defaults to False.

salt.engines.script.start(cmd, output='json', interval=1, onchange=False)

Parse stdout of a command and generate an event

The script engine will scrap stdout of the given script and generate an event based on the presence of the 'tag' key and its value.

If there is a data obj available, that will also be fired along with the tag.
Example

Given the following json output from a script:

```
{
    "tag" : "lots/of/tacos",
    "data" : { "toppings" : "cilantro" }
}
```

This will fire the event 'lots/of/tacos' on the event bus with the data obj as is.

Parameters

- **cmd** -- The command to execute
- **output** -- How to deserialize stdout of the script
- **interval** -- How often to execute the script
- **onchange** -- Only fire an event if the tag-specific output changes

26.5.13 salt.engines.slack

An engine that reads messages from Slack and can act on them

New in version 2016.3.0.

**depends**

- slackclient Python module

**Important:** This engine requires a bot user. To create a bot user, first go to the Custom Integrations page in your Slack Workspace. Copy and paste the following URL, and replace myworkspace with the proper value for your workspace:

https://myworkspace.slack.com/apps/manage/custom-integrations

Next, click on the Bots integration and request installation. Once approved by an admin, you will be able to proceed with adding the bot user. Once the bot user has been added, you can configure it by adding an avatar, setting the display name, etc. You will also at this time have access to your API token, which will be needed to configure this engine.

Finally, add this bot user to a channel by switching to the channel and using /invite @mybotuser. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

This engine has two boolean configuration parameters that toggle specific features (both default to False):

1. **control** - If set to True, then any message which starts with the trigger string (which defaults to ! and can be overridden by setting the trigger option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various groups will determine if the Slack user is allowed to run the command. The targets and default_target options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:
   - **target** - The target expression to use for the command
   - **tgt_type** - The match type, can be one of glob, list, pcre, grain, grain_pcre, pillar, nodegroup, range, ipcidr, or compound. The default value is glob.

Here are a few examples:
2. **fire_all** - If set to `True`, all messages which are not prefixed with the trigger string will fire as events onto Salt's `event bus <event-system>`. The tag for these events will be prefixed with the string specified by the `tag` config option (default: `salt/engines/slack`).

The `groups_pillar_name` config option can be used to pull group configuration from the specified pillar key.

**Note:** In order to use `groups_pillar_name`, the engine must be running as a minion running on the master, so that the `Caller` client can be used to retrieve that minions pillar data, because the master process does not have pillar data.

**Configuration Examples**

Changed in version 2017.7.0: Access control group support added

This example uses a single group called `default`. In addition, other groups are being loaded from pillar data. The group names do not have any significance, it is the users and commands defined within them that are used to determine whether the Slack user has permission to run the desired command.

```yaml
engines:
- slack:
  token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxxxxxx'
  control: True
  fire_all: False
  groups_pillar_name: 'slack_engine:groups_pillar'
  groups:
    default:
      users:
        - '*'
      commands:
        - test.ping
        - cmd.run
        - list_jobs
        - list_commands
      aliases:
        list_jobs:
          cmd: jobs.list_jobs
        list_commands:
          cmd: '\pillarget &lt;salt:engines:slack:valid_commands\', \(target=saltmaster tgt_type=list\)'
      default_target:
        target: saltmaster
        tgt_type: glob
      targets:
        test.ping:
          target: '*'
          tgt_type: glob
        cmd.run:
```

(continues on next page)
target: saltmaster
tgt_type: list

This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using *, the value must be quoted, or else PyYAML will fail to load the configuration.

```
engines:
  - slack:
      groups_pillar: slack_engine_pillar
token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxx'
control: True
fire_all: True
tag: salt/engines/slack
groups_pillar_name: 'slack_engine:groups_pillar'
groups:
  default:
    users:
    - '*'
    commands:
    - test.ping
    aliases:
      list_jobs:
        cmd: jobs.list_jobs
      list_commands:
        cmd: 'pillar.get salt:engines:slack:valid_commands
→target=saltmaster tgt_type=list'
gods:
  users:
  - garethgreenaway
  commands:
  - '*'
```

**class** salt.engines.slack.*SlackClient*(token)

**can_user_run**(user, command, groups)

Break out the permissions into the following:

Check whether a user is in any group, including whether a group has the '*' membership

**Parameters**

- **user**(str) -- The username being checked against
- **command**(str) -- The command that is being invoked (e.g. test.ping)
- **groups**(dict) -- The dictionary with groups permissions structure.

**Return type**

tuple

**Returns**

On a successful permitting match, returns 2-element tuple that contains the name of the group that successfully matched, and a dictionary containing the configuration of the group so it can be referenced.

On failure it returns an empty tuple
**commandline_to_list** *(cmdline_str, trigger_string)*

cmdline_str is the string of the command line trigger_string is the trigger string, to be removed

**control_message_target** *(slack_user_name, text, loaded_groups, trigger_string)*

Returns a tuple of (target, cmdline,) for the response

 Raises IndexError if a user can’t be looked up from all_slack_users

 Returns (False, False) if the user doesn’t have permission

 These are returned together because the commandline and the targeting interact with the group config
 (specifically aliases and targeting configuration) so taking care of them together works out.

 The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

**fire** *(tag, msg)*

This replaces a function in main called ‘fire’

 It fires an event into the salt bus.

**format_return_text** *(data, function, **kwargs)*

Print out YAML using the block mode

**generate_triggered_messages** *(token, trigger_string, groups, groups_pillar_name)*

slack_token = string trigger_string = string input_valid_users = set input_valid_commands = set

When the trigger_string prefixes the message text, yields a dictionary of:

```python
{
    'message_data': m_data,
    'cmdline': cmdline_list,  # this is a list
    'channel': channel,
    'user': m_data['user'],
    'slack_client': sc
}
```

else yields {'message_data': m_data} and the caller can handle that

When encountering an error (e.g. invalid message), yields {}, the caller can proceed to the next message

When the websocket being read from has given up all its messages, yields {'done': True} to indicate that
the caller has read all of the relevant data for now, and should continue its own processing and check
back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

**get_config_groups** *(groups_conf, groups_pillar_name)*

get info from groups in config, and from the named pillar

todo: add specification for the minion to use to recover pillar

**get_jobs_from_runner** *(outstanding_jids)*

Given a list of job_ids, return a dictionary of those job_ids that have completed and their results.

Query the salt event bus via the jobs runner. jobs.list_job will show a job in progress, jobs.lookup_jid
will return a job that has completed.

returns a dictionary of job id: result

**get_slack_channels** *(token)*

Get all channel names from Slack
get_slack_users(token)
Get all users from Slack

get_target(permited_group, cmdline, alias_cmdline)
When we are permitted to run a command on a target, look to see what the default targeting is for that
group, and for that specific command (if provided).

It's possible for None or False to be the result of either, which means that it's expected that the caller
provide a specific target.

If no configured target is provided, the command line will be parsed for target=foo and tgt_type=bar

Test for this:

```python
h = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type': 'list'}},
     'users': {'dmangot', 'jmickle', 'pcn'}}

f = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {}, 'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}

g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}
```

Run each of them through get_configured_target(('foo', f), 'pillar.get') and
confirm a valid target

message_text(m_data)
 Raises ValueError if a value doesn't work out, and TypeError if this isn't a message type

parse_args_and_kwargs(cmdline)
 cmdline: list
 returns tuple of: args (list), kwargs (dict)

run_command_async(msg)

Parameters

- message_generator (generator of dict) -- Generates messages from slack
  that should be run
- fire_all (bool) -- Whether to also fire messages to the event bus
- tag (str) -- The tag to send to use to send to the event bus
- interval (int) -- time to wait between ending a loop and beginning the next

run_commands_from_slack_async(message_generator, fire_all, tag, control, interval=1)
 Pull any pending messages from the message_generator, sending each one to either the event bus, the
command_async or both, depending on the values of fire_all and command

salt.engines.slack.start(token, control=False, trigger='!', groups=None, groups_pillar_name=None,
                          fire_all=False, tag='salt/engines/slack')

Listen to slack events and forward them to salt, new version
26.5.14 salt.engines.slack_bolt_engine

An engine that reads messages from Slack and can act on them

New in version 3006.0.

depends
  slack_bolt Python module

Important: This engine requires a Slack app and a Slack Bot user. To create a bot user, first go to the Custom Integrations page in your Slack Workspace. Copy and paste the following URL, and log in with account credentials with administrative privileges:

https://api.slack.com/apps/new

Next, click on the From scratch option from the Create an app popup. Give your new app a unique name, eg. SaltSlackEngine, select the workspace where your app will be running, and click Create App.

Next, click on Socket Mode and then click on the toggle button for Enable Socket Mode. In the dialog give your Socket Mode Token a unique name and then copy and save the app level token. This will be used as the app_token parameter in the Slack engine configuration.

Next, click on Event Subscriptions and ensure that Enable Events is in the on position. Then add the following bot events, message.channel and message.im to the Subscribe to bot events list.

Next, click on OAuth & Permissions and then under Bot Token Scope, click on Add an OAuth Scope. Ensure the following scopes are included:

- channels:history
- channels:read
- chat:write
- commands
- files:read
- files:write
- im:history
- mpim:history
- usergroups:read
- users:read

Once all the scopes have been added, click the Install to Workspace button under OAuth Tokens for Your Workspace, then click Allow. Copy and save the Bot User OAuth Token, this will be used as the bot_token parameter in the Slack engine configuration.

Finally, add this bot user to a channel by switching to the channel and using /invite @mybotuser. Keep in mind that this engine will process messages from each channel in which the bot is a member, so it is recommended to narrowly define the commands which can be executed, and the Slack users which are allowed to run commands.

This engine has two boolean configuration parameters that toggle specific features (both default to False):

1. control - If set to True, then any message which starts with the trigger string (which defaults to ! and can be overridden by setting the trigger option in the engine configuration) will be interpreted as a Salt CLI command and the engine will attempt to run it. The permissions defined in the various groups will determine if the Slack user is allowed to run the command. The targets and default_target options can be used to set targets for a given command, but the engine can also read the following two keyword arguments:
• target - The target expression to use for the command
• tgt_type - The match type, can be one of glob, list, pcre, grain, grain_pcre, pillar, nodegroup, range, ipcidr, or compound. The default value is glob.

Here are a few examples:

```
!test.ping target=*  
!state.apply foo target=os:CentOS tgt_type=grain  
!pkg.version mypkg target=role:database tgt_type=pillar
```

2. fire_all - If set to True, all messages which are not prefixed with the trigger string will fired as events onto Salt's re: event bus <event-system>. The tag for these events will be prefixed with the string specified by the tag config option (default: salt/engines/slack).

The groups_pillar_name config option can be used to pull group configuration from the specified pillar key.

Note: In order to use groups_pillar_name, the engine must be running as a minion running on the master, so that the Caller client can be used to retrieve that minion's pillar data, because the master process does not have pillar data.

### Configuration Examples

Changed in version 2017.7.0: Access control group support added

Changed in version 3006.0: Updated to use slack_bolt Python library.

This example uses a single group called default. In addition, other groups are being loaded from pillar data. The users and commands defined within these groups are used to determine whether the Slack user has permission to run the desired command.

```
engines:
  - slack_bolt:
    app_token: "xapp-xxxx-xxxxxxxxxx-xxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
This example shows multiple groups applying to different users, with all users having access to run test.ping. Keep in mind that when using *, the value must be quoted, or else PyYAML will fail to load the configuration.

```yaml
default_target:
  target: saltmaster
tgt_type: glob
targets:
  test.ping:
    target: '*'
tgt_type: glob
  cmd.run:
    target: saltmaster
tgt_type: list

engines:
  - slack_bolt:
      groups_pillar: slack_engine_pillar
      app_token: "xapp-x-xxxxxxxxxx-xxxxxxxxxxxx-
      bot_token: 'xoxb-xxxxxxxxxx-xxxxxxxxxxxxxxxxxxxxxxxx'
      control: True
      fire_all: True
tag: salt/engines/slack
groups_pillar_name: 'slack_engine:groups_pillar'
groups:
  default:
    users:
    - '*'
    commands:
    - test.ping
    aliases:
      list_jobs:
        cmd: jobs.list_jobs
      list_commands:
        cmd: 'pillar.get salt:engines:slack:valid_commands'
  - target=saltmaster tgt_type=list'
gods:
  users:
  - garethgreenaway
  commands:
    - '*'
```

**class** `salt.engines.slack_bolt_engine.SlackClient(app_token, bot_token, trigger_string)`

**can_user_run**(user, command, groups)

Check whether a user is in any group, including whether a group has the `*` membership

**Parameters**

- **user**(str) -- The username being checked against
- **command**(str) -- The command that is being invoked (e.g. test.ping)
- **groups**(dict) -- the dictionary with groups permissions structure.
Return type
tuple

Returns
On a successful permitting match, returns 2-element tuple that contains the name of the
group that successfully matched, and a dictionary containing the configuration of the group
so it can be referenced.

On failure it returns an empty tuple

**commandline_to_list**(cmdline_str, trigger_string)

**control_message_target**(slack_user_name, text, loaded_groups, trigger_string)

Returns a tuple of (target, cmdline,) for the response

 Raises IndexError if a user can’t be looked up from all_slack_users

Returns (False, False) if the user doesn’t have permission

These are returned together because the commandline and the targeting interact with the group config
(specifically aliases and targeting configuration) so taking care of them together works out.

The cmdline that is returned is the actual list that should be processed by salt, and not the alias.

**fire**(tag, msg)

This replaces a function in main called ‘fire’

It fires an event into the salt bus.

Parameters

- **tag**(str) -- The tag to use when sending events to the Salt event bus.
- **msg**(dict) -- The msg dictionary to send to the Salt event bus.

**format_return_text**(data, function, **kwargs)

Print out YAML using the block mode

Parameters

- **token** -- The return data that needs to be formatted.
- **token** -- The function that was used to generate the return data.

**generate_triggered_messages**(token, trigger_string, groups, groups_pillar_name)

slack_token = string trigger_string = string input_valid_users = set input_valid_commands = set

When the trigger_string prefixes the message text, yields a dictionary of:

```python
{
    'message_data': m_data,
    'cmdline': cmdline_list,  # this is a list
    'channel': channel,
    'user': m_data['user'],
    'slack_client': sc
}
```

else yields {‘message_data’: m_data} and the caller can handle that

When encountering an error (e.g. invalid message), yields {}, the caller can proceed to the next message
When the websocket being read from has given up all its messages, yields {'done': True} to indicate that the caller has read all of the relevant data for now, and should continue its own processing and check back for more data later.

This relies on the caller sleeping between checks, otherwise this could flood

**get_config_groups**(groups_conf, groups_pillar_name)
get info from groups in config, and from the named pillar

Parameters

- **group_conf**(dict) -- The dictionary containing the groups, group members, and the commands those group members have access to.
- **groups_pillar_name**(str) -- can be used to pull group configuration from the specified pillar key.

**get_jobs_from_runner**(outstanding_jids)
Given a list of job_ids, return a dictionary of those job_ids that have completed and their results.
Query the salt event bus via the jobs runner. jobs.list_job will show a job in progress, jobs.lookup_jid will return a job that has completed.

Parameters

- **outstanding_jids**(list) -- The list of job ids to check for completion.

returns a dictionary of job id: result

**get_slack_channels**(token)
Get all channel names from Slack

Parameters

- **token**(str) -- The Slack token being used to allow Salt to interact with Slack.

**get_slack_users**(token)
Get all users from Slack

Parameters

- **token** -- The Slack token being used to allow Salt to interact with Slack.

**get_target**(permitted_group, cmdline, alias_cmdline)
When we are permitted to run a command on a target, look to see what the default targeting is for that group, and for that specific command (if provided).

It’s possible for **None** or **False** to be the result of either, which means that it’s expected that the caller provide a specific target.

If no configured target is provided, the command line will be parsed for target=foo and tgt_type=bar
Test for this:

```
h = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {'target': '*', 'tgt_type': 'glob'},
     'targets': {'pillar.get': {'target': 'you_momma', 'tgt_type': 'list'},
                  'users': {'dmangot', 'jmickle', 'pcn'}}
f = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'},
     'default_target': {}, 'targets': {}, 'users': {'dmangot', 'jmickle', 'pcn'}}
g = {'aliases': {}, 'commands': {'cmd.run', 'pillar.get'}}
```
(continues on next page)
Run each of them through `get_configured_target(('foo', f), 'pillar.get')` and confirm a valid target.

**Parameters**

- **permitted_group** (tuple) -- A tuple containing the group name and group configuration to check for permission.
- **cmdline** (list) -- The command sent from Slack formatted as a list.
- **alias_cmdline** (str) -- An alias to a cmdline.

**message_text** (m_data)

Raises ValueError if a value doesn’t work out, and TypeError if this isn’t a message type

**Parameters**

- **m_data** (dict) -- The message sent from Slack

**message_trigger** (message)

**parse_args_and_kwargs** (cmdline)

**Parameters**

- **cmdline** (list) -- The command sent from Slack formatted as a list.

returns tuple of: args (list), kwargs (dict)

**run_command_async** (msg)

**Parameters**

- **msg** (dict) -- The message dictionary that contains the command and all information.

**run_commands_from_slack_async** (message_generator, fire_all, tag, control, interval=1)

Pull any pending messages from the message_generator, sending each one to either the event bus, the command_async or both, depending on the values of fire_all and command

**Parameters**

- **message_generator** (generator of dict) -- Generates messages from slack that should be run
- **fire_all** (bool) -- Whether to also fire messages to the event bus
- **control** (bool) -- If set to True, whether Slack is allowed to control Salt.
- **tag** (str) -- The tag to send to use to send to the event bus
- **interval** (int) -- time to wait between ending a loop and beginning the next

**salt.engines.slack_bolt_engine.start** (app_token, bot_token, control=False, trigger='!', groups=None, groups_pillar_name=None, fire_all=False, tag='salt/engines/slack')

Listen to slack events and forward them to salt, new version

**Parameters**

- **app_token** (str) -- The Slack application token used by Salt to communicate with Slack.
- **bot_token** (str) -- The Slack bot token used by Salt to communicate with Slack.
• **control (bool)** -- Determines whether or not commands sent from Slack with the trigger string will control Salt, defaults to False.

• **trigger (str)** -- The string that should preface all messages in Slack that should be treated as commands to send to Salt.

• **group (str)** -- The string that should preface all messages in Slack that should be treated as commands to send to Salt.

• **group_pillars** -- A pillar key that can be used to pull group configuration.

• **fire_all (bool)** -- If set to True, all messages which are not prefixed with the trigger string will fired as events onto Salt's ref: event bus <event-system>. The tag for these events will be prefixed with the string specified by the tag config option (default: salt/engines/slack).

• **tag (str)** -- The tag to prefix all events sent to the Salt event bus.

### 26.5.15 salt.engines.sqs_events

An engine that continuously reads messages from SQS and fires them as events.

Note that long polling is utilized to avoid excessive CPU usage.

New in version 2015.8.0.

```
    depends
        boto
```

#### Configuration

This engine can be run on the master or on a minion.

Example Config:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
sqs.message_format: json
```

Explicit sqs credentials are accepted but this engine can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not (or for **boto** version < 2.5.1) used you need to specify them either in a pillar or in the config file of the master or minion, as appropriate:

To deserialize the message from json:

```
sqs.message_format: json
```

It’s also possible to specify key, keyid and region via a profile:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```
A region may also be specified in the configuration:

```yaml
sqs.region: us-east-1
```

If a region is not specified, the default is `us-east-1`.

It's also possible to specify key, keyid and region via a profile:

```yaml
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsfdhkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

Additionally you can define cross account sqs:

```yaml
engines:
  - sqs_events:
      queue: prod
      owner_acct_id: 111111111111
```

Salt engines sqs_events start(`queue`, `profile=None`, `tag='salt/engine/sqs'`, `owner_acct_id=None`)  
Listen to sqs and fire message on event bus

### 26.5.16 salt.engines.stalekey

An engine that uses presence detection to keep track of which minions have been recently connected and remove their keys if they have not been connected for a certain period of time.

Requires that the `minion_data_cache` option be enabled.

New in version 2017.7.0.

**configuration**

Example configuration:

```yaml
engines:
  - stalekey:
      interval: 3600
      expire: 86400
```

Salt engines stalekey start(`interval=3600`, `expire=604800`)  
Start the engine

### 26.5.17 salt.engines.test

A simple test engine, not intended for real use but as an example

Salt engines test event_bus_context(`opts`)  
Salt engines test start()  
Listen to events and write them to a log file
26.5.18 salt.engines.thorium

Manage the Thorium complex event reaction system

```python
salt.engines.thorium.start(grains=False, grain_keys=None, pillar=False, pillar_keys=None)
```

Execute the Thorium runtime

26.5.19 salt.engines.webhook

Send events from webhook api

```python
salt.engines.webhook.start(address=None, port=5000, ssl_crt=None, ssl_key=None)
```

Api to listen for webhooks to send to the reactor.

Implement the webhook behavior in an engine. [rest_cherryp y Webhook docs](#)

Unlike the rest_cherryp y Webhook, this is only an unauthenticated webhook endpoint. If an authenticated webhook endpoint is needed, use the salt-api webhook which runs on the master and authenticates through eauth.

**Warning:** Unauthenticated endpoint

This engine sends webhook calls to the event stream. If the engine is running on a minion with `file_client: local` the event is sent to the minion event stream. Otherwise it is sent to the master event stream.

Example Config

```
engines:
  - webhook: {}

engines:
  - webhook:
    port: 8000
    address: 10.128.1.145
    ssl_crt: /etc/pki/tls/certs/localhost.crt
    ssl_key: /etc/pki/tls/certs/localhost.key
```

26.6 execution modules

Virtual modules
## 26.6.1 salt.modules.group

`group` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>groupadd</td>
<td>Linux, NetBSD, and OpenBSD systems using <code>groupadd(8)</code>, <code>groupdel(8)</code>, and <code>groupmod(8)</code></td>
</tr>
<tr>
<td>pw_group</td>
<td>FreeBSD-based OSes using <code>pw(8)</code></td>
</tr>
<tr>
<td>solaris_group</td>
<td>Solaris-based OSes using <code>groupadd(1M)</code>, <code>groupdel(1M)</code>, and <code>groupmod(1M)</code></td>
</tr>
<tr>
<td>win_groupadd</td>
<td>Windows</td>
</tr>
</tbody>
</table>

## 26.6.2 salt.modules.kernelpkg

`kernelpkg` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>kernelpkg_linux_apt</td>
<td>Debian/Ubuntu-based distros which use <code>apt-get</code> for package management</td>
</tr>
<tr>
<td>kernelpkg_linux_yum</td>
<td>RedHat-based distros and derivatives using <code>yum</code> or <code>dnf</code></td>
</tr>
</tbody>
</table>

## 26.6.3 salt.modules.pkg

`pkg` is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>aixpkg</td>
<td>AIX OS using <code>installp</code> and <code>rpm</code></td>
</tr>
<tr>
<td>aptpkg</td>
<td>Debian/Ubuntu-based distros which use <code>apt-get(8)</code> for package management</td>
</tr>
<tr>
<td>mac_brew_pkg</td>
<td>Mac OS software management using <code>Homebrew</code></td>
</tr>
<tr>
<td>ebuildpkg</td>
<td>Gentoo-based systems (utilizes the <code>portage</code> python module as well as <code>emerge(1)</code>)</td>
</tr>
<tr>
<td>freebsdspkg</td>
<td>FreeBSD-based OSes using <code>pkg_add(1)</code></td>
</tr>
<tr>
<td>openbsdspkg</td>
<td>OpenBSD-based OSes using <code>pkg_add(1)</code></td>
</tr>
<tr>
<td>pacmanpkg</td>
<td>Arch Linux-based distros using <code>pacman(8)</code></td>
</tr>
<tr>
<td>pkgin</td>
<td>NetBSD-based OSes using <code>pkgin(1)</code></td>
</tr>
<tr>
<td>pkgng</td>
<td>FreeBSD-based OSes using <code>pkg(8)</code></td>
</tr>
<tr>
<td>pkgtutil</td>
<td>Solaris-based OSes using OpenCSW's <code>pkgtutil(1)</code></td>
</tr>
<tr>
<td>solarispkg</td>
<td>Solaris-based OSes using <code>pkgadd(1M)</code></td>
</tr>
<tr>
<td>solarisipspkg</td>
<td>Solaris-based OSes using IPS <code>pkg(1)</code></td>
</tr>
</tbody>
</table>
| win_pkg            | Salt's [Windows Package Manager](https://docs.saltstack.com/en/latest/
| yumpkg             | RedHat-based distros and derivatives using `yum(8)` or `dnf(8)`        |
| zypperpkg          | SUSE-based distros using `zypper(8)`                                    |
26.6.4 salt.modules.service

service is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>debian_service</td>
<td>Debian Wheezy and earlier</td>
</tr>
<tr>
<td>freebsdservice</td>
<td>FreeBSD-based OSes using service(8)</td>
</tr>
<tr>
<td>gentoo_service</td>
<td>Gentoo Linux using sysvinit and rc-update(8)</td>
</tr>
<tr>
<td>mac_service</td>
<td>Mac OS hosts using launchctl(1)</td>
</tr>
<tr>
<td>netbsdsserv</td>
<td>NetBSD-based OSes</td>
</tr>
<tr>
<td>openbdserv</td>
<td>OpenBSD-based OSes</td>
</tr>
<tr>
<td>rh_service</td>
<td>RedHat-based distros and derivatives using service(8) and chkconfig(8). Supports both pure sysvinit and mixed sysvinit/upstart systems.</td>
</tr>
<tr>
<td>service</td>
<td>Fallback which simply wraps sysvinit scripts</td>
</tr>
<tr>
<td>smf_service</td>
<td>Solaris-based OSes which use SMF</td>
</tr>
<tr>
<td>systemd_ser</td>
<td>Linux distros which use systemd</td>
</tr>
<tr>
<td>upstart_ser</td>
<td>Ubuntu-based distros using upstart</td>
</tr>
<tr>
<td>win_service</td>
<td>Windows</td>
</tr>
</tbody>
</table>

26.6.5 salt.modules.shadow

shadow is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>aix_shadow</td>
<td>AIX</td>
</tr>
<tr>
<td>linux_shadow</td>
<td>Linux</td>
</tr>
<tr>
<td>bsd_shadow</td>
<td>FreeBSD, OpenBSD, NetBSD</td>
</tr>
<tr>
<td>solaris_shadow</td>
<td>Solaris-based OSes</td>
</tr>
<tr>
<td>win_shadow</td>
<td>Windows</td>
</tr>
</tbody>
</table>

26.6.6 salt.modules.sysctl

sysctl is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>freebsd_sysctl</td>
<td>FreeBSD</td>
</tr>
<tr>
<td>linux_sysctl</td>
<td>Linux</td>
</tr>
<tr>
<td>mac_sysctl</td>
<td>macOS</td>
</tr>
<tr>
<td>netbsd_sysctl</td>
<td>NetBSD</td>
</tr>
<tr>
<td>openbsd_sysctl</td>
<td>OpenBSD</td>
</tr>
</tbody>
</table>
26.6.7 salt.modules.user

user is a virtual module that is fulfilled by one of the following modules:

<table>
<thead>
<tr>
<th>Execution Module</th>
<th>Used for</th>
</tr>
</thead>
<tbody>
<tr>
<td>useradd</td>
<td>Linux, NetBSD, and OpenBSD systems using <code>useradd(8)</code>, <code>userdel(8)</code>, and <code>usermod(8)</code></td>
</tr>
<tr>
<td>pw_user</td>
<td>FreeBSD-based OSes using <code>pw(8)</code></td>
</tr>
<tr>
<td>solaris_user</td>
<td>Solaris-based OSes using <code>useradd(1M)</code>, <code>userdel(1M)</code>, and <code>usermod(1M)</code></td>
</tr>
<tr>
<td>mac_user</td>
<td>MacOS</td>
</tr>
<tr>
<td>win_useradd</td>
<td>Windows</td>
</tr>
</tbody>
</table>

*acme*  
ACME / Let's Encrypt module

*aix_group*  
Manage groups on Solaris

*aix_shadow*  
Manage account locks on AIX systems

*apkg*  
Package support for AIX

*aliases*  
Manage the information in the aliases file

*alternatives*  
Support for Alternatives system

*ansiblegate*  
Ansible Support

*apache*  
Support for Apache

*apcups*  
Module for apcupsd

*apf*  
Support for Advanced Policy Firewall (APF)

*arista_pyeapi*  
Arista pyeapi

*artifactory*  
Module for fetching artifacts from Artifactory

*at*  
Wrapper module for at(1)

*at_solaris*  
Wrapper for at(1) on Solaris-like systems

*augeas_cfg*  
Manages configuration files via augeas

*aws_sqs*  
Support for the Amazon Simple Queue Service.

*bamboohr*  
Support for BambooHR

*baredoc*  
Baredoc walks the installed module and state directories and generates dictionaries and lists of the function names and their arguments.

*bcache*  
Module for managing BCache sets

*beacons*  
Module for managing the Salt beacons on a minion

*bigip*  
An execution module which can manipulate an f5 bigip via iControl REST

*bluez_bluetooth*  
Support for Bluetooth (using BlueZ in Linux).
<table>
<thead>
<tr>
<th>Module</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boto3_elasticache</td>
<td>Execution module for Amazon Elasticache using boto3</td>
</tr>
<tr>
<td>boto3_elasticsearch</td>
<td>Connection module for Amazon Elasticsearch Service</td>
</tr>
<tr>
<td>boto3_route53</td>
<td>Execution module for Amazon Route53 written against Boto 3</td>
</tr>
<tr>
<td>boto3_sns</td>
<td>Connection module for Amazon SNS</td>
</tr>
<tr>
<td>boto_apigateway</td>
<td>Connection module for Amazon APIGateway</td>
</tr>
<tr>
<td>boto_asg</td>
<td>Connection module for Amazon Autoscale Groups</td>
</tr>
<tr>
<td>boto_cfn</td>
<td>Connection module for Amazon Cloud Formation</td>
</tr>
<tr>
<td>boto_cloudfront</td>
<td>Connection module for Amazon CloudFront</td>
</tr>
<tr>
<td>boto_cloudsearch</td>
<td>Connection module for Amazon CloudTrail</td>
</tr>
<tr>
<td>boto_cloudwatch</td>
<td>Connection module for Amazon CloudWatch</td>
</tr>
<tr>
<td>boto_cloudwatch_event</td>
<td>Connection module for Amazon CloudWatch Events</td>
</tr>
<tr>
<td>boto_cognitoidentity</td>
<td>Connection module for Amazon CognitoIdentity</td>
</tr>
<tr>
<td>boto_datapipeline</td>
<td>Connection module for Amazon Data Pipeline</td>
</tr>
<tr>
<td>boto_dynamodb</td>
<td>Connection module for Amazon DynamoDB</td>
</tr>
<tr>
<td>boto_ec2</td>
<td>Connection module for Amazon EC2</td>
</tr>
<tr>
<td>boto_efs</td>
<td>Connection module for Amazon EFS</td>
</tr>
<tr>
<td>boto_elasticache</td>
<td>Connection module for Amazon Elasticache</td>
</tr>
<tr>
<td>boto_elasticsearch_domain</td>
<td>Connection module for Amazon Elasticsearch Service</td>
</tr>
<tr>
<td>boto_elb</td>
<td>Connection module for Amazon ELB</td>
</tr>
<tr>
<td>boto_elbv2</td>
<td>Connection module for Amazon ALB</td>
</tr>
<tr>
<td>boto_iam</td>
<td>Connection module for Amazon IAM</td>
</tr>
<tr>
<td>boto_iot</td>
<td>Connection module for Amazon IoT</td>
</tr>
<tr>
<td>boto_kinesis</td>
<td>Connection module for Amazon Kinesis</td>
</tr>
<tr>
<td>boto_kms</td>
<td>Connection module for Amazon KMS</td>
</tr>
<tr>
<td>boto_lambda</td>
<td>Connection module for Amazon Lambda</td>
</tr>
<tr>
<td>boto_rds</td>
<td>Connection module for Amazon RDS</td>
</tr>
<tr>
<td>boto_route53</td>
<td>Connection module for Amazon Route53</td>
</tr>
<tr>
<td>boto_s3</td>
<td>Connection module for Amazon S3 using boto3</td>
</tr>
<tr>
<td>boto_s3_bucket</td>
<td>Connection module for Amazon S3 Buckets</td>
</tr>
<tr>
<td>boto_securitygroup</td>
<td>Connection module for Amazon Security Groups</td>
</tr>
<tr>
<td>boto_sns</td>
<td>Connection module for Amazon SNS</td>
</tr>
<tr>
<td>boto_sqs</td>
<td>Connection module for Amazon SQS</td>
</tr>
<tr>
<td>boto_ssm</td>
<td>Connection module for Amazon SSM</td>
</tr>
<tr>
<td>boto_vpc</td>
<td>Connection module for Amazon VPC</td>
</tr>
<tr>
<td>bower</td>
<td>Manage and query Bower packages</td>
</tr>
<tr>
<td>bridge</td>
<td>Module for gathering and managing bridging information</td>
</tr>
<tr>
<td>bsd_shadow</td>
<td>Manage the password database on BSD systems</td>
</tr>
<tr>
<td>btrfs</td>
<td>Module for managing BTRFS file systems</td>
</tr>
<tr>
<td>cabal</td>
<td>Manage and query Cabal packages</td>
</tr>
<tr>
<td>capirca_acl</td>
<td>Capirca ACL</td>
</tr>
<tr>
<td>cassandra_cql</td>
<td>Cassandra Database Module</td>
</tr>
<tr>
<td>celery</td>
<td>Support for scheduling celery tasks.</td>
</tr>
<tr>
<td>ceph</td>
<td>Module to provide ceph control with salt.</td>
</tr>
<tr>
<td>chassis</td>
<td>Glue execution module to link to the fx2 proxymodule.</td>
</tr>
<tr>
<td>chef</td>
<td>Execute chef in server or solo mode</td>
</tr>
<tr>
<td>chocolatey</td>
<td>A module that wraps calls to the Chocolatey package manager (<a href="http://chocolatey.org">http://chocolatey.org</a>)</td>
</tr>
<tr>
<td>chronos</td>
<td>Module providing a simple management interface to a chronos cluster.</td>
</tr>
</tbody>
</table>

<td>Manage Perl modules using CPAN</td>
</tr>
<tr>
<td><strong>cron</strong></td>
<td>Work with cron</td>
</tr>
<tr>
<td><strong>cryptdev</strong></td>
<td>Salt module to manage Unix cryptsetup jobs and the crypttab file</td>
</tr>
<tr>
<td><strong>csf</strong></td>
<td>Support for Config Server Firewall (CSF)</td>
</tr>
<tr>
<td><strong>cyg</strong></td>
<td>Manage cygwin packages.</td>
</tr>
<tr>
<td><strong>daemontools</strong></td>
<td>daemontools service module.</td>
</tr>
<tr>
<td><strong>data</strong></td>
<td>Manage a local persistent data structure that can hold any arbitrary data specific to the minion</td>
</tr>
<tr>
<td><strong>datadog_api</strong></td>
<td>An execution module that interacts with the Datadog API</td>
</tr>
<tr>
<td><strong>ddns</strong></td>
<td>Support for RFC 2136 dynamic DNS updates.</td>
</tr>
<tr>
<td><strong>deb_apache</strong></td>
<td>Module to provide Postgres compatibility to salt for debian family specific tools.</td>
</tr>
<tr>
<td><strong>debconfmod</strong></td>
<td>Support for Debconf</td>
</tr>
<tr>
<td><strong>debian_ip</strong></td>
<td>The networking module for Debian-based distros</td>
</tr>
<tr>
<td><strong>debian_service</strong></td>
<td>Service support for Debian systems (uses update-rc.d and /sbin/service)</td>
</tr>
<tr>
<td><strong>debuild_pkgbuild</strong></td>
<td>Debian Package builder system</td>
</tr>
<tr>
<td><strong>defaults</strong></td>
<td>Module to work with salt formula defaults files</td>
</tr>

### 26.6.8 salt.modules.acme

**ACME / Let’s Encrypt module**

New in version 2016.3.0.

This module currently looks for certbot script in the $PATH as - certbot, - letsencrypt, - certbot-auto, - letsencrypt-auto eventually falls back to /opt/letsencrypt/letsencrypt-auto

**Note:** Installation & configuration of the Let’s Encrypt client can for example be done using https://github.com/saltstack-formulas/letsencrypt-formula

**Warning:** Be sure to set at least accept-tos = True in cli.ini!

Most parameters will fall back to cli.ini defaults if None is given.

**DNS plugins**

This module currently supports the CloudFlare certbot DNS plugin. The DNS plugin credentials file needs to be passed in using the `dns_plugin_credentials` argument.

Make sure the appropriate certbot plugin for the wanted DNS provider is installed before using this module.

```
salt.modules.acme.cert(name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None, preferred_challenges=None, tls_sni_01_port=None, tls_sni_01_address=None, http_01_port=None, http_01_address=None, dns_plugin=None, dns_plugin_credentials=None, manual_auth_hook=None, manual_cleanup_hook=None)
```

Obtain/renew a certificate from an ACME CA, probably Let’s Encrypt.

**Parameters**

- `name` -- Common Name of the certificate (DNS name of certificate)
- `aliases` -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to use to use webroot. Otherwise use standalone mode
- **test_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of the private key file
- **group** -- group of the private key file
- **mode** -- mode of the private key file
- **certname** -- Name of the certificate to save
- **preferred_challenges** -- A sorted, comma delimited list of the preferred challenge to use during authorization with the most preferred challenge listed first.
- **tls_sni_01_port** -- Port used during tls-sni-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 443.
- **tls_sni_01_address** -- The address the server listens to during tls-sni-01 challenge.
- **http_01_port** -- Port used in the http-01 challenge. This only affects the port Certbot listens on. A conforming ACME server will still attempt to connect on port 80.
- **https_01_address** -- The address the server listens to during http-01 challenge.
- **dns_plugin** -- Name of a DNS plugin to use (currently only 'cloudflare' or 'digitalocean')
- **dns_plugin_credentials** -- Path to the credentials file if required by the specified DNS plugin
- **dns_plugin_propagate_seconds** -- Number of seconds to wait for DNS propagations before asking ACME servers to verify the DNS record. (default 10)
- **manual_auth_hook** -- Path to the manual authentication hook script.
- **manual_cleanup_hook** -- Path to the manual cleanup or post-authentication hook script.

**Return type**

dict

**Returns**

Dictionary with 'result' True/False/None, 'comment' and certificate's expiry date ('not_after')

**CLI Example:**
```
salt 'gitlab.example.com' acme.cert dev.example.com "[gitlab.example.com]" test_cert=True renew=14 webroot=/opt/gitlab/embedded/service/gitlab-rails/public
```

**salt.modules.acme.certs()**

Return a list of active certificates

**CLI Example:**
```
salt 'vhost.example.com' acme.certs
```
salt.modules.acme.expires(name)

The expiry date of a certificate in ISO format

Parameters
  name (str) -- Name of certificate

Return type
  str

Returns
  Expiry date in ISO format.

CLI Example:

```
salt 'gitlab.example.com' acme.expires dev.example.com
```

code

salt.modules.acme.has(name)

Test if a certificate is in the Let's Encrypt Live directory

Parameters
  name (str) -- Name of certificate

Return type
  bool

Code example:

```
if __salt__['acme.has']('dev.example.com'):
    log.info('That is one nice certificate you have there!')
```

code

salt.modules.acme.info(name)

Return information about a certificate

Parameters
  name (str) -- Name of certificate

Return type
  dict

Returns
  Dictionary with information about the certificate. If neither the tls nor the x509 module can be used to determine the certificate information, the information will be retrieved as one big text block under the key `text` using the openssl cli.

CLI Example:

```
salt 'gitlab.example.com' acme.info dev.example.com
```

code

salt.modules.acme.needs_renewal(name, window=None)

Check if a certificate needs renewal

Parameters
  name (str) -- Name of certificate
  window (bool/str/int) -- Window in days to renew earlier or True/force to just return True

Return type
  bool
Returns
Whether or not the certificate needs to be renewed.

Code example:

```python
if __salt__['acme.needs_renewal']('dev.example.com'):
    __salt__['acme.cert']('dev.example.com', **kwargs)
else:
    log.info('Your certificate is still good')
```

salt.modules.acme.renew_by(name, window=None)
Date in ISO format when a certificate should first be renewed

Parameters
• name (str) -- Name of certificate
• window (int) -- number of days before expiry when renewal should take place

Return type
str

Returns
Date of certificate renewal in ISO format.

### 26.6.9 salt.modules.aix_group

Manage groups on Solaris

---

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to 'group.info' is not available), see [here](#).

---

salt.modules.aix_group.add(name, gid=None, system=False, root=None, **kwargs)
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.aix_group.adduser(name, username, root=None)
Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.aix_group.chgid(name, gid)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```
salt.modules.aix_group.delete(name)
    Remove the named group
    CLI Example:
    ```
salt '*' group.delete foo
    ```

salt.modules.aix_group.deluser(name, username, root=None)
    Remove a user from the group.
    CLI Example:
    ```
salt '*' group.deluser foo bar
    ```
    Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.aix_group.getent(refresh=False)
    Return info on all groups
    CLI Example:
    ```
salt '*' group.getent
    ```

salt.modules.aix_group.info(name)
    Return information about a group
    CLI Example:
    ```
salt '*' group.info foo
    ```

salt.modules.aix_group.members(name, members_list, root=None)
    Replaces members of the group with a provided list.
    CLI Example:
    ```
salt '*' group.members foo 'user1,user2,user3,...'
    ```
    Replaces a membership list for a local group 'foo'.
    foo:x:1234:user1,user2,user3,...

26.6.10 salt.modules.aix_shadow

Manage account locks on AIX systems
New in version 2018.3.0.

    depends
    none

salt.modules.aix_shadow.locked(user)
    Query for all accounts which are flagged as locked.
    CLI Example:
    ```
salt <minion_id> shadow.locked ALL
    ```
salt.modules.aix_shadow.login_failures(user)
Query for all accounts which have 3 or more login failures.

CLI Example:

```bash
salt <minion_id> shadow.login_failures ALL
```

salt.modules.aix_shadow.unlock(user)
Unlock user for locked account

CLI Example:

```bash
salt <minion_id> shadow.unlock user
```

26.6.11 salt.modules.aixpkg
Package support for AIX

**Important:** If you feel that Salt should be using this module to manage filesets or rpm packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

salt.modules.aixpkg.available_version(*names, **kwargs)
This function is an alias of latest_version.

Return the latest available version of the named fileset/rpm package available for upgrade or installation. If more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for that package.

Changed in version 3005.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

Note: currently only functional for rpm packages due to filesets do not have a specific location to check

Requires yum of dnf available in order to query a repository

This function will always return an empty string for unfound fileset/rpm package.

salt.modules.aixpkg.install(name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs)
Install the named fileset(s)/rpm package(s).

Changed in version 3005:

**preference to install rpm packages are to use in the following order:**

- /opt/freeware/bin/dnf
- /usr/bin/yum
- /usr/bin/rpm

name
The name of the fileset or rpm package to be installed.
refresh
   Whether or not to update the yum database before executing.

pkgs
   A list of filesets and/or rpm packages to install. Must be passed as a python list. The name parameter
   will be ignored if this option is passed.

version
   Install a specific version of a fileset/rpm package. (Unused at present).

test
   Verify that command functions correctly.

Returns a dict containing the new fileset(s)/rpm package(s) names and versions:

   {"<package>" : {"old" : '<old-version>',
                  "new" : '<new-version>'}}

CLI Example:

```bash
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm
salt '*' pkg.install /stage/middleware/AIX/bash-4.2-3.aix6.1.ppc.rpm
   → refresh=True
salt '*' pkg.install /stage/middleware/AIX/VIOS2211_update/tpc_4.1.1.85.
   → bff
   → printers_7.2.2.0.bff
salt '*' pkg.install /stage/middleware/AIX/Xlc/usr/sys/inst.images/xlC.rte
salt '*' pkg.install /stage/middleware/AIX/Firefox/ppc-AIX53/Firefox.base
salt '*' pkg.install /cecc/repos/aix72/TL3/BASE/installp/ppc/bos.net
salt '*' pkg.install pkgs=["foo", "bar"]
salt '*' pkg.install libxml2
```

salt.modules.aixpkg.latest_version(*names, **kwargs)

Return the latest available version of the named fileset/rpm package available for upgrade or installation. If
more than one fileset/rpm package name is specified, a dict of name/version pairs is returned.

If the latest version of a given fileset/rpm package is already installed, an empty string will be returned for
that package.

Changed in version 3005.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

Note: currently only functional for rpm packages due to filesets do not have a specific location to check
   Requires yum of dnf available in order to query a repository

This function will always return an empty string for unfound fileset/rpm package.

salt.modules.aixpkg.list_pkgs(versions_as_list=False, **kwargs)

List the filesets/rpm packages currently installed as a dict:

   {"<package_name>" : "<version>"}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.aixpkg.remove(name=None, pkgs=None, **kwargs)
Remove specified fileset(s)/rpm package(s).

name
The name of the fileset or rpm package to be deleted.

Changed in version 3005:

preference to install rpm packages are to use in the following order:

```
/opt/freeware/bin/dnf /opt/freeware/bin/yum /usr/bin/yum /usr/bin/rpm
```

pkgs
A list of filesets and/or rpm packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <fileset/rpm package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove xlc.rte
salt '*' pkg.remove Firefox.base.adt
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.aixpkg.upgrade_available(name, **kwargs)
Check whether or not an upgrade is available for a given package

Changed in version 3005.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

Note: currently only functional for rpm packages due to filesets do not have a specific location to check Requires yum of dnf available in order to query a repository

salt.modules.aixpkg.version(*names, **kwargs)
Return the current installed version of the named fileset/rpm package If more than one fileset/rpm package name is specified a dict of name/version pairs is returned.

Changed in version 3005.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```
26.6.12 salt.modules.aliases

Manage the information in the aliases file

salt.modules.aliases.get_target(alias)

Return the target associated with an alias

CLI Example:

```
salt '*' aliases.get_target alias
```

salt.modules.aliases.has_target(alias, target)

Return true if the alias/target is set

CLI Example:

```
salt '*' aliases.has_target alias target
```

salt.modules.aliases.list_aliases()

Return the aliases found in the aliases file in this format:

```
{'alias': 'target'}
```

CLI Example:

```
salt '*' aliases.list_aliases
```

salt.modules.aliases.rm_alias(alias)

Remove an entry from the aliases file

CLI Example:

```
salt '*' aliases.rm_alias alias
```

salt.modules.aliases.set_target(alias, target)

Set the entry in the aliases file for the given alias, this will overwrite any previous entry for the given alias or create a new one if it does not exist.

CLI Example:

```
salt '*' aliases.set_target alias target
```

26.6.13 salt.modules.alternatives

Support for Alternatives system

**codeauthor**

Radek Rada <radek.rada@gmail.com>

salt.modules.alternatives.auto(name)

Trigger alternatives to set the path for <name> as specified by priority.

CLI Example:

```
salt '*' alternatives.auto name
```
salt.modules.alternatives.check_exists(name, path)
Check if the given path is an alternative for a name.
New in version 2015.8.4.
CLI Example:
```
salt '*' alternatives.check_exists name path
```

salt.modules.alternatives.check_installed(name, path)
Check if the current highest-priority match for a given alternatives link is set to the desired path
CLI Example:
```
salt '*' alternatives.check_installed name path
```

salt.modules.alternatives.display(name)
Display alternatives settings for defined command name
CLI Example:
```
salt '*' alternatives.display editor
```

salt.modules.alternatives.install(name, link, path, priority)
Install symbolic links determining default commands
CLI Example:
```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
```

salt.modules.alternatives.remove(name, path)
Remove symbolic links determining the default commands.
CLI Example:
```
salt '*' alternatives.remove name path
```

salt.modules.alternatives.set_(name, path)
Manually set the alternative <path> for <name>.
CLI Example:
```
salt '*' alternatives.set name path
```

salt.modules.alternatives.show_current(name)
Display the current highest-priority alternative for a given alternatives link
CLI Example:
```
salt '*' alternatives.show_current editor
```

salt.modules.alternatives.show_link(name)
Display master link for the alternative
New in version 2015.8.13,2016.3.4,2016.11.0.
CLI Example:
26.6.14 salt.modules.ansiblegate

Ansible Support

This module can have an optional minion-level configuration in /etc/salt/minion.d/ as follows:

    ansible_timeout: 1200

The timeout is how many seconds Salt should wait for any Ansible module to respond.

salt.modules.ansiblegate.call(module, *args, **kwargs)

Call an Ansible module by invoking it.

Parameters

- **module** -- the name of the module.
- **args** -- arguments to pass to the module
- **kwargs** -- Keywords to pass to the module

CLI Example:

```sh
salt * ansible.call ping data=foobar
```

salt.modules.ansiblegate.discover_playbooks(path=None, locations=None, playbook_extension=None, hosts_filename=None, syntax_check=False)

New in version 3005.

Discover Ansible playbooks stored under the given path or from multiple paths (locations).

This will search for files matching with the playbook file extension under the given root path and will also look for files inside the first level of directories in this path.

The return of this function would be a dict like this:

```json
{
    "my_ansible_playbook.yml": {
        "fullpath": "/home/foobar/playbooks/my_ansible_playbook.yml",
        "custom_inventory": "/home/foobar/playbooks/hosts"
    },
    "another_playbook.yml": {
        "fullpath": "/home/foobar/playbooks/another_playbook.yml",
        "custom_inventory": "/home/foobar/playbooks/hosts"
    },
    "lamp_simple/site.yml": {
        "fullpath": "/home/foobar/playbooks/lamp_simple/site.yml",
        "custom_inventory": "/home/foobar/playbooks/lamp_simple/hosts"
    },
    "lamp_proxy/site.yml": {
        "fullpath": "/home/foobar/playbooks/lamp_proxy/site.yml",
        "custom_inventory": "/home/foobar/playbooks/lamp_proxy/hosts"
    }
}
```

(continues on next page)
Parameters

- **path** -- Path to discover playbooks from.
- **locations** -- List of paths to discover playbooks from.
- **playbook_extension** -- File extension of playbooks file to search for. Default: "yml"
- **hosts_filename** -- Filename of custom playbook inventory to search for. Default: "hosts"
- **syntax_check** -- Skip playbooks that do not pass "ansible-playbook --syntax-check" validation. Default: False

Returns

The discovered playbooks under the given paths

CLI Example:

```bash
salt 'ansiblehost' ansible.discover_playbooks path=/srv/playbooks/
salt 'ansiblehost' ansible.discover_playbooks locations='["/srv/playbooks/
-", "/srv/foobar"]'
```

**salt.modules.ansiblegate.help** *(module=None, *args)*

Display help on Ansible standard module.

Parameters

- **module** -- The module to get the help

CLI Example:

```bash
salt * ansible.help ping
```

**salt.modules.ansiblegate.list** *(pattern=None)*

Lists available modules.

CLI Example:

```bash
salt * ansible.list
salt * ansible.list '*win*' # To get all modules matching 'win' on it's name
```

**salt.modules.ansiblegate.playbooks** *(playbook, rundir=None, check=False, diff=False,
extra_vars=None, flush_cache=False, forks=5, inventory=None,
limit=None, list_hosts=False, list_tags=False, list_tasks=False,
module_path=None, skip_tags=None, start_at_task=None,
syntax_check=False, tags=None, playbook_kwargs=None)*

26.6. execution modules 1317
Run Ansible Playbooks

Parameters

- **playbook** -- Which playbook to run.
- **rundir** -- Directory to run `ansible-playbook` in. (Default: None)
- **check** -- don't make any changes; instead, try to predict some of the changes that may occur (Default: False)
- **diff** -- when changing (small) files and templates, show the differences in those files; works great with --check (default: False)
- **extra_vars** -- set additional variables as key=value or YAML/JSON, if filename prepend with @, (default: None)
- **flush_cache** -- clear the fact cache for every host in inventory (default: False)
- **forks** -- specify number of parallel processes to use (Default: 5)
- **inventory** -- specify inventory host path or comma separated host list. (Default: None) (Ansible’s default is /etc/ansible/hosts)
- **limit** -- further limit selected hosts to an additional pattern (Default: None)
- **list_hosts** -- outputs a list of matching hosts; does not execute anything else (Default: False)
- **list_tags** -- list all available tags (Default: False)
- **list_tasks** -- list all tasks that would be executed (Default: False)
- **module_path** -- prepend colon-separated path(s) to module library. (Default: None)
- **skip_tags** -- only run plays and tasks whose tags do not match these values (Default: False)
- **start_at_task** -- start the playbook at the task matching this name (Default: None)
- **tags** -- only run plays and tasks tagged with these values (Default: None)

Param

- **syntax_check**: perform a syntax check on the playbook, but do not execute it (Default: False)

Returns

Playbook return

CLI Example:

```
salt 'ansiblehost' ansible.playbooks playbook=/srv/playbooks/play.yml
```

salt.modules.ansiblegate.targets (inventory="/etc/ansible/hosts", yaml=False, export=False)

New in version 3005.

Return the inventory from an Ansible inventory_file

Parameters

- **inventory** -- The inventory file to read the inventory from. Default: "/etc/ansible/hosts"
- **yaml** -- Return the inventory as yaml output. Default: False
- **export** -- Return inventory as export format. Default: False

CLI Example:
26.6.15 `salt.modules.apache`

Support for Apache

**Note:** The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into `deb_apache.py`, but will still load under the `apache` namespace when a Debian-based system is detected.

```python
salt.modules.apache.config(name, config, edit=True)
```

Create VirtualHost configuration files

- **name**
  File for the virtual host

- **config**
  VirtualHost configurations

**Note:** This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:

```bash
salt '*' apache.config /etc/httpd/conf.d/ports.conf config="[{'Listen': {'22'}}]"
```

```python
salt.modules.apache.directives()
```

Return list of directives together with expected arguments and places where the directive is valid (`apachectl -L`)

CLI Example:

```bash
salt '*' apache.directives
```

```python
salt.modules.apache.fullversion()
```

Return server version (`apachectl -V`)

CLI Example:

```bash
salt '*' apache.fullversion
```

```python
salt.modules.apache.modules()
```

Return list of static and shared modules (`apachectl -M`)

CLI Example:

```bash
salt '*' apache.modules
```
salt.modules.apache.server_status(`profile='default'`)

Get Information from the Apache server-status handler

**Note:** The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See [http://httpd.apache.org/docs/2.2/mod/mod_status.html](http://httpd.apache.org/docs/2.2/mod/mod_status.html)

The following configuration needs to exists in pillar/grains. Each entry nested in apache.server-status is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.

```
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5
```

CLI Examples:

```
salt '*' apache.server_status
salt '*' apache.server_status other-profile
```

salt.modules.apache.servermods()

Return list of modules compiled into the server (`apachectl -l`)

CLI Example:

```
salt '*' apache.servermods
```

salt.modules.apache.signal(`signal=None`)

Signals httpd to start, restart, or stop.

CLI Example:

```
salt '*' apache.signal restart
```

salt.modules.apache.useradd(`pwfile, user, password, opts=```)

Add HTTP user using the `htpasswd` command. If the `htpasswd` file does not exist, it will be created. Valid options that can be passed are:

```
n  Don't update file; display results on stdout.
m  Force MD5 hashing of the password (default).
d  Force CRYPT(3) hashing of the password.
p  Do not hash the password (plaintext).
s  Force SHA1 hashing of the password.
```

CLI Examples:

```
salt '*' apache.useradd /etc/httpd/htpasswd larry badpassword
salt '*' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

salt.modules.apache.userdel(`pwfile, user`)  

Delete HTTP user from the specified htpasswd file.

CLI Example:
salt '*' apache.userdel /etc/httpd/htpasswd larry

salt.modules.apache.version()
  Return server version (apachectl -v)
  CLI Example:
  salt '*' apache.version

salt.modules.apache.vhosts()
  Show the settings as parsed from the config file (currently only shows the virtualhost settings) (apachectl -S). Because each additional virtual host adds to the execution time, this command may require a long timeout be specified by using -t 10.
  CLI Example:
  salt -t 10 '*' apache.vhosts

26.6.16 salt.modules.apcups

Module for apcupsd

salt.modules.apcups.status()
  Return apcaccess output
  CLI Example:
  salt '*' apcups.status

salt.modules.apcups.status_battery()
  Return true if running on battery power
  CLI Example:
  salt '*' apcups.status_battery

salt.modules.apcups.status_charge()
  Return battery charge
  CLI Example:
  salt '*' apcups.status_charge

salt.modules.apcups.status_load()
  Return load
  CLI Example:
  salt '*' apcups.status_load
26.6.17 salt.modules.apf

Support for Advanced Policy Firewall (APF)

maintainer
Mostafa Hussein <mostafa.hussein91@gmail.com>
maturity
new
depends
python-iptables
platform
Linux

salt.modules.apf.allow(ip, port=None)
Add host (IP/FQDN) to allow_hosts.rules and immediately load new rule into firewall
CLI Example:
```
salt '*' apf.allow 127.0.0.1
```

salt.modules.apf.deny(ip)
Add host (IP/FQDN) to deny_hosts.rules and immediately load new rule into firewall
CLI Example:
```
salt '*' apf.deny 1.2.3.4
```

salt.modules.apf.disable()
Stop (flush) all firewall rules
CLI Example:
```
salt '*' apf.disable
```

salt.modules.apf.enable()
Load all firewall rules
CLI Example:
```
salt '*' apf.enable
```

salt.modules.apf.refresh()
Refresh & resolve dns names in trust rules
CLI Example:
```
salt '*' apf.refresh
```

salt.modules.apf.reload()
Stop (flush) & reload firewall rules
CLI Example:
```
salt '*' apf.reload
```
salt.modules.apf.remove(ip)
Remove host from [glob]*_hosts.rules and immediately remove rule from firewall

CLI Example:

```
salt '*' apf.remove 1.2.3.4
```

salt.modules.apf.running()
Check apf status

CLI Example:

```
salt '*' apf.running
```

### 26.6.18 salt.modules.apkpkg

Support for apk

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

New in version 2017.7.0.

salt.modules.apkpkg.file_dict(*packages, **kwargs*)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.apkpkg.file_list(*packages, **kwargs*)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.apkpkg.install(*name=None, refresh=False, pkgs=None, sources=None, **kwargs*)
Install the passed package, add refresh=True to update the apk database.

**name**
The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

CLI Example:

```
salt '*' pkg.install <package name>
```
refresh

Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

pkgs

A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['"foo", "bar"]
```

sources

A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

install_recommends

Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```

{
    '<package>': {
        'old': '<old-version>',
        'new': '<new-version>'
    }
}
```

salt.modules.apkpkg.latest_version('names', **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.apkpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```

{
    '<package_name>': '<version>'
}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.apkpkg.list_upgrades(refresh=True, **kwargs)

List all available package upgrades.

CLI Example:
salt.modules.apkpkg.owner(*paths, **kwargs)

Return the name of the package that owns the file. Multiple file paths can be passed. Like pkg.version
<salt.modules.apk.version>, if a single path is passed, a string will be returned, and if multiple paths
are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned
for that path.

CLI Example:

```
salt '*' pkg.owns /usr/bin/apachectl
salt '*' pkg.owns /usr/bin/apachectl /usr/bin/basename
```

salt.modules.apkpkg.purge(name=None, pkgs=None, **kwargs)

Alias to remove

salt.modules.apkpkg.refresh_db(**kwargs)

Updates the package list

- **True**: Database updated successfully
- **False**: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.apkpkg.remove(name=None, pkgs=None, purge=False, **kwargs)

Remove packages using apk del.

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this
option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.apkpkg.upgrade(name=None, pkgs=None, refresh=True, **kwargs)

Upgrades all packages via apk upgrade or a specific package if name or pkgs is specified. Name is ignored
if pkgs is specified

Returns a dict containing the changes.

```
{"<packages>": {"old": "<old-version>",
  "new": "<new-version>"}}
```

CLI Example:
salt '*' pkg.upgrade

salt.modules.apkpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

### 26.6.19 salt.modules.aptly

Aptly Debian repository manager.

New in version 2018.3.0.

salt.modules.aptly.cleanup_db(config_path='/etc/aptly.conf', dry_run=False)

Remove data regarding unreferenced packages and delete files in the package pool that are no longer being used by packages.

**Parameters**

- `dry_run (bool)` -- Report potential changes without making any changes.

**Returns**

A dictionary of the package keys and files that were removed.

**Return type**

`dict`

CLI Example:

```
salt '*' aptly.cleanup_db
```

salt.modules.aptly.delete_repo(name, config_path='/etc/aptly.conf', force=False)

Remove the repository.

**Parameters**

- `name (str)` -- The name of the repository.
- `config_path (str)` -- The path to the configuration file for the aptly instance.
- `force (bool)` -- Whether to remove the repository even if it is used as the source of an existing snapshot.

**Returns**

A boolean representing whether all changes succeeded.

**Return type**

`bool`

CLI Example:

```
salt '*' aptly.delete_repo name="test-repo"
```
salt.modules.aptly.get_config(config_path='/etc/aptly.conf')
Get the configuration data.

Parameters
  config_path (str) -- The path to the configuration file for the aptly instance.

Returns
A dictionary containing the configuration data.

Return type
dict

CLI Example:
salt '*' aptly.get_config

salt.modules.aptly.get_repo(name, config_path='/etc/aptly.conf', with_packages=False)
Get the details of the repository.

Parameters
  name (str) -- The name of the repository.
  config_path (str) -- The path to the configuration file for the aptly instance.
  with_packages (bool) -- Return a list of packages in the repo.

Returns
A dictionary containing information about the repository.

Return type
dict

CLI Example:
salt '*' aptly.get_repo name="test-repo"

salt.modules.aptly.list_mirrors(config_path='/etc/aptly.conf')
Get a list of all the mirrors.

Parameters
  config_path (str) -- The path to the configuration file for the aptly instance.

Returns
A list of the mirror names.

Return type
list

CLI Example:
salt '*' aptly.list_mirrors

salt.modules.aptly.list_published(config_path='/etc/aptly.conf')
Get a list of all the published repositories.

Parameters
  config_path (str) -- The path to the configuration file for the aptly instance.

Returns
A list of the published repository names.
salt.modules.aptly.list_repos(config_path='/etc/aptly.conf', with_packages=False)

List all of the repos.

Parameters

  - config_path (str) -- The path to the configuration file for the aptly instance.
  - with_packages (bool) -- Return a list of packages in the repo.

Returns

A dictionary of the repositories.

salt.modules.aptly.list_snapshots(config_path='/etc/aptly.conf', sort_by_time=False)

Get a list of all the snapshots.

Parameters

  - config_path (str) -- The path to the configuration file for the aptly instance.
  - sort_by_time (bool) -- Whether to sort by creation time instead of by name.

Returns

A list of the snapshot names.

salt.modules.aptly.new_repo(name, config_path='/etc/aptly.conf', comment=None, component=None, distribution=None, uploaders_file=None, from_snapshot=None, saltenv='base')

Create the new repository.

Parameters

  - name (str) -- The name of the repository.
  - config_path (str) -- The path to the configuration file for the aptly instance.
  - comment (str) -- The description of the repository.
  - component (str) -- The default component to use when publishing.
  - distribution (str) -- The default distribution to use when publishing.
  - uploaders_file (str) -- The repository upload restrictions config.
- `from_snapshot (str)` -- The snapshot to initialize the repository contents from.
- `saltenv (str)` -- The environment the file resides in.

Returns
A boolean representing whether all changes succeeded.

Return type
`bool`

CLI Example:
```
salt '*' aptly.new_repo name="test-repo" comment="Test main repo" component="main" distribution="trusty"
```

salt.modules.aptly.set_repo(name, config_path='/etc/aptly.conf', comment=None, component=None, distribution=None, uploaders_file=None, saltenv='base')

Configure the repository settings.

Parameters
- `name (str)` -- The name of the repository.
- `config_path (str)` -- The path to the configuration file for the aptly instance.
- `comment (str)` -- The description of the repository.
- `component (str)` -- The default component to use when publishing.
- `distribution (str)` -- The default distribution to use when publishing.
- `uploaders_file (str)` -- The repository upload restrictions config.
- `from_snapshot (str)` -- The snapshot to initialize the repository contents from.
- `saltenv (str)` -- The environment the file resides in.

Returns
A boolean representing whether all changes succeeded.

Return type
`bool`

CLI Example:
```
salt '*' aptly.set_repo name="test-repo" comment="Test universe repo" component="universe" distribution="xenial"
```

26.6.20 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

For repository management, the `python-apt` package must be installed.

```
import salt.modules.aptpkg
```

**class** salt.modules.aptpkg.SourceEntry(line, file=None)
repo_line()
    Return the repo line for the sources file
str()

class salt.modules.aptpkg.SourcesList
    add(type, uri, dist, orig_comps, architectures, signedby)
    add_file(file)
        Add the lines of a file to self.list
    remove(source)
        remove a source from the list of sources
    save()
        write all of the sources from the list of sources to the file.
salt.modules.aptpkg.add_repo_key(path=None, text=None, keyserver=None, keyid=None, saltenv='base',
    aptkey=True, keydir=None, keyfile=None)

    New in version 2017.7.0.
    Add a repo key using apt-key add.

    Parameters
    • path (str) -- The path of the key file to import.
    • text (str) -- The key data to import, in string form.
    • keyserver (str) -- The server to download the repo key specified by the keyid.
    • keyid (str) -- The key id of the repo key to add.
    • saltenv (str) -- The environment the key file resides in.
    • aptkey (bool) -- Use the binary apt-key.
    • keydir (str) -- The directory path to save keys. The default directory is /etc/apt/keyrings/ which is the recommended path for adding third party keys. This argument is only used when aptkey is False.
    • keyfile (str) -- The name of the key to add. This is only required when aptkey is False and you are using a keys server. This argument is only used when aptkey is False.

    Returns
    A boolean representing whether the repo key was added.

    Return type
    bool

    Warning: The apt-key binary is deprecated and will last be available in Debian 11 and Ubuntu 22.04. It is recommended to use aptkey=False when using this module.

    CLI Examples:

    salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'
    salt '*' pkg.add_repo_key text="'$KEY1'"
salt.modules.aptpkg.autoremove(list_only=False, purge=False)

Remove packages not required by another package using `apt-get autoremove`.

- **list_only**
  - [False] Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.

- **purge**
  - [False] Also remove package config data when autoremoving packages.
  
  New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

salt.modules.aptpkg.available_version(*names, **kwargs)

This function is an alias of `latest_version`.

- Changed in version 3007.0.

  Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

  If the latest version of a given package is already installed, an empty string will be returned for that package.

  A specific repo can be requested using the `fromrepo` keyword argument.

- `cache_valid_time`

  New in version 2016.11.0.

  Skip refreshing the package database if refresh has already occurred within <value> seconds.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.aptpkg.del_repo(repo, **kwargs)

Delete a repo from the sources.list / sources.list.d

- If the .list file is in the sources.list.d directory and the file that the repo exists in does not contain any other repo configuration, the file itself will be deleted.

- The repo passed in must be a fully formed repository definition string.

CLI Examples:

```
salt '*' pkg.del_repo "myrepo definition"
```
salt.modules.aptpkg.del_repo_key(name=None, aptkey=True, keydir=None, **kwargs)

New in version 2015.8.0.

Remove a repo key using apt-key del

name
Repo from which to remove the key. Unnecessary if keyid is passed.

keyid
The KeyID of the GPG key to remove

keyid_ppa
[False] If set to True, the repo's GPG key ID will be looked up from ppa.launchpad.net and removed.

Note: Setting this option to True requires that the name param also be passed.

aptkey
Use the binary apt-key.

keydir
The directory path to save keys. The default directory is /etc/apt/keyrings/ which is the recommended path for adding third party keys.

CLI Examples:
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True

salt.modules.aptpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict

salt.modules.aptpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list

salt.modules.aptpkg.get_repo(repo, **kwargs)
Display a repo from the sources.list / sources.list.d

The repo passed in needs to be a complete repo entry.
CLI Examples:

```
salt '*' pkg.get_repo "myrepo definition"
```

```
salt.modules.aptpkg.get_repo_keys(apptkey=True, keydir=None)
```

New in version 2017.7.0.

List known repo key details. 
- **apptkey**: Use the binary apt-key.
- **keydir**: The directory path to save keys. The default directory is `/etc/apt/keyrings/` which is the recommended path for adding third party keys. This argument is only used when `apptkey` is `False`.

**Returns**
A dictionary containing the repo keys.

**Return type**
dict

CLI Examples:

```
salt '*' pkg.get_repo_keys
```

```
salt.modules.aptpkg.get_selections(pattern=None, state=None)
```

View package state from the dpkg database.

Returns a dict of dicts containing the state, and package names:

```json
{
    '<host>': {
        '<state>': ['pkg1',
                    '...'],
        '...'}
}
```

CLI Example:

```
salt '*' pkg.get_selections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

```
salt.modules.aptpkg.hold(name=None, pkgs=None, sources=None, **kwargs)
```

New in version 2014.7.0.

Set package in 'hold' state, meaning it will not be upgraded.

**name**
The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs**
A list of packages to hold. Must be passed as a python list.

CLI Example:
salt '*' pkg.hold pkgs='["foo", "bar"]'

salt.modules.aptpkg.info_installed(names, **kwargs)
Returns the information of the named package(s) installed on the system.

names
The names of the packages for which to return information.

failhard
Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI Example:

salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> failhard=false

salt.modules.aptpkg.install(name=None, refresh=False, fromrepo=None, skip_verify=False, debconf=None, pkgs=None, sources=None, reinstall=False, downloadonly=False, ignore_epoch=False, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd==205, systemctl(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemctl(5) manpage for more information). If desired, usage of systemctl(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Install the passed package, add refresh=True to update the dpkg database.

name
The name of the package to be installed. Note that this parameter is ignored if either “pkgs” or “sources” is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the “sources” option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.

CLI Example:

salt '*' pkg.install <package name>

refresh
Whether or not to refresh the package database before installing.

cache_valid_time
New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

fromrepo
Specify a package repository to install from (e.g., apt-get -t unstable install somepackage)
skip_verify
Skip the GPG verification check (e.g., --allow-unauthenticated, or --force-bad-verify for install from package file).

debconf
Provide the path to a debconf answers file, processed before installation.

version
Install a specific version of the package, e.g. 1.2.3-0ubuntu0. Ignored if "pkgs" or "sources" is passed.
Changed in version 2018.3.0: version can now contain comparison operators (e.g. >1.2.3, <=2.0, etc.)

reinstall
[False] Specifying reinstall=True will use apt-get install --reinstall rather than simply apt-get install for requested packages that are already installed.
If a version is specified with the requested package, then apt-get install --reinstall will only be used if the installed version matches the requested version.
New in version 2015.8.0.

ignore_epoch
[False] Only used when the version of a package is specified using a comparison operator (e.g. >4.1).
If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.
New in version 2018.3.0.

Multiple Package Installation Options:

pkgs
A list of packages to install from a software repository. Must be passed as a python list.
CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

sources
A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.
32-bit packages can be installed on 64-bit systems by appending the architecture designation (:i386, etc.) to the end of the package name.
Changed in version 2014.7.0.
CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.deb"}]'
```

force_yes
Passes --force-yes to the apt-get command. Don't use this unless you know what you're doing.
New in version 0.17.4.

install_recommends
Whether to install the packages marked as recommended. Default is True.
New in version 2015.5.0.
**only_upgrade**

Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

**force_conf_new**

Always install the new version of any configuration files.

New in version 2015.8.0.

Returns a dict containing the new package names and versions:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

salt.modules.aptpkg.latest_version(*names, **kwargs)

Changed in version 3007.0.

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the fromrepo keyword argument.

**cache_valid_time**

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

**CLI Example:**

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.aptpkg.list_downloaded(root=None, **kwargs)

New in version 3000.

List prefetched packages downloaded by apt in the local disk.

**root**

operate on a different root directory.

**CLI Example:**

```
salt '*' pkg.list_downloaded
```

salt.modules.aptpkg.list_pkgs(versions_as_list=False, removed=False, purge_desired=False, **kwargs)

List the packages currently installed in a dict:

```python
{'<package_name>': '<version>'}
```

**removed**

If True, then only packages which have been removed (but not purged) will be returned.

**purge_desired**

If True, then only packages which have been marked to be purged, but can't be purged due to their status
as dependencies for other installed packages, will be returned. Note that these packages will appear in
installed
Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

```
salt.modules.aptpkg.list_repo_pkgs('args', '**kwargs')
```

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```
{
    'bash': ['4.3-14ubuntu1.1',
             '4.3-14ubuntu1'],
    'nginx': ['1.10.0-0ubuntu0.16.04.4',
              '1.9.15-0ubuntu1']
}
```

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

```
salt.modules.aptpkg.list_repos('**kwargs')
```

Lists all repos in the sources.list (and sources.lists.d) files

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True
```

```
salt.modules.aptpkg.list_upgrades(refresh=True, dist_upgrade=True, **kwargs)
```

List all available package upgrades.

**refresh**

Whether to refresh the package database before listing upgrades. Default: True.

**cache_valid_time**

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

**dist_upgrade**

Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

CLI Example:

```
salt '*' pkg.list_upgrades
```
salt.modules.aptpkg.mod_repo(repo, saltenv='base', aptkey=True, **kwargs)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the `ppa:<project>/repo` format is acceptable. `ppa:` format can only be used to create a new repository.

The following options are available to modify a repo definition:

- **architectures**
  A comma-separated list of supported architectures, e.g. `amd64` If this option is not set, all architectures (configured in the system) will be used.

- **comps**
  A comma separated list of components for the repo, e.g. `main`

- **file**
  A file name to be used

- **keystore**
  Keyserver to get gpg key from

- **keyid**
  Key ID or a list of key IDs to load with the `keystore` argument

- **key_url**
  URL to a GPG key to add to the APT GPG keyring

- **key_text**
  GPG key in string form to add to the APT GPG keyring
  New in version 2018.3.0.

- **consolidate**
  `[False]` If `True`, will attempt to de-duplicate and consolidate sources

- **comments**
  Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (`#`) before it.
  New in version 2015.8.9.

- **refresh**
  `[True]` Enable or disable (True or False) refreshing of the apt package database. The previous `refresh_db` argument was deprecated in favor of `refresh`. The `refresh_db` argument will still continue to work to ensure backwards compatibility, but please change to using the preferred `refresh`.

**Note:** Due to the way keys are stored for APT, there is a known issue where the key won’t be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

**CLI Examples:**

```
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

salt.modules.aptpkg.normalize_name(name)

Strips the architecture from the specified package name, if necessary.

**CLI Example:**
Salt modules.aptpkg.owner(*paths, **kwargs)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

salt.modules.aptpkg.parse_arch(name)

Parse name and architecture from the specified package name.

CLI Example:

```
salt '*' pkg.parse_arch zsh:amd64
```

salt.modules.aptpkg.purge(name=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `apt-get purge` along with all configuration files.

**name**

The name of the package to be deleted.

**pkgs**

A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.refresh_db(cache_valid_time=0, failhard=False, **kwargs)

Updates the APT database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- **True**: Database updated successfully
- False: Problem updating database
- None: Database already up-to-date

**cache_valid_time**

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

**failhard**

If False, return results of Err lines as False for the package database that encountered the error.
If True, raise an error with a list of the package databases that encountered errors.

CLI Example:

```bash
salt '*' pkg.refresh_db
```

**salt.modules.aptpkg.remove**(*name=*, *pkgs=*, **kwargs*)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a config option called `systemd.scope`, with a value of False (no quotes).

Remove packages using `apt-get remove`.

**name**

The name of the package to be deleted.

Multiple Package Options:

**pkgs**

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

**salt.modules.aptpkg.services_need_restart**(**kwargs**)

New in version 3003.

List services that use files which have been changed by the package manager. It might be needed to restart them.

Requires checkrestart from the debian-goodies package.

CLI Examples:

```bash
salt '*' pkg.services_need_restart
```
salt.modules.aptpkg.set_selections(path=None, selection=None, clear=False, saltenv='base')

Change package state in the dpkg database.

The state can be any one of, documented in dpkg(1):

- install
- hold
- deinstall
- purge

This command is commonly used to mark specific packages to be held from being upgraded, that is, to be kept at a certain version. When a state is changed to anything but being held, then it is typically followed by apt-get -u dselect-upgrade.

Note: Be careful with the clear argument, since it will start with setting all packages to deinstall state.

Returns a dict of dicts containing the package names, and the new and old versions:

```py
{
    '<host>': {
        '<package>': {
            'new': '<new-state>',
            'old': '<old-state>'
        }
    }
}
```

CLI Example:

```
salt '*' pkg.set_selections selection={()=>"install": ["netcat"]}
salt '*' pkg.set_selections selection={()=>"hold": ["openssh-server", "openssh-client"]}
salt '*' pkg.set_selections salt://path/to/file
salt '*' pkg.set_selections salt://path/to/file clear=True
```

salt.modules.aptpkg.show(*names, **kwargs)

New in version 2019.2.0.

Runs an apt-cache show on the passed package names, and returns the results in a nested dictionary. The top level of the return data will be the package name, with each package name mapping to a dictionary of version numbers to any additional information returned by apt-cache show.

filter

An optional comma-separated list (or quoted Python list) of case-insensitive keys on which to filter. This allows one to restrict the information returned for each package to a smaller selection of pertinent items.

refresh

[False] If True, the apt cache will be refreshed first. By default, no refresh is performed.

CLI Examples:

```
salt myminion pkg.show gawk
salt myminion pkg.show 'nginx-*'
salt myminion pkg.show 'nginx-*' filter=description,provides
```

salt.modules.aptpkg.unhold(name=None, pkgs=None, sources=None, **kwargs)

New in version 2014.7.0.

Set package current in 'hold' state to install state, meaning it will be upgraded.
name
The name of the package, e.g., ‘tmux’

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs
A list of packages to unhold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs=['"foo", "bar"]'
```

salt.modules.aptpkg.**upgrade**(refresh=True, dist_upgrade=False, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon’s control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Upgrades all packages via apt-get upgrade or apt-get dist-upgrade if dist_upgrade is True.

Returns a dictionary containing the changes:

```
{
'<package>': {'old': '<old-version>',
             'new': '<new-version>'}}
```

dist_upgrade
Whether to perform the upgrade using dist-upgrade vs upgrade. Default is to use upgrade.

New in version 2014.7.0.

refresh
[True] If True, the apt cache will be refreshed first. By default, this is True and a refresh is performed.

cache_valid_time
Skip refreshing the package database if refresh has already occurred within <value> seconds

download_only (or downloadonly)
Only download the packages, don't unpack or install them. Use downloadonly to be in line with yum and zypper module.

New in version 2018.3.0.

force_conf_new
Always install the new version of any configuration files.

New in version 2015.8.0.

allow_downgrades
Allow apt to downgrade packages without a prompt.

New in version 3005.

CLI Example:
salt '/*' pkg.upgrade

salt.modules.aptpkg.upgrade_available(name, **kwargs)
  Check whether or not an upgrade is available for a given package

  CLI Example:
  `salt '/*' pkg.upgrade_available <package name>`

salt.modules.aptpkg.version('names, **kwargs)
  Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

  CLI Example:
  `salt '/*' pkg.version <package name>`
  `salt '/*' pkg.version <package1> <package2> <package3> ...`

salt.modules.aptpkg.version_cmp(pkg1, pkg2, ignore_epoch=False, **kwargs)
  Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

  **ignore_epoch**
  [False] Set to True to ignore the epoch when comparing versions

  New in version 2015.8.10, 2016.3.2.

  CLI Example:
  `salt '/*' pkg.version_cmp '0.2.4-0ubuntu1' '0.2.4.1-0ubuntu1'`

26.6.21 salt.modules.archive

A module to wrap (non-Windows) archive calls

New in version 2014.1.0.

salt.modules.archive.cmd_unzip(zip_file, dest, excludes=None, options=None, template=None, runas=None, trim_output=False, password=None)

  New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.unzip.

  Uses the unzip command to unpack zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply unzip.

  **zip_file**
  Path of zip file to be unpacked

  **dest**
  The destination directory into which the file should be unpacked

  **excludes**
  [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

  **template**
  [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:
options
Optional when using zip archives, ignored when using other archives files. This is mostly used to overwrite existing files with o. This options are only used when unzip binary is used.

New in version 2016.3.1.

runas
[None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

trim_output
[False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

password
Password to use with password protected zip files

Note: This is not considered secure. It is recommended to instead use archive.unzip for password-protected ZIP files. If a password is used here, then the unzip command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.cmd_unzip /tmp/zipfile.zip '/tmp/{grains.id}′' excludes=file_1,file_2
```

```
salt '*' archive.cmd_unzip /tmp/zipfile.zip /home/strongbad/
  →excludes=file_1,file_2
```

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /home/strongbad/
  →excludes=file_1,file_2
```

salt.modules.archive.cmd_zip(zip_file, sources, template=None, cwd=None, runas=None)
New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.zip.

Uses the zip command to create zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply zip.

zip_file
Path of zip file to be created

sources
Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template
[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/
  →sourcefile1,/tmp/{{grains.id}}.txt
```

cwd
[None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a
zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

```
salt '*' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

New in version 2014.7.1.

**runas**

[None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

CLI Example:

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
```

# Globbing for sources (2017.7.0 and later)

```
salt '*' archive.cmd_zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

**salt.modules.archive.gunzip**(*gzipfile*, **template=None**, **runas=None**, **options=None**)  

Uses the gunzip command to unpack gzip files  

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz
```

**runas**

[None] The user with which to run the gzip command line

**options**

[None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt
salt '*' archive.gunzip /tmp/sourcefile.txt.gz
salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'
```

**salt.modules.archive.gzip**(*sourcefile*, **template=None**, **runas=None**, **options=None**)  

Uses the gzip command to create gzip files  

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gzip template=jinja /tmp/{{grains.id}}.txt
```

**runas**

[None] The user with which to run the gzip command line

**options**

[None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:
# Create /tmp/sourcefile.txt.gz
salt '*' archive.gzip /tmp/sourcefile.txt
salt '*' archive.gzip /tmp/sourcefile.txt options='-9 --verbose'

salt.modules.archive.is_encrypted(name, clean=False, saltenv='base', source_hash=None, use_etag=False)

New in version 2016.11.0.
Changed in version 3005.

Returns True if the zip archive is password-protected, False if not. If the specified file is not a ZIP archive, an error will be raised.

name
- The path / URL of the archive to check.

clean
- [False] Set this value to True to delete the path referred to by name once the contents have been listed. This option should be used with care.

Note: If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

saltenv
- [base] Specifies the fileserver environment from which to retrieve archive. This is only applicable when archive is a file from the salt:// fileserver.

source_hash
- If name is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

use_etag
- If True, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the source_hash parameter.

New in version 3005.

CLI Examples:

salt '*' archive.is_encrypted /path/to/myfile.zip
salt '*' archive.is_encrypted salt://foo.zip
salt '*' archive.is_encrypted salt://foo.zip saltenv=dev
salt '*' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt '*' archive.is_encrypted https://domain.tld/myfile.zip source_hash=f1d2d2f924e986ac86f7bf36c94bcdf32beec15
salt '*' archive.is_encrypted ftp://10.1.2.3/foo.zip

salt.modules.archive.list_(name, archive_format=None, options=None, strip_components=None, clean=False, verbose=False, saltenv='base', source_hash=None, use_etag=False)

New in version 2016.11.0.

Changed in version 2016.11.2,3005: The rarfile Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the rar CLI tool, which do not support listing
the contents in a parsable format.
List the files and directories in an tar, zip, or rar archive.

**Note:** This function will only provide results for XZ-compressed archives if the xz CLI command is available, as Python does not at this time natively support XZ compression in its tarfile module. Keep in mind however that most Linux distros ship with xz already installed.

To check if a given minion has xz, the following Salt command can be run:

```
salt minion_id cmd.which xz
```

If None is returned, then xz is not present and must be installed. It is widely available and should be packaged as either xz or xz-utils.

**name**
- Path/URL of archive

**archive_format**
- Specify the format of the archive (tar, zip, or rar). If this argument is omitted, the archive format will be guessed based on the value of the name parameter.

**options**

For tar archives only. This function will, by default, try to use the tarfile module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to tar -tf - to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by tarfile, this option can be used to specify a command that will decompress the archive to stdout. For example:

```
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --decompress --stdout'
```

**Note:** It is not necessary to manually specify options for gzip'ed archives, as gzip compression is natively supported by tarfile.

**strip_components**
- This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if --strip-components (or --strip) were used when extracting tar archives.

New in version 2016.11.2.

**clean**
- [False] Set this value to True to delete the path referred to by name once the contents have been listed. This option should be used with care.

**Note:** If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

**verbose**
- [False] If False, this function will return a list of files/dirs in the archive. If True, it will return a
dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

**saltenv**

[base] Specifies the fileserver environment from which to retrieve archive. This is only applicable when archive is a file from the salt:// fileserver.

**source_hash**

If name is an http(s)/ftp URL and the file exists in the minion’s file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

**use_etag**

If True, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the source_hash parameter.

New in version 3005.

CLI Examples:

```bash
salt '*' archive.list /path/to/myfile.tar.gz
salt '*' archive.list /path/to/myfile.tar.gz strip_components=1
salt '*' archive.list salt://foo.tar.gz
salt '*' archive.list https://domain.tld/myfile.zip
salt '*' archive.list https://domain.tld/myfile.zip source_hash=f1d2d2f924e986ac86f8d7b36c94bd0f32beec15
salt '*' archive.list ftp://10.1.2.3/foo.rar
```

**salt.modules.archive.rar** *(rarfile, sources, template=None, cwd=None, runas=None)*

Uses rar for Linux to create rar files

**rarfile**

Path of rar file to be created

**sources**

Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

**cwd**

[None] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

**template**

[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

```bash
salt '*' archive.rar template=jinja /tmp/rarfile.rar '/tmp/{-sourcefile1},/tmp/{{grains.id}}.txt'
```

CLI Example:
salt.modules.archive.tar(options, tarfile, sources=None, dest=None, cwd=None, template=None, runas=None)

Note: This function has changed for version 0.17.0. In prior versions, the cwd and template arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, sources must be a comma-separated list, and the cwd and template arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

options
Options to pass to the tar command

Changed in version 2015.8.0: The mandatory - prefixing has been removed. An options string beginning with a --long-option, would have uncharacteristically needed its first - removed under the former scheme.

Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they’re using the non-- format, when really they are using the with-- format.

tarfile
The filename of the tar archive to pack/unpack

sources
Comma delimited list of files to pack into the tarfile. Can also be passed as a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

dest
The destination directory into which to unpack the tarfile

cwd
[None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

template
[None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:

salt '*' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}}
→template=jinja

CLI Examples:

# Create a tarfile
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 /tmp/file_1,/tmp/file_2
# Create a tarfile using globbing (2017.7.0 and later)
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 '/tmp/file_*'
# Unpack a tarfile
salt '*' archive.tar xf foo.tar dest=/target/directory

salt.modules.archive.unrar(rarfile, dest, excludes=None, template=None, runas=None, trim_output=False)

Uses rar for Linux to unpack rar files

26.6. execution modules
rarfile
   Name of rar file to be unpacked

dest
   The destination directory into which to unpack the rar file

template
   [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:
   
   salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.id}}/ excludes=file_1,file_2

trim_output
   [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

   salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1, file_2

salt.modules.archive.unzip(zip_file, dest, excludes=None, options=None, template=None, runas=None, trim_output=False, password=None, extract_perms=True)

Uses the zipfile Python module to unpack zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function archive.cmd_unzip. For versions 2014.7.x and earlier, see the archive.cmd_zip documentation.

zip_file
   Path of zip file to be unpacked

dest
   The destination directory into which the file should be unpacked

excludes
   [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

options
   This options are only used when unzip binary is used. In this function is ignored.

   New in version 2016.3.1.

template
   [None] Can be set to 'jinja' or another supported template engine to render the command arguments before execution:
   
   salt '*' archive.unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.id}}/ excludes=file_1,file_2

runas
   [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

trim_output
   [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:
password

Password to use with password protected zip files

Note: The password will be present in the events logged to the minion log file at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.3.0.

extract_perms

[True] The Python zipfile module does not extract file/directory attributes by default. When this argument is set to True, Salt will attempt to apply the file permission attributes to the extracted files/folders.

On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored.

Set this argument to False to disable this behavior.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1, file_2
```

salt.modules.archive.zip(zip_file, sources, template=None, cwd=None, runas=None, zip64=False)

Uses the zipfile Python module to create zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function archive.cmd_zip. For versions 2014.7.x and earlier, see the archive.cmd_zip documentation.

zip_file

Path of zip file to be created

sources

Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template

[None] Can be set to ‘jinja’ or another supported template engine to render the command arguments before execution:

```
salt '*' archive.zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1, /tmp/{{grains.id}}.txt
```

cwd

[None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:
runas

[None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

zip64

[False] Used to enable ZIP64 support, necessary to create archives larger than 4 GByte in size. If true, will create ZIP file with the ZIPp64 extension when the zipfile is larger than 2 GB. ZIP64 extension is disabled by default in the Python native zip support because the default zip and unzip commands on Unix (the InfoZIP utilities) don't support these extensions.

CLI Example:

```
salt '*' archive.zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

26.6.22 salt.modules.arista_pyeapi

Arista pyeapi

New in version 2019.2.0.

Execution module to interface the connection with Arista switches, connecting to the remote network device using the pyeapi library. It is flexible enough to execute the commands both when running under an Arista Proxy Minion, as well as running under a Regular Minion by specifying the connection arguments, i.e., device_type, host, username, password etc.

```
codeauthor
Mircea Ulinic <ping@mirceaulinic.net>
```

default

new

depends

pyeapi

platform

unix

Note: To understand how to correctly enable the eAPI on your switch, please check https://eos.arista.com/arista-eapi-101/.

Dependencies

The pyeapi Execution module requires the Python Client for eAPI (pyeapi) to be installed: pip install pyeapi.
Usage

This module can equally be used via the `pyeapi` Proxy module or directly from an arbitrary (Proxy) Minion that is running on a machine having access to the network device API, and the `pyeapi` library is installed.

When running outside of the `pyeapi Proxy` (i.e., from another Proxy Minion type, or regular Minion), the pyeapi connection arguments can be either specified from the CLI when executing the command, or in a configuration block under the `pyeapi` key in the configuration opts (i.e., (Proxy) Minion configuration file), or Pillar. The module supports these simultaneously. These fields are the exact same supported by the `pyeapi` Proxy Module:

transport: `https`
   Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

host: `localhost`
   The IP address or DNS host name of the connection device.

username: `admin`
   The username to pass to the device to authenticate the eAPI connection.

password
   The password to pass to the device to authenticate the eAPI connection.

port
   The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

enablepwd
   The enable mode password if required by the destination node.

Example (when not running in a `pyeapi` Proxy Minion):

```yaml
pyeapi:
  username: test
  password: test
```

In case the `username` and `password` are the same on any device you are targeting, the block above (besides other parameters specific to your environment you might need) should suffice to be able to execute commands from outside a `pyeapi` Proxy, e.g.:

```bash
salt '* pyeapi.run_commands 'show version' 'show interfaces'
salt '* pyeapi.config 'ntp server 1.2.3.4'
```

Note: Remember that the above applies only when not running in a `pyeapi` Proxy Minion. If you want to use the `pyeapi Proxy`, please follow the documentation notes for a proper setup.

```python
salt.modules.arista_pyeapi.call(method, *args, **kwargs)
```

Invoke an arbitrary pyeapi method.

method
   The name of the pyeapi method to invoke.

args
   A list of arguments to send to the method invoked.

kwargs
   Key-value dictionary to send to the method invoked.
transport: http\[s\]
    Specifies the type of connection transport to use. Valid values for the connection are socket, http\_local, http, and https.

    **Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

host: localhost
    The IP address or DNS host name of the connection device.

    **Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

username: admin
    The username to pass to the device to authenticate the eAPI connection.

    **Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

password
    The password to pass to the device to authenticate the eAPI connection.

    **Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

port
    The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

    **Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

enablepwd
    The enable mode password if required by the destination node.

    **Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

---

**CLI Example:**

```
salt '*' pyeapi.call run_commands "['show version']"
```

```python
salt.modules.arista_pyeapi.config(
    commands=None, config_file=None, template_engine='jinja',
    context=None, defaults=None, saltenv='base', **kwargs)
```

Configures the node with the specified commands.

This method is used to send configuration commands to the node. It will take either a string or a list and prepend the necessary commands to put the session into config mode.

Returns the diff after the configuration commands are loaded.

**config_file**

The source file with the configuration commands to be sent to the device.

The file can also be a template that can be rendered using the template engine of choice.
This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the file from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

**commands**

The commands to send to the node in config mode. If the commands argument is a string it will be cast to a list. The list of commands will also be prepended with the necessary commands to put the session in config mode.

---

**Note:** This argument is ignored when `config_file` is specified.

**template_engine:** `jinja`

The template engine to use when rendering the source file. Default: `jinja`. To simply fetch the file without attempting to render, set this argument to `None`.

**context**

Variables to add to the template context.

**defaults**

Default values of the `context` dict.

**transport:** `https`

Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

---

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

**host:** `localhost`

The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

**username:** `admin`

The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

**password**

The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

**port**

The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).
**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**enablepwd**
The enable mode password if required by the destination node.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**CLI Example:**
```
salt '*' pyeapi.config commands="[\'ntp server 1.2.3.4\', \'ntp server 5.6.7.8\']"
salt '*' pyeapi.config config_file=salt://config.txt
salt '*' pyeapi.config config_file=https://bit.ly/2LGLcDy context="{"servers": [\'1.2.3.4\']}"
```

salt.modules.arista_pyeapi.get_config(**config='running-config', params=None, as_string=False, **kwargs**)  
Retrieves the config from the device.

This method will retrieve the config from the node as either a string or a list object. The config to retrieve can be specified as either the startup-config or the running-config.

**config:** **running-config**  
Specifies to return either the nodes startup-config or running-config. The default value is the running-config.

**params**  
A string of keywords to append to the command for retrieving the config.

**as_string:** **False**  
Flag that determines the response. If True, then the configuration is returned as a raw string. If False, then the configuration is returned as a list. The default value is False.

**transport:** **https**  
Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**host:** **localhost**  
The IP address or DNS host name of the connection device.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**username:** **admin**  
The username to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a **pyeapi** Proxy Minion.

**password**  
The password to pass to the device to authenticate the eAPI connection.
Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

**port**
The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for `http`, or 443 for `https`).

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

**enablepwd**
The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

### CLI Example:
```
salt '*' pyeapi.get_config
salt '*' pyeapi.get_config params='section snmp-server'
salt '*' pyeapi.get_config config='startup-config'
```

salt.modules.arista_pyeapi.get_connection(**kwargs)
Return the connection object to the pyeapi Node.

**Warning:** This function returns an unserializable object, hence it is not meant to be used on the CLI. This should mainly be used when invoked from other modules for the low level connection with the network device.

**kwargs**
Key-value dictionary with the authentication details.

**Usage Example:**
```
conn = __salt__['pyeapi.get_connection'](host='router1.example.com',
  username='example',
  password='example')
show_ver = conn.run_commands(['show version', 'show interfaces'])
```

salt.modules.arista_pyeapi.run_commands(*commands, **kwargs)
Sends the commands over the transport to the device.

This function sends the commands to the device using the nodes transport. This is a lower layer function that shouldn't normally need to be used, preferring instead to use `config()` or `enable()`.

**transport:** `https`
Specifies the type of connection transport to use. Valid values for the connection are `socket`, `http_local`, `http`, and `https`.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.
host: `localhost`
The IP address or DNS host name of the connection device.

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

username: `admin`
The username to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

password
The password to pass to the device to authenticate the eAPI connection.

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

port
The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

enablepwd
The enable mode password if required by the destination node.

**Note:** This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

CLI Example:
```
salt '*' pyeapi.run_commands 'show version'
salt '*' pyeapi.run_commands 'show version' encoding=text
salt '*' pyeapi.run_commands 'show version' encoding=text host=cr1.thn.lon username=example password=weak
```

Output example:
```
veos1:
|__
  __________
  architecture: i386
  bootupTimestamp: 1527541728.53
  hardwareRevision: internalBuildId: 63d2e89a-220d-4b8a-a9b3-0524fa8f9c5f
  internalVersion: 4.18.1F-4591672.4181F
  isIntlVersion: False
```

</tbody>
</table>

```python
salt.modules.arista_pyeapi.section(regex, config='running-config', **kwargs)
```

Return a section of the config.

**regex**
A valid regular expression used to select sections of configuration to return.

**config**
The configuration to return. Valid values for config are running-config or startup-config. The default value is running-config.

**transport**
https
Specifies the type of connection transport to use. Valid values for the connection are socket, http_local, http, and https.

---

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

**host**
localhost
The IP address or DNS host name of the connection device.

---

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

**username**
admin
The username to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

**password**
The password to pass to the device to authenticate the eAPI connection.

---

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.

**port**
The TCP port of the endpoint for the eAPI connection. If this keyword is not specified, the default value is automatically determined by the transport type (80 for http, or 443 for https).

---

**Note:** This argument does not need to be specified when running in a pyeapi Proxy Minion.
enablepwd
The enable mode password if required by the destination node.

Note: This argument does not need to be specified when running in a `pyeapi` Proxy Minion.

CLI Example:
```
salt '*'
```

26.6.23 salt.modules.artifactory

Module for fetching artifacts from Artifactory

```python
exception salt.modules.artifactory.ArtifactError(value)
```

```python
class salt.modules.artifactory.get_latest_release(artifact_url, repository, group_id, artifact_id, packaging, target_dir='~/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)```

Gets the latest release of the artifact

- **artifact_url**
  URL of artifactory instance

- **repository**
  Release repository in artifactory to retrieve artifact from, for example: libs-releases

- **group_id**
  Group Id of the artifact

- **artifact_id**
  Artifact Id of the artifact

- **packaging**
  Packaging type (jar, war, ear, etc)

- **target_dir**
  Target directory to download artifact to (default: /tmp)

- **target_file**
  Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

- **classifier**
  Artifact classifier name (ex: sources, javadoc, etc). Optional parameter.

- **username**
  Artifactory username. Optional parameter.

- **password**
  Artifactory password. Optional parameter.

```python
class salt.modules.artifactory.get_latest_snapshot(artifact_url, repository, group_id, artifact_id, packaging, target_dir='~/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)```

Gets latest snapshot of the given artifact
**artifactory_url**
URL of artifactory instance

**repository**
Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

**group_id**
Group Id of the artifact

**artifact_id**
Artifact Id of the artifact

**packaging**
Packaging type (jar,war,ear,etc)

**target_dir**
Target directory to download artifact to (default: /tmp)

**target_file**
Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)

**classifier**
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**
Artifactory username. Optional parameter.

**password**
Artifactory password. Optional parameter.

**salt.modules.artifactory.get_release**(artifactory_url, repository, group_id, artifact_id, packaging, version, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets the specified release of the artifact

**artifactory_url**
URL of artifactory instance

**repository**
Release repository in artifactory to retrieve artifact from, for example: libs-releases

**group_id**
Group Id of the artifact

**artifact_id**
Artifact Id of the artifact

**packaging**
Packaging type (jar,war,ear,etc)

**version**
Version of the artifact

**target_dir**
Target directory to download artifact to (default: /tmp)

**target_file**
Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

**classifier**
Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

**username**
Artifactory username. Optional parameter.
password
    Artifactory password. Optional parameter.

salt.modules.artifactory.get_snapshot(artifactory_url, repository, group_id, artifact_id, packaging, version, snapshot_version=None, target_dir='/tmp', target_file=None, classifier=None, username=None, password=None, use_literal_group_id=False)

Gets snapshot of the desired version of the artifact

artifact_url
    URL of artifactory instance

repository
    Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots

group_id
    Group Id of the artifact

artifact_id
    Artifact Id of the artifact

packaging
    Packaging type (jar,war,ear,etc)

version
    Version of the artifact

target_dir
    Target directory to download artifact to (default: /tmp)

target_file
    Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)

classifier
    Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.

username
    Artifactory username. Optional parameter.

password
    Artifactory password. Optional parameter.

salt.modules.artifactory.set_basic_auth(url, username, password)

Sets the username and password for a specific url. Helper method.

CLI Example:

26.6.24 salt.modules.at

Wrapper module for at(1)
Also, a ‘tag’ feature has been added to more easily tag jobs.

platform
    linux,openbsd,freebsd

Changed in version 2017.7.0.
salt.modules.at.at("args", **"kwargs")

Add a job to the queue.

The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
salt '*' at.at '"22:02"' 'bin/myscript' tag=nightly runas=jim
```

salt.modules.at.atc(jobid)

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

salt.modules.at.atq(tag=None)

List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

salt.modules.at.atrm("args")

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

salt.modules.at.jobcheck(**kwargs)

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```
26.6.25 salt.modules.at_solaris

Wrapper for at(1) on Solaris-like systems

Note: we try to mirror the generic at module where possible

maintainer

jorge schrauwen <sjorge@blackdot.be>

maturity

new

platform

solaris,illumos,smartso

New in version 2017.7.0.

salt.modules.at_solaris.at(*args, **kwargs)

Add a job to the queue.

The 'timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

salt.modules.at_solaris.atc(jobid)

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

salt.modules.at_solaris.atq(tag=None)

List all queued and running jobs or only those with an optional 'tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

salt.modules.at_solaris.atrm(*args)

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

salt.modules.at_solaris.jobcheck(**kwargs)

Check the job from queue. The kwargs dict include 'hour minute day month year tag runas' Other parameters will be ignored.
CLI Example:
```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

26.6.26 `salt.modules.augeas_cfg`

Manages configuration files via augeas

This module requires the `augeas` Python module.

**Warning:** Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:
```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```
For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.modules.augeas_cfg.execute(context=None, lens=None, commands=(), load_path=None)`

Execute Augeas commands

New in version 2014.7.0.

CLI Example:
```
salt '*' augeas.execute /files/etc/redis/redis.conf \
commands='["set bind 0.0.0.0", "set maxmemory 1G"]'
```

- **context**
  The Augeas context

- **lens**
  The Augeas lens to use

- **commands**
  The Augeas commands to execute

New in version 2016.3.0.

- **load_path**
  A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.get(path, value='', load_path=None)`

Get a value for a specific augeas path

CLI Example:
```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

- **path**
  The path to get the value of
value
The optional value to get

New in version 2016.3.0.

load_path
A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.ls(path, load_path=None)
List the direct children of a node

CLI Example:

```
salt '*' augeas.ls /files/etc/passwd
```

path
The path to list

New in version 2016.3.0.

load_path
A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.match(path, value='', load_path=None)
Get matches for path expression

CLI Example:

```
salt '*' augeas.match /files/etc/services/service-name ssh
```

path
The path to match

value
The value to match on

New in version 2016.3.0.

load_path
A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.remove(path, load_path=None)
Get matches for path expression

CLI Example:

```
salt '*' augeas.remove \
/files/etc/sysctl.conf/net.ipv4.conf.all.log_martians
```

path
The path to remove

New in version 2016.3.0.
**load_path**
A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

**salt.modules.augeas_cfg.setvalue("args")**
Set a value for a specific augeas path

CLI Example:
```
salt '*' augeas.setvalue /files/etc/hosts/1/canonical localhost
```
This will set the first entry in /etc/hosts to localhost

CLI Example:
```
salt '*' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 \
/files/etc/hosts/01/canonical test
```
Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:
```
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \
  "spec[user = '%wheel']/user" "%wheel" \ 
  "spec[user = '%wheel']/host_group/host" 'ALL' \ 
  "spec[user = '%wheel']/host_group/command[1]" 'ALL' \ 
  "spec[user = '%wheel']/host_group/command[1]/tag" 'PASSWD' \ 
  "spec[user = '%wheel']/host_group/command[2]" '/usr/bin/apt-get' \ 
  "spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```
Ensures that the following line is present in /etc/sudoers:
```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/
aptitude
```

**salt.modules.augeas_cfg.tree(path, load_path= None)**
Returns recursively the complete tree of a node

CLI Example:
```
salt '*' augeas.tree /files/etc/
```

**path**
The base of the recursive listing

New in version 2016.3.0.

**load_path**
A colon-separated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.
26.6.27 salt.modules.aws_sqs

Support for the Amazon Simple Queue Service.

`salt.modules.aws_sqs.create_queue(name, region, opts=None, user=None)`

Creates a queue with the correct name.

- **name**
  - Name of the SQS queue to create

- **region**
  - Region to create the SQS queue in

- **opts**
  - [None] Any additional options to add to the command line

- **user**
  - [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.create_queue <sqs queue> <region>
```

`salt.modules.aws_sqs.delete_message(queue, region, receipthandle, opts=None, user=None)`

Delete one or more messages from a queue in a region

- **queue**
  - The name of the queue to delete messages from

- **region**
  - Region where SQS queues exists

- **receipthandle**
  - The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from receive_message

- **opts**
  - [None] Any additional options to add to the command line

- **user**
  - [None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.delete_message <sqs queue> <region> receipthandle={<sqs\ReceiptHandle>}
```

New in version 2014.7.0.

`salt.modules.aws_sqs.delete_queue(name, region, opts=None, user=None)`

Deletes a queue in the region.

- **name**
  - Name of the SQS queue to deletes

- **region**
  - Name of the region to delete the queue from

- **opts**
  - [None] Any additional options to add to the command line
user
[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.delete_queue <sqs queue> <region>
```

```
salt.modules.aws_sqs.list_queues(region, opts=None, user=None)
```
List the queues in the selected region.

```
region
Region to list SQS queues for
```

```
opts
[None] Any additional options to add to the command line
```

```
user
[None] Run hg as a user other than what the minion runs as
```

CLI Example:

```
salt '*' aws_sqs.list_queues <region>
```

```
salt.modules.aws_sqs.queue_exists(name, region, opts=None, user=None)
```
Returns True or False on whether the queue exists in the region

```
name
Name of the SQS queue to search for
```

```
region
Name of the region to search for the queue in
```

```
opts
[None] Any additional options to add to the command line
```

```
user
[None] Run hg as a user other than what the minion runs as
```

CLI Example:

```
salt '*' aws_sqs.queue_exists <sqs queue> <region>
```

```
salt.modules.aws_sqs.receive_message(queue, region, num=1, opts=None, user=None)
```
Receive one or more messages from a queue in a region

```
queue
The name of the queue to receive messages from
```

```
region
Region where SQS queues exists
```

```
um
[1] The max number of messages to receive
```

```
opts
[None] Any additional options to add to the command line
```

```
user
[None] Run as a user other than what the minion runs as
```

CLI Example:
New in version 2014.7.0.

26.6.28 salt.modules.bamboohr

Support for BambooHR

New in version 2015.8.0.

Requires a subdomain and an apikey in /etc/salt/minion:

```
bamboohr:
  apikey: 012345678901234567890
  subdomain: mycompany
```

salt.modules.bamboohr.list_employees(order_by='id')

Show all employees for this company.

CLI Example:
```
salt myminion bamboohr.list_employees
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:
```
salt myminion bamboohr.list_employees order_by=id
salt myminion bamboohr.list_employees order_by=displayName
salt myminion bamboohr.list_employees order_by=workEmail
```

salt.modules.bamboohr.list_meta_fields()

Show all meta data fields for this company.

CLI Example:
```
salt myminion bamboohr.list_meta_fields
```

salt.modules.bamboohr.list_users(order_by='id')

Show all users for this company.

CLI Example:
```
salt myminion bamboohr.list_users
```

By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:
salt.modules.bamboohr.show_employee(emp_id, fields=None)
Show all employees for this company.

CLI Example:

```
salt myminion bamboohr.show_employee 1138
```

By default, the fields normally returned from bamboohr.list_employees are returned. These fields are:

- canUploadPhoto
- department
- displayName
- firstName
- id
- jobTitle
- lastName
- location
- mobilePhone
- nickname
- photoUploaded
- photoUrl
- workEmail
- workPhone
- workPhoneExtension

If needed, a different set of fields may be specified, separated by commas:

CLI Example:

```
salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth
```

A list of available fields can be found at [http://www.bamboohr.com/api/documentation/employees.php](http://www.bamboohr.com/api/documentation/employees.php)

salt.modules.bamboohr.update_employee(emp_id, key=None, value=None, items=None)
Update one or more items for this employee. Specifying an empty value will clear it for that employee.

CLI Examples:

```
salt myminion bamboohr.update_employee 1138 nickname Curly
salt myminion bamboohr.update_employee 1138 nickname ''
salt myminion bamboohr.update_employee 1138 items='"nickname": "Curly"'
salt myminion bamboohr.update_employee 1138 items='"nickname": ""
```
26.6.29 salt.modules.baredoc

Baredoc walks the installed module and state directories and generates dictionaries and lists of the function names and their arguments.

New in version 3001.

**salt.modules.baredoc.list_modules**(*name=False, names_only=False*)

Walk the Salt install tree for execution modules and return a dictionary or a list of their functions as well as their arguments.

**Parameters**

- **name** -- specify a specific module to list. If not specified, all modules will be listed.
- **names_only** -- Return only a list of the callable functions instead of a dictionary with arguments

**CLI Example:**

```
salt myminion baredoc.list_modules
myminion:  
    [...
        at:
        - atq:
            tag: null
        - atrm:
            args: args
        - at:
            args: args
            kwargs: kwargs
        - atc:
            jobid: null
        - jobcheck:
            kwargs: kwargs
    [...]
```

**salt.modules.baredoc.list_states**(*name=False, names_only=False*)

Walk the Salt install tree for state modules and return a dictionary or a list of their functions as well as their arguments.

**Parameters**

- **name** -- specify a specific module to list. If not specified, all modules will be listed.
- **names_only** -- Return only a list of the callable functions instead of a dictionary with arguments

**CLI Example:**

(example truncated for brevity)

```
salt myminion baredoc.list_states
myminion:  
```

(continues on next page)
salt.modules.baredoc.module_docs('names')

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

Parameters

- **name** -- specify a specific module to list.

CLI Example:

```
salt myminion baredoc.module_docs
```

salt.modules.baredoc.state_docs('names')

Return the docstrings for all state modules. Optionally, specify a state module or a function to narrow the selection.

Parameters

- **name** -- specify a specific module to list.

CLI Example:

```
salt myminion baredoc.state_docs at
26.6.30 salt.modules.bcache

Module for managing BCache sets

BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fs cache. It works by formatting one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and activating them.

It's available in Linux mainline kernel since 3.10

https://www.kernel.org/doc/Documentation/bcache.txt

This module needs the bcache userspace tools to function.

New in version 2016.3.0.

salt.modules.bcache.attach_(dev=None)

Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.

CLI Example:

```
salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1
```

Returns

bool or None if nuttin’ happened

salt.modules.bcache.back_make(dev, cache_mode='writeback', force=False, attach=True, bucket_size=None)

Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI Example:

```
salt '*' bcache.back_make sdc cache_mode=writeback attach=True
```

Parameters

- cache_mode -- writethrough, writeback, writaround or none.
- force -- Overwrite existing bcaches
- attach -- Immediately attach the backing device to the set
- bucket_size -- Size of a bucket (see kernel doc)

salt.modules.bcache.cache_make(dev, reserved=None, force=False, block_size=None, bucket_size=None, attach=True)

Create BCache cache on a block device. If blk discard is available the entire device will be properly cleared in advance.

CLI Example:

```
salt '*' bcache.cache_make sdb reserved=10% block_size=4096
```

Parameters
• **reserved** -- if dev is a full device, create a partition table with this size empty.

  **Note:** this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance

• **block_size** -- Block size of the cache; defaults to devices’ logical block size

• **force** -- Overwrite existing BCache sets

• **attach** -- Attach all existing backend devices immediately

salt.modules.bcache.config(dev=None, **kwargs)
Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI Example:

```bash
salt '*' bcache.config
salt '*' bcache.config bcachel
salt '*' bcache.config errors=panic journal_delay_ms=150
salt '*' bcache.config bcachel cache_mode=writeback writeback_percent=15
```

Returns

config or True/False

salt.modules.bcache.detach(dev=None)
Detach a backing device(s) from a cache set If no dev is given, all backing devices will be attached.

Detaching a backing device will flush its write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI Example:

```bash
salt '*' bcache.detach sdc
salt '*' bcache.detach bcachel
```

salt.modules.bcache.device(dev, stats=False, config=False, internals=False, superblock=False)
Check the state of a single bcache device

CLI Example:

```bash
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc stats=True
```

Parameters

• **stats** -- include statistics

• **settings** -- include all settings

• **internals** -- include all internals

• **superblock** -- include superblock info
salt.modules.bcache.start()

Trigger a start of the full bcache system through udev.

CLI Example:
```
salt '*' bcache.start
```

salt.modules.bcache.status(stats=False, config=False, internals=False, superblock=False, alldevs=False)

Show the full status of the BCache system and optionally all its involved devices

CLI Example:
```
salt '*' bcache.status
salt '*' bcache.status stats=True
salt '*' bcache.status internals=True alldevs=True
```

Parameters

- **stats** -- include statistics
- **config** -- include settings
- **internals** -- include internals
- **superblock** -- include superblock

salt.modules.bcache.stop(dev=None)

Stop a bcache device If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.

Warning: 'Stop' on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly 'disappear' from the device lists

CLI Example:
```
salt '*' bcache.stop
```

salt.modules.bcache.super_(dev)

Read out BCache SuperBlock

CLI Example:
```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

salt.modules.bcache.uuid(dev=None)

Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI Example:
```
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```
26.6.31 salt.modules.beacons

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

salt.modules.beacons.add(name, beacon_data, **kwargs)

Add a beacon on the minion

Parameters

• **name** -- Name of the beacon to configure

• **beacon_data** -- Dictionary or list containing configuration for beacon.

Returns

Boolean and status message on success or failure of add.

CLI Example:

```
salt '*' beacons.add ps "[{'processes': {'salt-master': 'stopped', 'apache2': 'stopped'}}]
```

salt.modules.beacons.delete(name, **kwargs)

Delete a beacon item

Parameters

• **name** -- Name of the beacon to delete

Returns

Boolean and status message on success or failure of delete.

CLI Example:

```
salt '*' beacons.delete ps
salt '*' beacons.delete load
```

salt.modules.beacons.disable(**kwargs)

Disable all beacons jobs on the minion

Returns

Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable
```

salt.modules.beacons.disable_beacon(name, **kwargs)

Disable a beacon on the minion

Name

Name of the beacon to disable.

Returns

Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable_beacon ps
```
salt.modules.beacons.enable(**kwargs)
   Enable all beacons on the minion

   Returns
   Boolean and status message on success or failure of enable.

   Return type
   bool

   CLI Example:
   ```
salt '*' beacons.enable
   ```

salt.modules.beacons.enable_beacon(name, **kwargs)
   Enable beacon on the minion

   Name
   Name of the beacon to enable.

   Returns
   Boolean and status message on success or failure of enable.

   CLI Example:
   ```
salt '*' beacons.enable_beacon ps
   ```

salt.modules.beacons.list_(return_yaml=True, include_pillar=True, include_opts=True, **kwargs)
   List the beacons currently configured on the minion

   Parameters
   - return_yaml -- Whether to return YAML formatted output, default True
   - include_pillar -- Whether to include beacons that are configured in pillar, default is True.
   - include_opts -- Whether to include beacons that are configured in opts, default is True.

   Returns
   List of currently configured Beacons.

   CLI Example:
   ```
salt '*' beacons.list
   ```

salt.modules.beacons.list_available(return_yaml=True, **kwargs)
   List the beacons currently available on the minion

   Parameters
   - return_yaml -- Whether to return YAML formatted output, default True

   Returns
   List of currently configured Beacons.

   CLI Example:
   ```
salt '*' beacons.list_available
   ```
salt.modules.beacons.modify(name, beacon_data, **kwargs)

Modify an existing beacon

Parameters

• **name** -- Name of the beacon to configure
• **beacon_data** -- Dictionary or list containing updated configuration for beacon.

Returns

Boolean and status message on success or failure of modify.

CLI Example:

```
salt '*' beacons.modify ps "[{'salt-master': 'stopped'}, {'apache2': 'stopped'}]"
```

salt.modules.beacons.reset(**kwargs)

Reset beacon configuration on the minion

CLI Example:

```
salt '*' beacons.reset
```

salt.modules.beacons.save(**kwargs)

Save all configured beacons to the minion config

Returns

Boolean and status message on success or failure of save.

CLI Example:

```
salt '*' beacons.save
```

26.6.32 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

maturity
develop

platform
f5_bigip_11.6

salt.modules.bigip.add_pool_member(hostname, username, password, name, member)

A function to connect to a bigip device and add a new member to an existing pool.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

name
The name of the pool to modify
The name of the member to add i.e. 10.1.1.2:80

CLI Example:
```
salt '*' bigip.add_pool_members bigip admin admin my-pool 10.2.2.1:80
```

### salt.modules.bigip.commit_transaction

```
hostname
username
password
label
```

A function to connect to a bigip device and commit an existing transaction.

- **hostname**
  The host/address of the bigip device
- **username**
  The iControl REST username
- **password**
  The iControl REST password
- **label**
  the label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.commit_transaction bigip admin admin my_transaction
```

### salt.modules.bigip.create_monitor

```
hostname
username
password
monitor_type
name
**kwargs
```

A function to connect to a bigip device and create a monitor.

- **hostname**
  The host/address of the bigip device
- **username**
  The iControl REST username
- **password**
  The iControl REST password
- **monitor_type**
  The type of monitor to create
- **name**
  The name of the monitor to create
- **kwargs**
  Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:
```
salt '*' bigip.create_monitor bigip admin admin http my-http-monitor
  → timeout=10 interval=5
```

### salt.modules.bigip.create_node

```
hostname
username
name
address
trans_label=None
```

A function to connect to a bigip device and create a node.

- **hostname**
  The host/address of the bigip device
- **username**
  The iControl REST username
password
  The iControl REST password

name
  The name of the node

address
  The address of the node

trans_label
  The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.create_node bigip admin admin 10.1.1.2
```

salt.modules.bigip.create_pool(
  hostname, username, password, name, members=None, 
  allow_nat=None, allow_snat=None, description=None, 
  gateway_failsafe_device=None, ignore_persisted_weight=None, 
  ip_tos_to_client=None, ip_tos_to_server=None, 
  link_qos_to_client=None, link_qos_to_server=None, 
  load_balancing_mode=None, min_active_members=None, 
  min_up_members=None, min_up_members_action=None, 
  min_up_members_checking=None, monitor=None, profiles=None, 
  queue_depth_limit=None, queue_on_connection_limit=None, 
  queue_time_limit=None, reselect_tries=None, 
  service_down_action=None, slow_ramp_time=None)

A function to connect to a bigip device and create a pool.

hostname
  The host/address of the bigip device

username
  The iControl REST username

password
  The iControl REST password

name
  The name of the pool to create.

members
  List of comma delimited pool members to add to the pool. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

allow_nat
  [yes | no]

CLI Example:

```
salt '*' bigip.create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80 monitor=http
```

salt.modules.bigip.create_profile( hostname, username, password, profile_type, name, **kwargs)

A function to connect to a bigip device and create a profile.

hostname
    The host/address of the bigip device
username
    The iControl REST username

password
    The iControl REST password

profile_type
    The type of profile to create

name
    The name of the profile to create

kwargs
    [ arg=val ] ... [ arg=key1:val1,key2:val2 ] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args
Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists \[i,i,i\]:
    param='item1,item2,item3'

Dictionary \[k:v,k:v,k:v\]:
    param='key-1:val-1,key-2:val2,key-3:va-3'

List of Dictionaries \[k:v,k:v|k:v,k:v|k:v,k:v\]:
    param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'

JSON: \'j{ ... }j\':
    cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

Escaping Delimiters:
Use \, or \: or \| to escape characters which shouldn't be treated as delimiters i.e. ciphers='DEFAULT\:!SSLv3'

CLI Example:

```
salt '*' bigip.create_profile bigip admin admin http my-http-profile
    defaultsFrom='/Common/http'
salt '*' bigip.create_profile bigip admin admin http my-http-profile
    defaultsFrom='/Common/http'
    enforcement=maxHeaderCount:3200,maxRequests:10
```
A function to connect to a bigip device and create a virtual server.

**hostname**
The host/address of the bigip device

**username**
The iControl REST username

**password**
The iControl REST password

**name**
The name of the virtual to create

**destination**
\[ [virtual_address_name:port] | [ipv4:port] | [ipv6:port] \]

**pool**
\[ [pool_name] | none \]

   pool=my-http-pool-http profiles=http,tcp
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 43.2.2.5:80 \
   pool=test-http-pool-http profiles=http,websecurity persist=cookie,\n   persist=hash \n   policies=asm_auto_l7_policy__http-virtual \n   rules=_sys_APM_ExchangeSupport_helper,_sys_https_redirect \n   related_rules=_sys_APM_activesync,_sys_APM_ExchangeSupport_helper \n   source_address_translation=snat:my-snat-pool \n   translate_address=enabled translate_port=enabled \n   traffic_classes=my-class,other-class \n   vlans=enabled:external,internal
```

salt.modules.bigip.delete_monitor( hostname, username, password, monitor_type, name )

A function to connect to a bigip device and delete an existing monitor.

hostname
   The host/address of the bigip device
username
   The iControl REST username
password
   The iControl REST password
monitor_type
   The type of monitor to delete
name
   The name of the monitor to delete

CLI Example:

```bash
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor
```
salt.modules.bigip.delete_node(hostname, username, password, name, trans_label=None)

A function to connect to a bigip device and delete a specific node.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the node which will be deleted.
- **trans_label**: The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.delete_node bigip admin admin my-node
```

salt.modules.bigip.delete_pool(hostname, username, password, name)

A function to connect to a bigip device and delete a specific pool.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the pool which will be deleted

CLI Example
```
salt '*' bigip.delete_pool bigip admin admin my-pool
```

salt.modules.bigip.delete_pool_member(hostname, username, password, name, member)

A function to connect to a bigip device and delete a specific pool.

- **hostname**: The host/address of the bigip device
- **username**: The iControl REST username
- **password**: The iControl REST password
- **name**: The name of the pool to modify
- **member**: The name of the pool member to delete

CLI Example:
salt 'bigip.delete_pool_member' bigip admin admin my-pool 10.2.2.2:80

salt.modules.bigip.delete_profile( hostname, username, password, profile_type, name)
A function to connect to a bigip device and delete an existing profile.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

profile_type
The type of profile to delete

name
The name of the profile to delete

CLI Example:
salt 'bigip.delete_profile' bigip admin admin http my-http-profile

salt.modules.bigip.delete_transaction( hostname, username, password, label)
A function to connect to a bigip device and delete an existing transaction.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

label
The label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt 'bigip.delete_transaction' bigip admin admin my_transaction

salt.modules.bigip.delete_virtual( hostname, username, password, name)
A function to connect to a bigip device and delete a specific virtual.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

name
The name of the virtual to delete

CLI Example:
```bash
salt '*' bigip.delete_virtual bigip admin admin my-virtual
```

### `salt.modules.bigip.list_monitor`

A function to connect to a bigip device and list an existing monitor. If no name is provided then all monitors of the specified type will be listed.

- **hostname**
  - The host/address of the bigip device
- **username**
  - The iControl REST username
- **password**
  - The iControl REST password
- **monitor_type**
  - The type of monitor(s) to list
- **name**
  - The name of the monitor to list

CLI Example:

```
salt '*' bigip.list_monitor bigip admin admin http my-http-monitor
```

### `salt.modules.bigip.list_node`

A function to connect to a bigip device and list all nodes or a specific node.

- **hostname**
  - The host/address of the bigip device
- **username**
  - The iControl REST username
- **password**
  - The iControl REST password
- **name**
  - The name of the node to list. If no name is specified then all nodes will be listed.
- **trans_label**
  - The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.list_node bigip admin admin my-node
```

### `salt.modules.bigip.list_pool`

A function to connect to a bigip device and list all pools or a specific pool.

- **hostname**
  - The host/address of the bigip device
- **username**
  - The iControl REST username
- **password**
  - The iControl REST password
- **name**
  - The name of the pool to list. If no name is specified then all pools will be listed.
CLI Example:
```
salt '*' bigip.list_pool bigip admin admin my-pool
```

**salt.modules.bigip.list_profile** *(hostname, username, password, profile_type, name=None)*

A function to connect to a bigip device and list an existing profile. If no name is provided than all profiles of the specified type will be listed.

- **hostname**
  The host/address of the bigip device

- **username**
  The iControl REST username

- **password**
  The iControl REST password

- **profile_type**
  The type of profile(s) to list

- **name**
  The name of the profile to list

CLI Example:
```
salt '*' bigip.list_profile bigip admin admin http my-http-profile
```

**salt.modules.bigip.list_transaction** *(hostname, username, password, label)*

A function to connect to a bigip device and list an existing transaction.

- **hostname**
  The host/address of the bigip device

- **username**
  The iControl REST username

- **password**
  The iControl REST password

- **label**
  the label of this transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
```
salt '*' bigip.list_transaction bigip admin admin my_transaction
```

**salt.modules.bigip.list_virtual** *(hostname, username, password, name=None)*

A function to connect to a bigip device and list all virtuals or a specific virtual.

- **hostname**
  The host/address of the bigip device

- **username**
  The iControl REST username

- **password**
  The iControl REST password

- **name**
  The name of the virtual to list. If no name is specified than all virtuals will be listed.

CLI Example:
salt '*' bigip.list_virtual bigip admin admin my-virtual

salt.modules.bigip.modify_monitor( hostname, username, password, monitor_type, name, **kwargs )
A function to connect to a bigip device and modify an existing monitor.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

monitor_type
The type of monitor to modify

name
The name of the monitor to modify

**kwargs
Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor
\t\t\t\t\t\timout=16 interval=6

salt.modules.bigip.modify_node( hostname, username, password, name, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, state=None, trans_label=None )
A function to connect to a bigip device and modify an existing node.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

name
The name of the node to modify

connection_limit
[integer]

description
[string]

dynamic_ratio
[integer]

logging
[enabled | disabled]

monitor
[[name] | none | default]
rate_limit
[integer]

ratio
[integer]

session
[user-enabled | user-disabled]

state
[user-down | user-up ]

trans_label
The label of the transaction stored within the grain: bigip_f5_trans:<label>

CLI Example:
salt '*' bigip.modify_node bigip admin admin 10.1.1.2 ratio=20
←logging=enabled

salt.modules.bigip.modify_pool(hostname, username, password, name, allow_nat=No,
allow_snat=No, description=None, gateway_failsafe_device=None,
ignore_persisted_weight=None, ip_tos_to_client=None,
ip_tos_to_server=None, link_qos_to_client=None,
link_qos_to_server=None, load_balancing_mode=None,
min_active_members=None, min_up_members=None,
min_up_members_action=None, min_up_members_checking=None,
monitor=None, profiles=None, queue_depth_limit=None,
queue_on_connection_limit=None, queue_time_limit=None,
reselect_tries=None, service_down_action=None,
slow_ramp_time=None)

A function to connect to a bigip device and modify an existing pool.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

name
The name of the pool to modify.

allow_nat
[yes | no]

allow_snat
[yes | no]

description
[string]

queue_time_limit
   [integer]

reselect_tries
   [integer]

service_down_action
   [drop | none | reselect | reset]

slow_ramp_time
   [integer]

CLI Example:
salt '*' bigip.modify_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.
   →2:80,10.1.1.3:80 min_active_members=1
salt.modules.bigip.modify_pool_member

A function to connect to a bigip device and modify an existing member of a pool.

**hostname**
The host/address of the bigip device

**username**
The iControl REST username

**password**
The iControl REST password

**name**
The name of the pool to modify

**member**
The name of the member to modify i.e. 10.1.1.2:80

**connection_limit**
[integer]

**description**
[string]

**dynamic_ratio**
[integer]

**inherit_profile**
[enabled | disabled]

**logging**
[enabled | disabled]

**monitor**
[name]

**priority_group**
[integer]

**profiles**
[none | profile_name]

**rate_limit**
[integer]

**ratio**
[integer]

**session**
[user-enabled | user-disabled]

**state**
[ user-up | user-down ]

CLI Example:

```
salt '*' bigip.modify_pool_member bigip admin admin my-pool 10.2.1.2:80
  → state=use-down session=user-disabled
```
salt.modules.bigip.modify_profile

A function to connect to a bigip device and create a profile.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

profile_type
The type of profile to create

name
The name of the profile to create

kwargs
[ arg=val ] ... [arg=key1:val1,key2:val2] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists [i,i,i]
param='item1,item2,item3'

Dictionary [k:v,k:v,k:v]
param='key-1:val-1,key-2:val2,key-3:va-3'

List of Dictionaries [k:v,k:v,k:v,k:v]
param='key-1:val-1,key-2:val2|key-1:val-1,
key-2:val-2|key-1:val-1,key-2:val-2'

JSON: 'j{ ... }j'
cert-key-chain='j{ "default": { "cert": "default.crt", "chain": "default.crt", "key": "default.key" } }j'

Escaping Delimiters:
Use `,` or `:` or `|` to escape characters which shouldn't be treated as delimiters i.e. ciphers='DEFAULT::SSLv3'

CLI Example:

```bash
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom='/Common/http'
```

```bash
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom='/Common/http'
  enforcement=maxHeaderCount:3200,maxRequests:10
```

```bash
salt '*' bigip.modify_profile bigip admin client-ssl my-client-ssl-1 retainCertificate=false 
```

(continues on next page)
ciphers='DEFAULT:!SSLv3'
cert_key_chain='j{ "default": { "cert": "default.crt", "chain":
"default.crt", "key": "default.key" } }j'

salt.modules.bigip.modify_virtual(hostname, username, password, name, destination=None,
pool=None, address_status=None, auto_lasthop=None,
bwc_policy=None, cmp_enabled=None, connection_limit=None,
dhcp_relay=None, description=None, fallback_persistence=None,

   [none | default | class_one,class_two ...]

translate_address
   [enabled | disabled]

translate_port
   [enabled | disabled]

vlans
   [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ...]

CLI Example:

```
salt 'bigip' bigip.modify_virtual bigip admin admin my-virtual source_address_translation=none
salt 'bigip' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule,my-other-rule
```

salt.modules.bigip.replace_pool_members

A function to connect to a bigip device and replace members of an existing pool with new members.

hostname
   The host/address of the bigip device

username
   The iControl REST username

password
   The iControl REST password

name
   The name of the pool to modify

members
   List of comma delimited pool members to replace existing members with. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

CLI Example:

```
salt 'bigip' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,10.2.2.2:80,10.2.2.3:80
```
salt.modules.bigip.start_transaction(hostname, username, password, label)

A function to connect to a bigip device and start a new transaction.

hostname
The host/address of the bigip device

username
The iControl REST username

password
The iControl REST password

label
The name / alias for this transaction. The actual transaction id will be stored within a grain called bigip_f5_trans:<label>

CLI Example:

```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```

26.6.33 salt.modules.bluez_bluetooth

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

```
bluez >= 5.7 bluez-libs >= 5.7 bluez-utils >= 5.7 pybluez >= 0.18
```

salt.modules.bluez_bluetooth.address()

Get the many addresses of the Bluetooth adapter

CLI Example:

```
salt '*' bluetooth.address
```

salt.modules.bluez_bluetooth.block(bdaddr)

Block a specific bluetooth device by BD Address

CLI Example:

```
```

salt.modules.bluez_bluetooth.discoverable(dev)

Enable this bluetooth device to be discoverable.

CLI Example:

```
salt '*' bluetooth.discoverable hci0
```

salt.modules.bluez_bluetooth.noscan(dev)

Turn off scanning modes on this device.

CLI Example:

```
salt '*' bluetooth.noscan hci0
```
salt.modules.bluez_bluetooth.pair(address, key)

Pair the bluetooth adapter with a device

CLI Example:

```bash
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234
```

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt.modules.bluez_bluetooth.power(dev, mode)

Power a bluetooth device on or off

CLI Examples:

```bash
salt '*' bluetooth.power hci0 on
salt '*' bluetooth.power hci0 off
```

salt.modules.bluez_bluetooth.scan()

Scan for bluetooth devices in the area

CLI Example:

```bash
salt '*' bluetooth.scan
```

salt.modules.bluez_bluetooth.start()

Start the bluetooth service.

CLI Example:

```bash
salt '*' bluetooth.start
```

salt.modules.bluez_bluetooth.stop()

Stop the bluetooth service.

CLI Example:

```bash
salt '*' bluetooth.stop
```

salt.modules.bluez_bluetooth.unblock(bdaddr)

Unblock a specific bluetooth device by BD Address

CLI Example:

```bash
```

salt.modules.bluez_bluetooth.unpair(address)

Unpair the bluetooth adapter from a device

CLI Example:

```bash
```

Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.
salt.modules.bluez_bluetooth.version()

Return Bluez version from bluetoothd -v

CLI Example:
salt '*' bluetoothd.version

26.6.34 salt.modules.boto3_elasticache

Execution module for Amazon Elasticache using boto3

New in version 2017.7.0.

configuration
This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

elasticsearch.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticsearch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

A region may also be specified in the configuration:

elasticsearch.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1

depends
boto3

salt.modules.boto3_elasticache.add_tags_to_resource(name, region=None, key=None, keyid=None, profile=None, **args)

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:
```python
salt myminion boto3_elasticache.add_tags_to_resource
Tags=[{'Key': 'TeamOwner', 'Value': 'infrastructure'}]
```

```python
salt.modules.boto3_elasticache.authorize_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)
```

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```python
salt myminion boto3_elasticache.authorize_cache_security_group_ingress mycachesecgrp
EC2SecurityGroupName=someEC2sg
EC2SecurityGroupOwnerId=SOMEOWNERID
```

```python
salt.modules.boto3_elasticache.cache_cluster_exists(name, conn=None, region=None, key=None, keyid=None, profile=None)
```

Check to see if a cache cluster exists.

Example:

```python
salt myminion boto3_elasticache.cache_cluster_exists myelasticache
```

```python
salt.modules.boto3_elasticache.cache_security_group_exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if an ElastiCache security group exists.

Example:

```python
salt myminion boto3_elasticache.cache_security_group_exists mysecuritygroup
```

```python
salt.modules.boto3_elasticache.cache_subnet_group_exists(name, region=None, key=None, keyid=None, profile=None)
```

Check to see if an ElastiCache subnet group exists.

Example:

```python
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

```python
salt.modules.boto3_elasticache.copy_snapshot(name, region=None, key=None, keyid=None, profile=None, **args)
```

Make a copy of an existing snapshot.

Example:

```python
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot
TargetSnapshotName=copyOfMySnapshot
```
salt.modules.boto3_elasticache.create_cache_cluster(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Create a cache cluster.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster
  
  Engine=redis
  CacheNodeType=cache.t2.micro
  NumCacheNodes=1
  SecurityGroupIds=[sg-11223344]
  CacheSubnetGroupName=myCacheSubnetGroup
```

salt.modules.boto3_elasticache.create_cache_parameter_group(name, region=None, key=None, keyid=None, profile=None, **args)

Create a cache parameter group.

Example:

```
salt myminion boto3_elasticache.create_cache_parameter_group name=myParamGroup
  
  CacheParameterGroupFamily=redis2.8
  Description="My Parameter Group"
```

salt.modules.boto3_elasticache.create_cache_security_group(name, region=None, key=None, keyid=None, profile=None, **args)

Create a cache security group.

Example:

```
salt myminion boto3_elasticache.create_cache_security_group mycachesecgrp
  
  Description='My Cache Security Group'
```

salt.modules.boto3_elasticache.create_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)

Create an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.create_cache_subnet_group name=my-subnet-group
  
  CacheSubnetGroupDescription="description"
  subnets=[myVPCSubnet1,myVPCSubnet2]
```

salt.modules.boto3_elasticache.create_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Create a replication group.

Example:

```python
salt myminion boto3_elasticache.create_replication_group
    name=myelasticache
    ReplicationGroupDescription=description
```

salt.modules.boto3_elasticache.delete_cache_cluster(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache cluster.

Example:

```python
salt myminion boto3_elasticache.delete myelasticache
```

salt.modules.boto3_elasticache.delete_cache_parameter_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache parameter group.

Example:

```python
salt myminion boto3_elasticache.delete_cache_parameter_group myParamGroup
```

salt.modules.boto3_elasticache.delete_cache_security_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete a cache security group.

Example:

```python
salt myminion boto3_elasticache.delete_cache_security_group myelasticachesg
```

salt.modules.boto3_elasticache.delete_cache_subnet_group(name, region=None, key=None, keyid=None, profile=None, **args)

Delete an ElastiCache subnet group.

Example:

```python
salt myminion boto3_elasticache.delete_subnet_group my-subnet-group
    region=us-east-1
```

salt.modules.boto3_elasticache.delete_replication_group(name, wait=600, region=None, key=None, keyid=None, profile=None, **args)

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:
salt.myminion boto3_elasticache.delete_replication_group my-replication-group

salt.modules.boto3_elasticache.describe_cache_clusters(name=None, conn=None, region=None, key=None, keyid=None, profile=None, **args)

Return details about all (or just one) Elasticache cache clusters.

Example:

salt.myminion boto3_elasticache.describe_cache_clusters
salt.myminion boto3_elasticache.describe_cache_clusters myelasticache

salt.modules.boto3_elasticache.describe_cache_parameter_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache cache clusters.

Example:

salt.myminion boto3_elasticache.describe_cache_parameter_groups
salt.myminion boto3_elasticache.describe_cache_parameter_groups myParameterGroup

salt.modules.boto3_elasticache.describe_cache_security_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache cache clusters.

Example:

salt.myminion boto3_elasticache.describe_cache_security_groups
salt.myminion boto3_elasticache.describe_cache_security_groups mycachesecgrp

salt.modules.boto3_elasticache.describe_cache_subnet_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.

Example:

salt.myminion boto3_elasticache.describe_cache_subnet_groups region=us-east-1

salt.modules.boto3_elasticache.describe_replication_groups(name=None, conn=None, region=None, key=None, keyid=None, profile=None)

Return details about all (or just one) Elasticache replication groups.
Example:

```bash
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache
```

Given:

```
salt.modules.boto3_elasticache.list_cache_subnet_groups(region=None, key=None, keyid=None, profile=None)
```

Return a list of all cache subnet group names.

Example:

```bash
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1
```

Given:

```
salt.modules.boto3_elasticache.list_tags_for_resource(name, region=None, key=None, keyid=None, profile=None, **args)
```

List tags on an ElastiCache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...

Example:

```bash
salt myminion boto3_elasticache.list_tags_for_resource name=cache_cluster ...
```

Given:

```
salt.modules.boto3_elasticache.modify_cache_cluster(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)
```

Update a cache cluster in place.

**Notes:** `{ApplyImmediately: False}` is pretty danged silly in the context of salt. You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT `CacheNodesToRemove` be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established, MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```bash
salt myminion boto3_elasticache.modify_cache_cluster name=myCacheCluster ...
```

Given:

```
salt.modules.boto3_elasticache.modify_cache_subnet_group(name, subnets=None, region=None, key=None, keyid=None, profile=None, **args)
```

Modify an ElastiCache subnet group.

Example:
salt.myminion boto3_elasticache.modify_cache_subnet_group

```
name=my-subnet-group
subnets='[myVPCSubnet3]'
```

salt.modules.boto3_elasticache.modify_replication_group(name, wait=600, security_groups=None, region=None, key=None, keyid=None, profile=None, **args)

Modify a replication group.

Example:

```
salt myminion boto3_elasticache.modify_replication_group
name=myelasticache
ReplicationGroupDescription=newDescription
```

salt.modules.boto3_elasticache.remove_tags_from_resource(name, region=None, key=None, keyid=None, profile=None, **args)

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
salt myminion boto3_elasticache.remove_tags_from_resource
TagKeys="[TeamOwner]"
```

salt.modules.boto3_elasticache.replication_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a replication group exists.

Example:

```
salt myminion boto3_elasticache.replication_group_exists myelasticache
```

salt.modules.boto3_elasticache.revoke_cache_security_group_ingress(name, region=None, key=None, keyid=None, profile=None, **args)

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.revoke_cache_security_group_ingress
cachesecgrp
```

(continues on next page)
26.6.35 salt.modules.boto3_elasticsearch

Connection module for Amazon Elasticsearch Service

New in version 3001.

configuration

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
es.keyid: GKTADJGHEIQSXMKKRBJ08H
es.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
es.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

All methods return a dict with:
- 'result' key containing a boolean indicating success or failure, 'error' key containing the error message returned by boto on error, 'response' key containing the data of the response returned by boto on success.

codeauthor
Herbert Buurman <herbert.buurman@ogd.nl>

depends
boto3

salt.modules.boto3_elasticsearch.add_tags(domain_name=None, arn=None, tags=None, region=None, key=None, keyid=None, profile=None)

Attaches tags to an existing Elasticsearch domain. Tags are a set of case-sensitive key value pairs. An Elasticsearch domain may have up to 10 tags.

Parameters

- **domain_name** *(str)* -- The name of the Elasticsearch domain you want to add tags to.
• **arn (str)** -- The ARN of the Elasticsearch domain you want to add tags to. Specifying this overrides **domain_name**.

• **tags (dict)** -- The dict of tags to add to the Elasticsearch domain.

**Return type**
dict

**Returns**
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```bash
salt myminion boto3_elasticsearch.add_tags domain_name=mydomain tags='{
  "foo": "bar", "baz": "qux"}"
```

salt.modules.boto3_elasticsearch.cancel_elasticsearch_service_software_update(domain_name, region=None, keyid=None, key=None, profile=None)

Cancels a scheduled service software update for an Amazon ES domain. You can only perform this operation before the AutomatedUpdateDate and when the UpdateStatus is in the PENDING_UPDATE state.

**Parameters**

- **domain_name (str)** -- The name of the domain that you want to stop the latest service software update on.

**Return type**
dict

**Returns**
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the current service software options. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.check_upgrade_eligibility(domain_name, elasticsearch_version, region=None, keyid=None, key=None, profile=None)

Helper function to determine in one call if an Elasticsearch domain can be upgraded to the specified Elasticsearch version.

This assumes that the Elasticsearch domain is at rest at the moment this function is called. I.e. The domain is not in the process of:

- being created.
- being updated.
- another upgrade running, or a check thereof.
- being deleted.

Behind the scenes, this does 3 things:
• Check if `elasticsearch_version` is among the compatible `elasticsearch` versions.
• Perform a check if the Elasticsearch domain is eligible for the upgrade.
• Check the result of the check and return the result as a boolean.

Parameters

- `name (str)` -- The Elasticsearch domain name to check.
- `elasticsearch_version (str)` -- The Elasticsearch version to upgrade to.

Return type
dict

Returns

Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success, also contains a key ‘response’ with boolean result of the check. Upon failure, also contains a key ‘error’ with the error message as value.

New in version 3001.

CLI Example:
```
salt myminion boto3_elasticsearch.check_upgrade_eligibility mydomain '6.7'
```

salt.modules.boto3_elasticsearch.create_elasticsearch_domain

Given a valid config, create a domain.

Parameters

- `domain_name (str)` -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).
- `elasticsearch_version (str)` -- String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".
- `elasticsearch_cluster_config (dict)` -- Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (str): The instance type for an Elasticsearch cluster.
- InstanceCount (int): The instance type for an Elasticsearch cluster.
- DedicatedMasterEnabled (bool): Indicate whether a dedicated master node is enabled.
- ZoneAwarenessEnabled (bool): Indicate whether zone awareness is enabled. If this is not enabled, the Elasticsearch domain will only be in one availability zone.
- ZoneAwarenessConfig (dict): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
  - AvailabilityZoneCount (int): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled. Allowed values: 2, 3
- DedicatedMasterType (str): The instance type for a dedicated master node.
- DedicatedMasterCount (int): Total number of dedicated master nodes, active and on standby, for the cluster.
- ebs_options (dict) -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (bool): Specifies whether EBS-based storage is enabled.
  - VolumeType (str): Specifies the volume type for EBS-based storage.
  - VolumeSize (int): Integer to specify the size of an EBS volume.
  - Iops (int): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).
- access_policies (str or dict) -- Dict or JSON string with the IAM access policy.
- snapshot_options (dict) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (int): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.
- vpc_options (dict) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (list): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (list): The list of security groups for the VPC endpoint.
- cognito_options (dict) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (str): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (str): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (str): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
- encryption_at_rest_options (dict) -- Dict specifying the encryption at rest options. Keys (case sensitive) in here are:
  - Enabled (bool): Specifies the option to enable Encryption At Rest.
  - KmsKeyId (str): Specifies the KMS Key ID for Encryption At Rest options.
- node_to_node_encryption_options (dict) -- Dict specifying the node to node encryption options. Keys (case sensitive) in here are:
- Enabled (bool): Specify True to enable node-to-node encryption.

- **advanced_options** *(dict)* -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options for more information.

- **log_publishing_options** *(dict)* -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:
  - INDEX_SLOW_LOGS
  - SEARCH_SLOW_LOGS
  - ES_APPLICATION_LOGS

  The value assigned to each key is a dict with the following case sensitive keys:
  - CloudWatchLogsLogGroupArn (str): The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled (bool): Specifies whether given log publishing option is enabled or not.

- **blocking** *(bool)* -- Whether or not to wait (block) until the Elasticsearch domain has been created.

Note: Not all instance types allow enabling encryption at rest. See https://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/aes-supported-instance-types.html

**Return type**

dict

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'reponse' with the domain status configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

**CLI Example:**

```
salt myminion boto3_elasticsearch.create_elasticsearch_domain mydomain \
  elasticsearch_cluster_config='{" \
  "InstanceType": "t2.micro.elasticsearch", \
  "InstanceCount": 1, \
  "DedicatedMasterEnabled": false, \
  "ZoneAwarenessEnabled": false} \
  ebs_options='{" \
  "EBSEnabled": true, \
  "VolumeType": "gp2", \
  "VolumeSize": 10, \
  "Iops": 0}' \
  access_policies='{" \
  "Version": "2012-10-17", \
  "Statement": [ \
  {"Effect": "Allow", \
  "Principal": {"AWS": "*"}, \
  "Action": "es:*", \
  "Resource": "arn:aws:es:us-east-1:1111111111:domain/mydomain/*", \
```

(continues on next page)
salt.modules.boto3_elasticsearch.delete_elasticsearch_domain(domain_name, blocking=False, region=None, key=None, keyid=None, profile=None)

Permanently deletes the specified Elasticsearch domain and all of its data. Once a domain is deleted, it cannot be recovered.

Parameters

- **domain_name** *(str)* -- The name of the domain to delete.
- **blocking** *(bool)* -- Whether or not to wait (block) until the Elasticsearch domain has been deleted.

Return type

*dict*

Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.delete_elasticsearch_service_role(region=None, keyid=None, key=None, profile=None)

Deletes the service-linked role that Elasticsearch Service uses to manage and maintain VPC domains. Role deletion will fail if any existing VPC domains use the role. You must delete any such Elasticsearch domains before deleting the role.

Return type

*dict*

Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.describe_elasticsearch_domain(domain_name, region=None, keyid=None, key=None, profile=None)

Given a domain name gets its status description.

Parameters

- **domain_name** *(str)* -- The name of the domain to get the status of.

Return type

*dict*
Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.describe_elasticsearch_domain_config(domain_name, region=None, keyid=None, key=None, profile=None)
```

Provides cluster configuration information about the specified Elasticsearch domain, such as the state, creation date, update version, and update date for cluster options.

**Parameters**

- **domain_name** *(str)* -- The name of the domain to describe.

**Return type**

```
dict
```

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the current configuration information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.describe_elasticsearch_domains(domain_names, region=None, keyid=None, key=None, profile=None)
```

Returns domain configuration information about the specified Elasticsearch domains, including the domain ID, domain endpoint, and domain ARN.

**Parameters**

- **domain_names** *(list)* -- List of domain names to get information for.

**Return type**

```
dict
```

**Returns**

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the list of domain status information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.describe_elasticsearch_domains ['["domain_a", "domain_b"]]
```
salt.modules.boto3_elasticsearch.describe_elasticsearch_instance_type_limits(instance_type, elasticsearch_version, domain_name=None, region=None, keyid=None, key=None, profile=None)

Describe Elasticsearch Limits for a given InstanceType and ElasticsearchVersion. When modifying existing Domain, specify the `DomainName` to know what Limits are supported for modifying.

Parameters
- **instance_type**: (str) -- The instance type for an Elasticsearch cluster for which Elasticsearch Limits are needed.
- **elasticsearch_version**: (str) -- Version of Elasticsearch for which Limits are needed.
- **domain_name**: (str) -- Represents the name of the Domain that we are trying to modify. This should be present only if we are querying for Elasticsearch Limits for existing domain.

Return type
- dict

Returns
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the limits information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:
```
salt myminion boto3_elasticsearch.describe_elasticsearch_instance_type_limits 
  instance_type=r3.8xlarge.elasticsearch 
  elasticsearch_version='6.2'
```

salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instance_offerings(reserved_elasticsearch_instance_offering_id=None, region=None, keyid=None, key=None, profile=None)

Lists available reserved Elasticsearch instance offerings.

Parameters
- **reserved_elasticsearch_instance_offering_id**: (str) -- The offering identifier filter value. Use this parameter to show only the available offering that matches the specified reservation identifier.
Return type
dict

Returns
Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success,
also contains a key ‘response’ with the list of offerings information. Upon failure, also contains
a key ‘error’ with the error message as value.

New in version 3001.
salt.modules.boto3_elasticsearch.describe_reserved_elasticsearch_instances(reserved_elasticsearch_instance_id=None,
region=None, keyid=None, key=None, profile=None)

Returns information about reserved Elasticsearch instances for this account.

Parameters
reserved_elasticsearch_instance_id (str) -- The reserved instance identifier filter value. Use this parameter to show only the reservation that matches the specified reserved Elasticsearch instance ID.

Return type
dict

Returns
Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success,
also contains a key ‘response’ with a list of information on reserved instances. Upon failure,
also contains a key ‘error’ with the error message as value.

Note
Version 1.9.174 of boto3 has a bug in that reserved_elasticsearch_instance_id is considered a
required argument, even though the documentation says otherwise.

New in version 3001.
salt.modules.boto3_elasticsearch.exists(domain_name=None, region=None, key=None, keyid=None, profile=None)

Given a domain name, check to see if the given domain exists.

Parameters
domain_name (str) -- The name of the domain to check.

Return type
dict

Returns
Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon failure,
also contains a key ‘error’ with the error message as value.

New in version 3001.
salt.modules.boto3_elasticsearch.get_compatible_elasticsearch_versions(domain_name=None,
region=None, keyid=None, key=None, profile=None)
Returns a list of upgrade compatible Elasticsearch versions. You can optionally pass a `domain_name` to get all upgrade compatible Elasticsearch versions for that specific domain.

Parameters

- `domain_name` *(str)*: The name of an Elasticsearch domain.

Return type

- `dict`

Returns

A dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of compatible versions. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.get_upgrade_history(*domain_name*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Retrieves the complete history of the last 10 upgrades that were performed on the domain.

Parameters

- `domain_name` *(str)*: The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

Return type

- `dict`

Returns

A dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a list of upgrade histories. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.get_upgrade_status(*domain_name*, *region=None*, *keyid=None*, *key=None*, *profile=None*)

Retrieves the latest status of the last upgrade or upgrade eligibility check that was performed on the domain.

Parameters

- `domain_name` *(str)*: The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

Return type

- `dict`

Returns

A dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with upgrade status information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.list_domain_names(*region=None*, *keyid=None*, *key=None*, *profile=None*)

Returns the name of all Elasticsearch domains owned by the current user's account.
Return type
dict

Returns
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success,
also contains a key 'response' with a list of domain names. Upon failure, also contains a key
'error' with the error message as value.

New in version 3001.
salt.modules.boto3_elasticsearch.list_elasticsearch_instance_types(elasticsearch_version,
domain_name=None, region=None, keyid=None, key=None, profile=None)

List all Elasticsearch instance types that are supported for given ElasticsearchVersion.

Parameters
- **elasticsearch_version** (*str*) -- Version of Elasticsearch for which list of supported
  elasticsearch instance types are needed.
- **domain_name** (*str*) -- DomainName represents the name of the Domain that we are
trying to modify. This should be present only if we are querying for list of available Elas-
ticsearch instance types when modifying existing domain.

Return type
dict

Returns
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success,
also contains a key 'response' with a list of Elasticsearch instance types. Upon failure, also
contains a key 'error' with the error message as value.

New in version 3001.
salt.modules.boto3_elasticsearch.list_elasticsearch_versions(region=None, keyid=None, key=None, profile=None)

List all supported Elasticsearch versions.

Return type
dict

Returns
Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success,
also contains a key 'response' with a list of Elasticsearch versions. Upon failure, also contains a
key 'error' with the error message as value.

New in version 3001.
salt.modules.boto3_elasticsearch.list_tags(domain_name=None, arn=None, region=None, key=None, keyid=None, profile=None)

Returns all tags for the given Elasticsearch domain.

Return type
dict
Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with a dict of tags. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.purchase_reserved_elasticsearch_instance_offering(  
    reserved_elasticsearch_instance_offering_id,  
    reservation_name,  
    instance_count=None,  
    region=None,  
    keyid=None,  
    key=None,  
    profile=None)  
```

Allows you to purchase reserved Elasticsearch instances.

Parameters

- `reserved_elasticsearch_instance_offering_id (str)` -- The ID of the reserved Elasticsearch instance offering to purchase.
- `reservation_name (str)` -- A customer-specified identifier to track this reservation.
- `instance_count (int)` -- The number of Elasticsearch instances to reserve.

Return type
dict

Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with purchase information. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

```
salt.modules.boto3_elasticsearch.remove_tags(tag_keys,  
    domain_name=None,  
    arn=None,  
    region=None,  
    key=None,  
    keyid=None,  
    profile=None)  
```

Removes the specified set of tags from the specified Elasticsearch domain.

Parameters

- `tag_keys (list)` -- List with tag keys you want to remove from the Elasticsearch domain.
- `domain_name (str)` -- The name of the Elasticsearch domain you want to remove tags from.
- `arn (str)` -- The ARN of the Elasticsearch domain you want to remove tags from. Specifying this overrides domain_name.

Return type
dict
Returns

Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon failure, also contains a key ‘error’ with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.remove_tags ['"foo", "bar"] domain_name=my_domain
```

salt.modules.boto3_elasticsearch.start_elasticsearch_service_software_update(domain_name, region=None, keyid=None, key=None, profile=None)

Schedules a service software update for an Amazon ES domain.

Parameters

- **domain_name** (str) -- The name of the domain that you want to update to the latest service software.

Return type

dict

Returns

Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success, also contains a key ‘response’ with service software information. Upon failure, also contains a key ‘error’ with the error message as value.

New in version 3001.

salt.modules.boto3_elasticsearch.update_elasticsearch_domain_config(domain_name, elastic_search_cluster_config=None, ebs_options=None, vpc_options=None, access_policies=None, snapshot_options=None, cognito_options=None, advanced_options=None, log_publishing_options=None, blocking=False, region=None, key=None, keyid=None, profile=None)

Modifies the cluster configuration of the specified Elasticsearch domain, for example setting the instance type and the number of instances.

Parameters
• **domain_name** (*str*) -- The name of the Elasticsearch domain that you are creating. Domain names are unique across the domains owned by an account within an AWS region. Domain names must start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

• **elasticsearch_cluster_config** (*dict*) -- Dictionary specifying the configuration options for an Elasticsearch domain. Keys (case sensitive) in here are:
  - InstanceType (*str*): The instance type for an Elasticsearch cluster.
  - InstanceCount (*int*): The instance type for an Elasticsearch cluster.
  - DedicatedMasterEnabled (*bool*): Indicate whether a dedicated master node is enabled.
  - ZoneAwarenessEnabled (*bool*): Indicate whether zone awareness is enabled.
  - ZoneAwarenessConfig (*dict*): Specifies the zone awareness configuration for a domain when zone awareness is enabled. Keys (case sensitive) in here are:
    - AvailabilityZoneCount (*int*): An integer value to indicate the number of availability zones for a domain when zone awareness is enabled. This should be equal to number of subnets if VPC endpoints is enabled.
  - DedicatedMasterType (*str*): The instance type for a dedicated master node.
  - DedicatedMasterCount (*int*): Total number of dedicated master nodes, active and on standby, for the cluster.

• **ebs_options** (*dict*) -- Dict specifying the options to enable or disable and specifying the type and size of EBS storage volumes. Keys (case sensitive) in here are:
  - EBSEnabled (*bool*): Specifies whether EBS-based storage is enabled.
  - VolumeType (*str*): Specifies the volume type for EBS-based storage.
  - VolumeSize (*int*): Integer to specify the size of an EBS volume.
  - Iops (*int*): Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

• **snapshot_options** (*dict*) -- Dict specifying the snapshot options. Keys (case sensitive) in here are:
  - AutomatedSnapshotStartHour (*int*): Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

• **vpc_options** (*dict*) -- Dict with the options to specify the subnets and security groups for the VPC endpoint. Keys (case sensitive) in here are:
  - SubnetIds (*list*): The list of subnets for the VPC endpoint.
  - SecurityGroupIds (*list*): The list of security groups for the VPC endpoint.

• **cognito_options** (*dict*) -- Dict with options to specify the cognito user and identity pools for Kibana authentication. Keys (case sensitive) in here are:
  - Enabled (*bool*): Specifies the option to enable Cognito for Kibana authentication.
  - UserPoolId (*str*): Specifies the Cognito user pool ID for Kibana authentication.
  - IdentityPoolId (*str*): Specifies the Cognito identity pool ID for Kibana authentication.
  - RoleArn (*str*): Specifies the role ARN that provides Elasticsearch permissions for accessing Cognito resources.
• **advanced_options** *(dict)* -- Dict with option to allow references to indices in an HTTP request body. Must be False when configuring access to individual sub-resources. By default, the value is True. See [http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options](http://docs.aws.amazon.com/elasticsearch-service/latest/developerguide/es-createupdatedomains.html#es-createdomain-configure-advanced-options) for more information.

• **access_policies** *(str/dict)* -- Dict or JSON string with the IAM access policy.

• **log_publishing_options** *(dict)* -- Dict with options for various type of logs. The keys denote the type of log file and can be one of the following:

  - **INDEX_SLOW_LOGS**, **SEARCH_SLOW_LOGS**, **ES_APPLICATION_LOGS**.

  The value assigned to each key is a dict with the following case sensitive keys:

  - CloudWatchLogsLogGroupArn *(str)*: The ARN of the Cloudwatch log group to which the log needs to be published.
  - Enabled *(bool)*: Specifies whether given log publishing option is enabled or not.

• **blocking** *(bool)* -- Whether or not to wait (block) until the Elasticsearch domain has been updated.

**Return type**

```
dict
```

**Returns**

Dictionary with key ‘result’ and as value a boolean denoting success or failure. Upon success, also contains a key ‘response’ with the domain configuration. Upon failure, also contains a key ‘error’ with the error message as value.

New in version 3001.

**CLI Example:**

```bash
salt myminion boto3_elasticsearch.update_elasticsearch_domain_config
  --mydomain
  --elasticsearch_cluster_config='{"InstanceType": "t2.micro.elasticsearch", "InstanceCount": 1, "DedicatedMasterEnabled": false, "ZoneAwarenessEnabled": false}'
  --ebs_options='{"EBSEnabled": true, "VolumeType": "gp2", "VolumeSize": 10, "Iops": 0}'}
  --snapshot_options='{"AutomatedSnapshotStartHour": 0}'}
  --advanced_options='{"rest.action.multi.allow_explicit_index": "true"}'}
```
salt.modules.boto3_elasticsearch.upgrade_elasticsearch_domain(domain_name, target_version, perform_check_only=None, blocking=False, region=None, keyid=None, key=None, profile=None)

Allows you to either upgrade your domain or perform an Upgrade eligibility check to a compatible Elasticsearch version.

Parameters

- **domain_name** *(str)* -- The name of an Elasticsearch domain. Domain names are unique across the domains owned by an account within an AWS region. Domain names start with a letter or number and can contain the following characters: a-z (lowercase), 0-9, and - (hyphen).

- **target_version** *(str)* -- The version of Elasticsearch that you intend to upgrade the domain to.

- **perform_check_only** *(bool)* -- This flag, when set to True, indicates that an Upgrade Eligibility Check needs to be performed. This will not actually perform the Upgrade.

- **blocking** *(bool)* -- Whether or not to wait (block) until the Elasticsearch domain has been upgraded.

Return type

dict

Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon success, also contains a key 'response' with the domain configuration. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.

CLI Example:

```
salt myminion boto3_elasticsearch.upgrade_elasticsearch_domain mydomain \
  target_version='6.7' \
  perform_check_only=True
```

salt.modules.boto3_elasticsearch.wait_for_upgrade(domain_name, region=None, keyid=None, key=None, profile=None)

Block until an upgrade-in-progress for domain name is finished.

Parameters

- **name** *(str)* -- The name of the domain to wait for.

Return type

dict

Returns

Dictionary with key 'result' and as value a boolean denoting success or failure. Upon failure, also contains a key 'error' with the error message as value.

New in version 3001.
26.6.36  salt.modules.boto3_route53

Execution module for Amazon Route53 written against Boto 3
New in version 2017.7.0.

configuration
This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

route53.region: us-east-1

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

Note that Route53 essentially ignores all (valid) settings for 'region', since there is only one Endpoint (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

depends
boto3

salt.modules.boto3_route53.associate_vpc_with_hosted_zone

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can't convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create_vpc_association_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate_vpc_with_hosted_zone() to create the association.

Note that if both sides happen to be within the same account, associate_vpc_with_hosted_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you're associating a VPC to a zone in a different account, as outlined above, you unfortunately
MUST use the HostedZoneId parameter exclusively.

**HostedZoneId**
The unique Zone Identifier for the Hosted Zone.

**Name**
The domain name associated with the Hosted Zone(s).

**VPCId**
When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName**
When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion**
When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

**Comment**
Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.associate_vpc_with_hosted_zone
  → Name=example.org, VPCName=myVPC
  → east-1 Comment="Whoo-hoo! I added another VPC."
```

```python
salt.modules.boto3_route53.change_resource_record_sets(HostedZoneId=None, Name=None, PrivateZone=None, ChangeBatch=None, region=None, key=None, keyid=None, profile=None)
```

See the AWS Route53 API docs as well as the Boto3 documentation for all the details...

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trival configurations.

```
{
  "Comment": "string",
  "Changes": [
    {
      "Action": "CREATE"|"DELETE"|"UPSERT",
      "ResourceRecordSet": {
        "Name": "string",
        "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR"|"SRV"|"SPF"|"AAAA",
        "SetIdentifier": "string",
        "Weight": 123,
        "Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2"|"ca-central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1"|"ap-southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-north-1"|"ap-south-1",
        "GeoLocation": {
```

(continues on next page)
"ContinentCode": "string",
"CountryCode": "string",
"SubdivisionCode": "string"
},
"Failover": "PRIMARY"|"SECONDARY",
"TTL": 123,
"ResourceRecords": [
{
"Value": "string"
},
"AliasTarget": {
"HostedZoneId": "string",
"DNSName": "string",
"EvaluateTargetHealth": True|False
},
"HealthCheckId": "string",
"TrafficPolicyInstanceId": "string"

CLI Example:

```bash
foo={
    "Name": "my-cname.example.org.",
    "TTL": 600,
    "Type": "CNAME",
    "ResourceRecords": [
    {
        "Value": "my-host.example.org"
    }]
}
```

salt.modules.boto3_route53.create_hosted_zone(Name, VPCId=None, VPCName=None, VPCRegion=None, CallerReference=None, Comment='', PrivateZone=False, DelegationSetId=None, region=None, key=None, keyid=None, profile=None)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

**Name**

The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.
VPCId
When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

VPCName
When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

VPCRegion
When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you’ll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

CallerReference
A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating new Hosted Zones. Maximum length of 128.

Comment
Any comments you want to include about the hosted zone.

PrivateZone
Boolean - Set to True if creating a private hosted zone.

DelegationSetId
If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create_delegation_set() is not yet implemented, so you’d need to manually create any delegation sets before utilizing this.

region
Region endpoint to connect to.

key
AWS key to bind with.

keyid
AWS keyid to bind with.

profile
Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
```
salt myminion boto3_route53.create_hosted_zone example.org.
```

salt.modules.boto3_route53.delete_hosted_zone( Id, region=None, key=None, keyid=None, profile=None)
Delete a Route53 hosted zone.

CLI Example:
```
salt myminion boto3_route53.delete_hosted_zone Z1234567890
```

salt.modules.boto3_route53.delete_hosted_zone_by_domain( Name, PrivateZone=None, region=None, key=None, keyid=None, profile=None)
Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

CLI Example:
Disassociates an Amazon VPC from a private hosted zone.

You can’t disassociate the last VPC from a private hosted zone. You also can't convert a private hosted zone into a public hosted zone.

Note that looking up hosted zones by name (e.g. using the Name parameter) only works XXX FACTCHECK within a single AWS account - if you’re disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME DOCU

**HostedZoneId**

The unique Zone Identifier for the Hosted Zone.

**Name**

The domain name associated with the Hosted Zone(s).

**VPCId**

When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

**VPCName**

When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

**VPCRegion**

When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

**Comment**

Any comments you want to include about the change being made.

CLI Example:

```bash
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org.
salt.modules.boto3_route53.disassociate_vpc_from_hosted_zone(HostedZoneId=None, Name=None, VPCId=None, VPCName=None, VPCRegion=None, Comment=None, region=None, key=None, keyid=None, profile=None)
```

Find a hosted zone with the given characteristics.

**Id**

The unique Zone Identifier for the Hosted Zone. Exclusive with Name.

**Name**

The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to
match more than one hosted zone (e.g. a public and a private if both exist) which will raise an error unless PrivateZone has also been passed in order split the different.

**PrivateZone**
- Boolean - Set to True if searching for a private hosted zone.

**region**
- Region to connect to.

**key**
- Secret key to be used.

**keyid**
- Access key to be used.

**profile**
- Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
```
salt myminion boto3_route53.find_hosted_zone Name=salt.org.
→ profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}"
```

**salt.modules.boto3_route53.get_hosted_zone** *(Id, region=None, key=None, keyid=None, profile=None)*

Return detailed info about the given zone.

**Id**
- The unique Zone Identifier for the Hosted Zone.

**region**
- Region to connect to.

**key**
- Secret key to be used.

**keyid**
- Access key to be used.

**profile**
- Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
```
salt myminion boto3_route53.get_hosted_zone Z1234567690
→ profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}"
```

**salt.modules.boto3_route53.get_hosted_zones_by_domain** *(Name, region=None, key=None, keyid=None, profile=None)*

Find any zones with the given domain name and return detailed info about them. Note that this can return multiple Route53 zones, since a domain name can be used in both public and private zones.

**Name**
- The domain name associated with the Hosted Zone(s).

**region**
- Region to connect to.
key
  Secret key to be used.

keyid
  Access key to be used.

profile
  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org.
  → profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'}
```

```
salt.modules.boto3_route53.get_resource_records(HostedZoneld=None, Name=None, StartRecordName=None, StartRecordType=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None)
```

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you've created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you'll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME DOCU

CLI Example:
```
salt myminion boto3_route53.get_records test.example.org example.org A
```

```
salt.modules.boto3_route53.list_hosted_zones(DelegationSetId=None, region=None, key=None, keyid=None, profile=None)
```

Return detailed info about all zones in the bound account.

DelegationSetId
  If you're using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.

region
  Region to connect to.

key
  Secret key to be used.

keyid
  Access key to be used.

profile
  Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:
salt documentation, release 3007.1

salt myminion boto3_route53.describe_hosted_zones

salt.modules.boto3_route53.update_hosted_zone_comment( Id=None, Name=None, Comment=None, PrivateZone=None, region=None, key=None, keyid=None, profile=None )

Update the comment on an existing Route 53 hosted zone.

Id
The unique Zone Identifier for the Hosted Zone.

Name
The domain name associated with the Hosted Zone(s).

Comment
Any comments you want to include about the hosted zone.

PrivateZone
Boolean - Set to True if changing a private hosted zone.

CLI Example:
salt myminion boto3_route53.update_hosted_zone_comment Name=example.org, Comment="This is an example comment for an example zone"

26.6.37 salt.modules.boto3_sns

Connection module for Amazon SNS

configuration
This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

sns.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H

(continues on next page)
depends
boto3

salt.modules.boto3_sns.create_topic(Name, region=None, key=None, keyid=None, profile=None)
Create an SNS topic.
CLI Example:

```
salt myminion boto3_sns.create_topic mytopic region=us-east-1
```

salt.modules.boto3_sns.delete_topic(TopicArn, region=None, key=None, keyid=None, profile=None)
Delete an SNS topic.
CLI Example:

```
salt myminion boto3_sns.delete_topic mytopic region=us-east-1
```

salt.modules.boto3_sns.describe_topic(name, region=None, key=None, keyid=None, profile=None)
Returns details about a specific SNS topic, specified by name or ARN.
CLI Example:

```
salt my_favorite_client boto3_sns.describe_topic a_sns_topic_of_my_choice
```

salt.modules.boto3_sns.get_subscription_attributes(SubscriptionArn, region=None, key=None, keyid=None, profile=None)
Returns all of the properties of a subscription.
CLI Example:

```
salt myminion boto3_sns.get_subscription_attributes somesubscription region=us-west-1
```

salt.modules.boto3_sns.get_topic_attributes(TopicArn, region=None, key=None, keyid=None, profile=None)
Returns all of the properties of a topic. Topic properties returned might differ based on the authorization of the user.
CLI Example:

```
salt myminion boto3_sns.get_topic_attributes someTopic region=us-west-1
```

salt.modules.boto3_sns.list_subscriptions(region=None, key=None, keyid=None, profile=None)
Returns a list of the requester's topics
CLI Example:

```
salt myminion boto3_sns.list_subscriptions region=us-east-1
```

salt.modules.boto3_sns.list_subscriptions_by_topic(TopicArn, region=None, key=None, keyid=None, profile=None)
Returns a list of the subscriptions to a specific topic
CLI Example:
```python
salt myminion boto3_sns.list_subscriptions_by_topic mytopic region=us-east-1
```

`salt.modules.boto3_sns.list_topics(region=None, key=None, keyid=None, profile=None)`

Returns a list of the requester's topics

CLI Example:

```bash
salt myminion boto3_sns.list_topics
```

`salt.modules.boto3_sns.set_subscription_attributes(SubscriptionArn, AttributeName, AttributeValue, region=None, key=None, keyid=None, profile=None)`

Set an attribute of a subscription to a new value.

CLI Example:

```bash
salt myminion boto3_sns.set_subscription_attributes someSubscription RawMessageDelivery jsonStringValue
```

`salt.modules.boto3_sns.set_topic_attributes(TopicArn, AttributeName, AttributeValue, region=None, key=None, keyid=None, profile=None)`

Set an attribute of a topic to a new value.

CLI Example:

```bash
salt myminion boto3_sns.set_topic_attributes someTopic DisplayName myDisplayNameValue
```

`salt.modules.boto3_sns.subscribe(TopicArn, Protocol, Endpoint, region=None, key=None, keyid=None, profile=None)`

Subscribe to a Topic.

CLI Example:

```bash
salt myminion boto3_sns.subscribe mytopic https https://www.example.com/sns-endpoint
```

`salt.modules.boto3_sns.topic_exists(name, region=None, key=None, keyid=None, profile=None)`

Check to see if an SNS topic exists.

CLI Example:

```bash
salt myminion boto3_sns.topic_exists mytopic region=us-east-1
```

`salt.modules.boto3_sns.unsubscribe(SubscriptionArn, region=None, key=None, keyid=None, profile=None)`

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```bash
salt myminion boto3_sns.unsubscribe my_subscription_arn region=us-east-1
```
26.6.38 salt.modules.boto_apigateway

Connection module for Amazon APIGateway

New in version 2016.11.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.1
- botocore >= 1.4.49

configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

- apigateway.keyid: GKTADJGHEIQXSXMKKRBJ08H
- apigateway.key: askdjghsdfjkgWupUjasdfklkdfklgjsdfjajkgghs

A region may also be specified in the configuration:

- apigateway.region: us-west-2

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

- myprofile:
  - keyid: GKTADJGHEIQXSXMKKRBJ08H
  - key: askdjghsdfjkgWupUjasdfklkdfklgjsdfjajkgghs
  - region: us-west-2

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

- created: true

or

- created: false
  - error:
    - message: error message

Request methods (e.g., describe_apigateway) return:

- apigateway:
  - {...}
  - {...}

or
error:
message: error message

salt.modules.boto_apigateway.activate_api_deployment(restApiId, stageName, deploymentId, region=None, key=None, keyid=None, profile=None)

Activates previously deployed deployment for a given stage

CLI Example:
```bash
salt myminion boto_apigateway.activate_api_deployment restApiId stagename deploymentId
```

salt.modules.boto_apigateway.api_exists(name, description=None, region=None, key=None, keyid=None, profile=None)

Check to see if the given Rest API Name and optionally description exists.

CLI Example:
```bash
salt myminion boto_apigateway.exists myapi_name
```

salt.modules.boto_apigateway.api_model_exists(restApiId, modelName, region=None, key=None, keyid=None, profile=None)

Check to see if the given modelName exists in the given restApiId

CLI Example:
```bash
salt myminion boto_apigateway.api_model_exists restApiId modelName
```

salt.modules.boto_apigateway.associate_api_key_stagekeys(apiKey, stagekeyslist, region=None, key=None, keyid=None, profile=None)

associate the given stagekeyslist to the given apiKey.

CLI Example:
```bash
salt myminion boto_apigateway.associate_api_key_stagekeys_api_key ["restapi id/stage name", ...]
```

salt.modules.boto_apigateway.attach_usage_plan_to_apis(plan_id, apis, region=None, key=None, keyid=None, profile=None)

Attaches given usage plan to each of the apis provided in a list of apiId and stage values

New in version 2017.7.0.

apis
- a list of dictionaries, where each dictionary contains the following:
  apId
- a string, which is the id of the created API in AWS ApiGateway
  stage
- a string, which is the stage that the created API is deployed to.

CLI Example:
salt.myminion.boto_apigateway.attach_usage_plan_to_apis(plan_id='usage\nplan id' apis='["apiId": "some id 1", "stage": "some stage 1"],')

salt.modules.boto_apigateway.create_api(name, description, cloneFrom=None, region=None, key=None, keyid=None, profile=None)

Create a new REST API Service with the given name

Returns {created: True} if the rest api was created and returns {created: False} if the rest api was not created.

CLI Example:

```
salt myminion boto_apigateway.create_api myapi_name api_description
```

salt.modules.boto_apigateway.create_api_deployment(restApiId, stageName, stageDescription='', description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API deployment.

CLI Example:

```
salt myminion boto_apigateway.create_api_deployent restApiId stagename
stageDescription=''

description=''

cacheClusterEnabled=True|False

cacheClusterSize='0.5'

variables='{{"name": "value"}}'
```

salt.modules.boto_apigateway.create_api_integration(restApiId, resourcePath, httpMethod, integrationType, integrationHttpMethod, uri, credentials, requestParameters=None, requestTemplates=None, region=None, key=None, keyid=None, profile=None)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential parameters will be ignored.

uri is in the form of (substitute APIGATEWAY_REGION and LAMBDA_FUNC_ARN) "arn:aws:apigateway:APIGATEWAY_REGION:lambda:path/2015-03-31/functions/LAMBDA_FUNC_ARN/invocations"

credentials is in the form of an iam role name or role arn.

CLI Example:

```
salt myminion boto_apigateway.create_api_integration restApiId resourcePath httpMethod

integrationType integrationHttpMethod uri

credentials ["{}" ["{}"]]
```

salt.modules.boto_apigateway.create_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, selectionPattern, responseParameters=None, responseTemplates=None, region=None, key=None, keyid=None, profile=None)

1436 Chapter 26. Salt Module Reference
Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response restApiId=\resourcePath httpMethod \statusCode selectionPattern ['{}' ['{}']] 
```

salt.modules.boto_apigateway.create_api_key(name, description, enabled=True, stageKeys=None, region=None, key=None, keyid=None, profile=None)

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with 'restApiId' and 'stageName' as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key name description
salt myminion boto_apigateway.create_api_key name description enabled=False 
salt myminion boto_apigateway.create_api_key name description \stageKeys=['{"restApiId": "id", "stageName": "stagename"}']
```

salt.modules.boto_apigateway.create_api_method(restApiId, resourcePath, httpMethod, authorizationType, apiKeyRequired=False, requestParameters=None, requestModels=None, region=None, key=None, keyid=None, profile=None)

Creates API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method restApiId resourcePath,\httpMethod, authorizationType, \apiKeyRequired=False, requestParameters='{"name", "value"}',\requestModels='{"content-type", "value"}'
```

salt.modules.boto_apigateway.create_api_method_response(restApiId, resourcePath, httpMethod, statusCode, responseParameters=None, responseModels=None, region=None, key=None, keyid=None, profile=None)

Create API method response for a method on a given resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method_response restApiId=\resourcePath httpMethod \(continues on next page)"
statusCode responseParameters='{"name": "True|False"}'
  responseModels='{"content-type": "model"}'

salt.modules.boto_apigateway.create_api_model(restApiId, modelName, modelDescription, schema, contentType='application/json', region=None, key=None, keyid=None, profile=None)

Create a new model in a given API with a given schema, currently only contentType supported is 'application/json'

CLI Example:
```
salt myminion boto_apigateway.create_api_model restApiId modelName modelDescription '<schema>'
```

salt.modules.boto_apigateway.create_api_resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given rest api id, and an absolute resource path, create all the resources and return all resources in the resourcepath, returns False on failure.

CLI Example:
```
salt myminion boto_apigateway.create_api_resources myapi_id resource_path
```

salt.modules.boto_apigateway.create_api_stage(restApiId, stageName, deploymentId, description='', cacheClusterEnabled=False, cacheClusterSize='0.5', variables=None, region=None, key=None, keyid=None, profile=None)

Creates a new API stage for a given restApild and deploymentId.

CLI Example:
```
salt myminion boto_apigateway.create_api_stage restApiId stagename deploymentId description='' cacheClusterEnabled=True|False cacheClusterSize='0.5' variables='{"name": "value"}'
```

salt.modules.boto_apigateway.create_usage_plan(name, description=None, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

name
Name of the usage plan

throttle
A dictionary consisting of the following keys:

rateLimit
requests per second at steady rate, float

burstLimit
maximum number of requests per second, integer
quota
A dictionary consisting of the following keys:

- **limit**: number of allowed requests per specified quota period [required if quota parameter is present]
- **offset**: number of requests to be subtracted from limit at the beginning of the period [optional]
- **period**: quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:
```
salt myminion boto_apigateway.create_usage_plan
  name='usage plan name'
  throttle='{"rateLimit": 10.0, "burstLimit": 10}]
```

```
salt.modules.boto_apigateway.delete_api
(name=\'usage plan name\'
, description=None, region=None, key=None, keyid=None, profile=None)
```

Delete all REST API Service with the given name and an optional API description

Returns {deleted: True, count: deleted_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:
```
salt myminion boto_apigateway.delete_api myapi_name
salt myminion boto_apigateway.delete_api myapi_name
  description=\'api\'
```

```
salt.modules.boto_apigateway.delete_api_deployment
(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)
```

Deletes API deployment for a given restApiId and deploymentID

CLI Example:
```
salt myminion boto_apigateway.delete_api_deployent restApiIdId deploymentIdId
```

```
salt.modules.boto_apigateway.delete_api_integration
(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)
```

Deletes an integration for a given method in a given API

CLI Example:
```
salt myminion boto_apigateway.delete_api_integration restApiId
  resourcePath httpMethod
```

```
salt.modules.boto_apigateway.delete_api_integration_response
(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)
```

Deletes an integration response for a given method in a given API

CLI Example:
salt.modules.boto_apigateway.delete_api_integration_response(restApiId, resourcePath, httpMethod, statusCode)

Deletes API integration response for a resource in the given API

CLI Example:
salt myminion boto_apigateway.delete_api_integration_response restApiId resourcePath httpMethod statusCode

salt.modules.boto_apigateway.delete_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

Deletes a given apiKey

CLI Example:
salt myminion boto_apigateway.delete_api_key apiKey apikeystring

salt.modules.boto_apigateway.delete_api_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Delete API method for a resource in the given API

CLI Example:
salt myminion boto_apigateway.delete_api_method restApiId resourcePath httpMethod

salt.modules.boto_apigateway.delete_api_method_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Delete API method response for a resource in the given API

CLI Example:
salt myminion boto_apigateway.delete_api_method_response restApiId resourcePath httpMethod statusCode

salt.modules.boto_apigateway.delete_api_model(restApiId, modelName, region=None, key=None, keyid=None, profile=None)

Delete a model identified by name in a given API

CLI Example:
salt myminion boto_apigateway.delete_api_model restApiId modelName

salt.modules.boto_apigateway.delete_api_resources(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given restApiId and an absolute resource path, delete the resources starting from the absolute resource path. If resourcepath is the root resource "/", the function will return False. Returns False on failure.

CLI Example:
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path

salt.modules.boto_apigateway.delete_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Deletes stage identified by stageName from API identified by restApild

CLI Example:
salt modules.boto_apigateway.delete_api_stage restApiId stageName

salt.modules.boto_apigateway.delete_usage_plan(plan_id, region=None, key=None, keyid=None, profile=None)

Deletes usage plan identified by plan_id
New in version 2017.7.0.

CLI Example:
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'

salt.modules.boto_apigateway.describe_api_deployment(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)

Get API deployment for a given restApiId and deploymentId.

CLI Example:
salt myminion boto_apigateway.describe_api_deployment restApiId=deploymentId

salt.modules.boto_apigateway.describe_api_deployments(restApiId, region=None, key=None, keyid=None, profile=None)

Gets information about the defined API Deployments. Return list of api deployments.

CLI Example:
salt myminion boto_apigateway.describe_api_deployments restApiId

salt.modules.boto_apigateway.describe_api_integration(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Get an integration for a given method in a given API

CLI Example:
salt myminion boto_apigateway.describe_api_integration restApiId=resourcePath httpMethod

salt.modules.boto_apigateway.describe_api_integration_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Get an integration response for a given method in a given API

CLI Example:
salt myminion boto_apigateway.describe_api_integration_response restApiId=resourcePath httpMethod statusCode
salt.modules.boto_apigateway.describe_api_key(apiKey, region=None, key=None, keyid=None, profile=None)

Gets info about the given api key

CLI Example:
```
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

salt.modules.boto_apigateway.describe_api_keys(region=None, key=None, keyid=None, profile=None)

Gets information about the defined API Keys. Return list of apiKeys.

CLI Example:
```
salt myminion boto_apigateway.describe_api_keys
```

salt.modules.boto_apigateway.describe_api_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Get API method for a resource in the given API

CLI Example:
```
salt myminion boto_apigateway.describe_api_method restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.describe_api_method_response(restApiId, resourcePath, httpMethod, statusCode, region=None, key=None, keyid=None, profile=None)

Get API method response for a resource in the given API

CLI Example:
```
salt myminion boto_apigateway.describe_api_method_response restApiId resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.describe_api_model(restApiId, modelName, flatten=True, region=None, key=None, keyid=None, profile=None)

Get a model by name for a given API

CLI Example:
```
salt myminion boto_apigateway.describe_api_model restApiId modelName [True]
```

salt.modules.boto_apigateway.describe_api_models(restApiId, region=None, key=None, keyid=None, profile=None)

Get all models for a given API

CLI Example:
```
salt myminion boto_apigateway.describe_api_models restApiId
```
salt.modules.boto_apigateway.describe_api_resource(restApiId, path, region=None, key=None, keyid=None, profile=None)

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path

salt.modules.boto_apigateway.describe_api_resource_method(restApiId, resourcePath, httpMethod, region=None, key=None, keyid=None, profile=None)

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.

CLI Example:
salt myminion boto_apigateway.describe_api_resource_method myapi_id resource_path httpmethod

salt.modules.boto_apigateway.describe_api_resources(restApiId, region=None, key=None, keyid=None, profile=None)

Given rest api id, return all resources for this api.

CLI Example:
salt myminion boto_apigateway.describe_api_resources myapi_id

salt.modules.boto_apigateway.describe_api_stage(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Get API stage for a given apiID and stage name

CLI Example:
salt myminion boto_apigateway.describe_api_stage restApiId stageName

salt.modules.boto_apigateway.describe_api_stages(restApiId, deploymentId, region=None, key=None, keyid=None, profile=None)

Get all API stages for a given apiID and deploymentID

CLI Example:
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId

salt.modules.boto_apigateway.describe_apis(name=None, description=None, region=None, key=None, keyid=None, profile=None)

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:
salt myminion boto_apigateway.describe_apis
salt myminion boto_apigateway.describe_apis name='api name'

(continues on next page)
salt.modules.boto_apigateway.describe_apis

name='api name'
description='desc str'

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:

salt myminion boto_apigateway.describe_usage_plans

salt.myminion boto_apigateway.describe_usage_plans(name='usage plan name'
plan_id='usage plan id')

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

salt.modules.boto_apigateway.detach_usage_plan_from_apis

plan_id=plan id'
as list of apiId and stage value

New in version 2017.7.0.

apis

a list of dictionaries, where each dictionary contains the following:

apiId

a string, which is the id of the created API in AWS ApiGateway

stage

a string, which is the stage that the created API is deployed to.

CLI Example:

salt myminion boto_apigateway.detach_usage_plan_to_apis
plan_id='usage plan id'
as='[{"apiId": "some id 1", "stage": "some stage 1"}]'

salt.modules.boto_apigateway.disable_api_key

api_key

disable the given apiKey.

CLI Example:

salt myminion boto_apigateway.enable_api_key api_key

salt.modules.boto_apigateway.disassociate_api_key_stagekeys

apiKey=apiKey

stagekeyslist=stagekeyslist

disassociate the given stagekeyslist to the given apiKey.

CLI Example:

salt myminion boto_apigateway.disassociate_stagekeys_api_key

api_key='["restapi id/stage name", ...]'
enable the given apiKey.

CLI Example:

```bash
salt myminion boto_apigateway.enable_api_key api_key
```

salt.modules.boto_apigateway.flush_api_stage_cache(restApiId, stageName, region=None, key=None, keyid=None, profile=None)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:

```bash
salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName
```

salt.modules.boto_apigateway.overwrite_api_stage_variables(restApiId, stageName, variables, region=None, key=None, keyid=None, profile=None)

Overwrite the stage variables for the given restApiId and stage name with the given variables, variables must be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:

```bash
salt myminion boto_apigateway.overwrite_api_stage_variables restApiId stageName variables='{"name": "value"}"
```

salt.modules.boto_apigateway.update_api_model_schema(restApiId, modelName, schema, region=None, key=None, keyid=None, profile=None)

update the schema (in python dictionary format) for the given model in the given restApiId

CLI Example:

```bash
salt myminion boto_apigateway.update_api_model_schema restApiId modelName schema
```

salt.modules.boto_apigateway.update_usage_plan(plan_id, throttle=None, quota=None, region=None, key=None, keyid=None, profile=None)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

```bash
plan_id
Id of the created usage plan
```
throttle
A dictionary consisting of the following keys:

rateLimit
requests per second at steady rate, float

burstLimit
maximum number of requests per second, integer

quota
A dictionary consisting of the following keys:

limit
number of allowed requests per specified quota period [required if quota parameter is present]

offset
number of requests to be subtracted from limit at the beginning of the period [optional]

period
quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present]

CLI Example:

```
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id' 
  throttle='{"rateLimit": 10.0, "burstLimit": 10}"
```

## 26.6.39 salt.modules.boto_asg

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

**configuration**

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
  amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
**asg.keyid**: GKTADJGHEIQSXMKKRBJ08H
**asg.key**: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
**asg.region**: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
**myprofile**:
  **keyid**: GKTADJGHEIQSXMKKRBJ08H
  **key**: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  **region**: us-east-1
```
depends
boto

depends
boto3

```
salt.modules.boto_asg.create(name, launch_config_name, availability_zones, min_size, max_size,
desired_capacity=None, load_balancers=None, default_cooldown=None,
health_check_type=None, health_check_period=None,
placement_group=None, vpc_zone_identifier=None, tags=None,
termination_policies=None, suspended_processes=None,
scaling_policies=None, scheduled_actions=None,
region=None, notification_arn=None, notification_types=None,
key=None, keyid=None, profile=None)
```

Create an autoscale group.

CLI Example:
```
salt myminion boto_asg.create myasg mylc 
    "["us-east-1a", "us-east-1e"]" 10
    load_balancers='["myelb", "myelb2"]'
    tags='[{"key": "Name", value="myasg", "propagate_at_launch": True}]'
```

```
salt.modules.boto_asg.create_launch_configuration(name, image_id, key_name=None,
vpc_id=None, vpc_name=None, security_groups=None, user_data=None,
instance_type='m1.small', kernel_id=None, ramdisk_id=None,
block_device_mappings=None, instance_monitoring=False,
spot_price=None, instance_profile_name=None,
ebs_optimized=False, associate_public_ip_address=None,
volume_type=None, delete_on_termination=True, iops=None,
use_block_device_types=False, region=None, key=None, keyid=None,
profile=None)
```

Create a launch configuration.

CLI Example:
```
salt myminion boto_asg.create_launch_configuration mylc image_id=ami-
0b9c9f62 key_name='mykey' security_groups='["mygroup"]'
instance_type='c3.2xlarge'
```

```
salt.modules.boto_asg.delete(name, force=False, region=None, key=None, keyid=None, profile=None)
```

Delete an autoscale group.

CLI Example:
```
salt myminion boto_asg.delete myasg region=us-east-1
```

```
salt.modules.boto_asg.delete_launch_configuration(name, region=None, key=None,
keyid=None, profile=None)
```

Delete a launch configuration.
CLI Example:

```
salt myminion boto_asg.delete_launch_configuration mylc
```

**salt.modules.boto_asg.describe_launch_configuration** (*name, region=None, key=None, keyid=None, profile=None*)

Dump details of a given launch configuration.

CLI Example:

```
salt myminion boto_asg.describe_launch_configuration mylc
```

**salt.modules.boto_asg.enter_standby** (*name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None*)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.enter_standby my_autoscale_group_name '["i-xxxxxx"]'
```

**salt.modules.boto_asg.exists** (*name, region=None, key=None, keyid=None, profile=None*)

Check to see if an autoscale group exists.

CLI Example:

```
salt myminion boto_asg.exists myasg region=us-east-1
```

**salt.modules.boto_asg.exit_standby** (*name, instance_ids, should_decrement_desired_capacity=False, region=None, key=None, keyid=None, profile=None*)

Exit desired instances from StandBy mode

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.exit_standby my_autoscale_group_name '["i-xxxxxx"]'
```

**salt.modules.boto_asg.get_all_groups** (*region=None, key=None, keyid=None, profile=None*)

Return all AutoScale Groups visible in the account (as a list of boto.ec2.autoscale.group.AutoScalingGroup).

New in version 2016.11.0.

CLI Example:

```
salt-call boto_asg.get_all_groups region=us-east-1 --output yaml
```

**salt.modules.boto_asg.get_all_launch_configurations** (*region=None, key=None, keyid=None, profile=None*)

Fetch and return all Launch Configuration with details.

CLI Example:

```
salt myminion boto_asg.get_all_launch_configurations
```
salt.modules.boto_asg.get_cloud_init_mime(cloud_init)
Get a mime multipart encoded string from a cloud-init dict. Currently supports boothooks, scripts and cloud-config.

CLI Example:
```
salt myminion boto.get_cloud_init_mime <cloud init>
```

salt.modules.boto_asg.get_config(name, region=None, key=None, keyid=None, profile=None)
Get the configuration for an autoscale group.

CLI Example:
```
salt myminion boto_asg.get_config myasg region=us-east-1
```

salt.modules.boto_asg.get_instances(name, lifecycle_state='InService', health_status='Healthy',
attribute='private_ip_address', attributes=None, region=None, key=None, keyid=None, profile=None)
return attribute of all instances in the named autoscale group.

CLI Example:
```
salt-call boto_asg.get_instances my_autoscale_group_name
```

salt.modules.boto_asg.get_scaling_policy_arn(as_group, scaling_policy_name, region=None, key=None, keyid=None, profile=None)
Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper method for boto_cloudwatch_alarm, for linking alarms to scaling policies.

CLI Example:
```
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

salt.modules.boto_asg.launch_configuration_exists(name, region=None, key=None, keyid=None, profile=None)
Check for a launch configuration's existence.

CLI Example:
```
salt myminion boto_asg.launch_configuration_exists mylc
```

salt.modules.boto_asg.list_groups(region=None, key=None, keyid=None, profile=None)
Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI Example:
```
salt-call boto_asg.list_groups region=us-east-1
```

salt.modules.boto_asg.list_launch_configurations(region=None, key=None, keyid=None, profile=None)
List all Launch Configurations.

CLI Example:
Update an autoscale group.

CLI Example:

```
salt myminion boto_asg.update myasg mylc 
"["us-east-1a", "us-east-1e"]" 10
load_balancers='["myelb", "myelb2"]'
tag='["key": "Name", value=
"myasg", "propagate_at_launch": True]'
```

### 26.6.40 salt.modules.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.

**configuration**

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H

cfn.key: askdjghsdfjkghWuwupujasdkflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cfn.region: us-east-1
```

**depends**

boto

salt.modules.boto_cfn.create

Create a CFN stack.

CLI Example:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.
com/bucket/template.cft' region=us-east-1
```

---

The provided text is a detailed explanation of how to use the `salt.modules.boto_asg.update` function and the `salt.modules.boto_cfn.create` function within the Salt Stack framework. The text includes examples of usage, configuration details, and dependencies required for these functions. The context of the usage is within an autoscale group and Cloud Formation stacks, respectively. The documentation is comprehensive, covering installation, configuration, and usage with CLI examples for both functions.
salt.modules.boto_cfn.delete(name, region=None, key=None, keyid=None, profile=None)
Delete a CFN stack.

CLI Example:
```
salt myminion boto_cfn.delete mystack region=us-east-1
```

salt.modules.boto_cfn.describe(name, region=None, key=None, keyid=None, profile=None)
Describe a stack.
New in version 2015.8.0.

CLI Example:
```
salt myminion boto_cfn.describe mystack region=us-east-1
```

salt.modules.boto_cfn.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if a stack exists.

CLI Example:
```
salt myminion boto_cfn.exists mystack region=us-east-1
```

salt.modules.boto_cfn.get_template(name, region=None, key=None, keyid=None, profile=None)
Check to see if attributes are set on a CFN stack.

CLI Example:
```
salt myminion boto_cfn.get_template mystack
```

salt.modules.boto_cfn.update_stack(name, template_body=None, template_url=None, parameters=None, notification_arns=None, disable_rollback=False, timeout_in_minutes=None, capabilities=None, tags=None, use_previous_template=None, stack_policy_during_update_body=None, stack_policy_during_update_url=None, stack_policy_body=None, stack_policy_url=None, region=None, key=None, keyid=None, profile=None)
Update a CFN stack.
New in version 2015.8.0.

CLI Example:
```
salt myminion boto_cfn.update_stack mystack template_url='https://s3.amazonaws.com/bucket/template.cft' region=us-east-1
```

salt.modules.boto_cfn.validate_template(template_body=None, template_url=None, region=None, key=None, keyid=None, profile=None)
Validate cloudformation template
New in version 2015.8.0.

CLI Example:
```
salt myminion boto_cfn.validate_template mystack-template
```
salt.modules.boto_cloudfront

Connection module for Amazon CloudFront

New in version 2018.3.0.

depends
  boto3

configuration
  This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary.
  More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

  cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
  cloudfront.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

  cloudfront.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

  myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1

salt.modules.boto_cloudfront.create_distribution(name, config, tags=None, region=None, key=None, keyid=None, profile=None)

Create a CloudFront distribution with the given name, config, and (optionally) tags.

  name
    Name for the CloudFront distribution

  config
    Configuration for the distribution

  tags
    Tags to associate with the distribution

  region
    Region to connect to

  key
    Secret key to use
Salt Documentation, Release 3007.1

keyid
Access key to use
profile
A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
CLI Example:
salt myminion boto_cloudfront.create_distribution name=mydistribution
,→profile=awsprofile
config='{"Comment":"partial configuration
,→","Enabled":true}'
salt.modules.boto_cloudfront.export_distributions(region=None, key=None, keyid=None,
profile=None)
Get details of all CloudFront distributions. Produces results that can be used to create an SLS file.
CLI Example:
salt-call boto_cloudfront.export_distributions --out=txt |
,→"s/local: //" > cloudfront_distributions.sls

sed

salt.modules.boto_cloudfront.get_distribution(name, region=None, key=None, keyid=None,
profile=None)
Get information about a CloudFront distribution (configuration, tags) with a given name.
name
Name of the CloudFront distribution
region
Region to connect to
key
Secret key to use
keyid
Access key to use
profile
A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.
CLI Example:
salt myminion boto_cloudfront.get_distribution name=mydistribution
,→profile=awsprofile
salt.modules.boto_cloudfront.update_distribution(name, config, tags=None, region=None,
key=None, keyid=None, profile=None)
Update the config (and optionally tags) for the CloudFront distribution with the given name.
name
Name of the CloudFront distribution
config
Configuration for the distribution
tags
Tags to associate with the distribution
region
Region to connect to
26.6. execution modules

1453


key
   Secret key to use

keyid
   Access key to use

profile
   A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

CLI Example:

```
salt myminion boto_cloudfront.update_distribution name=mydistribution
   profile=awsprofile
   config='{"Comment":"partial configuration
   "","Enabled":true}'
```

26.6.42 salt.modules.boto_cloudtrail

Connection module for Amazon CloudTrail

New in version 2016.3.0.

depends
   • boto
   • boto3

The dependencies listed above can be installed via package or pip.

configuration
   This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

   [http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
   amazon-ec2.html](http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html)

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfdkjgWupUjasdfsflkdlkjsdfsfgjksgh
```

A region may also be specified in the configuration:

```
cloudtrail.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
   keyid: GKTADJGHEIQSXMKKRBJ08H
   key: askdjghsdfdkjgWupUjasdfsflkdlkjsdfsfgjksgh
   region: us-east-1
```
salt.modules.boto_cloudtrail.add_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_cloudtrail.create(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.create my_trail my_bucket
```

salt.modules.boto_cloudtrail.delete(Name, region=None, key=None, keyid=None, profile=None)

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```
salt myminion boto_cloudtrail.delete mytrail
```

salt.modules.boto_cloudtrail.describe(Name, region=None, key=None, keyid=None, profile=None)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

salt.modules.boto_cloudtrail.exists(Name, region=None, key=None, keyid=None, profile=None)

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:

```
salt myminion boto_cloudtrail.exists mytrail
```

salt.modules.boto_cloudtrail.list(region=None, key=None, keyid=None, profile=None)

List all trails

Returns list of trails

CLI Example:
policies:
- {...}
- {...}

salt.modules.boto_cloudtrail.list_tags(Name, region=None, key=None, keyid=None, profile=None)
List tags of a trail

Returns
• {...}
• {...}

Return type
tags

CLI Example:
salt myminion boto_cloudtrail.list_tags my_trail

salt.modules.boto_cloudtrail.remove_tags(Name, region=None, key=None, keyid=None, profile=None, **kwargs)
Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value

salt.modules.boto_cloudtrail.start_logging(Name, region=None, key=None, keyid=None, profile=None)
Start logging for a trail

Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.

CLI Example:
salt myminion boto_cloudtrail.start_logging my_trail

salt.modules.boto_cloudtrail.status(Name, region=None, key=None, keyid=None, profile=None)
Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:
salt myminion boto_cloudtrail.describe mytrail

salt.modules.boto_cloudtrail.stop_logging(Name, region=None, key=None, keyid=None, profile=None)
Stop logging for a trail

Returns {stopped: true} if the trail was stopped and returns {stopped: False} if the trail was not stopped.

CLI Example:
salt myminion boto_cloudtrail.stop_logging my_trail

salt.modules.boto_cloudtrail.update(Name, S3BucketName, S3KeyPrefix=None, SnsTopicName=None, IncludeGlobalServiceEvents=None, IsMultiRegionTrail=None, EnableLogFileValidation=None, CloudWatchLogsLogGroupArn=None, CloudWatchLogsRoleArn=None, KmsKeyId=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, update a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

salt myminion boto_cloudtrail.update my_trail my_bucket

26.6.43 salt.modules.boto_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

configuration

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

cloudwatch.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1

depends

boto

salt.modules.boto_cloudwatch.convert_to_arn(arns, region=None, key=None, keyid=None, profile=None)

Convert a list of strings into actual arns. Converts convenience names such as 'scaling_policy:...'
CLI Example:

```sh
salt '*' convert_to_arn 'scaling_policy:'
```

```py
salt.modules.boto_cloudwatch.create_or_update_alarm(connection=None, name=None, metric=None, namespace=None, statistic=None, comparison=None, threshold=None, period=None, evaluation_periods=None, unit=None, alarm_actions=None, insufficient_data_actions=None, ok_actions=None, region=None, key=None, keyid=None, profile=None)
```

Create or update a cloudwatch alarm.

**Params are the same as:**

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. alarm_actions, insufficient_data_actions, and ok_actions must be lists of string. If the passed-in value is a string, it will be split on "" to produce a list. The strings themselves for alarm_actions, insufficient_data_actions, and ok_actions must be Amazon resource names (ARN's); however, this method also supports an arn lookup notation, as follows:

```
arn:aws:.... ARN as per https://docs.aws.amazon.com/general/latest/gr/aws-arns-and-namespaces.html scaling_policy:<as_name>:<scaling_policy_name> The named autoscale group scaling policy, for the named group (e.g. scaling_policy:my-asg:ScaleDown)
```

This is convenient for setting up autoscaling as follows. First specify a boto_asg.present state for an ASG with scaling_policies, and then set up boto_cloudwatch_alarm.present states which have alarm_actions that reference the scaling_policy.

CLI Example:

```sh
salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-east-1
```

```py
salt.modules.boto_cloudwatch.delete_alarm(name, region=None, key=None, keyid=None, profile=None)
```

Delete a cloudwatch alarm

CLI example to delete a queue:

```sh
salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1
```

```py
salt.modules.boto_cloudwatch.get_alarm(name, region=None, key=None, keyid=None, profile=None)
```

Get alarm details. Also can be used to check to see if an alarm exists.

CLI Example:

```sh
salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1
```

```py
salt.modules.boto_cloudwatch.get_all_alarms(region=None, prefix=None, key=None, keyid=None, profile=None)
```

Get all alarm details. Produces results that can be used to create an sls file.
If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

1. Make a "backup" of all existing alarms
   $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > legacy_alarms.sls

2. Get all alarms with new prefixed names
   $ salt-call boto_cloudwatch.get_all_alarms "prefix="MANAGED BY SALT" " --out=txt | sed "s/local: //" > managed_alarms.sls

3. Insert the managed alarms into cloudwatch
   $ salt-call state.template managed_alarms.sls

4. Manually verify that the new alarms look right

5. Delete the original alarms
   $ sed s/present/absent/ legacy_alarms.sls > remove_legacy_alarms.sls
   $ salt-call state.template remove_legacy_alarms.sls

6. Get all alarms again, verify no changes
   $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed "s/local: //" > final_alarms.sls
   $ diff final_alarms.sls managed_alarms.sls

CLI Example:

```
salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out=txt
```

26.6.44 salt.modules.boto_cloudwatch_event

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

configuration

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQXSXMSSM6J86HM
cloudwatch_event.key: askdjghsdfjksgHwupUjasdfsdfklgsdfjdksajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMSSM6J86HM
  key: askdjghsdfjksgHwupUjasdfsdfklgsdfjdksajkghs
  region: us-east-1
```

26.6. execution modules
depends
    boto3

salt.modules.boto_cloudwatch_event.create_or_update(Name, ScheduleExpression=None,
    EventPattern=None, Description=None, RoleArn=None, State=None,
    region=None, key=None, keyid=None, profile=None)

Given a valid config, create an event rule.
Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.
CLI Example:
    salt myminion boto_cloudwatch_event.create_or_update my_rule

salt.modules.boto_cloudwatch_event.delete(Name, region=None, key=None, keyid=None,
    profile=None)

Given a rule name, delete it.
Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.
CLI Example:
    salt myminion boto_cloudwatch_event.delete myrule

salt.modules.boto_cloudwatch_event.describe(Name, region=None, key=None, keyid=None,
    profile=None)

Given a rule name describe its properties.
Returns a dictionary of interesting properties.
CLI Example:
    salt myminion boto_cloudwatch_event.describe myrule

salt.modules.boto_cloudwatch_event.exists(Name, region=None, key=None, keyid=None,
    profile=None)

Given a rule name, check to see if the given rule exists.
Returns True if the given rule exists and returns False if the given rule does not exist.
CLI Example:
    salt myminion boto_cloudwatch_event.exists myevent region=us-east-1

salt.modules.boto_cloudwatch_event.list_rules(region=None, key=None, keyid=None,
    profile=None)

List, with details, all Cloudwatch Event rules visible in the current scope.
CLI Example:
    salt myminion boto_cloudwatch_event.list_rules region=us-east-1

salt.modules.boto_cloudwatch_event.list_targets(Rule, region=None, key=None, keyid=None,
    profile=None)

Given a rule name list the targets of that rule.
Returns a dictionary of interesting properties.
CLI Example:
```
salt myminion boto_cloudwatch_event.list_targets myrule
```

```salt.modules.boto_cloudwatch_event.put_targets(Rule, Targets, region=None, key=None, keyid=None, profile=None)
```

Add the given targets to the given rule

Returns a dictionary describing any failures.

CLI Example:
```
salt myminion boto_cloudwatch_event.put_targets myrule [{'Id': 'target1', 'Arn': 'arn:***'}]
```

```salt.modules.boto_cloudwatch_event.remove_targets(Rule, Ids, region=None, key=None, keyid=None, profile=None)
```

Given a rule name remove the named targets from the target list

Returns a dictionary describing any failures.

CLI Example:
```
salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']
```

### 26.6.45 salt.modules.boto_cognitoidentity

Connection module for Amazon CognitoIdentity

New in version 2016.11.0.

**configuration**

This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H
cognitoidentity.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cognitoidentity.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```
Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

<table>
<thead>
<tr>
<th>created: true</th>
</tr>
</thead>
</table>

or

| created: false |
| error: |
| message: error message |

Request methods (e.g., `describe_identity_pools`) return:

| identity_pools: |
| - {...} |
| - {...} |

or

| error: |
| message: error message |

```
depends
boto3
```

```
salt.modules.boto_cognitoidentity.create_identity_pool(IdentityPoolName, AllowUnauthenticatedIds=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)
```

Creates a new identity pool. All parameters except for IdentityPoolName is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name
```

```
← DeveloperProviderName=custom_developer_provider
```

```
salt.modules.boto_cognitoidentity.delete_identity_pools(IdentityPoolName, IdentityPoolId=None, region=None, key=None, keyid=None, profile=None)
```

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:
Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)
Returns a list of matched identity pool name's pool properties

CLI Example:

```bash
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles ''
  -IdentityPoolId=my_id_pool_id
```

Given an identity pool id, set the given AuthenticatedRole and UnauthenticatedRole (the Role can be an iam
arn, or a role name) If AuthenticatedRole or UnauthenticatedRole is not given, the authenticated and/or the
unauthenticated role associated previously with the pool will be cleared.
Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```bash
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
    -roles # this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
    -role # this set both roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
    -role and clear the unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
    -unauth role and clear the auth role
```
salt.modules.boto_cognitoidentity.update_identity_pool

(IdentityPoolId, IdentityPoolName=None, AllowUnauthenticatedIdentities=False, SupportedLoginProviders=None, DeveloperProviderName=None, OpenIdConnectProviderARNs=None, region=None, key=None, keyid=None, profile=None)

Updates the given IdentityPoolId's properties. All parameters except for IdentityPoolId, is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass '{}'

To clear OpenIdConnectProviderARNs pass '[]'

boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.

Returns the updated identity pool if successful

CLI Example:
salt myminion boto_cognitoidentity.update_identity_pool my_id_pool_id my_id_pool_name DeveloperProviderName=custom_developer_provider

26.6.46 salt.modules.boto_datapipeline

Connection module for Amazon Data Pipeline

New in version 2016.3.0.

depends
   boto3

salt.modules.boto_datapipeline.activate_pipeline

(pipeline_id, region=None, key=None, keyid=None, profile=None)

Start processing pipeline tasks. This function is idempotent.

CLI Example:
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id

salt.modules.boto_datapipeline.create_pipeline

(name, unique_id, description='', region=None, key=None, keyid=None, profile=None)

Create a new, empty pipeline. This function is idempotent.

CLI Example:
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id

salt.modules.boto_datapipeline.delete_pipeline

(pipeline_id, region=None, key=None, keyid=None, profile=None)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.

CLI Example:
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id

salt.modules.boto_datapipeline.describe_pipelines(pipeline_ids, region=None, key=None, keyid=None, profile=None)

Retrieve metadata about one or more pipelines.
CLI Example:

```
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```

salt.modules.boto_datapipeline.get_pipeline_definition(pipeline_id, version='latest', region=None, key=None, keyid=None, profile=None)

Get the definition of the specified pipeline.
CLI Example:

```
salt myminion boto_datapipeline.get_pipeline_definition my_pipeline_id
```

salt.modules.boto_datapipeline.list_pipelines(region=None, key=None, keyid=None, profile=None)

Get a list of pipeline ids and names for all pipelines.
CLI Example:

```
salt myminion boto_datapipeline.list_pipelines profile=myprofile
```

salt.modules.boto_datapipeline.pipeline_id_from_name(name, region=None, key=None, keyid=None, profile=None)

Get the pipeline id, if it exists, for the given name.
CLI Example:

```
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name
```

salt.modules.boto_datapipeline.put_pipeline_definition(pipeline_id, pipeline_objects, parameter_objects=None, parameter_values=None, region=None, key=None, keyid=None, profile=None)

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.
CLI Example:

```
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_pipeline_objects
```
26.6.47 salt.modules.boto_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

configuration

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghtjasdfklgjhsdfjajkg
```

A region may also be specified in the configuration:

```
region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghtjasdfklgjhsdfjajkg
  region: us-east-1
```

depends

boto

salt.modules.boto_dynamodb.create_global_secondary_index

table_name, global_index, region=None, key=None, keyid=None, profile=None)

Creates a single global secondary index on a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.create_global_secondary_index table_name / index_name
```

salt.modules.boto_dynamodb.create_table

(table_name, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None)

Creates a DynamoDB table.

CLI Example:
```
salt myminion boto_dynamodb.create_table table_name /
    region=us-east-1 /
    hash_key=id /
    hash_key_data_type=N /
    range_key=created_at /
    range_key_data_type=N /
    read_capacity_units=1 /
    write_capacity_units=1
```

```
salt.modules.boto_dynamodb.delete(table_name, region=None, key=None, keyid=None, profile=None)
```

Delete a DynamoDB table.

CLI Example:
```
salt myminion boto_dynamodb.delete table_name region=us-east-1
```

```
salt.modules.boto_dynamodb.describe(table_name, region=None, key=None, keyid=None, profile=None)
```

Describe a DynamoDB table.

CLI Example:
```
salt myminion boto_dynamodb.describe table_name region=us-east-1
```

```
salt.modules.boto_dynamodb.exists(table_name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a table exists.

CLI Example:
```
salt myminion boto_dynamodb.exists table_name region=us-east-1
```

```
salt.modules.boto_dynamodb.extract_index(index_data, global_index=False)
```

Instantiates and returns an AllIndex object given a valid index configuration.

CLI Example:
```
salt myminion boto_dynamodb.extract_index index
```

```
salt.modules.boto_dynamodb.list_tags_of_resource(resource_arn, region=None, key=None, keyid=None, profile=None)
```

Returns a dictionary of all tags currently attached to a given resource.

CLI Example:
```
```

New in version 3006.0.

```
salt.modules.boto_dynamodb.tag_resource(resource_arn, tags, region=None, key=None, keyid=None, profile=None)
```

Sets given tags (provided as list or dict) on the given resource.

CLI Example:
salt myminion boto_dynamodb.tag_resource

```
resource_arn=arn:aws:dynamodb:us-east-1:012345678901:table/my-table
<-> tags={'Name: my-table, Owner: Ops'}
```

New in version 3006.0.

**salt.modules.boto_dynamodb.untag_resource**

```
(resource_arn, tag_keys, region=None, key=None, keyid=None, profile=None)
```

Removes given tags (provided as list) from the given resource.

CLI Example:

```
salt myminion boto_dynamodb.untag_resource
resource_arn=arn:aws:dynamodb:us-east-1:012345678901:table/my-table
tag_keys=['Name, Owner']
```

New in version 3006.0.

**salt.modules.boto_dynamodb.update**

```
table_name, throughput=None, global_indexes=None, region=None, key=None, keyid=None, profile=None)
```

Update a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.update table_name region=us-east-1
```

**salt.modules.boto_dynamodb.update_global_secondary_index**

```
table_name, global_indexes, region=None, key=None, keyid=None, profile=None)
```

Updates the throughput of the given global secondary indexes.

CLI Example:

```
salt myminion boto_dynamodb.update_global_secondary_index table_name / indexes
```

### 26.6.48 salt.modules.boto_ec2

Connection module for Amazon EC2

New in version 2015.8.0.

**configuration**

```
This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```
If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgjhWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

depends
  boto

`salt.modules.boto_ec2.allocate_eip_address`(`domain=None, region=None, key=None, keyid=None, profile=None`)

Allocate a new Elastic IP address and associate it with your account.

**domain**
(string) Optional param - if set to exactly 'vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.

**returns**
(dict) dict of 'interesting' information about the newly allocated EIP, with probably the most interesting keys being 'public_ip'; and 'allocation_id' iff 'domain=vpc' was passed.

CLI Example:
```
salt-call boto_ec2.allocate_eip_address domain=vpc
```

New in version 2016.3.0.

`salt.modules.boto_ec2.assign_private_ip_addresses`(`network_interface_name=None, network_interface_id=None, private_ip_addresses=None, secondary_private_ip_address_count=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None`)

Assigns one or more secondary private IP addresses to a network interface.

**network_interface_id**
(string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

**network_interface_name**
(string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

**private_ip_addresses**
(list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with 'secondary_private_ip_address_count')

**secondary_private_ip_address_count**
(int) - The number of secondary IP addresses to assign to the network interface. (exclusive with 'private_ip_addresses')

**allow_reassociation**
(bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

**returns**
(bool) - True on success, False on failure.

CLI Example:
salt myminion boto_ec2.assign_private_ip_addresses network_interface_ →name=my_eni private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_ →name=my_eni secondary_private_ip_address_count=2

New in version 2017.7.0.
salt.modules.boto_ec2.associate_eip_address(instance_id=None, instance_name=None, public_ip=None, allocation_id=None, network_interface_id=None, network_interface_name=None, private_ip_address=None, allow_reassociation=False, region=None, key=None, keyid=None, profile=None)

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly one of either 'public_ip' or 'allocation_id', depending on whether you’re associating a VPC address or a plain EC2 address.

instance_id
  (string) – ID of the instance to associate with (exclusive with ‘instance_name’)

instance_name
  (string) – Name tag of the instance to associate with (exclusive with ‘instance_id’)

public_ip
  (string) – Public IP address, for standard EC2 based allocations.

allocation_id
  (string) – Allocation ID for a VPC-based EIP.

network_interface_id
  (string) – ID of the network interface to associate the EIP with

network_interface_name
  (string) – Name of the network interface to associate the EIP with

private_ip_address
  (string) – The primary or secondary private IP address to associate with the Elastic IP address.

allow_reassociation
  (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns
  (bool) - True on success, False on failure.

CLI Example:
salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep分配->allocation_id=eipalloc-ef382c8a

New in version 2016.3.0.
salt.modules.boto_ec2.attach_network_interface(device_index=None, name=None, network_interface_id=None, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None)

Attach an Elastic Network Interface.
New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-\rightarrow master device_index=0
```

```
salt.modules.boto_ec2.attach_volume(volume_id, instance_id, device, region=None, key=None, keyid=None, profile=None)
```

Attach an EBS volume to an EC2 instance. ..

**volume_id**
(string) – The ID of the EBS volume to be attached.

**instance_id**
(string) – The ID of the EC2 instance to attach the volume to.

**device**
(string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

**returns**
(bool) - True on success, False on failure.

CLI Example:

```
salt-call boto_ec2.attach_volume vol-12345678 i-87654321 /dev/sdh
```

```
salt.modules.boto_ec2.create_image(ami_name, instance_id=None, instance_name=None, tags=None, region=None, key=None, keyid=None, profile=None, description=None, no_reboot=False, dry_run=False, filters=None)
```

Given instance properties that define exactly one instance, create AMI and return AMI-id.

CLI Examples:

```
salt myminion boto_ec2.create_image ami_name instance_name=myinstance
salt myminion boto_ec2.create_image another_ami_name tags='{"mytag": "value"}', description='this is my ami'
```

```
salt.modules.boto_ec2.create_key(key_name, save_path, region=None, key=None, keyid=None, profile=None)
```

Creates a key and saves it to a given path. Returns the private key.

CLI Example:

```
salt myminion boto_ec2.create_key mykey /root/
```

```
salt.modules.boto_ec2.create_network_interface(name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, region=None, key=None, keyid=None, profile=None)
```

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-123456 description=my_eni groups=['my_group']
```
salt.modules.boto_ec2.create_tags(resource_ids, tags, region=None, key=None, keyid=None, profile=None)

Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids
(string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags
(dict) – Dictionary of name/value pairs. To create only a tag name, pass ” as the value.

returns
(bool) - True on success, False on failure.

CLI Example:
salt-call boto_ec2.create_tags vol-12345678 '{"Name": "myVolume01"}'

salt.modules.boto_ec2.create_volume(zone_name, size=None, snapshot_id=None, volume_type=None, iops=None, encrypted=False, kms_key_id=None, wait_for_creation=False, region=None, key=None, keyid=None, profile=None)

Create an EBS volume to an availability zone.

zone_name
(string) – The Availability zone name of the EBS volume to be created.

size
(int) – The size of the new volume, in GiB. If you’re creating the
volume from a snapshot and don’t specify a volume size, the default is the snapshot size.

snapshot_id
(string) – The snapshot ID from which the new volume will be created.

volume_type
(string) - The type of the volume. Valid volume types for AWS can be found here:

iops
(int) - The provisioned IOPS you want to associate with this volume.

encrypted
(bool) - Specifies whether the volume should be encrypted.

kms_key_id
(string) - If encrypted is True, this KMS Key ID may be specified to
encrypt volume with this key e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

wait_for_creation
(bool) - Whether or not to wait for volume creation to complete.

returns
(string) - created volume id on success, error message on failure.

CLI Example:
salt-call boto_ec2.create_volume us-east-1a size=10
salt-call boto_ec2.create_volume us-east-1a snapshot_id=snap-0123abcd

salt.modules.boto_ec2.delete_key(key_name, region=None, key=None, keyid=None, profile=None)
Deletes a key. Always returns True
CLI Example:
salt myminion boto_ec2.delete_key mykey

salt.modules.boto_ec2.delete_network_interface(name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None)
Create an Elastic Network Interface.
New in version 2016.3.0.
CLI Example:
salt myminion boto_ec2.create_network_interface my_eni subnet-12345678 → description=my_eni groups=[my_group]

salt.modules.boto_ec2.delete_tags(resource_ids, tags, region=None, key=None, keyid=None, profile=None)
Delete metadata tags for the specified resource ids.
New in version 2016.11.0.

resource_ids
(string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.

tags
(dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names.
If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted.
If you pass in a value of None for the tag value, all tags with that name will be deleted.

returns
(bool) - True on success, False on failure.

CLI Example:
salt-call boto_ec2.delete_tags vol-12345678 '{"Name": "myVolume01"}'
salt-call boto_ec2.delete_tags vol-12345678 '[["Name","MountPoint"]]

salt.modules.boto_ec2.delete_volume(volume_id, instance_id=None, device=None, force=False, region=None, key=None, keyid=None, profile=None)
Detach an EBS volume from an EC2 instance.
New in version 2016.11.0.

volume_id
(string) – The ID of the EBS volume to be deleted.

force
(bool) – Forces deletion even if the device has not yet been detached from its instance.

returns
(bool) - True on success, False on failure.
CLI Example:
```
salt-call boto_ec2.delete_volume vol-12345678
```

```
salt.modules.boto_ec2.detach_network_interface(name=None, network_interface_id=None, attachment_id=None, force=False, region=None, key=None, keyid=None, profile=None)
```

Detach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_ec2.detach_network_interface my_eni
```

```
salt.modules.boto_ec2.detach_volume(volume_id, instance_id=None, device=None, force=False, wait_for_detachement=False, region=None, key=None, keyid=None, profile=None)
```

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

volume_id

(string) – The ID of the EBS volume to be detached.

instance_id

(string) – The ID of the EC2 instance from which it will be detached.

device

(string) – The device on the instance through which the volume is exposed (e.g. /dev/sdh)

force

(bool) – Forces detachment if the previous detachment attempt did not occur cleanly.

   This option can lead to data loss or a corrupted file system. Use this option only as a last resort
   to detach a volume from a failed instance. The instance will not have an opportunity to flush file
   system caches nor file system meta data. If you use this option, you must perform file system check
   and repair procedures.

wait_for_detachement

(bool) - Whether or not to wait for volume detachment to complete.

returns

(bool) - True on success, False on failure.

CLI Example:
```
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
```

```
salt.modules.boto_ec2.disassociate_eip_address(public_ip=None, association_id=None, region=None, key=None, keyid=None, profile=None)
```

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either ‘association_id’ or ‘public_ip’, depending on whether you’re dealing with a VPC or EC2 Classic address.

public_ip

(string) – Public IP address, for EC2 Classic allocations.
**association_id**
(string) – Association ID for a VPC-bound EIP.

**returns**
(bool) - True on success, False on failure.

CLI Example:
```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-e3ba2d16
```

New in version 2016.3.0.

**salt.modules.boto_ec2.exists**(instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)

Given an instance id, check to see if the given instance id exists.

Returns True if the given instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:
```
salt myminion boto_ec2.exists myinstance
```

**salt.modules.boto_ec2.find_images**(ami_name=None, executable_by=None, owners=None, image_ids=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False)

Given image properties, find and return matching AMI ids

CLI Examples:
```
salt myminion boto_ec2.find_images tags='{"mytag": "value"}'
```

**salt.modules.boto_ec2.find_instances**(instance_id=None, name=None, tags=None, region=None, key=None, keyid=None, profile=None, return_objs=False, in_states=None, filters=None)

Given instance properties, find and return matching instance ids

CLI Examples:
```
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}'
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}''
```

**salt.modules.boto_ec2.get_all_eip_addresses**(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)

Get public addresses of some, or all EIPs associated with the current account.

**addresses**
(list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

**allocation_ids**
(list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

**returns**
(list) - A list of the requested EIP addresses
CLI Example:

```
salt-call boto_ec2.get_all_eip_addresses
```

New in version 2016.3.0.

**salt.modules.boto_ec2.get_all_tags** (filters=None, region=None, key=None, keyid=None, profile=None)

Describe all tags matching the filter criteria, or all tags in the account otherwise.

New in version 2018.3.0.

**filters**

(dict) - Additional constraints on which volumes to return. Note that valid filters vary extensively depending on the resource type. When in doubt, search first without a filter and then use the returned data to help fine-tune your search. You can generally garner the resource type from its ID (e.g. `vol-XXXXX` is a volume, `i-XXXXX` is an instance, etc.

CLI Example:

```
salt-call boto_ec2.get_all_tags '{"tag:Name": myInstanceNameTag, resource-type: instance}''
```

**salt.modules.boto_ec2.get_all_volumes** (volume_ids=None, filters=None, return_objs=False, region=None, key=None, keyid=None, profile=None)

Get a list of all EBS volumes, optionally filtered by provided `filters` param

New in version 2016.11.0.

**volume_ids**

(list) - Optional list of volume_ids. If provided, only the volumes associated with those in the list will be returned.

**filters**

(dict) - Additional constraints on which volumes to return. Valid filters are:

- `attachment.attach-time` - The time stamp when the attachment initiated.
- `attachment.delete-on-termination` - Whether the volume is deleted on instance termination.
- `attachment.device` - The device name that is exposed to the instance (for example, `/dev/sda1`).
- `attachment.instance-id` - The ID of the instance the volume is attached to.
- `attachment.status` - The attachment state (attaching | attached | detaching | detached).
- `availability-zone` - The Availability Zone in which the volume was created.
- `create-time` - The time stamp when the volume was created.
- `encrypted` - The encryption status of the volume.
- `size` - The size of the volume, in GiB.
- `snapshot-id` - The snapshot from which the volume was created.
- `status` - The status of the volume (creating | available | in-use | deleting | deleted | error).
- `tag:key=value` - The key/value combination of a tag assigned to the resource.
- `volume-id` - The volume ID.
- `volume-type` - The Amazon EBS volume type. This can be `gp2` for General Purpose SSD, `io1` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic volumes.
returns

(bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects

returns

(list) - A list of the requested values: Either the volume IDs or, if return_objs is True, boto.ec2.volume.Volume objects.

CLI Example:

```
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'
```

salt.modules.boto_ec2.get_attribute(attribute, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)

Get an EC2 instance attribute.

CLI Example:

```
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

salt.modules.boto_ec2.get_eip_address_info(addresses=None, allocation_ids=None, region=None, key=None, keyid=None, profile=None)

Get 'interesting' info about some, or all EIPs associated with the current account.

addresses

(list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

allocation_ids

(list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.
returns

(list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.

CLI Example:

```
salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15
```

New in version 2016.3.0.

```
salt.modules.boto_ec2.get_id(name=None, tags=None, region=None, key=None, keyid=None, profile=None, in_states=None, filters=None)
```

Given instance properties, return the instance id if it exists.

CLI Example:

```
salt myminion boto_ec2.get_id myinstance
```

```
salt.modules.boto_ec2.get_key(key_name, region=None, key=None, keyid=None, profile=None)
```

Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn't

CLI Example:

```
salt myminion boto_ec2.get_key mykey
```

```
salt.modules.boto_ec2.get_keys(keynames=None, filters=None, region=None, key=None, keyid=None, profile=None)
```

Gets all keys or filters them by name and returns a list. keynames (list):: A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. filters (dict) :: Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details.

CLI Example:

```
salt myminion boto_ec2.get_keys
```

```
salt.modules.boto_ec2.get_network_interface(name=None, network_interface_id=None, region=None, key=None, keyid=None, profile=None)
```

Get an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface name=my_eni
```

```
salt.modules.boto_ec2.get_network_interface_id(name, region=None, key=None, keyid=None, profile=None)
```

Get an Elastic Network Interface id from its name tag.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface_id name=my_eni
```
salt.modules.boto_ec2.get_tags(instance_id=None, keyid=None, key=None, profile=None, region=None)

Given an instance_id, return a list of tags associated with that instance.

returns
(list) - list of tags as key/value pairs

CLI Example:
```
salt myminion boto_ec2.get_tags instance_id
```

salt.modules.boto_ec2.get_unassociated_eip_address(domain='standard', region=None, key=None, keyid=None, profile=None)

Return the first unassociated EIP

**domain**
Indicates whether the address is an EC2 address or a VPC address (standard|vpc).

CLI Example:
```
salt-call boto_ec2.get_unassociated_eip_address
```

New in version 2016.3.0.

salt.modules.boto_ec2.get_zones(region=None, key=None, keyid=None, profile=None)

Get a list of AZs for the configured region.

CLI Example:
```
salt myminion boto_ec2.get_zones
```

salt.modules.boto_ec2.import_key(key_name, public_key_material, region=None, key=None, keyid=None, profile=None)

Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats:
- OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys)
- Base64 encoded DER format
- SSH public key file format as specified in RFC4716
- DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:
```
salt myminion boto_ec2.import mykey publickey
```

salt.modules.boto_ec2.modify_network_interface_attribute(name=None, network_interface_id=None, attr=None, value=None, region=None, key=None, keyid=None, profile=None)

Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_ec2.modify_network_interface_attribute my_eni
    → attr=description value='example description'
```

salt.modules.boto_ec2.release_eip_address(public_ip=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)

26.6. execution modules
Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.

**public_ip**
(string) - The public IP address - for EC2 elastic IPs.

**allocation_id**
(string) - The Allocation ID - for VPC elastic IPs.

**returns**
(bool) - True on success, False on failure

CLI Example:

```bash
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

salt.modules.boto_ec2.run(
    image_id=None, name=None, tags=None, key_name=None, security_groups=None,
    user_data=None, instance_type='m1.small', placement=None, kernel_id=None,
    ramdisk_id=None, monitoring_enabled=None, vpc_id=None, vpc_name=None,
    subnet_id=None, subnet_name=None, private_ip_address=None,
    block_device_map=None, disable_api_termination=None,
    instance_initiated_shutdown_behavior=None, placement_group=None,
    client_token=None, security_group_ids=None, security_group_names=None,
    additional_info=None, tenancy=None, instance_profile_arn=None,
    instance_profile_name=None, ebs_optimized=None,
    network_interface_id=None, network_interface_name=None, region=None,
    key=None, keyid=None, profile=None, network_interfaces=None)

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:

```bash
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance
```
placement
   (string) – The Availability Zone to launch the instance into.

kernel_id
   (string) – The ID of the kernel with which to launch the instances.

ramdisk_id
   (string) – The ID of the RAM disk with which to launch the instances.

monitoring_enabled
   (bool) – Enable detailed CloudWatch monitoring on the instance.

vpc_id
   (string) - ID of a VPC to bind the instance to. Exclusive with vpc_name.

vpc_name
   (string) - Name of a VPC to bind the instance to. Exclusive with vpc_id.

subnet_id
   (string) – The subnet ID within which to launch the instances for VPC.

subnet_name
   (string) – The name of a subnet within which to launch the instances for VPC.

private_ip_address
   (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).

block_device_map
   (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image. (string) - A string representation of a BlockDeviceMapping structure (dict) - A dict describing a BlockDeviceMapping structure

YAML example:

```yaml
device-maps:
  /dev/sdb:
    ephemeral_name: ephemeral0
  /dev/sdc:
    ephemeral_name: ephemeral1
  /dev/sdd:
    ephemeral_name: ephemeral2
  /dev/sde:
    ephemeral_name: ephemeral3
  /dev/sdf:
    size: 20
    volume_type: gp2
```

disable_api_termination
   (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

instance_initiated_shutdown_behavior
   (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate

placement_group
   (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

client_token
   (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.
**security_group_ids**
(list of strings) – The ID(s) of the VPC security groups with which to associate instances.

**security_group_names**
(list of strings) – The name(s) of the VPC security groups with which to associate instances.

**additional_info**
(string) – Specifies additional information to make available to the instance(s).

**tenancy**
(string) – The tenancy of the instance you want to launch. An instance with a tenancy of ‘dedicated’ runs on single-tenant hardware and can only be launched into a VPC. Valid values are: "default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

**instance_profile_arn**
(string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

**instance_profile_name**
(string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

**ebs_optimized**
(bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn’t available with all instance types.

**network_interfaces**
(boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

**network_interface_id**
(string) - ID of the network interface to attach to the instance

**network_interface_name**
(string) - Name of the network interface to attach to the instance

**salt.modules.boto_ec2.set_attribute**
(attribute, attribute_value, instance_name=None, instance_id=None, region=None, key=None, keyid=None, profile=None, filters=None)

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

CLI Example:

```
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_name=my_instance
```

Available attributes:

- **instanceType**
- **kernel**
- **ramdisk**
- **userData**
- **disableApiTermination**
- **instanceInitiatedShutdownBehavior**
- **rootDeviceName**
Salt Documentation, Release 3007.1

- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

```
salt.modules.boto_ec2.set_volumes_tags(
tag_maps, authoritative=False, dry_run=False,  
    region=None, key=None, keyid=None, profile=None)
```

New in version 2016.11.0.

**tag_maps** *(list)*
List of dicts of filters and tags, where ‘filters’ is a dict suitable for passing to the ‘filters’ argument of get_all_volumes() above, and ‘tags’ is a dict of tags to be set on volumes (via create_tags/delete_tags) as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance Name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is (‘pending’, ‘rebooting’, ‘running’, ‘stopping’, ‘stopped’).

YAML example fragment:

```
- filters:
    attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
    attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
  in_states:
    - stopped
    - terminated
- filters:
    instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
    volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

**authoritative** *(bool)*
If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.

**dry_run** *(bool)*
If true, don’t change anything, just return a dictionary describing any changes which would have been applied.
returns (dict)
A dict describing status and any changes.

**salt.modules.boto_ec2.terminate***(instance_id=None, name=None, region=None, key=None, keyid=None, profile=None, filters=None)***

Terminate the instance described by instance_id or name.

CLI Example:
```
salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
```

**salt.modules.boto_ec2.unassign_private_ip_addresses***(network_interface_name=None, network_interface_id=None, private_ip_addresses=None, region=None, key=None, keyid=None, profile=None)***

Unassigns one or more secondary private IP addresses from a network interface

**network_interface_id**
(string) - ID of the network interface to associate the IP with (exclusive with 'network_interface_name')

**network_interface_name**
(string) - Name of the network interface to associate the IP with (exclusive with 'network_interface_id')

**private_ip_addresses**
(list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

returns
(bool) - True on success, False on failure.

CLI Example:
```
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_name=my_eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

### 26.6.49 salt.modules.boto_efs

Connection module for Amazon EFS

New in version 2017.7.0.

**configuration**
This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

http://docs.aws.amazon.com/efs/latest/ug/access-control-managing-permissions.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file

```plaintext
    efs.keyid: GKTADJGHEIQSXMKKRBJ08H
    efs.key: askd+ghsdffjkghWupU/asdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration

```plaintext
    efs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```plaintext
    myprofile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askd+ghsdffjkghWupU/asdflkdfklgjsdfjajkghs
      region: us-east-1
```

The `boto3` package is used to interact with Amazon Elastic File System (EFS) through the `create_file_system` and `create_mount_target` functions.

### create_file_system

```python
salt.modules.boto_efs.create_file_system(**kwargs)
```

Creates a new, empty file system.

- **name** (string) - The name for the new file system
- **performance_mode** (string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO
- **creation_token** (string) - A unique name to be used as reference when creating an EFS. This will ensure idempotency. Set to name if not specified otherwise

**Returns**

- A dict of the data for the elastic file system

**CLI Example:**

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

### create_mount_target

```python
salt.modules.boto_efs.create_mount_target(**kwargs)
```

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

- **filesystemid** (string) - ID of the file system for which to create the mount target
- **subnetid**
- **ipaddress** (None)
- **securitygroups** (None)
- **keyid** (None)
- **key** (None)
- **profile** (None)
- **region** (None)

**CLI Example:**

```
salt 'my-minion' boto_efs.create_mount_target filesystemid
```

The `boto3` package is used to interact with Amazon Elastic File System (EFS) through the `create_file_system` and `create_mount_target` functions.

### create_file_system

```python
salt.modules.boto_efs.create_file_system(**kwargs)
```

Creates a new, empty file system.

- **name** (string) - The name for the new file system
- **performance_mode** (string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO
- **creation_token** (string) - A unique name to be used as reference when creating an EFS. This will ensure idempotency. Set to name if not specified otherwise

**Returns**

- A dict of the data for the elastic file system

**CLI Example:**

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

### create_mount_target

```python
salt.modules.boto_efs.create_mount_target(**kwargs)
```

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

- **filesystemid** (string) - ID of the file system for which to create the mount target
- **subnetid**
- **ipaddress** (None)
- **securitygroups** (None)
- **keyid** (None)
- **key** (None)
- **profile** (None)
- **region** (None)

**CLI Example:**

```
salt 'my-minion' boto_efs.create_mount_target filesystemid
```

The `boto3` package is used to interact with Amazon Elastic File System (EFS) through the `create_file_system` and `create_mount_target` functions.
subnetid
   (string) - ID of the subnet to add the mount target in.

ipaddress
   (string) - Valid IPv4 address within the address range
   of the specified subnet.

securitygroups
   (list[string]) - Up to five VPC security group IDs,
   of the form sg-xxxxxxxx. These must be for the same VPC as subnet specified.

returns
   (dict) - A dict of the response data

CLI Example:
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid

salt.modules.boto_efs.create_tags(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified in
the request already exists on the file system, this operation overwrites its value with the value provided in the request.

filesystemid
   (string) - ID of the file system for whose tags will be modified.

tags
   (dict) - The tags to add to the file system

CLI Example:
salt 'my-minion' boto_efs.create_tags

salt.modules.boto_efs.delete_file_system(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer exists
and you can't access any contents of the deleted file system. You can't delete a file system that is in use. That
is, if the file system has any mount targets, you must first delete them.

filesystemid
   (string) - ID of the file system to delete.

CLI Example:
salt 'my-minion' boto_efs.delete_file_system filesystemid

salt.modules.boto_efs.delete_mount_target(mounttargetid, keyid=None, key=None, profile=None, region=None, **kwargs)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which
might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you
might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associ-
ated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation
does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance
in your VPC via another mount target.
mounttargetid
   (string) - ID of the mount target to delete

CLI Example:

```
salt 'my-minion' boto_efs.delete_mount_target mounttargetid
```

`salt.modules.boto_efs.delete_tags` *(filesystemid, tags, keyid=None, key=None, profile=None, region=None, **kwargs)*

Deletes the specified tags from a file system.

filesystemid
   (string) - ID of the file system for whose tags will be removed.

tags
   (list[string]) - The tag keys to delete to the file system

CLI Example:

```
salt 'my-minion' boto_efs.delete_tags
```

`salt.modules.boto_efs.get_file_systems` *(filesystemid=None, keyid=None, key=None, profile=None, region=None, creation_token=None, **kwargs)*

Get all EFS properties or a specific instance property if filesystemid is specified

filesystemid
   (string) - ID of the file system to retrieve properties

creation_token
   (string) - A unique token that identifies an EFS. If filesystem created via create_file_system this would either be explicitly passed in or set to name. You can limit your search with this.

returns
   (list[dict]) - list of all elastic file system properties

CLI Example:

```
salt 'my-minion' boto_efs.get_file_systems efs-id
```

`salt.modules.boto_efs.get_mount_targets` *(filesystemid=None, mounttargetid=None, keyid=None, key=None, profile=None, region=None, **kwargs)*

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified

filesystemid
   (string) - ID of the file system whose mount targets to list
   Must be specified if mounttargetid is not

mounttargetid
   (string) - ID of the mount target to have its properties returned
   Must be specified if filesystemid is not

returns
   (list[dict]) - list of all mount point properties

CLI Example:

```
salt 'my-minion' boto_efs.get_mount_targets
```
salt.modules.boto_efs.get_tags(filesystemid, keyid=None, key=None, profile=None, region=None, **kwargs)

Return the tags associated with an EFS instance.

filesystemid  
(string) - ID of the file system whose tags to list

returns  
(list) - list of tags as key/value pairs

CLI Example:

```
salt 'my-minion' boto_efs.get_tags efs-id
```

salt.modules.boto_efs.set_security_groups(mounttargetid, securitygroup, keyid=None, key=None, profile=None, region=None, **kwargs)

Modifies the set of security groups in effect for a mount target

mounttargetid  
(string) - ID of the mount target whose security groups will be modified

securitygroups  
(list[string]) - list of no more than 5 VPC security group IDs.

CLI Example:

```
salt 'my-minion' boto_efs.set_security_groups my-mount-target-id my-sec-group
```

26.6.50 salt.modules.boto_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

configuration

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
**myprofile:**

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghtskghWupUjasdflkdfklgjsdfajkghs
region: us-east-1
```

depends

```
boto
```

```python
salt.modules.boto_elasticache.authorize_cache_security_group_ingress(name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)
```

Authorize network ingress from an ec2 security group to a cache security group.

CLI Example:

```
salt myminion boto_elasticache.authorize_cache_security_group_ingress
  → myelasticachesg myec2sg 879879
```

```python
salt.modules.boto_elasticache.create(name, num_cache_nodes=None, engine=None, cache_node_type=None, replication_group_id=None, engine_version=None, cache_parameter_group_name=None, cache_subnet_group_name=None, cache_security_group_names=None, security_group_ids=None, snapshot_arns=None, preferred_availability_zone=None, preferred_maintenance_window=None, port=None, notification_topic_arn=None, auto_minor_version_upgrade=None, wait=None, region=None, key=None, keyid=None, profile=None)
```

Create a cache cluster.

CLI Example:

```
salt myminion boto_elasticache.create myelasticache 1 redis cache.t1.micro
  → cache_security_group_names=['"myelasticachesg"']
```

```python
salt.modules.boto_elasticache.create_cache_security_group(name, description, region=None, key=None, keyid=None, profile=None)
```

Create a cache security group.

CLI Example:

```
salt myminion boto_elasticache.create_cache_security_group
  → myelasticachesg 'My Cache Security Group'
```

```python
salt.modules.boto_elasticache.create_replication_group(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

26.6. execution modules
Create replication group.

CLI Example:

```bash
salt myminion boto_elasticache.create_replication_group myelasticache=
  → myprimarycluster description
```

**salt.modules.boto_elasticache.create_subnet_group**

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:

```bash
salt myminion boto_elasticache.create_subnet_group
  → my-subnet-group
  → "group description"
  → subnet_ids='[subnet-12345678, subnet-87654321]
  → region=us-east-1
```

**salt.modules.boto_elasticache.delete**

Delete a cache cluster.

CLI Example:

```bash
salt myminion boto_elasticache.delete myelasticache
```

**salt.modules.boto_elasticache.delete_cache_security_group**

Delete a cache security group.

CLI Example:

```bash
salt myminion boto_elasticache.delete_cache_security_group
  → myelasticschesg 'My Cache Security Group'
```

**salt.modules.boto_elasticache.delete_replication_group**

Delete an ElastiCache replication group.

CLI Example:

```bash
salt myminion boto_elasticache.delete_replication_group
  → my-replication-group
  → region=us-east-1
```

**salt.modules.boto_elasticache.delete_subnet_group**

Delete an ElastiCache subnet group.

CLI Example:

```bash
salt myminion boto_elasticache.delete_subnet_group
  → my-subnet-group
  → region=us-east-1
```
salt.modules.boto_elasticache.describe_replication_group(name, region=None, key=None, keyid=None, profile=None, parameter=None)

Get replication group information.
CLI Example:
```
salt myminion boto_elasticache.describe_replication_group mygroup
```

salt.modules.boto_elasticache.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a cache cluster exists.
CLI Example:
```
salt myminion boto_elasticache.exists myelasticache
```

salt.modules.boto_elasticache.get_all_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)

Return a list of all cache subnet groups with details
CLI Example:
```
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

salt.modules.boto_elasticache.get_cache_subnet_group(name, region=None, key=None, keyid=None, profile=None)

Get information about a cache subnet group.
CLI Example:
```
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

salt.modules.boto_elasticache.get_config(name, region=None, key=None, keyid=None, profile=None)

Get the configuration for a cache cluster.
CLI Example:
```
salt myminion boto_elasticache.get_config myelasticache
```

salt.modules.boto_elasticache.get_group_host(name, region=None, key=None, keyid=None, profile=None)

Get hostname from replication cache group
CLI Example:
```
salt myminion boto_elasticache.get_group_host myelasticachegroup
```

salt.modules.boto_elasticache.get_node_host(name, region=None, key=None, keyid=None, profile=None)

Get hostname from cache node
CLI Example:
salt.myminion boto_elasticache.get_node_host myelasticache

salt.modules.boto_elasticache.group_exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if a replication group exists.
CLI Example:
salt myminion boto_elasticache.group_exists myelasticache

salt.modules.boto_elasticache.list_cache_subnet_groups(name=None, region=None, key=None, keyid=None, profile=None)
Return a list of all cache subnet group names
CLI Example:
salt myminion boto_elasticache.list_subnet_groups region=us-east-1

salt.modules.boto_elasticache.revoke_cache_security_group_ingress(name, ec2_security_group_name, ec2_security_group_owner_id, region=None, key=None, keyid=None, profile=None)
Revoke network ingress from an ec2 security group to a cache security group.
CLI Example:
salt myminion boto_elasticache.revoke_cache_security_group_ingress myelasticachesg myec2sg 879879

salt.modules.boto_elasticache.subnet_group_exists(name, tags=None, region=None, key=None, keyid=None, profile=None)
Check to see if an ElastiCache subnet group exists.
CLI Example:
salt myminion boto_elasticache.subnet_group_exists my-param-group region=us-east-1

26.6.51 salt.modules.boto_elasticsearch_domain

Connection module for Amazon Elasticsearch Service
New in version 2016.11.0.

configuration
This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkgwupUjasdfklkldjsfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgwupUjasdfklkldjsfjajkghs
  region: us-east-1
```

Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., `describe_function`) return:

```
domain:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends

boto3

```
salt.modules.boto_elasticsearch_domain.add_tags(DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None, **kwargs)
```

Add tags to a domain

Returns {tagged: true} if the domain was tagged and returns {tagged: False} if the domain was not tagged.

CLI Example:

```
salt myminion boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value
  → tag_b=tag_value
```
salt.modules.boto_elasticsearch_domain.create(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion=None)

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```
salt myminion boto_elasticsearch_domain.create mydomain \
    { 'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \ 
      'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false } \
    { 'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \ 
      'Iops': 0 } \
    { 'Version': "2012-10-17", "Statement": [{"Effect": "Allow", \ 
      "Principal": {"AWS": "*"}, "Action": "es:*", \ 
      "Resource": "arn:aws:es:us-east-1:11111111111:domain/mydomain/*"}, \ 
      { "IpAddress": { "aws:SourceIp": ["127.0.0.1"] } }, \ 
      { "AutomatedSnapshotStartHour": 0 } ] \ 
    } { "rest.action.multi.allow_explicit_index": "true" }
```

salt.modules.boto_elasticsearch_domain.delete(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:

```
salt myminion boto_elasticsearch_domain.delete mydomain
```

salt.modules.boto_elasticsearch_domain.describe(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.describe mydomain
```

salt.modules.boto_elasticsearch_domain.exists(DomainName, region=None, key=None, keyid=None, profile=None)

Given a domain name, check to see if the given domain exists.

Returns True if the given domain exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_elasticsearch_domain.exists mydomain
```

salt.modules.boto_elasticsearch_domain.list_tags(DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None)

1494 Chapter 26. Salt Module Reference
List tags of a trail

**Returns**

- {...}
- {...}

**Return type**
tags

CLI Example:

```bash
salt myminion boto_cloudtrail.list_tags my_trail
```

```python
salt.modules.boto_elasticsearch_domain.remove_tags(TagKeys, DomainName=None, ARN=None, region=None, key=None, keyid=None, profile=None)
```

Remove tags from a trail

Returns `{tagged: true}` if the trail was tagged and returns `{tagged: False}` if the trail was not tagged.

CLI Example:

```bash
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

```python
salt.modules.boto_elasticsearch_domain.status(DomainName, region=None, key=None, keyid=None, profile=None)
```

Given a domain name describe its status.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.status mydomain
```

```python
salt.modules.boto_elasticsearch_domain.update(DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, region=None, key=None, keyid=None, profile=None)
```

Update the named domain to the configuration.

Returns `{updated: true}` if the domain was updated and returns `{updated: False}` if the domain was not updated.

CLI Example:

```bash
salt myminion boto_elasticsearch_domain.update mydomain \  
   {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \  
   'DedicatedMasterEnabled': False, 'ZoneAwarenessEnabled': False} \  
   {'EBSEnabled': True, 'VolumeType': 'gp2', 'VolumeSize': 10, \  
   'Iops': 0} \  
   {'Version': '2012-10-17', 'Statement': [['Effect': 'Allow', \  
   'Principal': {'AWS': '*'}, 'Action': 'es:*', \  
   'Resource': 'arn:aws:es:us-east-1:1111111111:domain/mydomain/*'],
```

(continues on next page)
26.6.52 salt.modules.boto_elb

Connection module for Amazon ELB

New in version 2014.7.0.

configuration

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkgWupUjasdfldflgjsdfjajkggh
```

A region may also be specified in the configuration:

```
elb.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfldflgjsdfjajkggh
  region: us-east-1
```

depends

boto >= 2.33.0

salt.modules.boto_elb.apply_security_groups(name, security_groups, region=None, key=None, keyid=None, profile=None)

Apply security groups to ELB.

CLI Example:

```
salt myminion boto_elb.apply_security_groups myelb ['"mysecgroup1"']
```

salt.modules.boto_elb.attach_subnets(name, subnets, region=None, key=None, keyid=None, profile=None)

Attach ELB to subnets.

CLI Example:
Salt Documentation, Release 3007.1

salt myminion boto_elb.attach_subnets myelb '["mysubnet"]'
salt.modules.boto_elb.create(name, availability_zones, listeners, subnets=None, security_groups=None,
scheme='internet-facing', region=None, key=None, keyid=None,
profile=None)
Create an ELB
CLI example to create an ELB:
salt myminion boto_elb.create myelb '["us-east-1a", "us-east-1e"]' '{"elb_
,→port": 443, "elb_protocol": "HTTPS", ...}' region=us-east-1
salt.modules.boto_elb.create_listeners(name, listeners, region=None, key=None, keyid=None,
profile=None)
Create listeners on an ELB.
CLI Example:
salt myminion boto_elb.create_listeners myelb '[["HTTPS", "HTTP", 443, 80,
,→ "arn:aws:iam::11
11111:server-certificate/mycert"]]'
salt.modules.boto_elb.create_policy(name, policy_name, policy_type, policy, region=None,
key=None, keyid=None, profile=None)
Create an ELB policy.
New in version 2016.3.0.
CLI Example:
salt myminion boto_elb.create_policy myelb mypolicy
,→LBCookieStickinessPolicyType '{"CookieExpirationPeriod": 3600}'
salt.modules.boto_elb.delete(name, region=None, key=None, keyid=None, profile=None)
Delete an ELB.
CLI example to delete an ELB:
salt myminion boto_elb.delete myelb region=us-east-1
salt.modules.boto_elb.delete_listeners(name, ports, region=None, key=None, keyid=None,
profile=None)
Delete listeners on an ELB.
CLI Example:
salt myminion boto_elb.delete_listeners myelb '[80,443]'
salt.modules.boto_elb.delete_policy(name, policy_name, region=None, key=None, keyid=None,
profile=None)
Delete an ELB policy.
New in version 2016.3.0.
CLI Example:
salt myminion boto_elb.delete_policy myelb mypolicy

26.6. execution modules

1497


salt.modules.boto_elb.delete_tags(name, tags, region=None, key=None, keyid=None, profile=None)
Add the tags on an ELB

name
name of the ELB
tags
list of tags to remove

CLI Example:
```
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1', 'TagToRemove2']
```

salt.modules.boto_elb.deregister_instances(name, instances, region=None, key=None, keyid=None, profile=None)
Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:
- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered
- None: instance(s) not valid or not registered, no action taken

CLI Example:
```
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_id]"
```

salt.modules.boto_elb.detach_subnets(name, subnets, region=None, key=None, keyid=None, profile=None)
Detach ELB from subnets.

CLI Example:
```
salt myminion boto_elb.detach_subnets myelb '[:"mysubnet"]'
```

salt.modules.boto_elb.disable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)
Disable availability zones for ELB.

CLI Example:
```
salt myminion boto_elb.disable_availability_zones myelb '[:"us-east-1a"]'
```

salt.modules.boto_elb.enable_availability_zones(name, availability_zones, region=None, key=None, keyid=None, profile=None)
Enable availability zones for ELB.

CLI Example:
```
salt myminion boto_elb.enable_availability_zones myelb '[:"us-east-1a"]'
```

salt.modules.boto_elb.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an ELB exists.

CLI Example:
Salt Documentation, Release 3007.1

```
salt myminion boto_elb.exists myelb region=us-east-1
```

**salt.modules.boto_elb.get_all_elbs(region=\None, key=\None, keyid=\None, profile=\None)**

Return all load balancers associated with an account.

CLI Example:
```
salt myminion boto_elb.get_all_elbs region=us-east-1
```

**salt.modules.boto_elb.get_attributes(name, region=\None, key=\None, keyid=\None, profile=\None)**

Check to see if attributes are set on an ELB.

CLI Example:
```
salt myminion boto_elb.get_attributes myelb
```

**salt.modules.boto_elb.get_elb_config(name, region=\None, key=\None, keyid=\None, profile=\None)**

Get an ELB configuration.

CLI Example:
```
salt myminion boto_elb.exists myelb region=us-east-1
```

**salt.modules.boto_elb.get_health_check(name, region=\None, key=\None, keyid=\None, profile=\None)**

Get the health check configured for this ELB.

CLI Example:
```
salt myminion boto_elb.get_health_check myelb
```

**salt.modules.boto_elb.get_instance_health(name, region=\None, key=\None, keyid=\None, profile=\None, instances=\None)**

Get a list of instances and their health state.

CLI Example:
```
salt myminion boto_elb.get_instance_health myelb
salt myminion boto_elb.get_instance_health myelb region=us-east-1
  instances="[instance_id,instance_id]"
```

**salt.modules.boto_elb.list_elbs(region=\None, key=\None, keyid=\None, profile=\None)**

Return names of all load balancers associated with an account.

CLI Example:
```
salt myminion boto_elb.list_elbs region=us-east-1
```

**salt.modules.boto_elb.listener_dict_to_tuple(listener)**

Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.

CLI Example:
```
salt myminion boto_elb.listener_dict_to_tuple '{"elb_port":80,"instance_port":80,"elb_protocol":"HTTP"}'
```
salt.modules.boto_elb.register_instances(name, instances, region=None, key=None, keyid=None, profile=None)

Register instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:
- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI Example:
```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]
```

salt.modules.boto_elb.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

name (string)
Name of the ELB instance to set attributes for

attributes
A dict of attributes to set.
Valid attributes are:

access_log (dict)
- enabled (bool)
  Enable storage of access logs.

s3_bucket_name (string)
The name of the S3 bucket to place logs.

s3_bucket_prefix (string)
Prefix for the log file name.

emit_interval (int)
Interval for storing logs in S3 in minutes. Valid values are 5 and 60.

connection_draining (dict)
- enabled (bool)
  Enable connection draining.

timeout (int)
Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.

cross_zone_load_balancing (dict)
- enabled (bool)
  Enable cross-zone load balancing.

CLI example to set attributes on an ELB:
```
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled": "true", "s3_bucket_name": "mybucket", "s3_bucket_prefix": "mylogs/", "emit_interval": "5"}}' region=us-east-1
```
salt.modules.boto_elb.set_backend_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB backend server.

CLI Example:

```
salt myminion boto_elb.set_backend_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.set_health_check(name, health_check, region=None, key=None, keyid=None, profile=None)

Set attributes on an ELB.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

salt.modules.boto_elb.set_instances(name, instances, test=False, region=None, key=None, keyid=None, profile=None)

Set the instances assigned to an ELB to exactly the list given.

CLI Example:

```
salt myminion boto_elb.set_instances myelb region=us-east-1 instances="[instance_id,instance_id]"
```

salt.modules.boto_elb.set_listener_policy(name, port, policies=None, region=None, key=None, keyid=None, profile=None)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.set_tags(name, tags, region=None, key=None, keyid=None, profile=None)

Add the tags on an ELB.

New in version 2016.3.0.

name

name of the ELB

tags

dict of name/value pair tags

CLI Example:

```
salt myminion boto_elb.set_tags my-elb-name "{'Tag1': 'Value', 'Tag2': 'Another Value'}"
```
26.6.53 salt.modules.boto_elbv2

Connection module for Amazon ALB

New in version 2017.7.0.

configuration

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkgWupUjasdfklkdflgjsdfsdfajkghs
elbv2.region: us-west-2

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklkdflgjsdfsdfajkghs
  region: us-east-1

depends
boto3

salt.modules.boto_elbv2.create_target_group

Create target group if not present.

name (string) - The name of the target group.

protocol (string) - The protocol to use for routing traffic to the targets

port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

vpc_id (string) - The identifier of the virtual private cloud (VPC).
health_check_protocol
(string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

health_check_port
(string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

health_check_path
(string) - The ping path that is the destination on the targets for health checks. The default is /.

health_check_interval_seconds
(integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

health_check_timeout_seconds
(integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

healthy_threshold_count
(integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

unhealthy_threshold_count
(integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

returns
(bool) - True on success, False on failure.

CLI Example:
```
salt myminion boto_elbv2.create_target_group learn1give1 protocol=HTTP port=54006 vpc_id=vpc-deadbeef
```

salt.modules.boto_elbv2.delete_target_group(name, region=None, key=None, keyid=None, profile=None)

Delete target group.

name
(string) - Target Group Name or Amazon Resource Name (ARN).

returns
(bool) - True on success, False on failure.

CLI Example:
```
salt myminion boto_elbv2.delete_target_group
  --arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
```

salt.modules.boto_elbv2.deregister_targets(name, targets, region=None, key=None, keyid=None, profile=None)

Deregister targets to a target group of an ALB. targets is either a instance id string or a list of instance id's.

Returns:
- True: instance(s) deregistered successfully
- False: instance(s) failed to be deregistered
CLI Example:

```bash
salt myminion boto_elbv2.deregister_targets myelb instance_id
salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.describe_target_health(name, targets=None, region=None, key=None, keyid=None, profile=None)

Get the current health check status for targets in a target group.

CLI Example:

```bash
salt myminion boto_elbv2.describe_target_health
  arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
  targets="i-isdf23ifjf"
```

salt.modules.boto_elbv2.register_targets(name, targets, region=None, key=None, keyid=None, profile=None)

Register targets to a target group of an ALB. `targets` is either a instance id string or a list of instance id's.

Returns:

- True: instance(s) registered successfully
- False: instance(s) failed to be registered

CLI Example:

```bash
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.target_group_exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a target group exists.

CLI Example:

```bash
salt myminion boto_elbv2.target_group_exists
  arn:aws:elasticloadbalancing:us-west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163
```

26.6.54 salt.modules.boto_iam

Connection module for Amazon IAM

New in version 2014.7.0.

configuration

This module accepts explicit iam credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:
It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgWupUjasdfklgjsdfjajkghs
  region: us-east-1
```

depends
  boto

`salt.modules.boto_iam.add_user_to_group(user_name, group_name, region=None, key=None, keyid=None, profile=None)`

Add user to group.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.add_user_to_group myuser mygroup
```

`salt.modules.boto_iam.associate_profile_to_role(profile_name, role_name, region=None, key=None, keyid=None, profile=None)`

Associate an instance profile with an IAM role.

CLI Example:
```
salt myminion boto_iam.associate_profile_to_role myirole myiprofile
```

`salt.modules.boto_iam.attach_group_policy(policy_name, group_name, region=None, key=None, keyid=None, profile=None)`

Attach a managed policy to a group.

CLI Example:
```
salt myminion boto_iam.attach_group_policy mypolicy mygroup
```

`salt.modules.boto_iam.attach_role_policy(policy_name, role_name, region=None, key=None, keyid=None, profile=None)`

Attach a managed policy to a role.

CLI Example:
```
salt myminion boto_iam.attach_role_policy mypolicy myrole
```

`salt.modules.boto_iam.attach_user_policy(policy_name, user_name, region=None, key=None, keyid=None, profile=None)`

Attach a managed policy to a user.

CLI Example:
salt.myminion boto_iam.attach_user_policy mypolicy myuser

salt.modules.boto_iam.build_policy(region=None, key=None, keyid=None, profile=None)
Build a default assume role policy.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.build_policy

salt.modules.boto_iam.create_access_key(user_name, region=None, key=None, keyid=None, profile=None)
Create access key id for a user.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_access_key myuser

salt.modules.boto_iam.create_group(group_name, path=None, region=None, key=None, keyid=None, profile=None)
Create a group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_group group

salt.modules.boto_iam.create_instance_profile(name, region=None, key=None, keyid=None, profile=None)
Create an instance profile.
CLI Example:
salt myminion boto_iam.create_instance_profile myiprofile

salt.modules.boto_iam.create_login_profile(user_name, password, region=None, key=None, keyid=None, profile=None)
Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.create_login_profile user_name password

salt.modules.boto_iam.create_policy(policy_name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None)
Create a policy.
CLI Example:
salt.modules.boto_iam.create_policy_version(policy_name, policy_document,
set_as_default=None, region=None, key=None, keyid=None, profile=None)

Create a policy version.

CLI Example:

salt myminios boto_iam.create_policy_version mypolicy '{"Version": "2012-10-17",
→"Statement": [{ "Effect": "Allow", "Action": ["s3:Get*", "s3:List*"],
→"Resource": ["arn:aws:s3:::my-bucket/shared/*/"],}]}'

salt.modules.boto_iam.create_role(name, policy_document=None, path=None, region=None,
key=None, keyid=None, profile=None)

Create an instance role.

CLI Example:

salt myminion boto_iam.create_role myrole

salt.modules.boto_iam.create_role_policy(role_name, policy_name, policy, region=None,
key=None, keyid=None, profile=None)

Create or modify a role policy.

CLI Example:

salt myminion boto_iam.create_role_policy myirole mypolicy '{"MyPolicy":

salt.modules.boto_iam.create_saml_provider(name, saml_metadata_document, region=None,
key=None, keyid=None, profile=None)

Create SAML provider

CLI Example:

salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_
→metadata_document

salt.modules.boto_iam.create_user(user_name, path=None, region=None, key=None, keyid=None, profile=None)

Create a user.

New in version 2015.8.0.

CLI Example:

salt myminion boto_iam.create_user myuser

salt.modules.boto_iam.deactivate_mfa_device(user_name, serial, region=None, key=None, keyid=None, profile=None)

Deactivates the specified MFA device and removes it from association with the user.
New in version 2016.3.0.

CLI Example:
```
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

salt.modules.boto_iam.delete_access_key(access_key_id, user_name=None, region=None, key=None, keyid=None, profile=None)

Delete access key id from a user.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_iam.delete_access_key myuser
```

salt.modules.boto_iam.delete_group(group_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.

CLI Example:
```
salt myminion boto_iam.delete_group mygroup
```

salt.modules.boto_iam.delete_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a group policy.

CLI Example:
```
salt myminion boto_iam.delete_group_policy mygroup mypolicy
```

salt.modules.boto_iam.delete_instance_profile(name, region=None, key=None, keyid=None, profile=None)

Delete an instance profile.

CLI Example:
```
salt myminion boto_iam.delete_instance_profile myiprofile
```

salt.modules.boto_iam.delete_login_profile(user_name, region=None, key=None, keyid=None, profile=None)

Deletes a login profile for the specified user.

New in version 2016.3.0.

CLI Example:
```
salt myminion boto_iam.delete_login_profile user_name
```

salt.modules.boto_iam.delete_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Delete a policy.

CLI Example:
```
salt myminion boto_iam.delete_policy mypolicy
```
salt.modules.boto_iam.delete_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Delete a policy version.

CLI Example:

```
salt myminion boto_iam.delete_policy_version mypolicy v1
```

salt.modules.boto_iam.delete_role(name, region=None, key=None, keyid=None, profile=None)

Delete an IAM role.

CLI Example:

```
salt myminion boto_iam.delete_role myirole
```

salt.modules.boto_iam.delete_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a role policy.

CLI Example:

```
salt myminion boto_iam.delete_role_policy myirole mypolicy
```

salt.modules.boto_iam.delete_saml_provider(name, region=None, key=None, keyid=None, profile=None)

Delete SAML provider

CLI Example:

```
salt myminion boto_iam.delete_saml_provider my_saml_provider_name
```

salt.modules.boto_iam.delete_server_cert(cert_name, region=None, key=None, keyid=None, profile=None)

Deletes a certificate from Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_server_cert mycert_name
```

salt.modules.boto_iam.delete_user(user_name, region=None, key=None, keyid=None, profile=None)

Delete a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_user myuser
```

salt.modules.boto_iam.delete_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)

Delete a user policy.

CLI Example:

```
salt myminion boto_iam.delete_user_policy myuser mypolicy
```
salt.modules.boto_iam.delete_virtual_mfa_device(serial, region=None, key=None, keyid=None, profile=None)

Deletes the specified virtual MFA device.

CLI Example:

```
salt myminion boto_iam.delete_virtual_mfa_device serial_num
```

salt.modules.boto_iam.describe_role(name, region=None, key=None, keyid=None, profile=None)

Get information for a role.

CLI Example:

```
salt myminion boto_iam.describe_role myirole
```

salt.modules.boto_iam.detach_group_policy(policy_name, group_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```

salt.modules.boto_iam.detach_role_policy(policy_name, role_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

salt.modules.boto_iam.detach_user_policy(policy_name, user_name, region=None, key=None, keyid=None, profile=None)

Detach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

salt.modules.boto_iam.disassociate_profile_from_role(profile_name, role_name, region=None, key=None, keyid=None, profile=None)

Disassociate an instance profile from an IAM role.

CLI Example:

```
salt myminion boto_iam.disassociate_profile_from_role myirole myiprofile
```

salt.modules.boto_iam.export_roles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

```
salt-call boto_iam.export_roles --out=t txt | sed "s/local://" > iam_roles.sls
```
salt.modules.boto_iam.export_users(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get all IAM user details. Produces results that can be used to create an sls file.
New in version 2016.3.0.
CLI Example:
```
salt-call boto_iam.export_users --out=txt | sed "s/local: //" > iam_users.sls
```

salt.modules.boto_iam.get_account_id(region=None, key=None, keyid=None, profile=None)

Get a the AWS account id associated with the used credentials.
CLI Example:
```
salt myminion boto_iam.get_account_id
```

salt.modules.boto_iam.get_account_policy(region=None, key=None, keyid=None, profile=None)

Get account policy for the AWS account.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_account_policy
```

salt.modules.boto_iam.get_all_access_keys(user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None)

Get all access keys from a user.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_all_access_keys myuser
```

salt.modules.boto_iam.get_all_group_policies(group_name, region=None, key=None, keyid=None, profile=None)

Get a list of policy names from a group.
CLI Example:
```
salt myminion boto_iam.get_all_group_policies mygroup
```

salt.modules.boto_iam.get_all_groups(path_prefix='/', region=None, key=None, keyid=None, profile=None)

Get and return all IAM group details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
```
salt-call boto_iam.get_all_groups
```

salt.modules.boto_iam.get_all_instance_profiles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

26.6. execution modules
Get and return all IAM instance profiles, starting at the optional path.
New in version 2016.11.0.
CLI Example:
```
salt-call boto_iam.get_all_instance_profiles
```

```python
salt.modules.boto_iam.get_all_mfa_devices(user_name, region=None, key=None, keyid=None, profile=None)
```
Get all MFA devices associated with an IAM user.
New in version 2016.3.0.
CLI Example:
```
salt myminion boto_iam.get_all_mfa_devices user_name
```

```python
salt.modules.boto_iam.get_all_roles(path_prefix=None, region=None, key=None, keyid=None, profile=None)
```
Get and return all IAM role details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
```
salt-call boto_iam.get_all_roles
```

```python
salt.modules.boto_iam.get_all_user_policies(user_name, marker=None, max_items=None, region=None, key=None, keyid=None, profile=None)
```
Get all user policies.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_all_user_policies myuser
```

```python
salt.modules.boto_iam.get_all_users(path_prefix='?', region=None, key=None, keyid=None, profile=None)
```
Get and return all IAM user details, starting at the optional path.
New in version 2016.3.0.
CLI Example:
```
salt-call boto_iam.get_all_users
```

```python
salt.modules.boto_iam.get_group(group_name, region=None, key=None, keyid=None, profile=None)
```
Get group information.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_group mygroup
```
salt.modules.boto_iam.get_group_members(group_name, region=None, key=None, keyid=None, profile=None)

Get group information.
New in version 2016.3.0.
CLI Example:
```
salt myminion boto_iam.get_group mygroup
```

salt.modules.boto_iam.get_group_policy(group_name, policy_name, region=None, key=None, keyid=None, profile=None)

Retrieves the specified policy document for the specified group.
New in version 2015.8.0.
CLI Example:
```
salt myminion boto_iam.get_group_policy mygroup policynname
```

salt.modules.boto_iam.get_policy(policy_name, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.
CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.get_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.
CLI Example:
```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.get_role_policy(role_name, policy_name, region=None, key=None, keyid=None, profile=None)

Get a role policy.
CLI Example:
```
salt myminion boto_iam.get_role_policy myirole mypolicy
```

salt.modules.boto_iam.get_saml_provider(name, region=None, key=None, keyid=None, profile=None)

Get SAML provider document.
CLI Example:
```
salt myminion boto_iam.get_saml_provider arn
```

salt.modules.boto_iam.get_saml_provider_arn(name, region=None, key=None, keyid=None, profile=None)

Get SAML provider
CLI Example:
salt.minion boto_iam.get_saml_provider_arn my_saml_provider_name

salt.modules.boto_iam.get_server_certificate(cert_name, region=None, key=None, keyid=None, profile=None)

Returns certificate information from Amazon
New in version 2015.8.0.
CLI Example:
salt minion boto_iam.get_server_certificate mycert_name

salt.modules.boto_iam.get_user(user_name=None, region=None, key=None, keyid=None, profile=None)
Get user information.
New in version 2015.8.0.
CLI Example:
salt minion boto_iam.get_user myuser

salt.modules.boto_iam.get_user_policy(user_name, policy_name, region=None, key=None, keyid=None, profile=None)
Retrieves the specified policy document for the specified user.
New in version 2015.8.0.
CLI Example:
salt minion boto_iam.get_user_policy myuser mypolicyname

salt.modules.boto_iam.instance_profile_exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an instance profile exists.
CLI Example:
salt minion boto_iam.instance_profile_exists myiprofile

salt.modules.boto_iam.list_attached_group_policies(group_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)
List entities attached to the given group.
CLI Example:
salt minion boto_iam.list_entities_for_policy mypolicy

salt.modules.boto_iam.list_attached_role_policies(role_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)
List entities attached to the given role.
CLI Example:
salt minion boto_iam.list_entities_for_policy mypolicy
salt.modules.boto_iam.list_attached_user_policies(user_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities attached to the given user.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_entities_for_policy(policy_name, path_prefix=None, entity_filter=None, region=None, key=None, keyid=None, profile=None)

List entities that a policy is attached to.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.list_instance_profiles(path_prefix='/', region=None, key=None, keyid=None, profile=None)

List all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

```
salt-call boto_iam.list_instance_profiles
```

salt.modules.boto_iam.list_policies(region=None, key=None, keyid=None, profile=None)

List policies.

CLI Example:

```
salt myminion boto_iam.list_policies
```

salt.modules.boto_iam.list_policy_versions(policy_name, region=None, key=None, keyid=None, profile=None)

List versions of a policy.

CLI Example:

```
salt myminion boto_iam.list_policy_versions mypolicy
```

salt.modules.boto_iam.list_role_policies(role_name, region=None, key=None, keyid=None, profile=None)

Get a list of policy names from a role.

CLI Example:

```
salt myminion boto_iam.list_role_policies myirole
```

salt.modules.boto_iam.list_saml_providers(region=None, key=None, keyid=None, profile=None)

List SAML providers.

CLI Example:
salt myminion boto_iam.list_saml_providers

salt.modules.boto_iam.policy_exists(policy_name, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.
CLI Example:
salt myminion boto_iam.instance_profile_exists myiprofile

salt.modules.boto_iam.policy_version_exists(policy_name, version_id, region=None, key=None, keyid=None, profile=None)

Check to see if policy exists.
CLI Example:
salt myminion boto_iam.instance_profile_exists myiprofile

salt.modules.boto_iam.profile_associated(role_name, profile_name, region, key, keyid, profile)

Check to see if an instance profile is associated with an IAM role.
CLI Example:
salt myminion boto_iam.profile_associated myirole myiprofile

salt.modules.boto_iam.put_group_policy(group_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)

Adds or updates the specified policy document for the specified group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.put_group_policy mygroup policynname policyrules

salt.modules.boto_iam.put_user_policy(user_name, policy_name, policy_json, region=None, key=None, keyid=None, profile=None)

Adds or updates the specified policy document for the specified user.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.put_user_policy myuser policynname policyrules

salt.modules.boto_iam.remove_user_from_group(group_name, user_name, region=None, key=None, keyid=None, profile=None)

Remove user from group.
New in version 2015.8.0.
CLI Example:
salt myminion boto_iam.remove_user_from_group mygroup myuser
salt.modules.boto_iam.role_exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an IAM role exists.
CLI Example:

```
salt myminion boto_iam.role_exists myirole
```

salt.modules.boto_iam.set_default_policy_version(policy_name, version_id, region=None, key=None, keyid=None, profile=None)
Set the default version of a policy.
CLI Example:

```
salt myminion boto_iam.set_default_policy_version mypolicy v1
```

salt.modules.boto_iam.update_account_password_policy(allow_users_to_change_password=None, hard_expiry=None, max_password_age=None, minimum_password_length=None, passwordReusePrevention=None, require_lowercase_characters=None, require_numbers=None, require_symbols=None, require_uppercase_characters=None, region=None, key=None, keyid=None, profile=None)
Update the password policy for the AWS account.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.update_account_password_policy True
```

salt.modules.boto_iam.update_assume_role_policy(role_name, policy_document, region=None, key=None, keyid=None, profile=None)
Update an assume role policy for a role.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement":"...
    "\n"
```

salt.modules.boto_iam.update_saml_provider(name, saml_metadata_document, region=None, key=None, keyid=None, profile=None)
Update SAML provider.
CLI Example:

```
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_metadata_document
```

salt.modules.boto_iam.upload_server_cert(cert_name, cert_body, private_key, cert_chain=None, path=None, region=None, key=None, keyid=None, profile=None)
Upload a certificate to Amazon.
New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_iam.upload_server_cert mycert_name crt priv_key
```

**Parameters**

- **cert_name** -- The name for the server certificate. Do not include the path in this value.
- **cert_body** -- The contents of the public key certificate in PEM-encoded format.
- **private_key** -- The contents of the private key in PEM-encoded format.
- **cert_chain** -- The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** -- The path for the server certificate.
- **region** -- The name of the region to connect to.
- **key** -- The key to be used in order to connect
- **keyid** -- The keyid to be used in order to connect
- **profile** -- The profile that contains a dict of region, key, keyid

**Returns**

True / False

```python
salt.modules.boto_iam.user_exists_in_group(
user_name, group_name, region=None, key=None,
keyid=None, profile=None)
```

Check if user exists in group.
New in version 2015.8.0.

CLI Example:

```bash
salt myminion boto_iam.user_exists_in_group myuser mygroup
```

26.6.55 **salt.modules.boto_iot**

Connection module for Amazon IoT
New in version 2016.3.0.

**depends**

- boto
- boto3

The dependencies listed above can be installed via package or pip.

**configuration**

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:
If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
iot.keyid: GKTADJGHEIQXSXMKRBBJ08H
iot.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
iot.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```yaml
myprofile:
  keyid: GKTADJGHEIQXSXMKRBBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

salt.modules.boto_iot.attach_principal_policy(policyName, principal, region=None, key=None, keyid=None, profile=None)

Attach the specified policy to the specified principal (certificate or other credential.)

Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.

CLI Example:
```
salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID
```

salt.modules.boto_iot.create_policy(policyName, policyDocument, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a policy.

Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.

CLI Example:
```
salt myminion boto_iot.create_policy my_policy

'

salt.modules.boto_iot.create_policy_version(policyName, policyDocument, setAsDefault=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, create a new version of a policy.

Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.

CLI Example:
Given a valid config, create a thing type. Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.create_thing_type mythingtype 
thingtype_description_string 
"["searchable_attr_1", "searchable_attr_2"]"
```

Given a valid config, create a topic rule. Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```bash
salt myminion boto_iot.create_topic_rule my_rule 
"SELECT * FROM 'some/thing'

"["lambda":{"functionArn":"arn:aws:lambda:..."},
"sns":{"targetArn":"arn:aws:sns:...","roleArn":"arn:aws:iam...
```

Given a policy name, delete it. Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:

```bash
salt myminion boto_iot.delete_policy mypolicy
```

Given a policy name and version, delete it. Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.

CLI Example:

```bash
salt myminion boto_iot.delete_policy_version mypolicy_version
```

Given a thing type name, delete it.
Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.delete_thing_type mythingtype
```

**salt.modules.boto_iot.delete_topic_rule** *(ruleName, region=None, key=None, keyid=None, profile=None)*

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```bash
salt myminion boto_iot.delete_rule myrule
```

**salt.modules.boto_iot.deprecate_thing_type** *(thingTypeName, undoDeprecate=False, region=None, key=None, keyid=None, profile=None)*

Given a thing type name, deprecate it when undoDeprecate is False and undeprecate it when undoDeprecate is True.

Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:

```bash
salt myminion boto_iot.deprecate_thing_type mythingtype
```

**salt.modules.boto_iot.describe_policy** *(policyName, region=None, key=None, keyid=None, profile=None)*

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_policy mypolicy
```

**salt.modules.boto_iot.describe_policy_version** *(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)*

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```bash
salt myminion boto_iot.describe_policy_version mypolicy version
```

**salt.modules.boto_iot.describe_thing_type** *(thingTypeName, region=None, key=None, keyid=None, profile=None)*

Given a thing type name describe its properties.

Returns a dictionary of interesting properties.

New in version 2016.11.0.
CLI Example:
```
salt myminion boto_iot.describe_thing_type mythingtype
```

`salt.modules.boto_iot.describe_topic_rule` *(ruleName, region=None, key=None, keyid=None, profile=None)*

Given a topic rule name describe its properties.
Returns a dictionary of interesting properties.
CLI Example:
```
salt myminion boto_iot.describe_topic_rule myrule
```

`salt.modules.boto_iot.detach_principal_policy` *(policyName, principal, region=None, key=None, keyid=None, profile=None)*

Detach the specified policy from the specified principal (certificate or other credential.)
Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.
CLI Example:
```
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID
```

`salt.modules.boto_iot.list_policies` *(region=None, key=None, keyid=None, profile=None)*

List all policies
Returns list of policies
CLI Example:
```
salt myminion boto_iot.list_policies
```

Example Return:
```
  policies:
  - {...}
  - {...}
```

`salt.modules.boto_iot.list_policy_versions` *(policyName, region=None, key=None, keyid=None, profile=None)*

List the versions available for the given policy.
CLI Example:
```
salt myminion boto_iot.list_policy_versions mypolicy
```

Example Return:
```
  policyVersions:
  - {...}
  - {...}
```

`salt.modules.boto_iot.list_principal_policies` *(principal, region=None, key=None, keyid=None, profile=None)*

List the policies attached to the given principal.
CLI Example:
salt myminion boto_iot.list_principal_policies myprincipal

Example Return:

```
policies:
- {...}
- {...}
```

salt.modules.boto_iot.list_topic_rules(topic=None, ruleDisabled=None, region=None, key=None, keyid=None, profile=None)

List all rules (for a given topic, if specified)
Returns list of rules
CLI Example:

```
salt myminion boto_iot.list_topic_rules
```

Example Return:

```
rules:
- {...}
- {...}
```

salt.modules.boto_iot.policy_exists(policyName, region=None, key=None, keyid=None, profile=None)

Given a policy name, check to see if the given policy exists.
Returns True if the given policy exists and returns False if the given policy does not exist.
CLI Example:

```
salt myminion boto_iot.policy_exists mypolicy
```

salt.modules.boto_iot.policy_version_exists(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Given a policy name and version ID, check to see if the given policy version exists.
Returns True if the given policy version exists and returns False if the given policy version does not exist.
CLI Example:

```
salt myminion boto_iot.policy_version_exists mypolicy versionid
```

salt.modules.boto_iot.replace_topic_rule(ruleName, sql, actions, description, ruleDisabled=False, region=None, key=None, keyid=None, profile=None)

Given a valid config, replace a topic rule with the new values.
Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.
CLI Example:

```
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.\_thing\" \\
]"["lambda":"functionArn":"arn:::something"],"sns":\"[ "targetArn":"arn:::something","roleArn":"arn:::something"]}']
```
salt.modules.boto_iot.set_default_policy_version(policyName, policyVersionId, region=None, key=None, keyid=None, profile=None)

Sets the specified version of the specified policy as the policy's default (operative) version. This action affects all certificates that the policy is attached to.

Returns {changed: true} if the policy version was set {changed: False} if the policy version was not set.

CLI Example:
```bash
salt myminion boto_iot.set_default_policy_version mypolicy versionid
```

salt.modules.boto_iot.thing_type_exists(thingTypeName, region=None, key=None, keyid=None, profile=None)

Given a thing type name, check to see if the given thing type exists

Returns True if the given thing type exists and returns False if the given thing type does not exist.

New in version 2016.11.0.

CLI Example:
```bash
salt myminion boto_iot.thing_type_exists mythingtype
```

salt.modules.boto_iot.topic_rule_exists(ruleName, region=None, key=None, keyid=None, profile=None)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:
```bash
salt myminion boto_iot.topic_rule_exists myrule
```

26.6.56 salt.modules.boto_kinesis

Connection module for Amazon Kinesis

New in version 2017.7.0.

configuration

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```yaml
kinesis.keyid: GKTADJGHEIQSXMKKRBJ08H
kinesis.key: askdjghsdfjkghWupUjasdflkdkfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```yaml
kinesis.region: us-east-1
```
If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjdkgjsdfajkghs
  region: us-east-1
```

depends
  boto3

```
salt.modules.boto_kinesis.create_stream(stream_name, num_shards, region=None, key=None, keyid=None, profile=None)
```

Create a stream with name stream_name and initial number of shards num_shards.

CLI Example:
```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

```
salt.modules.boto_kinesis.decrease_stream_retention_period(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)
```

Decrease stream retention period to retention_hours

CLI Example:
```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N region=us-east-1
```

```
salt.modules.boto_kinesis.delete_stream(stream_name, region=None, key=None, keyid=None, profile=None)
```

Delete the stream with name stream_name. This cannot be undone! All data will be lost‼

CLI Example:
```
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

```
salt.modules.boto_kinesis.disable_enhanced_monitoring(stream_name, metrics, region=None, key=None, keyid=None, profile=None)
```

Disable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI Example:
```
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics", "to", "disable"] region=us-east-1
```

```
salt.modules.boto_kinesis.enable_enhanced_monitoring(stream_name, metrics, region=None, key=None, keyid=None, profile=None)
```

Enable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI Example:
The salt module for AWS Kinesis provides several functions to manage Kinesis streams. Here are the details of some of these functions:

- **salt.modules.boto_kinesis.exists(stream_name, region=None, key=None, keyid=None, profile=None)**
  - Description: Check if the stream exists. Returns False and the error if it does not.
  - CLI Example:
    ```
    salt myminion boto_kinesis.exists my_stream region=us-east-1
    ```

- **salt.modules.boto_kinesis.get_info_for_reshard(stream_details)**
  - Description: Collect some data: number of open shards, key range, etc. Modifies stream_details to add a sorted list of OpenShards. Returns (min_hash_key, max_hash_key, stream_details).
  - CLI Example:
    ```
    salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
    ```

- **salt.modules.boto_kinesis.get_stream_when_active(stream_name, region=None, key=None, keyid=None, profile=None)**
  - Description: Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error and break.
  - CLI Example:
    ```
    salt myminion boto_kinesis.get_stream_when_active my_stream region=us-east-1
    ```

- **salt.modules.boto_kinesis.increase_stream_retention_period(stream_name, retention_hours, region=None, key=None, keyid=None, profile=None)**
  - Description: Increase stream retention period to retention_hours.
  - CLI Example:
    ```
    salt myminion boto_kinesis.increase_stream_retention_period my_stream retention_hours region=us-east-1
    ```

- **salt.modules.boto_kinesis.list_streams(region=None, key=None, keyid=None, profile=None)**
  - Description: Return a list of all streams visible to the current account.
  - CLI Example:
    ```
    salt myminion boto_kinesis.list_streams
    ```

- **salt.modules.boto_kinesis.long_int(hash_key)**
  - Description: The hash key is a 128-bit int, sent as a string. It's necessary to convert to int/long for comparison operations. This helper method handles python 2/3 incompatibility.
  - CLI Example:
    ```
    salt myminion boto_kinesis.long_int some_MD5_hash_as_string
    ```
Returns
long object if python 2.X, int object if python 3.X

`salt.modules.boto_kinesis.reshard`(*stream_name*, *desired_size*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single split or merge operation. This function decides where to split or merge with the assumption that the ultimate goal is a balanced partition space.

For safety, user must past in `force=True`; otherwise, the function will dry run.

CLI Example:
```
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

Returns
True if a split or merge was found/performed, False if nothing is needed

26.6.57 `salt.modules.boto_kms`

Connection module for Amazon KMS

New in version 2015.8.0.

configuration
This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
```

If IAM roles are not used you need to specify them either in a pillar or in the minion’s config file:

```
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kms.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs region: us-east-1
```

depends
boto

`salt.modules.boto_kms.create_alias`(*alias_name*, *target_key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a display name for a key.

CLI Example:
salt myminion boto_kms.create_alias 'alias/mykey' key_id

```
salt.modules.boto_kms.create_grant(  
    key_id, grantees_principal, retiring_principal=None,  
    operations=None, constraints=None, grant_tokens=None,  
    region=None, key=None, keyid=None, profile=None)
```

Adds a grant to a key to specify who can access the key and under what conditions.

CLI Example:

```
salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::11111111:/role/myrole' operations='["Encrypt","Decrypt"]'
```

salt.modules.boto_kms.create_key(  
    policy=None, description=None, key_usage=None, region=None,  
    key=None, keyid=None, profile=None)

Creates a master key.

CLI Example:

```
salt myminion boto_kms.create_key '{"Statement":...}' "My master key"
```

salt.modules.boto_kms.decrypt(  
    ciphertext_blob, encryption_context=None, grant_tokens=None,  
    region=None, key=None, keyid=None, profile=None)

Decrypt ciphertext.

CLI Example:

```
salt myminion boto_kms.decrypt encrypted_ciphertext
```

salt.modules.boto_kms.describe_key(  
    key_id, region=None, key=None, keyid=None, profile=None)

Get detailed information about a key.

CLI Example:

```
salt myminion boto_kms.describe_key 'alias/mykey'
```

salt.modules.boto_kms.disable_key(  
    key_id, region=None, key=None, keyid=None, profile=None)

Mark key as disabled.

CLI Example:

```
salt myminion boto_kms.disable_key 'alias/mykey'
```

salt.modules.boto_kms.disable_key_rotation(  
    key_id, region=None, key=None, keyid=None, profile=None)

Disable key rotation for specified key.

CLI Example:

```
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

salt.modules.boto_kms.enable_key(  
    key_id, region=None, key=None, keyid=None, profile=None)

Mark key as enabled.

CLI Example:
salt.myminion boto_kms.enable_key 'alias/mykey'

salt.modules.boto_kms.enable_key_rotation(key_id, region=None, key=None, keyid=None, profile=None)

Disable key rotation for specified key.

CLI Example:

```
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

salt.modules.boto_kms.encrypt(key_id, plaintext, encryption_context=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Encrypt plaintext into cipher text using specified key.

CLI Example:

```
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaindata' '{"aws:username": "myuser"}'
```

salt.modules.boto_kms.generate_data_key(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key.

CLI Example:

```
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.generate_data_key_without_plaintext(key_id, encryption_context=None, number_of_bytes=None, key_spec=None, grant_tokens=None, region=None, key=None, keyid=None, profile=None)

Generate a secure data key without a plaintext copy of the key.

CLI Example:

```
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey' number_of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.generate_random(number_of_bytes=None, region=None, key=None, keyid=None, profile=None)

Generate a random string.

CLI Example:

```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

salt.modules.boto_kms.get_key_policy(key_id, policy_name, region=None, key=None, keyid=None, profile=None)

Get the policy for the specified key.
CLI Example:

```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

`salt.modules.boto_kms.get_key_rotation_status` *(key_id, region=none, key=none, keyid=none, profile=none)*

Get status of whether or not key rotation is enabled for a key.

CLI Example:

```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

`salt.modules.boto_kms.key_exists` *(key_id, region=none, key=none, keyid=none, profile=none)*

Check for the existence of a key.

CLI Example:

```
salt myminion boto_kms.key_exists 'alias/mykey'
```

`salt.modules.boto_kms.list_grants` *(key_id, limit=none, marker=none, region=none, key=none, keyid=none, profile=none)*

List grants for the specified key.

CLI Example:

```
salt myminion boto_kms.list_grants 'alias/mykey'
```

`salt.modules.boto_kms.list_key_policies` *(key_id, limit=none, marker=none, region=none, key=none, keyid=none, profile=none)*

List key_policies for the specified key.

CLI Example:

```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

`salt.modules.boto_kms.put_key_policy` *(key_id, policy_name, policy, region=none, key=none, keyid=none, profile=none)*

Attach a key policy to the specified key.

CLI Example:

```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

`salt.modules.boto_kms.re_encrypt` *(ciphertext_blob, destination_key_id, source_encryption_context=none, destination_encryption_context=none, grant_tokens=none, region=none, key=none, keyid=none, profile=none)*

Reencrypt encrypted data with a new master key.

CLI Example:

```
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{"Statement":...}''
salt.modules.boto_kms.revoke_grant(key_id, grant_id, region=None, key=None, keyid=None, profile=None)

Revoke a grant from a key.

CLI Example:

```bash
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

salt.modules.boto_kms.update_key_description(key_id, description, region=None, key=None, keyid=None, profile=None)

Update a key's description.

CLI Example:

```bash
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

26.6.58 salt.modules.boto_lambda

Connection module for Amazon Lambda

New in version 2016.3.0.

```
depends
  • boto
  • boto3
```

The dependencies listed above can be installed via package or pip.

configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQXSXMZRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQXSXMZRBJ08H
  key: askdjghsdfjkghWupUjasdflkdklgjsdfjajkghs
  region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```
Request methods (e.g., `describe_function`) return:

```python
function:
- {...}
- {...}
```

or

```python
error:
  message: error message
```

salt.modules.boto_lambda.add_permission(FunctionName, StatementId, Action, Principal, SourceArn=None, SourceAccount=None, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Add a permission to a lambda function.

Returns `{added: true}` if the permission was added and returns `{added: False}` if the permission was not added.

CLI Example:

```bash
salt myminion boto_lamba.add_permission my_function my_id "lambda:*" \
  s3.amazonaws.com aws:arn:::bucket-name \
  aws-account-id
```

salt.modules.boto_lambda.alias_exists(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name, check to see if the given alias exists.

Returns `True` if the given alias exists and returns `False` if the given alias does not exist.

CLI Example:

```bash
salt myminion boto_lambda.alias_exists myfunction myalias
```

salt.modules.boto_lambda.create_alias(FunctionName, Name, FunctionVersion, Description='', region=None, key=None, keyid=None, profile=None)

Given a valid config, create an alias to a function.

Returns `{created: true}` if the alias was created and returns `{created: False}` if the alias was not created.

CLI Example:

```bash
salt myminion boto_lamba.create_alias my_function my_alias $LATEST "An" \
  ^alias"
```

salt.modules.boto_lambda.create_event_source_mapping(EventSourceArn, FunctionName, StartingPosition, Enabled=True, BatchSize=100, region=None, key=None, keyid=None, profile=None)
Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the stream.

Returns {created: true} if the event source mapping was created and returns {created: False} if the event source mapping was not created.

CLI Example:
```
salt myminion boto_lamba.create_event_source_mapping arn::::eventsource\n  → myfunction LATEST
```

salt.modules.boto_lambda.create_function(FunctionName, Runtime, Role, Handler, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Description='', Timeout=3, MemorySize=128, Publish=False, WaitForRole=False, RoleRetries=5, region=None, key=None, keyid=None, profile=None, VpcConfig=None, Environment=None)

New in version 2017.7.0.

Given a valid config, create a function.

Environment

The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
   'Variables': {
      'VariableName': 'VariableValue'
   }
}
```

Returns {'created': True} if the function was created and {created: False} if the function was not created.

CLI Example:
```
salt myminion boto_lamba.create_function my_function python2.7 my_role my_\n  → file.my_function my_function.zip
salt myminion boto_lamba.create_function my_function python2.7 my_role my_\n  → file.my_function salt://files/my_function.zip
```

salt.modules.boto_lambda.delete_alias(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name, delete the alias.

Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:
```
salt myminion boto_lamba.delete_alias myfunction myalias
```

salt.modules.boto_lambda.delete_event_source_mapping(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)
Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping.

Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_event_source_mapping 260c423d-e8b5-4443-8d6a-5e91b9ecd0fa
```

**salt.modules.boto_lambda.delete_function**(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Given a function name and optional version qualifier, delete it.

Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_function myfunction
```

**salt.modules.boto_lambda.describe_alias**(FunctionName, Name, region=None, key=None, keyid=None, profile=None)

Given a function name and alias name describe the properties of the alias.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_alias myalias
```

**salt.modules.boto_lambda.describe_event_source_mapping**(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)

Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_event_source_mapping uuid
```

**salt.modules.boto_lambda.describe_function**(FunctionName, region=None, key=None, keyid=None, profile=None)

Given a function name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_function myfunction
```

**salt.modules.boto_lambda.event_source_mapping_exists**(UUID=None, EventSourceArn=None, FunctionName=None, region=None, key=None, keyid=None, profile=None)
Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:
```
salt myminion boto_lambda.alias_exists myfunction myalias
```

salt.modules.boto_lambda.function_exists(FunctionName, region=None, key=None, keyid=None, profile=None)

Given a function name, check to see if the given function name exists.

Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:
```
salt myminion boto_lambda.function_exists myfunction
```

salt.modules.boto_lambda.get_event_source_mapping_ids(EventSourceArn, FunctionName, region=None, key=None, keyid=None, profile=None)

Given an event source and function name, return a list of mapping IDs

CLI Example:
```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

salt.modules.boto_lambda.get_permissions(FunctionName, Qualifier=None, region=None, key=None, keyid=None, profile=None)

Get resource permissions for the given lambda function

Returns dictionary of permissions, by statement ID

CLI Example:
```
salt myminion boto_lamba.get_permissions my_function
permissions: {...}
```

salt.modules.boto_lambda.list_function_versions(FunctionName, region=None, key=None, keyid=None, profile=None)

List the versions available for the given function.

Returns list of function versions

CLI Example:
```
versions:
  - {...}
  - {...}
```

salt.modules.boto_lambda.list_functions(region=None, key=None, keyid=None, profile=None)

List all Lambda functions visible in the current scope.

CLI Example:
salt myminion boto_lambda.list_functions

```
salt.modules.boto_lambda.remove_permission(FunctionName, StatementId, Qualifier=None, region=None, key=None, keyid=None, profile=None)
```

Remove a permission from a lambda function.

Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.

CLI Example:

```
salt myminion boto_lambda.remove_permission my_function my_id
```

```
salt.modules.boto_lambda.update_alias(FunctionName, Name, FunctionVersion=None, Description=None, region=None, key=None, keyid=None, profile=None)
```

Update the named alias to the configuration.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lambda.update_alias my_lambda my_alias $LATEST
```

```
salt.modules.boto_lambda.update_event_source_mapping(UUID, FunctionName=None, Enabled=None, BatchSize=None, region=None, key=None, keyid=None, profile=None)
```

Update the event source mapping identified by the UUID.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lambda.update_event_source_mapping uuid→ FunctionName=new_function
```

```
salt.modules.boto_lambda.update_function_code(FunctionName, ZipFile=None, S3Bucket=None, S3Key=None, S3ObjectVersion=None, Publish=False, region=None, key=None, keyid=None, profile=None)
```

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.

CLI Example:

```
salt myminion boto_lambda.update_function_code my_function→ ZipFile=function.zip
```

```
salt.modules.boto_lambda.update_function_config(FunctionName, Role=None, Handler=None, Description=None, Timeout=None, MemorySize=None, region=None, key=None, keyid=None, profile=None, VpcConfig=None, WaitForRole=False, RoleRetries=5, Environment=None)
```

Update the function configuration with the given parameters.
New in version 2017.7.0.

Update the named lambda function to the configuration.

**Environment**

The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns {'updated': True} if the function was updated, and {'updated': False} if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_config my_function my_role my_
    → file.my_function "my lambda function"
```

**26.6.59 salt.modules.boto_rds**

Connection module for Amazon RDS

New in version 2015.8.0.

**configuration**

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
    → amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
[rds.keyid]: GKTADJGHEIQSXMKKRBJ08H
[rds.key]: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
[rds.region]: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
[myprofile]:
    [keyid]: GKTADJGHEIQSXMKKRBJ08H
    [key]: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    [region]: us-east-1
```
depends
doctorpython

salt.modules.boto_rds.create(name, allocated_storage, db_instance_class, engine, master_username, master_user_password, db_name=None, db_security_groups=None, vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None, db_subnet_group_name=None, preferred_maintenance_window=None, db_parameter_group_name=None, backup_retention_period=None, preferred_backup_window=None, port=None, multi_az=None, engine_version=None, auto_minor_version_upgrade=None, license_model=None, iops=None, option_group_name=None, character_set_name=None, publicly_accessible=None, wait_status=None, tags=None, db_cluster_identifier=None, storage_type=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, domain_iam_role_name=None, region=None, promotion_tier=None, key=None, keyid=None, profile=None)

Create an RDS Instance

CLI example to create an RDS Instance:

```bash
salt myminion boto_rds.create myrds t2.micro MySQL sqlusr sqlpassw
```

salt.modules.boto_rds.create_option_group(name, engine_name, major_engine_version, option_group_description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS option group

CLI example to create an RDS option group:

```bash
salt myminion boto_rds.create_option_group my-opt-group mysql 5.6
```

salt.modules.boto_rds.create_parameter_group(name, db_parameter_group_family, description, tags=None, region=None, key=None, keyid=None, profile=None)

Create an RDS parameter group

CLI example to create an RDS parameter group:

```bash
salt myminion boto_rds.create_parameter_group my-param-group mysql5.6
```

salt.modules.boto_rds.create_read_replica(name, source_name, db_instance_class=None, availability_zone=None, port=None, auto_minor_version_upgrade=None, iops=None, option_group_name=None, publicly_accessible=None, tags=None, db_subnet_group_name=None, storage_type=None, copy_tags_to_snapshot=None, monitoring_interval=None, monitoring_role_arn=None, region=None, key=None, keyid=None, profile=None)

Create an RDS read replica
CLI example to create an RDS read replica:
```
salt myminion boto_rds.create_read_replica replicaname source_name
```

```
salt.modules.boto_rds.create_subnet_group(name, description, subnet_ids, tags=None, region=None, key=None, keyid=None, profile=None)
```

Create an RDS subnet group

CLI example to create an RDS subnet group:
```
salt myminion boto_rds.create_subnet_group my-subnet-group → "group description" '[subnet-12345678, subnet-87654321]' → region=us-east-1
```

```
salt.modules.boto_rds.delete(name, skip_final_snapshot=None, final_db_snapshot_identifier=None, region=None, key=None, keyid=None, profile=None, tags=None, wait_for_deletion=True, timeout=180)
```

Delete an RDS instance.

CLI Example:
```
salt myminion boto_rds.delete myrds skip_final_snapshot=True → region=us-east-1
```

```
salt.modules.boto_rds.delete_option_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete an RDS option group.

CLI Example:
```
salt myminion boto_rds.delete_option_group my-opt-group → region=us-east-1
```

```
salt.modules.boto_rds.delete_parameter_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete an RDS parameter group.

CLI Example:
```
salt myminion boto_rds.delete_parameter_group my-param-group → region=us-east-1
```

```
salt.modules.boto_rds.delete_subnet_group(name, region=None, key=None, keyid=None, profile=None)
```

Delete an RDS subnet group.

CLI Example:
```
salt myminion boto_rds.delete_subnet_group my-subnet-group → region=us-east-1
```

```
salt.modules.boto_rds.describe(name, tags=None, region=None, key=None, keyid=None, profile=None)
```

Return RDS instance details.

CLI Example:
salt myminion boto_rds.describe myrds

salt.modules.boto_rds.describe_db_instances(name=None, filters=None, jmespath='DBInstances', region=None, key=None, keyid=None, profile=None)

Return a detailed listing of some, or all, DB Instances visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI Example:

carnival salt myminion boto_rds.describe_db_instances jmespath='DBInstances[*].DBInstanceIdentifier'

salt.modules.boto_rds.describe_db_subnet_groups(name=None, filters=None, jmespath='DBSubnetGroups', region=None, key=None, keyid=None, profile=None)

Return a detailed listing of some, or all, DB Subnet Groups visible in the current scope. Arbitrary subelements or subsections of the returned dataset can be selected by passing in a valid JMSEPath filter as well.

CLI Example:

carnival salt myminion boto_rds.describe_db_subnet_groups

salt.modules.boto_rds.describe_parameter_group(name=None, Filters=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)

Returns a list of DBParameterGroup descriptions. CLI example to description of parameter group:

carnival salt myminion boto_rds.describe_parameter_group parametergroupname region=us-east-1

salt.modules.boto_rds.describe_parameters(name=None, Source=None, MaxRecords=None, Marker=None, region=None, key=None, keyid=None, profile=None)

Returns a list of DBParameterGroup parameters. CLI example to description of parameters

carnival salt myminion boto_rds.describe_parameters parametergroupname region=us-east-1

salt.modules.boto_rds.exists(name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Check to see if an RDS exists.

CLI Example:

carnival salt myminion boto_rds.exists myrds region=us-east-1

salt.modules.boto_rds.get_endpoint(name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Return the endpoint of an RDS instance.

CLI Example:

carnival salt myminion boto_rds.get_endpoint myrds
salt.modules.boto_rds.modify_db_instance(name, allocated_storage=None,
allow_major_version_upgrade=None,
apply_immediately=None,
allow_minor_version_upgrade=None,
backup_retention_period=None,
ca_certificate_identifier=None,
character_set_name=None,
copy_tags_to_snapshot=None,
db_cluster_identifier=None, db_instance_class=None,
db_name=None, db_parameter_group_name=None,
db_port_number=None, db_security_groups=None,
db_subnet_group_name=None, domain=None,
domain_iam_role_name=None, engine_version=None,
iops=None, kms_key_id=None, license_model=None,
master_user_password=None,
monitoring_interval=None, monitoring_role_arn=None,
multi_az=None, new_db_instance_identifier=None,
option_group_name=None,
pREFERRED_backup_window=None,
pREFERRED_maintenance_window=None,
promotion_tier=None, publicly_accessible=None,
storage_encrypted=None, storage_type=None,
tde_credential_arn=None,
tde_credential_password=None,
vpc_security_group_ids=None,
region=None, key=None,
keyid=None, profile=None)

Modify settings for a DB instance. CLI example to description of parameters

```
salt myminion boto_rds.modify_db_instance db_instance_identifier
  → region=us-east-1
```

salt.modules.boto_rds.option_group_exists(name, tags=None, region=None, key=None,
keyid=None, profile=None)

Check to see if an RDS option group exists.

CLI Example:

```
salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1
```

salt.modules.boto_rds.parameter_group_exists(name, tags=None, region=None, key=None,
keyid=None, profile=None)

Check to see if an RDS parameter group exists.

CLI Example:

```
salt myminion boto_rds.parameter_group_exists myparametergroup
  → region=us-east-1
```

salt.modules.boto_rds.subnet_group_exists(name, tags=None, region=None, key=None,
keyid=None, profile=None)

Check to see if an RDS subnet group exists.

CLI Example:
Update an RDS parameter group.

CLI Example:

```bash
salt myminion boto_rds.update_parameter_group my-param-group
  → region=us-east-1
```

salt.modules.boto_rds.update_parameter_group(name, parameters,
apply_method='pending-reboot', tags=None,
region=None, key=None, keyid=None,
profile=None)

26.6.60 salt.modules.boto_route53

Connection module for Amazon Route53

New in version 2014.7.0.

configuration

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

If a region is not specified, the default is 'universal', which is what the boto_route53 library expects, rather than None.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends

boto
salt.modules.boto_route53.add_record(name, value, zone, record_type, identifier=None, ttl=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)

Add a record to a zone.

CLI Example:

```
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.org A
```

**retry_on_errors**  
Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries**  
Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

salt.modules.boto_route53.create_healthcheck(ip_addr=None, fqdn=None, region=None, key=None, keyid=None, profile=None, port=53, hc_type='TCP', resource_path='', string_match=None, request_interval=30, failure_threshold=3, retry_on_errors=True, error_retries=5)

Create a Route53 healthcheck

New in version 2018.3.0.

**ip_addr**  
IP address to check. `ip_addr` or `fqdn` is required.

**fqdn**  
Domain name of the endpoint to check. `ip_addr` or `fqdn` is required

**port**  
Port to check

**hc_type**  
Healthcheck type. HTTP | HTTPS | HTTP_STR_MATCH | HTTPS_STR_MATCH | TCP

**resource_path**  
Path to check

**string_match**  
If `hc_type` is HTTP_STR_MATCH or HTTPS_STR_MATCH, the string to search for in the response body from the specified resource

**request_interval**  
The number of seconds between the time that Amazon Route 53 gets a response from your endpoint and the time that it sends the next health-check request.
failure_threshold
The number of consecutive health checks that an endpoint must pass or fail for Amazon Route 53 to change the current status of the endpoint from unhealthy to healthy or vice versa.

region
Region endpoint to connect to

key
AWS key

keyid
AWS keyid

profile
AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_healthcheck 192.168.0.1
salt myminion boto_route53.create_healthcheck 192.168.0.1 port=443 hc_type=HTTPS
<resource_path>/fqdn=blog.saltstack.furniture
```

salt.modules.boto_route53.create_hosted_zone

```
domain_name, caller_ref=None, comment='',
private_zone=False, vpc_id=None,
vpc_name=None, vpc_region=None, region=None,
key=None, keyid=None, profile=None
```

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

domain_name
The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

caller_ref
A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. It can take several minutes for the change to replicate globally, and change from PENDING to INSYNC status. Thus it’s best to provide some value for this where possible, since duplicate calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created. On the other hand, if a zone is created with a given caller_ref, then deleted, a second attempt to create a zone with the same caller_ref will fail until that caller_ref is flushed from the Route53 system, which can take upwards of 24 hours.

comment
Any comments you want to include about the hosted zone.

private_zone
Set True if creating a private hosted zone.

vpc_id
When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_name. Ignored when creating a non-private zone.

vpc_name
When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_id. Ignored when creating a non-private zone.
vpc_region
When creating a private hosted zone, the region of the associated VPC is required. If not provided, an
effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you'll need to
provide an explicit value for this option. Ignored when creating a non-private zone.

region
Region endpoint to connect to.

key
AWS key to bind with.

keyid
AWS keyid to bind with.

profile
Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```sh
salt myminion boto_route53.create_hosted_zone example.org
```

```
salt.modules.boto_route53.create_zone(zone, private=True, vpc_id=None, vpc_region=None,
region=None, key=None, keyid=None, profile=None)
```

Create a Route53 hosted zone.
New in version 2015.8.0.

zone
DNS zone to create

private
True/False if the zone will be a private zone

vpc_id
VPC ID to associate the zone to (required if private is True)

vpc_region
VPC Region (required if private is True)

region
region endpoint to connect to

key
AWS key

keyid
AWS keyid

profile
AWS pillar profile

CLI Example:

```sh
salt myminion boto_route53.create_zone example.org
```

```
salt.modules.boto_route53.delete_record(name, zone, record_type, identifier=None,
all_records=False, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False,
private_zone=False, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True,
error_retries=5)
```
Modify a record in a zone.

CLI Example:

```
salt myminion boto_route53.delete_record test.example.org example.org A
```

**retry_on_errors**
Continue to query if the zone exists after an error is raised. The previously used argument `retry_on_rate_limit` was deprecated for this argument. Users can still use `retry_on_rate_limit` to ensure backwards compatibility, but please migrate to using the favored `retry_on_errors` argument instead.

**error_retries**
Number of times to attempt to query if the zone exists. The previously used argument `rate_limit_retries` was deprecated for this arguments. Users can still use `rate_limit_retries` to ensure backwards compatibility, but please migrate to using the favored `error_retries` argument instead.

salt.modules.boto_route53.delete_zone(zone, region=None, key=None, keyid=None, profile=None)
Delete a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.delete_zone example.org
```

salt.modules.boto_route53.describe_hosted_zones( zone_id=None, domain_name=None, region=None, key=None, keyid=None, profile=None)
Return detailed info about one, or all, zones in the bound account. If neither zone_id nor domain_name is provided, return all zones. Note that the return format is slightly different between the 'all' and 'single' description types.

**zone_id**
The unique identifier for the Hosted Zone

**domain_name**
The FQDN of the Hosted Zone (including final period)

**region**
Region to connect to.

**key**
Secret key to be used.

**keyid**
Access key to be used.

**profile**
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com. → profile='{"region": "us-east-1", "keyid": "A12345678AB", → "key": "xblahblahblah"}'}
```
salt.modules.boto_route53.get_record(name, zone, record_type, fetch_all=False, region=None, key=None, keyid=None, profile=None, split_dns=False, private_zone=False, identifier=None, retry_on_rate_limit=None, rate_limit_retries=None, retry_on_errors=True, error_retries=5)

Get a record from a zone.

CLI Example:
```
salt myminion boto_route53.get_record test.example.org example.org A
```

retry_on_errors
Continue to query if the zone exists after an error is raised. The previously used argument retry_on_rate_limit was deprecated for this argument. Users can still use retry_on_rate_limit to ensure backwards compatibility, but please migrate to using the favored retry_on_errors argument instead.

error_retries
Number of times to attempt to query if the zone exists. The previously used argument rate_limit_retries was deprecated for this arguments. Users can still use rate_limit_retries to ensure backwards compatibility, but please migrate to using the favored error_retries argument instead.

salt.modules.boto_route53.list_all_zones_by_id(region=None, key=None, keyid=None, profile=None)

List, by their IDs, all hosted zones in the bound account.

region
Region to connect to.

key
Secret key to be used.

keyid
Access key to be used.

profile
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:
```
salt myminion boto_route53.list_all_zones_by_id
```

salt.modules.boto_route53.list_all_zones_by_name(region=None, key=None, keyid=None, profile=None)

List, by their FQDNs, all hosted zones in the bound account.

region
Region to connect to.

key
Secret key to be used.

keyid
Access key to be used.

profile
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:
Modify a record in a zone.

CLI Example:
```bash
salt myminion boto_route53.modify_record test.example.org 1.1.1.example.org A
```
26.6.61 salt.modules.boto_s3

Connection module for Amazon S3 using boto3

New in version 2018.3.0.

configuration

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends

boto3

salt.modules.boto_s3.get_object_metadata(name, extra_args=None, region=None, key=None, keyid=None, profile=None)

Get metadata about an S3 object. Returns None if the object does not exist.

You can pass AWS SSE-C related args and/or RequestPayer in extra_args.

CLI Example:

```
salt myminion boto_s3.get_object_metadata /my_bucket/path/to/object
    region=us-east-1
    key=key
    keyid=keyid
    profile=profile
```
salt.modules.boto_s3.upload_file(source, name, extra_args=None, region=None, key=None, keyid=None, profile=None)

Upload a local file as an S3 object.

CLI Example:
```
salt myminion boto_s3.upload_file /path/to/local/file my_bucket/path/to/object region=us-east-1 key=key keyid=keyid profile=profile
```

26.6.62 salt.modules.boto_s3_bucket

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration

This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
[conf]
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

A region may also be specified in the configuration:

[conf]
s3.region: us-east-1

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```
salt.modules.boto_s3_bucket.create(Bucket, ACL=None, LocationConstraint=None, GrantFullControl=None, GrantRead=None, GrantReadACP=None, GrantWrite=None, GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)

Given a valid config, create an S3 Bucket.

Returns [created: true] if the bucket was created and returns [created: False] if the bucket was not created.

CLI Example:

```
salt myminion boto_s3_bucket.create my_bucket
    GrantFullControl='emailaddress@example@example.com'
    GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"'
    GrantReadACP='emailaddress="exampl@example.com",id="2345678909876432"'
    LocationConstraint=us-west-1
```

salt.modules.boto_s3_bucket.delete(Bucket, MFA=None, RequestPayer=None, Force=False, region=None, key=None, keyid=None, profile=None)

Given a bucket name, delete it, optionally emptying it first.

Returns [deleted: true] if the bucket was deleted and returns [deleted: False] if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

salt.modules.boto_s3_bucket.delete_cors(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the CORS configuration for the given bucket.

Returns [deleted: true] if CORS was deleted and returns [deleted: False] if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

salt.modules.boto_s3_bucket.delete_lifecycle_configuration(Bucket, region=None, key=None, keyid=None, profile=None)

Delete the lifecycle configuration for the given bucket.

Returns [deleted: true] if Lifecycle was deleted and returns [deleted: False] if Lifecycle was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

salt.modules.boto_s3_bucket.delete_objects(Bucket, Delete, MFA=None, RequestPayer=None, region=None, key=None, keyid=None, profile=None)

Delete objects in a given S3 bucket.

Returns [deleted: true] if all objects were deleted and [deleted: false, failed: [key, ...]] otherwise.

CLI Example:
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key:8
    →myobject]}'

salt.modules.boto_s3_bucket.delete_policy(Bucket, region=None, key=None, keyid=None,
    profile=None)

    Delete the policy from the given bucket
    Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.
    CLI Example:
    salt myminion boto_s3_bucket.delete_policy my_bucket

salt.modules.boto_s3_bucket.delete_replication(Bucket, region=None, key=None, keyid=None,
    profile=None)

    Delete the replication config from the given bucket
    Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication config-
    uration was not deleted.
    CLI Example:
    salt myminion boto_s3_bucket.delete_replication my_bucket

salt.modules.boto_s3_bucket.delete_tagging(Bucket, region=None, key=None, keyid=None,
    profile=None)

    Delete the tags from the given bucket
    Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.
    CLI Example:
    salt myminion boto_s3_bucket.delete_tagging my_bucket

salt.modules.boto_s3_bucket.delete_website(Bucket, region=None, key=None, keyid=None,
    profile=None)

    Remove the website configuration from the given bucket
    Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration
    was not deleted.
    CLI Example:
    salt myminion boto_s3_bucket.delete_website my_bucket

salt.modules.boto_s3_bucket.describe(Bucket, region=None, key=None, keyid=None, profile=None)

    Given a bucket name describe its properties.
    Returns a dictionary of interesting properties.
    CLI Example:
    salt myminion boto_s3_bucket.describe mybucket

salt.modules.boto_s3_bucket.empty(Bucket, MFA=None, RequestPayer=None, region=None, key=None,
    keyid=None, profile=None)

    Delete all objects in a given S3 bucket.
Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.empty mybucket
```

`salt.modules.boto_s3_bucket.exists(Bucket, region=None, key=None, keyid=None, profile=None)`

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

`salt.modules.boto_s3_bucket.list(region=None, key=None, keyid=None, profile=None)`

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
  - {...}
  - {...}
```

`salt.modules.boto_s3_bucket.list_object_versions(Bucket, Delimiter=None, EncodingType=None, Prefix=None, region=None, key=None, keyid=None, profile=None)`

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

`salt.modules.boto_s3_bucket.list_objects(Bucket, Delimiter=None, EncodingType=None, Prefix=None, FetchOwner=False, StartAfter=None, region=None, key=None, keyid=None, profile=None)`

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

`salt.modules.boto_s3_bucket.put_acl(Bucket, ACL=None, AccessControlPolicy=None,
  GrantFullControl=None, GrantRead=None,
  GrantReadACP=None, GrantWrite=None,
  GrantWriteACP=None, region=None, key=None, keyid=None, profile=None)`

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.
CLI Example:

```bash
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \
    GrantFullControl='emailaddress@example@example.com' \
    GrantRead='uri=http://acs.amazonaws.com/groups/global/\n    AllUsers' \
    GrantReadACP='emailaddress="exampl@example.com",id=\n    "2345678909876432'"
```

```
salt.modules.boto_s3_bucket.put_cors(Bucket, CORSRules, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the CORS rules for a bucket.
Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:

```bash
salt myminion boto_s3_bucket.put_cors my_bucket "[\n    "AllowedHeaders": [],\n    "AllowedMethods": ["GET"],\n    "AllowedOrigins": ["*"],\n    "ExposeHeaders": [],\n    "MaxAgeSeconds": 123,\n]"
```

```
salt.modules.boto_s3_bucket.put_lifecycle_configuration(Bucket, Rules, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the Lifecycle rules for a bucket.
Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

```bash
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket "[\n    "Expiration": {...},\n    "ID": "idstring",\n    "Prefix": "prefixstring",\n    "Status": "enabled",\n    "Transitions": [{...}],\n    "NoncurrentVersionTransitions": [{...}],\n    "NoncurrentVersionExpiration": {...}\n]"
```

```
salt.modules.boto_s3_bucket.put_logging(Bucket, TargetBucket=None, TargetPrefix=None, TargetGrants=None, region=None, key=None, keyid=None, profile=None)
```

Given a valid config, update the logging parameters for a bucket.
Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```bash
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket "[...]
\n    prefix"
```
salt.modules.boto_s3_bucket.put_notification_configuration(Bucket,
    TopicConfigurations=None,
    QueueConfigurations=None,
    LambdaFunctionConfigurations=None,
    region=None,
    key=None,
    keyid=None,
    profile=None)

Given a valid config, update the notification parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```python
salt myminion boto_s3_bucket.put_notification_configuration my_bucket [{...}] \
[{...}] \
[{...]}
```

salt.modules.boto_s3_bucket.put_policy(Bucket, Policy, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the policy for a bucket.

Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:

```python
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

salt.modules.boto_s3_bucket.put_replication(Bucket, Role, Rules, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the replication configuration for a bucket.

Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:

```python
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

salt.modules.boto_s3_bucket.put_request_payment(Bucket, Payer, region=None, key=None, keyid=None, profile=None)

Given a valid config, update the request payment configuration for a bucket.

Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:

```python
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

salt.modules.boto_s3_bucket.put_tagging(Bucket, region=None, key=None, keyid=None, profile=None, **kwargs)

Given a valid config, update the tags for a bucket.

Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.

CLI Example:
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]

salt.modules.boto_s3_bucket.\texttt{put\_versioning}(\texttt{Bucket}, \texttt{Status}, \texttt{MFADelete=\texttt{None}}, \texttt{MFA=\texttt{None}}, \texttt{region=\texttt{None}}, \texttt{key=\texttt{None}}, \texttt{keyid=\texttt{None}}, \texttt{profile=\texttt{None}})

Given a valid config, update the versioning configuration for a bucket.

Returns \{\texttt{updated}: \texttt{true}\} if versioning configuration was updated and returns \{\texttt{updated}: \texttt{False}\} if versioning configuration was not updated.

CLI Example:

\texttt{salt myminion boto_s3_bucket.put\_versioning my_bucket Enabled}

salt.modules.boto_s3_bucket.\texttt{put\_website}(\texttt{Bucket}, \texttt{ErrorDocument=\texttt{None}}, \texttt{IndexDocument=\texttt{None}}, \texttt{RedirectAllRequestsTo=\texttt{None}}, \texttt{RoutingRules=\texttt{None}}, \texttt{region=\texttt{None}}, \texttt{key=\texttt{None}}, \texttt{keyid=\texttt{None}}, \texttt{profile=\texttt{None}})

Given a valid config, update the website configuration for a bucket.

Returns \{\texttt{updated}: \texttt{true}\} if website configuration was updated and returns \{\texttt{updated}: \texttt{False}\} if website configuration was not updated.

CLI Example:

\texttt{salt myminion boto_s3_bucket.put\_website my_bucket IndexDocument='\{"Suffix \\n\rightarrow ':'index.html''\}'

\textbf{26.6.63 salt.modules.boto_secgroup}

Connection module for Amazon Security Groups

New in version 2014.7.0.

\textbf{configuration}

This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

\url{http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html}

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

\texttt{secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H}
\texttt{secgroup.key: askdjghsdfjkghWupUjasdflkdkflgjsdfjajkghs}

A region may also be specified in the configuration:

\texttt{secgroup.region: us-east-1}

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkldfklgjsdfjajkght
  region: us-east-1

depends
  boto

salt.modules.boto_secgroup.authorize(name=None, source_group_name=None,
  source_group_owner_id=None, ip_protocol=None,
  from_port=None, to_port=None, cidr_ip=None,
  group_id=None, source_group_group_id=None, region=None,
  key=None, keyid=None, profile=None, vpc_id=None,
  vpc_name=None, egress=False)

Add a new rule to an existing security group.

CLI Example:

```
salt myminion boto_secgroup.authorize mysecgroup
  ip_protocol=tcp
  from_port=80
  to_port=80
cidr_ip='["10.0.0.0/8", "192.168.0.0/24"]'
```

salt.modules.boto_secgroup.convert_to_group_ids(groups, vpc_id=None,
  vpc_name=None, region=None, key=None, keyid=None,
  profile=None)

Given a list of security groups and a vpc_id, convert_to_group_ids will convert all list items in the given list to security group ids.

CLI Example:

```
salt myminion boto_secgroup.convert_to_group_ids mysecgroup
  vpc-89yhh7h
```

salt.modules.boto_secgroup.create(name, description, vpc_id=None,
  vpc_name=None, region=None, key=None, keyid=None,
  profile=None)

Create a security group.

CLI Example:

```
salt myminion boto_secgroup.create mysecgroup
  "'My Security Group'"
```

salt.modules.boto_secgroup.delete(name=None, group_id=None, region=None,
  key=None, keyid=None, profile=None, vpc_id=None,
  vpc_name=None)

Delete a security group.

CLI Example:

```
salt myminion boto_secgroup.delete mysecgroup
```

salt.modules.boto_secgroup.delete_tags(tags, name=None, group_id=None,
  vpc_name=None, vpc_id=None, region=None, key=None, keyid=None,
  profile=None)

Deletes tags from a security group.

New in version 2016.3.0.

tags
  a list of tags to remove
name
    the name of the security group

group_id
    the group id of the security group (in lieu of a name/vpc combo)

vpc_name
    the name of the vpc to search the named group for

vpc_id
    the id of the vpc, in lieu of the vpc_name

region
    the amazon region

key
    amazon key

keyid
    amazon keyid

profile
    amazon profile

CLI Example:
```
salt myminion boto_secgroup.delete_tags ['TAG_TO_DELETE1', 'TAG_TO_DELETE2'] security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

```
salt.modules.boto_secgroup.exists(name=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, group_id=None)
```

Check to see if a security group exists.

CLI Example:
```
salt myminion boto_secgroup.exists mysecgroup
```

```
salt.modules.boto_secgroup.get_all_security_groups(groupnames=None, group_ids=None, filters=None, region=None, key=None, keyid=None, profile=None)
```

Return a list of all Security Groups matching the given criteria and filters.

Note that the groupnames argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you’ll want to use the group-name filter instead.

The valid keys for the filters argument can be found in AWS's API documentation.

CLI Example:
```
salt myminion boto_secgroup.get_all_security_groups filters='\{group-name:\"mygroup\"\}'
```

```
salt.modules.boto_secgroup.get_config(name=None, group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None)
```

Get the configuration for a security group.

CLI Example:
```
salt myminion boto_secgroup.get_config mysecgroup
```
salt.modules.boto_secgroup.get_group_id(name, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Get a Group ID given a Group Name or Group Name and VPC ID

CLI Example:
```
salt myminion boto_secgroup.get_group_id mysecgroup
```

salt.modules.boto_secgroup.revoke(name=None, source_group_name=None, source_group_owner_id=None, ip_protocol=None, from_port=None, to_port=None, cidr_ip=None, group_id=None, source_group_group_id=None, region=None, key=None, keyid=None, profile=None, vpc_id=None, vpc_name=None, egress=False)

Remove a rule from an existing security group.

CLI Example:
```
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_port=80 to_port=80 cidr_ip='10.0.0.0/8'
```

salt.modules.boto_secgroup.set_tags(tags, name=None, group_id=None, vpc_name=None, vpc_id=None, region=None, key=None, keyid=None, profile=None)

Sets tags on a security group.

New in version 2016.3.0.

```
tag

dict of key:value pair of tags to set on the security group

name
	the name of the security group

group_id
	the group id of the security group (in lie of a name/vpc combo)

vpc_name
	the name of the vpc to search the named group for

vpc_id
	the id of the vpc, in lieu of the vpc_name

region
	the amazon region

key
	amazon key

keyid
	amazon keyid

profile
	amazon profile
```

CLI Example:
```
salt myminion boto_secgroup.set_tags "{'TAG1': 'Value1', 'TAG2': 'Value2'}" security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```
26.6.64 salt.modules.boto_sns

Connection module for Amazon SNS

configuration
This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance
through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API
and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-
amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

<table>
<thead>
<tr>
<th>sns.keyid: GKTADJGHEIQSXMKKRBJ08H</th>
</tr>
</thead>
<tbody>
<tr>
<td>sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs</td>
</tr>
</tbody>
</table>

A region may also be specified in the configuration:

| sns.region: us-east-1 |

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:

<table>
<thead>
<tr>
<th>myprofile:</th>
</tr>
</thead>
<tbody>
<tr>
<td>keyid: GKTADJGHEIQSXMKKRBJ08H</td>
</tr>
<tr>
<td>key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs</td>
</tr>
<tr>
<td>region: us-east-1</td>
</tr>
</tbody>
</table>

depends
boto

salt.modules.boto_sns.create(name, region=None, key=None, keyid=None, profile=None)
Create an SNS topic.

CLI example to create a topic:

salt myminion boto_sns.create mytopic region=us-east-1

salt.modules.boto_sns.delete(name, region=None, key=None, keyid=None, profile=None)
Delete an SNS topic.

CLI example to delete a topic:

salt myminion boto_sns.delete mytopic region=us-east-1

salt.modules.boto_sns.exists(name, region=None, key=None, keyid=None, profile=None)
Check to see if an SNS topic exists.

CLI Example:

salt myminion boto_sns.exists mytopic region=us-east-1

salt.modules.boto_sns.get_all_subscriptions_by_topic(name, region=None, key=None, keyid=None, profile=None)

1560 Chapter 26. Salt Module Reference
Get list of all subscriptions to a specific topic.

CLI example to delete a topic:

```bash
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1
```

```python
salt.modules.boto_sns.get_all_topics(region=None, key=None, keyid=None, profile=None)
```

Returns a list of all topics.

CLI Example:

```bash
salt myminion boto_sns.get_all_topics
```

```python
salt.modules.boto_sns.get_arn(name, region=None, key=None, keyid=None, profile=None)
```

Returns the full ARN for a given topic name.

CLI Example:

```bash
salt myminion boto_sns.get_arn mytopic
```

```python
salt.modules.boto_sns.subscribe(topic, protocol, endpoint, region=None, key=None, keyid=None, profile=None)
```

Subscribe to a topic.

CLI example to delete a topic:

```bash
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns-endpoint region=us-east-1
```

```python
salt.modules.boto_sns.unsubscribe(topic, subscription_arn, region=None, key=None, keyid=None, profile=None)
```

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```bash
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1
```

New in version 2016.11.0.

---

### 26.6.65 salt.modules.boto_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

**configuration**

This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

---

26.6. execution modules 1561
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs

A region may also be specified in the configuration:

sqs.region: us-east-1

If a region is not specified, the default is us-east-1.

It’s also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a
string to pull from pillars or minion config:

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfajkghs
  region: us-east-1

depends
  boto3

salt.modules.boto_sqs.create(name, attributes=None, region=None, key=None, keyid=None, profile=None)

Create an SQS queue.

CLI Example:

salt myminion boto_sqs.create myqueue region=us-east-1

salt.modules.boto_sqs.delete(name, region=None, key=None, keyid=None, profile=None)

Delete an SQS queue.

CLI Example:

salt myminion boto_sqs.delete myqueue region=us-east-1

salt.modules.boto_sqs.exists(name, region=None, key=None, keyid=None, profile=None)

Check to see if a queue exists.

CLI Example:

salt myminion boto_sqs.exists myqueue region=us-east-1

salt.modules.boto_sqs.get_attributes(name, region=None, key=None, keyid=None, profile=None)

Return attributes currently set on an SQS queue.

CLI Example:

salt myminion boto_sqs.get_attributes myqueue

salt.modules.boto_sqs.list_(prefix='', region=None, key=None, keyid=None, profile=None)

Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:
salt myminion boto_sqs.list region=us-east-1

salt.modules.boto_sqs.set_attributes(name, attributes, region=None, key=None, keyid=None, profile=None)

Set attributes on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.set_attributes myqueue '  
→{ReceiveMessageWaitTimeSeconds: 20}' region=us-east-1
```

### 26.6.66 salt.modules.boto_ssm

Connection module for Amazon SSM

**configuration**

This module uses IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary.

More Information available at:

**depends**

boto3

salt.modules.boto_ssm.delete_parameter(Name, region=None, key=None, keyid=None, profile=None)

Removes a parameter from the SSM parameter store

New in version 3000.

```
salt-call boto_ssm.delete_parameter test-param
```

salt.modules.boto_ssm.get_parameter(name, withdecryption=False, resp_json=False, region=None, key=None, keyid=None, profile=None)

Retrieves a parameter from SSM Parameter Store

New in version 3000.

```
salt-call boto_ssm.get_parameter test-param withdescription=True
```

salt.modules.boto_ssm.put_parameter(Name, Value, Description=None, Type='String', KeyId=None, Overwrite=False, AllowedPattern=None, region=None, key=None, keyid=None, profile=None)

Sets a parameter in the SSM parameter store

New in version 3000.

```
salt-call boto_ssm.put_parameter test-param test_value Type=SecureString
→KeyId=alias/aws/ssm Description='test encrypted key'
```
26.6.67 salt.modules.boto_vpc

Connection module for Amazon VPC

New in version 2014.7.0.

depends

• boto >= 2.8.0
• boto3 >= 1.2.6

configuration

This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
| vpc.keyid | GKTADJGHEIQSXMKKRBJ08H |
| vpc.key    | askdjghsdfjkgihWupUjasdfklkdfklgjsdfjajkghs |
```

A region may also be specified in the configuration:

```
vpc.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
| myprofile |
| keyid    | GKTADJGHEIQSXMKKRBJ08H |
| key      | askdjghsdfjkgihWupUjasdfklkdfklgjsdfjajkghs |
| region   | us-east-1 |
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error: |
  message: error message
```

Request methods (e.g., describe_vpc) return:

```
vpcs:
  - {...}
  - {...}
```

or

```
error: |
  message: error message
```

New in version 2016.11.0.
Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```python
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da region=us-west-2
```

Check to see if VPC peering connection is pending

```python
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Accept VPC peering connection

```python
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

Deleting VPC peering connection via this module

```python
# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.accept_vpc_peering_connection(conn_id='', name='', region='None, key=None, keyid=None, profile=None, dry_run=False)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

Parameters

- **conn_id** -- The ID to use. String type.
- **name** -- The name of this VPC peering connection. String type.
- **region** -- The AWS region to use. Type string.
**key** -- The key to use for this connection. Type string.

**keyid** -- The key id to use.

**profile** -- The profile to use.

**dry_run** -- The dry_run flag to set.

**Returns**

dict

Warning: Please specify either the vpc_peering_connection_id or name but not both. Specifying both will result in an error!

CLI Example:

```bash
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
  region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

```python
salt.modules.boto_vpc.associate_dhcp_options_to_vpc(dhcp_options_id, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```bash
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402'
```

```python
salt.modules.boto_vpc.associate_network_acl_to_subnet(network_acl_id=None, subnet_id=None, network_acl_name=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```bash
salt myminion boto_vpc.associate_network_acl_to_subnet
  network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'

salt myminion boto_vpc.associate_network_acl_to_subnet
  network_acl_id='myacl' subnet_id='mysubnet'
```

```python
salt.modules.boto_vpc.associate_route_table(route_table_id=None, subnet_id=None, route_table_name=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'

salt myminion boto_vpc.associate_route_table route_table_name='myrtb' subnet_name='mysubnet'

salt.modules.boto_vpc.check_vpc(vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Check whether a VPC with the given name or id exists. Returns the vpc_id or None. Raises SaltInvocationError if both vpc_id and vpc_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

salt.modules.boto_vpc.create(cidr_block, instance_tenancy=None, vpc_name=None, enable_dns_support=None, enable_dns_hostnames=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a valid CIDR block, create a VPC.

An optional instance_tenancy argument can be provided. If provided, the valid values are 'default' or 'dedicated'

An optional vpc_name argument can be provided.

Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.

CLI Example:

```
salt myminion boto_vpc.create '10.0.0.0/24'
```

salt.modules.boto_vpc.create_customer_gateway(vpn_connection_type, ip_address, bgp_asn, customer_gateway_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a valid VPN connection type, a static IP address and a customer gateway’s Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
```

salt.modules.boto_vpc.create_dhcp_options(domain_name=None, domain_name_servers=None, ntp_servers=None, netbios_name_servers=None, netbios_node_type=None, dhcp_options_name=None, tags=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.
Changed in version 2015.8.0: Added vpc_name and vpc_id arguments

CLI Example:
```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \ 
domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' \ 
netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \ 
vpc_name='myvpc'
```

```
salt.modules.boto_vpc.create_internet_gateway
internet_gateway_name=None, vpc_id=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_vpc.create_internet_gateway \ 
internet_gateway_name=myigw vpc_name=myvpc
```

```
salt.modules.boto_vpc.create_nat_gateway(subnet_id=None, subnet_name=None, allocation_id=None, region=None, key=None, keyid=None, profile=None)
```

Create a NAT Gateway within an existing subnet. If allocation_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:
```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

```
salt.modules.boto_vpc.create_network_acl(vpc_id=None, vpc_name=None, network_acl_name=None, subnet_id=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a vpc_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc_name, subnet_id, and subnet_name arguments

CLI Example:
```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```
salt.modules.boto_vpc.create_network_acl_entry(network_acl_id=None, rule_number=None, protocol=None, rule_action=None, cidr_block=None, egress=None, network_acl_name=None, icmp_code=None, icmp_type=None, port_range_from=None, port_range_to=None, region=None, key=None, keyid=None, profile=None)

Creates a network acl entry.

CLI Example:
```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' 'all' 'deny' '0.0.0.0/0' egress=true
```

salt.modules.boto_vpc.create_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, gateway_id=None, internet_gateway_name=None, instance_id=None, interface_id=None, vpc_peering_connection_id=None, vpc_peering_connection_name=None, region=None, key=None, keyid=None, profile=None, nat_gateway_id=None, nat_gateway_subnet_name=None, nat_gateway_subnet_id=None)

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:
```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-a1b2c3'
```

salt.modules.boto_vpc.create_route_table(vpc_id=None, vpc_name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Creates a route table.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:
```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' route_table_name='myroutetable'
salt myminion boto_vpc.create_route_table vpc_name='myvpc' route_table_name='myroutetable'
```

salt.modules.boto_vpc.create_subnet(vpc_id=None, cidr_block=None, vpc_name=None, availability_zone=None, subnet_name=None, tags=None, region=None, key=None, keyid=None, profile=None, auto_assign_public_ipv4=False)

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:
salt.modules.boto_vpc.create_subnet(vpc_id='vpc-6b1fe402', subnet_name='mysubnet', cidr_block='10.0.0.0/25')
salt.modules.boto_vpc.create_subnet(vpc_name='myvpc', subnet_name='mysubnet', cidr_block='10.0.0.0/25')

salt.modules.boto_vpc.customer_gateway_exists(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)

Given a customer gateway ID, check if the customer gateway ID exists.
Returns True if the customer gateway ID exists; Returns False otherwise.

CLI Example:
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gateway_name=mycgw

salt.modules.boto_vpc.delete(vpc_id=None, name=None, vpc_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID or VPC name, delete the VPC.
Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.

CLI Example:
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'

salt.modules.boto_vpc.delete_customer_gateway(customer_gateway_id=None, customer_gateway_name=None, region=None, key=None, keyid=None, profile=None)

Given a customer gateway ID or name, delete the customer gateway.
Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.
Changed in version 2015.8.0: Added customer_gateway_name argument

CLI Example:
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'

salt.modules.boto_vpc.delete_dhcp_options(dhcp_options_id=None, dhcp_options_name=None, region=None, key=None, keyid=None, profile=None)

Delete dhcp options by id or name.
New in version 2015.8.0.

CLI Example:
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'

salt.modules.boto_vpc.delete_internet_gateway(internet_gateway_id=None, internet_gateway_name=None, detach=False, region=None, key=None, keyid=None, profile=None)

Delete an internet gateway (by name or id).
Returns True if the internet gateway was deleted and otherwise False.
New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-\-1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```

salt.modules.boto_vpc.delete_nat_gateway(nat_gateway_id, release_eips=False, region=None, key=None, keyid=None, profile=None, wait_for_delete=False, wait_for_delete_retries=5)

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

- **nat_gateway_id**
  - Id of the NAT Gateway

- **release_eips**
  - whether to release the elastic IPs associated with the given NAT Gateway Id

- **region**
  - Region to connect to.

- **key**
  - Secret key to be used.

- **keyid**
  - Access key to be used.

- **profile**
  - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

- **wait_for_delete**
  - whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.

- **wait_for_delete_retries**
  - NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:

```
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```

salt.modules.boto_vpc.delete_network_acl(network_acl_id=None, network_acl_name=None, disassociate=False, region=None, key=None, keyid=None, profile=None)

Delete a network acl based on the network_acl_id or network_acl_name provided.

CLI Examples:

```
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \ disassociate=false
```
salt.myminion.boto_vpc.delete_network_acl network_acl_name='myacl' \ disassociate=true

salt.modules.boto_vpc.delete_network_acl_entry(network_acl_id=None, rule_number=None, egress=None, network_acl_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a network acl entry.

CLI Example:
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'

salt.modules.boto_vpc.delete_route(route_table_id=None, destination_cidr_block=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a route.

CLI Example:
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'

salt.modules.boto_vpc.delete_route_table(route_table_id=None, route_table_name=None, region=None, key=None, keyid=None, profile=None)

Deletes a route table.

CLI Examples:
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'

salt.modules.boto_vpc.delete_subnet(subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)

Given a subnet ID or name, delete the subnet.
Returns True if the subnet was deleted and returns False if the subnet was not deleted.
Changed in version 2015.8.0: Added subnet_name argument

CLI Example:
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'

salt.modules.boto_vpc.delete_vpc_peering_connection(conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None, dry_run=False)

Delete a VPC peering connection.
New in version 2016.11.0.

conn_id
The connection ID to check. Exclusive with conn_name.

conn_name
The connection name to check. Exclusive with conn_id.

region
Region to connect to.
key
Secret key to be used.

keyid
Access key to be used.

profile
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

dry_run
If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc

# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
region=us-west-2

# Specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a939e3
```

```
salt.modules.boto_vpc.describe(vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Describe a VPC's properties. If no VPC ID/Name is specified then describe the default VPC.

Returns a dictionary of interesting properties.

Changed in version 2015.8.0: Added vpc_name argument

CLI Example:

```
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

```
salt.modules.boto_vpc.describe_nat_gateways(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None)
```

Return a description of nat gateways matching the selection criteria.

This function requires boto3 to be installed.

CLI Example:

```
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

```
salt.modules.boto_vpc.describe_route_tables(route_table_id=None, route_table_name=None, vpc_id=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:
salt.modules.boto_vpc.describe_route_tables(vpc_id='vpc-a6a9efc3')

salt.modules.boto_vpc.describe_subnet(subnet_id=None, subnet_name=None, region=None, key=None, keyid=None, profile=None)

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet

salt.modules.boto_vpc.describe_subnets(subnet_ids=None, subnet_names=None, vpc_id=None, cidr=None, region=None, key=None, keyid=None, profile=None)

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:
salt myminion boto_vpc.describe_subnets
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab', 'subnet-ba1987cd']
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21

salt.modules.boto_vpc.describe_vpc_peering_connection(name, region=None, key=None, keyid=None, profile=None)

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the active, pending-acceptance or provisioning state.

New in version 2016.11.0.

Parameters

- name -- The string name for this VPC peering connection
- region -- The aws region to use
- key -- Your aws key
- keyid -- The key id associated with this aws account
- profile -- The profile to use

Returns
dict
CLI Example:

```
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
# Specify a region
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

```
salt.modules.boto_vpc.describe_vpcs(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Describe all VPCs, matching the filter criteria if provided.
Returns a list of dictionaries with interesting properties.
New in version 2015.8.0.
CLI Example:

```
salt myminion boto_vpc.describe_vpcs
```

```
salt.modules.boto_vpc.dhcp_options_exists(dhcp_options_id=None, name=None, dhcp_options_name=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Check if a dhcp option exists.
Returns True if the dhcp option exists; Returns False otherwise.
CLI Example:

```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

```
salt.modules.boto_vpc.disassociate_network_acl(subnet_id=None, vpc_id=None, subnet_name=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)
```

Given a subnet ID, disassociates a network acl.
CLI Example:

```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

```
salt.modules.boto_vpc.disassociate_route_table(association_id, region=None, key=None, keyid=None, profile=None)
```

Disassociates a route table.

```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

```
salt.modules.boto_vpc.exists(vpc_id=None, name=None, cidr=None, tags=None, region=None, key=None, keyid=None, profile=None)
```

Given a VPC ID, check to see if the given VPC ID exists.
Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.
CLI Example:
salt myminion boto_vpc.exists myvpc

salt.modules.boto_vpc.get_dhcp_options(dhcp_options_name=None, dhcp_options_id=None, 
region=None, key=None, keyid=None, profile=None)

Return a dict with the current values of the requested DHCP options set

CLI Example:

salt myminion boto_vpc.get_dhcp_options 'myfunnydhcpoptionsname'

New in version 2016.3.0.

salt.modules.boto_vpc.get_id(name=None, cidr=None, tags=None, region=None, key=None, 
keyid=None, profile=None)

Given VPC properties, return the VPC id if a match is found.

CLI Example:

salt myminion boto_vpc.get_id myvpc

salt.modules.boto_vpc.get_resource_id(resource, name=None, resource_id=None, region=None, 
key=None, keyid=None, profile=None)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

salt myminion boto_vpc.get_resource_id internet_gateway myigw

salt.modules.boto_vpc.get_subnet_association(subnets, region=None, key=None, keyid=None, 
profile=None)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the 
given subnets are associated with different VPC IDs.

CLI Examples:

salt myminion boto_vpc.get_subnet_association subnet-61b47516

salt myminion boto_vpc.get_subnet_association [ 'subnet-61b47516', 'subnet- 
→2cb9785b' ]

salt.modules.boto_vpc.is_peering_connection_pending(conn_id=None, conn_name=None, 
region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

conn_id
The connection ID to check. Exclusive with conn_name.

conn_name
The connection name to check. Exclusive with conn_id.
region
Region to connect to.

key
Secret key to be used.

keyid
Access key to be used.

profile
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
    region=us-west-2
# Specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a939e3

salt.modules.boto_vpc.nat_gateway_exists(nat_gateway_id=None, subnet_id=None, subnet_name=None, vpc_id=None, vpc_name=None, states=('pending', 'available'), region=None, key=None, keyid=None, profile=None)

Checks if a nat gateway exists.
This function requires boto3 to be installed.
New in version 2016.11.0.

CLI Example:
salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'

salt.modules.boto_vpc.network_acl_exists(network_acl_id=None, name=None, network_acl_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a network acl exists.
Returns True if the network acl exists or returns False if it doesn’t exist.

CLI Example:
salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'

salt.modules.boto_vpc.peering_connection_pending_from_vpc(conn_id=None, conn_name=None, vpc_id=None, vpc_name=None, region=None, key=None, keyid=None, profile=None)

Check if a VPC peering connection is in the pending state, and requested from the given VPC.
New in version 2016.11.0.
conn_id
The connection ID to check. Exclusive with conn_name.

conn_name
The connection name to check. Exclusive with conn_id.

vpc_id
Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc_name.

vpc_name
Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc_id.

region
Region to connect to.

dict
Secret key to be used.

keyid
Access key to be used.

profile
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
```

salt.modules.boto_vpc.replace_network_acl_entry
```
(network_acl_id=None, rule_number=None,
protocol=None, rule_action=None,
cidr_block=None, egress=False,
network_acl_name=None, icmp_code=None,
icmp_type=None, port_range_from=None,
port_range_to=None, region=None,
key=None, keyid=None, profile=None)
```

Replaces a network acl entry.

CLI Example:

```
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' 'all' 'deny' '0.0.0.0/0' egress=true
```

salt.modules.boto_vpc.replace_route
```
(route_table_id=None, destination_cidr_block=None,
route_table_name=None, gateway_id=None,
instance_id=None, interface_id=None, region=None,
key=None, keyid=None, profile=None, vpc_peering_connection_id=None)
```

Replaces a route.

CLI Example:

```
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-a1b2c3'
```

salt.modules.boto_vpc.replace_route_table_association
```
(association_id, route_table_id,
region=None, key=None,
keyid=None, profile=None)
```

Replaces a route table association.

CLI Example:
salt.myminion.boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-1f382e7d'

salt.modules.boto_vpc.request_vpc_peering_connection(requester_vpc_id=None, requester_vpc_name=None, peer_vpc_id=None, peer_vpc_name=None, name=None, peer_owner_id=None, peer_region=None, region=None, key=None, keyid=None, profile=None, dry_run=False)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

**requester_vpc_id**
ID of the requesting VPC. Exclusive with requester_vpc_name.

**requester_vpc_name**
Name tag of the requesting VPC. Exclusive with requester_vpc_id.

**peer_vpc_id**
ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

**peer_vpc_name**
Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account and same region, else resolving it into a vpc ID will almost certainly fail. Exclusive with peer_vpc_id.

**name**
The name to use for this VPC peering connection.

**peer_owner_id**
ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

**peer_region**
Region of peer VPC. For inter-region vpc peering connections. Not required for intra-region peering connections.

New in version 3005.

**region**
Region to connect to.

**key**
Secret key to be used.

**keyid**
Access key to be used.

**profile**
A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

**dry_run**
If True, skip application and return status.

CLI Example:
# Create a named VPC peering connection
```
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-→be82e9da name=my_vpc_connection
```

# Without a name
```
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-→be82e9da
```

# Specify a region
```
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-→be82e9da region=us-west-2
```

salt.modules.boto_vpc.resource_exists(resource, name=None, resource_id=None, tags=None, region=None, key=None, keyid=None, profile=None)

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text}} on error.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

salt.modules.boto_vpc.route_exists(destination_cidr_block, route_table_name=None, route_table_id=None, gateway_id=None, instance_id=None, interface_id=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a route exists.

New in version 2015.8.0.

CLI Example:
```
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_id='local' route_table_name='test'
```

salt.modules.boto_vpc.route_table_exists(route_table_id=None, name=None, route_table_name=None, tags=None, region=None, key=None, keyid=None, profile=None)

Checks if a route table exists.

CLI Example:
```
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

salt.modules.boto_vpc.subnet_exists(subnet_id=None, name=None, subnet_name=None, cidr=None, tags=None, zones=None, region=None, key=None, keyid=None, profile=None)

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added subnet_name argument Deprecated name argument

CLI Example:
```
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```
26.6.68 salt.modules.bower

Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

salt.modules.bower.install(pkg, dir, pkgs=None, runas=None, env=None)

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

pkg
A package name in any format accepted by Bower, including a version identifier

dir
The target directory in which to install the package

pkgs
A list of package names in the same format as the pkg parameter

runas
The user to run Bower with

env
Environment variables to set when invoking Bower. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project
salt '*' bower.install jquery#2.0 /path/to/project
```

salt.modules.bower.list_(dir, runas=None, env=None)

List installed Bower packages.

dir
The directory whose packages will be listed

runas
The user to run Bower with

env
Environment variables to set when invoking Bower. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

salt.modules.bower.prune(dir, runas=None, env=None)

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

dir
The directory whose packages will be pruned
runas
   The user to run Bower with

env
   Environment variables to set when invoking Bower. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

salt.modules.bower.uninstall(pkg, dir, runas=None, env=None)
Uninstall a Bower package.

pkg
   A package name in any format accepted by Bower
dir
   The target directory from which to uninstall the package
runas
   The user to run Bower with
env
   Environment variables to set when invoking Bower. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

26.6.69 salt.modules.bridge

Module for gathering and managing bridging information

salt.modules.bridge.add(br=None)
   Creates a bridge
   CLI Example:
   
   ```
salt '*' bridge.add br0
   ```

salt.modules.bridge.addif(br=None, iface=None)
   Adds an interface to a bridge
   CLI Example:
   
   ```
salt '*' bridge.addif br0 eth0
   ```

salt.modules.bridge.delete(br=None)
   Deletes a bridge
   CLI Example:
   
   ```
salt '*' bridge.delete br0
   ```
salt.modules.bridge.delif \((br=None, iface=None)\)
Removes an interface from a bridge

CLI Example:
```
salt '*' bridge.delif br0 eth0
```

salt.modules.bridge.find Interfaces \('args\)"
Returns the bridge to which the interfaces are bond to

CLI Example:
```
salt '*' bridge.find Interfaces eth0 [eth1...]
```

salt.modules.bridge.interfaces \((br=None)\)
Returns interfaces attached to a bridge

CLI Example:
```
salt '*' bridge.interfaces br0
```

salt.modules.bridge.list_()
Returns the machine's bridges list

CLI Example:
```
salt '*' bridge.list
```

salt.modules.bridge.show \((br=None)\)
Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:
```
salt '*' bridge.show
salt '*' bridge.show br0
```

salt.modules.bridge.stp \((br=None, state='disable', iface=None)\)
Sets Spanning Tree Protocol state for a bridge

CLI Example:
```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:
```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```
26.6.70 `salt.modules.bsd_shadow`

Manage the password database on BSD systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to 'shadow.info' is not available), see here.

`salt.modules.bsd_shadow.default_hash()`

Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.bsd_shadow.del_password(name)`

New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.bsd_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

- `password` Plaintext password to be hashed.
- `crypt_salt` Cryptographic salt. If not given, a random 8-character salt will be generated.
- `algorithm` The following hash algorithms are supported:
  - md5
  - blowfish (not in mainline glibc, only available in distros that add it)
  - sha256
  - sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
  algorithm=sha256
```

`salt.modules.bsd_shadow.info(name)`

Return information for the specified user

CLI Example:
salt '*' shadow.info someuser

call.modules.bsd_shadow.set_change(name, change)
Sets the time at which the password expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.
A value of 0 sets the password to never expire.
CLI Example:
```python
salt '*' shadow.set_change username 1419980400
```

call.modules.bsd_shadow.set_expire(name, expire)
Sets the time at which the account expires (in seconds since the UNIX epoch). See man 8 usermod on NetBSD and OpenBSD or man 8 pw on FreeBSD.
A value of 0 sets the account to never expire.
CLI Example:
```python
salt '*' shadow.set_expire username 1419980400
```

call.modules.bsd_shadow.set_password(name, password)
Set the password for a named user. The password must be a properly defined hash. A password hash can be generated with gen_password().
It is important to make sure that a supported cipher is used.
CLI Example:
```python
salt '*' shadow.set_password someuser '$1$UYClxa628.9qXjpQCjM4a..'
```

26.6.71 call.modules.btrfs

Module for managing BTRFS file systems.
call.modules.btrfs.add(mountpoint, *devices, **kwargs)
Add a devices to a BTRFS filesystem.
General options:
- nodiscard: Do not perform whole device TRIM
- force: Force overwrite existing filesystem on the disk
CLI Example:
```python
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```

call.modules.btrfs.convert(device, permanent=False, keeplf=False)
Convert ext2/3/4 to BTRFS. Device should be mounted.
Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.
General options:
- permanent: Specify if the migration should be permanent (false by default)
• keeplf: Keep lost+found of the partition (removed by default, but still in the image, if not permanent migration)

CLI Example:

```
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

salt.modules.btrfs.defragment(path)
Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a mountpoint of the filesystem, then only this mount point is defragmented.

CLI Example:

```
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

salt.modules.btrfs.delete(mountpoint, *devices, **kwargs)
Remove devices from a BTRFS filesystem.

CLI Example:

```
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

salt.modules.btrfs.devices()
Get known BTRFS formatted devices on the system.

CLI Example:

```
salt '*' btrfs.devices
```

salt.modules.btrfs.features()
List currently available BTRFS features.

CLI Example:

```
salt '*' btrfs.mkfs_features
```

salt.modules.btrfs.info(device)
Get BTRFS filesystem information.

CLI Example:

```
salt '*' btrfs.info /dev/sda1
```

salt.modules.btrfs.mkfs(*devices, **kwargs)
Create a file system on the specified device. By default wipes out with force.

General options:

- **allocsize**: Specify the BTRFS offset from the start of the device.
- **bytecount**: Specify the size of the resultant filesystem.
- **nodesize**: Node size.
- **leaffszie**: Specify the nodesize, the tree block size in which btrfs stores data.
• **noforce**: Prevent force overwrite when an existing filesystem is detected on the device.

• **sectorsize**: Specify the sectorsize, the minimum data block allocation unit.

• **nodiscard**: Do not perform whole device TRIM operation by default.

• **uuid**: Pass UUID or pass True to generate one.

**Options:**

• **dto** (raid0|raid1|raid5|raid6|raid10|single|dup)
  Specify how the data must be spanned across the devices specified.

• **mto** (raid0|raid1|raid5|raid6|raid10|single|dup)
  Specify how metadata must be spanned across the devices specified.

• **fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

**CLI Example:**

```bash
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

**salt.modules.btrfs.properties** *(obj, type=None, set=None)*

List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

**General options:**

• **type**: Possible types are s[ubvol], f[ilesystem], i[node] and d[evice].

• **force**: Force overwrite existing filesystem on the disk

• **set**: `<key=value,key1=value1...>` Options for a filesystem properties.

**CLI Example:**

```bash
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My→Storage"'
```

**salt.modules.btrfs.resize** *(mountpoint, size)*

Resize filesystem.

**General options:**

• **mountpoint**: Specify the BTRFS mountpoint to resize.

• **size**: (+/-)<newsize>[kKmGtPgE]max) Specify the new size of the target.

**CLI Example:**

```bash
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

**salt.modules.btrfs.subvolume_create** *(name, dest=None, qgroupids=None)*

Create subvolume `name` in `dest`.

Return True if the subvolume is created, False is the subvolume is already there.

**name**

Name of the new subvolume.
dest
If not given, the subvolume will be created in the current directory, if given will be in /dest/name

groupids
Add the newly created subvolume to a qgroup. This parameter is a list

CLI Example:
salt '*' btrfs.subvolume_create var
salt '*' btrfs.subvolume_create var dest=/mnt
salt '*' btrfs.subvolume_create var qgroupids='[200]'

salt.modules.btrfs.subvolume_delete(name=None, names=None, commit=None)
Delete the subvolume(s) from the filesystem
The user can remove one single subvolume (name) or multiple of them at the same time (names). One of the two parameters needs to specified.
Please, refer to the documentation to understand the implication on the transactions, and when the subvolume is really deleted.
Return True if the subvolume is deleted, False is the subvolume was already missing.

name
Name of the subvolume to remove

names
List of names of subvolumes to remove

commit
  • 'after': Wait for transaction commit at the end
  • 'each': Wait for transaction commit after each delete

CLI Example:
salt '*' btrfs.subvolume_delete /var/volumes/tmp
salt '*' btrfs.subvolume_delete /var/volumes/tmp commit=after

salt.modules.btrfs.subvolume_exists(path)
Check if a subvolume is present in the filesystem.

path
Mount point for the subvolume (full path)

CLI Example:
salt '*' btrfs.subvolume_exists /mnt/var

salt.modules.btrfs.subvolume_find_new(name, last_gen)
List the recently modified files in a subvolume

name
Name of the subvolume

last_gen
Last transid marker from where to compare

CLI Example:
salt '*/' btrfs.subvolume_find_new /var/volumes/tmp 1024

salt.modules.btrfs.subvolume_get_default(path)
  Get the default subvolume of the filesystem path
  
  path
      Mount point for the subvolume

  CLI Example:
  
  salt '*/' btrfs.subvolume_get_default /var/volumes/tmp

salt.modules.btrfs.subvolume_list(path, parent_id=False, absolute=False, ogeneration=False, generation=False, subvolumes=False, uuid=False, parent_uuid=False, sent_subvolume_uuid=False, snapshots=False, readonly=False, deleted=False, generation_cmp=None, ogeneration_cmp=None, sort=None)
  List the subvolumes present in the filesystem.

  path
      Mount point for the subvolume

  parent_id
      Print parent ID

  absolute
      Print all the subvolumes in the filesystem and distinguish between absolute and relative path with respect to the given <path>

  ogeneration
      Print the ogeneration of the subvolume

  generation
      Print the generation of the subvolume

  subvolumes
      Print only subvolumes below specified <path>

  uuid
      Print the UUID of the subvolume

  parent_uuid
      Print the parent uuid of subvolumes (and snapshots)

  sent_subvolume_uuid
      Print the UUID of the sent subvolume, where the subvolume is the result of a receive operation

  snapshots
      Only snapshot subvolumes in the filesystem will be listed

  readonly
      Only readonly subvolumes in the filesystem will be listed

  deleted
      Only deleted subvolumes that are yet not cleaned

  generation_cmp
      List subvolumes in the filesystem that its generation is >=, <= or = value. '+' means >= value, '-' means <= value, If there is neither '+' nor '-', it means = value
ogeneration_cmp
List subvolumes in the filesystem that its ogeneration is >=, <= or = value

sort
List subvolumes in order by specified items. Possible values: * rootid * gen * ogen * path You can add ‘+’
or ‘-‘ in front of each items, ‘+‘ means ascending, ‘-‘ means descending. The default is ascending. You can
combine it in a list.

CLI Example:

```
salt '*' btrfs.subvolume_list /var/volumes/tmp
salt '*' btrfs.subvolume_list /var/volumes/tmp path=True
salt '*' btrfs.subvolume_list /var/volumes/tmp sort='[-rootid]'
```

salt.modules.btrfs.subvolume_set_default(subvolid, path)
Set the subvolume as default

subvolid
ID of the new default subvolume

path
Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_set_default 257 /var/volumes/tmp
```

salt.modules.btrfs.subvolume_show(path)
Show information of a given subvolume

path
Mount point for the filesystem

CLI Example:

```
salt '*' btrfs.subvolume_show /var/volumes/tmp
```

salt.modules.btrfs.subvolume_snapshot(source, dest=None, name=None, read_only=False)
Create a snapshot of a source subvolume

source
Source subvolume from where to create the snapshot

dest
If only dest is given, the subvolume will be named as the basename of the source

name
Name of the snapshot

read_only
Create a read only snapshot

CLI Example:

```
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp dest=./snapshots
salt '*' btrfs.subvolume_snapshot /var/volumes/tmp name=backup
```

salt.modules.btrfs.subvolume_sync(path, subvolids=None, sleep=None)
Wait until given subvolume are completely removed from the filesystem after deletion.
path
   Mount point for the filesystem

subvolids
   List of IDs of subvolumes to wait for

sleep
   Sleep N seconds between checks (default: 1)

CLI Example:

```bash
salt '*' btrfs.subvolume_sync /var/volumes/tmp
salt '*' btrfs.subvolume_sync /var/volumes/tmp subvolids='[257]'`

salt.modules.btrfs.**usage**(path)
   Show in which disk the chunks are allocated.

CLI Example:

```bash
salt '*' btrfs.usage /your/mountpoint`

salt.modules.btrfs.**version**()
   Return BTRFS version.

CLI Example:

```bash
salt '*' btrfs.version`

### 26.6.72 salt.modules.cabal

Manage and query Cabal packages

New in version 2015.8.0.

salt.modules.cabal.**install**(pkg=None, pkgs=None, user=None, install_global=False, env=None)
   Install a cabal package.

   pkg
      A package name in format accepted by cabal-install. See: https://wiki.haskell.org/Cabal-Install

   pkgs
      A list of packages names in same format as pkg

   user
      The user to run cabal install with

   install_global
      Install package globally instead of locally

   env
      Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```bash
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5`
salt.modules.cabal.list(pkg=None, user=None, installed=False, env=None)

List packages matching a search string.

pkg
Search string for matching package names

user
The user to run cabal list with

installed
If True, only return installed packages.

e
Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

caballist

salt.modules.cabal.uninstall(pkg, user=None, env=None)

Uninstall a cabal package.

pkg
The package to uninstall

user
The user to run ghc-pkg unregister with

e
Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

caballist

salt.modules.cabal.update(user=None, env=None)

Updates list of known packages.

user
The user to run cabal update with

e
Environment variables to set when invoking cabal. Uses the same env format as the cmd.run execution function.

CLI Example:

```
salt '*' cabal.update
```
26.6.73 salt.modules.capirca_acl

Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

**codeauthor**

Mircea Ulinic <ping@mirceaulinic.net> & Robert Ankeny <robankeny@google.com>

**maturity**

new

**depends**

capirca

**platform**

unix

**Dependencies**

The firewall configuration is generated by Capirca.

To install Capirca, execute: `pip install capirca`.

```python
salt.modules.capirca_acl.get_filter_config(platform, filter_name, filter_options=None, terms=None, prepend=True, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, only_lower_merge=False, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d')
```

Return the configuration of a policy filter.

**platform**

The name of the Capirca platform.

**filter_name**

The name of the policy filter.

**filter_options**

Additional filter options. These options are platform-specific. See the complete list of options.

**terms**

List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless merge_pillar is set as False.

**prepend**: `True`

When merge_pillar is set as True, the final list of terms generated by merging the terms from terms with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to False.

**pillar_key**: `acl`

The key in the pillar containing the default attributes values. Default: acl.

**pillarenv**

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
**saltenv**

Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar: True**

Merge the CLI variables with the pillar. Default: `True`.

**only_lower_merge: False**

Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`.

**revision_id**

Add a comment in the filter config having the description for the changes applied.

**revision_no**

The revision count.

**revision_date: True**

Boolean flag: display the date when the filter configuration was generated. Default: `True`.

**revision_date_format: %Y/%m/%d**

The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (year/month/day).

CLI Example:

```bash
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$

The filter configuration has been loaded from the pillar, having the following structure:

```
netACL:
  - my-filter:
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port:
          - [5678, 5680]
        protocol: tcp
        action: accept
```

`salt.modules.capirca_acl.get_filter_pillar(filter_name, pillar_key='acl', pillarenv=None, saltenv=None)`
Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

**filter_name**
The name of the filter.

**pillar_key**
The root key of the whole policy config.

**pillarenv**
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**
Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

```python
salt.modules.capirca_acl.get_policy_config(
    platform, filters=None, prepend=True,
    pillar_key='acl', pillarenv=None, saltenv=None,
    merge_pillar=True, only_lower_merge=False,
    revision_id=None, revision_no=None,
    revision_date=True,
    revision_date_format='%Y/%m/%d')
```

Return the configuration of the whole policy.

**platform**
The name of the Capirca platform.

**filters**
List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

**prepend:** `True`
When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

**pillar_key:** `acl`
The key in the pillar containing the default attributes values. Default: `acl`.

**pillarenv**
Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**
Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

**merge_pillar:** `True`
Merge the CLI variables with the pillar. Default: `True`.

**only_lower_merge:** `False`
Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`.

**revision_id**
Add a comment in the policy config having the description for the changes applied.

**revision_no**
The revision count.

**revision_date:** `True`
Boolean flag: display the date when the policy configuration was generated. Default: `True`.

26.6. execution modules
revision_date_format: %Y/%m/%d
The date format to be used when generating the perforce data. Default: %Y/%m/%d
(<year>/<month>/<day>).

CLI Example:

```
salt '* capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    **
    */
    filter my-filter {
      term my-term {
        from {
          source-port [ 1234 1235 ];
        }
        then {
          reject;
        }
      }
      term my-other-term {
        from {
          protocol tcp;
          source-port 5678-5680;
        }
        then accept;
      }
    }
  }
}
firewall {
  family inet {
    replace:
    /*
    ** $Id:$
    ** $Date:$
    ** $Revision:$
    **
    */
    filter my-other-filter {
      interface-specific;
      term dummy-term {
        from {
          protocol [ tcp udp ];
        }
        then {
```

(continues on next page)
The policy configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
    options:
      - not-interface-specific
    terms:
      - my-term:
        source_port: [1234, 1235]
        action: reject
      - my-other-term:
        source_port: [5678, 5680]
        protocol: tcp
        action: accept
    - my-other-filter:
      terms:
        - dummy-term:
          protocol:
            - tcp
            - udp
          action: reject
```

salt.modules.capirca_acl.get_term_config(platform, filter_name, term_name, filter_options=None, pillar_key='acl', pillarenv=None, saltenv=None, merge_pillar=True, revision_id=None, revision_no=None, revision_date=True, revision_date_format='%Y/%m/%d', source_service=None, destination_service=None, **term_fields)

Return the configuration of a single policy term.

**platform**
The name of the Capirca platform.

**filter_name**
The name of the policy filter.

**term_name**
The name of the term.

**filter_options**
Additional filter options. These options are platform-specific. E.g.: `inet6, bridge, object-group`, See the complete list of options.

**pillar_key: acl**
The key in the pillar containing the default attributes values. Default: acl. If the pillar contains the following structure:
### firewall:

- **my-filter:**
  
  **terms:**
  
  - **my-term:**
    
    - **source_port:** 1234
    
    - **source_address:**
      
      - 1.2.3.4/32
      
      - 5.6.7.8/32

The pillar_key field would be specified as firewall.

### pillarenv

Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

### saltenv

Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

### merge_pillar: True

Merge the CLI variables with the pillar. Default: True.

### revision_id

Add a comment in the term config having the description for the changes applied.

### revision_no

The revision count.

### revision_date: True

Boolean flag: display the date when the term configuration was generated. Default: True.

### revision_date_format: %Y/%m/%d

The date format to be used when generating the perforce data. Default: %Y/%m/%d (year/month/day).

### source_service

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the file state.

### destination_service

A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as source_service.

### term_fields

Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

**Note:** The following fields are accepted:

- action
- address
- address_exclude
- comment
• counter
• expiration
• destination_address
• destination_address_exclude
• destination_port
• destination_prefix
• forwarding_class
• forwarding_class_except
• logging
• log_name
• loss_priority
• option
• policer
• port
• precedence
• principals
• protocol
• protocol_except
• qos
• pan_application
• routing_instance
• source_address
• source_address_exclude
• source_port
• source_prefix
• verbatim
• packet_length
• fragment_offset
• hop_limit
• icmp_type
• ether_type
• traffic_class_count
• traffic_type
• translated
• dscp_set
• dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

**Note:** The following fields can be also a single value and a list of values:
- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: destination_address can be either defined as:

```
**destination_address:**  172.17.17.1/24
```

or as a list of destination IP addresses:

```
**destination_address:**
  - 172.17.17.1/24
  - 172.17.19.1/24
```

or a list of services to be matched:

```
**source_service:**
  - ntp
  - snmp
  - ldap
  - bgpd
```

**Note:** The port fields source_port and destination_port can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
**source_port:**
  - [1000, 2000]
  - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.3.4 destination_address=5.6.7.8 action=accept

Output Example:

```
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
remark term-name
permit ip host 1.2.3.4 host 5.6.7.8
exit
```

salt.modules.capirca_acl.get_term_pillar(filter_name, term_name, pillar_key='acl', pillarenv=None, saltenv=None)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

**filter_name**
- The name of the filter.

**term_name**
- The name of the term.

**pillar_key: acl**
- The root key of the whole policy config. Default: acl.

**pillarenv**
- Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

**saltenv**
- Included only for compatibility with pillarenv_from_saltenv, and is otherwise ignored.

### 26.6.74 salt.modules.cassandra_cql

Cassandra Database Module

New in version 2015.5.0.

This module works with Cassandra v2 and v3 and hence generates queries based on the internal schema of said version.

**depends**
- DataStax Python Driver for Apache Cassandra [https://github.com/datastax/python-driver](https://github.com/datastax/python-driver) pip install cassandra-driver

**referenced by**
- Salt's cassandra_cql returner

**configuration**
- The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion’s pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
  cluster: 192.168.50.10
  port: 9000
```
Example configuration in the config for a cluster:

```yaml
[cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin]
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with `ssl options`:

If `ssl_options` are present in cassandra config the cassandra_cql returner will use SSL. SSL isn’t used if `ssl_options` isn’t specified.

```yaml
[cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

  # SSL version should be one from the ssl module
  # This is an optional parameter
  ssl_version: PROTOCOL_TLSv1]
```

Additionally you can also specify the `protocol_version` to use.

```yaml
[cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  # defaults to 4, if not set
  protocol_version: 3]
```

Also all configuration could be passed directly to module as arguments.

```
salt minion1 cassandra_cql.info contact_points=delme-nextgen-01 port=9042 cql_user=cassandra cql_pass=cassandra protocol_version=4
salt minion1 cassandra_cql.info ssl_options='{"ca_certs": /path/to/-ca.crt}’
```

We can also provide the load balancing policy as arguments.
Run a query on a Cassandra cluster and return a dictionary.

Parameters

- **query** *(str)* -- The query to execute.
- **contact_points** *(str | list)* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **params** *(str)* -- The parameters for the query, optional.
- **protocol_version** *(int)* -- Cassandra protocol version to use.
- **load_balancing_policy** *(str)* -- cassandra.policy class name to use
- **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
- **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

A dictionary from the return values of the query

Return type

list[dict]

CLI Example:

```bash
cassandra-server' cassandra_cql.cql_query "SELECT * FROM users_by_name WHERE first_name = 'jane"
```

Run a query on a Cassandra cluster and return a dictionary.

```
salt.modules.cassandra_cql.cql_query(query, contact_points=None, port=None, cql_user=None, cql_pass=None, protocol_version=None, load_balancing_policy=None, load_balancing_policy_args=None, ssl_options=None)
```
This function should not be used asynchronously for SELECTs -- it will not return anything and we don’t currently have a mechanism for handling a future that will return results.

Parameters

- **query** (*str*) -- The query to execute.
- **statement_name** (*str*) -- Name to assign the prepared statement in the **__context__** dictionary
- **statement_arguments** (*list[**str**]*) -- Bind parameters for the SQL statement
- **asynchronous** (*bool*) -- Run this query in asynchronous mode
- **async** (*bool*) -- Run this query in asynchronous mode (an alias to ‘asynchronous’)
  NOTE: currently it overrides ‘asynchronous’ and it will be dropped in version 3001!
- **callback_errors** (*Function callable*) -- Function to call after query runs if there is an error
- **contact_points** (*str | list[*str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **params** (*str*) -- The parameters for the query, optional.
- **protocol_version** -- Cassandra protocol version to use.
- **load_balancing_policy** (*str*) -- cassandra.policy class name to use
- **load_balancing_policy_args** (*dict*) -- cassandra.policy constructor args
- **ssl_options** (*dict*) -- Cassandra protocol version to use.

Returns

A dictionary from the return values of the query

**CLI Example:**

```bash
# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT INTO USERS (first_name, last_name) VALUES (?, ?)" statement_arguments=['John', 'Doe'], asynchronous=True

# Select data, should not be asynchronous because there is not currently a facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT * FROM USERS WHERE first_name=?" statement_arguments=['John']
```
Create a new keyspace in Cassandra.

Parameters

- **keyspace** *(str)* -- The keyspace name
- **replication_strategy** *(str)* -- either SimpleStrategy or NetworkTopologyStrategy
- **replication_factor** *(int)* -- number of replicas of data on multiple nodes. not used if using NetworkTopologyStrategy
- **replication_datacenters** *(str | dict)* -- string or dict of datacenter names to replication factors, required if using NetworkTopologyStrategy (will be a dict if coming from state file).
- **contact_points** *(str | list)* -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **protocol_version** *(int)* -- Cassandra protocol version to use.
- **load_balancing_policy** *(str)* -- cassandra.policy class name to use
- **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
- **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

The info for the keyspace or False if it does not exist.

Return type

dict

CLI Example:

```bash
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace&
  replication_strategy=NetworkTopologyStrategy replication_
datacenters='{"datacenter_1": 3, "datacenter_2": 2}''
```

Create a new cassandra user with credentials and superuser status.

Parameters
• **username** *(str)* -- The name of the new user.
• **password** *(str)* -- The password of the new user.
• **superuser** *(bool)* -- Is the new user going to be a superuser? default: False
• **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
• **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
• **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
• **port** *(int)* -- The Cassandra cluster port, defaults to None.
• **protocol_version** *(int)* -- Cassandra protocol version to use.
• **load_balancing_policy** *(str)* -- cassandra.policy class name to use
• **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
• **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret
salt 'minion1' cassandra_cql.create_user username=joe password=secret\n  superuser=True
salt 'minion1' cassandra_cql.create_user username=joe password=secret\n  superuser=True contact_points=minion1
```

salt.modules.cassandra_cql.drop_keyspace(*keyspace*, *contact_points=None*, *port=None*,
  *cql_user=None*, *cql_pass=None*, *protocol_version=None*,
  *load_balancing_policy=None*,
  *load_balancing_policy_args=None*, *ssl_options=None*)

Drop a keyspace if it exists in a Cassandra cluster.

Parameters

• **keyspace** *(str)* -- The keyspace to drop.
• **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
• **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
• **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
• **port** *(int)* -- The Cassandra cluster port, defaults to None.
• **protocol_version** *(int)* -- Cassandra protocol version to use.
• **load_balancing_policy** *(str)* -- cassandra.policy class name to use
• **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
• **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

The info for the keyspace or False if it does not exist.
Return type
dict

CLI Example:
```
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1
```

```
salt.modules.cassandra_cql.grant_permission(username, resource=None, resource_type='keyspace',
permission=None, contact_points=None, port=None,
cql_user=None, cql_pass=None, protocol_version=None,
load_balancing_policy=None,
load_balancing_policy_args=None,
ssl_options=None)
```

Grant permissions to a user.

Parameters

- **username** *(str)* -- The name of the user to grant permissions to.
- **resource** *(str)* -- The resource (keyspace or table), if None, permissions for all resources are granted.
- **resource_type** *(str)* -- The resource_type (keyspace or table), defaults to 'keyspace'.
- **permission** *(str)* -- A permission name (e.g. select), if None, all permissions are granted.
- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **protocol_version** *(int)* -- Cassandra protocol version to use.
- **load_balancing_policy** *(str)* -- cassandra.policy class name to use
- **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
- **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

Return type

CLI Example:
```
salt 'minion1' cassandra_cql.grant_permission
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_
→keyspace permission=select
salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_
→table resource_type=table permission=select contact_
→points=minion1
```
salt.modules.cassandra_cql.info(
    contact_points=None, port=None, cql_user=None, cql_pass=None,
    protocol_version=None, load_balancing_policy=None,
    load_balancing_policy_args=None, ssl_options=None)

Show the Cassandra information for this cluster.

Parameters

- **contact_points** (str | list[str]) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (str) -- The Cassandra user if authentication is turned on.
- **cql_pass** (str) -- The Cassandra user password if authentication is turned on.
- **port** (int) -- The Cassandra cluster port, defaults to None.
- **protocol_version** (int) -- Cassandra protocol version to use.
- **load_balancing_policy** (str) -- cassandra.policy class name to use
- **load_balancing_policy_args** (dict) -- cassandra.policy constructor args
- **ssl_options** (dict) -- Cassandra protocol version to use.

Returns

The information for this Cassandra cluster.

Return type

dict

CLI Example:

```
salt 'minion1' cassandra_cql.info
salt 'minion1' cassandra_cql.info contact_points=minion1
```

salt.modules.cassandra_cql.keyspace_exists(
    keyspace, contact_points=None, port=None,
    cql_user=None, cql_pass=None,
    protocol_version=None, load_balancing_policy=None,
    load_balancing_policy_args=None, ssl_options=None)

Check if a keyspace exists in a Cassandra cluster.

CLI Example:

```
salt 'minion1' cassandra_cql.keyspace_exists keyspace=system
```
salt.modules.cassandra_cql.list_column_families(keyspace=None, contact_points=None, port=None, cql_user=None, cql_pass=None, protocol_version=None, load_balancing_policy=None, load_balancing_policy_args=None, ssl_options=None)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

Parameters

- **keyspace** *(str)* -- The keyspace to provide the column families for, optional.
- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **protocol_version** *(int)* -- Cassandra protocol version to use.
- **load_balancing_policy** *(str)* -- cassandra.policy class name to use
- **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
- **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

The column families in this Cassandra cluster.

Return type

list[dict]

CLI Example:

```
salt 'minion1' cassandra_cql.list_column_families
salt 'minion1' cassandra_cql.list_column_families contact_points=minion1
salt 'minion1' cassandra_cql.list_column_families keyspace=system
```

salt.modules.cassandra_cql.list_keyspaces(contact_points=None, port=None, cql_user=None, cql_pass=None, protocol_version=None, load_balancing_policy=None, load_balancing_policy_args=None, ssl_options=None)

List keyspaces in a Cassandra cluster.

Parameters

- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **protocol_version** *(int)* -- Cassandra protocol version to use.
- **load_balancing_policy** *(str)* -- cassandra.policy class name to use
• **load_balancing_policy_args** (*dict*) -- cassandra.policy constructor args

• **ssl_options** (*dict*) -- Cassandra protocol version to use.

Returns
The keyspaces in this Cassandra cluster.

Return type
list[dict]

CLI Example:

```
salt 'minion1' cassandra_cql.list_keyspaces
salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1
<port=9000>
```

```python
salt.modules.cassandra_cql.list_permissions (username=None, resource=None, resource_type='keyspace', permission=None, contact_points=None, port=None, cql_user=None, cql_pass=None, protocol_version=None, load_balancing_policy=None, load_balancing_policy_args=None, ssl_options=None)
```

List permissions.

Parameters

• **username** (*str*) -- The name of the user to list permissions for.

• **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are listed.

• **resource_type** (*str*) -- The resource_type (keyspace or table), defaults to 'keyspace'.

• **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are listed.

• **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.

• **cql_user** (*str*) -- The Cassandra user if authentication is turned on.

• **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.

• **port** (*int*) -- The Cassandra cluster port, defaults to None.

• **protocol_version** (*int*) -- Cassandra protocol version to use.

• **load_balancing_policy** (*str*) -- cassandra.policy class name to use

• **load_balancing_policy_args** (*dict*) -- cassandra.policy constructor args

• **ssl_options** (*dict*) -- Cassandra protocol version to use.

Returns
Dictionary of permissions.

Return type
dict

CLI Example:
salt 'minion1' cassandra_cql.list_permissions
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_  
  → keyspace permission=select
salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_  
  → table resource_type=table permission=select contact_  
  → points=minion1

salt.modules.cassandra_cql.list_users(contact_points=None, port=None, cql_user=None,  
  cql_pass=None, protocol_version=None,  
  load_balancing_policy=None,  
  load_balancing_policy_args=None, ssl_options=None)

List existing users in this Cassandra cluster.

Parameters

- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **protocol_version** *(int)* -- Cassandra protocol version to use.
- **load_balancing_policy** *(str)* -- cassandra.policy class name to use
- **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
- **ssl_options** *(dict)* -- Cassandra protocol version to use.

Returns

The list of existing users.

Return type

dict

CLI Example:

<table>
<thead>
<tr>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>salt 'minion1' cassandra_cql.list_users</td>
</tr>
<tr>
<td>salt 'minion1' cassandra_cql.list_users contact_points=minion1</td>
</tr>
</tbody>
</table>

salt.modules.cassandra_cql.version(contact_points=None, port=None, cql_user=None, cql_pass=None,  
  protocol_version=None, load_balancing_policy=None,  
  load_balancing_policy_args=None, ssl_options=None)

Show the Cassandra version.

Parameters

- **contact_points** *(str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** *(str)* -- The Cassandra user if authentication is turned on.
- **cql_pass** *(str)* -- The Cassandra user password if authentication is turned on.
- **port** *(int)* -- The Cassandra cluster port, defaults to None.
• **protocol_version** *(int)* -- Cassandra protocol version to use.
• **load_balancing_policy** *(str)* -- cassandra.policy class name to use
• **load_balancing_policy_args** *(dict)* -- cassandra.policy constructor args
• **ssl_options** *(dict)* -- Cassandra protocol version to use.

**Returns**
The version for this Cassandra cluster.

**Return type**
str

CLI Example:
```
salt 'minion1' cassandra_cql.version
salt 'minion1' cassandra_cql.version contact_points=minion1
```

### 26.6.75 salt.modules.celery

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

**Note:** A new app (and thus new connections) is created for each task execution

salt.modules.celery.run_task(*task_name*, **args=None**, **kwargs=None**, **broker=None**, **backend=None**, **wait_for_result=False**, **timeout=None**, **propagate=True**, **interval=0.5**, **no_ack=True**, **raise_timeout=True**, **config=None**)  

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:
```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \ backend=redis://localhost wait_for_result=true
```

**task_name**
The task name, e.g. tasks.sleep

**args**
Task arguments as a list

**kwargs**
Task keyword arguments

**broker**
Broker for celeryapp, see celery documentation

**backend**
Result backend for celeryapp, see celery documentation

**wait_for_result**
Wait until task result is read from result backend and return result, Default: False

**timeout**
Timeout waiting for result from celery, see celeryAsyncResult.get documentation
propagate
  Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True

interval
  Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5

no_ack
  see celery AsyncResult.get documentation. Default: True

raise_timeout
  Raise timeout exception if waiting for task result times out. Default: False

config
  Config dict for celery app, See celery documentation

26.6.76 salt.modules.ceph

Module to provide ceph control with salt.

depends
  • ceph_cfg Python module

New in version 2016.11.0.

salt.modules.ceph.ceph_version()
  Get the version of ceph installed

  CLI Example:

  ```
salt '*' ceph.ceph_version
  ```

salt.modules.ceph.cluster_quorum(**kwargs)
  Get the cluster's quorum status

  CLI Example:

  ```
salt '*' ceph.cluster_quorum \\
  'cluster_name'='ceph' \\
  'cluster_uuid'='cluster_uuid'
  ```

cluster_uuid
  The cluster UUID. Defaults to value found in ceph config file.

cluster_name
  The cluster name. Defaults to ceph.

salt.modules.ceph.cluster_status(**kwargs)
  Get the cluster status, including health if in quorum

  CLI Example:

  ```
salt '*' ceph.cluster_status \\
  'cluster_name'='ceph' \\
  'cluster_uuid'='cluster_uuid'
  ```

cluster_uuid
  The cluster UUID. Defaults to value found in ceph config file.
**cluster_name**
The cluster name. Defaults to `ceph`.

`salt.modules.ceph.keyring_auth_add(**kwargs)`
Add keyring to authorized list

CLI Example:
```
salt '*' ceph.keyring_auth_add
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

**keyring_type** (required)
One of `admin`, `mon`, `osd`, `rgw`, `mds`

**cluster_uuid**
The cluster UUID. Defaults to value found in ceph config file.

**cluster_name**
The cluster name. Defaults to `ceph`.

`salt.modules.ceph.keyring_auth_del(**kwargs)`
Remove keyring from authorised list

CLI Example:
```
salt '*' ceph.keyring_osd_auth_del
  'keyring_type'='admin'
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

**keyring_type** (required)
One of `admin`, `mon`, `osd`, `rgw`, `mds`

**cluster_uuid**
The cluster UUID. Defaults to value found in ceph config file.

**cluster_name**
The cluster name. Defaults to `ceph`.

`salt.modules.ceph.keyring_auth_list(**kwargs)`
List all cephx authorization keys

CLI Example:
```
salt '*' ceph.keyring_auth_list
  'cluster_name'='ceph'
  'cluster_uuid'='cluster_uuid'
```

**cluster_name**
The cluster name. Defaults to `ceph`.

**cluster_uuid**
The cluster UUID. Defaults to value found in ceph config file.
salt.modules.ceph.keyring_create(**kwargs)
Create keyring for cluster

CLI Example:

```bash
salt '*' ceph.keyring_create \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

keyring_type (required)
One of admin, mon, osd, rgw, mds

classer_uuid
The cluster UUID. Defaults to value found in ceph config file.

classer_name
The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_present(**kwargs)
Returns True if the keyring is present on disk, otherwise False

CLI Example:

```bash
salt '*' ceph.keyring_present \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

keyring_type (required)
One of admin, mon, osd, rgw, mds

classer_uuid
The cluster UUID. Defaults to value found in ceph config file.

classer_name
The cluster name. Defaults to ceph.

salt.modules.ceph.keyring_purge(**kwargs)
Delete keyring for cluster

CLI Example:

```bash
salt '*' ceph.keyring_purge \
    'keyring_type'='admin' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

keyring_type (required)
One of admin, mon, osd, rgw, mds

classer_uuid
The cluster UUID. Defaults to value found in ceph config file.

classer_name
The cluster name. Defaults to ceph.
If no ceph config file is found, this command will fail.

**salt.modules.ceph.keyring_save(**kwargs)**

Create save keyring locally

CLI Example:

```bash
salt '*' ceph.keyring_save
  keyring_type='admin'
  cluster_name='ceph'
  cluster_uuid='cluster_uuid'
```

- **keyring_type (required)**
  One of admin, mon, osd, rgw, mds

- **cluster_uuid**
  The cluster UUID. Defaults to value found in ceph config file.

- **cluster_name**
  The cluster name. Defaults to ceph.

**salt.modules.ceph.mds_create(**kwargs)**

Create a mds

CLI Example:

```bash
salt '*' ceph.mds_create
  name='mds.name'
  port=1000,
  addr='fqdn.example.org'
  cluster_name='ceph'
  cluster_uuid='cluster_uuid'
```

- **name (required)**
  The MDS name (must start with mds.)

- **port (required)**
  Port to which the MDS will listen

- **addr (required)**
  Address or IP address for the MDS to listen

- **cluster_uuid**
  The cluster UUID. Defaults to value found in ceph config file.

- **cluster_name**
  The cluster name. Defaults to ceph.

**salt.modules.ceph.mds_destroy(**kwargs)**

Remove a mds

CLI Example:

```bash
salt '*' ceph.mds_destroy
  name='mds.name'
  cluster_name='ceph'
  cluster_uuid='cluster_uuid'
```
name (required)
The MDS name (must start with mds.)

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.mon_active(**kwargs)
Returns True if the mon daemon is running, otherwise False

CLI Example:
```
salt '*' ceph.mon_active
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.mon_create(**kwargs)
Create a mon node

CLI Example:
```
salt '*' ceph.mon_create
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.mon_is(**kwargs)
Returns True if the target is a mon node, otherwise False

CLI Example:
```
salt '*' ceph.mon_is
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

cluster_name
The cluster name. Defaults to ceph.

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.
salt.modules.ceph.mon_quorum(**kwargs)

Returns True if the mon daemon is in the quorum, otherwise False

CLI Example:

```bash
salt '*' ceph.mon_quorum \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.mon_status(**kwargs)

Get status from mon daemon

CLI Example:

```bash
salt '*' ceph.mon_status \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.osd_activate(**kwargs)

Activate an OSD

CLI Example:

```bash
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

salt.modules.ceph.osd_discover()

List all OSD by cluster

CLI Example:

```bash
salt '*' ceph.osd_discover
```

salt.modules.ceph.osd_prepare(**kwargs)

Prepare an OSD

CLI Example:

```bash
salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc' \
    'journal_dev'='device' \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid' \
    'osd_fs_type'='xfs' \
    'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \ 
    'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'
```
cluster_uuid
   The device to store the osd data on.

journal_dev
   The journal device. defaults to osd_dev.

cluster_name
   The cluster name. Defaults to ceph.

cluster_uuid
   The cluster date will be added too. Defaults to the value found in local config.

osd_fs_type
   set the file system to store OSD data with. Defaults to "xfs".

osd_uuid
   set the OSD data UUID. If set will return if OSD with data UUID already exists.

journal_uuid
   set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

salt.modules.ceph.partition_is(dev)
   Check whether a given device path is a partition or a full disk.
   CLI Example:
   ```
salt '*' ceph.partition_is /dev/sdc1
   ```

salt.modules.ceph.partition_list()
   List partitions by disk
   CLI Example:
   ```
salt '*' ceph.partition_list
   ```

salt.modules.ceph.partition_list_journal()
   List all OSD journal partitions by partition
   CLI Example:
   ```
salt '*' ceph.partition_list_journal
   ```

salt.modules.ceph.partition_list_osd()
   List all OSD data partitions by partition
   CLI Example:
   ```
salt '*' ceph.partition_list_osd
   ```

salt.modules.ceph.pool_add(pool_name, **kwargs)
   Create a pool
   CLI Example:
   ```
salt '*' ceph.pool_add pool_name \  
   'cluster_name'='ceph' \  
   'cluster_uuid'='cluster_uuid'
   ```
**cluster_name**

The cluster name. Defaults to **ceph**.

**cluster_uuid**

The cluster UUID. Defaults to value found in ceph config file.

**pg_num**

Default to 8

**pgp_num**

Default to pg_num

**pool_type**

can take values "replicated" or "erasure"

**erasure_code_profile**

The "erasure_code_profile"

**crush_ruleset**

The crush map rule set

---

**salt.modules.ceph.pool_del(pool_name,**kwargs)**

Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

---

**salt.modules.ceph.pool_list(**kwargs)**

List all pools

CLI Example:

```
salt '*' ceph.pool_list \
    'cluster_name'='ceph' \
    'cluster_uuid'='cluster_uuid'
```

---

**salt.modules.ceph.purge(**kwargs)**

purge ceph configuration on the node

CLI Example:
salt '*' ceph.purge
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'

**cluster_name**
The cluster name. Defaults to ceph.

**cluster_uuid**
The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.rgw_create(**kwargs)
Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create
    'name' = 'rgw.name'
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

**name (required)**
The RGW client name. Must start with rgw.

**cluster_uuid**
The cluster UUID. Defaults to value found in ceph config file.

**cluster_name**
The cluster name. Defaults to ceph.

salt.modules.ceph.rgw_destroy(**kwargs)
Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy
    'name' = 'rgw.name'
    'cluster_name'='ceph'
    'cluster_uuid'='cluster_uuid'
```

**name (required)**
The RGW client name (must start with rgw.)

**cluster_uuid**
The cluster UUID. Defaults to value found in ceph config file.

**cluster_name**
The cluster name. Defaults to ceph.

salt.modules.ceph.rgw_pools_create(**kwargs)
Create pools for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_create
```

**salt modules**

Salt Documentation, Release 3007.1
cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.rgw_pools_missing(**kwargs)
Show pools missing for rgw

CLI Example:
salt '*' ceph.rgw_pools_missing

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

cluster_name
The cluster name. Defaults to ceph.

salt.modules.ceph.zap(target=None, **kwargs)
Destroy the partition table and content of a given disk.

salt '*' ceph.osd_prepare 'dev'='/dev/vdc' \ 'cluster_name'='ceph' \ 'cluster_uuid'='cluster_uuid'

dev
The block device to format.

cluster_name
The cluster name. Defaults to ceph.

cluster_uuid
The cluster UUID. Defaults to value found in ceph config file.

26.6.77 salt.modules.chassis

Glue execution module to link to the fx2 proxymodule.

Depends: iDRAC Remote execution module (salt.modules.dracr)

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for
salt.modules.dracr.

This execution module calls through to a function in the fx2 proxy module called chconfig. That function looks
up the function passed in the cmd parameter in salt.modules.dracr and calls it.

New in version 2015.8.2.

salt.modules.chassis.chassis_credentials()
salt.modules.chassis.cmd(cmd, *args, **kwargs)
26.6.78 salt.modules.chef

Execute chef in server or solo mode

```python
salt.modules.chef.client(whyrun=False, localmode=False, logfile=None, **kwargs)
```

Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

- **server**
  The chef server URL

- **client_key**
  Set the client key file location

- **config**
  The configuration file to use

- **config-file-jail**
  Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).

- **environment**
  Set the Chef Environment on the node

- **group**
  Group to set privilege to

- **json-attributes**
  Load attributes from a JSON file or URL

- **localmode**
  Point chef-client at local repository if True

- **log_level**
  Set the log level (debug, info, warn, error, fatal)

- **logfile**
  Set the log file location

- **node-name**
  The node name for this client

- **override-runlist**
  Replace current run list with specified items for a single run

- **pid**
  Set the PID file location, defaults to /tmp/chef-client.pid

- **run-lock-timeout**
  Set maximum duration to wait for another client run to finish, default is indefinitely.

- **runlist**
  Permanently replace current run list with specified items

- **user**
  User to set privilege to

- **validation_key**
  Set the validation key file location, used for registering new clients
whyrun
Enable whyrun mode when set to True

salt.modules.chef.solo(whyrun=False, logfile=None, **kwargs)
Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.
CLI Example:
salt '*' chef.solo override-runlist=test

cfg
The configuration file to use

tm
Set the Chef Environment on the node

gr
Group to set privilege to

json_attributes
Load attributes from a JSON file or URL

log_level
Set the log level (debug, info, warn, error, fatal)

logfile
Set the log file location

node_name
The node name for this client

override_runlist
Replace current run list with specified items for a single run

recipe-url
Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache

run_lock_timeout
Set maximum duration to wait for another client run to finish, default is indefinitely.

user
User to set privilege to

whyrun
Enable whyrun mode when set to True

26.6.79 salt.modules.chocolatey
A module that wraps calls to the Chocolatey package manager (http://chocolatey.org)
New in version 2014.1.0.
salt.modules.chocolatey.add_source(name, source_location, username=None, password=None, priority=None)
Instructs Chocolatey to add a source.

Parameters
- name (str) -- The name of the source to be added as a chocolatey repository.
- source (str) -- Location of the source you want to work with.
• **username** *(str)* -- Provide username for chocolatey sources that need authentication credentials.

• **password** *(str)* -- Provide password for chocolatey sources that need authentication credentials.

• **priority** *(int)* -- The priority order of this source as compared to other sources, lower is better. Defaults to 0 (no priority). All priorities above 0 will be evaluated first, then zero-based values will be evaluated in config file order.

CLI Example:

```bash
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> priority=100
salt '*' chocolatey.add_source <source name> <source_location> user=<user> password=<password>
```

salt.modules.chocolatey.bootstrap *(force=False, source=None, version=None)*

Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host’s version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

**Note:** If PowerShell is installed, you may have to restart the host machine for Chocolatey to work.

**Note:** If you’re installing offline using the source parameter, the PowerShell and .NET requirements must already be met on the target. This shouldn’t be a problem on Windows versions 2012/8 and later.

**Note:** If you’re installing chocolatey version 2.0+ the system requires .NET 4.8. Installing this requires a reboot, therefore this module will not automatically install .NET 4.8.

**Parameters**

• **force** *(bool)* -- Run the bootstrap process even if Chocolatey is found in the path.

• **source** *(str)* -- The location of the .nupkg file or .ps1 file to run from an alternate location. This can be one of the following types of URLs:
  - `salt://`
  - `http(s)//`
  - `ftp://`
  - `file://` - A local file on the system

  New in version 3001.

• **version** *(str)* -- The version of chocolatey to install. The latest version is installed if this value is `None`. Default is `None`

  New in version 3007.1.
Returns
The stdout of the Chocolatey installation script

Return type
str

CLI Example:

```bash
# To bootstrap Chocolatey
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True

# To bootstrap Chocolatey offline from a file on the salt master
salt '*' chocolatey.bootstrap source=salt://files/chocolatey.nupkg

# To bootstrap Chocolatey from a file on C:\Temp
salt '*' chocolatey.bootstrap source=C:\Temp\chocolatey.nupkg

# To bootstrap Chocolatey version 1.4.0
salt '*' chocolatey.bootstrap version=1.4.0
```

salt.modules.chocolatey.chocolatey_version(refresh=False)
Returns the version of Chocolatey installed on the minion.

Parameters
- **refresh** (bool) -- Refresh the cached version of chocolatey
  New in version 3007.1.

CLI Example:

```bash
salt '*' chocolatey.chocolatey_version
```

salt.modules.chocolatey.disable_source(name)
Instructs Chocolatey to disable a source.

Parameters
- **name** (str) -- Name of the source repository to disable.

CLI Example:

```bash
salt '*' chocolatey.disable_source <name>
```

salt.modules.chocolatey.enable_source(name)
Instructs Chocolatey to enable a source.

Parameters
- **name** (str) -- Name of the source repository to enable.

CLI Example:

```bash
salt '*' chocolatey.enable_source <name>
```

salt.modules.chocolatey.install(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None, allow_multiple=False, execution_timeout=None)
Instructs Chocolatey to install a package.
Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. Default is `None`.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is `None`.

Alternate Sources:
- cygwin
- python
- ruby
- webpi
- windowsfeatures

- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is `False`.
- **pre_versions** (*bool*) -- Include pre-release packages. Default is `False`.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list. Default is `None`.
- **override_args** (*bool*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` install_args will be appended to the end of the default arguments. Default is `None`.
- **force_x86** (*bool*) -- Force x86 (32bit) installation on 64bit systems. Default is `False`.
- **package_args** (*str*) -- Arguments you want to pass to the package. Default is `None`.
- **allow_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is `False`.

New in version 2017.7.0.

- **execution_timeout** (*str*) -- Chocolatey execution timeout value you want to pass to the installation process. Default is `None`.

New in version 2018.3.0.

Returns

The output of the `chocolatey` command

Return type

*str*

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```

```
salt.modules.chocolatey.install_cygwin(name, install_args=None, override_args=False)
```

Instructs Chocolatey to install a package via Cygwin.
**Parameters**

- `name (str)` -- The name of the package to be installed. Only accepts a single argument.
- `install_args (str)` -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list
- `override_args (bool)` -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` `install_args` will be appended to the end of the default arguments

**CLI Example:**

```bash
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args>
←override_args=True
```

**salt.modules.chocolatey.install_gem(name, version=None, install_args=None, override_args=False)**

Instructs Chocolatey to install a package via Ruby's Gems.

**Parameters**

- `name (str)` -- The name of the package to be installed. Only accepts a single argument.
- `version (str)` -- Install a specific version of the package. Defaults to the latest version available.
- `install_args (str)` -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list
- `override_args (bool)` -- Set to `True` if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to `False` `install_args` will be appended to the end of the default arguments

**CLI Example:**

```bash
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args>
←override_args=True
```

**salt.modules.chocolatey.install_missing(name, version=None, source=None)**

Instructs Chocolatey to install a package if it doesn’t already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls `chocolatey.install` instead, as `installmissing` is deprecated as of that version and will be removed in Chocolatey 1.0.

**Parameters**

- `name (str)` -- The name of the package to be installed. Only accepts a single argument.
- `version (str)` -- Install a specific version of the package. Defaults to the latest version available.
- `source (str)` -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

**CLI Example:**
salt.modules.chocolatey.install_missing(<package name>)
salt.modules.chocolatey.install_missing(<package name>, version=<package version>)

salt.modules.chocolatey.install_python(name, version=None, install_args=None, override_args=False)
Instructs Chocolatey to install a package via Python's easy_install.

Parameters
- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **version** (*str*) -- Install a specific version of the package. Defaults to the latest version available.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **override_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments.

CLI Example:
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args>
override_args=True

salt.modules.chocolatey.install_webpi(name, install_args=None, override_args=False)
Instructs Chocolatey to install a package via the Microsoft Web PI service.

Parameters
- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.
- **override_args** (*bool*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments.

CLI Example:
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args>
override_args=True

salt.modules.chocolatey.install_windowsfeatures(name)
Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

Parameters
- **name** (*str*) -- The name of the feature to be installed. Only accepts a single argument.

CLI Example:
salt '*' chocolatey.install_windowsfeatures <package name>
salt.modules.chocolatey.list_ (narrow=None, all_versions=False, pre_versions=False, source=None, local_only=False, exact=False)

Instructs Chocolatey to pull a vague package list from the repository.

**Parameters**

- **narrow** *(str)* -- Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all_versions** *(bool)* -- Display all available package versions in results. Default is False.
- **pre_versions** *(bool)* -- Display pre-release packages in results. Default is False.
- **source** *(str)* -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local_only** *(bool)* -- Only display packages that are installed locally. Default is False.
- **exact** *(bool)* -- Only display packages that match `narrow` exactly. Default is False.

New in version 2017.7.0.

**Returns**

A dictionary of results.

**Return type**

dict

**CLI Example:**

```bash
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

salt.modules.chocolatey.list_sources()

Returns the list of installed sources.

**CLI Example:**

```bash
salt '*' chocolatey.list_sources
```

salt.modules.chocolatey.list_webpi()

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

**Returns**

List of webpi packages

**Return type**

str

**CLI Example:**

```bash
salt '*' chocolatey.list_webpi
```

salt.modules.chocolatey.list_windowsfeatures()

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

**Returns**

List of Windows Features
Return type
str

CLI Example:
```
salt '*' chocolatey.list_windowsfeatures
```

`salt.modules.chocolatey.unbootstrap()`
Uninstall chocolatey from the system by doing the following:

- Delete the Chocolatey Directory
- Remove Chocolatey from the path
- Remove Chocolatey environment variables

New in version 3001.

Returns
A list of items that were removed, otherwise an empty list

Return type
list

CLI Example:
```
salt * chocolatey.unbootstrap
```

`salt.modules.chocolatey.uninstall(name, version=None, uninstall_args=None, override_args=False, force=False)`

Instructs Chocolatey to uninstall a package.

Parameters
- `name (str)` -- The name of the package to be uninstalled. Only accepts a single argument.
- `version (str)` -- Uninstalls a specific version of the package. Defaults to the latest version installed.
- `uninstall_args (str)` -- A list of uninstall arguments you want to pass to the uninstallation process, i.e. product key or feature list.
- `override_args` -- Set to True if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments.

CLI Example:
```
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>«
←uninstall_args=<args> override_args=True
```

`salt.modules.chocolatey.update(name, source=None, pre_versions=False)`
Instructs Chocolatey to update packages on the system.

Parameters
- `name (str)` -- The name of the package to update, or "all" to update everything installed on the system.
• **source** *(str)*-- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

• **pre_versions** *(bool)*-- Include pre-release packages in comparison. Defaults to False.

**CLI Example:**
```
salt "*" chocolatey.update all
salt "*" chocolatey.update <package name> pre_versions=True
```

**salt.modules.chocolatey.upgrade** *(name, version=None, source=None, force=False, pre_versions=False, install_args=None, override_args=False, force_x86=False, package_args=None)*

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated). This command will install the package if not installed.

**Parameters**

- **name** *(str)*-- The name of the package to update, or "all" to update everything installed on the system.

- **version** *(str)*-- Install a specific version of the package. Defaults to latest version.

- **source** *(str)*-- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

- **force** *(bool)*-- Reinstall the same version already installed.

- **pre_versions** *(bool)*-- Include pre-release packages in comparison. Defaults to False.

- **install_args** *(str)*-- A list of install arguments you want to pass to the installation process, i.e. product key or feature list.

- **override_args** *(bool)*-- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments.

- **force_x86** *(bool)*-- Force x86 (32bit) installation on 64bit systems. Defaults to False.

- **package_args** *(str)*-- A list of arguments you want to pass to the package.

**Returns**

Results of the chocolatey command

**Return type**

str

**CLI Example:**
```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

**salt.modules.chocolatey.version** *(name, check_remote=False, source=None, pre_versions=False)*

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

**Parameters**

- **name** *(str)*-- The name of the package to check. Required.
• **check_remote** *(bool)* -- Get the version number of the latest package from the remote feed. Default is False.

• **source** *(str)* -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

• **pre_versions** *(bool)* -- Include pre-release packages in comparison. Default is False.

**Returns**
A dictionary of currently installed software and versions

**Return type**
dict

**CLI Example:**

```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

### 26.6.80 salt.modules.chronos

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

**salt.modules.chronos.has_job(name)**

Return whether the given job is currently configured.

**CLI Example:**

```
salt chronos-minion-id chronos.has_job my-job
```

**salt.modules.chronos.job(name)**

Return the current server configuration for the specified job.

**CLI Example:**

```
salt chronos-minion-id chronos.job my-job
```

**salt.modules.chronos.jobs()**

Return a list of the currently installed job names.

**CLI Example:**

```
salt chronos-minion-id chronos.jobs
```

**salt.modules.chronos.rm_job(name)**

Remove the specified job from the server.

**CLI Example:**

```
salt chronos-minion-id chronos.rm_job my-job
```
salt.modules.chronos.update_job(name, config)

Update the specified job with the given configuration.

CLI Example:

```plaintext
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

26.6.81 salt.modules.chroot

Module for chroot

:maintainer: Alberto Planas <aplanas@suse.com>
:maturity: new
:depends: None
:platform: Linux

salt.modules.chroot.apply_(root, mods=None, **kwargs)

Apply an state inside a chroot.

This function will call chroot.highstate or chroot.sls based on the arguments passed to this function. It exists as a more intuitive way of applying states.

**root**
Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check state.apply_ documentation.

CLI Example:

```plaintext
salt myminion chroot.apply /chroot
salt myminion chroot.apply /chroot stuff
salt myminion chroot.apply /chroot stuff pillar='{"foo": "bar"}"
```

salt.modules.chroot.call(root, function, *args, **kwargs)

Executes a Salt function inside a chroot environment.

The chroot does not need to have Salt installed, but Python is required.

**root**
Path to the chroot environment

**function**
Salt execution module function

CLI Example:

```plaintext
salt myminion chroot.call /chroot test.ping
salt myminion chroot.call /chroot ssh.set_auth_key user key=mykey
```

salt.modules.chroot.create(root)

Create a basic chroot environment.

Note that this environment is not functional. The caller needs to install the minimal required binaries, including Python if chroot.call is called.

**root**
Path to the chroot environment

CLI Example:

```plaintext
salt myminion chroot.create /chroot
```
salt.modules.chroot.exist(root)

Return True if the chroot environment is present.

root
Path to the chroot environment

CLI Example:
```
salt myminion chroot.exist /chroot
```

salt.modules.chroot.highstate(root, **kwargs)

Retrieve the state data from the salt master for this minion and execute it inside the chroot.

root
Path to the chroot environment

For a formal description of the possible parameters accepted in this function, check state.highstate documentation.

CLI Example:
```
salt myminion chroot.highstate /chroot
salt myminion chroot.highstate /chroot pillar='{"foo": "bar"}''
```

salt.modules.chroot.in_chroot()

Return True if the process is inside a chroot jail

New in version 3004.

CLI Example:
```
salt myminion chroot.in_chroot
```

salt.modules.chroot.sls(root, mods, saltenv='base', test=None, exclude=None, **kwargs)

Execute the states in one or more SLS files inside the chroot.

root
Path to the chroot environment

saltenv
Specify a salt fileserver environment to be used when applying states

mods
List of states to execute

test
Run states in test-only (dry-run) mode

exclude
Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing sls or id keys. Glob-patterns may be used to match multiple states.

For a formal description of the possible parameters accepted in this function, check state.sls documentation.

CLI Example:
```
salt '*' chroot.sls /chroot stuff pillar='{"foo": "bar"}''
```
26.6.82 salt.modules.cimc

Module to provide Cisco UCS compatibility to Salt

- **codeauthor**
  - Spencer Ervin <spencer_ervin@hotmail.com>
- **maturity**
  - new
- **depends**
  - none
- **platform**
  - unix

### Configuration

This module accepts connection configuration details either as parameters, or as configuration settings in pillar as a Salt proxy. Options passed into opts will be ignored if options are passed into pillar.

**See also:**

*Cisco UCS Proxy Module*

### About

This execution module was designed to handle connections to a Cisco UCS server. This module adds support to send connections directly to the device through the rest API.

**salt.modules.cimc.activate_backup_image** *(reset=False)*

Activates the firmware backup image.

**CLI Example:**

```
salt '*' cimc.activate_backup_image
salt '*' cimc.activate_backup_image reset=True
```

**salt.modules.cimc.create_user** *(uid=None, username=None, password=None, priv=None)*

Create a CIMC user with username and password.

**Parameters**

- **uid** *(int)* -- The user ID slot to create the user account in.
- **username** *(str)* -- The name of the user.
- **password** *(str)* -- The clear text password of the user.
- **priv** *(str)* -- The privilege level of the user.

**CLI Example:**

```
salt '*' cimc.create_user 11 username=admin password=foobar priv=admin
```
salt.modules.cimc.get_bios_defaults()
Get the default values of BIOS tokens.
CLI Example:

```
salt '*' cimc.get_bios_defaults
```

salt.modules.cimc.get_bios_settings()
Get the C240 server BIOS token values.
CLI Example:

```
salt '*' cimc.get_bios_settings
```

salt.modules.cimc.get_boot_order()
Retrieves the configured boot order table.
CLI Example:

```
salt '*' cimc.get_boot_order
```

salt.modules.cimc.get_cpu_details()
Get the CPU product ID details.
CLI Example:

```
salt '*' cimc.get_cpu_details
```

salt.modules.cimc.get_disks()
Get the HDD product ID details.
CLI Example:

```
salt '*' cimc.get_disks
```

salt.modules.cimc.get_ethernet_interfaces()
Get the adapter Ethernet interface details.
CLI Example:

```
salt '*' cimc.get_ethernet_interfaces
```

salt.modules.cimc.get_fibre_channel_interfaces()
Get the adapter fibre channel interface details.
CLI Example:

```
salt '*' cimc.get_fibre_channel_interfaces
```

salt.modules.cimc.get_firmware()
Retrieves the current running firmware versions of server components.
CLI Example:

```
salt '*' cimc.get_firmware
```
salt.modules.cimc.get_hostname()
Retrieves the hostname from the device.
New in version 2019.2.0.
CLI Example:
```
salt '*' cimc.get_hostname
```

salt.modules.cimc.get_ldap()
Retrieves LDAP server details.
CLI Example:
```
salt '*' cimc.get_ldap
```

salt.modules.cimc.get_management_interface()
Retrieve the management interface details.
CLI Example:
```
salt '*' cimc.get_management_interface
```

salt.modules.cimc.get_memory_token()
Get the memory RAS BIOS token.
CLI Example:
```
salt '*' cimc.get_memory_token
```

salt.modules.cimc.get_memory_unit()
Get the IMM/Memory unit product ID details.
CLI Example:
```
salt '*' cimc.get_memory_unit
```

salt.modules.cimc.get_network_adapters()
Get the list of network adapters and configuration details.
CLI Example:
```
salt '*' cimc.get_network_adapters
```

salt.modules.cimc.get_ntp()
Retrieves the current running NTP configuration.
CLI Example:
```
salt '*' cimc.get_ntp
```

salt.modules.cimc.get_pci_adapters()
Get the PCI adapter product ID details.
CLI Example:
```
salt '*' cimc.get_pci_adapters
```
salt.modules.cimc.get_power_configuration()
Get the configuration of the power settings from the device. This is only available on some C-Series servers.
New in version 2019.2.0.
CLI Example:
```python
salt '*' cimc.get_power_configuration
```

salt.modules.cimc.get_power_supplies()
Retrieves the power supply unit details.
CLI Example:
```python
salt '*' cimc.get_power_supplies
```

salt.modules.cimc.get_snmp_config()
Get the snmp configuration details.
CLI Example:
```python
salt '*' cimc.get_snmp_config
```

salt.modules.cimc.get_syslog()
Get the Syslog client-server details.
CLI Example:
```python
salt '*' cimc.get_syslog
```

salt.modules.cimc.get_syslog_settings()
Get the Syslog configuration settings from the system.
New in version 2019.2.0.
CLI Example:
```python
salt '*' cimc.get_syslog_settings
```

salt.modules.cimc.get_system_info()
Get the system information.
CLI Example:
```python
salt '*' cimc.get_system_info
```

salt.modules.cimc.get_users()
Get the CIMC users.
CLI Example:
```python
salt '*' cimc.get_users
```

salt.modules.cimc.get_vic_adapters()
Get the VIC adapter general profile details.
CLI Example:
```
salt '*' cimc.get_vic_adapters
```

**salt.modules.cimc.get_vic_uplinks()**

Get the VIC adapter uplink port details.

CLI Example:
```
salt '*' cimc.get_vic_uplinks
```

```
salt.modules.cimc.mount_share(name=None, remote_share=None, remote_file=None, mount_type='nfs',
                                username=None, password=None)
```

Mounts a remote file through a remote share. Currently, this feature is supported in version 1.5 or greater. The remote share can be either NFS, CIFS, or WWW.

**Some of the advantages of CIMC Mounted vMedia include:**
- Communication between mounted media and target stays local (inside datacenter)
- Media mounts can be scripted/automated
- No vKVM requirements for media connection
- Multiple share types supported
- Connections supported through all CIMC interfaces

**Note:** CIMC Mounted vMedia is enabled through BIOS configuration.

**Parameters**

- **name (str)** -- The name of the volume on the CIMC device.
- **remote_share (str)** -- The file share link that will be used to mount the share. This can be NFS, CIFS, or WWW. This
- **file. (must be the directory path and not the full path to the remote)**
- **remote_file (str)** -- The name of the remote file to mount. It must reside within remote_share.
- **mount_type (str)** -- The type of share to mount. Valid options are nfs, cifs, and www.
- **username (str)** -- An optional requirement to pass credentials to the remote share. If not provided, an
- **made. (unauthenticated connection attempt will be)**
- **password (str)** -- An optional requirement to pass a password to the remote share. If not provided, an
- **made. --**

CLI Example:
```
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs
                        remote_file=sl1huu.iso
```
```
salt '*' cimc.mount_share name=WIN7 remote_share=10.xxx.27.xxx:/nfs
                        remote_file=sl1huu.iso username=bob password=badpassword
```

```
salt.modules.cimc.reboot()
```

Power cycling the server.

CLI Example:
salt '*' cimc.reboot

salt.modules.cimc.set_hostname(hostname=None)
Sets the hostname on the server.
New in version 2019.2.0.

Parameters

    hostname (str) -- The new hostname to set.

CLI Example:
salt '*' cimc.set_hostname foobar

salt.modules.cimc.set_logging_levels(remote=None, local=None)
Sets the logging levels of the CIMC devices. The logging levels must match the following options: emergency, alert, critical, error, warning, notice, informational, debug.
New in version 2019.2.0.

Parameters

- remote (str) -- The logging level for SYSLOG logs.
- local (str) -- The logging level for the local device.

CLI Example:
salt '*' cimc.set_logging_levels remote=error local=notice

salt.modules.cimc.set_ntp_server(server1='', server2='', server3='', server4=')
Sets the NTP servers configuration. This will also enable the client NTP service.

Parameters

- server1 (str) -- The first IP address or FQDN of the NTP servers.
- server2 (str) -- The second IP address or FQDN of the NTP servers.
- server3 (str) -- The third IP address or FQDN of the NTP servers.
- server4 (str) -- The fourth IP address or FQDN of the NTP servers.

CLI Example:
salt '*' cimc.set_ntp_server 10.10.10.1
salt '*' cimc.set_ntp_server 10.10.10.1 foo.bar.com

salt.modules.cimc.set_power_configuration(policy=None, delayType=None, delayValue=None)
Sets the power configuration on the device. This is only available for some C-Series servers.
New in version 2019.2.0.

Parameters

- policy (str) -- The action to be taken when chassis power is restored after
- following (delayed with this option. This can be one of the) -- reset: The server is allowed to boot up normally when power is restored. The server can restart immediately or, optionally, after a fixed or random delay.
- stay-off: The server remains off until it is manually restarted.
last-state: The server restarts and the system attempts to restore any processes that were running before power was lost.

• **delayType** *(str)* -- If the selected policy is reset, the restart can be

• **following** -- fixed: The server restarts after a fixed delay.
  random: The server restarts after a random delay.

• **delayValue** *(int)* -- If a fixed delay is selected, once chassis power is

• **rebooting** *(restored and the Cisco IMC has finished)* --

• **for** *(the system waits)* --

• **an** *(the specified number of seconds before restarting the server. Enter)* --

• **240** *(integer between 0 and)* --

CLI Example:

```
salt '*' cimc.set_power_configuration stay-off
salt '*' cimc.set_power_configuration reset fixed 0
```

**salt.modules.cimc.set_syslog_server(server=None, type='primary')**

Set the SYSLOG server on the host.

Parameters

• **server** *(str)* -- The hostname or IP address of the SYSLOG server.

• **type** *(str)* -- Specifies the type of SYSLOG server. This can either be primary (default) or secondary.

CLI Example:

```
salt '*' cimc.set_syslog_server foo.bar.com
salt '*' cimc.set_syslog_server foo.bar.com primary
salt '*' cimc.set_syslog_server foo.bar.com secondary
```

**salt.modules.cimc.set_user(uid=None, username=None, password=None, priv=None, status=None)**

Sets a CIMC user with specified configurations.

New in version 2019.2.0.

Parameters

• **uid** *(int)* -- The user ID slot to create the user account in.

• **username** *(str)* -- The name of the user.

• **password** *(str)* -- The clear text password of the user.

• **priv** *(str)* -- The privilege level of the user.

• **status** *(str)* -- The account status of the user.

CLI Example:
salt '*' cimc.set_user 11 username=admin password=foobar priv=admin active

salt.modules.cimc.tftp_update_bios(server=None, path=None)
Update the BIOS firmware through TFTP.

Parameters
- server (str) -- The IP address or hostname of the TFTP server.
- path (str) -- The TFTP path and filename for the BIOS image.

CLI Example:
salt '*' cimc.tftp_update_bios foo.bar.com HP-SL2.cap

salt.modules.cimc.tftp_update_cimc(server=None, path=None)
Update the CIMC firmware through TFTP.

Parameters
- server (str) -- The IP address or hostname of the TFTP server.
- path (str) -- The TFTP path and filename for the CIMC image.

CLI Example:
salt '*' cimc.tftp_update_cimc foo.bar.com HP-SL2.bin

26.6.83 salt.modules.ciscoconfparse_mod

Execution module for ciscoconfparse

New in version 2019.2.0.

This module can be used for basic configuration parsing, audit or validation for a variety of network platforms having Cisco IOS style configuration (one space indentation), including: Cisco IOS, Cisco Nexus, Cisco IOS-XR, Cisco IOS-XR, Cisco ASA, Arista EOS, Brocade, HP Switches, Dell PowerConnect Switches, or Extreme Networks devices. In newer versions, ciscoconfparse provides support for brace-delimited configuration style as well, for platforms such as: Juniper Junos, Palo Alto, or F5 Networks.

See http://www.pennington.net/py/ciscoconfparse/index.html for further details.

depends
ciscoconfparse

This module depends on the Python library with the same name, ciscoconfparse - to install execute: pip install ciscoconfparse.

salt.modules.ciscoconfparse_mod.filter_lines(config=None, config_path=None, parent_regex=None, child_regex=None, saltenv='base')

Return a list of detailed matches, for the configuration blocks (parent-child relationship) whose parent respects the regular expressions configured via the parent_regex argument, and the child matches the child_regex regular expression. The result is a list of dictionaries with the following keys:

- match: a boolean value that tells whether child_regex matched any children lines.
- parent: the parent line (as text).
- child: the child line (as text). If no child line matched, this field will be None.
Note that the return list contains the elements that matched the parent condition, the parent_regex regular expression. Therefore, the parent field will always have a valid value, while match and child may default to False and None respectively when there is not child match.

CLI Example:

```bash
salt '*' ciscoconfparse.filter_lines config_path=https://bit.ly/2mAdq7z
  →parent_regex='Gigabit' child_regex='shutdown'
```

Example output (for the example above):

```
[
  {
    'parent': 'interface GigabitEthernet1',
    'match': False,
    'child': None
  },
  {
    'parent': 'interface GigabitEthernet2',
    'match': True,
    'child': 'shutdown'
  },
  {
    'parent': 'interface GigabitEthernet3',
    'match': True,
    'child': 'shutdown'
  }
]
```

salt.modules.ciscoconfparse_mod.find_lines(config=None, config_path=None, regex=None, saltenv='base')

Return all the lines (as text) that match the expression in the regex argument.

**config**

The configuration sent as text.

**Note:** This argument is ignored when config_path is specified.

**config_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

**regex**

The regular expression to match the lines against.

**saltenv:** base

Salt files server environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

CLI Example:

```bash
salt '*' ciscoconfparse.find_lines config_path=https://bit.ly/2mAdq7z
  →regex='ip address'
```

Output example:
salt.modules.ciscoconfparse_mod.find_lines_w_child(config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base')

Return a list of parent lines (as text) matching the regular expression parent_regex that have children lines matching child_regex.

config
The configuration sent as text.

Note: This argument is ignored when config_path is specified.

cfg

config_path
The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex
The regular expression to match the parent lines against.

child_regex
The regular expression to match the child lines against.

ignore_ws: False
Whether to ignore the white spaces.

saltenv: base
Salt fileserver environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

CLI Example:

```
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2mAdq7z parent_line='line con' child_line='stopbits'
salt '*' ciscoconfparse.find_lines_w_child config_path=https://bit.ly/2uIRxau parent_regex='ge-(\.)' child_regex='unit \d+'```

salt.modules.ciscoconfparse_mod.find_lines_wo_child(config=None, config_path=None, parent_regex=None, child_regex=None, ignore_ws=False, saltenv='base')

Return a list of parent ciscoconfparse.IOSCfgLine lines as text, which matched the parent_regex and whose children did not match child_regex. Only the parent ciscoconfparse.IOSCfgLine text lines will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.

config
The configuration sent as text.

Note: This argument is ignored when config_path is specified.
**config_path**
The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**parent_regex**
The regular expression to match the parent lines against.

**child_regex**
The regular expression to match the child lines against.

**ignore_ws**: `False`
Whether to ignore the white spaces.

**saltenv**: `base`
Salt fileservre environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

CLI Example:
```bash
grep 'line con' path/to/config.txt
```

salt.modules.ciscoconfparse_mod.find_objects(config=None, config_path=None, regex=None, saltenv='base')

Return all the line objects that match the expression in the `regex` argument.

### Warning:
This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines`.

**config**
The configuration sent as text.

**Note**: This argument is ignored when `config_path` is specified.

**config_path**
The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**regex**
The regular expression to match the lines against.

**saltenv**: `base`
Salt fileservre environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

Usage example:
```python
objects = __salt__['ciscoconfparse.find_objects'](config_path='salt://path/to/config.txt', regex='Gigabit')

for obj in objects:
    print(obj.text)
```
Salt Documentation, Release 3007.1

salt.modules.ciscoconfparse_mod.find_objects_w_child(config=None, config_path=None,
parent_regex=None,
child_regex=None, ignore_ws=False,
saltenv='base')

Parse through the children of all parent lines matching parent_regex, and return a list of child objects, which matched the child_regex.

Warning: This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using ciscoconfparse.

config
The configuration sent as text.

config_path
The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., salt://, https://, ftp://, s3://, etc.

parent_regex
The regular expression to match the parent lines against.

child_regex
The regular expression to match the child lines against.

ignore_ws: False
Whether to ignore the white spaces.

saltenv: base
Salt fileserv environment from which to retrieve the file. This argument is ignored when config_path is not a salt:// URL.

Usage example:
```
objects = __salt__['ciscoconfparse.find_objects_w_child'](config_path='https://bit.ly/2mAdq7z',
parent_regex='line con',
child_regex='stopbits')

for obj in objects:
    print(obj.text)
```

salt.modules.ciscoconfparse_mod.find_objects_wo_child(config=None, config_path=None,
parent_regex=None,
child_regex=None, ignore_ws=False,
saltenv='base')

Return a list of parent ciscoconfparse.IOSCfgLine objects, which matched the parent_regex and whose children did not match child_regex. Only the parent ciscoconfparse.IOSCfgLine objects will be returned. For simplicity, this method only finds oldest ancestors without immediate children that match.
**Warning:** This function is mostly valuable when invoked from other Salt components (i.e., execution modules, states, templates etc.). For CLI usage, please consider using `ciscoconfparse.find_lines_wo_child`.

---

**config**

The configuration sent as text.

**Note:** This argument is ignored when `config_path` is specified.

**config_path**

The absolute or remote path to the file with the configuration to be parsed. This argument supports the usual Salt filesystem URIs, e.g., `salt://`, `https://`, `ftp://`, `s3://`, etc.

**parent_regex**

The regular expression to match the parent lines against.

**child_regex**

The regular expression to match the child lines against.

**ignore_ws:** `False`

Whether to ignore the white spaces.

**saltenv:** `base`

Salt fileserver environment from which to retrieve the file. This argument is ignored when `config_path` is not a `salt://` URL.

---

Usage example:

```python
objects = __salt__['ciscoconfparse.find_objects_wo_child'](config_path=
    'https://bit.ly/2mAdq7z',
    'line con',
    'stopbits')
for obj in objects:
    print(obj.text)
```

---

**26.6.84 salt.modules.cisconso**

Execution module for Cisco Network Services Orchestrator Proxy minions

New in version 2016.11.0.

For documentation on setting up the cisconso proxy minion look in the documentation for `salt.proxy.cisconso`.

`salt.modules.cisconso.apply_rollback(datastore, name)`

Apply a system rollback

**Parameters**

- `datastore` (DatastoreType(str enum)) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- `name` (str) -- an ID of the rollback to restore
salt cisco-nso cisconso.apply_rollback

salt.modules.cisconso.get_data(datastore, path)
Get the configuration of the device tree at the given path

Parameters
- **datastore** (DatastoreType(str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated

Returns
The network configuration at that tree

Return type
dict

salt cisco-nso cisconso.get_data running 'devices/ex0'

salt.modules.cisconso.get_rollback(name)
Get the backup of stored a configuration rollback

Parameters
- **name** (str) -- Typically an ID of the backup

Returns
the contents of the rollback snapshot

Return type
str

salt cisco-nso cisconso.get_rollback

salt.modules.cisconso.get_rollbacks()
Get a list of stored configuration rollbacks

salt cisco-nso cisconso.get_rollbacks

salt.modules.cisconso.info()
Return system information for grains of the NSO proxy minion

salt '*' cisconso.info

salt.modules.cisconso.set_data_value(datastore, path, data)
Set a data entry in a datastore

Parameters
- **datastore** (DatastoreType(str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
- **data** (dict) -- The new value at the given path

Return type
bool
Returns
True if successful, otherwise error.

```
salt cisco-nso cisconso.set_data_value running 'devices/ex0/routes' 10.0.0.0/20/24
```

## 26.6.85 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

**salt.modules.cloud.action** *(fun=None, cloudmap=None, names=None, provider=None, instance=None, **kwargs)*

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f
```

**salt.modules.cloud.create** *(provider, names, opts=None, **kwargs)*

Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True
```

**salt.modules.cloud.destroy** *(names)*

Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

**salt.modules.cloud.full_query** *(query_type='list_nodes_full')*

List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

**salt.modules.cloud.get_instance** *(name, provider=None)*

Return details on an instance.

Similar to the cloud action show_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:
salt.modules.cloud.has_instance(name, provider=None)
    Return true if the instance is found on a provider
    CLI Example:
    salt minionname cloud.has_instance myinstance

salt.modules.cloud.list_images(provider='all')
    List cloud provider images for the given providers
    CLI Example:
    salt minionname cloud.list_images my-gce-config

salt.modules.cloud.list_locations(provider='all')
    List cloud provider locations for the given providers
    CLI Example:
    salt minionname cloud.list_locations my-gce-config

salt.modules.cloud.list_sizes(provider='all')
    List cloud provider sizes for the given providers
    CLI Example:
    salt minionname cloud.list_sizes my-gce-config

salt.modules.cloud.map_run(path=None, **kwargs)
    Execute a salt cloud map file
    Cloud Map data can be retrieved from several sources:
    • a local file (provide the path to the file to the ‘path’ argument)
    • a JSON-formatted map directly (provide the appropriately formatted to using the ‘map_data’ argument)
    • the Salt Pillar (provide the map name of under ‘pillar:cloud:maps’ to the ‘map_pillar’ argument)
    
    Note: Only one of these sources can be read at a time. The options are listed in their order of precedence.
    CLI Examples:
    salt minionname cloud.map_run /path/to/cloud.map
    salt minionname cloud.map_run path=/path/to/cloud.map
    salt minionname cloud.map_run map_pillar='map_pillar'
    .. versionchanged:: 2018.3.1
    salt minionname cloud.map_run map_data='actual map data'

salt.modules.cloud.network_create(provider, names, **kwargs)
    Create private network
    CLI Example:
### salt.minionname.cloud.network_create

```
salt.minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24'
```

#### salt.modules.cloud.network_list(provider)
List private networks

CLI Example:
```
salt.minionname cloud.network_list my-nova
```

#### salt.modules.cloud.profile_(profile, names, vm_overrides=None, opts=None, **kwargs)
Spin up an instance using Salt Cloud

CLI Example:
```
salt.minionname cloud.profile my-gce-config myinstance
```

#### salt.modules.cloud.query(query_type='list_nodes')
List cloud provider data for all providers

CLI Examples:
```
salt.minionname cloud.query
salt.minionname cloud.query list_nodes_full
salt.minionname cloud.query list_nodes_select
```

#### salt.modules.cloud.select_query(query_type='list_nodes_select')
List selected nodes

CLI Example:
```
salt.minionname cloud.select_query
```

#### salt.modules.cloud.virtual_interface_create(provider, names, **kwargs)
Attach private interfaces to a server

CLI Example:
```
salt.minionname cloud.virtual_interface_create my-nova names=['salt-master->'] net_name='salt'
```

#### salt.modules.cloud.virtual_interface_list(provider, names, **kwargs)
List virtual interfaces on a server

CLI Example:
```
salt.minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

#### salt.modules.cloud.volume_attach(provider, names, **kwargs)
Attach volume to a server

CLI Example:
```
salt.minionname cloud.volume_attach my-nova myblock server_name=myserver device='/dev/xvdf'
```
salt.modules.cloud.volume_create(provider, names, **kwargs)

Create volume

CLI Example:

```
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

salt.modules.cloud.volume_delete(provider, names, **kwargs)

Delete volume

CLI Example:

```
salt minionname cloud.volume_delete my-nova myblock
```

salt.modules.cloud.volume_detach(provider, names, **kwargs)

Detach volume from a server

CLI Example:

```
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

salt.modules.cloud.volume_list(provider)

List block storage volumes

CLI Example:

```
salt minionname cloud.volume_list my-nova
```

26.6.86 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

salt.modules.cmdmod.exec_code(lang, code, cwd=None, args=None, **kwargs)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

All parameters from cmd.run_all except python_shell can be used.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
salt '*' cmd.exec_code ruby 'puts "cheese"' args=["arg1", "arg2"] env={'"F00": "bar"'}
```

salt.modules.cmdmod.exec_code_all(lang, code, cwd=None, args=None, **kwargs)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

All parameters from cmd.run_all except python_shell can be used.

CLI Example:
salt '*
| cmd.exec_code_all ruby 'puts "cheese"'
| cmd.exec_code_all ruby 'puts "cheese"' args=['"arg1", "arg2"']
| env='{"FOO": "bar"}"

salt.modules.cmdmod.has_exec(cmd)
Returns true if the executable is available on the minion, false otherwise

CLI Example:
salt '* cmd.has_exec cat

salt.modules.cmdmod.powershell(cmd, cwd=None, stdin=None, runas=None, shell='powershell',
| env=None, clean_env=False, template=None, rstrip=True, umask=None,
| output_encoding=None, output_loglevel='debug', hide_output=False,
| timeout=None, reset_system_locale=True, ignore_recode=False,
| saltenv=None, use_vt=False, password=None, depth=None,
| encode_cmd=False, success_retcodes=None, success_stdout=None,
| success_stderr=None, **kwargs)

Execute the passed PowerShell command and return the output as a dictionary.

Other cmd.* functions (besides cmd.powershell_all) return the raw text output of the command. This function appends | ConvertTo-JSON to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use cmd.run with the shell=powershell option.

For example:
salt '* cmd.run '$PSVersionTable.CLRVersion' shell=powershell
| salt '* cmd.run 'Get-NetTCPConnection' shell=powershell

New in version 2016.3.0.

Warning: This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal cmd.run parameters, this command offers the depth parameter to change the Windows default depth for the ConvertTo-JSON powershell command. The Windows default is 2. If you need more depth, set that here.

Note: For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- **cmd** (str) -- The powershell command to run.
- **cwd** (str) -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin** (str) -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas**(str) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

- **password**(str) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell**(str) -- Specify an alternate shell. Defaults to "powershell". Can also use "pwsh" for powershell core if present on the system

- **python_shell**(bool) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env**(dict) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.powershell 'some command' env={"FOO": "bar"}
  ```

  Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses Path as opposed to PATH for other systems.

- **clean_env**(bool) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **template**(str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip**(bool) -- Strip all whitespace off the end of output before it is returned.

- **umask**(str) -- The umask (in octal) to use when running the command.

- **output_encoding**(str) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the locale line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel**(str) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.
- **ignore_retcode (bool)** -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **hide_output (bool)** -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout (int)** -- A timeout in seconds for the executed process to return.

- **use_vt (bool)** -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **reset_system_locale (bool)** -- Resets the system locale

- **saltenv (str)** -- The salt environment to use. Default is 'base'

- **depth (int)** -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

  New in version 2016.3.4.

- **encode_cmd (bool)** -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

- **success_retcodes (list)** --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **success_stdout (list)** --

  This parameter will allow a list of strings that when found in standard output should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **success_stderr (list)** --

  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **stdin_raw_newlines (bool)** --
False
If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

Returns
dict
A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

Example:

```python
salt.modules.cmdmod.powershell_all(cmd, cwd=None, stdin=None, runas=None, shell='powershell',
                                   env=None, clean_env=False, template=None, rstrip=True,
                                   umask=None, output_encoding=None, output_loglevel='debug',
                                   quiet=False, timeout=None, reset_system_locale=True,
                                   ignore_retcode=False, saltenv=None, use_vt=False,
                                   password=None, depth=None, encode_cmd=False, force_list=False,
                                   success_retcodes=None, success_stdout=None,
                                   success_stderr=None, **kwargs)
```

Execute the passed PowerShell command and return a dictionary with a result field representing the output of the command, as well as other fields showing us what the PowerShell invocation wrote to stderr, the process id, and the exit code of the invocation.

This function appends | ConvertTo-JSON to the command before actually invoking powershell.

An unquoted empty string is not valid JSON, but it's very normal for the Powershell output to be exactly that. Therefore, we do not attempt to parse empty Powershell output (which would result in an exception). Instead we treat this as a special case and one of two things will happen:

- If the value of the force_list parameter is True, then the result field of the return dictionary will be an empty list.
- If the value of the force_list parameter is False, then the return dictionary will not have a result key added to it. We aren't setting result to None in this case, because None is the Python representation of "null" in JSON. (We likewise can't use False for the equivalent reason.)

If Powershell's output is not an empty string and Python cannot parse its content, then a CommandExecutionError exception will be raised.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is other than list then one of two things will happen:

- If the value of the force_list parameter is True, then the result field will be a singleton list with the Python object as its sole member.
- If the value of the force_list parameter is False, then the value of result will be the unmodified Python object.

If Powershell's output is not an empty string, Python is able to parse its content, and the type of the resulting Python object is list, then the value of result will be the unmodified Python object. The force_list parameter has no effect in this case.

**Note**: An example of why the force_list parameter is useful is as follows: The Powershell command dir x | ConvertTo-Json results in

- no output when x is an empty directory.
• a dictionary object when x contains just one item.
• a list of dictionary objects when x contains multiple items.

By setting `force_list` to `True` we will always end up with a list of dictionary items, representing files, no matter how many files x contains. Conversely, if `force_list` is `False`, we will end up with no result key in our return dictionary when x is an empty directory, and a dictionary object when x contains just one file.

If you want a similar function but with a raw textual result instead of a Python dictionary, you should use `cmd.run_all` in combination with `shell=powershell`.

The remaining fields in the return dictionary are described in more detail in the Returns section.

Example:

```bash
salt '*' cmd.run_all '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run_all 'Get-NetTCPConnection' shell=powershell
```

New in version 2018.3.0.

**Warning:** This passes the `cmd` argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

**Note:** For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

**Parameters**

- `cmd (str)` -- The powershell command to run.
- `cwd (str)` -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- `stdin (str)` -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- `runas (str)` -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- `password (str)` -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
- `shell (str)` -- Specify an alternate shell. Defaults to "powershell". Can also use "pwsh" for powershell core if present on the system.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
salt myminion cmd.powershell_all 'some command' env='{"FOO": "bar"}'
  ```

  Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses Path as opposed to PATH for other systems.

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.

- **umask** (*str*) -- The umask (in octal) to use when running the command.

- **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

  Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **reset_system_locale** (*bool*) -- Resets the system locale
• **ignore_retcode** -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **saltenv**(str) -- The salt environment to use. Default is 'base'

• **depth**(int) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

• **encode_cmd**(bool) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

• **force_list**(bool) -- The purpose of this parameter is described in the preamble of this function's documentation. Default value is False.

• **success_retcodes**(list) --
  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

• **success_stdout**(list) --
  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

• **success_stderr**(list) --
  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

• **stdin_raw_newlines**(bool) --
  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

  New in version 2019.2.0.

**Returns**

A dictionary with the following entries:

  **result**
  For a complete description of this field, please refer to this function's preamble. This key will not be added to the dictionary when `force_list` is False and Powershell's output is the empty string.

  **stderr**
  What the PowerShell invocation wrote to `stderr`.
process id of the PowerShell invocation

retcode
This is the exit code of the invocation of PowerShell. If the final execution status (in PowerShell) of our command (with `| ConvertTo-JSON` appended) is `False` this should be non-0. Likewise if PowerShell exited with `$LASTEXITCODE` set to some non-0 value, then `retcode` will end up with this value.

Return type
dict

CLI Example:
```
salt '*' cmd.powershell_all "$PSVersionTable.CLRVersion"
```

CLI Example:
```
salt '*' cmd.powershell_all "dir mydirectory" force_list=True
```

salt.modules.cmdmod.retcodestr(c, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)

Execute a shell command and return the command's return code.

Parameters

- **cmd**(str) -- The command to run. ex: `ls -lart /home`
- **cwd**(str) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin**(str) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas**(str) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

Warning: For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:
```
  cmd.retcodestr('echo "h="baz"
```

- **password**(str) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **group** *(str)* -- Group to run command as. Not currently supported on Windows.
- **shell** *(str)* -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env** *(dict)* -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```bash
salt myminion cmd.retcode 'some command' env='{"F00": "bar"} '
```

**Note:** When using environment variables on Window’s, case-sensitivity matters, i.e. Window’s uses *Path* as opposed to *PATH* for other systems.

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.
- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.
- **umask** *(str)* -- The umask (in octal) to use when running the command.
- **output_encoding** *(str)* -- Control the encoding used to decode the command’s output.

**Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the *locale* line in the output of *test.versions_report*.

New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

**Note:** The command being run will still be logged at the *debug* loglevel regardless, unless *quiet* is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.
• **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• **success_retcodes** *(list)* --

  This parameter will allow a list of
  non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

• **success_stdout** *(list)* --

  This parameter will allow a list of
  strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

• **success_stderr** *(list)* --

  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

• **stdin_raw_newlines** *(bool)* --

  False
  If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.

Return type

  int

Return type

  None

Returns

  Return Code as an int or None if there was an exception.

CLI Example:

```
salt '*\' cmd.retcode "file /bin/bash"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*\' cmd.retcode template=jinja "file {{{grains.pythonpath[0]}}}/python"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

```
salt '*\' cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```
salt.modules.cmdmod.run(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, redirect_stderr=True, bg=False, password=None, encoded_cmd=False, raise_err=False, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)

Execute the passed command and return the output as a string

Parameters

- **cmd (str)** -- The command to run. ex: ls -lart /home
- **cwd (str)** -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin (str)** -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running.

**Warning:** For versions 2018.3.3 and above on macosx while using runas, on linux while using run, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
import salt

myminion = salt.client.get_local_client('local')
myminion.cmd.run('echo \"h="baz\"\"', runas='macuser')
```

- **group (str)** -- Group to run command as. Not currently supported on Windows.
- **password (str)** -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **shell (str)** -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **bg (bool)** -- If True, run command in background and do not await or deliver its results

New in version 2016.3.0.
- **env (dict)** -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run 'some command' env='\"FOO\": "bar\"\"'
```
When using environment variables on Window’s, case-sensitivity matters, i.e. Window’s uses `Path` as opposed to `PATH` for other systems.

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the `env` argument to this function.

- **prepend_path** *(str)* -- $PATH segment to prepend (trailing `:` not necessary) to $PATH

  New in version 2018.3.0.

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **output_encoding** *(str)* -- Control the encoding used to decode the command’s output.

  New in version 2018.3.0.

  - **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

    Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* -- If `True`, suppress stdout and stderr in the return data.

  Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **redirect_stderr (bool)** -- If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired. Default is True

  New in version 3006.9.

- **encoded_cmd (bool)** -- Specify if the supplied command is encoded. Only applies to shell 'powershell' and 'pwsh'.

  New in version 2018.3.0.

  Older versions of powershell seem to return raw xml data in the return. To avoid raw xml data in the return, prepend your command with the following before encoding:

  ```powershell
  $ProgressPreference='SilentlyContinue'; <your command>
  ```

  The following powershell code block will encode the Write-Output command so that it will not have the raw xml data in the return:

  ```powershell
  # target string
  $Command = '$ProgressPreference="SilentlyContinue"; Write-Output "hello"'

  # Convert to Base64 encoded string
  $Encoded = [convert]::ToBase64String([System.Text.Encoding]::Unicode.GetBytes($Command))
  Write-Output $Encoded
  ```

- **raise_err (bool)** -- If True and the command has a nonzero exit code, a CommandExecutionError exception will be raised.

  **Warning:** This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

  The use of python_shell=True means that the shell will accept any input including potentially malicious commands such as 'good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True

**Parameters**

- **success_retcodes (list)** --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **success_stdout (list)** --

  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.
• **success_stderr** *(list)* --
  This parameter will allow a list of
  strings that when found in standard error should be considered a success. If stderr re-
  turned from the run matches any in the provided list, the return code will be overridden
  with zero.

  New in version 3004.

• **stdin_raw_newlines** *(bool)* --
  False
  If True, Salt will not automatically convert the characters \n present in the stdin
  value to newlines.

  New in version 2019.2.0.

• **windows_codepage** *(int)* --
  65001
  Only applies to Windows: the minion uses C:WindowsSystem32chcp.com to verify or set
  the code page before the command cmd is executed. Code page 65001 corresponds with
  UTF-8 and allows international localization of Windows.

  New in version 3002.

CLI Example:

```bash
salt '*' cmd.run "ls -l | awk '/foo/{print \$2}''
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments
before execution. For example:

```bash
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/ →{print \$2}'"
```

Specify an alternate shell with the shell parameter:

```bash
salt '*' cmd.run "Get-ChildItem C:\" shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can
be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.run "grep f stdin='one\ntwo\nthree\nfour\nfive\n'"
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the
format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell
command by manually specifying the kwarg:

```bash
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

salt.modules.cmdmod.run_all(cmd, cwd=None, stdin=None, runas=None, group=None, shell='\bin/sh',
  python_shell=None, env=None, clean_env=False, template=None,
  rstrip=True, umask=None, output_encoding=None, output_loglevel='debug',
  log_callback=None, hide_output=False, timeout=None,
  reset_system_locale=True, ignore_retcode=False, saltenv=None,
  use_vt=False, redirect_stderr=False, password=None, encoded_cmd=False,
  prepend_path=None, success_retcodes=None, success_stdout=None,
  success_stderr=None, **kwargs)
Execute the passed command and return a dict of return data

Parameters

- **cmd (str)** -- The command to run. ex: `ls -lart /home`
- **cwd (str)** -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- **stdin (str)** -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macosx while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```
cmd.run_all 'echo "$h=baz"' runas=macuser
```

- **password (str)** -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.
  
  New in version 2016.3.0.
- **group (str)** -- Group to run command as. Not currently supported on Windows.
- **shell (str)** -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **env (dict)** -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_all 'some command' env='{"FOO": "bar"}'
```

**Note:** When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses `Path` as opposed to `PATH` for other systems.

- **clean_env (bool)** -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.
- **prepend_path (str)** -- $PATH segment to prepend (trailing ':' not necessary) to $PATH
  
  New in version 2018.3.0.
- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip** *(bool)* -- Strip all whitespace off the end of output before it is returned.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **output_encoding** *(str)* -- Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the *locale* line in the output of `test.versions_report`.

  New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the debug loglevel regardless, unless quiet is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **hide_output** *(bool)* -- If True, suppress stdout and stderr in the return data.

  **Note:** This is separate from output_loglevel, which only handles how Salt logs to the minion log.

  New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **encoded_cmd** *(bool)* -- Specify if the supplied command is encoded. Only applies to shell ‘powershell’ and ‘pwsh’.

  New in version 2018.3.0.

  Older versions of powershell seem to return raw xml data in the return. To avoid raw xml data in the return, prepend your command with the following before encoding:

  `$ProgressPreference='SilentlyContinue'; <your command>`

  The following powershell code block will encode the Write-Output command so that it will not have the raw xml data in the return:
# target string
$Command = '$_ProgressPreference="SilentlyContinue"; Write-$File "hello"

# Convert to Base64 encoded string
$Encoded = [convert]::ToBase64String([System.Text.Encoding]::Unicode.GetBytes($command))
Write-Output $Encoded

- **redirect_stderr**(bool) -- If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

  New in version 2015.8.2.

- **password** -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **bg**(bool) -- If True, run command in background and do not await or deliver its results.

  New in version 2016.3.6.

- **success_retcodes**(list) --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 2019.2.0.

- **success_stdout**(list) --

  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **success_stderr**(list) --

  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

  New in version 3004.

- **stdin_raw_newlines**(bool) --

  False

  If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

  New in version 2019.2.0.
salt '*cmd.run_all "ls -l | awk '/foo/\{print \$2\}'"

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution.

salt '* cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/\{print \$2\}""

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

salt '* cmd.run_all "grep f" stdin='one\ntwo
three
four
five
'

salt.modules.cmdmod.run_bg(cmd, cwd=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, umask=None, timeout=None, output_encoding=None, output_loglevel='debug', log_callback=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)

New in version 2016.3.0.

Execute the passed command in the background and return its PID

Note: If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend systemd-run --scope to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

Parameters

- **cmd (str)** -- The command to run. ex: ls -lart /home
- **cwd (str)** -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **group (str)** -- Group to run command as. Not currently supported on Windows.
- **shell (str)** -- Shell to execute under. Defaults to the system default shell.
- **output_encoding (str)** -- Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the locale line in the output of test.versions_report.

New in version 2018.3.0.

- **output_loglevel (str)** -- Control the loglevel at which the output from the command is logged to the minion log.
Note: The command being run will still be logged at the debug log level regardless, unless quiet is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip logging the output if the command has a nonzero exit code.

- **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

  **Warning:** For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

  Example:

  ```python
  cmd.run_bg 'echo "h=baz" runas=macuser'
  ```

  **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** -- Specify an alternate shell. Defaults to the system’s default shell.

- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env** *(dict)* -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```python
  salt myminion cmd.run_bg 'some command' env={"FOO": "bar"}
  ```

  Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows' uses Path as opposed to PATH for other systems.

- **clean_env** *(bool)* -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **prepend_path** *(str)* -- $PATH segment to prepend (trailing ‘:’ not necessary) to $PATH

  New in version 2018.3.0.

- **template** *(str)* -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **umask** *(str)* -- The umask (in octal) to use when running the command.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.
Warning: This function does not process commands through a shell unless the `python_shell` argument is set to `True`. This means that any shell-specific functionality such as 'echo' or the use of pipes, redirection or `&&`, should either be migrated to `cmd.shell` or have the `python_shell=True` flag set here.

The use of `python_shell=True` means that the shell will accept _any_ input including potentially malicious commands such as `good_command;rm -rf /`. Be absolutely certain that you have sanitized your input prior to using `python_shell=True`.

Parameters

- **success_retcodes** (list) --
  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.
  New in version 2019.2.0.

- **success_stdout** (list) --
  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.
  New in version 3004.

- **success_stderr** (list) --
  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.
  New in version 3004.

- **stdin_raw_newlines** (bool) --
  False
  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.
  New in version 2019.2.0.

CLI Example:

```shell
cmd.run_bg "fstrim-all"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```shell
cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/,→\n{print \"$2\"}""
```

Specify an alternate shell with the shell parameter:

```shell
cmd.run_bg "Get-ChildItem C:\" shell='powershell'
```
If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*! cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait''
```

```
salt.modules.cmdmod.run_chroot(root, cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=True, binds=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='quiet', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, bg=False, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)
```

New in version 2014.7.0.

This function runs `cmd.run_all` wrapped within a chroot, with dev and proc mounted in the chroot

**Parameters**

- **root** *(str)* -- Path to the root of the jail to use.
- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input:
- **runas** *(str)* -- User to run script as.
- **group** *(str)* -- Group to run script as.
- **shell** *(str)* -- Shell to execute under. Defaults to the system default shell.
- **cmd** *(str)* -- The command to run. ex: `ls -lart /home`
- **cwd** *(str)* -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **runas** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.
- **shell** -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell** *(bool)* -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **binds** *(list)* -- List of directories that will be exported inside the chroot with the bind option.

New in version 3000.

- **env** *(dict)* -- Environment variables to be set prior to execution.

**Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_chroot 'some command' env='{"FOO": "bar"}'}
```
Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses Path as opposed to PATH for other systems.

- **clean_env**(dict) -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **template**(str) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip**(bool) -- Strip all whitespace off the end of output before it is returned.

- **umask**(str) -- The umask (in octal) to use when running the command.

- **output_encoding**(str)-- Control the encoding used to decode the command's output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the **locale** line in the output of **test.versions_report**.

New in version 2018.3.0.

- **output_loglevel**(str)-- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the **debug** loglevel regardless, unless **quiet** is used for this value.

- **ignore_retcode**(bool) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as **True** to skip logging the output if the command has a nonzero exit code.

- **hide_output**(bool) -- If **True**, suppress stdout and stderr in the return data.

Note: This is separate from **output_loglevel**, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout**(int) -- A timeout in seconds for the executed process to return.

- **use_vt**(bool) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes** --

  This parameter will allow a list of 
  non-zero return codes that should be considered a success. If the return code returned
from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success_stdout**(list) --
  
  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success_stderr**(list) --
  
  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

**Parar str stdin**

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/ → bootstrap.sh'
```

```
salt.modules.cmdmod.run_stderr(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)
```

Execute a command and only return the standard error

Parameters

- **cmd**(str) -- The command to run. ex: `ls -lart /home`

- **cwd**(str) -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).

- **stdin**(str) -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas**(str) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.
Warning: For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:
```
cmd.run_stderr 'echo "h=\"baz\"\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\nrunas=macuser\n'''
```

- **password (str)** -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **group (str)** -- Group to run command as. Not currently supported on Windows.

- **shell (str)** -- Specify an alternate shell. Defaults to the system’s default shell.

- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

- **env (dict)** -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```
salt myminion cmd.run_stderr 'some command' env='{"FOO": "bar"}!
```

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses Path as opposed to PATH for other systems.

- **clean_env (bool)** -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

- **prepend_path (str)** -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

- **template (str)** -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

- **rstrip (bool)** -- Strip all whitespace off the end of output before it is returned.

- **umask (str)** -- The umask (in octal) to use when running the command.

- **output_encoding (str)** -- Control the encoding used to decode the command’s output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the locale line in the output of `test.versions_report`.

New in version 2018.3.0.
• **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

• **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output** *(bool)* -- If `True`, suppress stdout and stderr in the return data.

  **Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

• **timeout** *(int)* -- A timeout in seconds for the executed process to return.

• **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

• **success_retcodes** *(list)* --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

• **success_stdout** *(list)* --

  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

• **success_stderr** *(list)* --

  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

• **stdin_raw_newlines** *(bool)* --

  False

  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print $2}'"

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/'~foo/{print $2}"

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.

salt '*' cmd.run_stderr "grep f" stdin='one
two
three
four
five
'

salt.modules.cmdmod.run_stdout(cmd, cwd=None, stdin=None, runas=None, group=None, shell='/bin/sh', python_shell=None, env=None, clean_env=False, template=None, rstrip=True, umask=None, output_encoding=None, output_loglevel='debug', log_callback=None, hide_output=False, timeout=None, reset_system_locale=True, ignore_retcode=False, saltenv=None, use_vt=False, password=None, prepend_path=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)

Execute a command, and only return the standard out

**Parameters**

- **cmd** *(str)* -- The command to run. ex: `ls -lart /home`
- **cwd** *(str)* -- The directory from which to execute the command. Defaults to the home directory of the user specified by runas (or the user under which Salt is running if runas is not specified).
- **stdin** *(str)* -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** *(str)* -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

**Warning:** For versions 2018.3.3 and above on macOS while using runas, to pass special characters to the command you need to escape the characters on the shell.

Example:

```bash
cmd.run_stdout 'echo "h="baz""' runas=macuser
```

- **password** *(str)* -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **group** *(str)* -- Group to run command as. Not currently supported on Windows.
- **shell** *(str)* -- Specify an alternate shell. Defaults to the system's default shell.
Salt Documentation, Release 3007.1

• python_shell (bool) -- If False, let python handle the positional arguments. Set to
True to use shell features, such as pipes or redirection.
• env (dict) -- Environment variables to be set prior to execution.
Note: When passing environment variables on the CLI, they should be passed as the string
representation of a dictionary.
salt myminion cmd.run_stdout 'some command' env='{"FOO":
,→"bar"}'

Note: When using environment variables on Window's, case-sensitivity matters, i.e. Window's uses Path as opposed to PATH for other systems.
• clean_env (bool) -- Attempt to clean out all other shell environment variables and set
only those provided in the 'env' argument to this function.
• prepend_path (str) -- $PATH segment to prepend (trailing ':' not necessary) to $PATH
New in version 2018.3.0.
• template (str) -- If this setting is applied then the named templating engine will be
used to render the downloaded file. Currently jinja, mako, and wempy are supported.
• rstrip (bool) -- Strip all whitespace off the end of output before it is returned.
• umask (str) -- The umask (in octal) to use when running the command.
• output_encoding (str) -- Control the encoding used to decode the command's output.
Note: This should not need to be used in most cases. By default, Salt will try to use the
encoding detected from the system locale, and will fall back to UTF-8 if this fails. This
should only need to be used in cases where the output of the command is encoded in
something other than the system locale or UTF-8.
To see the encoding Salt has detected from the system locale, check the locale line in the
output of test.versions_report.
New in version 2018.3.0.
• output_loglevel (str) -- Control the loglevel at which the output from the command
is logged to the minion log.
Note: The command being run will still be logged at the debug loglevel regardless, unless
quiet is used for this value.
• ignore_retcode (bool) -- If the exit code of the command is nonzero, this is treated
as an error condition, and the output from the command will be logged to the minion log.
However, there are some cases where programs use the return code for signaling and a
nonzero exit code doesn't necessarily mean failure. Pass this argument as True to skip
logging the output if the command has a nonzero exit code.
• hide_output (bool) -- If True, suppress stdout and stderr in the return data.

26.6. execution modules

1681


Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes** *(list)* --

  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success_stdout** *(list)* --

  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success_stderr** *(list)* --

  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin_raw_newlines** *(bool)* --

  False

  If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

New in version 2019.2.0.

CLI Example:

```bash
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}"
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```bash
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/\nfoo/{print \$2}""
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```
salt.modules.cmdmod.script(source, args=None, cwd=None, stdin=None, runas=None, group=None,
    shell='/bin/sh', python_shell=None, env=None, template=None, umask=None,
    output_encoding=None, output_loglevel='debug', log_callback=None,
    hide_output=False, timeout=None, reset_system_locale=True, saltenv=None,
    use_vt=False, bg=False, password=None, success_retcodes=None,
    success_stdout=None, success_stderr=None, **kwargs)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

Parameters

- **source (str)** -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args (str)** -- String of command line args to pass to the script. Only used if no args are specified as part of the name argument. To pass a string containing spaces in YAML, you will need to doubly-quote it:

```
salt myminion cmd.script salt://foo.sh "arg1 'arg two' arg3"
```
- **cwd (str)** -- The directory from which to execute the command. Defaults to the directory returned from Python's tempfile.mkstemp.
- **stdin (str)** -- A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas (str)** -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the password argument, and the target user account must be in the Administrators group.

**Note:** For Windows's users, specifically Server users, it may be necessary to specify your runas user using the User Logon Name instead of the legacy logon name. Traditionally, logons would be in the following format.

```
Domain/user
```

In the event this causes issues when executing scripts, use the UPN format which looks like the following.

```
user@domain.local
```

More information <https://github.com/saltstack/salt/issues/55080>

- **password (str)** -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- **group (str)** -- Group to run script as. Not currently supported on Windows.
- **shell (str)** -- Specify an alternate shell. Defaults to the system's default shell.
- **python_shell (bool)** -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.
- **bg (bool)** -- If True, run script in background and do not await or deliver its results
• **env** (*dict*) -- Environment variables to be set prior to execution.

Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```shell
cmd.script some command env={"FOO": "bar"}
```

Note: When using environment variables on Window’s, case-sensitivity matters, i.e. Window’s uses `Path` as opposed to `PATH` for other systems.

• **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

• **umask** (*str*) -- The umask (in octal) to use when running the command.

• **output_encoding** (*str*) -- Control the encoding used to decode the command’s output.

Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

• **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

• **ignore_retcode** (*bool*) -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn’t necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output** (*bool*) -- If `True`, suppress stdout and stderr in the return data.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

• **timeout** (*int*) -- If the command has not terminated after timeout seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

• **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
• **success_retcodes** *(list)* --

This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

• **success_stdout** *(list)* --

This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

• **success_stderr** *(list)* --

This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

• **stdin_raw_newlines** *(bool)* --

False

If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\infile.txt' shell='powershell'
salt '*' cmd.script salt://scripts/runme.sh stdin='one
two
three
four
nfive
'
```

salt.modules.cmdmod.script_retcode*(source, args=None, cwd=None, stdin=None, runas=None, group=None, shell='bin/sh', python_shell=None, env=None, template='jinja', umask=None, timeout=None, reset_system_locale=True, saltenv=None, output_encoding=None, output_loglevel='debug', log_callback=None, use_vt=False, password=None, success_retcodes=None, success_stdout=None, success_stderr=None, **kwargs)*

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

**Parameters**
• **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`.

• **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the `name` argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: `'arg1 'arg two' arg3'`.

• **cwd** (*str*) -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).

• **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

• **runas** (*str*) -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

• **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

• **group** (*str*) -- Group to run script as. Not currently supported on Windows.

• **shell** (*str*) -- Specify an alternate shell. Defaults to the system's default shell.

• **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection.

• **env** (*dict*) -- Environment variables to be set prior to execution.

  Note: When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

```python
salt myminion cmd.script_retcode 'some command' env='{"FOO": "bar"}"
```

  Note: When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses `Path` as opposed to `PATH` for other systems.

• **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

• **umask** (*str*) -- The umask (in octal) to use when running the command.

• **output_encoding** (*str*) -- Control the encoding used to decode the command's output.

  Note: This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.
To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

New in version 2018.3.0.

- **output_loglevel** *(str)* -- Control the loglevel at which the output from the command is logged to the minion log.

    **Note**: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

- **ignore_retcode** *(bool)* -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

- **timeout** *(int)* -- If the command has not terminated after timeout seconds, send the subprocess `sigterm`, and if `sigterm` is ignored, follow up with `sigkill`

- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

- **success_retcodes** *(list)* --

    This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

    New in version 2019.2.0.

- **success_stdout** *(list)* --

    This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

    New in version 3004.

- **success_stderr** *(list)* --

    This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

    New in version 3004.

- **stdin_raw_newlines** *(bool)* --

    If `True`, Salt will not automatically convert the characters `\n` present in the `stdin` value to newlines.

    New in version 2019.2.0.

CLI Example:
A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

```bash
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin='one
two
three
four
five'
```

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

- `cmd (str)` -- The command to run. ex: `ls -lart /home`
- `cwd (str)` -- The directory from which to execute the command. Defaults to the home directory of the user specified by `runas` (or the user under which Salt is running if `runas` is not specified).
- `stdin (str)` -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- `runas (str)` -- Specify an alternate user to run the command. The default behavior is to run as the user under which Salt is running. If running on a Windows minion you must also use the `password` argument, and the target user account must be in the Administrators group.

Warning: For versions 2018.3.3 and above on macOS while using `runas`, to pass special characters to the command you need to escape the characters on the shell.

Example:

```bash
salt.modules.cmdmod.shell 'echo 'h="baz"'' runas=macuser
```

- `group (str)` -- Group to run command as. Not currently supported on Windows.
- `password (str)` -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.0.
- `shell (int)` -- Shell to execute under. Defaults to the system default shell.
- `bg (bool)` -- If True, run command in background and do not await or deliver its results
• **env (dict)** -- Environment variables to be set prior to execution.

  **Note:** When passing environment variables on the CLI, they should be passed as the string representation of a dictionary.

  ```
  salt myminion cmd.shell 'some command' env='{"FOO": "bar"}'
  ```

  **Note:** When using environment variables on Windows, case-sensitivity matters, i.e. Windows uses `Path` as opposed to `PATH` for other systems.

• **clean_env (bool)** -- Attempt to clean out all other shell environment variables and set only those provided in the 'env' argument to this function.

• **prepend_path (str)** -- $PATH segment to prepend (trailing ':' not necessary) to $PATH

  New in version 2018.3.0.

• **template (str)** -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported.

• **rstrip (bool)** -- Strip all whitespace off the end of output before it is returned.

• **umask (str)** -- The umask (in octal) to use when running the command.

• **output_encoding (str)** -- Control the encoding used to decode the command’s output.

  **Note:** This should not need to be used in most cases. By default, Salt will try to use the encoding detected from the system locale, and will fall back to UTF-8 if this fails. This should only need to be used in cases where the output of the command is encoded in something other than the system locale or UTF-8.

  To see the encoding Salt has detected from the system locale, check the `locale` line in the output of `test.versions_report`.

  New in version 2018.3.0.

• **output_loglevel (str)** -- Control the loglevel at which the output from the command is logged to the minion log.

  **Note:** The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

• **ignore_retcode (bool)** -- If the exit code of the command is nonzero, this is treated as an error condition, and the output from the command will be logged to the minion log. However, there are some cases where programs use the return code for signaling and a nonzero exit code doesn't necessarily mean failure. Pass this argument as `True` to skip logging the output if the command has a nonzero exit code.

• **hide_output (bool)** -- If `True`, suppress stdout and stderr in the return data.

  **Note:** This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.
New in version 2018.3.0.

- **timeout** *(int)* -- A timeout in seconds for the executed process to return.
- **use_vt** *(bool)* -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

**Warning:** This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

### Parameters

- **success_retcodes** *(list)* --
  This parameter will allow a list of non-zero return codes that should be considered a success. If the return code returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 2019.2.0.

- **success_stdout** *(list)* --
  This parameter will allow a list of strings that when found in standard out should be considered a success. If stdout returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **success_stderr** *(list)* --
  This parameter will allow a list of strings that when found in standard error should be considered a success. If stderr returned from the run matches any in the provided list, the return code will be overridden with zero.

New in version 3004.

- **stdin_raw_newlines** *(bool)* --
  False
  If True, Salt will not automatically convert the characters \n present in the stdin value to newlines.

New in version 2019.2.0.

#### CLI Example:

```salt
salt '*' cmd.shell "ls -l | awk '/foo\{/print \$2\}""
```

The template arg can be set to 'jinja' or another supported template engine to render the command arguments before execution. For example:

```salt
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/\n\{print \$2\}""
```

Specify an alternate shell with the shell parameter:
A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```python
cmd = 'sed -e s/=/:/g'
```

The `salt.modules.cmdmod.shell_info()` function provides information about a shell or script languages which often use `#!`. The values returned are dependent on the shell or scripting languages all return the `installed`, `path`, `version`, `version_raw` parameters.

### Parameters
- `shell` *(str)* -- Name of the shell. Support shells/script languages include
  - `bash`
  - `cmd`
  - `perl`
  - `php`
  - `powershell`
  - `python`
  - `zsh` *(ruby and)*
- `list_modules` *(bool)* -- True to list modules available to the shell.
- `modules` *(Currently only lists powershell)*

### Returns
A dictionary of information about the shell

#### Return type
dict

```python
{'version': '<2 or 3 numeric components dot-separated>',
 'version_raw': '<full version string>',
 'path': '<full path to binary>',
 'installed': '<True, False or None>',
 '<attribute>': '<attribute value>'
}
```

#### Note:
- `installed` is always returned, if `None` or `False` also returns error and may also return `stdout` for diagnostics.
- `version` is for use in determine if a shell/script language has a particular feature set, not for package management.
• The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor
Damon Atkins <https://github.com/damon-atkins>

salt.modules.cmdmod.shells()
Lists the valid shells on this system via the /etc/shells file
New in version 2015.5.0.
CLI Example:

```
salt '*' cmd.shells
```

salt.modules.cmdmod.tty(device, echo='')
Echo a string to a specific tty
CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

salt.modules.cmdmod.which(cmd)
Returns the path of an executable available on the minion, None otherwise
CLI Example:

```
salt '*' cmd.which cat
```

salt.modules.cmdmod.which_bin(cmds)
Returns the first command found in a list of commands
CLI Example:

```
salt '*' cmd.which_bin '[:pip2, pip, pip-python]'
```

26.6.87 salt.modules.composer

Use composer to install PHP dependencies for a directory

salt.modules.composer.did_composer_install(dir)
Test to see if the vendor directory exists in this directory
dir
Directory location of the composer.json file
CLI Example:

```
salt '*' composer.did_composer_install /var/www/application
```
salt.modules.composer.install\(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None\)

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

directory
  Directory location of the composer.json file.

composer
  Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

php
  Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas
  Which system user to run composer as.

prefer_source
  --prefer-source option of composer.

prefer_dist
  --prefer-dist option of composer.

no_scripts
  --no-scripts option of composer.

no_plugins
  --no-plugins option of composer.

optimize
  --optimize-autoloader option of composer. Recommended for production.

no_dev
  --no-dev option for composer. Recommended for production.

quiet
  --quiet option for composer. Whether or not to return output from composer.

composer_home
  $COMPOSER_HOME environment variable

eov
  A list of environment variables to be set prior to execution.

CLI Example:

```
salt '*' composer.install /var/www/application
salt '*' composer.install /var/www/application no_dev=True
   optimize=True
```

salt.modules.composer.selfupdate\(composer=None, php=None, runas=None, quiet=False, composer_home='/root'\)

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.
**composer**
Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php**
Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas**
Which system user to run composer as.

**quiet**
--quiet option for composer. Whether or not to return output from composer.

**composer_home**
$COMPOSER_HOME environment variable

CLI Example:

```
salt '*' composer.selfupdate
```

salt.modules.composer.update(directory, composer=None, php=None, runas=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', env=None)

Update composer dependencies for a directory.

If composer install has not yet been run, this runs composer install instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the composer and php parameters will need to be set to the location of the executables.

**directory**
Directory location of the composer.json file.

**composer**
Location of the composer.phar file. If not set composer will just execute "composer" as if it is installed globally. (i.e. /path/to/composer.phar)

**php**
Location of the php executable to use with composer. (i.e. /usr/bin/php)

**runas**
Which system user to run composer as.

**prefer_source**
--prefer-source option of composer.

**prefer_dist**
--prefer-dist option of composer.

**no_scripts**
--no-scripts option of composer.

**no_plugins**
--no-plugins option of composer.

**optimize**
--optimize-autoloader option of composer. Recommended for production.

**no_dev**
--no-dev option for composer. Recommended for production.

**quiet**
--quiet option for composer. Whether or not to return output from composer.
**composer_home**

$COMPOSER_HOME environment variable

**env**

A list of environment variables to be set prior to execution.

CLI Example:

```
salt '*' composer.update /var/www/application
salt '*' composer.update /var/www/application no_dev=True
```

## 26.6.88 salt.modules.config

Return config information

**salt.modules.config.backup_mode**(*backup=*)

Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

**salt.modules.config.dot_vals**(*value*)

Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

**salt.modules.config.gather_bootstrap_script**(*bootstrap=None*)

Download the salt-bootstrap script, and return its location

**bootstrap**

URL of alternate bootstrap script

CLI Example:

```
salt '*' config.gather_bootstrap_script
```

**salt.modules.config.get**(*key, default='', delimiter=':', merge=None, omit_opts=False, omit_pillar=False, omit_master=False, omit_grains=False*)

New in version 0.14.0.

Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by the default argument. If this argument is not specified, default falls back to an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{ 'pkg': { 'apache': 'httpd' } }
```

To retrieve the value associated with the apache key, in the sub-dictionary corresponding to the pkg key, the following command can be used:
The colon (:) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The delimiter argument was added, to allow delimiters other than : to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires pillar_opts to be set to True in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam spam bacon and spam
  - spam sausage spam spam bacon spam tomato and spam
```

**Note:** Minion configuration options built into Salt (like those defined [here](#)) will always be defined in the Minion configuration and thus cannot be overridden by grains or pillar data. However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

### Arguments

**delimiter**

New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

**merge**

New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

**Note:** The merging described above does not mean that grain data will end up in the Minion’s pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.
The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down, following the same criteria. For example:

  ```python
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
  >>> merged
  {'foo': {'bar': 1, 'baz': 2, 'qux': False},
   'hosts': ['d', 'e', 'f'],
   'only_dict1': None,
   'only_dict2': None}
  ```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

  ```python
  >>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
  >>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
  >>> merged
  {'foo': {'baz': 2, 'qux': False},
   'hosts': ['d', 'e', 'f'],
   'only_dict1': None,
   'only_dict2': None}
  ```

CLI Example:

```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

**salt.modules.config.items()**

Return the complete config from the currently running minion process. This includes defaults for values not set in the config file.

CLI Example:

```
salt '*' config.items
```

**salt.modules.config.manage_mode(mode)**

Return a mode value, normalized to a string

CLI Example:

```
salt '*' config.manage_mode
```

**salt.modules.config.merge(value, default='', omit_opts=False, omit_master=False, omit_pillar=False)**

Retrieves an option based on key, merging all matches.
Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```
salt '*' config.merge schedule
```

**salt.modules.config.option**

```python
def value, default=None, omit_opts=False, omit_grains=False, omit_pillar=False,
omit_master=False, omit_all=False, wildcard=False):
```

Returns the setting for the specified config value. The priority for matches is the same as in `config.get`, only this function does not recurse into nested data structures. Another difference between this function and `config.get` is that it comes with a set of "sane defaults". To view these, you can run the following command:

```
salt '*' config.option '*' omit_all=True wildcard=True
```

default

The default value if no match is found. If not specified, then the fallback default will be an empty string, unless `wildcard=True`, in which case the return will be an empty dictionary.

**omit_opts**

[False] Pass as `True` to exclude matches from the minion configuration file

**omit_grains**

[False] Pass as `True` to exclude matches from the grains

**omit_pillar**

[False] Pass as `True` to exclude matches from the pillar data

**omit_master**

[False] Pass as `True` to exclude matches from the master configuration file

**omit_all**

[True] Shorthand to omit all of the above and return matches only from the "sane defaults".

New in version 3000.

**wildcard**

[False] If used, this will perform pattern matching on keys. Note that this will also significantly change the return data. Instead of only a value being returned, a dictionary mapping the matched keys to their values is returned. For example, using `wildcard=True` with a key of 'foo.ba*' could return a dictionary like so:

```
{ 'foo.bar': True, 'foo.baz': False}
```

New in version 3000.

CLI Example:

```
salt '*' config.option redis.host
```

**salt.modules.config.valid_fileproto**

```
(uri)
```

Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:

```
salt '*' config.valid_fileproto salt://path/to/file
```
26.6.89 salt.modules.consul

Interact with Consul

https://www.consul.io

salt.modules.consul.acl_clone(`consul_url=None, token=None, **kwargs`)  
Information about an ACL token.

Parameters

- `consul_url` -- The Consul server URL.
- `id` -- Unique identifier for the ACL to update.

Returns

Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.acl_create(`consul_url=None, token=None, **kwargs`)  
Create a new ACL token.

Parameters

- `consul_url` -- The Consul server URL.
- `name` -- Meaningful indicator of the ACL’s purpose.
- `type` -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- `rules` -- The Consul server URL.

Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_create
```

salt.modules.consul.acl_delete(`consul_url=None, token=None, **kwargs`)  
Delete an ACL token.

Parameters

- `consul_url` -- The Consul server URL.
- `id` -- Unique identifier for the ACL to update.

Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.acl_info(`consul_url=None, **kwargs`)  
Information about an ACL token.

Parameters
- `consul_url` -- The Consul server URL.
- `id` -- Unique identifier for the ACL to update.

Returns
Information about the ACL requested.

CLI Example:
```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

`salt.modules.consul.acl_list`(consul_url=None, token=None, **kwargs)

List the ACL tokens.

Parameters
- `consul_url` -- The Consul server URL.

Returns
List of ACLs

CLI Example:
```
salt '*' consul.acl_list
```

`salt.modules.consul.acl_update`(consul_url=None, token=None, **kwargs)

Update an ACL token.

Parameters
- `consul_url` -- The Consul server URL.
- `name` -- Meaningful indicator of the ACL's purpose.
- `id` -- Unique identifier for the ACL to update.
- `type` -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- `rules` -- The Consul server URL.

Returns
Boolean & message of success or failure.

CLI Example:
```
salt '*' consul.acl_update
```

`salt.modules.consul.agent_check_deregister`(consul_url=None, token=None, checkid=None)

The agent will take care of deregistering the check from the Catalog.

Parameters
- `consul_url` -- The Consul server URL.
- `checkid` -- The ID of the check to deregister from Consul.

Returns
Boolean and message indicating success or failure.

CLI Example:
salt '*/' consul.agent_check_deregister checkid='Memory Utilization'

salt.modules.consul.agent_check_fail (consul_url=None, token=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

Parameters

- consul_url -- The Consul server URL.
- checkid -- The ID of the check to deregister from Consul.
- note -- A human-readable message with the status of the check.

Returns

Boolean and message indicating success or failure.

CLI Example:

salt '*/' consul.agent_check_fail checkid='redis_check1' note='Forcing check into critical state.'

salt.modules.consul.agent_check_pass (consul_url=None, token=None, checkid=None, **kwargs)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

Parameters

- consul_url -- The Consul server URL.
- checkid -- The ID of the check to mark as passing.
- note -- A human-readable message with the status of the check.

Returns

Boolean and message indicating success or failure.

CLI Example:

salt '*/' consul.agent_check_pass checkid='redis_check1' note='Forcing check into passing state.'

salt.modules.consul.agent_check_register (consul_url=None, token=None, **kwargs)

The register endpoint is used to add a new check to the local agent.

Parameters

- consul_url -- The Consul server URL.
- name -- The description of what the check is for.
- id -- The unique name to use for the check, if not provided 'name' is used.
- notes -- Human readable description of the check.
- script -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- http -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- ttl -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
**interval** -- Interval at which the check should run.

**Returns**
Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/bin/check_mem.py' interval='15s'
```

`salt.modules.consul.agent_check_warn(consul_url=None, token=None, checkid=None, **kwargs)`
This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

**Parameters**
- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

**Returns**
Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into warning state.'
```

`salt.modules.consul.agent_checks(consul_url=None, token=None)`
Returns the checks the local agent is managing

**Parameters**
- **consul_url** -- The Consul server URL.

**Returns**
Returns the checks the local agent is managing

CLI Example:
```
salt '*' consul.agent_checks
```

`salt.modules.consul.agent_join(consul_url=None, token=None, address=None, **kwargs)`
Triggers the local agent to join a node

**Parameters**
- **consul_url** -- The Consul server URL.
- **address** -- The address for the agent to connect to.
- **wan** -- Causes the agent to attempt to join using the WAN pool.

**Returns**
Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_join address='192.168.1.1'
```
salt.modules.consul.agent_leave(consul_url=None, token=None, node=None)

Used to instruct the agent to force a node into the left state.

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node the agent will force into left state

Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

salt.modules.consul.agent_maintenance(consul_url=None, token=None, **kwargs)

Manages node maintenance mode

Parameters

- **consul_url** -- The Consul server URL.
- **enable** -- The enable flag is required. Acceptable values are either true (to enter mainten-
  ance mode) or false (to resume normal operation).
- **reason** -- If provided, its value should be a text string explaining the reason for placing
  the node into maintenance mode.

Returns

Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in
  progress'
```

salt.modules.consul.agent_members(consul_url=None, token=None, **kwargs)

Returns the members as seen by the local serf agent

Parameters

- **consul_url** -- The Consul server URL.

Returns

Returns the members as seen by the local serf agent

CLI Example:

```
salt '*' consul.agent_members
```

salt.modules.consul.agent_self(consul_url=None, token=None)

Returns the local node configuration

Parameters

- **consul_url** -- The Consul server URL.

Returns

Returns the local node configuration

CLI Example:
salt '*' consul.agent_self

salt.modules.consul.agent_service_deregister(consul_url=None, token=None, serviceid=None)
Used to remove a service.

Parameters
- **consul_url** -- The Consul server URL.
- **serviceid** -- A serviceid describing the service.

Returns
Boolean and message indicating success or failure.

CLI Example:
salt '*' consul.agent_service_deregister serviceid='redis'

salt.modules.consul.agent_service_maintenance(consul_url=None, token=None, serviceid=None, **kwargs)
Used to place a service into maintenance mode.

Parameters
- **consul_url** -- The Consul server URL.
- **serviceid** -- A name of the service.
- **enable** -- Whether the service should be enabled or disabled.
- **reason** -- A human readable message of why the service was enabled or disabled.

Returns
Boolean and message indicating success or failure.

CLI Example:
salt '*' consul.agent_service_deregister serviceid='redis' enable='True', reason='Down for upgrade'

salt.modules.consul.agent_service_register(consul_url=None, token=None, **kwargs)
The used to add a new service, with an optional health check, to the local agent.

Parameters
- **consul_url** -- The Consul server URL.
- **name** -- A name describing the service.
- **address** -- The address used by the service, defaults to the address of the agent.
- **port** -- The port used by the service.
- **id** -- Unique ID to identify the service, if not provided the value of the name parameter is used.
- **tags** -- Identifying tags for service, string or list.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
• **check_ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.

• **check_interval** -- Interval at which the check should run.

Returns
Boolean and message indicating success or failure.

CLI Example:
```
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]' address='127.0.0.1' port='8080' check_script='/usr/local/bin/check_redis.py' interval='10s'
```

salt.modules.consul.agent_services(consul_url=None, token=None)

Returns the services the local agent is managing

Parameters
• **consul_url** -- The Consul server URL.

Returns
Returns the services the local agent is managing

CLI Example:
```
salt '*' consul.agent_services
```

salt.modules.consul.catalog_datacenters(consul_url=None, token=None)

Return list of available datacenters from catalog.

Parameters
• **consul_url** -- The Consul server URL.

Returns
The list of available datacenters.

CLI Example:
```
salt '*' consul.catalog_datacenters
```

salt.modules.consul.catalog_deregister(consul_url=None, token=None, **kwargs)

Deregisters a node, service, or check

Parameters
• **consul_url** -- The Consul server URL.
• **node** -- The node to deregister.
• **datacenter** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
• **checkid** -- The ID of the health check to deregister.
• **serviceid** -- The ID of the service to deregister.

Returns
Boolean & message of success or failure.

CLI Example:
salt.modules.consul.catalog_register

```
salt '*' consul.catalog_register node='node1' serviceid='redis_server1'
   -> checkid='redis_check1'
```

**salt.modules.consul.catalog_node** *(consul_url=None, token=None, node=None, **kwargs)*

Information about the registered node.

**Parameters**

- **consul_url** -- The Consul server URL.
- **node** -- The node to request information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

Information about the requested node.

**CLI Example:**

```
salt '*' consul.catalog_service service='redis'
```

**salt.modules.consul.catalog_nodes** *(consul_url=None, token=None, **kwargs)*

Return list of available nodes from catalog.

**Parameters**

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

The list of available nodes.

**CLI Example:**

```
salt '*' consul.catalog_nodes
```

**salt.modules.consul.catalog_register** *(consul_url=None, token=None, **kwargs)*

Registers a new node, service, or check

**Parameters**

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **node** -- The node to register.
- **address** -- The address of the node.
- **service** -- The service that will be registered.
- **service_address** -- The address that the service listens on.
- **service_port** -- The port for the service.
- **service_id** -- A unique identifier for the service, if this is not provided "name" will be used.
- **service_tags** -- Any tags associated with the service.
- **check** -- The name of the health check to register
- **check_status** -- The initial status of the check, must be one of unknown, passing, warning, or critical.
- **check_service** -- The service that the check is performed against.
- **check_id** -- Unique identifier for the service.
- **check_notes** -- An opaque field that is meant to hold human-readable text.

**Returns**
Boolean & message of success or failure.

**CLI Example:**
```bash
salt '*' consul.catalog_register node='node1' address='192.168.1.1' service='redis' service_address='127.0.0.1' service_port='8080' service_id='redis_server1'
```

```python
salt.modules.consul.catalog_service(consul_url=None, token=None, service=None, **kwargs)
```
Information about the registered service.

**Parameters**
- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **tag** -- Filter returned services with tag parameter.

**Returns**
Information about the requested service.

**CLI Example:**
```bash
salt '*' consul.catalog_service service='redis'
```

```python
salt.modules.consul.catalog_services(consul_url=None, token=None, **kwargs)
```
Return list of available services rom catalog.

**Parameters**
- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**
The list of available services.

**CLI Example:**
```bash
salt '*' consul.catalog_services
```

```python
salt.modules.consul.delete(consul_url=None, token=None, key=None, **kwargs)
```
Delete values from Consul

**Parameters**
- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
• **recurse** -- Delete values recursively beginning at the value of key.

• **cas** -- This flag is used to turn the DELETE into a Check-And-Set operation.

**Returns**

Boolean & message of success or failure.

**CLI Example:**

```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

`salt.modules.consul.event_fire`(consul_url=None, token=None, name=None, **kwargs)

List the ACL tokens.

**Parameters**

- **consul_url** -- The Consul server URL.

- **name** -- The name of the event to fire.

- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

- **node** -- Filter by node name.

- **service** -- Filter by service name.

- **tag** -- Filter by tag name.

**Returns**

List of ACLs

**CLI Example:**

```
salt '*' consul.event_fire name='deploy'
```

`salt.modules.consul.event_list`(consul_url=None, token=None, **kwargs)

List the recent events.

**Parameters**

- **consul_url** -- The Consul server URL.

- **name** -- The name of the event to fire.

**Returns**

List of ACLs

**CLI Example:**

```
salt '*' consul.event_list
```

`salt.modules.consul.get`(consul_url=None, key=None, token=None, recurse=False, decode=False, raw=False)

Get key from Consul

**Parameters**

- **consul_url** -- The Consul server URL.

- **key** -- The key to use as the starting point for the list.

- **recurse** -- Return values recursively beginning at the value of key.
- **decode** -- By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **raw** -- Simply return the decoded value of the key.

**Returns**

The keys in Consul.

**CLI Example:**

```bash
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
sicul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```bash
salt '*' consul.get key='web' recurse=True decode=True raw=True
```

By default Consult will return other information about the key, the raw option will return only the raw value.

salt.modules.consul.health_checks(consul_url=None, token=None, service=None, **kwargs)

Health information about the registered service.

**Parameters**

- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

Health information about the requested node.

**CLI Example:**

```bash
salt '*' consul.health_checks service='redis1'
```

salt.modules.consul.health_node(consul_url=None, token=None, node=None, **kwargs)

Health information about the registered node.

**Parameters**

- **consul_url** -- The Consul server URL.
- **node** -- The node to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**

Health information about the requested node.

**CLI Example:**

```bash
salt '*' consul.health_node node='node1'
```

salt.modules.consul.health_service(consul_url=None, token=None, service=None, **kwargs)

Health information about the registered service.

**Parameters**
• **consul_url** -- The Consul server URL.
• **service** -- The service to request health information about.
• **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
• **tag** -- Filter returned services with tag parameter.
• **passing** -- Filter results to only nodes with all checks in the passing state.

**Returns**
Health information about the requested node.

**CLI Example:**
salt '*' consul.health_service service='redis1'
salt '*' consul.health_service service='redis1' passing='True'

**salt.modules.consul.health_state**(consul_url=None, token=None, state=None,**kwargs)
Returns the checks in the state provided on the path.

**Parameters**
• **consul_url** -- The Consul server URL.
• **state** -- The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
• **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

**Returns**
The checks in the provided state.

**CLI Example:**
salt '*' consul.health_state state='redis1'
salt '*' consul.health_state service='redis1' passing='True'

**salt.modules.consul.list_**(consul_url=None, token=None, key=None,**kwargs)
List keys in Consul

**Parameters**
• **consul_url** -- The Consul server URL.
• **key** -- The key to use as the starting point for the list.

**Returns**
The list of keys.

**CLI Example:**
salt '*' consul.list
salt '*' consul.list key='web'

**salt.modules.consul.put**(consul_url=None, token=None, key=None, value=None,**kwargs)
Put values into Consul

**Parameters**
- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **value** -- The value to set the key to.
- **flags** -- This can be used to specify an unsigned value between 0 and $2^{64}-1$. Clients can choose to use this however makes sense for their application.
- **cas** -- This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** -- This flag is used to turn the PUT into a lock acquisition operation.
- **release** -- This flag is used to turn the PUT into a lock release operation.

**Returns**

Boolean & message of success or failure.

**CLI Example:**

```
salt '*' consul.put key='web/key1' value="Hello there"
salt '*' consul.put key='web/key1' value="Hello there" acquire='d5d371f4-c80-520-12fd-8810be175592'
salt '*' consul.put key='web/key1' value="Hello there" release='d5d371f4-c80-520-12fd-8810be175592'
```

salt.modules.consul.session_create(consul_url=None, token=None, **kwargs)

Used to create a session.

**Parameters**

- **consul_url** -- The Consul server URL.
- **lockdelay** -- Duration string using a "s" suffix for seconds. The default is 15s.
- **node** -- Must refer to a node that is already registered, if specified. By default, the agent's own node name is used.
- **name** -- A human-readable name for the session
- **checks** -- A list of associated health checks. It is highly recommended that, if you override this list, you include the default "serfHealth".
- **behavior** -- Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** -- Session is invalidated if it is not renewed before the TTL expires

**Returns**

Boolean and message indicating success or failure.

**CLI Example:**

```
salt '*' consul.session_create node='node1' name='my-session' behavior="delete" ttl='3600s'
```

salt.modules.consul.session_destroy(consul_url=None, token=None, session=None, **kwargs)

Destroy session

26.6. execution modules
Parameters

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to destroy.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.session_info (consul_url=None, token=None, session=None, **kwargs)

Information about a session

Parameters

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to return information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.

Returns

Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.session_list (consul_url=None, token=None, return_list=False, **kwargs)

Used to list sessions.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the "dc" parameter.
- **return_list** -- By default, all information about the sessions is returned, using the return_list parameter will return a list of session IDs.

Returns

A list of all available sessions.

CLI Example:

```
salt '*' consul.session_list
```

salt.modules.consul.status_leader (consul_url=None, token=None)

Returns the current Raft leader

Parameters

- **consul_url** -- The Consul server URL.
Returns
The address of the Raft leader.

CLI Example:
```bash
salt '*' consul.status_leader
```

salt.modules.consul.status_peers(consul_url, token=None)
Returns the current Raft peer set

Parameters
**consul_url** -- The Consul server URL.

Returns
Retrieves the Raft peers for the datacenter in which the agent is running.

CLI Example:
```bash
salt '*' consul.status_peers
```

### 26.6.90 salt.modules.container_resource

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the `lxc`, `nspawn`, and `docker` execution modules. They provide for common logic to be re-used for common actions.

salt.modules.container_resource.cache_file(source)
Wrapper for cp.cache_file which raises an error if the file was unable to be cached.

CLI Example:
```bash
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```

salt.modules.container_resource.copy_to(name, source, dest, container_type=None, path=None, exec_driver=None, overwrite=False, makedirs=False)

Common logic for copying files to containers

**path**
path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:
```bash
salt myminion container_resource.copy_to mycontainer /local/file/path /<container/file/path container_type=docker exec_driver=nsenter
```

salt.modules.container_resource.run(name, cmd, container_type=None, exec_driver=None, output=None, no_start=False, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, path=None, use_vt=False, keep_env=None)

Common logic for running shell commands in containers

**path**
path to the container parent (for LXC only) default: `/var/lib/lxc` (system default)

CLI Example:
```
salt myminion container_resource.run mycontainer 'ps aux' container_
    -type=docker exec_driver=nsenter output=stdout
```

### 26.6.91 salt.modules.cp

Minion side functions for salt-cp

**salt.modules.cp.cache_dest** *(url, saltenv=None)*

- **New in version 3000.**
  - Changed in version 3005: saltenv will use value from config if not explicitly set
  - Returns the expected cache path for the file, if cached using `cp.cache_file`

  **Note:** This only returns the _expected_ path, it does not tell you if the URL is really cached. To check if the URL is cached, use `cp.is_cached` instead.

  **CLI Examples:**
  ```
salt '*' cp.cache_dest https://foo.com/bar.rpm
salt '*' cp.cache_dest salt://my/file
salt '*' cp.cache_dest salt://my/file saltenv=dev
```

**salt.modules.cp.cache_dir** *(path, saltenv=None, include_empty=False, include_pat=None, exclude_pat=None)*

- **Changed in version 3005:** saltenv will use value from config if not explicitly set
- Download and cache everything under a directory from the master

  **include_pat**
  - [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

  - **New in version 2014.7.0.**

  **exclude_pat**
  - [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

  **Note:** If used with include_pat, files matching this pattern will be excluded from the subset of files defined by include_pat.

  **New in version 2014.7.0.**

  **CLI Examples:**
  ```
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

**salt.modules.cp.cache_file** *(path, saltenv=None, source_hash=None, verify_ssl=True, use_etag=False)*

- **Changed in version 3005:** saltenv will use value from config if not explicitly set
- Used to cache a single file on the Minion
- Returns the location of the new cached file on the Minion
source_hash
If name is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

verify_ssl
If False, remote https file sources (https://) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag
If True, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the source_hash parameter.

New in version 3005.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. saltenv) from which to cache the file. One is to use the saltenv parameter, and the other is to use a querystring syntax in the salt:// URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a salt:// URL, and the path does not exist, then False will be returned.

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.cache_file_ssh(path, saltenv=None, source_hash=None, verify_ssl=True, use_etag=False)

This function is an alias of cache_file.

Changed in version 3005: saltenv will use value from config if not explicitly set

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion

source_hash
If name is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

verify_ssl
If False, remote https file sources (https://) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

use_etag
If True, remote http/https file sources will attempt to use the ETag header to determine if
the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the `source_hash` parameter.

New in version 3005.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

**salt.modules.cp.cache_files**

`paths`, `saltenv=None`

```
Changed in version 3005: `saltenv` will use value from config if not explicitly set
```

**Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master**

CLI Example:

```
salt '*' cp.cache_files salt://path/to/file1,salt://path/to/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf
<-saltenv=config
<-conf?saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below command will cache the first file from the `config1` environment, and the second one from the `config2` environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/
<-bar.conf?saltenv=config2
```

**Note:** It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.
salt.modules.cp.cache_local_file(path)
Cache a local file on the minion in the localfiles cache
CLI Example:
```
salt '*' cp.cache_local_file /etc/hosts
```

salt.modules.cp.cache_master(saltenv=None)
Changed in version 3005: saltenv will use value from config if not explicitly set
Retrieve all of the files on the master and cache them locally
CLI Example:
```
salt '*' cp.cache_master
```

salt.modules.cp.envs()
List available environments for fileserver
CLI Example:
```
salt '*' cp.envs
```

salt.modules.cp.get_dir(path, dest, saltenv=None, template=None, gzip=None, **kwargs)
Changed in version 3005: saltenv will use value from config if not explicitly set
Used to recursively copy a directory from the salt master
CLI Example:
```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```
get_dir supports the same template and gzip arguments as get_file.

salt.modules.cp.get_file(path, dest, saltenv=None, makedirs=False, template=None, gzip=None, **kwargs)
Changed in version 3005: saltenv will use value from config if not explicitly set
Changed in version 2018.3.0: dest can now be a directory
Used to get a single file from the salt master
CLI Example:
```
salt '*' cp.get_file salt://path/to/file /minion/dest
```
Template rendering can be enabled on both the source and destination file names like so:
```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc
    → template=jinja
```
This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the gzip named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.
There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```bash
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

```python
salt.modules.cp.get_file_str(path, saltenv=None)
```

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Download a file from a URL to the Minion cache directory and return the contents of that file

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```bash
salt '*' cp.get_file_str salt://my/file
```

```python
salt.modules.cp.get_template(path, dest='', template='jinja', saltenv=None, makedirs=False, **kwargs)
```

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Render a file as a template before setting it down. Warning, order is not the same as in `fileclient.cp` for non breaking old API.

CLI Example:

```bash
salt '*' cp.get_template salt://path/to/template /minion/dest
```

```python
salt.modules.cp.get_url(path, dest='', saltenv=None, makedirs=False, source_hash=None)
```

Changed in version 3005: `saltenv` will use value from config if not explicitly set

Changed in version 2018.3.0: `dest` can now be a directory

Used to get a single file from a URL.

**path**

A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file://`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

**dest**

The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (`''`), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

**saltenv**

Salt fileserver environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.
source_hash

If path is an http(s) or ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the file if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

salt.modules.cp.hash_file(path, saltenv=None)

Changed in version 3005: saltenv will use value from config if not explicitly set

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

salt.modules.cp.hash_file_ssh(path, saltenv=None)

This function is an alias of hash_file.

Changed in version 3005: saltenv will use value from config if not explicitly set

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.hash_file_ssh salt://path/to/file
```

salt.modules.cp.is_cached(path, saltenv=None)

Changed in version 3005: saltenv will use value from config if not explicitly set

Returns the full path to a file if it is cached locally on the minion otherwise returns a blank string

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

salt.modules.cp.list_master(saltenv=None, prefix="")

Changed in version 3005: saltenv will use value from config if not explicitly set

List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

salt.modules.cp.list_master_dirs(saltenv=None, prefix="")

Changed in version 3005: saltenv will use value from config if not explicitly set

List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```
salt.modules.cp.list_master_symlinks(saltenv=None, prefix="")

Changed in version 3005: saltenv will use value from config if not explicitly set

List all of the symlinks stored on the master

CLI Example:
```bash
salt '*' cp.list_master_symlinks
```

salt.modules.cp.list_minion(saltenv=None)

Changed in version 3005: saltenv will use value from config if not explicitly set

List all of the files cached on the minion

CLI Example:
```bash
salt '*' cp.list_minion
```

salt.modules.cp.list_states(saltenv=None)

Changed in version 3005: saltenv will use value from config if not explicitly set

List all of the available state files in an environment

CLI Example:
```bash
salt '*' cp.list_states
```

salt.modules.cp.push(path, keep_symlinks=False, upload_path=None, remove_source=False)

WARNING Files pushed to the master will have global read permissions..

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set file_recv to True in the master configuration file, and restart the master.

keep_symlinks

Keep the path value without resolving its canonical form

upload_path

Provide a different path inside the master's minion files cachedir

remove_source

Remove the source file on the minion

New in version 2016.3.0.

CLI Example:
```bash
salt '*' cp.push /etc/fstab keep_symlinks=True
salt '*' cp.push /etc/system-release upload_path='/new/path/system-release'
salt '*' cp.push /etc/fstab remove_source=True
```

salt.modules.cp.push_dir(path, glob=None, upload_path=None)

Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to /var/cache/salt/master/minions/minion-id/files). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.
Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set file_recv to True in the master configuration file, and restart the master.

**upload_path**

Provide a different path and directory name inside the master's minion files cachedir

CLI Example:

```bash
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

salt.modules.cp.recv(*files, dest*)

Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

CLI Example:

```bash
salt '*' cp.recv
```

salt.modules.cp.recv_chunked(*dest, chunk, append=False, compressed=True, mode=None*)

This function receives files copied to the minion using salt-cp and is not intended to be used directly on the CLI.

CLI Example:

```bash
salt '*' cp.recv_chunked
```

salt.modules.cp.stat_file(*path, saltenv=None, octal=True*)

Changed in version 3005: saltenv will use value from config if not explicitly set

Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```bash
salt '*' cp.stat_file salt://path/to/file
```

26.6.92 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

salt.modules.cpan.install(*module*)

Install a Perl module from CPAN

CLI Example:

```bash
salt '*' cpan.install Template::Alloy
```

salt.modules.cpan.list_()

List installed Perl modules, and the version installed

CLI Example:
salt '*i' cpan.list

salt.modules.cpan.remove(module, details=False)
Attempt to remove a Perl module that was installed from CPAN. Because the cpan command doesn't actually support "uninstall"-like functionality, this function will attempt to do what it can, with what it has from CPAN. Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:
salt '*i' cpan.remove Old::Package

salt.modules.cpan.show(module)
Show information about a specific Perl module

CLI Example:
salt '*i' cpan.show Template::Alloy

salt.modules.cpan.show_config()
Return a dict of CPAN configuration values

CLI Example:
salt '*i' cpan.show_config

26.6.93 salt.modules.cron

Work with cron

Note: Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

salt.modules.cron.get_entry(user, identifier=None, cmd=None)
Return the specified entry from user's crontab. identifier will be used if specified, otherwise will lookup cmd
Either identifier or cmd should be specified.

user:
User's crontab to query

identifier:
Search for line with identifier

cmd:
Search for cron line with cmd

CLI Example:
salt '*i' cron.get_entry root identifier=task1

salt.modules.cron.list_tab(user)
Return the contents of the specified user's crontab

CLI Example:
salt '*/' cron.list_tab root

salt.modules.cron.ls(user)
This function is an alias of list_tab.
Return the contents of the specified user's crontab
CLI Example:
salt '*/' cron.list_tab root

salt.modules.cron.raw_cron(user)
Return the contents of the user's crontab
CLI Example:
salt '*/' cron.raw_cron root

salt.modules.cron.rm(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)
This function is an alias of rm_job.
Remove a cron job for a specified user. If any of the day/time params are specified, the job will only
be removed if the specified params match.
CLI Example:
salt '*/' cron.rm_job root /usr/local/weekly
salt '*/' cron.rm_job root /usr/bin/foo dayweek=1

salt.modules.cron.rm_env(user, name)
Remove cron environment variable for a specified user.
CLI Example:
salt '*/' cron.rm_env root MAILTO

salt.modules.cron.rm_job(user, cmd, minute=None, hour=None, daymonth=None, month=None, dayweek=None, identifier=None)
Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be
removed if the specified params match.
CLI Example:
salt '*/' cron.rm_job root /usr/local/weekly
salt '*/' cron.rm_job root /usr/bin/foo dayweek=1

salt.modules.cron.rm_special(user, cmd, special=None, identifier=None)
Remove a special cron job for a specified user.
CLI Example:
salt '*/' cron.rm_special root /usr/bin/foo

salt.modules.cron.set_env(user, name, value=None)
Set up an environment variable in the crontab.
CLI Example:
### salt.modules.cron

**set_job**

Sets a cron job up for a specified user.

**CLI Example:**

```
salt '*' cron.set_job root '*' '*' '*' '*' 1 /usr/local/weekly
```

**set_special**

Set up a special command in the crontab.

**CLI Example:**

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

**write_cron_file**

Writes the contents of a file to a user's crontab

**CLI Example:**

```
salt '*' cron.write_cron_file root /tmp/new_cron
```

Changed in version 2015.8.9.

**Note:** Some OS' do not support specifying user via the crontab command i.e. (Solaris, AIX)

**write_cron_file_verbose**

Writes the contents of a file to a user's crontab and return error message on error

**CLI Example:**

```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

**Note:** Some OS' do not support specifying user via the crontab command i.e. (Solaris, AIX)

### 26.6.94 salt.modules.cryptdev

Salt module to manage Unix cryptsetup jobs and the crypttab file

New in version 2018.3.0.

**active**

List existing device-mapper device details.

**close**

Close a crypt device using cryptsetup.

**CLI Example:**
salt '*' cryptdev.close foo

salt.modules.cryptdev.crypttab(config='/etc/crypttab')
List the contents of the crypttab
CLI Example:
salt '*' cryptdev.crypttab

salt.modules.cryptdev.open(name, device, keyfile)
Open a crypt device using cryptsetup. The keyfile must not be None or 'none', because cryptsetup will otherwise ask for the password interactively.
CLI Example:
salt '*' cryptdev.open foo /dev/sdz1 /path/to/keyfile

salt.modules.cryptdev.rm_crypttab(name, config='/etc/crypttab')
Remove the named mapping from the crypttab. If the described entry does not exist, nothing is changed, but the command succeeds by returning 'absent'. If a line is removed, it returns 'change'.
CLI Example:
salt '*' cryptdev.rm_crypttab foo

salt.modules.cryptdev.set_crypttab(name, device, password='none', options='', config='/etc/crypttab', test=False, match_on='name')
Verify that this device is represented in the crypttab, change the device to match the name passed, or add the name if it is not present.
CLI Example:
salt '*' cryptdev.set_crypttab foo /dev/sdz1 mypassword swap,size=256

26.6.95 salt.modules.csf

Support for Config Server Firewall (CSF)

maintainer
Mostafa Hussein <mostafa.hussein91@gmail.com>
maturity
new
platform
Linux

salt.modules.csf.allow(ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment='')
Add an rule to csf allowed hosts See _access_rule(). 1- Add an IP:
CLI Example:
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
salt.modules.csf.allow_port

Like `allow_ports`, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:

```bash
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.allow_ports

Fully replace the incoming or outgoing ports line in the csf.conf file - e.g. TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:

```bash
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp' direction='in'
```

salt.modules.csf.build_directions

salt.modules.csf.deny

Add an rule to csf denied hosts See `_access_rule()`. 1- Deny an IP:

CLI Example:

```bash
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosty"
```

salt.modules.csf.disable

Disable csf permanently

CLI Example:

```bash
salt '*' csf.disable
```

salt.modules.csf.disable_testing_mode

salt.modules.csf.enable

Activate csf if not running

CLI Example:

```bash
salt '*' csf.enable
```

salt.modules.csf.enable_testing_mode

salt.modules.csf.exists

Returns true a rule for the ip already exists based on the method supplied. Returns false if not found.

CLI Example:

```bash
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

salt.modules.csf.get_option

1726 Chapter 26. Salt Module Reference
salt.modules.csf.get_ports(\texttt{proto='tcp', direction='in'})

Lists ports from csf.conf based on direction and protocol. e.g. - TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc..

CLI Example:

```
salt '*\' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.get_skipped_nics(\texttt{ipv6=False})

salt.modules.csf.get_testing_status()

salt.modules.csf.reload()

Restart csf

CLI Example:

```
salt '*\' csf.reload
```

salt.modules.csf.remove_rule(\texttt{method, ip, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment=''}

salt.modules.csf.remove_temp_rule(\texttt{ip})

salt.modules.csf.running()

Check csf status

CLI Example:

```
salt '*\' csf.running
```

salt.modules.csf.set_option(\texttt{option, value})

salt.modules.csf.skip_nic(\texttt{nic, ipv6=False})

salt.modules.csf.skip_nics(\texttt{nics, ipv6=False})

salt.modules.csf.split_option(\texttt{option})

salt.modules.csf.tempallow(\texttt{ip=None, ttl=None, port=None, direction=None, comment=''}

Add an rule to the temporary ip allow list. See _access_rule(). 1- Add an IP:

CLI Example:

```
salt '*\' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='\#\n\rightarrow Temp dev ssh access'
```

salt.modules.csf.tempdeny(\texttt{ip=None, ttl=None, port=None, direction=None, comment=''}

Add a rule to the temporary ip deny list. See _access_rule(). 1- Add an IP:

CLI Example:

```
salt '*\' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='\#\n\rightarrow Brute force attempt'
```

salt.modules.csf.unallow(\texttt{ip})

Remove a rule from the csf denied hosts See _access_rule(). 1- Deny an IP:

CLI Example:
salt '*' csf.unallow 127.0.0.1

salt.modules.csf.undeny(ip)
    Remove a rule from the csf denied hosts See _access_rule(). 1- Deny an IP:
    CLI Example:
    salt '*' csf.undeny 127.0.0.1

26.6.96 salt.modules.cyg

Manage cygwin packages.
Module file to accompany the cyg state.
salt.modules.cyg.check_valid_package(package, cyg_arch='x86_64', mirrors=None)
    Check if the package is valid on the given mirrors.
    Parameters
        • package -- The name of the package
        • cyg_arch -- The cygwin architecture
    • mirrors -- any mirrors to check
    Returns (bool): True if Valid, otherwise False
    CLI Example:
    salt '*' cyg.check_valid_package <package name>

salt.modules.cyg.install(packages=None, cyg_arch='x86_64', mirrors=None)
    Install one or several packages.
    packages [None] The packages to install
    cyg_arch [x86_64] Specify the architecture to install the package under Current options are x86 and x86_64
    CLI Example:
    salt '*' cyg.install dos2unix
    salt '*' cyg.install dos2unix mirrors="[{http://mirror': 'http://url/to/
←public/key}]'

salt.modules.cyg.list_(package='', cyg_arch='x86_64')
    List locally installed packages.
    package [''] package name to check. else all
    cyg_arch:
        Cygwin architecture to use Options are x86 and x86_64
    CLI Example:
salt modules.cyg.uninstall \( (\text{packages, cyg\_arch}=\text{x86\_64}, \text{mirrors}=\text{None}) \)

Uninstall one or several packages.

\textbf{packages}

The packages to uninstall.

\textbf{cyg\_arch}

\([\text{x86\_64}]\) Specify the architecture to remove the package from Current options are x86 and x86_64

CLI Example:

\begin{verbatim}
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors="[{'http://mirror': 'http://url/to/public/key}]
\end{verbatim}

salt modules.cyg.update \( (\text{cyg\_arch}=\text{x86\_64}, \text{mirrors}=\text{None}) \)

Update all packages.

\textbf{cyg\_arch}

\([\text{x86\_64}]\) Specify the cygwin architecture update Current options are x86 and x86_64

CLI Example:

\begin{verbatim}
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors="[{'http://mirror': 'http://url/to/public/key}]
\end{verbatim}

26.6.97 salt modules.daemontools

daemontools service module. This module will create daemontools type service watcher.

This module is compatible with the service states, so it can be used to maintain services using the provider argument:

\begin{verbatim}
myservice:
    service.running:
        - provider: daemontools
\end{verbatim}

salt modules.daemontools.available \( \text{name} \)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

\begin{verbatim}
salt '*' daemontools.available foo
\end{verbatim}

salt modules.daemontools.disabled \( \text{name} \)

Return True if the named service is enabled, false otherwise

New in version 2015.5.6.

CLI Example:

\begin{verbatim}
salt '*' daemontools.disabled <service name>
\end{verbatim}
salt.modules.daemontools.enabled(name, **kwargs)

Return True if the named service is enabled, false otherwise. A service is considered enabled if in your service directory:
- an executable ./run file exist
- a file named "down" does not exist

New in version 2015.5.7.

name
Service name

CLI Example:

```
salt '*' daemontools.enabled <service name>
```

salt.modules.daemontools.full_restart(name)

Calls daemontools.restart() function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

salt.modules.daemontools.get_all()

Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```

salt.modules.daemontools.missing(name)

The inverse of daemontools.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' daemontools.missing foo
```

salt.modules.daemontools.reload_(name)

Wrapper for term() function

CLI Example:

```
salt '*' daemontools.reload <service name>
```

salt.modules.daemontools.restart(name)

Restart service via daemontools. This will stop/start service

CLI Example:

```
salt '*' daemontools.restart <service name>
```

salt.modules.daemontools.start(name)

Starts service via daemontools

CLI Example:

```
salt '*' daemontools.start <service name>
```
salt.modules.daemontools.

**status** (*name, sig=None*)

Return the status for a service via daemontools, return pid if running

CLI Example:

```
salt '*' daemontools.status <service name>
```

**stop** (*name*)

Stops service via daemontools

CLI Example:

```
salt '*' daemontools.stop <service name>
```

**term** (*name*)

Send a TERM to service via daemontools

CLI Example:

```
salt '*' daemontools.term <service name>
```

26.6.98 **salt.modules.data**

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

**cas** (*key, value, old_value*)

Check and set a value in the minion datastore

CLI Example:

```
salt '*' data.cas <key> <value> <old_value>
```

**clear** ()

Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:

```
salt '*' data.clear
```

**dump** (*new_data*)

Replace the entire datastore with a passed data structure

CLI Example:

```
salt '*' data.dump '{'eggs': 'spam'}'
```

**get** (*key, default=None*)

Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.get key
salt '*' data.get ['"key1", "key2"]'
```
salt.modules.data.has_key(key)
Check if key is in the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.has_key <mykey>
```

salt.modules.data.items()
Get items from the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.items
```

salt.modules.data.keys()
Get all keys from the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.keys
```

salt.modules.data.load()
Return all of the data in the minion datastore
CLI Example:
```
salt '*' data.load
```

salt.modules.data.pop(key, default=None)
Pop (return & delete) a value from the minion datastore
New in version 2015.5.2.
CLI Example:
```
salt '*' data.pop <key> "there was no val"
```

salt.modules.data.update(key, value)
Update a key with a value in the minion datastore
CLI Example:
```
salt '*' data.update <key> <value>
```

salt.modules.data.values()
Get values from the minion datastore
New in version 2015.8.0.
CLI Example:
```
salt '*' data.values
```
26.6.99 salt.modules.datadog_api

An execution module that interacts with the Datadog API

    depends
datadog Python module

Note: The following parameters are required for all functions:

api_key
The datadog API key

app_key
The datadog application key

Full argument reference is available on the Datadog API reference page https://docs.datadoghq.com/api/
salt.modules.datadog_api.cancel_downtime(api_key=None, app_key=None, scope=None, id=None)

Cancel a downtime by id or by scope.

    CLI Example:

    ```
    salt-call datadog.cancel_downtime scope='host:app01' \ 
       api_key='0123456789' \ 
       app_key='9876543210'
    ```

Arguments - Either scope or id is required.

    Parameters

- id -- The downtime ID
- scope -- The downtime scope

salt.modules.datadog_api.post_event(api_key=None, app_key=None, title=None, text=None, 
date_happened=None, priority=None, host=None, tags=None, 
alert_type=None, aggregation_key=None, 
source_type_name=None)

Post an event to the Datadog stream.

    CLI Example

    ```
    salt-call datadog.post_event api_key='0123456789' \ 
       app_key='9876543210' \ 
       title='Salt Highstate' \ 
       text="Salt highstate was run on $(salt-call\ 
       -grains.get id)\" \ 
       tags=('["service:salt", "event:highstate"]'
    ```

Required arguments

    Parameters

- title -- The event title. Limited to 100 characters.
- text -- The body of the event. Limited to 4000 characters. The text supports markdown.

Optional arguments

    Parameters
- **date_happened** -- POSIX timestamp of the event.
- **priority** -- The priority of the event (‘normal’ or ‘low’).
- **host** -- Host name to associate with the event.
- **tags** -- A list of tags to apply to the event.
- **alert_type** -- "error", "warning", "info" or "success".
- **aggregation_key** -- An arbitrary string to use for aggregation, max length of 100 characters.
- **source_type_name** -- The type of event being posted.

```
salt.modules.datadog_api.schedule_downtime(
    scope, api_key=None,
    app_key=None,
    monitor_id=None,
    start=None,
    end=None,
    message=None,
    recurrence=None, timezone=None,
    test=False)
```

Schedule downtime for a scope of monitors.

CLI Example:

```
salt-call datadog.schedule_downtime 'host:app2' \
    stop=$(date --date='30 minutes' +%s) \
    app_key='0123456789' \
    api_key='9876543210'
```

Optional arguments

Parameters

- **monitor_id** -- The ID of the monitor
- **start** -- Start time in seconds since the epoch
- **end** -- End time in seconds since the epoch
- **message** -- A message to send in a notification for this downtime
- **recurrence** -- Repeat this downtime periodically
- **timezone** -- Specify the timezone

26.6.100 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.

depends

- dsynpython Python module

configuration

If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key
             (default='HMAC-MDS.SIG-ALG.REG.INT').
```

(continues on next page)
Other possible values: hmac-sha1, hmac-sha224, hmac-sha256, hmac-sha384, hmac-sha512

The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```json
{"keyname." : "keycontent"}
```

```
salt.modules.ddns.add_host(zone, name, ttl, ip, nameserver='127.0.0.1', replace=True, timeout=5, port=53, **kwargs)
```

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```
salt nsl ddns.add_host example.com host1 60 10.1.1.1
```

```
salt.modules.ddns.delete(zone, name, rdtype=None, data=None, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)
```

Delete a DNS record.

CLI Example:

```
salt nsl ddns.delete example.com host1 A
```

```
salt.modules.ddns.delete_host(zone, name, nameserver='127.0.0.1', timeout=5, port=53, **kwargs)
```

Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```
salt nsl ddns.delete_host example.com host1
```

```
salt.modules.ddns.update(zone, name, ttl, rdtype, data, nameserver='127.0.0.1', timeout=5, replace=False, port=53, **kwargs)
```

Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:

```
salt nsl ddns.update example.com host1 60 A 10.0.0.1
```

### 26.6.101 salt.modules.deb_apache

**Warning:** This module will be removed from Salt in version 3009 in favor of the apache Salt Extension.

Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the apache namespace.
salt.modules.deb_apache.a2disconf(conf)
  New in version 2016.3.0.
  Runs a2disconf for the given conf.
  This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
  CLI Examples:
  
  ```bash
  salt '*' apache.a2disconf security
  ```

salt.modules.deb_apache.a2dismod(mod)
  Runs a2dismod for the given mod.
  This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
  CLI Examples:
  
  ```bash
  salt '*' apache.a2dismod vhost_alias
  ```

salt.modules.deb_apache.a2dissite(site)
  Runs a2dissite for the given site.
  This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
  CLI Examples:
  
  ```bash
  salt '*' apache.a2dissite example.com
  ```

salt.modules.deb_apache.a2enconf(conf)
  New in version 2016.3.0.
  Runs a2enconf for the given conf.
  This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
  CLI Examples:
  
  ```bash
  salt '*' apache.a2enconf security
  ```

salt.modules.deb_apache.a2enmod(mod)
  Runs a2enmod for the given mod.
  This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
  CLI Examples:
  
  ```bash
  salt '*' apache.a2enmod vhost_alias
  ```

salt.modules.deb_apache.a2ensite(site)
  Runs a2ensite for the given site.
  This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
  CLI Examples:
  
  ```bash
  salt '*' apache.a2ensite example.com
  ```
salt.modules.deb_apache.check_conf_enabled

New in version 2016.3.0.
Checks to see if the specific conf symlink is in /etc/apache2/conf-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
CLI Examples:

```bash
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

salt.modules.deb_apache.check_mod_enabled

Checks to see if the specific mod symlink is in /etc/apache2/mods-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
CLI Examples:

```bash
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf
```

salt.modules.deb_apache.check_site_enabled

Checks to see if the specific site symlink is in /etc/apache2/sites-enabled.
This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).
CLI Examples:

```bash
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

26.6.102 salt.modules.deb_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.
salt.modules.deb_postgres.cluster_create(version, name='main', port=None, locale=None,
encoding=None, datadir=None,
allow_group_access=None, data_checksums=None,
wal_segsize=None)

Adds a cluster to the Postgres server.
CLI Example:

```bash
salt '*' postgres.cluster_create '9.3'
salt '*' postgres.cluster_create '9.3' 'main'
salt '*' postgres.cluster_create '9.3' locale='fr_FR'
salt '*' postgres.cluster_create '11' data_checksums=True wal_segsize='32'
```

salt.modules.deb_postgres.cluster_exists(version, name='main')
Checks if a given version and name of a cluster exists.
CLI Example:
salt '*' postgres.cluster_exists '9.3'
salt '*' postgres.cluster_exists '9.3' 'main'

```python
salt.modules.deb_postgres.cluster_list(verbos=False)
```
Return a list of cluster of Postgres server (tuples of version and name).

CLI Example:
```
salt '*' postgres.cluster_list
salt '*' postgres.cluster_list verbose=True
```

```python
salt.modules.deb_postgres.cluster_remove(version, name='main', stop=False)
```
Remove a cluster on a Postgres server. By default it doesn't try to stop the cluster.

CLI Example:
```
salt '*' postgres.cluster_remove '9.3'
salt '*' postgres.cluster_remove '9.3' 'main'
salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```

## 26.6.103 salt.modules.debconfmod

Support for Debconf.

```python
salt.modules.debconfmod.get_selections(fetchempty=True)
```
Answers to debconf questions for all packages in the following format:

```
{ 'package': [['question', 'type', 'value'], ...]}
```

CLI Example:
```
salt '*' debconf.get_selections
```

```python
salt.modules.debconfmod.set_(package, question, type, value, *extra)
```
Set answers to debconf questions for a package.

CLI Example:
```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

```python
salt.modules.debconfmod.set_file(path, saltenv='base', **kwargs)
```
Set answers to debconf questions from a file.

CLI Example:
```
salt '*' debconf.set_file salt://path/to/pkg.selections
```

```python
salt.modules.debconfmod.set_template(path, template, context, defaults, saltenv='base', **kwargs)
```
Set answers to debconf questions from a template.
path
  location of the file containing the package selections

template
  template format

context
  variables to add to the template environment

default
  default values for the template environment

CLI Example:

```bash
salt '*' debconf.set_template salt://path/to/pkg.selections.jinja jinja
```

salt.modules.debconfmod.show(name)

Answers to debconf questions for a package in the following format:

```
[['question', 'type', 'value'], ...]
```

If debconf doesn’t know about a package, we return None.

CLI Example:

```bash
salt '*' debconf.show <package name>
```

26.6.104 salt.modules.debian_ip

The networking module for Debian-based distros

References:

salt.modules.debian_ip.apply_network_settings(**settings)

Apply global network configuration.

CLI Example:

```bash
salt '*' ip.apply_network_settings
```

salt.modules.debian_ip.build_bond(iface, **settings)

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```bash
salt '*' ip.build_bond bond0 mode=balance-alb
```

salt.modules.debian_ip.build_interface(iface, iface_type, enabled, **settings)

Build an interface script for a network interface.

CLI Example:

```bash
salt '*' ip.build_interface eth0 eth <settings>
```
salt.modules.debian_ip.build_network_settings(**settings)
Build the global network script.
CLI Example:
```
salt '*' ip.build_network_settings <settings>
```

salt.modules.debian_ip.build_routes(iface, **settings)
Add route scripts for a network interface using up commands.
CLI Example:
```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.debian_ip.down(iface, iface_type)
Shutdown a network interface
CLI Example:
```
salt '*' ip.down eth0 eth
```

salt.modules.debian_ip.get_bond(iface)
Return the content of a bond script
CLI Example:
```
salt '*' ip.get_bond bond0
```

salt.modules.debian_ip.get_interface(iface)
Return the contents of an interface script
CLI Example:
```
salt '*' ip.get_interface eth0
```

salt.modules.debian_ip.get_network_settings()
Return the contents of the global network script.
CLI Example:
```
salt '*' ip.get_network_settings
```

salt.modules.debian_ip.get_routes(iface)
Return the routes for the interface
CLI Example:
```
salt '*' ip.get_routes eth0
```

salt.modules.debian_ip.up(iface, iface_type)
Start up a network interface
CLI Example:
```
salt '*' ip.up eth0 eth
```
26.6.105 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.debian_service.available(name)
Returns True if the specified service is available, otherwise returns False.

CLI Example:
salt '*' service.available sshd

salt.modules.debian_service.disable(name, **kwargs)
Disable the named service to start at boot

CLI Example:
salt '*' service.disable <service name>

salt.modules.debian_service.disabled(name)
Return True if the named service is disabled, false otherwise

CLI Example:
salt '*' service.disabled <service name>

salt.modules.debian_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
salt '*' service.enable <service name>

salt.modules.debian_service.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '*' service.enabled <service name>

salt.modules.debian_service.force_reload(name)
Force-reload the named service

CLI Example:
salt '*' service.force_reload <service name>

salt.modules.debian_service.get_all()
Return all available boot services

CLI Example:
salt '*' service.get_all
salt.modules.debian_service.get_disabled()

Return a set of services that are installed but disabled

CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.debian_service.get_enabled()

Return a list of service that are enabled on boot

CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.debian_service.missing(name)

The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' service.missing sshd
```

salt.modules.debian_service.reload_(name)

Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.debian_service.restart(name)

Restart the named service

CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.debian_service.start(name)

Start the specified service

CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.debian_service.status(name, sig=None)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool
CLI Example:
```
salt '*' service.status <service name> [service signature]
```

```
salt.modules.debian_service.stop(name)
Stop the specified service
```

CLI Example:
```
salt '*' service.stop <service name>
```

26.6.106 salt.modules.debuild_pkgbuild

Debian Package builder system
New in version 2015.8.0.
This system allows for all of the components to build debs safely in chrooted environments. This also provides a
function to generate debian repositories
This module implements the pkgbuild interface
```
salt.modules.debuild_pkgbuild.build(runas, tgt, dest_dir, spec, sources, deps, env, template, saltenv='base', log_dir='/var/log/salt/pkgbuild')
```

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources,
use pbuilder to safely build the platform package
CLI Example:
```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html
https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/
- deb/python-libnacl.control
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in
/var/www/html/ on the minion
```
salt.modules.debuild_pkgbuild.make_repo(repodir, keyid=None, env=None, use_passphrase=False, gnupghome='/etc/salt/gpgkeys', runas='root', timeout=15.0)
```

Make a package repository and optionally sign it and packages present
Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and
packages present. This state is best used with onchanges linked to your package building states.
```
repodir
The directory to find packages that will be in the repository.
```
```
keyid
Changed in version 2016.3.0.
Optional Key ID to use in signing packages and repository. This consists of the last 8 hex digits of the
GPG key ID.
```
Salt Documentation, Release 3007.1

Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc. These pillar values are assumed to be filenames which are present in gnupghome. The pillar keys shown below have to match exactly.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_keyname: gpg_pkg_key.pem
```
```
gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env

Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

use_passphrase

[False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome

[/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with keyid.

runas

User to create the repository as, and optionally sign packages.

**Note:** Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout

[15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

```
salt.modules.debuild_pkgbuild.make_src_pkg(dest_dir, spec, sources, env=None, saltenv='base', runas='root')
```

Create a platform specific source package from the given platform spec/control file and sources.

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/
https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/ 
~deb/python-libnacl.control.tar.xz
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

1744 Chapter 26. Salt Module Reference
This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

dest_dir
Absolute path for directory to write source package

spec
Absolute path to spec file or equivalent

sources
Absolute path to source files to build source package from

eenv
[None] A list or dictionary of environment variables to be set prior to execution. Example:

```yaml
- env:
  - DEB_BUILD_OPTIONS: 'nocheck'
```

Warning: The above illustrates a common PyYAML pitfall, that yes, no, on, off, true, and false are all loaded as boolean True and False values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found here.

saltenv: base
Salt environment variables

runas
User to create the files and directories

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

26.6.107 salt.modules.defaults

Module to work with salt formula defaults files

```python
salt.modules.defaults.deepcopy(source)
```

Allows deep copy of objects in formulas.

By default, Python does not copy objects, it creates bindings between a target and an object.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

```python
salt.modules.defaults.get(key, default='')
```

defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying core:users:root will try to load salt://core/defaults.yaml and salt://core/defaults.json.

26.6. execution modules
salt.modules.defaults.

merge(dest, src, merge_lists=False, in_place=True, convert_none=True)

Allows deep merging of dicts in formulas.

merge_lists
[False] If True, it will also merge lists instead of replace their items.

in_place
[True] If True, it will merge into dest dict, if not it will make a new copy from that dict and return it.

convert_none
[True] If True, it will convert src and dest to empty dicts if they are None. If True and dest is None but in_place is True, raises TypeError. If False it will make a new copy from that dict and return it.

New in version 3005.

CLI Example:

```
salt '*' defaults.merge '{a: b}' '{d: e}'
```

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

salt.modules.defaults.

update(dest, defaults, merge_lists=True, in_place=True, convert_none=True)

Allows setting defaults for group of data set e.g. group for nodes.

This function is a combination of defaults.merge and defaults.deepcopy to avoid redundant in jinja.

Example:

```
group01:
defaults:
    enabled: True
extra:
    - test
    - stage
nodes:
    host01:
        index: foo
        upstream: bar
    host02:
        index: foo2
        upstream: bar2

{% do salt['defaults.update'](group01.nodes, group01.defaults) %}
```

Each node will look like the following:

```
host01:
    enabled: True
    index: foo
    upstream: bar
extra:
    - test
    - stage
```

merge_lists
[True] If True, it will also merge lists instead of replace their items.
in_place
   [True] If True, it will merge into dest dict. if not it will make a new copy from that dict and return it.

convert_none
   [True] If True, it will convert src and dest to empty dicts if they are None. If True and dest is None but
in_place is True, raises TypeError. If False it will make a new copy from that dict and return it.

New in version 3005.

It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

26.6.108 salt.modules.devinfo

Module for devinfo :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

salt.modules.devinfo.filter_(udev_in=None, udev_ex=None)
   Returns a list of devices, filtered under udev keys.

udel_in
   A dictionary of key:values that are expected in the device udev information

udel_ex
   A dictionary of key:values that are not expected in the device udev information (excluded)

The key is a lower case string, joined by dots, that represent a path in the udev information dictionary. For
example, 'e.id_bus' will represent the udev entry udev['E']["ID_BUS"]

If the udev entry is a list, the algorithm will check that at least one item match one item of the value of the
parameters.

Returns list of devices that match udev_in and do not match udev_ex.

CLI Example:

```
salt '*' devinfo.filter udev_in='"e.id_bus": "ata"'
```

salt.modules.devinfo.hwinfo(items=None, short=True, listmd=False, devices=None)
   Probe for hardware

    items
      List of hardware items to inspect. Default ['bios', 'cpu', 'disk', 'memory', 'network', 'partition']

    short
      Show only a summary. Default True.

    listmd

    devices
      List of devices to show information from. Default None.

CLI Example:

```
salt '*' devinfo.hwinfo
salt '*' devinfo.hwinfo items='"disk"' short=no
salt '*' devinfo.hwinfo items='"disk"' short=no devices='"/dev/sda"'
salt '*' devinfo.hwinfo devices=/dev/sda
```
26.6.109 salt.modules.devmap

Device-Mapper module

salt.modules.devmap.multipath_flush(device)

Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

salt.modules.devmap.multipath_list()

Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

26.6.110 salt.modules.dig

Compendium of generic DNS utilities. The ‘dig’ command line tool must be installed in order to use this module.

salt.modules.dig.A(host, nameserver=None)

Return the A record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

salt.modules.dig.AAAA(host, nameserver=None)

Return the AAAA record for host.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

salt.modules.dig.CNAME(host, nameserver=None)

Return the CNAME record for host.

New in version 3005.

CLI Example:

```
salt ns1 dig.CNAME mail.google.com
```

salt.modules.dig.MX(domain, resolve=False, nameserver=None)

Return a list of lists for the MX of domain.

If the resolve argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it’s very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don’t use the resolver here, resolve them in a separate step.

CLI Example:
salt modules.dig.NS(domain, resolve=True, nameserver=None)

Return a list of IPs of the nameservers for domain
If resolve is False, don't resolve names.
CLI Example:
salt ns1 dig.NS google.com

salt modules.dig.PTR(host, nameserver=None)

New in version 3006.0.
Return the PTR record for host.
Always returns a list.
CLI Example:
salt ns1 dig.PTR 1.2.3.4

salt modules.dig.SPF(domain, record='SPF', nameserver=None)

Return the allowed IPv4 ranges in the SPF record for domain.
If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.
CLI Example:
salt ns1 dig.SPF google.com

salt modules.dig.TXT(host, nameserver=None)

Return the TXT record for host.
Always returns a list.
CLI Example:
salt ns1 dig.TXT google.com

salt modules.dig.a(host, nameserver=None)

Return the A record for host.
Always returns a list.
CLI Example:
salt ns1 dig.A www.google.com

salt modules.dig.aaaa(host, nameserver=None)

Return the AAAA record for host.
Always returns a list.
CLI Example:
salt ns1 dig.AAAA www.google.com
salt.modules.dig.check_ip(addr)
    Check if address is a valid IP. returns True if valid, otherwise False.
    CLI Example:
    ```
salt ns1 dig.check_ip 127.0.0.1
    ```

salt.modules.dig.cname(host, nameserver=None)
    Return the CNAME record for host.
    New in version 3005.
    CLI Example:
    ```
salt ns1 dig.CNAME mail.google.com
    ```

salt.modules.dig.mx(domain, resolve=False, nameserver=None)
    Return a list of lists for the MX of domain.
    If the resolve argument is True, resolve IPs for the servers.
    It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.
    CLI Example:
    ```
salt ns1 dig.MX google.com
    ```

salt.modules.dig.ns(domain, resolve=True, nameserver=None)
    Return a list of IPs of the nameservers for domain.
    If resolve is False, don't resolve names.
    CLI Example:
    ```
salt ns1 dig.NS google.com
    ```

salt.modules.dig.ptr(host, nameserver=None)
    New in version 3006.0.
    Return the PTR record for host.
    Always returns a list.
    CLI Example:
    ```
salt ns1 dig.PTR 1.2.3.4
    ```

salt.modules.dig.spf(domain, record='SPF', nameserver=None)
    Return the allowed IPv4 ranges in the SPF record for domain.
    If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.
    CLI Example:
    ```
salt ns1 dig.SPF google.com
    ```
26.6.111 salt.modules.disk

Module for managing disks and blockdevices

salt.modules.disk.blkid(device=None, token=None)

Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

device
    Device name from the system
token
    Any valid token used for the search

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
salt '*' disk.blkid token=UUID=6a38ee5-7235-44e7-8b22-816a403bad5d
salt '*' disk.blkid token=TYPE=ext4
```

salt.modules.disk.dump(device, args=None)

Return all contents of dumpe2fs for a specified device

device
    The device path to dump.
args
    A list of attributes to return. Returns all by default.

CLI Example:

```
salt '*' disk.dump /dev/sda1
```

salt.modules.disk.format_(device, fs_type='ext4', inode_size=None, lazy_itable_init=None, fat=None, force=False)

Format a filesystem onto a device

New in version 2016.11.0.

device
    The device in which to create the new filesystem
fs_type
    The type of filesystem to create
inode_size
    Size of the inodes
    This option is only enabled for ext and xfs filesystems
lazy_itable_init
    If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.
    This option is only enabled for ext filesystems
fat
    FAT size option. Can be 12, 16 or 32, and can only be used on fat or vfat filesystems.
force

Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems.

This option is dangerous, use it with caution.

CLI Example:
```
salt '*' disk.format /dev/sdX1
```

salt.modules.disk.fstype(device)

Return the filesystem name of the specified device

New in version 2016.11.0.

device

The name of the device

CLI Example:
```
salt '*' disk.fstype /dev/sdX1
```

salt.modules.disk.get_fstype_from_path(path)

Return the filesystem type of the underlying device for a specified path.

New in version 3006.0.

path

The path for the function to evaluate.

CLI Example:
```
salt '*' disk.get_fstype_from_path /root
```

salt.modules.disk.hdparms(disks, args='aAbBeCdggHiJkMmNnQrRuW')

Retrieve disk parameters.

New in version 2016.3.0.

disks

Single disk or list of disks to query.

args

Sequence of hdparm flags to fetch.

CLI Example:
```
salt '*' disk.hdparms /dev/sda
```

salt.modules.disk.hpa(disks, size=None)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It's often used by OEMS to hide parts of a disk, and for overprovisioning SSD's

**Warning:** Setting the HPA might clobber your data, be very careful with this on active disks!
New in version 2016.3.0.

CLI Example:

```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

`salt.modules.disk.inodeusage(args=None)`

Return inode usage information for volumes mounted on this minion

**args**
Sequence of flags to pass to the `df` command.

CLI Example:

```
salt '*' disk.inodeusage
```

`salt.modules.disk.iostat(interval=1, count=5, disks=None)`

Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' disk.iostat 1 5 disks=sda
```

`salt.modules.disk.percent(args=None)`

Return partition information for volumes mounted on this minion

**args**
Specify a single partition for which to return data.

CLI Example:

```
salt '*' disk.percent /var
```

`salt.modules.disk.resize2fs(device)`

Resizes the filesystem.

CLI Example:

```
salt '*' disk.resize2fs /dev/sda1
```

`salt.modules.disk.smart_attributes(dev, attributes=None, values=None)`

Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (https://www.backblaze.com/blog/hard-drive-smart-stats/): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.smart_attributes /dev/sda
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```
salt.modules.disk.tune(device, **kwargs)
    Set attributes for the specified device
    CLI Example:
    
    salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True

    Valid options are: read-ahead, filesystem-read-ahead, read-only, read-write.
    See the blockdev(8) manpage for a more complete description of these options.

salt.modules.disk.usage(args=None)
    Return usage information for volumes mounted on this minion
    args
        Sequence of flags to pass to the df command.
    Changed in version 2019.2.0: Default for SunOS changed to 1 kilobyte blocks
    CLI Example:
    
    salt '*' disk.usage

salt.modules.disk.wipe(device)
    Remove the filesystem information
    CLI Example:
    
    salt '*' disk.wipe /dev/sda1

26.6.112 salt.modules.djangomod

Manage Django sites

salt.modules.djangomod.collectstatic(settings_module, bin_env=None, no_post_process=False, ignore=None, dry_run=False, clear=False, link=False, no_default_ignore=False, pythonpath=None, env=None, runas=None)

    Collect static files from each of your applications into a single location that can easily be served in production.
    CLI Example:
    
    salt '*' django.collectstatic <settings_module>

salt.modules.djangomod.command(settings_module, command, bin_env=None, pythonpath=None, env=None, runas=None, **args, **kwargs)

    Run arbitrary django management command
    CLI Example:
    
    salt '*' django.command <settings_module> <command>

salt.modules.djangomod.createsuperuser(settings_module, username, email, bin_env=None, database=None, pythonpath=None, env=None, runas=None)

    Create a super user for the database. This function defaults to use the --noinput flag which prevents the creation of a password for the superuser.
CLI Example:

```
salt '*' django.createsuperuser <settings_module> user user@example.com
```

```
salt.modules.djangomod.loaddata(settings_module, fixtures, bin_env=None, database=None, pythonpath=None, env=None)
```

Load fixture data

Fixtures:
comma separated list of fixtures to load

CLI Example:

```
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>
```

```
salt.modules.djangomod.migrate(settings_module, app_label=None, migration_name=None, bin_env=None, database=None, pythonpath=None, env=None, noinput=True, runas=None)
```

Run migrate

Execute the Django-Admin migrate command (requires Django 1.7 or higher).

New in version 3000.

**settings_module**

Specifies the settings module to use. The settings module should be in Python package syntax, e.g. `mysite.settings`. If this isn’t provided, django-admin will use the DJANGO_SETTINGS_MODULE environment variable.

**app_label**

Specific app to run migrations for, instead of all apps. This may involve running other apps’ migrations too, due to dependencies.

**migration_name**

Named migration to be applied to a specific app. Brings the database schema to a state where the named migration is applied, but no later migrations in the same app are applied. This may involve unapplying migrations if you have previously migrated past the named migration. Use the name zero to unapply all migrations for an app.

**bin_env**

Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

**database**

Database to migrate. Defaults to 'default'.

**pythonpath**

Adds the given filesystem path to the Python import search path. If this isn’t provided, django-admin will use the PYTHONPATH environment variable.

**env**

A list of environment variables to be set prior to execution.

Example:

```
module.run:
  - name: django.migrate
```

(continues on next page)
settings_module: my_django_app.settings

env:
  - DATABASE_USER: 'mydbuser'

noinput

Suppresses all user prompts. Defaults to True.

runas

The user name to run the command as.

CLI Example:

```
salt '*' django.migrate <settings_module>
salt '*' django.migrate <settings_module> <app_label>
salt '*' django.migrate <settings_module> <app_label> <migration_name>
```

salt.modules.djangomod.syncdb(settings_module, bin_env=None, migrate=False, database=None, pythonpath=None, env=None, noinput=True, runas=None)

Run syncdb

Execute the Django-Admin syncdb command, if South is available on the minion the migrate option can be passed as True calling the migrations to run after the syncdb completes.

NOTE: The syncdb command was deprecated in Django 1.7 and removed in Django 1.9. For Django versions 1.9 or higher use the migrate command instead.

CLI Example:

```
salt '*' django.syncdb <settings_module>
```

26.6.113 salt.modules.dnsmasq

Module for managing dnsmasq

salt.modules.dnsmasq.fullversion()

Shows installed version of dnsmasq and compile options.

CLI Example:

```
salt '*' dnsmasq.fullversion
```

salt.modules.dnsmasq.get_config(config_file='/etc/dnsmasq.conf')

Dumps all options from the config file.

config_file

The location of the config file from which to obtain contents. Defaults to /etc/dnsmasq.conf.

CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file='/etc/dnsmasq.conf'
```

salt.modules.dnsmasq.set_config(config_file='/etc/dnsmasq.conf', follow=True, **kwargs)

Sets a value or a set of values in the specified file. By default, if conf-dir is configured in this file, salt will attempt to set the option in any file inside the conf-dir where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting follow to False will turn off this behavior.
If a config option currently appears multiple times (such as dhcp-host, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the config_file.

Parameters

- **config_file** *(string)* -- config file where settings should be updated / added.
- **follow** *(bool)* -- attempt to set the config option inside any file within the conf-dir where it has already been enabled.
- **kwargs** -- key value pairs that contain the configuration settings that you want set.

CLI Examples:

```
salt '*' dnsmasq.set_config domain=mydomain.com
salt '*' dnsmasq.set_config follow=False domain=mydomain.com
salt '*' dnsmasq.set_config config_file=/etc/dnsmasq.conf domain=mydomain.com
```

**salt.modules.dnsmasq.version()**

Shows installed version of dnsmasq.

CLI Example:

```
salt '*' dnsmasq.version
```

### 26.6.114 salt.modules.dnsutil

Compendium of generic DNS utilities.

**Note:** Some functions in the dnsutil execution module depend on dig.

**salt.modules.dnsutil.A**(host, nameserver=None)

Return the A record(s) for host.

Always returns a list.

CLI Example:

```
salt ns1 dnsutil.A www.google.com
```

**salt.modules.dnsutil.AAAA**(host, nameserver=None)

Return the AAAA record(s) for host.

Always returns a list.

New in version 2014.7.5.

CLI Example:

```
salt ns1 dnsutil.AAAA www.google.com
```

**salt.modules.dnsutil.MX**(domain, resolve=False, nameserver=None)

Return a list of lists for the MX of domain.

If the 'resolve' argument is True, resolve IPs for the servers.
It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dnsutil.MX google.com
```

`salt.modules.dnsutil.NS(domain, resolve=True, nameserver=None)`

Return a list of IPs of the nameservers for domain.

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dnsutil.NS google.com
```

`salt.modules.dnsutil.SPF(domain, record='SPF', nameserver=None)`

Return the allowed IPv4 ranges in the SPF record for domain.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dnsutil.SPF google.com
```

`salt.modules.dnsutil.check_ip(ip_addr)`

Check that string `ip_addr` is a valid IP

CLI Example:

```
salt ns1 dnsutil.check_ip 127.0.0.1
```

`salt.modules.dnsutil.hosts_append(hostsfile='/etc/hosts', ip_addr=None, entries=None)`

Append a single line to the `/etc/hosts` file.

CLI Example:

```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

`salt.modules.dnsutil.hosts_remove(hostsfile='/etc/hosts', entries=None)`

Remove a host from the `/etc/hosts` file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:

```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

`salt.modules.dnsutil.parse_hosts(hostsfile='/etc/hosts', hosts=None)`

Parse `/etc/hosts` file.

CLI Example:

```
salt '*' dnsutil.parse_hosts
```
salt.modules.dnsutil.parse_zone(zonefile=None, zone=None)

Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:
```
salt nsl dnsutil.parse_zone /var/lib/named/example.com.zone
```

salt.modules.dnsutil.serial(zone='', update=False)

Return, store and update a dns serial for your zone files.

**zone**: a keyword for a specific zone

**update**: store an updated version of the serial in a grain

If `update` is False, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored.

If `update` is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:
```
salt nsl dnsutil.serial example.com
```

### 26.6.115 salt.modules.dockercompose

**Warning**: This module will be removed from Salt in version 3009 in favor of the [docker Salt Extension](https://docs.saltstack.com/en/latest/ref/modules/index.html#module-dockercompose).

Module to import docker-compose via saltstack

New in version 2016.3.0.

- **maintainer**: Jean Praloran <jeanpralo@gmail.com>
- **maturity**: new
- **depends**: docker-compose>=1.5
- **platform**: all
Introduction

This module allows one to deal with docker-compose file in a directory.

This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

Installation Prerequisites

This execution module requires at least version 1.4.0 of both docker-compose and Docker. docker-compose can easily be installed using pip install:

```
salt myminion pip.install docker-compose>1.5.0
```

How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command create, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto 'database:
    image: mongo:3.0
    command: mongod --smallfiles --quiet --logpath=/dev/null
'
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

Docker-compose method supported

- up
- restart
- stop
- start
- pause
- unpause
- kill
- rm
- ps
- pull
- build

Functions

- docker-compose.yml management
  - dockercompose.create
  - dockercompose.get

- Manage containers
  - dockercompose.restart
  - dockercompose.stop
  - dockercompose.pause
  - dockercompose.unpause
  - dockercompose.start
  - dockercompose.kill
  - dockercompose.rm
  - dockercompose.up

- Manage containers image:
  - dockercompose.pull
  - dockercompose.build

- Gather information about containers:
  - dockercompose.ps

- Manage service definitions:
  - dockercompose.service_create
  - dockercompose.service_upsert
  - dockercompose.service_remove
  - dockercompose.service_set_tag

Detailed Function Documentation

**salt.modules.dockercompose**. **build**(path, service_names=``None``)

Build image for containers in the docker-compose file, service_names is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the `build` keyword

**path**
Path where the docker-compose file is stored on the server
service_names
   If specified will pull only the image for the specified services

   CLI Example:
   ```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored
   → '[janus]'  
   ```

salt.modules.dockercompose.create(path, docker_compose)
   Create and validate a docker-compose file into a directory

   path
      Path where the docker-compose file will be stored on the server

    docker_compose
      docker_compose file

   CLI Example:
   ```
salt myminion dockercompose.create /path/where/docker-compose/stored
   → content
   ```

salt.modules.dockercompose.get(path)
   Get the content of the docker-compose file into a directory

   path
      Path where the docker-compose file is stored on the server

   CLI Example:
   ```
salt myminion dockercompose.get /path/where/docker-compose/stored
   ```

salt.modules.dockercompose.kill(path, service_names=None)
   Kill containers in the docker-compose file, service_names is a python list, if omitted kill all containers

   path
      Path where the docker-compose file is stored on the server

   service_names
      If specified will kill only the specified services

   CLI Example:
   ```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored
   → '[janus]'  
   ```

salt.modules.dockercompose.pause(path, service_names=None)
   Pause running containers in the docker-compose file, service_names is a python list, if omitted pause all containers

   path
      Path where the docker-compose file is stored on the server

   service_names
      If specified will pause only the specified services

   CLI Example:
salt.modules.dockercompose.ps(path)
List all running containers and report some information about them

path
Path where the docker-compose file is stored on the server

CLI Example:
```
salt myminion dockercompose.ps /path/where/docker-compose/stored
```

salt.modules.dockercompose.pull(path, service_names=None)
Pull image for containers in the docker-compose file, service_names is a python list, if omitted pull all images

path
Path where the docker-compose file is stored on the server

service_names
If specified will pull only the image for the specified services

CLI Example:
```
salt myminion dockercompose.pull /path/where/docker-compose/stored
```

salt.modules.dockercompose.restart(path, service_names=None)
Restart container(s) in the docker-compose file, service_names is a python list, if omitted restart all containers

path
Path where the docker-compose file is stored on the server

service_names
If specified will restart only the specified services

CLI Example:
```
salt myminion dockercompose.restart /path/where/docker-compose/stored
```

salt.modules.dockercompose.rm(path, service_names=None)
Remove stopped containers in the docker-compose file, service_names is a python list, if omitted remove all stopped containers

path
Path where the docker-compose file is stored on the server

service_names
If specified will remove only the specified stopped services

CLI Example:
```
salt myminion dockercompose.rm /path/where/docker-compose/stored
```
salt.modules.dockercompose.service_create(path, service_name, definition)

Create the definition of a docker-compose service. This fails when the service already exists. This does not pull or up the service. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces.

- **path**
  - Path where the docker-compose file is stored on the server

- **service_name**
  - Name of the service to create

- **definition**
  - Service definition as yaml or json string

**CLI Example:**
```
salt myminion dockercompose.service_create /path/where/docker-compose/ stored service_name definition
```

salt.modules.dockercompose.service_remove(path, service_name)

Remove the definition of a docker-compose service. This does not rm the container. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces.

- **path**
  - Path where the docker-compose file is stored on the server

- **service_name**
  - Name of the service to remove

**CLI Example:**
```
salt myminion dockercompose.service_remove /path/where/docker-compose/ stored service_name
```

salt.modules.dockercompose.service_set_tag(path, service_name, tag)

Change the tag of a docker-compose service. This does not pull or up the service. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces.

- **path**
  - Path where the docker-compose file is stored on the server

- **service_name**
  - Name of the service to remove

- **tag**
  - Name of the tag (often used as version) that the service image should have

**CLI Example:**
```
salt myminion dockercompose.service_set_tag /path/where/docker-compose/ stored service_name tag
```

salt.modules.dockercompose.service_upsert(path, service_name, definition)

Create or update the definition of a docker-compose service. This does not pull or up the service. This will re-write your yaml file. Comments will be lost. Indentation is set to 2 spaces.

- **path**
  - Path where the docker-compose file is stored on the server

- **service_name**
  - Name of the service to create

**CLI Example:**
```
salt myminion dockercompose.service_upsert /path/where/docker-compose/ stored service_name definition
```
**definition**

Service definition as yaml or json string

CLI Example:

```bash
salt myminion dockercompose.service_upsert /path/where/docker-compose/ → stored service_name definition
```

salt.modules.dockercompose.start(*path*, *service_names=None*)

Start containers in the docker-compose file, *service_names* is a python list, if omitted start all containers

- **path**
  
  Path where the docker-compose file is stored on the server

- **service_names**
  
  If specified will start only the specified services

CLI Example:

```bash
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored → '[janus]'
```

salt.modules.dockercompose.stop(*path*, *service_names=None*)

Stop running containers in the docker-compose file, *service_names* is a python list, if omitted stop all containers

- **path**
  
  Path where the docker-compose file is stored on the server

- **service_names**
  
  If specified will stop only the specified services

CLI Example:

```bash
salt myminion dockercompose.stop /path/where/docker-compose/stored
salt myminion dockercompose.stop /path/where/docker-compose/stored → '[janus]'
```

salt.modules.dockercompose.unpause(*path*, *service_names=None*)

Un-Pause containers in the docker-compose file, *service_names* is a python list, if omitted un-pause all containers

- **path**
  
  Path where the docker-compose file is stored on the server

- **service_names**
  
  If specified will un-pause only the specified services

CLI Example:

```bash
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored → '[janus]'
```

salt.modules.dockercompose.up(*path*, *service_names=None*)

Create and start containers defined in the docker-compose.yml file located in *path*, *service_names* is a python list, if omitted create and start all containers
path
    Path where the docker-compose file is stored on the server

service_names
    If specified will create and start only the specified services

CLI Example:

    salt myminion dockercompose.up /path/where/docker-compose/stored
    salt myminion dockercompose.up /path/where/docker-compose/stored 'janus'

26.6.116 salt.modules.dockermod

Warning: This module will be removed from Salt in version 3009 in favor of the docker Salt Extension.

Management of Docker Containers
New in version 2015.8.0.
Changed in version 2017.7.0: This module has replaced the legacy docker execution module.

depends
docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using pip.install:

    salt myminion pip.install docker

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

    salt myminion pip.uninstall docker-py
    salt myminion pip.install docker

Authentication

If you have previously performed a docker login from the minion, then the credentials saved in ~/.docker/config.json will be used for any actions which require authentication. If not, then credentials can be configured in any of the following locations:

- Minion config file
- Grains
- Pillar data
- Master config file (requires pillar_opts to be set to True in Minion config file in order to work)

Important: Versions prior to 3000 require that Docker credentials are configured in Pillar data. Be advised that Pillar data is still recommended though, because this keeps the configuration from being stored on the Minion.
Also, keep in mind that if one gets your ~/.docker/config.json, the password can be decoded from its contents.

The configuration schema is as follows:

```
docker-registries:
  <registry_url>:
    username: <username>
    password: <password>
```

For example:

```
docker-registries:
  hub:
    username: foo
    password: s3cr3t
```

**Note:** As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying hub in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. https://index.docker.io/v1/).

More than one registry can be configured. Salt will look for Docker credentials in the docker-registries Pillar key, as well as any key ending in -docker-registries. For example:

```
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
    username: foo
    password: s3cr3t
```

To login to the configured registries, use the `docker.login` function. This only needs to be done once for a given registry, and it will store/update the credentials in ~/.docker/config.json.

**Note:** For Salt releases before 2016.3.7 and 2016.11.4, `docker.login` is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.
Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the Executing Commands Within a Running Container section for more details on how this config parameter is used.

These configuration options are retrieved using `config.get` (click the link for further information).

Executing Commands Within a Running Container

**Note:** With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

Multiple methods exist for executing commands within Docker containers:

- `lxc-attach`: Default for older versions of docker
- `nsenter`: Enters container namespace to run command
- `docker-exec`: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see `config.get`) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either `nsenter` or `lxc-attach`) based on the Execution Driver value returned from `docker info`. `docker-exec` will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a USER directive was used to run as a non-privileged user, `docker-exec` would be unable to perform the action as root. Salt can still use `docker-exec` as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the `cmd` module. They are as follows:

- `docker.retcode`
- `docker.run`
- `docker.run_all`
- `docker.run_stderr`
- `docker.run_stdout`
- `docker.script`
- `docker.script_retcode`
Detailed Function Documentation

```python
class salt.modules.dockermod.DockerJSONDecoder(*, object_hook=None, parse_float=None, parse_int=None, parse_constant=None, strict=True, object_pairs_hook=None)

decode(s, _w=None)
    Return the Python representation of s (a str instance containing a JSON document).

salt.modules.dockermod.apply_(name, mods=None, **kwargs)
    New in version 2019.2.0.
    Apply states! This function will call highstate or state.sls based on the arguments passed in, apply is intended
    to be the main gateway for all state executions.
    CLI Example:
    ```
salt 'docker' docker.apply web01
salt 'docker' docker.apply web01 test
salt 'docker' docker.apply web01 test,pkgs
    ```

salt.modules.dockermod.build(path=None, repository=None, tag=None, cache=True, rm=True, api_response=False, fileobj=None, dockerfile=None, buildargs=None)
    Changed in version 2018.3.0: If the built image should be tagged, then the repository and tag must now be
    passed separately using the repository and tag arguments, rather than together in the (now deprecated)
    image argument.
    Builds a docker image from a Dockerfile or a URL
    path
        Path to directory on the Minion containing a Dockerfile
    repository
        Optional repository name for the image being built
            New in version 2018.3.0.
    tag
        [latest] Tag name for the image (required if repository is passed)
            New in version 2018.3.0.
    image
        Deprecated since version 2018.3.0: Use both repository and tag instead
    cache
        [True] Set to False to force the build process not to use the Docker image cache, and pull all required
        intermediate image layers
    rm
        [True] Remove intermediate containers created during build
    api_response
        [False] If True: an API_Response key will be present in the return data, containing the raw output
        from the Docker API.
    fileobj
        Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file path
        argument. This argument should not be used from the CLI, only from other Salt code.
```
**dockerfile**

Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

**buildargs**

A dictionary of build arguments provided to the docker build process.

**RETURN DATA**

A dictionary containing one or more of the following keys:

- **Id** - ID of the newly-built image
- **Time_Elapsed** - Time in seconds taken to perform the build
- **Intermediate_Containers** - IDs of containers created during the course of the build process
  
  *(Only present if rm=False)*

- **Images** - A dictionary containing one or more of the following keys:
  
  - **Already_Pulled** - Layers that were already present on the Minion
  - **Pulled** - Layers that were pulled

  *(Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)*

- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

  *(Only present if the image specified by the "repository" and "tag" arguments was not present on the Minion, or if cache=False)*

**CLI Example:**

```bash
salt myminion docker.build /path/to/docker/build/dir
salt myminion docker.build https://github.com/myuser/myrepo.git
  \→ repository=myimage tag=latest
salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile.
  \→ different repository=myimage tag=dev
```

**salt.modules.dockermod.call**(name, function, *args, **kwargs)

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

**name**

Container name or ID

**function**

Salt execution module function

**CLI Example:**

```bash
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2
  \→ key1=val1
```
salt.modules.dockermod.commit(name, repository, tag='latest', message=None, author=None)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Commits a container, thereby promoting it to an image. Equivalent to running the docker commit Docker CLI command.

name
    Container name or ID to commit

repository
    Repository name for the image being committed
    New in version 2018.3.0.

tag
    [latest] Tag name for the image
    New in version 2018.3.0.

image
    Deprecated since version 2018.3.0: Use both repository and tag instead

message
    Commit message (Optional)

author
    Author name (Optional)

RETURN DATA

A dictionary containing the following keys:

- **Id** - ID of the newly-created image
- **Image** - Name of the newly-created image
- **Time_Elapsed** - Time in seconds taken to perform the commit

CLI Example:

```shell
salt myminion docker.commit mycontainer myuser/myimage mytag
```

salt.modules.dockermod.compare_container(first, second, ignore=None)

This function is an alias of compare_containers.

New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from docker.compare_container to docker.compare_containers (old function name remains as an alias)

Compare two containers' Config and and HostConfig and return any differences between the two.

first
    Name or ID of first container

second
    Name or ID of second container

ignore
    A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:
salt.modules.dockermod.compare_container_networks

New in version 2018.3.0.

Returns the differences between two containers’ networks. When a network is only present one of the two containers, that network’s diff will simply be represented with \texttt{True} for the side of the diff in which the network is present) and \texttt{False} for the side of the diff in which the network is absent.

This function works by comparing the contents of both containers’ \texttt{Networks} keys (under \texttt{NetworkSettings}) in the return data from \texttt{docker.inspect_container}. Because each network contains some items that either A) only set at runtime, B) naturally varying from container to container, or both, by default the following keys in each network are examined:

- Aliases
- Links
- IPAMConfig

The exception to this is if \texttt{IPAMConfig} is unset (i.e. null) in one container but not the other. This happens when no static IP configuration is set, and automatic IP configuration is in effect. So, in order to report on changes between automatic IP configuration in one container and static IP configuration in another container (as we need to do for the \texttt{docker_container.running} state), automatic IP configuration will also be checked in these cases.

This function uses the \texttt{docker.compare_container_networks} minion config option to determine which keys to examine. This provides flexibility in the event that features added in a future Docker release necessitate changes to how Salt compares networks. In these cases, rather than waiting for a new Salt release one can just set \texttt{docker.compare_container_networks}.

Changed in version 3000: This config option can now also be set in pillar data and grains. Additionally, it can be set in the master config file, provided that \texttt{pillar_opts} is enabled on the minion.

\textbf{Note:} The checks for automatic IP configuration described above only apply if \texttt{IPAMConfig} is among the keys set for static IP checks in \texttt{docker.compare_container_networks}.

\begin{itemize}
\item \texttt{first} Name or ID of first container (old)
\item \texttt{second} Name or ID of second container (new)
\end{itemize}

CLI Example:

\begin{verbatim}
salt myminion docker.compare_container_networks foo bar
salt myminion docker.compare_container_networks foo bar ignore=Hostname
\end{verbatim}

salt.modules.dockermod.compare_containers

New in version 2017.7.0.

Changed in version 2018.3.0: Renamed from \texttt{docker.compare_container} to \texttt{docker.compare_containers} (old function name remains as an alias)

Compare two containers’ Config and and HostConfig and return any differences between the two.

\begin{itemize}
\item \texttt{first} Name or ID of first container
second
Name or ID of second container

ignore
A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

CLI Examples:
```bash
salt myminion docker.compare_containers foo bar
salt myminion docker.compare_containers foo bar ignore=Hostname
```

```
salt.modules.dockermod.compare_networks(first, second, ignore='Name,Id,Created,Containers')
```

New in version 2018.3.0.

Compare two networks and return any differences between the two

first
Name or ID of first container

second
Name or ID of second container

ignore
[Name,Id,Created,Containers] A comma-separated list (or Python list) of keys to ignore when comparing.

CLI Example:
```bash
salt myminion docker.compare_network foo bar
```

```
salt.modules.dockermod.connect_container_to_network(container, net_id, **kwargs)
```

New in version 2015.8.3.

Changed in version 2017.7.0: Support for ipv4_address argument added

Changed in version 2018.3.0: All arguments are now passed through to connect_container_to_network(), allowing for any new arguments added to this function to be supported automagically.

Connect container to network. See the connect_container_to_network() docs for information on supported arguments.

**container**
Container name or ID

**net_id**
Network name or ID

CLI Examples:
```bash
salt myminion docker.connect_container_to_network web-1 mynet
salt myminion docker.connect_container_to_network web-1 mynet ipv4_address=10.20.0.10
salt myminion docker.connect_container_to_network web-1\n  --ipv4_address=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abacc2e14f7f014f729b2bc
```

```
salt.modules.dockermod.connected(name, verbose=False)
```

New in version 2018.3.0.

Return a list of running containers attached to the specified network
name
   Network name

verbose
   [False] If True, return extended info about each container (IP configuration, etc.)

CLI Example:

```
salt myminion docker.connected net_name
```

**salt.modules.dockermod.copy_from**(name, source, dest, overwrite=False, makedirs=False)

Copy a file from inside a container to the Minion

name
   Container name

source
   Path of the file on the container’s filesystem

dest
   Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be
   copied into that directory.

overwrite
   [False] Unless this option is set to True, then if a file exists at the location specified by the dest argu-
   ment, an error will be raised.

makedirs
   [False] Create the parent directory on the container if it does not already exist.

**RETURN DATA**

A boolean (True if successful, otherwise False)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /temp
```

**salt.modules.dockermod.copy_to**(name, source, dest, exec_driver=None, overwrite=False, makedirs=False)

Copy a file from the host into a container

name
   Container name

source
   File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt
   fileserv.

dest
   Destination on the container. Must be an absolute path. If the destination is a directory, the file will be
   copied into that directory.

exec_driver
   [None] If not passed, the execution driver will be detected as described above.

overwrite
   [False] Unless this option is set to True, then if a file exists at the location specified by the dest argu-
   ment, an error will be raised.
makedirs
[False] Create the parent directory on the container if it does not already exist.

RETURN DATA
A boolean (True if successful, otherwise False)

CLI Example:
```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

```
salt.modules.dockermod.cp(name, source, dest, overwrite=False, makedirs=False)
```

This function is an alias of `copy_from`.

Copy a file from inside a container to the Minion

name
Container name

source
Path of the file on the container's filesystem

dest
Destination on the Minion. Must be an absolute path. If the destination is a directory, the file
will be copied into that directory.

overwrite
[False] Unless this option is set to True, then if a file exists at the location specified by the
dest argument, an error will be raised.

makedirs
[False] Create the parent directory on the container if it does not already exist.

RETURN DATA
A boolean (True if successful, otherwise False)

CLI Example:
```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.
  → log /home/myuser
```

```
salt.modules.dockermod.create(image, name=None, start=False, skip_translate=None,
  ignore_collisions=False, validate_ip_addrs=True, client_timeout=60,
  **kwargs)
```

Create a new container

image
Image from which to create the container

name
Name for the new container. If not provided, Docker will randomly generate one for you (it will be
 included in the return data).

start
[False] If True, start container after creating it

New in version 2018.3.0.

skip_translate
This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the
event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs
in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```
salt myminion docker.create image=centos:7.3.1611 skip_translate=True environment={"F00": "bar"}"
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

**ignore_collisions**

[False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

**validate_ip_addrs**

[True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`.

**client_timeout**

[60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

**Note:** This is only used if Salt needs to pull the requested image.

**CONTAINER CONFIGURATION ARGUMENTS**

**auto_remove (or rm)**

[False] Enable auto-removal of the container on daemon side when the container’s process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:

- `auto_remove=True`
- `rm=True`

**binds**

Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:`<container_path>` - host_path is mounted within the container as container_path with read-write access.
- `<host_path>:`<container_path>`:<seleinx_context>` - host_path is mounted within the container as container_path with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:`<container_path>`:<read_only>` - host_path is mounted within the container as container_path, with the read-only or read-write setting explicitly defined.
• `<host_path>:<container_path>:<read_only>,<selinux_context>` -
  host_path is mounted within the container as container_path, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

  `<read_only>` can be either `ro` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

  `<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

  **Note:** When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

  Binds can be expressed as a comma-separated list or a Python list, however in cases where both ro/rw and an selinux context are specified, the binds *must* be specified as a Python list.

Examples:

- binds=/srv/www:/var/www:ro
- binds=/srv/www:/var/www:rw
- binds=/srv/www:/var/www
- binds='[/srv/www:/var/www:ro,Z]'
- binds='[/srv/www:/var/www:rw,Z]'
- binds=/srv/www:/var/www:Z

  **Note:** The second and third examples above are equivalent to each other, as are the last two examples.

**blkio_weight**

Block I/O weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

**blkio_weight_device**

Block I/O weight (relative device weight), specified as a list of expressions in the format `PATH:WEIGHT`

Example: `blkio_weight_device=/dev/sda:100`

**cap_add**

List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- cap_add=SYS_ADMIN,MKNOD
- cap_add=[SYS_ADMIN, MKNOD]`

**cap_drop**

List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- cap_drop=SYS_ADMIN,MKNOD,
- cap_drop=[SYS_ADMIN, MKNOD]"
**command (or cmd)**
Command to run in the container
Example: command=bash or cmd=bash
Changed in version 2015.8.1: cmd is now also accepted

**cpuset_cpus (or cpuset)**
CPUs on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0,1).
Examples:
- cpuset_cpus="0-3"
- cpuset="0,1"

**cpuset_mems**
Memory nodes on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0,1). Only effective on NUMA systems.
Examples:
- cpuset_mems="0-3"
- cpuset_mems="0,1"

**cpu_group**
The length of a CPU period in microseconds
Example: cpu_group=100000

**cpu_period**
Microseconds of CPU time that the container can get in a CPU period
Example: cpu_period=50000

**cpu_shares**
CPU shares (relative weight), specified as an integer between 2 and 1024.
Example: cpu_shares=512

**detach**
[False] If True, run the container's command in the background (daemon mode)
Example: detach=True

**devices**
List of host devices to expose within the container
Examples:
- devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"
- devices="[/dev/net/tun', '/dev/xvda1:/dev/xvda1', '/dev/xvdb1:/dev/xvdb1:r']"

**device_read_bps**
Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb.
Examples:
- device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"
- device_read_bps="[/dev/sda:100mb', '/dev/sdb:5mb']"
**device_read_iops**
Limit read rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations.

Examples:
- `device_read_iops="/dev/sda:1000, /dev/sdb:500"
- `device_read_iops="['/dev/sda:1000', '/dev/sdb:500']"

**device_write_bps**
Limit write rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb or gb.

Examples:
- `device_write_bps="/dev/sda:100mb, /dev/sdb:50mb"
- `device_write_bps="['/dev/sda:100mb', '/dev/sdb:50mb']"

**device_write_iops**
Limit write rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations.

Examples:
- `device_write_iops="/dev/sda:1000, /dev/sdb:500"
- `device_write_iops="['/dev/sda:1000', '/dev/sdb:500']"

**dns**
List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:
- `dns=8.8.8.8, 8.8.4.4`
- `dns="['8.8.8.8', '8.8.4.4']"

**dns_opt**
Additional options to be added to the container’s resolv.conf file

Example: `dns_opt=ndots:9`

**dns_search**
List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:
- `dns_search=foo1.domain.tld, foo2.domain.tld`
- `dns_search="[foo1.domain.tld, foo2.domain.tld]"

**domainname**
The domain name to use for the container

Example: `domainname=domain.tld`

**entrypoint**
Entrypoint for the container. Either a string (e.g. "mycmd --arg1 --arg2") or a Python list (e.g. "['mycmd', '--arg1', '--arg2']")

Examples:
entrypoint="cat access.log"
entrypoint="['cat', 'access.log']"

**environment (or env)**

Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:
- `environment='VAR1=value,VAR2=value'`
- `environment="[VAR1=value, VAR2=value]"
- `environment={VAR1: 'value', VAR2: 'value'}`

**extra_hosts**

Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:
- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`
- `extra_hosts="['web1:10.9.8.7', 'web2:10.9.8.8']"
- `extra_hosts="{'web1': '10.9.8.7', 'web2': '10.9.8.8'}"`

*Note: To skip IP address validation, use validate_ip_addrs=False*

**group_add**

List of additional group names and/or IDs that the container process will run as

Examples:
- `group_add=web,network`
- `group_add="['web', 'network']"

**hostname**

Hostname of the container. If not provided, and if a name has been provided, the hostname will default to the name that was passed.

Example: `hostname=web1`

*Warning: If the container is started with network_mode=host, the hostname will be overridden by the hostname of the Minion.*

**interactive (or stdin_open): False**

Leave stdin open, even if not attached

Examples:
- `interactive=True`
- `stdin_open=True`

**ipc_mode (or ipc)**

Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:
• container:<container_name_or_id> reuses another container shared memory, semaphores and message queues
• host: use the host's shared memory, semaphores and message queues

Examples:
• ipc_mode=container:foo
• ipc=host

**Warning:** Using host gives the container full access to local shared memory and is therefore considered insecure.

**isolation**
Specifies the type of isolation technology used by containers

Example: isolation=hyperv

**Note:** The default value on Windows server is process, while the default value on Windows client is hyperv. On Linux, only default is supported.

**labels (or label)**
Add metadata to the container. Labels can be set both with and without values:

Examples:
• labels=foo,bar=baz
• labels="['foo', 'bar=baz']"

Changed in version 2018.3.0: Labels both with and without values can now be mixed. Earlier releases only permitted one method or the other.

**links**
Link this container to another. Links should be specified in the format <container_name_or_id>:<link_alias>. Multiple links can be passed, ether as a comma separated list or a Python list.

Examples:
• links=web1:link1,web2:link2,
• links="[ 'web1:link1', 'web2:link2']"
• links="{ 'web1': 'link1', 'web2': 'link2'}"

**log_driver**
Set container's logging driver. Requires Docker 1.6 or newer.

Example:
• log_driver=syslog

**Note:** The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

**log_opt**
Config options for the log_driver config option. Requires Docker 1.6 or newer.
Example:

- `log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
- `log_opt="['syslog-address=tcp://192.168.0.42', 'syslog-facility=daemon']"
- `log_opt="{"syslog-address": 'tcp://192.168.0.42', 'syslog-facility': 'daemon'}"

**lxc_conf**

Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"
- `lxc_conf="['lxc.utsname=docker', 'lxc.arch=x86_64']"
- `lxc_conf="{'lxc.utsname': 'docker', 'lxc.arch': 'x86_64'}"

**Note:** These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

**mac_address**

MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

**mem_limit (or memory)**

[0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

**mem_swappiness**

Tune a container’s memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

**memswap_limit (or memory_swap)**

[-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

Examples:

- `memswap_limit=16`
- `memory_swap=2147483648`

**network_disabled**

[False] If True, networking will be disabled within the container

Example: `network_disabled=True`

**network_mode**

[bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- **none** - No networking (equivalent of the Docker CLI argument \(--net=none\)). Not to be confused with Python's `None`.
- **container:`name_or_id`** - Reuses another container's network stack
- **host** - Use the host's network stack inside the container

**Warning**: Using `host` mode gives the container full access to the host's system's services (such as D-Bus), and is therefore considered insecure.

Examples:
- `network_mode=null`
- `network_mode=container:web1`

**oom_kill_disable**
Whether to disable OOM killer
Example: `oom_kill_disable=False`

**oom_score_adj**
An integer value containing the score given to the container in order to tune OOM killer preferences
Example: `oom_score_adj=500`

**pid_mode**
Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.
Example: `pid_mode=host`

**pids_limit**
Set the container's PID limit. Set to `-1` for unlimited.
Example: `pids_limit=2000`

**port_bindings (or publish)**
Bind exposed ports which were exposed using the `ports` argument to `docker.create`. These should be passed in the same way as the `--publish` argument to the `docker run` CLI command:
- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:
- `port_bindings="5000:5000,2123:2123/udp,8080"
- `port_bindings=["5000:5000", '2123:2123/udp', 8080]`

Port bindings can also include ranges:
- `port_bindings="14505-14506:4505-4506"
<table>
<thead>
<tr>
<th><strong>Note:</strong></th>
<th>When specifying a protocol, it must be passed in the <code>containerPort</code> value, as seen in the examples above.</th>
</tr>
</thead>
</table>

**ports**
A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:
- `ports=1111,2222/udp`
- `ports=[1111, '2222/udp']`

**privileged**
[False] If True, runs the exec process with extended privileges

Example: `privileged=True`

**publish_all_ports** (or `publish_all`)
False
Publish all ports to the host

Example: `publish_all_ports=True`

**read_only**
[False] If True, mount the container’s root filesystem as read only

Example: `read_only=True`

**restart_policy** (or `restart`)
Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

Examples:
- `restart_policy=on-failure:5`
- `restart_policy=always`

**security_opt**
Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:
- `security_opt=apparmor:unconfined,param2:value2`
- `security_opt='["apparmor:unconfined", "param2:value2"]'`

**Important:** Some security options can contain commas. In these cases, this argument must be passed as a Python list, as splitting by comma will result in an invalid configuration.

**Note:** See the documentation for `security_opt` at https://docs.docker.com/engine/reference/run/#security-configuration

**shm_size**
Size of `/dev/shm`
Example: `shm_size=128M`

**stop_signal**
The signal used to stop the container. The default is **SIGTERM**.
Example: `stop_signal=SIGRTMIN+3`

**stop_timeout**
Timeout to stop the container, in seconds
Example: `stop_timeout=5`

**storage_opt**
Storage driver options for the container
Examples:
- `storage_opt='dm.basesize=40G'`
- `storage_opt="[\'dm.basesize=40G\']"`
- `storage_opt="\{'dm.basesize': '40G'\}"`

**sysctls (or sysctl)**
Set sysctl options for the container
Examples:
- `sysctl='fs.nr_open=1048576,kernel.pid_max=32768'`
- `sysctls="[\'fs.nr_open=1048576\', \'kernel.pid_max=32768\']"`
- `sysctls="\{'fs.nr_open': '1048576', \'kernel.pid_max\': \'32768\'}"`

**tmpfs**
A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option cannot be passed as a comma-separated list.

Examples:
- `tmpfs="[/run:rw,noexec,nosuid,size=65536k\', './var/lib/mysql:rw, noexec,nosuid,size=600m']}"
- `tmpfs="\{'/run': 'rw,noexec,nosuid,size=65536k', './var/lib/mysql': 'rw,noexec,nosuid,size=600m'}"`

**tty**
[False] Attach TTYs
Example: `tty=True`

**ulimits (or ulimit)**
List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:
- `ulimits="nofile=1024:1024,nproc=60"
- `ulimits="[\'nofile=1024:1024\', \'nproc=60\']"`
**user**
User under which to run exec process
Example: `user=foo`

**userns_mode (or user_ns_mode)**
Sets the user namespace mode, when the user namespace remapping option is enabled.
Example: `userns_mode=host`

**volumes (or volume)**
List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.
Examples:
- `volumes=/mnt/vol1,/mnt/vol2`
- `volume='[/mnt/vol1', '/mnt/vol2']"`

**volumes_from**
Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.
Example: `volumes_from=foo,volumes_from=foo,bar,volumes_from='[foo, bar]'`

**volume_driver**
Sets the container's volume driver
Example: `volume_driver=foobar`

**working_dir (or workdir)**
Working directory inside the container
Examples:
- `working_dir=/var/log/nginx`
- `workdir=/var/www/myapp`

**RETURN DATA**
A dictionary containing the following keys:
- `Id` - ID of the newly-created container
- `Name` - Name of the newly-created container

**CLI Example:**
```
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"

# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True
tty=True command=bash
```

salt.modules.dockermod.create_network(name, skip_translate=None, ignore_collisions=False, validate_ip_addrs=True, client_timeout=60, **kwargs)

Changed in version 2018.3.0: Support added for network configuration options other than driver and driver_opts, as well as IPAM configuration.

Create a new network
Note: This function supports all arguments for network and IPAM pool configuration which are available for the release of docker-py installed on the minion. For that reason, the arguments described below in the NETWORK CONFIGURATION ARGUMENTS and IP ADDRESS MANAGEMENT (IPAM) sections may not accurately reflect what is available on the minion. The docker.get_client_args function can be used to check the available arguments for the installed version of docker-py (they are found in the network_config and ipam_config sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

name
Network name

skip_translate
This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt’s translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and all translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- docker-py Low-level API
- Docker Engine API

New in version 2018.3.0.

ignore_collisions
[False] Since many of docker-py’s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

New in version 2018.3.0.

validate_ip_addrs
[True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`.

Note: When validating subnets, whether or not the IP portion of the subnet is a valid subnet boundary will not be checked. The IP will portion will be validated, and the subnet size will be checked to confirm it is a valid number (1-32 for IPv4, 1-128 for IPv6).

New in version 2018.3.0.

NETWORK CONFIGURATION ARGUMENTS

driver
Network driver

Example: `driver=macvlan`
**driver_opts (or driver_opt, or options)**

Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`.

Examples:
- `driver_opts='macvlan_mode=bridge,parent=eth0'
- `driver_opts='[macvlan_mode=bridge, parent=eth0']`
- `driver_opts='{macvlan_mode: 'bridge', 'parent': 'eth0'}'

**check_duplicate**

[True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

Example: `check_duplicate=False`

**internal**

[False] If True, restricts external access to the network

Example: `internal=True`

**labels**

Add metadata to the network. Labels can be set both with and without values:

Examples (with values):
- `labels="label1=value1,label2=value2"
- `labels="[label1=value1, 'label2=value2']"
- `labels="{label1: 'value1', 'label2': 'value2'}"`

Examples (without values):
- `labels=label1,label2`
- `labels="[label1, 'label2']"

**enable_ipv6 (or ipv6)**

[False] Enable IPv6 on the network

Example: `enable_ipv6=True`

---

**Note:** While it should go without saying, this argument must be set to True to configure an IPv6 subnet. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the Docker IPv6 docs for information on how to do this.

---

**attachable**

[False] If True, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

Example: `attachable=True`

---

**Note:** While support for this option was added in API version 1.24, its value was not added to the `inpsect` results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version
1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope**
Specify the network's scope (local, global or swarm)
Example: scope=local

**ingress**
[False] If True, create an ingress network which provides the routing-mesh in swarm mode
Example: ingress=True

**IP ADDRESS MANAGEMENT (IPAM)**
This function supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the IPAM arguments as shown below, as individual arguments on the Salt CLI. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the ipam_pools argument. See the CLI Examples below. These docs also have more information on these arguments.

**IPAM ARGUMENTS**

**ipam_driver**
IPAM driver to use, if different from the default one
Example: ipam_driver=foo

**ipam_opts**
Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format varname=value.
Examples:
- ipam_opts='foo=bar,baz=qux'
- ipam_opts="['foo=bar', 'baz=quz']"
- ipam_opts="{'foo': 'bar', 'baz': 'qux'}"

**IPAM POOL ARGUMENTS**

**subnet**
Subnet in CIDR format that represents a network segment
Example: subnet=192.168.50.0/25

**iprange** (or ip_range)
Allocate container IP from a sub-range within the subnet
Subnet in CIDR format that represents a network segment
Example: iprange=192.168.50.64/26

**gateway**
IPv4 gateway for the master subnet
Example: gateway=192.168.50.1

**aux_addresses** (or aux_address)
A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format host=ipaddr.
Examples:
• aux_addresses='foo.bar.tld=192.168.50.10,hello.world.tld=192.168.50.11'
• aux_addresses=['foo.bar.tld=192.168.50.10', 'hello.world.tld=192.168.50.11']
• aux_addresses={'foo.bar.tld': '192.168.50.10', 'hello.world.tld': '192.168.50.11'}

CLI Examples:

```bash
salt myminion docker.create_network web_network driver=bridge
# IPv4
salt myminion docker.create_network macvlan_network driver=macvlan driver_opts="{'parent':'eth0'}" gateway=172.20.0.1 subnet=172.20.0.0/24
# IPv4 and IPv6
salt myminion docker.create_network mynet ipam_pools=[{"subnet": "10.0.0.0/24", "gateway": "10.0.0.1"}, {"subnet": "fe3f:2180:26:1::60/123", "gateway": "fe3f:2180:26:1::61"}]
```

```
salt.modules.dockermod.create_volume(name, driver=None, driver_opts=None)
  Create a new volume
  New in version 2015.8.4.
  name
    name of volume
driver
    Driver of the volume
driver_opts
    Options for the driver volume

CLI Example:
salt myminion docker.create_volume my_volume driver=local
```

```
salt.modules.dockermod.dangling(prune=False, force=False)
  Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:
  • Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
  • Images which were loaded using docker.load (or the docker load Docker CLI command), but not tagged.

  prune
    [False] Remove these images

  force
    [False] If True, and if prune=True, then forcibly remove these images.

RETURN DATA
  If prune=False, the return data will be a list of dangling image IDs.
  If prune=True, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:
```
• Comment - Any error encountered when trying to prune a dangling image
  
  *(Only present if prune failed)*
  
• Removed - A boolean (True if prune was successful, False if not)

CLI Example:

```bash
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

salt.modules.dockermod.depends(name)

Returns the containers and images, if any, which depend on the given image

**name**

Name or ID of image

**RETURN DATA**

A dictionary containing the following keys:

• **Containers** - A list of containers which depend on the specified image
• **Images** - A list of IDs of images which depend on the specified image

CLI Example:

```bash
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

salt.modules.dockermod.diff(name)

Get information on changes made to container's filesystem since it was created. Equivalent to running the
`docker diff` Docker CLI command.

**name**

Container name or ID

**RETURN DATA**

A dictionary containing any of the following keys:

• **Added** - A list of paths that were added.
• **Changed** - A list of paths that were changed.
• **Deleted** - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```bash
salt myminion docker.diff mycontainer
```

salt.modules.dockermod.disconnect_all_containers_from_network(network_id)

New in version 2018.3.0.

Runs `docker.disconnect_container_from_network` on all containers connected to the specified network, and returns the names of all containers that were disconnected.

**network_id**

Network name or ID

CLI Examples:
```
salt myminion docker.disconnect_all_containers_from_network mynet
-1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.disconnect_container_from_network(container, network_id)

New in version 2015.8.3.
Disconnect container from network

**container**  
Container name or ID

**network_id**  
Network name or ID

CLI Examples:
```
salt myminion docker.disconnect_container_from_network web-1 mynet
-1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.exists(name)

Check if a given container exists

**name**  
Container name or ID

**RETURN DATA**

A boolean (True if the container exists, otherwise False)

CLI Example:
```
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.export(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)

Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

**name**  
Container name or ID

**path**  
Absolute path on the Minion where the container will be exported

**overwrite**  
[False] Unless this option is set to True, then if a file exists at the location specified by the path argument, an error will be raised.

**makedirs**  
[False] If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.

**compression**  
[None] Can be set to any of the following:

- gzip or gz for gzip compression
- bzip2 or bz2 for bzip2 compression
• \texttt{xz} or \texttt{lzma} for XZ compression (requires \texttt{xz-utils}, as well as the \texttt{lzma} module from Python 3.3, available in Python 2 and Python 3.0-3.2 as \texttt{backports.lzma})

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the \texttt{path} parameter.

\textbf{push}

[False] If \texttt{True}, the container will be pushed to the master using \texttt{cp.push}.

\textbf{Note:} This requires \texttt{file_recv} to be set to \texttt{True} on the Master.

\textbf{RETURN DATA}

A dictionary will containing the following keys:

• \texttt{Path} - Path of the file that was exported
• \texttt{Push} - Reports whether or not the file was successfully pushed to the Master
  \textit{(Only present if push=True)}
• \texttt{Size} - Size of the file, in bytes
• \texttt{Size\_Human} - Size of the file, in human-readable units
• \texttt{Time\_Elapsed} - Time in seconds taken to perform the export

CLI Examples:

\begin{verbatim}
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
\end{verbatim}

salt.modules.dockermod.\texttt{freeze}(name)

This function is an alias of \texttt{pause}.

Pauses a container

\begin{verbatim}
name
\end{verbatim}

\texttt{Container name or ID}

\textbf{RETURN DATA}

A dictionary will be returned, containing the following keys:

• \texttt{status} - A dictionary showing the prior state of the container as well as the new state
• \texttt{result} - A boolean noting whether or not the action was successful
• \texttt{comment} - Only present if the container cannot be paused

CLI Example:

\begin{verbatim}
salt myminion docker.pause mycontainer
\end{verbatim}

salt.modules.dockermod.\texttt{get\_client\_args}(limit=None)

New in version 2016.3.6,2016.11.4,2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's \texttt{create_container} function.

Changed in version 2018.3.0: Added ability to limit the input to specific client functions
Many functions in Salt have been written to support the full list of arguments for a given function in the docker-py Low-level API. However, depending on the version of docker-py installed on the minion, the available arguments may differ. This function will get the arguments for various functions in the installed version of docker-py, to be used as a reference.

**limit**

An optional list of categories for which to limit the return. This is useful if only a specific set of arguments is desired, and also keeps other function’s argspecs from needlessly being examined.

**AVAILABLE LIMITS**

- **create_container** - arguments accepted by `create_container()` (used by `docker.create`)
- **host_config** - arguments accepted by `create_host_config()` (used to build the host config for `docker.create`)
- **connect_container_to_network** - arguments used by `connect_container_to_network()` to construct an endpoint config when connecting to a network (used by `docker.connect_container_to_network`)
- **create_network** - arguments accepted by `create_network()` (used by `docker.create_network`)
- **ipam_config** - arguments used to create an IPAM pool (used by `docker.create_network` in the process of constructing an IPAM config dictionary)

**CLI Example:**

```
salt myminion docker.get_client_args
salt myminion docker.get_client_args logs
salt myminion docker.get_client_args create_container,connect_container_to_network
```

**salt.modules.dockermod.highstate**

(name, saltenv='base', **kwargs)

Apply a highstate to the running container

New in version 2019.2.0.

The container does not need to have Salt installed, but Python is required.

**name**

Container name or ID

**saltenv**

[base] Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

**CLI Example:**

```
salt myminion docker.highstate compassionate_mirzakhani
```

**salt.modules.dockermod.history**

(name, quiet=False)

Return the history for an image. Equivalent to running the `docker history` Docker CLI command.

**name**

Container name or ID

**quiet**

[False] If True, the return data will simply be a list of the commands run to build the container.

```
$ salt myminion docker.history nginx:latest quiet=True
myminion:
  - FROM scratch
```

(continues on next page)
ADD

```bash
ADD \[file:ef063ed0ae9579362871b9f23d2bc0781ef7cd4de6ac822052cf6c9c5a12b1e2\] /
```

```bash
in /
```

```bash
- CMD 
  
  ```bash
  [/bin/bash]
  ```

- ln -sf /dev/stderr /var/log/nginx/error.log
- VOLUME [\[/var/cache/nginx\]]
- EXPOSE map[80/tcp:{}, 443/tcp:{}]
- CMD [nginx -g daemon off;]
```

```
https://github.com/saltstack/salt/pull/22421
```

RETURN DATA

If quiet=False, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- **Command** - The command executed in this build step
- **Id** - Layer ID
- **Size** - Cumulative image size, in bytes
- **Size_Human** - Cumulative image size, in human-readable units
- **Tags** - Tag(s) assigned to this layer
- **Time_Created_Epoch** - Time this build step was completed (Epoch time)
- **Time_Created_Local** - Time this build step was completed (Minion’s local timezone)

CLI Example:

```bash
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.images(verbosе=False, **kwargs)

Returns information about the Docker images on the Minion. Equivalent to running the docker images Docker CLI command.

```bash
all
```

[False] If True, untagged images will also be returned

```bash
verbose
```

[False] If True, a docker inspect will be run on each image returned.

RETURN DATA

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:
salt.modules.dockermod.import_(source, repository, tag='latest', api_response=False)

Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Imports content from a local tarball or a URL as a new docker image

source
Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileserver (i.e. salt:/path/to/rootfs/tarball.tar.xz. To import a file from a saltenv other than base (e.g. dev), pass it at the end of the URL (ex. salt://path/to/rootfs/tarball.tar.xz?saltenv=dev).

repository
Repository name for the image being imported

New in version 2018.3.0.

tag
[latest] Tag name for the image

New in version 2018.3.0.

image
Deprecated since version 2018.3.0: Use both repository and tag instead

api_response
[False] If True an api_response key will be present in the return data, containing the raw output from the Docker API.

RETURN DATA
A dictionary containing the following keys:

- Id - ID of the newly-created image
- Image - Name of the newly-created image
- Time_Elapsed - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/centos:7
```

salt.modules.dockermod.info()

Returns a dictionary of system-wide information. Equivalent to running the docker info Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

salt.modules.dockermod.inspect(name)

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:
- `docker.inspect_container`
- `docker.inspect_image`
- `docker.inspect_volume`
- `docker.inspect_network`

The first of these to find a match will be returned.

**name**

Container/image/volume/network name or ID

**RETURN DATA**

A dictionary of container/image/volume/network information

**CLI Example:**

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

`salt.modules.dockermod.inspect_container(name)`

Retrieves container information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for container information.

**name**

Container name or ID

**RETURN DATA**

A dictionary of container information

**CLI Example:**

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

`salt.modules.dockermod.inspect_image(name)`

Retrieves image information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for image information.

**Note:** To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

**name**

Image name or ID

**RETURN DATA**

A dictionary of image information

**CLI Examples:**

```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```
salt.modules.dockermod.inspect_network(network_id)
Inspect Network

- network_id
  ID of network

CLI Example:
```
salt myminion docker.inspect_network
  -1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.inspect_volume(name)
Inspect Volume

- name
  Name of volume

New in version 2015.8.4.

CLI Example:
```
salt myminion docker.inspect_volume my_volume
```

salt.modules.dockermod.kill(name)
Kill all processes in a running container instead of performing a graceful shutdown

- name
  Container name or ID

RETURN DATA
A dictionary will be returned, containing the following keys:

- status - A dictionary showing the prior state of the container as well as the new state
- result - A boolean noting whether or not the action was successful
- comment - Only present if the container cannot be killed

CLI Example:
```
salt myminion docker.kill mycontainer
```

salt.modules.dockermod.layers(name)
Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.

- name
  Image name or ID

CLI Example:
```
salt myminion docker.layers centos:7
```

salt.modules.dockermod.list_containers(**kwargs)
Returns a list of containers by name. This is different from docker.ps in that docker.ps returns its results organized by container ID.

- all
  [False] If True, stopped containers will be included in return data

CLI Example:
salt.myminion.docker.list_containers

salt.modules.dockermod.list_tags()
Returns a list of tagged images

CLI Example:
salt myminion docker.list_tags

salt.modules.dockermod.load(path, repository=None, tag=None)
Changed in version 2018.3.0: If the loaded image should be tagged, then the repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

Load a tar archive that was created using docker.save (or via the Docker CLI using docker save).

path
Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. salt://path/to/docker/saved/image.tar). To load a file from a saltenv other than base (e.g. dev), pass it at the end of the URL (ex. salt://path/to/rootfs/tarball.tar.xz?saltenv=dev).

repository
If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo using docker.tag. If a repository name is provided, then the tag argument is also required.

New in version 2018.3.0.

tag
Tag name to go along with the repository name, if the loaded image is to be tagged.

New in version 2018.3.0.

image
Deprecated since version 2018.3.0: Use both repository and tag instead

RETURN DATA
A dictionary will be returned, containing the following keys:

• Path - Path of the file that was saved
• Layers - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
• Image - Name of tag applied to topmost layer
  (Only present if tag was specified and tagging was successful)
• Time_Elapsed - Time in seconds taken to load the file
• Warning - Message describing any problems encountered in attempt to tag the topmost layer
  (Only present if tag was specified and tagging failed)

CLI Example:
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar
  → repository=myuser/myimage tag=mytag
salt.modules.dockermod.login(*registries)

New in version 2016.3.7,2016.11.4,2017.7.0.

Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to just those registries. If no registry URLs are provided, Salt will attempt to login to all configured registries.

**RETURN DATA**

A dictionary containing the following keys:

- **Results** - A dictionary mapping registry URLs to the authentication result. `True` means a successful login, `False` means a failed login.
- **Errors** - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.login
salt myminion docker.login hub
salt myminion docker.login hub https://mydomain.tld/registry/
```

salt.modules.dockermod.logout(*registries)

New in version 3001.

Performs a `docker logout` to remove the saved authentication details for one or more configured repositories.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to logout of just those registries. If no registry URLs are provided, Salt will attempt to logout of all configured registries.

**RETURN DATA**

A dictionary containing the following keys:

- **Results** - A dictionary mapping registry URLs to the authentication result. `True` means a successful logout, `False` means a failed logout.
- **Errors** - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.logout
salt myminion docker.logout hub
salt myminion docker.logout hub https://mydomain.tld/registry/
```

salt.modules.dockermod.logs(name, **kwargs)

Changed in version 2018.3.0: Support for all of docker-py's `logs()` function's arguments, with the exception of `stream`.

Returns the logs for the container. An interface to docker-py's `logs()` function.

**name**

Container name or ID

**stdout**

[True] Return stdout lines

**stderr**

[True] Return stderr lines
timestamps
  [False] Show timestamps

tail
  [all] Output specified number of lines at the end of logs. Either an integer number of lines or the string all.

since
  Show logs since the specified time, passed as a UNIX epoch timestamp. Optionally, if timelib is installed on the minion the timestamp can be passed as a string which will be resolved to a date using timelib.strtodatetime().

follow
  [False] If True, this function will block until the container exits and return the logs when it does. The default behavior is to return what is in the log at the time this function is executed.

CLI Examples:

```
# All logs
salt myminion docker.logs mycontainer
# Last 100 lines of log
salt myminion docker.logs mycontainer tail=100
# Just stderr
salt myminion docker.logs mycontainer stdout=False
# Logs since a specific UNIX timestamp
salt myminion docker.logs mycontainer since=1511688459
# Flexible format for "since" argument (requires timelib)
salt myminion docker.logs mycontainer since='1 hour ago'
salt myminion docker.logs mycontainer since='1 week ago'
salt myminion docker.logs mycontainer since='1 fortnight ago'
```

salt.modules.dockermod.networks(names=None, ids=None)

Changed in version 2017.7.0: The names and ids can be passed as a comma-separated list now, as well as a Python list.

Changed in version 2018.3.0: The Containers key for each network is no longer always empty.

List existing networks

names
  Filter by name

ids
  Filter by id

CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.pause(name)

Pauses a container

name
  Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:
- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be paused

**CLI Example:**

```bash
salt myminion docker.pause mycontainer
```

```python
salt.modules.dockermod.pid(name)
```

Returns the PID of a container

**name**

Container name or ID

**CLI Example:**

```bash
salt myminion docker.pid mycontainer
salt myminion docker.pid 0123456789ab
```

```python
salt.modules.dockermod.port(name, private_port=None)
```

Returns port mapping information for a given container. Equivalent to running the `docker port` Docker CLI command.

**name**

Container name or ID

*Changed in version 2019.2.0:* This value can now be a pattern expression (using the pattern-matching characters defined in `fnmatch`). If a pattern expression is used, this function will return a dictionary mapping container names which match the pattern to the mappings for those containers. When no pattern expression is used, a dictionary of the mappings for the specified container name will be returned.

**private_port**

[None] If specified, get information for that specific port. Can be specified either as a port number (i.e. 5000), or as a port number plus the protocol (i.e. 5000/udp).

If this argument is omitted, all port mappings will be returned.

**RETURN DATA**

A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

**CLI Examples:**

```bash
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
salt myminion docker.port mycontainer 5000/udp
```

```python
salt.modules.dockermod.prune(containers=False, networks=False, images=False, build=False, volumes=False, system=None, **filters)
```

New in version 2019.2.0.

Prune Docker's various subsystems

**Note:** This requires docker-py version 2.1.0 or later.

**containers**

[False] If True, prunes stopped containers (documentation)
images
  [False] If True, prunes unused images (documentation)

networks
  [False] If False, prunes unreferenced networks (documentation)

build
  [False] If True, clears the builder cache

Note: Only supported in Docker 17.07.x and newer. Additionally, filters do not apply to this argument.

volumes
  [False] If True, prunes unreferenced volumes (documentation)

system
  If True, prunes containers, images, networks, and builder cache. Assumed to be True if none of containers, images, networks, or build are set to True.

Note: volumes=True must still be used to prune volumes

filters

  • dangling=True (images only) - remove only dangling images
  • until=<timestamp> - only remove objects created before given timestamp. Not applicable to volumes. See the documentation links above for examples of valid time expressions.
  • label - only remove objects matching the label expression. Valid expressions include labelname or labelname=value.

CLI Examples:

```bash
salt myminion docker.prune system=True
salt myminion docker.prune system=True until=12h
salt myminion docker.prune images=True dangling=True
salt myminion docker.prune images=True label=foo,bar=baz
```

salt.modules.dockermod.ps_(filters=None, **kwargs)
Returns information about the Docker containers on the Minion. Equivalent to running the docker ps Docker CLI command.

all
  [False] If True, stopped containers will also be returned

host: False
  If True, local host's network topology will be included

verbose
  [False] If True, a docker inspect will be run on each container returned.

filters: None
  A dictionary of filters to be processed on the container list. Available filters:
  • exited (int): Only containers with specified exit code
  • status (str): One of restarting, running, paused, exited
  • label (str): format either "key" or "key=value"

26.6. execution modules
RETURN DATA
A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```python
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{'label': 'role=web'}"
```

```python
salt.modules.dockermod.pull(image, insecure_registry=False, api_response=False, client_timeout=60)
```

Changed in version 2018.3.0: If no tag is specified in the `image` argument, all tags for the image will be pulled. For this reason it is recommended to pass `image` using the `repo:tag` notation.

Pulls an image from a Docker registry

- **image**
  - Image to be pulled

- **insecure_registry**
  - [False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

- **api_response**
  - [False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

  **Note:** This may result in a lot of additional return data, especially for larger images.

- **client_timeout**
  - Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA
A dictionary will be returned, containing the following keys:

- **Layers** - A dictionary containing one or more of the following keys:
  - **Already_Pulled** - Layers that that were already present on the Minion
  - **Pulled** - Layers that that were pulled

- **Status** - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

- **Time_Elapsed** - Time in seconds taken to perform the pull

CLI Example:

```python
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

```python
salt.modules.dockermod.push(image, insecure_registry=False, api_response=False, client_timeout=60)
```

Changed in version 2015.8.4: The Id and Image keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.
image
Image to be pushed. If just the repository name is passed, then all tagged images for the specified repo will be pushed. If the image name is passed in repo:tag notation, only the specified image will be pushed.

insecure_registry
[False] If True, the Docker client will permit the use of insecure (non-HTTPS) registries.

api_response
[False] If True, an API_Response key will be present in the return data, containing the raw output from the Docker API.

client_timeout
Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA
A dictionary will be returned, containing the following keys:

- Layers - A dictionary containing one or more of the following keys:
  - Already_Pushed - Layers that that were already present on the Minion
  - Pushed - Layers that that were pushed
- Time_Elapsed - Time in seconds taken to perform the push

CLI Example:
```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

call modules.dockermod.remove_network(network_id)
Remove a network

network_id
  Network name or ID

CLI Examples:
```
salt myminion docker.remove_network mynet
salt myminion docker.remove_network
  1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

call modules.dockermod.remove_volume(name)
Remove a volume

New in version 2015.8.4.

name
  Name of volume

CLI Example:
```
salt myminion docker.remove_volume my_volume
```

call modules.dockermod.rename(name, new_name)
New in version 2017.7.0.

Renames a container. Returns True if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then False will be returned.
name
   Name or ID of existing container

ew_name
   New name to assign to container

CLI Example:

```
salt myminion docker.rename foo bar
```

salt.modules.dockermod.resolve_image_id(name)

New in version 2018.3.0.

Given an image name (or partial image ID), return the full image ID. If no match is found among the locally-pulled images, then False will be returned.

CLI Examples:

```
salt myminion docker.resolve_image_id foo
salt myminion docker.resolve_image_id foo:bar
salt myminion docker.resolve_image_id 36540f359ca3
```

salt.modules.dockermod.resolve_tag(name, **kwargs)

New in version 2017.7.2.

Changed in version 2018.3.0: Instead of matching against pulled tags using `docker.list_tags`, this function now simply inspects the passed image name using `docker.inspect_image` and returns the first matching tag. If no matching tags are found, it is assumed that the passed image is an untagged image ID, and the full ID is returned.

Inspects the specified image name and returns the first matching tag in the inspect results. If the specified image is not pulled locally, this function will return False.

name
   Image name to resolve. If the image is found but there are no tags, this means that the image name passed was an untagged image. In this case the image ID will be returned.

all
   [False] If True, a list of all matching tags will be returned. If the image is found but there are no tags, then a list will still be returned, but it will simply contain the image ID.

New in version 2018.3.0.

tags
   Deprecated since version 2018.3.0.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag centos:7 all=True
salt myminion docker.resolve_tag c9f378ac27d9
```

salt.modules.dockermod.restart(name, timeout=10)

Restarts a container

name
   Container name or ID

timeout
   [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)
RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **restarted** - If restart was successful, this key will be present and will be set to True.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

```
salt.modules.dockermod.retcode(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run `cmd.retcode` within a container

- **name**
  Container name or ID in which to run the command

- **cmd**
  Command to run

- **exec_driver**
  [None] If not passed, the execution driver will be detected as described above.

- **stdin**
  [None] Standard input to be used for the command

- **output_loglevel**
  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

- **use_vt**
  [False] Use SaltStack’s utils.vt to stream output to console.

- **keep_env**
  [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.rm_(name, force=False, volumes=False, **kwargs)
```

Removes a container

- **name**
  Container name or ID

- **force**
  [False] If True, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.

- **stop**
  [False] If True, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to False by default to prevent accidental removal of a running container.
New in version 2017.7.0.

**timeout**
Optional timeout to be passed to `docker.stop` if stopping the container.

New in version 2018.3.0.

**volumes**
[False] Also remove volumes associated with container

**RETURN DATA**
A list of the IDs of containers which were removed

**CLI Example:**
```bash
column
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

**salt.modules.dockermod.rmi(**`names`, **`**kwargs**`)**
Removes an image

**name**
Name (in repo:tag notation) or ID of image.

**force**
[False] If True, the image will be removed even if the Minion has containers created from that image

**prune**
[True] If True, untagged parent image layers will be removed as well, set this to False to keep them.

**RETURN DATA**
A dictionary will be returned, containing the following two keys:
- **Layers** - A list of the IDs of image layers that were removed
- **Tags** - A list of the tags that were removed
- **Errors** - A list of any errors that were encountered

**CLI Examples:**
```bash
column
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

**salt.modules.dockermod.run**(``name``, **cmd**, **exec_driver=None**, **stdin=None**, **python_shell=True**, **output_loglevel=’debug’**, **use_vt=False**, **ignore_retcode=False**, **keep_env=None**)  
Run `cmd.run` within a container

**name**
Container name or ID in which to run the command

**cmd**
Command to run

**exec_driver**
[None] If not passed, the execution driver will be detected as described above.

**stdin**
[None] Standard input to be used for the command
output_loglevel
   [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
   [False] Use SaltStack’s utils.vt to stream output to console.

keep_env
   [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment
variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of
environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

salt.modules.dockermod.run_all(name, cmd, exec_driver=None, stdin=None, python_shell=True,
    output_loglevel='debug', use_vt=False, ignore_retcode=False,
    keep_env=None)

Run cmd.run_all within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in
the return dict is from the host, not from the container.

name
   Container name or ID in which to run the command

cmd
   Command to run

exec_driver
   [None] If not passed, the execution driver will be detected as described above.

stdin
   [None] Standard input to be used for the command

output_loglevel
   [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
   [False] Use SaltStack’s utils.vt to stream output to console.

keep_env
   [None] If not passed, only a sane default PATH environment variable will be set. If True, all environment
variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of
environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

salt.modules.dockermod.run_container(image, name=None, skip_translate=None,
    ignore_collisions=False, validate_ip_addrs=True,
    client_timeout=60, bg=False, replace=False, force=False,
    networks=None, **kwargs)

New in version 2018.3.0.
Equivalent to `docker run` on the Docker CLI. Runs the container, waits for it to exit, and returns the container’s logs when complete.

**Note:** Not to be confused with `docker.run`, which provides a `cmd.run`-like interface for executing commands in a running container.

This function accepts the same arguments as `docker.create`, with the exception of `start`. In addition, it accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned. Finally, the `bg` argument described below can be used to optionally run the container in the background (the default behavior is to block until the container exits).

`bg`

[False] If True, this function will not wait for the container to exit and will not return its logs. It will however return the container’s name and ID, allowing for `docker.logs` to be used to view the logs.

**Note:** The logs will be inaccessible once the container exits if `auto_remove` is set to True, so keep this in mind.

`replace`

[False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

`force`

[False] If True, and the named container already exists, and `replace` is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a False result.

`networks`

Networks to which the container should be connected. If automatic IP configuration is being used, the networks can be a simple list of network names. If custom IP configuration is being used, then this argument must be passed as a dictionary.

CLI Examples:

```bash
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/→myscript.sh
# Run container in the background
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/→myscript.sh bg=True
# Connecting to two networks using automatic IP configuration
salt myminion docker.run_container myuser/myimage command='perl /scripts/→sync.py' networks=net1,net2
# net1 using automatic IP, net2 using static IPv4 address
salt myminion docker.run_container myuser/myimage command='perl /scripts/→sync.py' networks='{"net1": {}, "net2": {ipv4_address: "192.168.27.12 →"}}'
```

salt.modules.dockermod.run_stderr(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)

Run `cmd.run_stderr` within a container

```bash
name

Container name or ID in which to run the command
```
cmd
Command to run

exec_driver
[None] If not passed, the execution driver will be detected as described above.

stdin
[None] Standard input to be used for the command

output_loglevel
[debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
[False] Use SaltStack’s utils.vt to stream output to console.

keep_env
[None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.run_stdout(name, cmd, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, ignore_retcode=False, keep_env=None)
```

Run cmd.run_stdout within a container

name
Container name or ID in which to run the command

cmd
Command to run

exec_driver
[None] If not passed, the execution driver will be detected as described above.

stdin
[None] Standard input to be used for the command

output_loglevel
[debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
[False] Use SaltStack’s utils.vt to stream output to console.

keep_env
[None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container’s host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

```
salt.modules.dockermod.save(name, path, overwrite=False, makedirs=False, compression=None, **kwargs)
```

Saves an image and to a file on the minion. Equivalent to running the docker save Docker CLI command, but unlike docker save this will also work on named images instead of just images IDs.

26.6. execution modules
name
   Name or ID of image. Specify a specific tag by using the repo:tag notation.

path
   Absolute path on the Minion where the image will be exported

overwrite
   [False] Unless this option is set to True, then if the destination file exists an error will be raised.

makedirs
   [False] If True, then if the parent directory of the file specified by the path argument does not exist, Salt will attempt to create it.

compression
   [None] Can be set to any of the following:
   - gzip or gz for gzip compression
   - bzip2 or bz2 for bzip2 compression
   - xz or lzma for XZ compression (requires xz-utils, as well as the lzma module from Python 3.3, available in Python 2 and Python 3.0-3.2 as backports.lzma)

   This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the path parameter.

   Note: Since the Docker API does not support docker save, compression will be a bit slower with this function than with docker.export since the image(s) will first be saved and then the compression done afterwards.

push
   [False] If True, the container will be pushed to the master using cp.push.

   Note: This requires file_recv to be set to True on the Master.

RETURN DATA
A dictionary will be returned, containing the following keys:
- Path - Path of the file that was saved
- Push - Reports whether or not the file was successfully pushed to the Master
  (Only present if push=True)
- Size - Size of the file, in bytes
- Size_Human - Size of the file, in human-readable units
- Time_Elapsed - Time in seconds taken to perform the save

CLI Examples:

salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar

salt.modules.dockermod.script(name, source, saltenv='base', args=None, template=None, exec_driver=None, stdin=None, python_shell=True, output_loglevel='debug', ignore_retcode=False, use_vt=False, keep_env=None)
Run `cmd.script` within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

- **name**
  Container name or ID

- **source**
  Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

- **args**
  A string containing additional command-line options to pass to the script.

- **template**
  [None] Templating engine to use on the script before running.

- **exec_driver**
  [None] If not passed, the execution driver will be detected as described *above*.

- **stdin**
  [None] Standard input to be used for the script

- **output_loglevel**
  [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

- **use_vt**
  [False] Use SaltStack's `utils.vt` to stream output to console.

- **keep_env**
  [None] If not passed, only a sane default `PATH` environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

**CLI Example:**

```bash
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
```

```bash
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin=
"one\ntwo\nthree\nfour\nfive\n! output_loglevel=quiet
```

**salt.modules.dockermod.script_retcode**

```python
cmd.script_retcode(name, source, saltenv='base', args=None, template=None,
exec_driver=None, stdin=None, python_shell=True,
output_loglevel='debug', ignore_retcode=False, use_vt=False,
keep_env=None)
```

Run `cmd.script_retcode` within a container

- **name**
  Container name or ID

- **source**
  Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

- **args**
  A string containing additional command-line options to pass to the script.
template
[None] Templating engine to use on the script before running.

exec_driver
[None] If not passed, the execution driver will be detected as described above.

stdin
[None] Standard input to be used for the script

output_loglevel
[debug] Level at which to log the output from the script. Set to quiet to suppress logging.

use_vt
[False] Use SaltStack’s utils.vt to stream output to console.

keep_env
[None] If not passed, only a sane default PATH environment variable will be set. If True, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```salt
salt myminion docker.script_retcode mycontainer salt://docker_script.py
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh
ściarg1 arg2 "arg 3"
⟩
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh
ściarg1 arg2 "arg 3"
⟩
stdin='one	two
three
four
five
' output_loglevel=quiet
```

salt.modules.dockermod.search(name, official=False, trusted=False)

Searches the registry for an image

name
Search keyword

official
[False] Limit results to official builds

trusted
[False] Limit results to trusted builds

RETURN DATA

A dictionary with each key being the name of an image, and the following information for each image:

- Description - Image description
- Official - A boolean (True if an official build, False if not)
- Stars - Number of stars the image has on the registry
- Trusted - A boolean (True if a trusted build, False if not)

CLI Example:

```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

salt.modules.dockermod.signal_(name, signal)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the Standard Signals section of the signal(7) manpage. Run man 7 signal on a Linux host to browse this manpage.
name
  Container name or ID

signal
  Signal to send to container

RETURN DATA
  If the signal was successfully sent, True will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

salt.modules.dockermod.sls(name, mods=None, **kwargs)
  Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

name
  Container name or ID

mods
  [None] A string containing comma-separated list of SLS with defined states to apply to the container.

saltenv
  [base] Specify the environment from which to retrieve the SLS indicated by the mods parameter.

pillarenv
  Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.

  New in version 2018.3.0.

pillar
  Custom Pillar values, passed as a dictionary of key-value pairs

  Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.

  New in version 2018.3.0.

CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

salt.modules.dockermod.sls_build(repository, tag='latest', base='opensuse/python', mods=None, dryrun=False, **kwargs)
  Changed in version 2018.3.0: The repository and tag must now be passed separately using the repository and tag arguments, rather than together in the (now deprecated) image argument.

  Build a Docker image using the specified SLS modules on top of base image

  New in version 2016.11.0.

  The base image does not need to have Salt installed, but Python is required.
repository
    Repository name for the image to be built
    New in version 2018.3.0.

tag
    [latest] Tag name for the image to be built
    New in version 2018.3.0.

name
    Deprecated since version 2018.3.0: Use both repository and tag instead

base
    [opensuse/python] Name or ID of the base image

mods
    A string containing comma-separated list of SLS with defined states to apply to the base image.

saltenv
    [base] Specify the environment from which to retrieve the SLS indicated by the mods parameter.

pillarenv
    Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the pillarenv option. When neither the pillarenv minion config option nor this CLI argument is used, all Pillar environments will be merged together.
    New in version 2018.3.0.

pillar
    Custom Pillar values, passed as a dictionary of key-value pairs

    Note: Values passed this way will override Pillar values set via pillar_roots or an external Pillar source.
    New in version 2018.3.0.

dryrun: False
    when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.

RETURN DATA
    A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

    CLI Example:

    salt myminion docker.sls_build imgname base=mybase mods=rails,web

    salt.modules.dockermod.start_(name)
    Start a container

    name
        Container name or ID

RETURN DATA
    A dictionary will be returned, containing the following keys:

        • status - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be started

CLI Example:

```
salt myminion docker.start mycontainer
```

**salt.modules.dockermod.state(name)**

Returns the state of the container

**name**

Container name or ID

**RETURN DATA**

A string representing the current state of the container (either **running**, **paused**, or **stopped**)

CLI Example:

```
salt myminion docker.state mycontainer
```

**salt.modules.dockermod.stop(name, timeout=None, **kwargs)**

Stops a running container

**name**

Container name or ID

**unpause**

[False] If **True** and the container is paused, it will be unpaused before attempting to stop the container.

**timeout**

Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container's configuration will be checked. If the container was created using the **stop_timeout** argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be stopped

CLI Examples:

```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

**salt.modules.dockermod.tag_(name, repository, tag='latest', force=False)**

Changed in version 2018.3.0: The repository and tag must now be passed separately using the **repository** and **tag** arguments, rather than together in the (now deprecated) **image** argument.

Tag an image into a repository and return **True**. If the tag was unsuccessful, an error will be raised.

**name**

ID of image
repository
    Repository name for the image to be built
    New in version 2018.3.0.

tag
    [latest] Tag name for the image to be built
    New in version 2018.3.0.

image
    Deprecated since version 2018.3.0: Use both repository and tag instead

force
    [False] Force apply tag

CLI Example:

```
salt myminion docker.tag 0123456789ab myrepo/mycontainer mytag
```

salt.modules.dockermmod.top(name)

Runs the docker top command on a specific container

name
    Container name or ID

CLI Example:

```
salt myminion docker.top mycontainer
```

RETURN DATA

A list of dictionaries containing information about each process

```
salt myminion docker.top 0123456789ab
```

salt.modules.dockermmod.unfreeze(name)

This function is an alias of unpause.

Unpauses a container

name
    Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container cannot be unpaused

CLI Example:

```
salt myminion docker.pause mycontainer
```

salt.modules.dockermmod.unpause(name)

Unpauses a container

name
    Container name or ID
**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **comment** - Only present if the container can not be unpaused

CLI Example:

```bash
salt myminion docker.pause mycontainer
```

**salt.modules.dockermod.version()**

Returns a dictionary of Docker version information. Equivalent to running the `docker version` Docker CLI command.

CLI Example:

```bash
salt myminion docker.version
```

**salt.modules.dockermod.volumes(filters=None)**

List existing volumes

New in version 2015.8.4.

- **filters**
  
  There is one available filter: `dangling=true`

CLI Example:

```bash
salt myminion docker.volumes filters="{"dangling": True}"
```

**salt.modules.dockermod.wait(name, ignore_already_stopped=False, fail_on_exit_status=False)**

Wait for the container to exit gracefully, and return its exit code

**Note:** This function will block until the container is stopped.

- **name**
  
  Container name or ID

- **ignore_already_stopped**
  
  Boolean flag that prevents execution to fail, if a container is already stopped.

- **fail_on_exit_status**
  
  Boolean flag to report execution as failure if `exit_status` is different than 0.

**RETURN DATA**

A dictionary will be returned, containing the following keys:

- **status** - A dictionary showing the prior state of the container as well as the new state
- **result** - A boolean noting whether or not the action was successful
- **exit_status** - Exit status for the container
- **comment** - Only present if the container is already stopped

CLI Example:
26.6.117 salt.modules.dpkg_lowpkg

Support for DEB packages

salt.modules.dpkg_lowpkg.bin_pkg_info(path, saltenv='base')
New in version 2015.8.0.

Parses DEB metadata and returns a dictionary of information about the package (name, version, etc.).

path
Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. salt://path/to/file.deb). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv
[base] Salt fileserver environment from which to retrieve the package. Ignored if path is a local file path on the minion.

CLI Example:
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb

salt.modules.dpkg_lowpkg.file_dict(*packages, **kwargs)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '*' lowpkg.file_dict hostname
salt '*' lowpkg.file_dict hostname mount
salt '*' lowpkg.file_dict

salt.modules.dpkg_lowpkg.file_list(*packages, **kwargs)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:
salt '*' lowpkg.file_list hostname
salt '*' lowpkg.file_list hostname mount
salt '*' lowpkg.file_list

salt.modules.dpkg_lowpkg.info(*packages, **kwargs)
Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

packages
The names of the packages for which to return information.

failhard
Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.
CLI Example:

```bash
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

```
salt.modules.dpkg_lowpkg.list_pkgs('packages', **kwargs)
```

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

Virtual package resolution requires aptitude. Because this function uses dpkg, virtual packages will be reported as not installed.

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs hostname
salt '*' lowpkg.list_pkgs hostname mount
```

```
salt.modules.dpkg_lowpkg.unpurge('packages')
```

Change package selection for each package specified to 'install'

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

26.6.118 salt.modules.drac

Manage Dell DRAC

```
salt.modules.drac.change_password(username, password, uid=None)
```

Change users password

CLI Example:

```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

```
salt.modules.drac.create_user(username, password, permissions, users=None)
```

Create user accounts

CLI Example:

```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
• clear_logs : Clear Logs
  • server_control_commands : Execute Server Control Commands
  • console_redirection : Access Console Redirection
  • virtual_media : Access Virtual Media
  • test_alerts : Test Alerts
  • debug_commands : Execute Debug Commands

salt.modules.drac.delete_user(username, uid=None)

Delete a user

    CLI Example:
    salt dell drac.delete_user [USERNAME] [UID - optional]
    salt dell drac.delete_user diana 4

salt.modules.drac.email_alerts(action)

Enable/Disable email alerts

    CLI Example:
    salt dell drac.email_alerts True
    salt dell drac.email_alerts False

salt.modules.drac.list_users()

List all DRAC users

    CLI Example:
    salt dell drac.list_users

salt.modules.drac.nameservers("ns")

Configure the nameservers on the DRAC

    CLI Example:
    salt dell drac.nameservers [NAMESERVERS]
    salt dell drac.nameservers ns1.example.com ns2.example.com

salt.modules.drac.network_info()

Return Network Configuration

    CLI Example:
    salt dell drac.network_info

salt.modules.drac.server_hardreset()

Performs a reset (reboot) operation on the managed server.

    CLI Example:
    salt dell drac.server_hardreset
salt.modules.drac.server_poweroff()

Powers down the managed server.

CLI Example:

```
salt dell drac.server_poweroff
```

salt.modules.drac.server_poweron()

Powers up the managed server.

CLI Example:

```
salt dell drac.server_poweron
```

salt.modules.drac.server_pxe()

Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell drac.server_pxe
```

salt.modules.drac.server_reboot()

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:

```
salt dell drac.server_reboot
```

salt.modules.drac.set_network(ip, netmask, gateway)

Configure Network

CLI Example:

```
salt dell drac.set_network DRAC IP [NETMASK] GATEWAY
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

salt.modules.drac.set_permissions(username, permissions, uid=None)

Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX -optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

**DRAC Privileges**

- **login**: Login to iDRAC
- **drac**: Configure iDRAC
- **user_management**: Configure Users
- **clear_logs**: Clear Logs
- **server_control_commands**: Execute Server Control Commands
- **console_redirection**: Access Console Redirection
• virtual_media : Access Virtual Media
• test_alerts : Test Alerts
• debug_commands : Execute Debug Commands

```python
salt.modules.drac.set_snmp(community)
```
Configure SNMP community string

CLI Example:
```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

```python
salt.modules.drac.syslog(server, enable=True)
```
Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:
```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

```python
salt.modules.drac.system_info()
```
Return System information

CLI Example:
```
salt dell drac.system_info
```

### 26.6.119 salt.modules.dracr

Manage Dell DRAC. New in version 2015.8.2.

```python
salt.modules.dracr.bare_rac_cmd(cmd, host=None, admin_username=None, admin_password=None)
```

```python
salt.modules.dracr.change_password(username, password, uid=None, host=None, admin_username=None, admin_password=None, module=None)
```
Change user's password

CLI Example:
```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have ‘root’ as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.
salt.modules.dracr.create_user(username, password, permissions, users=None, host=None, admin_username=None, admin_password=None)

Create user accounts

CLI Example:

```bash
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login: Login to iDRAC
- drac: Configure iDRAC
- user_management: Configure Users
- clear_logs: Clear Logs
- server_control_commands: Execute Server Control Commands
- console_redirection: Access Console Redirection
- virtual_media: Access Virtual Media
- test_alerts: Test Alerts
- debug_commands: Execute Debug Commands

salt.modules.dracr.delete_user(username, uid=None, host=None, admin_username=None, admin_password=None)

Delete a user

CLI Example:

```bash
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

salt.modules.dracr.deploy_password(username, password, host=None, admin_username=None, admin_password=None, module=None)

Change the QuickDeploy password, used for switches as well

CLI Example:

```bash
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
host=<remote DRAC> admin_username=<DRAC user>
admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have 'root' as UID 1, so if you can depend on that then setting the password is much quicker.

salt.modules.dracr.deploy_snmp(snmp, host=None, admin_username=None, admin_password=None, module=None)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:
salt.dell.dracr.deploy_snmp SNMP_STRING
    host=<remote DRAC or CMC>  admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt.dell.dracr.deploy_password diana secret

salt.modules.dracr.email_alerts (action, host=None, admin_username=None, admin_password=None)
    Enable/Disable email alerts
    CLI Example:
    salt dell dracr.email_alerts True
    salt dell dracr.email_alerts False

salt.modules.dracr.get_chassis_datacenter (host=None, admin_username=None, admin_password=None)
    Get the datacenter of the chassis.
    host
        The chassis host.
    admin_username
        The username used to access the chassis.
    admin_password
        The password used to access the chassis.
    CLI Example:
    salt '*' dracr.set_chassis_location host=111.222.333.444
    admin_username=root  admin_password=secret

salt.modules.dracr.get_chassis_location (host=None, admin_username=None, admin_password=None)
    Get the location of the chassis.
    host
        The chassis host.
    admin_username
        The username used to access the chassis.
    admin_password
        The password used to access the chassis.
    CLI Example:
    salt '*' dracr.set_chassis_location host=111.222.333.444
    admin_username=root  admin_password=secret

salt.modules.dracr.get_chassis_name (host=None, admin_username=None, admin_password=None)
    Get the name of a chassis.
    host
        The chassis host.
    admin_username
        The username used to access the chassis.
admin_password
   The password used to access the chassis.

CLI Example:

```
salt '*' dracr.get_chassis_name host=111.222.333.444 admin_username=root admin_password=secret
```

salt.modules.dracr.get_dns_dracname(host=None, admin_username=None, admin_password=None)
salt.modules.dracr.get_general(cfg_sec, cfg_var, host=None, admin_username=None, admin_password=None)
salt.modules.dracr.get_slotname(slot, host=None, admin_username=None, admin_password=None)

Get the name of a slot number in the chassis.

slot
   The number of the slot for which to obtain the name.

host
   The chassis host.

admin_username
   The username used to access the chassis.

admin_password
   The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444 admin_username=root admin_password=secret
```

salt.modules.dracr.idrac_general(blade_name, command, idrac_password=None, host=None, admin_username=None, admin_password=None)

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like 'server-1', 'server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the idrac_password kwarg.

Parameters

- **blade_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin_username** -- CMC username
- **admin_password** -- CMC password

Returns

stdout if the retcode is 0, otherwise a standard cmd.run_all dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

salt.modules.dracr.inventory(host=None, admin_username=None, admin_password=None)
salt.modules.dracr.list_slotnames(host=None, admin_username=None, admin_password=None)
List the names of all slots in the chassis.

host
The chassis host.

admin_username
The username used to access the chassis.

admin_password
The password used to access the chassis.

CLI Example:
salt-call --local dracr.list_slotnames host=111.222.333.444 
admin_username=root admin_password=secret

salt.modules.dracr.list_users(host=None, admin_username=None, admin_password=None, 
module=None)
List all DRAC users

CLI Example:
salt dell dracr.list_users

salt.modules.dracr.nameservers(ns, host=None, admin_username=None, admin_password=None, 
module=None)
Configure the nameservers on the DRAC

CLI Example:
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com 
admin_username=root admin_password=calvin module=server-1 
host=192.168.1.1

salt.modules.dracr.network_info(host=None, admin_username=None, admin_password=None, 
module=None)
Return Network Configuration

CLI Example:
salt dell dracr.network_info

salt.modules.dracr.server_hardreset(host=None, admin_username=None, admin_password=None, 
module=None)
Performs a reset (reboot) operation on the managed server.

host
The chassis host.

admin_username
The username used to access the chassis.

admin_password
The password used to access the chassis.

module
The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.
CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

```
salt.modules.dracr.server_power
    (status, host=None, admin_username=None, admin_password=None, module=None)
```

**status**
One of 'powerup', 'powerdown', 'powercycle', 'hardreset', 'graceshutdown'

**host**
The chassis host.

**admin_username**
The username used to access the chassis.

**admin_password**
The password used to access the chassis.

**module**
The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

```
salt.modules.dracr.server_poweroff
    (host=None, admin_username=None, admin_password=None, module=None)
```

Powers down the managed server.

**host**
The chassis host.

**admin_username**
The username used to access the chassis.

**admin_password**
The password used to access the chassis.

**module**
The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.

CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

```
salt.modules.dracr.server_poweron
    (host=None, admin_username=None, admin_password=None, module=None)
```

Powers up the managed server.

**host**
The chassis host.

**admin_username**
The username used to access the chassis.

**admin_password**
The password used to access the chassis.
module

The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.

CLI Example:

```bash
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

salt.modules.dracr.server_powerstatus(host=None, admin_username=None, admin_password=None, module=None)

return the power status for the passed module

CLI Example:

```bash
salt dell dracr.server_powerstatus
```

salt.modules.dracr.server_pxe(host=None, admin_username=None, admin_password=None)

Configure server to PXE perform a one off PXE boot

CLI Example:

```bash
salt dell dracr.server_pxe
```

salt.modules.dracr.server_reboot(host=None, admin_username=None, admin_password=None, module=None)

Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

host
The chassis host.

admin_username
The username used to access the chassis.

admin_password
The password used to access the chassis.

module
The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.

CLI Example:

```bash
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

salt.modules.dracr.set_chassis_datacenter(location, host=None, admin_username=None, admin_password=None)

Set the location of the chassis.

location
The name of the datacenter to be set on the chassis.

host
The chassis host.

admin_username
The username used to access the chassis.
admin_password
    The password used to access the chassis.

CLI Example:

```bash
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.set_chassis_location(location, host=None, admin_username=None,
    admin_password=None)

Set the location of the chassis.

location
    The name of the location to be set on the chassis.

host
    The chassis host.

admin_username
    The username used to access the chassis.

admin_password
    The password used to access the chassis.

CLI Example:

```bash
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.set_chassis_name(name, host=None, admin_username=None,
    admin_password=None)

Set the name of the chassis.

name
    The name to be set on the chassis.

host
    The chassis host.

admin_username
    The username used to access the chassis.

admin_password
    The password used to access the chassis.

CLI Example:

```bash
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.set_dns_dracname(name, host=None, admin_username=None,
    admin_password=None)

salt.modules.dracr.set_general(cfg_sec, cfg_var, val, host=None, admin_username=None,
    admin_password=None)

salt.modules.dracr.set_network(ip, netmask, gateway, host=None, admin_username=None,
    admin_password=None)

Configure Network on the CMC or individual iDRAC. Use set_niccfg for blade and switch addresses.
CLI Example:
```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
    admin_username=root admin_password=calvin host=192.168.1.1
```

salt.modules.dracr.set_niccfg(ip=None, netmask=None, gateway=None, dhcp=False, host=None, admin_username=None, admin_password=None, module=None)

salt.modules.dracr.set_nicvlan(vlan=None, host=None, admin_username=None, admin_password=None, module=None)

salt.modules.dracr.set_permissions(username, permissions, uid=None, host=None, admin_username=None, admin_password=None)

Configure users permissions

CLI Example:
```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
    [USER_INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.dracr.set_slotname(slot, name, host=None, admin_username=None, admin_password=None)

Set the name of a slot in a chassis.

slot
    The slot number to change.

name
    The name to set. Can only be 15 characters long.

host
    The chassis host.

admin_username
    The username used to access the chassis.

admin_password
    The password used to access the chassis.

CLI Example:
salt '/*' dracr.set_slotname 2 my-slotname host=111.222.333.444
    admin_username=root admin_password=secret

salt.modules.dracr.set_snmp(community, host=None, admin_username=None, admin_password=None)
Configure CMC or individual iDRAC SNMP community string. Use deploy_snmp for configuring chassis
switch SNMP.
CLI Example:
salt dell dracr.set_snmp [COMMUNITY]
    salt dell dracr.set_snmp public

salt.modules.dracr.syslog(server, enable=True, host=None, admin_username=None, admin_password=None, module=None)
Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. How-
ever, if you want to disable syslog you will need to specify a server followed by False
CLI Example:
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
    salt dell dracr.syslog 0.0.0.0 False

salt.modules.dracr.system_info(host=None, admin_username=None, admin_password=None, module=None)
Return System information
CLI Example:
salt dell dracr.system_info

salt.modules.dracr.update_firmware(filename, host=None, admin_username=None, admin_password=None)
Updates firmware using local firmware file
salt dell dracr.update_firmware firmware.exe
This executes the following command on your FX2 (using username and password stored in the pillar data)
racadm update -f firmware.exe -u user -p pass

salt.modules.dracr.update_firmware_nfs_or_cifs(filename, share, host=None, admin_username=None, admin_password=None)
Executes the following for CIFS (using username and password stored in the pillar data)
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
Or for NFS (using username and password stored in the pillar data)
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
Salt command for CIFS:
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe //IP-
Salt command for NFS:

```bash
salt dell dracr.update_firmware_nfs_or_cifs firmware.exe IP-<address>/share
```

### 26.6.120 salt.modules.drbd

DRBD administration module

**salt.modules.drbd.overview()**

Show status of the DRBD devices, support two nodes only. drbd-overview is removed since drbd-utils-9.6.0, use status instead.

CLI Example:

```bash
salt '*' drbd.overview
```

**salt.modules.drbd.status(name='all')**

- **Parameters**
  - `name (str)` -- Resource name.

- **Returns**
  - drbd status of resource.

- **Return type**
  - list(dict(res))

CLI Example:

```bash
salt '*' drbd.status
salt '*' drbd.status name=<resource name>
```

### 26.6.121 salt.modules.dummyproxy_pkg

Package support for the dummy proxy used by the test suite

**salt.modules.dummyproxy_pkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)**

**salt.modules.dummyproxy_pkg.installed(name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs)**

**salt.modules.dummyproxy_pkg.list_pkgs(versions_as_list=False, **kwargs)**

**salt.modules.dummyproxy_pkg.remove(name=None, pkgs=None, **kwargs)**

**salt.modules.dummyproxy_pkg.upgrade(name=None, pkgs=None, refresh=True, skip_verify=True, normalize=True, **kwargs)**
salt.modules.dummyproxy_pkg.version(*names, **kwargs)
    Returns a string representing the package version or an empty string if not installed. If more than one package
    name is specified, a dict of name/version pairs is returned.

    CLI Example:
    
    salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

26.6.122 salt.modules.dummyproxy_service

Provide the service module for the dummy proxy used in integration tests

salt.modules.dummyproxy_service.enabled(name, sig=None)
    Only the 'rebbull' service is 'enabled' in the test
    New in version 2016.11.3.

salt.modules.dummyproxy_service.get_all()
    Return a list of all available services
    New in version 2016.11.3.
    CLI Example:
    
    salt '*' service.get_all

salt.modules.dummyproxy_service.list_()
    Return a list of all available services.
    New in version 2016.11.3.
    CLI Example:
    
    salt '*' service.list

salt.modules.dummyproxy_service.restart(name, sig=None)
    Restart the specified service with dummy.
    New in version 2016.11.3.
    CLI Example:
    
    salt '*' service.restart <service name>

salt.modules.dummyproxy_service.running(name, sig=None)
    Return whether this service is running.
    New in version 2016.11.3.

salt.modules.dummyproxy_service.start(name, sig=None)
    Start the specified service on the dummy
    New in version 2016.11.3.
    CLI Example:
    
    salt '*' service.start <service name>
salt.modules.dummyproxy_service.status(name, sig=None)

Return the status for a service via dummy, returns a bool whether the service is running.
New in version 2016.11.3.

CLI Example:
```
salt '*' service.status <service name>
```

salt.modules.dummyproxy_service.stop(name, sig=None)

Stop the specified service on the dummy
New in version 2016.11.3.

CLI Example:
```
salt '*' service.stop <service name>
```

26.6.123  salt.modules.ebuildpkg

Support for Portage

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see here.

optdepends

- portage Python adapter

For now all package names **MUST** include the package category, i.e. 'vim' will not work, 'app-editors/vim' will.

salt.modules.ebuildpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.
Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.ebuildpkg.check_db(*names, **kwargs)

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key found, which will be a boolean value denoting if a match was found in the package database.
2. If found is False, then a second key called suggestions will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in category/pkgname format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:
Salt Documentation, Release 3007.1

```bash
salt '*' pkg.check_db <package1> <package2> <package3>
```

```python
salt.modules.ebuildpkg.check_extra_requirements(pkgname, pkgver)
```

Check if the installed package already has the given requirements.

CLI Example:

```bash
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' ' ~>4.1:2:4.
~1::gentoo[nls,fortran]'
```

```python
salt.modules.ebuildpkg.depclean(name=None, slot=None, fromrepo=None, pkgs=None)
```

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

**name**
The name of the package to be cleaned.

**slot**
Restrict the remove to a specific slot. Ignored if name is None.

**fromrepo**
Restrict the remove to a specific slot. Ignored if name is None.

**pkgs**
Clean multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```bash
salt '*' pkg.depclean <package name>
```

```python
salt.modules.ebuildpkg.ex_mod_init(low)
```

If the config option ebuild.enforce_nice_config is set to True, this module will enforce a nice tree structure for /etc/portage/package.* configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.

Changed in version 2014.7.0: Configure option added to make this behaviour optional, defaulting to off.

See also:

- ebuild.ex_mod_init is called automatically when a state invokes a pkg state on a Gentoo system. salt.states.pkg.mod_init()
- ebuild.ex_mod_init uses portage_config.enforce_nice_config to do the lifting. salt.modules.portage_config.enforce_nice_config()

CLI Example:

```bash
salt '*' pkg.ex_mod_init
```

```python
salt.modules.ebuildpkg.install(name=None, refresh=False, pkgs=None, sources=None, slot=None, fromrepo=None, uses=None, binhost=None, **kwargs)
```

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage

26.6. execution modules
of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to sync the portage tree before package is installed.

**name**

The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the "sources" option described below.

**CLI Example:**

```bash
salt '*' pkg.install <package name>
```

**refresh**

Whether or not to sync the portage tree before installing.

**version**

Install a specific version of the package, e.g. 1.0.9-r1. Ignored if "pkgs" or "sources" is passed.

**slot**

Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if "pkgs" or "sources" or "version" is passed.

**CLI Example:**

```bash
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

**fromrepo**

Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if "pkgs" or "sources" or "version" is passed.

**CLI Example:**

```bash
salt '*' pkg.install salt fromrepo='gentoo'
```

**uses**

Similar to slot, but specifies a list of use flag. Ignored if "pkgs" or "sources" or "version" is passed.

**CLI Example:**

```bash
salt '*' pkg.install sys-devel/gcc uses='["nptl","-nossp"]'
```

Multiple Package Installation Options:

**pkgs**

A list of packages to install from the portage tree. Must be passed as a python list.

**CLI Example:**

```bash
salt '*' pkg.install pkgs='["foo","bar",~category/package:slot::repository[use]]'
```

**sources**

A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

**CLI Example:**

```bash
```
salt '*' pkg.install sources='[["foo": "salt://foo.tbz2"],{"bar": "salt://bar.tbz2"}]'

**binhost**

has two options try and force. try - tells emerge to try and install the package from a configured binhost.
force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```python
dict = 
{
'email': {
'old': 'old-version',
'new': 'new-version'}}
```

### salt.modules.ebuildpkg.latest_version(names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package
name is specified, a dict of name/version pairs is returned.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

### salt.modules.ebuildpkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```python
dict = 
{
'email': {
'old': 'old-version',
'new': 'new-version'}}
```

CLI Example:

```bash
salt '*' pkg.list_pkgs
```

### salt.modules.ebuildpkg.list_upgrades(refresh=True, backtrack=3, **kwargs)

List all available package upgrades.

**refresh**

Whether or not to sync the portage tree before checking for upgrades.

**backtrack**

Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an
unsatisfied dependency (default: 3).

New in version 2015.8.0.

CLI Example:

```bash
salt '*' pkg.list_upgrades
```

### salt.modules.ebuildpkg.porttree_matches(name)

Returns a list containing the matches for a given package name from the portage tree. Note that the specific
version of the package will not be provided for packages that have several versions in the portage tree, but
rather the name of the package (i.e. "dev-python/paramiko").

### salt.modules.ebuildpkg.purge(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now
used to isolate commands which modify installed packages from the salt-minion daemon's control group.
This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion
service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage
of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Portage does not have a purge, this function calls remove followed by depclean to emulate a purge process

name

The name of the package to be deleted.

slot

Restrict the remove to a specific slot. Ignored if name is None.

fromrepo

Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

pkgs

Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.ebuildpkg.refresh_db(**kwargs)

Update the portage tree using the first available method from the following list:

- `emaint sync`
- `eix-sync`
- `emerge-webrsync`
- `emerge --sync`

To prevent the portage tree from being synced within one day of the previous sync, add the following pillar data for this minion:

```
portage:
  sync_wait_one_day: True
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.ebuildpkg.remove(name=None, slot=None, fromrepo=None, pkgs=None, **kwargs)

Changed in version 2015.8.12, 2016.3.3, 2016.11.0: On minions running systemd>=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon’s control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a `config option` called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `emerge --unmerge`. 
name
The name of the package to be deleted.

slot
Restrict the remove to a specific slot. Ignored if name is None.

fromrepo
Restrict the remove to a specific slot. Ignored if name is None.

Multiple Package Options:

pkgs
Uninstall multiple packages. slot and fromrepo arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]
```

salt.modules.ebuildpkg.update(pkg, slot=None, fromrepo=None, refresh=False, binhost=None, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Updates the passed package (emerge --update package)

slot
Restrict the update to a particular slot. It will update to the latest version within the slot.

fromrepo
Restrict the update to a particular repository. It will update to the latest version within the repository.

binhost
has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

salt.modules.ebuildpkg.upgrade(refresh=True, binhost=None, backtrack=3, **kwargs)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage
of systemd-run(1) can be suppressed by setting a config option called systemd.scope, with a value of False (no quotes).

Run a full system upgrade (emerge -uDN @world)

binhost
- has two options try and force. try - tells emerge to try and install the package from a configured binhost.
- force - forces emerge to install the package from a binhost otherwise it fails out.

backtrack
- Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: 3).
- New in version 2015.8.0.

Returns a dictionary containing the changes:

```python
{'<package>': {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:
salt '*' pkg.upgrade

salt.modules.ebuildpkg.upgrade_available(name, **kwargs)
- Check whether or not an upgrade is available for a given package

CLI Example:
salt '*' pkg.upgrade_available <package name>

salt.modules.ebuildpkg.version(*names, **kwargs)
- Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...

salt.modules.ebuildpkg.version_clean(version)
- Clean the version string removing extra data.

CLI Example:
salt '*' pkg.version_clean <version_string>

salt.modules.ebuildpkg.version_cmp(pkg1, pkg2, **kwargs)
- Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
26.6.124 salt.modules.eix

Support for Eix
salt.modules.eix.sync()

Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

salt.modules.eix.update()

Update the eix database

CLI Example:

```
salt '*' eix.update
```

26.6.125 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

depends
elasticsearch-py

configuration

This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'

elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
    - 'pillar.items'
    - 'grains.items'
  proxies:

(continues on next page)
When specifying proxies the requests backend will be used and the `proxies` data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into `pillar`.

Some functionality might be limited by `elasticsearch-py` and Elasticsearch server versions.

```python
salt.modules.elasticsearch.alias_create(indices, alias, hosts=None, body=None, profile=None, source=None)
```

Create an alias for a specific index/indices

- **indices**
  Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

- **alias**
  Alias name

- **body**
  Optional definition such as routing or filter as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

- **source**
  URL of file specifying optional definition such as routing or filter. Cannot be used in combination with `body`.

CLI Example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

```python
salt.modules.elasticsearch.alias_delete(indices, aliases, hosts=None, body=None, profile=None, source=None)
```

Delete an alias of an index

- **indices**
  Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

- **aliases**
  Alias names separated by comma

CLI Example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

```python
salt.modules.elasticsearch.alias_exists(aliases, indices=None, hosts=None, profile=None)
```

Return a boolean indicating whether given alias exists

- **indices**
  Single or multiple indices separated by comma, use `_all` to perform the operation on all indices.

- **aliases**
  Alias names separated by comma

CLI Example:
salt myminion elasticsearch.alias_exists None testindex

salt.modules.elasticsearch.aliased(indices=indices, aliases=aliases, hosts=hosts, profile=profile)
Check for the existence of an alias and if it exists, return it

    indices
    Single or multiple indices separated by comma, use _all to perform the operation on all indices.

    aliases
    Alias names separated by comma

    CLI Example:
    salt myminion elasticsearch.alias_get testindex

salt.modules.elasticsearch.cluster_get_settings(flat_settings=flat_settings, include_defaults=include_defaults, hosts=hosts, profile=profile)
New in version 3000.
Return Elasticsearch cluster settings.

    flat_settings
    Return settings in flat format.

    include_defaults
    Whether to return all default clusters setting.

    CLI Example:
    salt myminion elasticsearch.cluster_get_settings

salt.modules.elasticsearch.cluster_health(index=index, level='level', local=local, hosts=hosts, profile=profile)
New in version 2017.7.0.
Return Elasticsearch cluster health.

    index
    Limit the information returned to a specific index

    level
    Specify the level of detail for returned information, default 'cluster', valid choices are: 'cluster', 'indices', 'shards'

    local
    Return local information, do not retrieve the state from master node

    CLI Example:
    salt myminion elasticsearch.cluster_health

salt.modules.elasticsearch.cluster_put_settings(body=body, flat_settings=flat_settings, hosts=hosts, profile=profile)
New in version 3000.
Set Elasticsearch cluster settings.

    body
    The settings to be updated. Can be either 'transient' or 'persistent' (survives cluster restart) http://www.elastic.co/guide/en/elasticsearch/reference/current/cluster-update-settings.html
flat_settings

Return settings in flat format.

CLI Example:

```
salt myminion elasticsearch.cluster_put_settings '{"persistent": {
    "indices.recovery.max_bytes_per_sec": "50mb"}}'
salt myminion elasticsearch.cluster_put_settings '{"transient": {
    "indices.recovery.max_bytes_per_sec": "50mb"}}'
```

```
salt.modules.elasticsearch.cluster_stats(nodes=None, hosts=None, profile=None)
```

New in version 2017.7.0.

Return Elasticsearch cluster stats.

```
nodes
List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all
```

CLI Example:

```
salt myminion elasticsearch.cluster_stats
```

```
salt.modules.elasticsearch.document_create(index, doc_type, body=None, id=None, hosts=None, profile=None, source=None)
```

Create a document in a specified index.

```
index
Index name where the document should reside
```
```
doc_type
Type of the document
```
```
body
Document to store
```
```
source
URL of file specifying document to store. Cannot be used in combination with body.
```
```
id
Optional unique document identifier for specified doc_type (empty for random)
```

CLI Example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

```
salt.modules.elasticsearch.document_delete(index, doc_type, id, hosts=None, profile=None)
```

Delete a document from an index.

```
index
Index name where the document resides
```
```
doc_type
Type of the document
```
```
id
Document identifier
```

CLI Example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-
        384m0Buq_8U80wQZ
```
salt.modules.elasticsearch.document_exists

Return a boolean indicating whether given document exists

index
   Index name where the document resides

id
   Document identifier

doc_type
   Type of the document, use _all to fetch the first document matching the ID across all types

CLI Example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

salt.modules.elasticsearch.document_get

Check for the existence of a document and if it exists, return it

index
   Index name where the document resides

id
   Document identifier

doc_type
   Type of the document, use _all to fetch the first document matching the ID across all types

CLI Example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

salt.modules.elasticsearch.flush_synced

New in version 3000.

Perform a normal flush, then add a generated unique marker (sync_id) to all shards. 

```
```

index
   (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to '_all'.

ignore_unavailable
   (Optional, boolean) If true, missing or closed indices are not included in the response. Defaults to false.

allow_no_indices
   (Optional, boolean) If true, the request does not return an error if a wildcard expression or _all value retrieves only missing or closed indices. This parameter also applies to index aliases that point to a missing or closed index.

expand_wildcards
   (Optional, string) Controls what kind of indices that wildcard expressions can expand to.

Valid values are:

- **all** - Expand to **open** and **closed** indices.
- **open** - Expand only to **open** indices.
- **closed** - Expand only to **closed** indices.
- **none** - Wildcard expressions are **not** accepted.
The defaults settings for the above parameters depend on the API being used.

CLI Example:

```bash
salt myminion elasticsearch.flush_synced index='index1,index2' ignore_unavailable=True allow_no_indices=True expand_wildcards='all'
```

salt.modules.elasticsearch.index_close(index, allow_no_indices=True, expand_wildcards='open', ignore_unavailable=True, hosts=None, profile=None)

New in version 2017.7.0.

Close specified index.

**index**
Index to be closed

**allow_no_indices**
Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

**expand_wildcards**
Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'

**ignore_unavailable**
Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI Example:

```bash
salt myminion elasticsearch.index_close testindex
```

salt.modules.elasticsearch.index_create(index, body=None, hosts=None, profile=None, source=None)

Create an index

**index**
Index name

**body**
Index definition, such as settings and mappings as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

**source**
URL to file specifying index definition. Cannot be used in combination with body.

CLI Example:

```bash
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings": {"index
→": {"number_of_shards": 3, "number_of_replicas": 2}}}'
```

salt.modules.elasticsearch.index_delete(index, hosts=None, profile=None)

Delete an index

**index**
Index name

CLI Example:
salt myminion elasticsearch.index_delete testindex

salt.modules.elasticsearch.index_exists(index, hosts=None, profile=None)
    Return a boolean indicating whether given index exists
    index
        Index name
    CLI Example:
    salt myminion elasticsearch.index_exists testindex

salt.modules.elasticsearch.index_get(index, hosts=None, profile=None)
    Check for the existence of an index and if it exists, return it
    index
        Index name
    CLI Example:
    salt myminion elasticsearch.index_get testindex

salt.modules.elasticsearch.index_get_settings(hosts=None, profile=None, **kwargs)
    New in version 3000.
    Check for the existence of an index and if it exists, return its settings
    index
        (Optional, string) A comma-separated list of index names; use _all or empty string for all indices. Defaults to '_all'.
    name
        (Optional, string) The name of the settings that should be included
    allow_no_indices
        (Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
    expand_wildcards
        (Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: 'open', 'closed', 'none', 'all'
    flat_settings
        (Optional, boolean) Return settings in flat format
    ignore_unavailable
        (Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)
    include_defaults
        (Optional, boolean) Whether to return all default setting for each of the indices.
    local
        (Optional, boolean) Return local information, do not retrieve the state from master node
    The defaults settings for the above parameters depend on the API version being used.
    CLI Example:
salt.myminion.elasticsearch.index_get_settings(index='testindex')

salt.modules.elasticsearch.index_open(index, allow_no_indices=True, expand_wildcards='closed', ignore_unavailable=True, hosts=None, profile=None)

New in version 2017.7.0.
Open specified index.

index
Index to be opened
allow_no_indices
Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
expand_wildcards
Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: ‘open’, ‘closed’, ‘none’, ‘all’
ignore_unavailable
Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI Example:
salt myminion elasticsearch.index_open testindex

salt.modules.elasticsearch.index_put_settings(body=None, hosts=None, profile=None, source=None, **kwargs)

New in version 3000.

body
The index settings to be updated.
source
URL to file specifying index definition. Cannot be used in combination with body.
index
(Optional, string) A comma-separated list of index names; use _all or empty string to perform the operation on all indices
allow_no_indices
(Optional, boolean) Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
expand_wildcards
(Optional, string) Whether to expand wildcard expression to concrete indices that are open, closed or both. Valid choices are: ‘open’, ‘closed’, ‘none’, ‘all’

flat_settings
(Optional, boolean) Return settings in flat format (default: false)
nignore_unavailable
(Optional, boolean) Whether specified concrete indices should be ignored when unavailable (missing or closed)
master_timeout
(Optional, time units) Explicit operation timeout for connection to master node
preserve_existing
(Optional, boolean) Whether to update existing settings. If set to true existing settings on an index remain unchanged, the default is false

The defaults settings for the above parameters depend on the API version being used.

Note: Elasticsearch time units can be found here: https://www.elastic.co/guide/en/elasticsearch/reference/current/common-options.html#time-units

CLI Example:
salt myminion elasticsearch.index_put_settings index=testindex body='{"settings": {"index": {"number_of_replicas": 2}}}'

salt.modules.elasticsearch.index_template_create(name, body=None, hosts=None, profile=None, source=None)
Create an index template

name
Index template name

body

source
URL to file specifying template definition. Cannot be used in combination with body.

CLI Example:
salt myminion elasticsearch.index_template_create testindex_templ '{"template": "logstash-*", "order": 1, "settings": { "number_of_shards": 1 }}'

salt.modules.elasticsearch.index_template_delete(name, hosts=None, profile=None)
Delete an index template (type) along with its data

name
Index template name

CLI Example:
salt myminion elasticsearch.index_template_delete testindex_templ user

salt.modules.elasticsearch.index_template_exists(name, hosts=None, profile=None)
Return a boolean indicating whether given index template exists

name
Index template name

CLI Example:
salt myminion elasticsearch.index_template_exists testindex_templ

salt.modules.elasticsearch.index_template_get(name, hosts=None, profile=None)
Retrieve template definition of index or index/type
name
   Index template name

CLI Example:

```
salt myminion elasticsearch.index_template_get testindex_template
```

salt.modules.elasticsearch.info(*hosts=*, *profile=*)

New in version 2017.7.0.

Return Elasticsearch information.

CLI Example:

```
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra
```

salt.modules.elasticsearch.mapping_create(*index*, *doc_type*, *body=*, *hosts=*, *profile=*, *source=*)

Create a mapping in a given index

```
index
   Index for the mapping

doc_type
   Name of the document type

body

source
   URL to file specifying mapping definition. Cannot be used in combination with *body*.
```

CLI Example:

```
salt myminion elasticsearch.mapping_create testindex user '{ "user" : { → "properties" : { "message" : { "type" : "string", "store" : true } } } }'
```

salt.modules.elasticsearch.mapping_delete(*index*, *doc_type*, *hosts=*, *profile=*)

Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

```
index
   Index for the mapping

doc_type
   Name of the document type
```

CLI Example:

```
salt myminion elasticsearch.mapping_delete testindex user
```

salt.modules.elasticsearch.mapping_get(*index*, *doc_type*, *hosts=*, *profile=*)

Retrieve mapping definition of index or index/type

```
index
   Index for the mapping

doc_type
   Name of the document type
```
CLI Example:
```
salt myminion elasticsearch.mapping_get testindex user
```

```
salt.modules.elasticsearch.node_info(nodes=None, flat_settings=False, hosts=None, profile=None)
```
New in version 2017.7.0.
Return Elasticsearch node information.

**nodes**
List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

**flat_settings**
Flatten settings keys

CLI Example:
```
salt myminion elasticsearch.node_info flat_settings=True
```

```
salt.modules.elasticsearch.ping(allow_failure=False, hosts=None, profile=None)
```
New in version 2017.7.0.
Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

**allow_failure**
Throw exception if ping fails

CLI Example:
```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

```
salt.modules.elasticsearch.pipeline_create(id, body, hosts=None, profile=None)
```
New in version 2017.7.0.
Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

**id**
Pipeline id

**body**

CLI Example:
```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my custom pipeline", "processors": [{"set": {"field": "collector_timestamp_millis", "value": "{\_ingest\_timestamp\}"}}]}'
```

```
salt.modules.elasticsearch.pipeline_delete(id, hosts=None, profile=None)
```
New in version 2017.7.0.
Delete Ingest pipeline. Available since Elasticsearch 5.0.

**id**
Pipeline id

CLI Example:
**salt**

**myminion**

**elasticsearch.pipeline_delete**

```bash
salt myminion elasticsearch.pipeline_delete mypipeline
```

*

**elasticsearch.pipeline_get**

```python
salt.modules.elasticsearch.pipeline_get(id, hosts=None, profile=None)
```

- **id**
  
  Pipeline id

- **hosts**
  
  Optional list of hosts.

- **profile**
  
  Optional profile name.

- **New in version 2017.7.0.**

- **Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.**

- **CLI Example:**

```bash
salt myminion elasticsearch.pipeline_get mypipeline
```

**elasticsearch.pipeline_simulate**

```python
salt.modules.elasticsearch.pipeline_simulate(id, body, verbose=False, hosts=None, profile=None)
```

- **id**
  
  Pipeline id

- **body**
  

- **verbose**
  
  Specifying if the output should be more verbose

- **New in version 2017.7.0.**

- **Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.**

- **CLI Example:**

```bash
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs": [{"_index":"index","_type":"type","_id":"id","_source":{"foo":"bar"}},{"_index":"index","_type":"type","_id":"id","_source":{"foo":"rab"}]}}'
```

**elasticsearch.repository_create**

```python
salt.modules.elasticsearch.repository_create(name, body, hosts=None, profile=None)
```

- **name**
  
  Repository name

- **body**
  

- **New in version 2017.7.0.**

- **Create repository for storing snapshots. Note that shared repository paths have to be specified in path.repo Elasticsearch configuration option.**

- **CLI Example:**

```bash
salt myminion elasticsearch.repository_create testrepo '{"type":"fs","settings":{"location":"/tmp/test","compress":true}}'
```

**elasticsearch.repository_delete**

```python
salt.modules.elasticsearch.repository_delete(name, hosts=None, profile=None)
```

- **name**
  
  Delete existing repository.

- **New in version 2017.7.0.**

- **Delete existing repository.**
name
  Repository name

CLI Example:

```
salt myminion elasticsearch.repository_delete testrepo
```

`salt.modules.elasticsearch.repository_get(name, local=False, hosts=None, profile=None)`

New in version 2017.7.0.
Get existing repository details.

name
  Repository name
local
  Retrieve only local information, default is false

CLI Example:

```
salt myminion elasticsearch.repository_get testrepo
```

`salt.modules.elasticsearch.repository_verify(name, hosts=None, profile=None)`

New in version 2017.7.0.
Obtain list of cluster nodes which successfully verified this repository.

name
  Repository name

CLI Example:

```
salt myminion elasticsearch.repository_verify testrepo
```

`salt.modules.elasticsearch.search_template_create(id, body, hosts=None, profile=None)`

New in version 2017.7.0.
Create search template by supplied definition

id
  Template ID
body
  Search template definition

CLI Example:

```
salt myminion elasticsearch.search_template_create mytemplate '{{"template
→":{"query":{"match":{"title":"{{query_string}}"}}}}
```

`salt.modules.elasticsearch.search_template_delete(id, hosts=None, profile=None)`

New in version 2017.7.0.
Delete existing search template definition.

id
  Template ID

CLI Example:
Salt Documentation, Release 3007.1

salt myminion elasticsearch.search_template_delete mytemplate

salt.modules.elasticsearch.search_template_get(id, hosts=None, profile=None)
   New in version 2017.7.0.
   Obtain existing search template definition.

   id
   Template ID

   CLI Example:

salt myminion elasticsearch.search_template_get mytemplate

salt.modules.elasticsearch.snapshot_create(repository, snapshot, body=None, hosts=None, profile=None)
   New in version 2017.7.0.
   Create snapshot in specified repository by supplied definition.

   repository
   Repository name

   snapshot
   Snapshot name

   body

   CLI Example:

salt myminion elasticsearch.snapshot_create testrepo testsnapshot '{
   →"indices":"index_1,index_2","ignore_unavailable":true,"include_global_
   →state":false}'

salt.modules.elasticsearch.snapshot_delete(repository, snapshot, hosts=None, profile=None)
   New in version 2017.7.0.
   Delete snapshot from specified repository.

   repository
   Repository name

   snapshot
   Snapshot name

   CLI Example:

salt myminion elasticsearch.snapshot_delete testrepo testsnapshot

salt.modules.elasticsearch.snapshot_get(repository, snapshot, ignore_unavailable=False, hosts=None, profile=None)
   New in version 2017.7.0.
   Obtain snapshot residing in specified repository.

   repository
   Repository name
snapshot
Snapshot name, use _all to obtain all snapshots in specified repository

ignore_unavailable
Ignore unavailable snapshots

CLI Example:
```
salt myminion elasticsearch.snapshot_get testrepo testsnapshot
```

```
salt.modules.elasticsearch.snapshot_restore(repository, snapshot, body=None, hosts=None, profile=None)
```

New in version 2017.7.0.
Restore existing snapshot in specified repository by supplied definition.

repository
Repository name

snapshot
Snapshot name

body

CLI Example:
```
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{ →"indices":"index_1,index_2","ignore_unavailable":true,"include_global_ →state":true}'
```

```
salt.modules.elasticsearch.snapshot_status(repository=None, snapshot=None, ignore_unavailable=False, hosts=None, profile=None)
```

New in version 2017.7.0.
Obtain status of all currently running snapshots.

repository
Particular repository to look for snapshots

snapshot
Snapshot name

ignore_unavailable
Ignore unavailable snapshots

CLI Example:
```
salt myminion elasticsearch.snapshot_status ignore_unavailable=True
```

26.6. execution modules
26.6.126  salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

salt.modules.environ.get(key, default='')

Get a single salt process environment variable.

key
   String used as the key for environment lookup.

default
   If the key is not found in the environment, return this value. Default: ''

CLI Example:

salt '*' environ.get foo
salt '*' environ.get baz default=False

salt.modules.environ.has_value(key, value=None)

Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.

key
   Must be a string. Used as key for environment lookup.

value:
   Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.

CLI Example:

salt '*' environ.has_value foo

salt.modules.environ.item(keys, default='')

Get one or more salt process environment variables. Returns a dict.

keys
   Either a string or a list of strings that will be used as the keys for environment lookup.

default
   If the key is not found in the environment, return this value. Default: ''

CLI Example:

salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None

salt.modules.environ.items()

Return a dict of the entire environment set for the salt process

CLI Example:

salt '*' environ.items

salt.modules.environ.setenv(environ, false_unsets=False, clear_all=False, update_minion=False, permanent=False)

Set multiple salt process environment variables from a dict. Returns a dict.
environ
Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the 'false_unsets' parameter for behavior when a value set to False.

false_unsets
If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all
USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion
If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent
On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

salt.modules.environ.setval(key, val, false_unsets=False, permanent=False)
Set a single salt process environment variable. Returns True on success.

key
The environment key to set. Must be a string.

val
The value to set. Must be a string or False. Refer to the 'false_unsets' parameter for behavior when set to False.

false_unsets
If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False.

permanent
On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```
26.6.127 salt.modules.eselect

Support for eselect, Gentoo’s configuration and management tool.

salt.modules.eselect.exec_action(module, action, module_parameter=None, action_parameter=None, state_only=False)

Execute an arbitrary action on a module.

module
    name of the module to be executed

action
    name of the module’s action to be run

module_parameter
    additional params passed to the defined module

action_parameter
    additional params passed to the defined action

state_only
    don’t return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```
salt '*' eselect.exec_action php update action_parameter='apache2'
```

salt.modules.eselect.get_current_target(module, module_parameter=None, action_parameter=None)

Get the currently selected target for the given module.

module
    name of the module to be queried for its current target

module_parameter
    additional params passed to the defined module

action_parameter
    additional params passed to the ‘show’ action

CLI Example (current target of system-wide java-vm):

```
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of kernel symlink):

```
salt '*' eselect.get_current_target kernel
```

salt.modules.eselect.get_modules()

List available eselect modules.

CLI Example:

```
salt '*' eselect.get_modules
```

salt.modules.eselect.get_target_list(module, action_parameter=None)

List available targets for the given module.

module
    name of the module to be queried for its targets
action_parameter
    additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```bash
salt '*' eselect.get_target_list kernel
```

```
salt.modules.eselect.set_target(module, target, module_parameter=None, action_parameter=None)
```

Set the target for the given module. Target can be specified by index or name.

module
    name of the module for which a target should be set
target
    name of the target to be set for this module
module_parameter
    additional params passed to the defined module
action_parameter
    additional params passed to the defined action

CLI Example (setting target of system-wide java-vm):

```bash
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of kernel symlink):

```bash
salt '*' eselect.set_target kernel linux-3.17.5-gentoo
```

---

26.6.128 salt.modules.esxcluster

Module used to access the esxcluster proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the ESX cluster module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

```
salt.modules.esxcluster.get_details()
```

26.6.129 salt.modules.esxdatacenter

Module used to access the esxdatacenter proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the ESX data center module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.
salt.modules.esxdatacenter.get_details()

### 26.6.130 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the ESXi module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

**Depends:** *vSphere Remote Execution Module (salt.modules.vsphere)*

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for *salt.modules.vsphere*.

This execution module calls through to a function in the ESXi proxy module called *ch_config*, which looks up the function passed in the *command* parameter in *salt.modules.vsphere* and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the `esxi.cmd <vsphere-function-name>` syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg-type manner.

```bash
salt 'esxi-proxy' esxi.cmd system_info
salt 'esxi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

```python
salt.modules.esxi.cmd(command, *args, **kwargs)
salt.modules.esxi.get_details()
```

### 26.6.131 salt.modules.esxvm

Module used to access the esx proxy connection methods

**Warning:** This module will be deprecated in a future release of Salt. VMware strongly recommends using the VMware Salt extensions instead of the ESX VSM module. Because the Salt extensions are newer and actively supported by VMware, they are more compatible with current versions of ESXi and they work well with the latest features in the VMware product line.

```python
salt.modules.esxvm.get_details()
```
26.6.132  salt.modules.etcd_mod

Execution module to work with etcd

depends

- python-etcd or etcd3-py

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

In order to choose whether to use etcd API v2 or v3, you can put the following configuration option in the same place as your etcd configuration. This option defaults to true, meaning you will use v2 unless you specify otherwise.

```
 etcd.require_v2: True
```

When using API v3, there are some specific options available to be configured within your etcd profile. They are defaulted to the following...

```
 etcd.encode_keys: False
 etcd.encode_values: True
 etcd.raw_keys: False
 etcd.raw_values: False
 etcd.unicode_errors: "surrogateescape"
```

etcd.encode_keys indicates whether you want to pre-encode keys using msgpack before adding them to etcd.

---

**Note:** If you set `etcd.encode_keys` to True, all recursive functionality will no longer work. This includes `tree` and `ls` and all other methods if you set `recurse/recursive` to True. This is due to the fact that when encoding with msgpack, keys like `/salt` and `/salt/stack` will have differing byte prefixes, and etcd v3 searches recursively using prefixes.

`etcd.encode_values` indicates whether you want to pre-encode values using msgpack before adding them to etcd. This defaults to True to avoid data loss on non-string values wherever possible.

`etcd.raw_keys` determines whether you want the raw key or a string returned.

`etcd.raw_values` determines whether you want the raw value or a string returned.

`etcd.unicode_errors` determines what you policy to follow when there are encoding/decoding errors.

---

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to True.
Be aware that setting pillar_opts to True has security implications as this makes all master configuration settings available in all minion's pillars.

salt.modules.etcd_mod.get_(key, recurse=False, profile=None, **kwargs)
New in version 2014.7.0.
Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```bash
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
salt myminion etcd.get /path/to/key host=127.0.0.1 port=2379
```

salt.modules.etcd_mod.ls_(path='/', profile=None, **kwargs)
New in version 2014.7.0.
Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```bash
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
salt myminion etcd.ls /path/to/dir/ host=127.0.0.1 port=2379
```

salt.modules.etcd_mod.rm_(key, recurse=False, profile=None, **kwargs)
New in version 2014.7.0.
Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.

CLI Example:

```bash
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/key host=127.0.0.1 port=2379
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

salt.modules.etcd_mod.set_(key, value, profile=None, ttl=None, directory=False, **kwargs)
New in version 2014.7.0.
Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.

CLI Example:

```bash
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/key value host=127.0.0.1 port=2379
salt myminion etcd.set /path/to/dir '' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

salt.modules.etcd_mod.tree(path='/', profile=None, **kwargs)
New in version 2014.7.0.
Recurse through etcd and return all values. Returns None on failure.

CLI Example:
salt minion etcd.tree
salt minion etcd.tree profile=my_etcd_config
salt minion etcd.tree host=127.0.0.1 port=2379
salt minion etcd.tree /path/to/keys profile=my_etcd_config

salt.modules.etcd_mod.update(fields, path='', profile=None, **kwargs)
New in version 2016.3.0.
Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
'/some/example/key': 'bar',
'/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
'some': {
'example': {
'key': 'bar'
},
'another': {
'example': {
'key': 'baz'
}
}
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing '/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The 'path' parameter will optionally set the root of the path to use.

CLI Example:

```
salt minion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}" profile=my_etcd_config
salt minion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}"
→ host=127.0.0.1 port=2379
salt minion etcd.update "{"/path/to/key": 'baz', '/another/key': 'bar'}"
→ path='some/root'
```

salt.modules.etcd_mod.watch(key, recurse=False, profile=None, timeout=0, index=None, **kwargs)
New in version 2016.3.0.
Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}
26.6.133 salt.modules.ethtool

Module for running ethtool command

New in version 2016.3.0.

codeauthor
        Krzysztof Pawlowski <msciciel@msciciel.eu>
maturity
        new
depends
        python-ethtool
platform
        linux

salt.modules.ethtool.set_coalesce(devname, **kwargs)

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_
\   tx=on|off] [rx_usecs=N] [rx_frames=N]  
\   [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_
\   usecs_irq=N] [tx_frames_irq=N] [stats_block_usecs=N] [pkt_rate_low=N]  
\   [rx_usecs_low=N] [rx_frames_low=N] [tx_usecs_low=N] [tx_frames_low=N]  
\   [pkt_rate_high=N] [rx_usecs_high=N] [rx_frames_high=N] [tx_usecs_
\   high=N] [tx_frames_high=N] [sample_interval=N]
```

salt.modules.ethtool.set_feature(devname, **kwargs)

Changes the feature parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_feature <devname> sg=off
```

salt.modules.ethtool.set_offload(devname, **kwargs)

Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```
salt.modules.ethtool.set_pause(devname, **kwargs)
New in version 3006.0.
Changes the pause parameters of the specified network device
CLI Example:
```
salt '*' ethtool.set_pause <devname> autoneg=off rx=off tx=off
```

salt.modules.ethtool.set_ring(devname, **kwargs)
Changes the rx/tx ring parameters of the specified network device
CLI Example:
```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

salt.modules.ethtool.show_coalesce(devname)
Queries the specified network device for coalescing information
CLI Example:
```
salt '*' ethtool.show_coalesce <devname>
```

salt.modules.ethtool.show_driver(devname)
Queries the specified network device for associated driver information
CLI Example:
```
salt '*' ethtool.show_driver <devname>
```

salt.modules.ethtool.show_features(devname)
New in version 3006.0.
Queries the specified network device for associated feature information
CLI Example:
```
salt '*' ethtool.show_features <devname>
```

salt.modules.ethtool.show_offload(devname)
Queries the specified network device for the state of protocol offload and other features
CLI Example:
```
salt '*' ethtool.show_offload <devname>
```

salt.modules.ethtool.show_pause(devname)
New in version 3006.0.
Queries the specified network device for associated pause information
CLI Example:
```
salt '*' ethtool.show_pause <devname>
```

salt.modules.ethtool.show_ring(devname)
Queries the specified network device for rx/tx ring parameter information
CLI Example:
26.6.134 salt.modules.event

Use the *Salt Event System* to fire events from the master to the minion and vice-versa.

salt.modules.event.fire(data, tag)

Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```bash
salt '*' event.fire '{"data":"my event data"}' 'tag'
```

salt.modules.event.fire_master(data, tag, preload=None)

Fire an event off up to the master server

CLI Example:

```bash
salt '*' event.fire_master '{"data":"my event data"}' 'tag'
```

salt.modules.event.send(tag, data=None, preload=None, with_env=False, with_grains=False,
with_pillar=False, with_env_opts=False, **kwargs)

Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.

- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.

- **with_env** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.

- **with_grains** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.

- **with_pillar** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember that Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in `state.sls` from the Master, through an event on the Minion, then back to the Master.

- **with_env_opts** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.

- **kwargs** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.
CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

## 26.6.135 `salt.modules.extfs`

Module for managing ext2/3/4 file systems

salt.modules.extfs.attributes(device, args=None)

Return attributes from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

salt.modules.extfs.blocks(device, args=None)

Return block and inode info from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

salt.modules.extfs.dump(device, args=None)

Return all contents of dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

salt.modules.extfs.mkfs(device, fs_type, full_return=False, **kwargs)

Create a file system on the specified device

**full_return**

[False] If True, the full cmd.run_all dictionary will be returned instead of just stdout/stderr text. Useful for setting the result of the module.run state.

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- **block_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext_opts**: extended file system options (comma-separated)
- **fragment_size**: size of fragments
- **force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- **blocks_per_group**: number of blocks in a block group
- **number_of_groups**: ext4 option for a virtual block group
- **bytes_per_inode**: set the bytes/inode ratio
- **inode_size**: size of the inode
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **blocks_file**: read bad blocks from file
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **test**: set to True to not actually create the file system (mke2fs -n)
- **number_of_inodes**: override default number of inodes
- **creator_os**: override “creator operating system” field
- **opts**: mount options (comma separated)
- **revision**: set the filesystem revision (default 1)
- **super**: write superblock and group descriptors only
- **fs_type**: set the filesystem type (REQUIRED)
- **usage_type**: how the filesystem is going to be used
- **uuid**: set the UUID for the file system
- **cluster_size**: specify the size of cluster in bytes for file systems using the bigalloc feature
- **root_directory**: copy the contents of the given directory into the root directory of the file system
- **errors_behavior**: change the behavior of the kernel code when errors are detected

See the `mke2fs(8)` manpage for a more complete description of these options.

**salt.modules.extfs.tune**(device, full_return=False, **kwargs)

Set attributes for the specified device (using tune2fs)

**full_return**

[False] If True, the full `cmd.run_all` dictionary will be returned instead of just stdout/stderr text. Useful for setting the result of the `module.run` state.

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl, noexec'
```

Valid options are:

- **max**: max mount count
- **count**: mount count
- **error**: error behavior
- **extended_opts**: extended options (comma separated)
- **force**: force, even if there are errors (set to True)
- **group**: group name or gid that can use the reserved blocks
- **interval**: interval between checks
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **label**: label to apply to the file system
- **reserved_percentage**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **opts**: mount options (comma separated)
- **feature**: set or clear a feature (comma separated)
- **mmp_check**: mmp check interval
- **reserved**: reserved blocks count
- **quota_opts**: quota options (comma separated)
- **time**: time last checked
- **user**: user or uid who can use the reserved blocks
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

### 26.6.136 `salt.modules.file`

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data.

#### class `salt.modules.file.AttrChanges`(*added, removed*)

- **added**: Alias for field number 0
- **removed**: Alias for field number 1

#### `salt.modules.file.access`(*path, mode*)

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>f</td>
<td>Test the existence of the path</td>
</tr>
<tr>
<td>r</td>
<td>Test the readability of the path</td>
</tr>
<tr>
<td>w</td>
<td>Test the writability of the path</td>
</tr>
<tr>
<td>x</td>
<td>Test whether the path can be executed</td>
</tr>
</tbody>
</table>

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

#### `salt.modules.file.append`(*path, **kwargs*)

New in version 0.9.5.

Append text to the end of a file
path
  path to file
*args
  strings to append to file

CLI Example:
```
salt '*' file.append /etc/motd \
  "With all thine offerings thou shalt offer salt." \
  "Salt is what makes things taste bad when it isn't in them."
```

Attention
If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:
```
salt '*' file.append /etc/motd args='cheese=spam'
salt '*' file.append /etc/motd args="["cheese=spam","spam=cheese"]"
```

salt.modules.file.apply_template_on_contents
  contents, template, context, defaults, saltenv
Return the contents after applying the templating engine

  contents
    template string
  template
    template format
  context
    Overrides default context variables passed to the template.
  defaults
    Default context passed to the template.

CLI Example:
```
salt '*' file.apply_template_on_contents \
  contents='This is a {{ template }} string.' \
  template=jinja \
  "context={}" "defaults={'template': 'cool'}" \
  saltenv=base
```

salt.modules.file.basename
  path
Returns the final component of a pathname

New in version 2015.5.0.
This can be useful at the CLI but is frequently useful when scripting.
```
{% set filename = salt['file.basename'](source_file) %}
```

CLI Example:
```
salt '*' file.basename 'test/test.config'
```
salt.modules.file.blockreplace(path, marker_start='#-- start managed zone --', marker_end='#-- end managed zone --', content='', append_if_not_found=False, prepend_if_not_found=False, backup='.bak', dry_run=False, show_changes=True, append_newline=False, insert_before_match=None, insert_after_match=None)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

**path**

Filesystem path to the file to be edited

**marker_start**

The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker_end**

The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

**content**

The content to be used between the two lines identified by marker_start and marker_stop.

**append_if_not_found:** False

If markers are not found and set to True then, the markers and content will be appended to the file.

**prepend_if_not_found:** False

If markers are not found and set to True then, the markers and content will be prepended to the file.

**insert_before_match**

If markers are not found, this parameter can be set to a regex which will insert the block before the first found occurrence in the file.

New in version 3001.

**insert_after_match**

If markers are not found, this parameter can be set to a regex which will insert the block after the first found occurrence in the file.

New in version 3001.

**backup**

The file extension to use for a backup of the file if any edit is made. Set to False to skip making a backup.

**dry_run:** False

If True, do not make any edits to the file and simply return the changes that would be made.

**show_changes:** True

Controls how changes are presented. If True, this function will return a unified diff of the changes made. If False, then it will return a boolean (True if any changes were made, otherwise False).
append_newline: False
Controls whether or not a newline is appended to the content block. If the value of this argument is True then a newline will be added to the content block. If it is False, then a newline will not be added to the content block. If it is None then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.
Changed in version 2017.7.5,2018.3.1: New behavior added when value is None.
Changed in version 2019.2.0: The default value of this argument will change to None to match the behavior of the file.blockreplace state

CLI Example:

```bash
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO
 NOT EDIT --' |
'##-- end managed zone foobar --' \ 
$'10.0.1.1 foo.foobar\n10.0.1.2 bar. 
fooobar' True
```

```
salt.modules.file.chattr(*files, **kwargs)
New in version 2018.3.0.
Change the attributes of files. This function accepts one or more files and the following options:

operator
Can be either add or remove. Determines whether attributes should be added or removed from files

attributes
One or more of the following characters: aAcCdDeijPsStTu, representing attributes to add to/remove from files

version
A version number to assign to the file(s)

flags
One or more of the following characters: RVf, representing flags to assign to chattr (recurse, verbose, suppress most errors)

CLI Example:

```bash
salt '*' file.chattr foo1.txt foo2.txt operator=add attributes=ai
salt '*' file.chattr foo3.txt operator=remove attributes=i version=2
```

```
salt.modules.file.check_file_meta(name, sfn, source, source_sum, user, group, mode, attrs, saltenv, contents=None, seuser=None, seuser=None, setype=None, serange=None, verify_ssl=True, follow_symlinks=False)
Check for the changes in the file metadata.

CLI Example:

```bash
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf None salt:// http/httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755'
```

Note: Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.
name
Path to file destination

sfn
Template-processed source file contents

source
URL to file source

source_sum
File checksum information as a dictionary

```
{hash_type: md5, hsum: <md5sum>}
```

user
Destination file user owner

group
Destination file group owner

mode
Destination file permissions mode

attrs
Destination file attributes
New in version 2018.3.0.

saltenv
Salt environment used to resolve source files

contents
File contents

seuser
selinux user attribute
New in version 3001.

serole
selinux role attribute
New in version 3001.

setype
selinux type attribute
New in version 3001.

serange
selinux range attribute
New in version 3001.

verify_ssl
If False, remote https file sources (https://) will not attempt to validate the servers certificate. Default is True.
New in version 3002.

follow_symlinks
If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.
New in version 3005.
**salt.modules.file.check_hash** *(path, file_hash)*

Check if a file matches the given hash string

Returns **True** if the hash matches, otherwise **False**.

**path**
Path to a file local to the minion.

**hash**
The hash to check against the file specified in the **path** argument.

*Changed in version 2016.11.4.*

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

**CLI Example:**

```sh
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

**salt.modules.file.check_managed** *(name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, seuser=None, serole=None, setype=None, serange=None, follow_symlinks=False, **kwargs)*

Check to see what changes need to be made for a file

**follow_symlinks**
If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

*New in version 3005.*

**CLI Example:**

```sh
```

**salt.modules.file.check_managed_changes** *(name, source, source_hash, source_hash_name, user, group, mode, attrs, template, context, defaults, saltenv, contents=None, skip_verify=False, keep_mode=False, seuser=None, serole=None, setype=None, serange=None, verify_ssl=True, follow_symlinks=False, **kwargs)*

Return a dictionary of what changes need to be made for a file

*Changed in version 3001: selinux attributes added*

**verify_ssl**
If **False**, remote https file sources (https://) and source_hash will not attempt to validate the servers certificate. Default is **True**.

*New in version 3002.*

**follow_symlinks**
If the desired path is a symlink, follow it and check the permissions of the file to which the symlink points.

*New in version 3005.*
CLI Example:
```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://
- httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755
  → ' jinja True None None base
```

```
salt.modules.file.check_perms(name, ret, user, group, mode, attrs=None, follow_symlinks=False, seuser=None, serole=None, setype=None, serange=None)
```

Changed in version 3001: Added selinux options

Check the permissions on files, modify attributes and chown if needed. File attributes are only verified if lsattr(1) is installed.

CLI Example:
```
salt '*' file.check_perms /etc/sudoers '{}' root root 400 ai
```

Changed in version 2014.1.3: follow_symlinks option added

```
salt.modules.file.chgrp(path, group)
```

Change the group of a file

```
path
  path to the file or directory
```

```
group
  group owner
```

CLI Example:
```
salt '*' file.chgrp /etc/passwd root
```

```
salt.modules.file.chown(path, user, group)
```

Chown a file, pass the file the desired user and group

```
path
  path to the file or directory
```

```
user
  user owner
```

```
group
  group owner
```

CLI Example:
```
salt '*' file.chown /etc/passwd root root
```

```
salt.modules.file.comment(path, regex, char='#', backup='.bak')
```

Deprecated since version 0.17.0: Use replace() instead.

Comment out specified lines in a file

```
path
  The full path to the file to be edited
```

```
regex
  A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^(foo)$)
char: #
The character to be inserted at the beginning of a line in order to comment it out

backup: .bak
The file will be backed up before edit with this file extension

**Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

**CLI Example:**
salt '* file.comment /etc/modules pcspkr

```
salt.modules.file.comment_line(path, regex, char='#', cmnt=True, backup='.bak')
```
Comment or Uncomment a line in a text file.

**Parameters**
- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with `^` that will find the line you wish to comment. Can be as simple as `^color =`
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is `#`
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is `.bak` Set to False/None to not keep a backup.

**Returns**
boolean Returns True if successful, False if not

**CLI Example:**
The following example will comment out the pcspkr line in the /etc/modules file using the default `#` character and create a backup file named modules.bak

```
salt '* file.comment_line '/etc/modules' '^pcspkr'
```

**CLI Example:**
The following example will uncomment the log_level setting in minion config file if it is set to either warning, info, or debug using the `#` character and create a backup file named minion.bk

```
salt '* file.comment_line 'C:\salt\conf\minion' '^log_level:\[(\d|\w)]' '#' False '.bk'
```

```
salt.modules.file.contains(path, text)
```
Deprecated since version 0.17.0: Use `search()` instead.

Return True if the file at path contains text

**CLI Example:**

```
salt '* file.contains /etc/crontab 'mymaintenance.sh'
```
盐文档，发布3007.1

salt.modules.file\._contains\._glob\((\text{path, glob_expr})\)
   
   备用版本0.17.0：Use \text{search()}\ instead.
   
   返回True if the given glob matches a string in the named file.
   
   CLI Example:
   
   ```
   salt '*/' file.contains_glob /etc/foobar 'cheese*'
   ```

salt.modules.file\._contains\._regex\((\text{path, regex, lchar=''})\)
   
   备用版本0.17.0：Use \text{search()}\ instead.
   
   返回True if the given regular expression matches any line in the text of a given file.
   
   If the lchar argument (leading char) is specified, it will strip \text{lchar} from the left side of each line before trying to match.
   
   CLI Example:
   
   ```
   salt '*/' file.contains_regex /etc/crontab
   ```

salt.modules.file\._copy\((\text{src, dst, recurse=False, remove_existing=False})\)
   
   Copy a file or directory from source to dst.
   
   In order to copy a directory, the recurse flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to \text{cp -r} on unix)
   
   remove_existing will remove all files in the target directory, and then copy files from the source.
   
   Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by \text{states.file.managed} and \text{states.file.recurse}.
   
   CLI Example:
   
   ```
   salt '*/' file.copy /path/to/src /path/to/dst
   salt '*/' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
   salt '*/' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove-existing=True
   ```

salt.modules.file\._delete\._backup\((\text{path, backup_id})\)
   
   新版本0.17.0.
   
   Delete a previous version of a file that was backed up using Salt's \text{file state backup} system.
   
   path
   
   The path to the minion to check for backups.
   
   backup_id
   
   The numeric id for the backup you wish to delete, as found using \text{file.list_backups}.
   
   CLI Example:
   
   ```
   salt '*/' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.txt 0
   ```
salt.modules.file.directory_exists(path)
Tests to see if path is a valid directory. Returns True/False.

CLI Example:
```
salt '*' file.directory_exists /etc
```

salt.modules.file.dirname(path)
Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars
...
```

CLI Example:
```
salt '*' file.dirname 'test/path/filename.config'
```

salt.modules.file.diskusage(path)
Recursively calculate disk usage of path and return it in bytes

CLI Example:
```
salt '*' file.diskusage /path/to/check
```

salt.modules.file.extract_hash(hash_fn, hash_type='sha256', file_name='', source='', source_hash_name=None)

Changed in version 2016.3.5: Prior to this version, only the file_name argument was considered for file-name matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing /tmp/myfile.tar.gz when the remote file was at https://mydomain.tld/different_name.tar.gz. The file.managed state now also passes this function the source URI as well as the source_hash_name (if specified). In cases where source_hash_name is specified, it takes precedence over both the file_name and source. When it is not specified, file_name takes precedence over source. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when source_hash_name is specified. They will be used as fallback matches if there is no match to the source_hash_name value.

This routine is called from the file.managed state to pull a hash from a remote file. Regular expressions are used line by line on the source_hash file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian *.dsc files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then None will be returned.

For example:
```
 openerp_7.0-latest-1.tar.gz:
 file.managed:
   - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
```

(continues on next page)
CLI Example:
```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

```python
salt.modules.file.file_exists(path)
```
Tests to see if path is a valid file. Returns True/False.

CLI Example:
```
salt '*' file.file_exists /etc/passwd
```

```python
salt.modules.file.find(path, *args, **kwargs)
```
Approximate the Unix find(1) command and return a list of paths that meet the specified criteria.

The options include match criteria:

- name = path-glob  # case sensitive
- iname = path-glob  # case insensitive
- regex = path-regex # case sensitive
- iregex = path-regex # case insensitive
- type = file-types  # match any listed type
- user = users  # match any listed user
- group = groups  # match any listed group
- size = [+-]number[size-unit]  # default unit = byte
- mtime = interval  # modified since date
- grep = regex  # search file contents

and/or actions:

- delete [= file-types]  # default type = 'f'
- exec = command [arg ...]  # where {} is replaced by pathname
- print [= print-opts]

and/or depth criteria:

- maxdepth = maximum depth to transverse in path
- mindepth = minimum depth to transverse before checking files or directories

The default action is print=path

**path-glob:**

- `*` = match zero or more chars
- `?` = match any char
- `[abc]` = match a, b, or c
- `[^abc]` or `[^abc]` = match anything except a, b, and c
- `[x-y]` = match chars x through y
- `^[x-y]` or `^[x-y]` = match anything except chars x through y
- `{a,b,c}` = match a or b or c
path-regex: a Python Regex (regular expression) pattern to match pathnames

file-types: a string of one or more of the following:

- a: all file types
- b: block device
- c: character device
- d: directory
- p: FIFO (named pipe)
- f: plain file
- l: symlink
- s: socket

users: a space and/or comma separated list of user names and/or uids

groups: a space and/or comma separated list of group names and/or gids

size-unit:

- b: bytes
- k: kilobytes
- m: megabytes
- g: gigabytes
- t: terabytes

interval:

- \[<num>w\] \[<num>d\] \[<num>h\] \[<num>m\] \[<num>s\]

where:
- w: week
- d: day
- h: hour
- m: minute
- s: second

print-opts: a comma and/or space separated list of one or more of the following:

- group: group name
- md5: MD5 digest of file contents
- mode: file permissions (as integer)
- mtime: last modification time (as time_t)
- name: file basename
- path: file absolute path
- size: file size in bytes
- type: file type
- user: user name

CLI Examples:

```bash
salt '*/' file.find / type=f name=\.*\.[a-z] size=+10m
salt '*/' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*/' file.find /var/log name=\.*\.[0-9] mtime=+30d size=+10m delete
```

salt.modules.file.get_devmm(name)

Get major/minor info from a device
CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

```
salt.modules.file.get_diff(file1, file2, saltenv='base', show_filenames=True, show_changes=True, template=False, source_hash_file1=None, source_hash_file2=None)
```

Return unified diff of two files

**file1**

The first file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file local to the minion.

**file2**

The second file to feed into the diff utility

Changed in version 2018.3.0: Can now be either a local or remote file. In earlier releases, this had to be a file on the salt fileserver (i.e. `salt://somefile.txt`)

**show_filenames**: True

Set to False to hide the filenames in the top two lines of the diff.

**show_changes**: True

If set to False, and there are differences, then instead of a diff a simple message stating that show_changes is set to False will be returned.

**template**: False

Set to True if two templates are being compared. This is not useful except for within states, with the obfuscate_templates option set to True.

New in version 2018.3.0.

**source_hash_file1**

If `file1` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

**source_hash_file2**

If `file2` is an http(s)/ftp URL and the file exists in the minion's file cache, this option can be passed to keep the minion from re-downloading the archive if the cached copy matches the specified hash.

New in version 2018.3.0.

CLI Examples:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
salt '*' file.get_diff /tmp/foo.txt /tmp/bar.txt
```

```
salt.modules.file.get_gid(path, follow_symlinks=True)
```

Return the id of the group that owns a given file

**path**

file or directory of which to get the gid

**follow_symlinks**

indicated if symlinks should be followed

CLI Example:
**file.get_gid**

```salt
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

**salt.modules.file.get_group(path, follow_symlinks=True)**

Return the group that owns a given file

- **path**
  - file or directory of which to get the group

- **follow_symlinks**
  - indicated if symlinks should be followed

**CLI Example:**

```salt
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

**salt.modules.file.get_hash(path, form='sha256', chunk_size=65536)**

Get the hash sum of a file

This is better than **get_sum** for the following reasons:

- It does not read the entire file into memory.
- It does not return a string on error. The returned value of **get_sum** cannot really be trusted since it is vulnerable to collisions: `get_sum(..., 'xyz') == 'Hash xyz not supported'`

- **path**
  - path to the file or directory

- **form**
  - desired sum format

- **chunk_size**
  - amount to sum at once

**CLI Example:**

```salt
salt '*' file.get_hash /etc/shadow
```

**salt.modules.file.get_managed(name, template, source, source_hash, source_hash_name, user, group, mode, attrs, saltenv, context, defaults, skip_verify=False, verify_ssl=True, use_etag=False, source_hash_sig=None, signed_by_any=None, signed_by_all=None, keyring=None, gnupghome=None, **kwargs)**

Return the managed file data for file.managed

- **name**
  - location where the file lives on the server

- **template**
  - template format

- **source**
  - managed source file

- **source_hash**
  - hash of the source file
source_hash_name
When source_hash refers to a remote file, this specifies the filename to look for in that file.
New in version 2016.3.5.

user
Owner of file

group
Group owner of file

mode
Permissions of file

attrs
Attributes of file
New in version 2018.3.0.

context
Variables to add to the template context

defaults
Default values of for context_dict

skip_verify
If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and
the source_hash argument will be ignored.
New in version 2016.3.0.

verify_ssl
If False, remote https file sources (https://) and source_hash will not attempt to validate the servers
certificate. Default is True.
New in version 3002.

use_etag
If True, remote http/https file sources will attempt to use the ETag header to determine if the remote file
needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed
on a web server without requiring a full hash comparison via the source_hash parameter.
New in version 3005.

source_hash_sig
When source is a remote file source, source_hash is a file, skip_verify is not true and
use_etag is not true, ensure a valid GPG signature exists on the source hash file. Set this
to true for an inline (clearsigned) signature, or to a file URI retrievable by :py:func:`cp.cache_file`
<salt.modules.cp.cache_file> for a detached one.
New in version 3007.0.

signed_by_any
When verifying source_hash_sig, require at least one valid signature from one of a list of key fingerprints. This is passed to gpg.verify.
New in version 3007.0.

signed_by_all
When verifying source_hash_sig, require a valid signature from each of the key fingerprints in this
list. This is passed to gpg.verify.
New in version 3007.0.
keyring
When verifying source_hash_sig, use this keyring.
New in version 3007.0.

gnuhome
When verifying source_hash_sig, use this GnuPG home.
New in version 3007.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755'
```

salt.modules.file.get_mode(path, follow_symlinks=True)
Return the mode of a file

path
file or directory of which to get the mode

follow_symlinks
indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: follow_symlinks option added

salt.modules.file.get_selinux_context(path)
Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

salt.modules.file.get_source_sum(file_name='', source='', source_hash=None, source_hash_name=None, saltenv='base', verify_ssl=True, source_hash_sig=None, signed_by_any=None, signed_by_all=None, keyring=None, gnuhome=None)
New in version 2016.11.0.

Used by file.get_managed to obtain the hash and hash type from the parameters specified below.

file_name
Optional file name being managed, for matching with file.extract_hash.

source
Source file, as used in file and other states. If source_hash refers to a file containing hashes, then this filename will be used to match a filename in that file. If the source_hash is a hash expression, then this argument will be ignored.

source_hash
Hash file/expression, as used in file and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and file.extract_hash will be used to obtain a hash from it.

source_hash_name
Specific file name to look for when source_hash refers to a remote file, used to disambiguate ambiguous matches.
saltenv: base
Salt fileserver environment from which to retrieve the source_hash. This value will only be used when source_hash refers to a file on the Salt fileserver (i.e. one beginning with salt://).

verify_ssl
If False, remote https file sources (https://) and source_hash will not attempt to validate the servers certificate. Default is True.

New in version 3002.

source_hash_sig
When source is a remote file source and source_hash is a file, ensure a valid GPG signature exists on the source hash file. Set this to true for an inline (clearsigned) signature, or to a file URI retrievable by :py:func:`cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

New in version 3007.0.

signed_by_any
When verifying source_hash_sig, require at least one valid signature from one of a list of key fingerprints. This is passed to gpg.verify.

New in version 3007.0.

signed_by_all
When verifying source_hash_sig, require a valid signature from each of the key fingerprints in this list. This is passed to gpg.verify.

New in version 3007.0.

keyring
When verifying source_hash_sig, use this keyring.

New in version 3007.0.

gnupghome
When verifying source_hash_sig, use this GnuPG home.

New in version 3007.0.

CLI Example:

salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
  source_hash=499ae16dcaea71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
  source_hash=https://mydomain.tld/ hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/
  source_hash=https://mydomain.tld/ hashes.md5 source_hash_
  name=./dir2/foo.tar.gz

salt.modules.file.get_sum(path, form='sha256')
Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 (default)
- sha384
- sha512
path
  path to the file or directory

form
  desired sum format

CLI Example:

```bash
salt '*' file.get_sum /etc/passwd sha512
```

salt.modules.file.get_uid(path, follow_symlinks=True)

Return the id of the user that owns a given file

path
  file or directory of which to get the uid

follow_symlinks
  indicated if symlinks should be followed

CLI Example:

```bash
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.get_user(path, follow_symlinks=True)

Return the user that owns a given file

path
  file or directory of which to get the user

follow_symlinks
  indicated if symlinks should be followed

CLI Example:

```bash
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: follow_symlinks option added

salt.modules.file.gid_to_group(gid)

Convert the group id to the group name on this system

gid
  gid to convert to a group name

CLI Example:

```bash
salt '*' file.gid_to_group 0
```

salt.modules.file.grep(path, pattern, *opts)

Grep for a string in the specified file

**Note:** This function's return value is slated for refinement in future versions of Salt

Windows does not support the grep functionality.
path
Path to the file to be searched

Note: Globbing is supported (i.e. /var/log/foo/*.log, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

pattern
Pattern to match. For example: test, or a[0-5]

opts
Additional command-line flags to pass to the grep command. For example: -v, or -i  -B2

Note: The options should come after a double-dash (as shown in the examples below) to keep Salt’s own argument parser from interpreting them.

CLI Example:
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i0
  → -B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l

salt.modules.file.group_to_gid(group)
Convert the group to the gid on this system

   group
group to convert to its gid

CLI Example:
salt '*' file.group_to_gid root

salt.modules.file.is_blkdev(name)
Check if a file exists and is a block device.

CLI Example:
salt '*' file.is_blkdev /dev/blk

salt.modules.file.is_chrdev(name)
Check if a file exists and is a character device.

CLI Example:
salt '*' file.is_chrdev /dev/chr

salt.modules.file.is_fifo(name)
Check if a file exists and is a FIFO.

CLI Example:
salt '*' file.is_fifo /dev/fifo
salt.modules.file.is_hardlink(path)
Check if the path is a hard link by verifying that the number of links is larger than 1
CLI Example:

```
salt '*' file.is_hardlink /path/to/link
```

salt.modules.file.is_link(path)
Check if the path is a symbolic link
CLI Example:

```
salt '*' file.is_link /path/to/link
```

salt.modules.file.join(*args)
Return a normalized file system path for the underlying OS
New in version 2014.7.0.
This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}
{% set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/usr/local/bin'
```

salt.modules.file.lchown(path, user, group)
Chown a file, pass the file the desired user and group without following symlinks.

- **path**: path to the file or directory
- **user**: user owner
- **group**: group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

salt.modules.file.line(path, content=None, match=None, mode=None, location=None, before=None, after=None, show_changes=True, backup=False, quiet=False, indent=True)
New in version 2015.8.0.
Line-focused editing of a file.

Note: file.line exists for historic reasons, and is not generally recommended. It has a lot of quirks. You may find file.replace to be more suitable.
file.line is most useful if you have single lines in a file (potentially a config file) that you would like to manage. It can remove, add, and replace a single line at a time.

**path**
Filesystem path to the file to be edited.

**content**
Content of the line. Allowed to be empty if mode='delete'.

**match**
Match the target line for an action by a fragment of a string or regular expression.
If neither before nor after are provided, and match is also None, match falls back to the content value.

**mode**
Defines how to edit a line. One of the following options is required:

- **ensure**
  If line does not exist, it will be added. If before and after are specified either zero lines, or lines that contain the content line are allowed to be in between before and after. If there are lines, and none of them match then it will produce an error.

- **replace**
  If line already exists, the entire line will be replaced.

- **delete**
  Delete the line, if found.

- **insert**
  Nearly identical to ensure. If a line does not exist, it will be added.

  The differences are that multiple (and non-matching) lines are allowed between before and after, if they are specified. The line will always be inserted right before before. insert also allows the use of location to specify that the line should be added at the beginning or end of the file.

  **Note:** If mode='insert' is used, at least one of location, before, or after is required. If location is used, before and after are ignored.

**location**
In mode='insert' only, whether to place the content at the beginning or end of a the file. If location is provided, before and after are ignored. Valid locations:

- **start**
  Place the content at the beginning of the file.

- **end**
  Place the content at the end of the file.

**before**
Regular expression or an exact case-sensitive fragment of the string. Will be tried as both a regex and a part of the line. Must match exactly one line in the file. This value is only used in ensure and insert modes. The content will be inserted just before this line, with matching indentation unless indent=False.

**after**
Regular expression or an exact case-sensitive fragment of the string. Will be tried as both a regex and a part of the line. Must match exactly one line in the file. This value is only used in ensure and insert.
modes. The content will be inserted directly after this line, unless before is also provided. If before is not provided, indentation will match this line, unless indent=False.

**show_changes**
Output a unified diff of the old file and the new file. If False return a boolean if any changes were made. Default is True

**Note:** Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

**backup**
Create a backup of the original file with the extension: "Year-Month-Day-Hour-Minutes-Seconds".

**quiet**
Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

**indent**
Keep indentation with the previous line. This option is not considered when the delete mode is specified. Default is True

**CLI Example:**
```
salt '*' file.line /etc/nsswitch.conf "networks: files dns" after="hosts::.*?" mode='ensure'
```

**Note:** If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:
```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_SPOOL=yes" mode="replace"
```

**Examples:**
Here's a simple config file.

```yaml
[some_config]
# Some config file
# this line will go away

here=False
away=True
goodybe=away
```

```
salt '*' file.line /some/file.conf mode=delete match=away
```

This will produce:

```yaml
[some_config]
# Some config file

here=False
```

(continues on next page)
away=True
goodbye=away

If that command is executed 2 more times, this will be the result:

```yaml
[some_config]
# Some config file
here=False
```

If we reset the file to its original state and run

```
salt * file.line /some/file.conf mode=replace match=away content=here
```

Three passes will this state will result in this file:

```
[some_config]
# Some config file
here
here=here
here=here
```

Each pass replacing the first line found.

Given this file:

```
is insert after me
something
insert before me
```

The following command

```
salt * file.line /some/file.txt mode=insert after="insert after me" before="insert before me" content=thrice
```

If that command is executed 3 times, the result will be:

```
is insert after me
something
thrice
thrice
thrice
insert before me
```

If the mode is ensure instead, it will fail each time. To succeed, we need to remove the incorrect line between before and after:

```
is insert after me
insert before me
```

With an ensure mode, this will insert thrice the first time and make no changes for subsequent calls. For something simple this is fine, but if you have instead blocks like this:

26.6. execution modules
And you try to use ensure this way:

```
salt \* file.line /tmp/fun.txt mode="ensure" content="this = should be\n\→my content" after="Begin SomeBlock" before="End"
```

This will fail because there are multiple `End` lines. Without that problem, it still would fail because there is a non-matching line, `foo = bar`. Ensure only allows either zero, or the matching line present to be present in between `before` and `after`.

**salt.modules.file.link** *(src, path)*

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '!' file.link /path/to/file /path/to/link
```

**salt.modules.file.list_backup** *(path, limit=None)*

This function is an alias of list_backups.

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's file state backup system.

- **path**
  
The path on the minion to check for backups

- **limit**
  
Limit the number of results to the most recent N backups

CLI Example:

```
salt '!' file.list_backups /foo/bar/baz.txt
```

**salt.modules.file.list_backups** *(path, limit=None)*

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's file state backup system.

- **path**
  
The path on the minion to check for backups

- **limit**
  
Limit the number of results to the most recent N backups

CLI Example:

```
salt '!' file.list_backups /foo/bar/baz.txt
```
salt.modules.file.list_backups_dir(path, limit=None)

Lists the previous versions of a directory backed up using Salt’s file state backup system.

- **path**
  The directory on the minion to check for backups

- **limit**
  Limit the number of results to the most recent N backups

CLI Example:

```bash
salt '*' file.list_backups_dir /foo/bar/baz/
```

salt.modules.file.lsattr(path)

New in version 2018.3.0.

Changed in version 2018.3.1: If lsattr is not installed on the system, None is returned.

Changed in version 2018.3.4: If on AIX, None is returned even if in filesystem as lsattr on AIX is not the same thing as the linux version.

Obtain the modifiable attributes of the given file. If path is to a directory, an empty list is returned.

- **path**
  path to file to obtain attributes of. File/directory must exist.

CLI Example:

```bash
salt '*' file.lsattr foo1.txt
```

salt.modules.file.lstat(path)

New in version 2014.1.0.

Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```bash
salt '*' file.lstat /path/to/file
```

salt.modules.file.makedirs_(path, user=None, group=None, mode=None)

Ensure that the directory containing this path is available.

**Note:** The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is /opt/code, then it would be treated as /opt/ but if the path ends with a trailing slash like /opt/code/, then it would be treated as /opt/code/.

CLI Example:

```bash
salt '*' file.makedirs /opt/code/
```

salt.modules.file.makedirs_perms(name, user=None, group=None, mode='0755')

Taken and modified from os.makedirs to set user, group and mode for each directory created.

CLI Example:

```bash
salt '*' file.makedirs_perms /opt/code
```
**manage_file**

```python
(name, sfn, ret, source, source_sum, user, group, mode, attrs, saltenv,
 backup, makedirs=False, template=None, show_changes=True,
 contents=None, dir_mode=None, follow_symlinks=True,
 skip_verify=False, keep_mode=False, encoding=None,
 encoding_errors='strict', seuser=None, serole=None, setype=None,
 serange=None, verify_ssl=True, use_etag=False, signature=None,
 source_hash_sig=None, signed_by_any=None, signed_by_all=None,
 keyring=None, gnupghome=None, **kwargs)
```

Checks the destination against what was retrieved with `get_managed` and makes the appropriate modifications (if necessary).

- **name**
  - location to place the file

- **sfn**
  - location of cached file on the minion

  This is the path to the file stored on the minion. This file is placed on the minion using `cp.cache_file`. If the hash sum of that file matches the `source_sum`, we do not transfer the file to the minion again.

  This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using `salt.files.utils.copyfile()`

- **ret**
  - The initial state return data structure. Pass in `None` to use the default structure.

- **source**
  - file reference on the master

- **source_sum**
  - sum hash for source

- **user**
  - user owner

- **group**
  - group owner

- **backup**
  - backup_mode

- **attrs**
  - attributes to be set on file: " " means remove all of them

  New in version 2018.3.0.

- **makedirs**
  - make directories if they do not exist

- **template**
  - format of templating

- **show_changes**
  - Include diff in state return

- **contents**:
  - contents to be placed in the file

- **dir_mode**
  - mode for directories created with `makedirs`
skip_verify: False
    If True, hash verification of remote file sources (http://, https://, ftp://) will be skipped, and the source_hash argument will be ignored.

    New in version 2016.3.0.

keep_mode: False
    If True, and the source is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

    Note: keep_mode does not work with salt-ssh.

    As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion.

encoding
    If specified, then the specified encoding will be used. Otherwise, the file will be encoded using the system locale (usually UTF-8). See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

    New in version 2017.7.0.

encoding_errors: 'strict'
    Default is `'strict'`. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the error handling schemes.

    New in version 2017.7.0.

seuser
    selinux user attribute

    New in version 3001.

serange
    selinux range attribute

    New in version 3001.

setype
    selinux type attribute

    New in version 3001.

serange
    selinux range attribute

    New in version 3001.

verify_ssl
    If False, remote https file sources (https://) will not attempt to validate the servers certificate. Default is True.

    New in version 3002.

use_etag
    If True, remote http/https file sources will attempt to use the ETag header to determine if the remote file needs to be downloaded. This provides a lightweight mechanism for promptly refreshing files changed on a web server without requiring a full hash comparison via the source_hash parameter.

    New in version 3005.
signature
Ensure a valid GPG signature exists on the selected source file. Set this to true for inline signatures, or to a file URI retrievable by `pyfunc:` `cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

Note: A signature is only enforced directly after caching the file, before it is moved to its final destination. Existing target files (with the correct checksum) will neither be checked nor deleted.

It will be enforced regardless of source type and will be required on the final output, therefore this does not lend itself well when templates are rendered. The file will not be modified, meaning inline signatures are not removed.

New in version 3007.0.

source_hash_sig
When source is a remote file source, source_hash is a file, skip_verify is not true and use_etag is not true, ensure a valid GPG signature exists on the source hash file. Set this to true for an inline (clearsigned) signature, or to a file URI retrievable by `pyfunc:` `cp.cache_file <salt.modules.cp.cache_file>` for a detached one.

Note: A signature on the source_hash file is enforced regardless of changes since its contents are used to check if an existing file is in the correct state - but only for remote sources! As for signature, existing target files will not be modified, only the cached source_hash and source_hash_sig files will be removed.

New in version 3007.0.

signed_by_any
When verifying signatures either on the managed file or its source hash file, require at least one valid signature from one of a list of key fingerprints. This is passed to `gpg.verify`.

New in version 3007.0.

signed_by_all
When verifying signatures either on the managed file or its source hash file, require a valid signature from each of the key fingerprints in this list. This is passed to `gpg.verify`.

New in version 3007.0.

keyring
When verifying signatures, use this keyring.

New in version 3007.0.

gnupghome
When verifying signatures, use this GnuPG home.

New in version 3007.0.

CLI Example:
```
```

Changed in version 2014.7.0: follow_symlinks option added
salt.modules.file.mkdir(dir_path, user=None, group=None, mode=None)
Ensure that a directory is available.
    CLI Example:
        salt '*' file.mkdir /opt/jetty/context

salt.modules.file.mknod(name, ntype="block", major=0, minor=0, user=None, group=None, mode='0600')
New in version 0.17.0.
Create a block device, character device, or fifo pipe. Identical to the gnu mknod.
    CLI Examples:
        salt '*' file.mknod /dev/chr c 180 31
        salt '*' file.mknod /dev/blk b 8 999
        salt '*' file.mknod /dev/fifo p

salt.modules.file.mknod_blkdev(name, major, minor, user=None, group=None, mode='0660')
New in version 0.17.0.
Create a block device.
    CLI Example:
        salt '*' file.mknod_blkdev /dev/blk 8 999

salt.modules.file.mknod_chrdev(name, major, minor, user=None, group=None, mode='0660')
New in version 0.17.0.
Create a character device.
    CLI Example:
        salt '*' file.mknod_chrdev /dev/chr 180 31

salt.modules.file.mknod_fifo(name, user=None, group=None, mode='0660')
New in version 0.17.0.
Create a FIFO pipe.
    CLI Example:
        salt '*' file.mknod_fifo /dev/fifo

salt.modules.file.move(src, dst, disallow_copy_and_unlink=False)
Move a file or directory
    disallow_copy_and_unlink
        If True, the operation is offloaded to the file.rename execution module function. This will use os.rename underneath, which will fail in the event that src and dst are on different filesystems. If False (the default), shutil.move will be used in order to fall back on a "copy then unlink" approach, which is required for moving across filesystems.
New in version 3006.0.
    CLI Example:
        salt '*' file.move /path/to/src /path/to/dst
salt.modules.file.normpath(path)
  Returns Normalize path, eliminating double slashes, etc.
  New in version 2015.5.0.
  This can be useful at the CLI but is frequently useful when scripting.

```python
{% from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_ ~vars %}
```

CLI Example:

```bash
salt '*' file.normpath 'a/b/c/..
```

salt.modules.file.open_files(by_pid=False)
  Return a list of all physical open files on the system.

CLI Examples:

```bash
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

salt.modules.file.pardir()
  Return the relative parent directory path symbol for underlying OS
  New in version 2014.7.0.
  This can be useful when constructing Salt Formulas.

```python
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```bash
salt '*' file.pardir
```

salt.modules.file.patch(originalfile, patchfile, options='', dry_run=False)
  New in version 0.10.4.
  Apply a patch to a file or directory.
  Equivalent to:

```bash
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```bash
patch <options> -i <patchfile> -d <originalfile> -p0
```

originalfile
  The full path to the file or directory to be patched

patchfile
  A patch file to apply to originalfile

options
  Options to pass to patch.
Note: Windows now supports using patch as of 3004.

In order to use this function in Windows, please install the patch binary through your own means and ensure it's found in the system Path. If installing through git-for-windows, please select the optional "Use Git and optional Unix tools from the Command Prompt" option when installing Git.

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
salt '*' file.patch C:\file1.txt C:\file3.patch
```

```
salt.modules.file.path_exists_glob(path)
Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []. Tilde expansion is not supported. Returns True/False.
New in version 2014.7.0.
CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

```
salt.modules.file.prepend(path, *args, **kwargs)
New in version 2014.7.0.
Prepend text to the beginning of a file
path
    path to file
*args
    strings to prepend to the file
CLI Example:

```
salt '*' file.prepend /etc/motd "With all thine offerings thou shalt offer salt." "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'
salt '*' file.prepend /etc/motd args="['cheese=spam', 'spam=cheese']"
```

```
salt.modules.file.psed(path, before, after, limit='', backup=''.bak', flags='gMS', escape_all=False, multi=False)
Deprecated since version 0.17.0: Use replace() instead.
Make a simple edit to a file (pure Python version)
Equivalent to:
```
```
```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

**path**
The full path to the file to be edited

**before**
A pattern to find in order to replace with **after**

**after**
Text that will replace **before**

**limit:** `''`
An initial pattern to search for before searching for **before**

**backup:** `.bak`
The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup

**flags:** **gMS**
Flags to modify the search. Valid values are:

- `g`: Replace all occurrences of the pattern, not just the first.
- `I`: Ignore case.
- `L`: Make `\w`, `\W`, `\b`, `\B`, `\s` and `\S` dependent on the locale.
- `M`: Treat multiple lines as a single line.
- `S`: Make `.` match all characters, including newlines.
- `U`: Make `\w`, `\W`, `\b`, `\B`, `\d`, `\D`, `\s` and `\S` dependent on Unicode.
- `X`: Verbose (whitespace is ignored).

**multi:** **False**
If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the **before** and **after** patterns.

CLI Example:
```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

**salt.modules.file.read**(*path*, **binary=False**)
New in version 2017.7.0.
Return the content of the file.

**Parameters**

- `binary` (**bool**) -- Whether to read and return binary data

CLI Example:
```
salt '*' file.read /path/to/file
```

**salt.modules.file.readdir**(*path*)
New in version 2014.1.0.
Return a list containing the contents of a directory

CLI Example:
salt.modules.file.readlink(path, canonicalize=False)

Return the path that a symlink points to

Parameters

- **path** *(str)* -- The path to the symlink
- **canonicalize** *(bool)* -- Get the canonical path eliminating any symbolic links encountered in the path

Returns

The path that the symlink points to

Return type

str

Raises

- **SaltInvocationError** -- path is not absolute
- **SaltInvocationError** -- path is not a link
- **CommandExecutionError** -- error reading the symbolic link

CLI Example:

```
salt '*' file.readlink /path/to/link
```

salt.modules.file.remove(path, **kwargs)

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

Changed in version 3000: The method now works on all types of file system entries, not just files, directories and symlinks.

salt.modules.file.remove_backup(path, backup_id)

This function is an alias of delete_backup.

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's file state backup system.

path

The path on the minion to check for backups

backup_id

The numeric id for the backup you wish to delete, as found using file.list_backups

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/
    →home/foo/bar/baz.txt 0
```
salt.modules.file.rename\(src, dst\)

Rename a file or directory

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

salt.modules.file.replace\(path, pattern, repl, count=0, flags=8, bufsize=1, append_if_not_found=False, prepend_if_not_found=False, not_found_content=None, backup='.bak', dry_run=False, search_only=False, show_changes=True, ignore_if_missing=False, preserve_inode=True, backslash_literal=False\)

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made.

This is a pure Python implementation that wraps Python’s `sub()`.

**path**

Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

**pattern**

A regular expression, to be matched using Python’s `search()`.

**repl**

The replacement text

**count:** 0

Maximum number of pattern occurrences to be replaced. If count is a positive integer \(n\), only \(n\) occurrences will be replaced, otherwise all occurrences will be replaced.

**flags (list or int)**

A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE', 'MULTILINE']`. Optionally, flags may be an int, with a value corresponding to the XOR (\(\lor\)) of all the desired flags. Defaults to 8 (which supports 'MULTILINE').

**bufsize (int or str)**

How much of the file to buffer into memory at once. The default value 1 processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

**append_if_not_found:** False

New in version 2014.7.0.

If set to `True`, and pattern is not found, then the content will be appended to the file.

**prepend_if_not_found:** False

New in version 2014.7.0.

If set to `True` and pattern is not found, then the content will be prepended to the file.

**not_found_content**

New in version 2014.7.0.

Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

**backup:** .bak

The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.
**dry_run**: False
If set to True, no changes will be made to the file, the function will just return the changes that would have been made (or a True/False value if show_changes is set to False).

**search_only**: False
If set to true, this no changes will be performed on the file, and this function will simply return True if the pattern was matched, and False if not.

**show_changes**: True
If True, return a diff of changes made. Otherwise, return True if changes were made, and False if not.

---

**Note**: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

**ignore_if_missing**: False
New in version 2015.8.0.
If set to True, this function will simply return False if the file doesn’t exist. Otherwise, an error will be thrown.

**preserve_inode**: True
New in version 2015.8.0.
Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by copying the file, reading from the copy, and writing to the file at the original inode. If False, the file will be moved rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using backup to create a backup copy).

**backslash_literal**: False
New in version 2016.11.7.
Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=''
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-
address:'
```

**CLI Examples:**
```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
→'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags=
→'[MULTILINE, IGNORECASE]'
```

salt.modules.file.restore_backup(path, backup_id)
New in version 0.17.0.
Restore a previous version of a file that was backed up using Salt’s file state backup system.

26.6. execution modules
path
The path on the minion to check for backups

backup_id
The numeric id for the backup you wish to restore, as found using `file.list_backups`

CLI Example:
```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

salt.modules.file.restorecon(path, recursive=False)
Reset the SELinux context on a given path

CLI Example:
```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

salt.modules.file.rmdir(path, recursive=False, verbose=False, older_than=None)
New in version 2014.1.0.
Changed in version 3006.0: Changed return value for failure to a boolean.
Remove the specified directory. Fails if a directory is not empty.

recurse
When `recurse` is set to `True`, all empty directories within the path are pruned.
New in version 3006.0.

verbose
When `verbose` is set to `True`, a dictionary is returned which contains more information about the removal process.
New in version 3006.0.

older_than
When `older_than` is set to a number, it is used to determine the number of days which must have passed since the last modification timestamp before a directory will be allowed to be removed. Setting the value to 0 is equivalent to leaving it at the default of `None`.
New in version 3006.0.

CLI Example:
```
salt '*' file.rmdir /tmp/foo/
```

salt.modules.file.search(path, pattern, flags=8, bufsize=1, ignore_if_missing=False, multiline=False)
New in version 0.17.0.
Search for occurrences of a pattern in a file
Except for multiline, params are identical to `replace()`.

multiline
If true, inserts 'MULTILINE' into `flags` and sets `bufsize` to 'file'.
New in version 2015.8.0.

CLI Example:
```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```
salt.modules.file.sed(path, before, after, limit='', backup='.bak', options='-r -e', flags='g', escape_all=False, negate_match=False)

Deprecated since version 0.17.0: Use replace() instead.

Make a simple edit to a file

Equivalent to:

```
  sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

- **path**
  - The full path to the file to be edited

- **before**
  - A pattern to find in order to replace with after

- **after**
  - Text that will replace before

- **limit:** ''
  - An initial pattern to search for before searching for before

- **backup:** .bak
  - The file will be backed up before edit with this file extension; WARNING: each time sed/comment/uncomment is called will overwrite this backup

- **options:** -r -e
  - Options to pass to sed

- **flags:** g
  - Flags to modify the sed search; e.g., i for case-insensitive pattern matching

- **negate_match:** False
  - Negate the search command (!)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the before and after patterns.

CLI Example:

```
  salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.sed_contains(path, text, limit='', flags='g')

Deprecated since version 0.17.0: Use search() instead.

Return True if the file at path contains text. Utilizes sed to perform the search (line-wise search).

Note: the p flag will be added to any flags you pass in.

CLI Example:

```
  salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.seek_read(path, size, offset)

New in version 2014.1.0.

Seek to a position on a file and read it

- **path**
  - path to file

26.6. execution modules
seek
amount to read at once

offset
offset to start into the file

CLI Example:
```
salt 'salt' file.seek_read /path/to/file 4096 0
```

salt.modules.file.seek_write(path, data, offset)
New in version 2014.1.0.
Seek to a position on a file and write to it

path
path to file

data
data to write to file

offset
position in file to start writing

CLI Example:
```
salt 'salt' file.seek_write /path/to/file 'some data' 4096
```

salt.modules.file.set_mode(path, mode)
Set the mode of a file

path
file or directory of which to set the mode

mode
mode to set the path to

CLI Example:
```
salt 'salt' file.set_mode /etc/passwd 0644
```

salt.modules.file.set_selinux_context(path, user=None, role=None, type=None, range=None, persist=False)
Changed in version 3001: Added persist option
Set a specific SELinux label on a given path

CLI Example:
```
salt 'salt' file.set_selinux_context path <user> <role> <type> <range>
salt 'salt' file.set_selinux_context /etc/yum.repos.d/epel.repo system_u:
→object_r system_conf_t s0
```

salt.modules.file.source_list(source, source_hash, saltenv)
Check the source list and return the source to use

CLI Example:
```
salt 'salt' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum
→': <md5sum>}' base
```
salt.modules.file.stats(path, hash_type=None, follow_symlinks=True)

Return a dict containing the stats for a given file

CLI Example:
```
salt '*' file.stats /etc/passwd
```

salt.modules.file.statvfs(path)

New in version 2014.1.0.
Perform a statvfs call against the filesystem that the file resides on

CLI Example:
```
salt '*' file.statvfs /path/to/file
```

salt.modules.file.symlink(src, path, force=False, atomic=False, follow_symlinks=True)

Create a symbolic link (symlink, soft link) to a file

Parameters
- **src** (str) -- The path to a file or directory
- **path** (str) -- The path to the link. Must be an absolute path
- **force** (bool) -- Overwrite an existing symlink with the same name .. versionadded:: 3005
- **atomic** (bool) -- Use atomic file operations to create the symlink .. versionadded:: 3006.0
- **follow_symlinks** (bool) -- If set to False, use os.path.lexists() for existence checks instead of os.path.exists(). .. versionadded:: 3007.0

Returns
True if successful, otherwise raises CommandExecutionError

Return type
bool

CLI Example:
```
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.file.touch(name, atime=None, mtime=None)

New in version 0.9.5.
Just like the touch command, create a file if it doesn't exist or simply update the atime and mtime if it already does.

atime:
Access time in Unix epoch time. Set it to 0 to set atime of the file with Unix date of birth. If this parameter isn't set, atime will be set with current time.

mtime:
Last modification in Unix epoch time. Set it to 0 to set mtime of the file with Unix date of birth. If this parameter isn't set, mtime will be set with current time.

CLI Example:
```
salt '*' file.touch /var/log/emptyfile
```
salt.modules.file.truncate(path, length)

New in version 2014.1.0.

Seek to a position on a file and delete everything after that point.

path
  path to file

length
  offset into file to truncate

CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

salt.modules.file.uid_to_user(uid)

Convert a uid to a user name.

uid
  uid to convert to a username

CLI Example:

```
salt '*' file.uid_to_user 0
```

salt.modules.file.uncomment(path, regex, char='#', backup='.bak')

Deprecated since version 0.17.0: Use replace() instead.

Uncomment specified commented lines in a file.

path
  The full path to the file to be edited

regex
  A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()).

char:
  The character to remove in order to uncomment a line

backup: .bak
  The file will be backed up before edit with this file extension; WARNING: each time sed/comment/uncomment is called will overwrite this backup.

CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

salt.modules.file.user_to_uid(user)

Convert user name to a uid.

user
  user name to convert to its uid

CLI Example:

```
salt '*' file.user_to_uid root
```
salt.modules.file.write(path, *args, **kwargs)

New in version 2014.7.0.

Write text to a file, overwriting any existing contents.

path
    path to file
*args
    strings to write to the file

CLI Example:

can `salt '*' file.write /etc/motd \n    "With all thine offerings thou shalt offer salt."`

Attention

If you need to pass a string to append and that string contains an equal sign, you must include the argument name, args. For example:

```
can `salt '*' file.write /etc/motd args='cheese=spam'
can `salt '*' file.write /etc/motd args='[cheese=spam, spam=cheese]'
```

---

**26.6.137 salt.modules.firewalld**

Support for firewalld.

New in version 2015.2.0.

salt.modules.firewalld.add_interface(zone, interface, permanent=True)

    Bind an interface to a zone

    New in version 2016.3.0.

    CLI Example:

```
can `salt '*' firewall.add_interface zone eth0`
```

salt.modules.firewalld.add_masquerade(zone=None, permanent=True)

    Enable masquerade on a zone. If zone is omitted, default zone will be used.

    New in version 2015.8.0.

    CLI Example:

```
can `salt '*' firewall.add_masquerade`
```

To enable masquerade on a specific zone

```
can `salt '*' firewall.add_masquerade dmz`
```
salt.modules.firewalld.add_port(zone, port, permanent=True, force_masquerade=False)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port internal 443/tcp
```

force_masquerade

when a zone is created ensure masquerade is also enabled on that zone.

salt.modules.firewalld.add_port_fwd(zone, src, dest, proto='tcp', dstaddr='', permanent=True, force_masquerade=False)

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

force_masquerade

when a zone is created ensure masquerade is also enabled on that zone.

salt.modules.firewalld.add_rich_rule(zone, rule, permanent=True)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_rich_rule zone 'rule'
```

salt.modules.firewalld.add_service(service, zone=None, permanent=True)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewalld.add_service ssh my_zone
```

salt.modules.firewalld.add_service_port(service, port)

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_port zone 80
```
salt.modules.firewalld.add_service_protocol(service, protocol)
Add a new protocol to the specified service.
New in version 2016.11.0.
CLI Example:
```
salt '*' firewalld.add_service_protocol zone ssh
```

salt.modules.firewalld.add_source(zone, source, permanent=True)
Bind a source to a zone
New in version 2016.3.0.
CLI Example:
```
salt '*' firewalld.add_source zone 192.168.1.0/24
```

salt.modules.firewalld.allow_icmp(zone, icmp, permanent=True)
Allow a specific ICMP type on a zone
New in version 2015.8.0.
CLI Example:
```
salt '*' firewalld.allow_icmp zone echo-reply
```

salt.modules.firewalld.block_icmp(zone, icmp, permanent=True)
Block a specific ICMP type on a zone
New in version 2015.8.0.
CLI Example:
```
salt '*' firewalld.block_icmp zone echo-reply
```

salt.modules.firewalld.default_zone()
Print default zone for connections and interfaces
CLI Example:
```
salt '*' firewalld.default_zone
```

salt.modules.firewalld.delete_service(name, restart=True)
Delete an existing service
CLI Example:
```
salt '*' firewalld.delete_service my_service
```
By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
```
salt '*' firewalld.delete_service my_service False
```

salt.modules.firewalld.delete_zone(zone, restart=True)
Delete an existing zone
CLI Example:
salt '*' firewalld.delete_zone my_zone

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

salt '*' firewalld.delete_zone my_zone False

salt.modules.firewalld.get_icmp_types(permanent=True)
Print predefined icmptypes

CLI Example:

salt '*' firewalld.get_icmp_types

salt.modules.firewalld.get_interfaces(zone, permanent=True)
List interfaces bound to a zone
New in version 2016.3.0.

CLI Example:

salt '*' firewalld.get_interfaces zone

salt.modules.firewalld.get_masquerade(zone=None, permanent=True)
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

salt '*' firewalld.get_masquerade zone

salt.modules.firewalld.get_rich_rules(zone, permanent=True)
List rich rules bound to a zone
New in version 2016.11.0.

CLI Example:

salt '*' firewalld.get_rich_rules zone

salt.modules.firewalld.get_service_ports(service)
List ports of a service.
New in version 2016.11.0.

CLI Example:

salt '*' firewalld.get_service_ports zone

salt.modules.firewalld.get_service_protocols(service)
List protocols of a service.
New in version 2016.11.0.

CLI Example:

salt '*' firewalld.get_service_protocols zone
salt.modules.firewalld.get_services(permanent=True)
Print predefined services
CLI Example:
salt '*' firewalld.get_services

salt.modules.firewalld.get_sources(zone, permanent=True)
List sources bound to a zone
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.get_sources zone

salt.modules.firewalld.get_zones(permanent=True)
Print predefined zones
CLI Example:
salt '*' firewalld.get_zones

salt.modules.firewalld.list_all(zone=None, permanent=True)
List everything added for or enabled in a zone
CLI Example:
salt '*' firewalld.list_all

List a specific zone
salt '*' firewalld.list_all my_zone

salt.modules.firewalld.list_icmp_block(zone, permanent=True)
List ICMP blocks on a zone
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_icmp_block zone

salt.modules.firewalld.list_port_fwd(zone, permanent=True)
List port forwarding
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_port_fwd public

salt.modules.firewalld.list_ports(zone, permanent=True)
List all ports in a zone.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.list_ports

salt.modules.firewalld.list_services(zone=None, permanent=True)
List services added for zone as a space separated list. If zone is omitted, default zone will be used.
CLI Example:
salt '*' firewalld.list_services

List a specific zone
salt '*' firewalld.list_services my_zone

salt.modules.firewalld.list_zones(permanent=True)
List everything added for or enabled in all zones
CLI Example:
salt '*' firewalld.list_zones

salt.modules.firewalld.make_permanent()
Make current runtime configuration permanent.
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.make_permanent

salt.modules.firewalld.new_service(name, restart=True)
Add a new service
CLI Example:
salt '*' firewalld.new_service my_service

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
salt '*' firewalld.new_service my_service False

salt.modules.firewalld.new_zone(zone, restart=True)
Add a new zone
CLI Example:
salt '*' firewalld.new_zone my_zone

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False
salt '*' firewalld.new_zone my_zone False

salt.modules.firewalld.reload_rules()
Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.
New in version 2016.11.0.
CLI Example:
### salt '*' firewalld.reload_rules

salt.modules.firewalld.remove_interface(zone, interface, permanent=True)
Remove an interface bound to a zone
New in version 2016.3.0.
CLI Example:
salt '*' firewalld.remove_interface zone eth0

### salt.modules.firewalld.remove_masquerade(zone=None, permanent=True)
Remove masquerade on a zone. If zone is omitted, default zone will be used.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.remove_masquerade

To remove masquerade on a specific zone
salt '*' firewalld.remove_masquerade dmz

### salt.modules.firewalld.remove_port(zone, port, permanent=True)
Remove a specific port from a zone.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.remove_port internal 443/tcp

### salt.modules.firewalld.remove_port_fwd(zone, src, dest, proto='tcp', dstaddr='', permanent=True)
Remove Port Forwarding.
New in version 2015.8.0.
CLI Example:
salt '*' firewalld.remove_port_fwd public 80 443 tcp

### salt.modules.firewalld.remove_rich_rule(zone, rule, permanent=True)
Add a rich rule to a zone
New in version 2016.11.0.
CLI Example:
salt '*' firewalld.remove_rich_rule zone 'rule'

### salt.modules.firewalld.remove_service(service, zone=None, permanent=True)
Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.
CLI Example:
salt '*' firewalld.remove_service ssh
To remove a service from a specific zone

```bash
salt '*' firewalld.remove_service ssh dmz
```

**salt.modules.firewalld.remove_service_port** *(service, port)*
Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```bash
salt '*' firewalld.remove_service_port zone 80
```

**salt.modules.firewalld.remove_service_protocol** *(service, protocol)*
Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```bash
salt '*' firewalld.remove_service_protocol zone ssh
```

**salt.modules.firewalld.remove_source** *(zone, source, permanent=True)*
Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```bash
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

**salt.modules.firewalld.set_default_zone** *(zone)*
Set default zone

CLI Example:

```bash
salt '*' firewalld.set_default_zone damian
```

**salt.modules.firewalld.version** *

Return version from firewall-cmd

CLI Example:

```bash
salt '*' firewalld.version
```

---

### 26.6.138 salt.modules.freebsd_sysctl

Module for viewing and modifying sysctl parameters

**salt.modules.freebsd_sysctl.assign** *(name, value)*
Assign a single sysctl parameter for this minion

CLI Example:

```bash
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```
salt.modules.freebsd_sysctl.get(name)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.freebsd_sysctl.persist(name, value, config='/etc/sysctl.conf')

Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf
```

salt.modules.freebsd_sysctl.show(config_file=False)

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file
instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.6.139 salt.modules.freebsd_update

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

maintainer

George Mamalakis <mamalos@gmail.com>

maturity

new

platform

FreeBSD

salt.modules.freebsd_update.fetch(**kwargs)

New in version 2016.3.4.

tfreebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.

kwargs:

Parameters of freebsd-update command.

salt.modules.freebsd_update.ids(**kwargs)

New in version 2016.3.4.

freebsd-update IDS wrapper function. Compares the system against a "known good" index of the installed release.

kwargs:

Parameters of freebsd-update command.
salt.modules.freebsd_update.install(**kwargs)
    New in version 2016.3.4.
    freebsd-update install wrapper. Install the most recently fetched updates or upgrade.
    **kwargs:
    Parameters of freebsd-update command.

salt.modules.freebsd_update.rollback(**kwargs)
    New in version 2016.3.4.
    freebsd-update rollback wrapper. Uninstalls the most recently installed updates.
    **kwargs:
    Parameters of freebsd-update command.

salt.modules.freebsd_update.update(**kwargs)
    New in version 2016.3.4.
    Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.
    **kwargs:
    Parameters of freebsd-update command.

salt.modules.freebsd_update.upgrade(**kwargs)
    New in version 2016.3.4.
    Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:
    
    yes | freebsd-upgrade -r VERSION
    
    the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.
    **kwargs:
    Parameters of freebsd-update command.

26.6.140 salt.modules.freebsdjail

The jail module for FreeBSD

salt.modules.freebsdjail.fstab(jail)
    Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.
    CLI Example:
    
    salt '*' jail.fstab <jail name>

salt.modules.freebsdjail.get_enabled()
    Return which jails are set to be run
    CLI Example:
    
    salt '*' jail.get_enabled

salt.modules.freebsdjail.is_enabled()
    See if jail service is actually enabled on boot
    CLI Example:
salt '*' jail.is_enabled <jail name>

salt.modules.freebsdjail.restart(jail='')
    Restart the specified jail or all, if none specified

    CLI Example:
    salt '*' jail.restart [<jail name>]

salt.modules.freebsdjail.show_config(jail)
    Display specified jail's configuration

    CLI Example:
    salt '*' jail.show_config <jail name>

salt.modules.freebsdjail.start(jail='')
    Start the specified jail or all, if none specified

    CLI Example:
    salt '*' jail.start [<jail name>]

salt.modules.freebsdjail.status(jail)
    See if specified jail is currently running

    CLI Example:
    salt '*' jail.status <jail name>

salt.modules.freebsdjail.stop(jail='')
    Stop the specified jail or all, if none specified

    CLI Example:
    salt '*' jail.stop [<jail name>]

salt.modules.freebsdjail.sysctl()
    Dump all jail related kernel states (sysctl)

    CLI Example:
    salt '*' jail.sysctl

26.6.141 salt.modules.freebsdkmod

Module to manage FreeBSD kernel modules

salt.modules.freebsdkmod.available()
    Return a list of all available kernel modules

    CLI Example:
    salt '*' kmod.available

26.6. execution modules
salt.modules.freebsdkmod.check_available(mod)
Check to see if the specified kernel module is available
CLI Example:
```shell
salt '*' kmod.check_available vmm
```
salt.modules.freebsdkmod.is_loaded(mod)
Check to see if the specified kernel module is loaded
CLI Example:
```shell
salt '*' kmod.is_loaded vmm
```
salt.modules.freebsdkmod.load(mod, persist=False)
Load the specified kernel module
mod
Name of the module to add
persist
Write the module to sysrc kld_modules to make it load on system reboot
CLI Example:
```shell
salt '*' kmod.load bhyve
```
salt.modules.freebsdkmod.lsmod()
Return a dict containing information about currently loaded modules
CLI Example:
```shell
salt '*' kmod.lsmod
```
salt.modules.freebsdkmod.mod_list(only_persist=False)
Return a list of the loaded module names
CLI Example:
```shell
salt '*' kmod.mod_list
```
salt.modules.freebsdkmod.remove(mod, persist=False, comment=True)
Remove the specified kernel module
mod
Name of module to remove
persist
Also remove module from /boot/loader.conf
comment
If persist is set don’t remove line from /boot/loader.conf but only comment it
CLI Example:
```shell
salt '*' kmod.remove vmm
```
26.6.142  salt.modules.freebsdpkg

Remote package support using pkg_add(1)

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

**Warning:** This module has been completely rewritten. Up to and including version 0.17.0, it supported pkg_add(1), but checked for the existence of a pkgng local database and, if found, would provide some of pkgng's functionality. The rewrite of this module has removed all pkgng support, and moved it to the pkgng execution module. For versions <= 0.17.0, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the `sys.doc` function:

```bash
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use pkgng on a FreeBSD 9 system, you will need to override the pkg provider by setting the `providers` parameter in your Minion config file, in order to use pkgng.

**providers:**

```
pkg: pkgng
```

More information on pkgng support can be found in the documentation for the `pkgng` module.

This module will respect the `PACKAGEROOT` and `PACKAGESITE` environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters `freebsdpkg.PACKAGEROOT` and `freebsdpkg.PACKAGESITE` are recognized. These config parameters are looked up using `config.get` and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

   ```python
   freebsdpkg.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/
   packages-9-stable/Latest/
   ```

2. **CLI arguments.** Both the `packageroot` (used interchangeably with `fromrepo` for API compatibility) and `packagesite` CLI arguments are recognized, and override their config counterparts from section 1 above.

   ```bash
   salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
   salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
   salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/FreeBSD/ports/ia64/packages-9-stable/Latest/
   ```

   .. note::

   These arguments can also be passed through `in` states:

   ```yaml
   .. code-block:: yaml

   zsh:
   ```

(continues on next page)
pkg.installed:

salt.modules.freebsdpkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

pkg_add(1) is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```bash
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.freebsdpkg.delete(name=None, pkgs=None, **kwargs)

This function is an alias of remove.

Remove packages using pkg_delete(1)

name

The name of the package to be deleted.

Multiple Package Options:

pkgs

A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.freebsdpkg.file_dict(*packages, **kwargs)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.freebsdpkg.file_list(*packages, **kwargs)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```bash
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```
salt.modules.freebsdpkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)

Install package(s) using pkg_add(1)

name
   The name of the package to be installed.

refresh
   Whether or not to refresh the package database before installing.

fromrepo or packageroot
   Specify a package repository from which to install. Overrides the system default, as well as the PACK-
   AGEROOT environment variable.

package site
   Specify the exact directory from which to install the remote package. Overrides the PACKAGESITE
   environment variable, if present.

Multiple Package Installation Options:

pkgs
   A list of packages to install from a software repository. Must be passed as a python list.

   CLI Example:

   `salt '*' pkg.install pkgs=['"foo", "bar"]'`

sources
   A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the
   values being the source URI or local path to the package.

   CLI Example:

   `salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.deb"}]']`

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

`salt '*' pkg.install <package name>`

salt.modules.freebsdpkg.latest_version(*names, **kwargs)

pkg_add(1) is not capable of querying for remote packages, so this function will always return results as if
there is no package available for install or upgrade.

CLI Example:

`salt '*' pkg.latest_version <package name>`

salt.modules.freebsdpkg.list_pkgs(versions_as_list=False, with_origin=False, **kwargs)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

26.6. execution modules
with_origin
    [False] Return a nested dictionary containing both the origin name and version for each installed package.
    
    New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.freebsdpkg.purge(name=None, pkgs=None, **kwargs)`
This function is an alias of `remove`.

Remove packages using `pkg_delete(1)`

**name**
The name of the package to be deleted.

Multiple Package Options:

**pkgs**
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.freebsdpkg.refresh_db(**kwargs)`

`pkg_add(1)` does not use a local database of available packages, so this function simply returns `True`. It exists merely for API compatibility.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.freebsdpkg.remove(name=None, pkgs=None, **kwargs)`
Remove packages using `pkg_delete(1)`

**name**
The name of the package to be deleted.

Multiple Package Options:

**pkgs**
A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
salt.modules.freebsdpkg.version(*names, **kwargs)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

with_origin

[False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

26.6.143 salt.modules.freebsdpports

Install software from the FreeBSD ports(7) system

New in version 2014.1.0.

This module allows you to install ports using BATCH=yes to bypass configuration prompts. It is recommended to use the ports state to install ports, but it is also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

salt.modules.freebsdpports.config(name, reset=False, **kwargs)

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use ports.showconfig.

name

The port name, in category/name format

reset

[False] If True, runs a make rmconfig for the port, clearing its configuration before setting the desired options

CLI Examples:

```
salt '*' ports.config security/nmap IPV6=off
```

salt.modules.freebsdpports.deinstall(name)

De-install a port.

CLI Example:

```
salt '*' ports.deinstall security/nmap
```

salt.modules.freebsdpports.install(name, clean=True)

Install a port from the ports tree. Installs using BATCH=yes for non-interactive building. To set config options for a given port, use ports.config.
clean

[True] If True, cleans after installation. Equivalent to running make install clean BATCH=yes.

Note: It may be helpful to run this function using the -t option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

CLI Example:

```
salt -t 1200 '*' ports.install security/nmap
```

salt.modules.freebsdports.list_all()

Lists all ports available.

CLI Example:

```
salt '*' ports.list_all
```

**Warning:** Takes a while to run, and returns a LOT of output

salt.modules.freebsdports.rmconfig(name)

Clear the cached options for the specified port; run a make rmconfig

name

The name of the port to clear

CLI Example:

```
salt '*' ports.rmconfig security/nmap
```

salt.modules.freebsdports.search(name)

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n*'  
salt '*' ports.search nmap
```

**Warning:** Takes a while to run

salt.modules.freebsdports.showconfig(name, default=False, dict_return=False)

Show the configuration options for a given port.

**default**

[False] Show the default options for a port (not necessarily the same as the current configuration)

**dict_return**

[False] Instead of returning the output of make showconfig, return the data in a dictionary

CLI Example:
salt '/*' ports.showconfig security/nmap
salt '/*' ports.showconfig security/nmap default=True

salt.modules.freebsdports.update(extract=False)
Update the ports tree

extract
  [False] If True, runs a portsnap extract after fetching, should be used for first-time installation of the ports tree.

CLI Example:
salt '/*' ports.update

26.6.144  salt.modules.freebsdservice
The service module for FreeBSD

Important:  If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

salt.modules.freebsdservice.available(name, jail=None)
Check that the given service is available.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:
salt '/*' service.available sshd

salt.modules.freebsdservice.disable(name, **kwargs)
Disable the named service to start at boot
Arguments the same as for enable()

Changed in version 2016.3.4.

jail (optional keyword argument)
  the jail's id or name

chroot (optional keyword argument)
  the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:
salt '/*' service.disable <service name>

salt.modules.freebsdservice.disabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
salt '/*' service.disabled <service name>
salt.modules.freebsdservice.enable(name, **kwargs)

Enable the named service to start at boot

name
    service name

config
    [/etc/rc.conf] Config file for managing service. If config value is empty string, then
    /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.

    Also service.config variable can be used to change default.

    Changed in version 2016.3.4.

jail (optional keyword argument)
    the jail's id or name

chroot (optional keyword argument)
    the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

    salt '*' service.enable <service name>

salt.modules.freebsdservice.enabled(name, **kwargs)

Return True if the named service is enabled, false otherwise

name
    Service name

    Changed in version 2016.3.4.

    Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

    salt '*' service.enabled <service name>

salt.modules.freebsdservice.get_all(jail=None)

Return a list of all available services

    Changed in version 2016.3.4.

    jail: optional jid or jail name

CLI Example:

    salt '*' service.get_all

salt.modules.freebsdservice.get_disabled(jail=None)

Return what services are available but not enabled to start at boot

    Changed in version 2016.3.4.

    Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

    salt '*' service.get_disabled
salt.modules.freebsdservice.get_enabled(jail=None)
Return what services are set to run on boot
Changed in version 2016.3.4.
Support for jail (representing jid or jail name) keyword argument in kwargs
CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.freebsdservice.missing(name, jail=None)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
Changed in version 2016.3.4.
jail: optional jid or jail name
CLI Example:
```
salt '*' service.missing sshd
```

salt.modules.freebsdservice.reload_(name, jail=None)
Restart the named service
Changed in version 2016.3.4.
jail: optional jid or jail name
CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.freebsdservice.restart(name, jail=None)
Restart the named service
Changed in version 2016.3.4.
jail: optional jid or jail name
CLI Example:
```
salt '*' service.restart <service name>
```

salt.modules.freebsdservice.start(name, jail=None)
Start the specified service
Changed in version 2016.3.4.
jail: optional jid or jail name
CLI Example:
```
salt '*' service.start <service name>
```

salt.modules.freebsdservice.status(name, sig=None, jail=None)
Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
Changed in version 2016.3.4.
Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
Parameters

- **name** *(str)* -- The name of the service to check
- **sig** *(str)* -- Signature to use to find the service via ps

Returns

True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type

bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.freebsdservice.stop(name, jail=None)`

Stop the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.stop <service name>
```

26.6.145 `salt.modules.freezer`

Module for freezer :
maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

`salt.modules.freezer.compare(old, new)`

Display the difference between two frozen states. The results are shown as as a dictionary with keys for packages and repositories. Each key may contain a changes dictionary showing items that differ between the two frozen states. Items shown in the "old" changes but not the "new" were removed. Items in "new" but not "old" were added. Items shown in both probably updated/changed versions between freezes.

old

Name of the "old" frozen state. Required.

new

Name of the "new" frozen state. Required.

CLI Example:

```
salt '*' freezer.freeze pre_install post_install
```

`salt.modules.freezer.freeze(name=None, force=False, **kwargs)`

Save the list of package and repos in a freeze file.

As this module is build on top of the pkg module, the user can send extra attributes to the underlying pkg module via kwargs. This function will call pkg.list_pkgs and pkg.list_repos, and any additional arguments will be passed through to those functions.

name

Name of the frozen state. Optional.

force

If true, overwrite the state. Optional.
CLI Example:

```
salt '*' freezer.freeze
salt '*' freezer.freeze pre_install
salt '*' freezer.freeze force=True root=/chroot
```

salt.modules.freezer.list()  
Return the list of frozen states.

CLI Example:

```
salt '*' freezer.list
```

salt.modules.freezer.restore(name=None, clean=False, **kwargs)  
Make sure that the system contains the packages and repos from a frozen state.

Read the list of packages and repositories from the freeze file, and compare it with the current list of packages and repos. If there is any difference, all the missing packages are repos will be installed, and all the extra packages and repos will be removed.

As this module is build on top of the pkg module, the user can send extra attributes to the underlying pkg module via kwargs. This function will call pkg.list_repos, pkg.mod_repo, pkg.list_pkgs, pkg.install, pkg.remove and pkg.del_repo, and any additional arguments will be passed through to those functions.

name  
Name of the frozen state. Optional.

clean  
If True remove the frozen information YAML from the cache

New in version 3000.

CLI Example:

```
salt '*' freezer.restore
salt '*' freezer.restore root=/chroot
```

salt.modules.freezer.status(name=None)  
Return True if there is already a frozen state.

A frozen state is merely a list of packages (including the version) in a specific time. This information can be used to compare with the current list of packages, and revert the installation of some extra packages that are in the system.

name  
Name of the frozen state. Optional.

CLI Example:

```
salt '*' freezer.status
salt '*' freezer.status pre_install
```
26.6.146 salt.modules.gcp_addon

A route is a rule that specifies how certain packets should be handled by the virtual network. Routes are associated with virtual machine instances by tag, and the set of routes for a particular VM is called its routing table. For each packet leaving a virtual machine, the system searches that machine’s routing table for a single best matching route. New in version 2018.3.0.

This module will create a route to send traffic destined to the Internet through your gateway instance.

```python
codeauthor
Pratik Bandarkar <pratik.bandarkar@gmail.com>
maturity
new
depends
google-api-python-client
platform
Linux

salt.modules.gcp_addon.route_create(credential_file=None, project_id=None, name=None, dest_range=None, next_hop_instance=None, instance_zone=None, tags=None, network=None, priority=None)
```

Create a route to send traffic destined to the Internet through your gateway instance

credential_file
[string] File location of application default credential. For more information, refer: https://developers.google.com/identity/protocols/application-default-credentials

project_id
[string] Project ID where instance and network resides.

name
[string] name of the route to create

next_hop_instance
[string] the name of an instance that should handle traffic matching this route.

instance_zone
[string] zone where instance("next_hop_instance") resides

network
[string] Specifies the network to which the route will be applied.

dest_range
[string] The destination range of outgoing packets that the route will apply to.

tags
[list] (optional) Identifies the set of instances that this route will apply to.

priority
[int] (optional) Specifies the priority of this route relative to other routes. default=1000

CLI Example:

```bash
salt 'salt-master.novalocal' gcp.route_create
credential_file=/root/secret_key.json
project_id=cp100-170315
```

(continues on next page)
In above example, the instances which are having tag "no-ip" will route the packet to instance "instance-1" (if packet is intended to other network)

26.6.147 salt.modules.gem

Manage ruby gems.

salt.modules.gem.install(gems, ruby=None, gem_bin=None, runas=None, version=None, rdoc=False, ri=False, pre_releases=False, proxy=None, source=None)

Installs one or several gems.

Parameters

- **gems** -- string The gems to install
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn't play nice with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s). For rubygems > 3 this is interpreted as the --no-document arg and the ri option will then be ignored
- **ri** -- boolean : False Generate RI documentation for the gem(s). For rubygems > 3 this is interpreted as the --no-document arg and the rdoc option will then be ignored
- **pre_releases** -- boolean : False Include pre-releases in the available versions
- **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname[:port]

salt.modules.gem.list_(prefix='', ruby=None, runas=None, gem_bin=None)

List locally installed gems.

Parameters
• **prefix** -- string : Only list gems when the name matches this prefix.

• **gem_bin** -- string : None Full path to `gem` binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas** -- string : None The user to run `gem` as.

CLI Example:

```
salt '*' gem.list
```

`salt.modules.gem.list_upgrades(**ruby=None, runas=None, gem_bin=None**)`

New in version 2015.8.0.

Check if an upgrade is available for installed gems

• **gem_bin**
  [None] Full path to `gem` binary to use.

• **ruby**
  [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas**
  [None] The user to run `gem` as.

CLI Example:

```
salt '*' gem.list_upgrades
```

`salt.modules.gem.sources_add(**source_uri, ruby=None, runas=None, gem_bin=None**)`

Add a gem source.

Parameters

• **source_uri** -- string The source URI to add.

• **gem_bin** -- string : None Full path to `gem` binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas** -- string : None The user to run `gem` as.

CLI Example:

```
salt '*' gem.sources_add http://rubygems.org/
```

`salt.modules.gem.sources_list(**ruby=None, runas=None, gem_bin=None**)`

List the configured gem sources.

Parameters

• **gem_bin** -- string : None Full path to `gem` binary to use.

• **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

• **runas** -- string : None The user to run `gem` as.

CLI Example:
Remove a gem source.

**Parameters**

- `source_uri` -- string The source URI to remove.
- `gem_bin` -- string : None Full path to gem binary to use.
- `ruby` -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- `runas` -- string : None The user to run gem as.

**CLI Example:**

```
salt '*' gem.sources_remove http://rubygems.org/
```

Uninstall one or several gems.

**Parameters**

- `gems` -- string The gems to uninstall.
- `gem_bin` -- string : None Full path to gem binary to use.
- `ruby` -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- `runas` -- string : None The user to run gem as.

**CLI Example:**

```
salt '*' gem.uninstall vagrant
```

Update one or several gems.

**Parameters**

- `gems` -- string The gems to update.
- `gem_bin` -- string : None Full path to gem binary to use.
- `ruby` -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- `runas` -- string : None The user to run gem as.

**CLI Example:**

```
salt '*' gem.update vagrant
```

Update rubygems.

**Parameters**

- `version` -- string : (newest) The version of rubygems to install.
- `gem_bin` -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:
```
salt '*' gem.update_system
```

salt.modules.gem.version(ruby=\text{None}, runas=\text{None}, gem_bin=\text{None})

Print out the version of gem

Parameters
- **gem_bin** -- string : None Full path to gem binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if gem_bin is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:
```
salt '*' gem.version
```

26.6.148 **salt.modules.genesis**

Module for managing container and VM images

New in version 2014.7.0.

salt.modules.genesis.avail_platforms()

Return which platforms are available

CLI Example:
```
salt myminion genesis.avail_platforms
```

salt.modules.genesis.bootstrap(platform=\text{rpm}, root=\text{dir}, img_format=\text{dir}, fs_format=\text{ext2}, fs_opts=\text{None}, arch=\text{None}, flavor=\text{None}, repo_url=\text{None}, static_gemu=\text{None}, img_size=\text{None}, mount_dir=\text{None}, pkg_cache=\text{None}, pkgs=\text{None}, exclude_pkgs=\text{None}, epel_url=\text{http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm})

Create an image for a specific platform.

Please note that this function \textit{MUST} be run as root, as images that are created make files belonging to root.

platform
Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

root
Local path to create the root of the image filesystem.

img_format
Which format to create the image in. By default, just copies files into a directory on the local filesystem (dir). Future support will exist for \texttt{sparse}.

fs_format
When using a non-dir img_format, which filesystem to format the image to. By default, ext2.
fs_opts
   When using a non-dir img_format, a dict of opts may be specified.

arch
   Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

flavor
   Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, wheezy on Debian.

repo_url
   Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: http://ftp.debian.org/debian/)

static_qemu
   Local path to the static qemu binary required for this arch. (e.x.: /usr/bin/qemu-amd64-static)

pkg_confs
   The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

img_size
   If img_format is not dir, then the size of the image must be specified.

mount_dir
   If img_format is not dir, then the image must be mounted somewhere. If the mount_dir is not specified, then it will be created at /opt/salt-genesis.<random_uuid>. This directory will be unmounted and removed when the process is finished.

pkg_cache
   This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

pkgs
   A list of packages to be installed on this image. For RedHat, this will include yum, centos-release and iputils by default.

exclude_pkgs
   A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

epel_url
   The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64
   ≡ flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

salt.modules.genesis.**ldd_deps**(filename, ret=None)

Recurse through a set of dependencies reported by ldd, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

```
salt myminion genesis.ldd_deps bash
salt myminion genesis.ldd_deps /bin/bash
```
salt.modules.genesis.mksls\(fmt, src, dst=None\)

Convert an installation file/script to an SLS file. Currently supports kickstart, preseed, and autoyast.

CLI Examples:

```
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg
salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg /path/to/→dest.sls
```

New in version 2015.8.0.

salt.modules.genesis.pack\(name, root, path=None, pack_format='tar', compress='bzip2'\)

Pack up a directory structure, into a specific format

CLI Examples:

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

salt.modules.genesis.unpack\(name, dest=None, path=None, pack_format='tar', compress='bz2'\)

Unpack an image into a directory structure

CLI Example:

```
salt myminion genesis.unpack centos /root/centos
```

26.6.149 salt.modules.gentoo_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a

different module (or gives an error similar to 'service.start' is not available), see [here](#).

salt.modules.gentoo_service.available\(name\)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.gentoo_service.disable\(name, **kwargs\)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.disabled\(name\)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```
salt.modules.gentoo_service.enable(name, **kwargs)
Enable the named service to start at boot

CLI Example:
```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.enabled(name, **kwargs)
Return True if the named service is enabled, false otherwise

CLI Example:
```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.get_all()
Return all available boot services

CLI Example:
```
salt '*' service.get_all
```

salt.modules.gentoo_service.get_disabled()
Return a set of services that are installed but disabled

CLI Example:
```
salt '*' service.get_disabled
```

salt.modules.gentoo_service.get_enabled()
Return a list of service that are enabled on boot

CLI Example:
```
salt '*' service.get_enabled
```

salt.modules.gentoo_service.missing(name)
The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:
```
salt '*' service.missing sshd
```

salt.modules.gentoo_service.reload_(name)
Reload the named service

CLI Example:
```
salt '*' service.reload <service name>
```

salt.modules.gentoo_service.restart(name)
Restart the named service

CLI Example:
salt '*' service.restart <service name>
salt.modules.gentoo_service.start(name)
   Start the specified service
   CLI Example:
   salt '*' service.start <service name>
salt.modules.gentoo_service.status(name, sig=None)
   Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.
   Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
   Parameters
   • name (str) -- The name of the service to check
   • sig (str) -- Signature to use to find the service via ps
   Returns
   True if running, False otherwise dict: Maps service name to True if running, False otherwise
   Return type
   bool
   CLI Example:
   salt '*' service.status <service name> [service signature]
salt.modules.gentoo_service.stop(name)
   Stop the specified service
   CLI Example:
   salt '*' service.stop <service name>
salt.modules.gentoo_service.zap(name)
   Resets service state
   CLI Example:
   salt '*' service.zap <service name>

26.6.150 salt.modules.gentoolkitmod

Support for Gentoolkit
salt.modules.gentoolkitmod.eclean_dist(destructive=False, package_names=False, size_limit=0, time_limit=0, fetch_restricted=False, exclude_file='/etc/eclean/distfiles.exclude')
   Clean obsolete portage sources
   destructive
   Only keep minimum for reinstallation
package_names
Provide all versions of installed packages. Only meaningful if used with destructive=True

size_limit <size>
Don't delete distfiles bigger than <size>. <size> is a size specification: "10M" is "ten megabytes", "200K" is "two hundreds kilobytes", etc. Units are: G, M, K and B.

time_limit <time>
Don't delete distfiles modified since <time> <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

fetch_restricted
Protect fetch-restricted files. Only meaningful if used with destructive=True

exclude_file
Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```
{'cleaned': {'<dist file>': <size>},
'deprecated': {'<package>': '<dist file>'},
'saved': {'<package>': '<dist file>'},
'total_cleaned': <size>
```

CLI Example:

```
salt '*' gentoolkit.eclean_dist destructive=True
```

salt.modules.gentoolkitmod.eclean_pkg(destructive=False, package_names=False, time_limit=0,
exclude_file='/etc/eclean/distfiles.exclude')

Clean obsolete binary packages

destructive
Only keep minimum for reinstalltion

package_names
Provide all versions of installed packages. Only meaningful if used with destructive=True

time_limit <time>
Don't delete distfiles files modified since <time> <time> is an amount of time: "1y" is "one year", "2w" is "two weeks", etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

exclude_file
Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```
{'cleaned': {'<dist file>': <size>},
'total_cleaned': <size>
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

salt.modules.gentoolkitmod.glsa_check_list(glsa_list)
List the status of Gentoo Linux Security Advisories
glsa_list
can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers 'all'
and 'affected'

Returns a dict containing glsa ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
'status': <glsa status>,
'CVEs': [<list of CVEs>]}}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

```
salt.modules.gentoolkitmod.revdep_rebuild( lib=None)
```

Fix up broken reverse dependencies

lib
Search for reverse dependencies for a particular library rather than every library on the system. It can
be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

26.6.151 salt.modules.git

Support for the Git SCM

```
salt.modules.git.add( cwd, filename, opts='', git_opts='', user=None, password=None, ignore_retcode=False,
output_encoding=None)
```

Changed in version 2015.8.0: The --verbose command line argument is now implied

Interface to git-add(1)

cwd
The path to the git checkout

filename
The location of the file/directory to add, relative to cwd

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=
(as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the add subcommand), in a single string. This
is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.
user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

salt.modules.git.archive(cwd, output, rev='HEAD', prefix=None, git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

Changed in version 2015.8.0: Returns True if successful, raises an error if not.

Interface to git-archive(1), exports a tarball/zip file of the repository

cwd
The path to be archived

Note: git archive permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by cwd (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at /tmp/foo, then passing /tmp/foo/bar as the cwd will result in just the files underneath /tmp/foo/bar to be exported as an archive.

output
The path of the archive to be created

overwrite
[False] Unless set to True, Salt will over overwrite an existing archive at the path specified by the output argument.
New in version 2015.8.0.

rev
[HEAD] The revision from which to create the archive
format
Manually specify the file format of the resulting archive. This argument can be omitted, and `git
archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`,
`gz`, and `tgz` are extensions that are recognized automatically, and `git` can be configured to support other
archive types with the addition of `git` configuration keys.

See the `git-archive(1)` manpage explanation of the `--format` argument (as well as the
`CONFIGURATION` section of the manpage) for further information.

New in version 2015.8.0.

prefix
Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top
level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be
`baz`, and the resulting archive will contain a top-level directory by that name).

Note: The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend
a prefix, so Salt’s behavior differs slightly from `git archive` in this respect. Use `prefix=' '` to create
an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version,
it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a
top-level directory.

git_opts
Any additional options to add to git command itself (not the `archive` subcommand), in a single string.
This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-
Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are
run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.
CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

```
salt.modules.git.branch(cwd, name=None, opts='''', git_opts='''', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

**Interface to git-branch(1)**

- **cwd**
  The path to the git checkout

- **name**
  Name of the branch on which to operate. If not specified, the current branch will be assumed.

- **opts**
  Any additional options to add to the command line, in a single string

**Note:** To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

- **git_opts**
  Any additional options to add to git command itself (not the `branch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

  New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

- **user**
  User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password**
  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **ignore_retcode**
  [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

  New in version 2015.8.0.

- **output_encoding**
  Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

  **Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

  New in version 2018.3.1.

**CLI Examples:**
salt.modules.git.checkout(cwd, rev=None, force=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to git-checkout(1)

cwd
The path to the git checkout

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts
Any additional options to add to git command itself (not the checkout subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

rev
The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using -b or -B in opts.

force
[False] Force a checkout even if there might be overwritten changes

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.
output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'

# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='--track
newbranch'

# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='--track
newbranch'
```

```
salt.modules.git.clone(cwd, url=None, name=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, saltenv='base', output_encoding=None)
```

Interface to `git-clone(1)`

cwd
Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made within this directory.

url
The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

name
Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

opts
Any additional options to add to the command line, in a single string

git_opts
Any additional options to add to git command itself (not the `clone` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.
**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https_user**

Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**https_pass**

Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

**ignore_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.git
```

```
salt.modules.git.commit(cwd, message, opts='', git_opts='', user=None, password=None, filename=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-commit(1)`
cwd
   The path to the git checkout

message
   Commit message

opts
   Any additional options to add to the command line, in a single string. These opts will be added to the
   end of the git command being run.

   **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=`
   (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

   The `−m` option should not be passed here, as the commit message will be defined by the `message`
   argument.

git_opts
   Any additional options to add to git command itself (not the `commit` subcommand), in a single string.
   This is useful for passing `−c` to run git with temporary changes to the git configuration.
   
   New in version 2017.7.0.

   **Note:** This is only supported in git 1.7.2 and newer.

user
   User under which to run the git command. By default, the command is run by the user under which the
   minion is running.

password
   Windows only. Required when specifying `user`. This parameter will be ignored on non-
   Windows platforms.
   
   New in version 2016.3.4.

filename
   The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used
   to commit a file without first staging it.

   **Note:** This argument only works on files which are already tracked by the git repository.
   
   New in version 2015.8.0.

ignore_retcode
   [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
   
   New in version 2015.8.0.

output_encoding
   Use this option to specify which encoding to use to decode the output from any git commands which are
   run. This should not be needed in most cases.

   **Note:** This should only be needed if the files in the repository were created with filenames using an
   encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Examples:
```bash
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

```python
salt.modules.git.config_get(key, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)
```

Get the value of a key in the git configuration file

- **key**: The name of the configuration key to get
  
  Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

- **cwd**: The path to the git checkout
  
  Changed in version 2015.8.0: Now optional if `global` is set to `True`

- **global**: [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

  New in version 2015.8.0.

- **all**: [False] If `True`, return a list of all values set for `key`. If the key does not exist, `None` will be returned.

  New in version 2015.8.0.

- **user**: User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password**: Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **ignore_retcode**: [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

  New in version 2015.8.0.

- **output_encoding**: Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

  New in version 2018.3.1.

CLI Examples:
salt.myminion.git.config_get user.name cwd=/path/to/repo
salt.myminion.git.config_get user.email global=True
salt.myminion.git.config_get core.gitproxy cwd=/path/to/repo all=True

salt.modules.git.config_get_regex(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

This function is an alias of config_get_regex.

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the value_regex. If no values match, an empty dictionary will be returned.

key
Regex on which key names will be matched

value_regex
If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the value_regex will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the value_regex argument.

cwd
The path to the git checkout

global
[False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar

# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'

# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^[user].*' global=True

salt.modules.git.config_get_regexp (key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the value_regex. If no values match, an empty dictionary will be returned.

**key**  
Regex on which key names will be matched

**value_regex**  
If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

**Important:** Only values matching the value_regex will be part of the return data. So, if key matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the value_regex argument.

cwd  
The path to the git checkout

global  
[False] If True, query the global git configuration. Otherwise, only the local git configuration will be queried.

user  
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding  
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
salt.modules.git.config_set(key, value=None, multivar=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

cwd
The path to the git checkout. Must be an absolute path, or the word global to indicate that a global key should be set.

Changed in version 2014.7.0: Made cwd argument optional if is_global=True

key
The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from setting_name to key

value
The value to set for the specified key. Incompatible with the multivar argument.

Changed in version 2015.8.0: Argument renamed from setting_value to value

add
[False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

multivar
Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the value argument.

New in version 2015.8.0.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

global
[False] If True, set a global variable

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

salt.modules.git.config_unset(key, value_regex=None, cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Unset a key in the git configuration file

cwd
The path to the git checkout. Must be an absolute path, or the word global to indicate that a global key should be unset.

key
The name of the configuration key to unset

value_regex
Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if all is set to True.

all
[False] If True unset all values for a multivar. If False, and key is a multivar, an error will be raised.

global
[False] If True, unset a global variable. Otherwise, a local variable will be unset.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True

salt.modules.git.current_branch(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

cwd
The path to the git checkout

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:
salt myminion git.current_branch /path/to/repo

salt.modules.git.describe(cwd, rev='HEAD', user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the git-describe(1) string (or the SHA1 hash if there are no tags) for the given revision.

cwd
The path to the git checkout

rev
[HEAD] The revision to describe

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**ignore_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2015.8.0.

New in version 2018.3.1.

**CLI Examples:**

```bash
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

salt.modules.git.diff(cwd=None, item1=None, item2=None, opts='', git_opts='', user=None, password=None, no_index=False, cached=False, paths=None, output_encoding=None)

New in version 2015.8.12, 2016.3.3, 2016.11.0.

**Interface to** `git-diff(1)`

**cwd**

The path to the git checkout

**item1 and item2**

Revision(s) to pass to the git diff command. One or both of these arguments may be ignored if some of the options below are set to True. When cached is False, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

**opts**

Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts**

Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**no_index**

[False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to True. If this is left False in these instances, then a normal git diff will be performed against the index (i.e. unstaged changes), and files in the **paths** option will be used to narrow down the diff output.

**Note:** Requires Git 1.5.1 or newer. Additionally, when set to True, **item1** and **item2** will be ignored.

**cached**

[False] If True, compare staged changes to **item1** (if specified), otherwise compare them to the most recent commit.

**Note:** **item2** is ignored if this option is is set to True.

**paths**

File paths to pass to the git diff command. Can be passed as a comma-separated list or a Python list.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1, →path/to/file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/ →absolute/path/to/file2
```

salt.modules.git.**discard_local_changes**(cwd, path='.', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2019.2.0.

26.6. execution modules
Runs a git checkout -- <path> from the directory specified by cwd.

**cwd**
The path to the git checkout

**path**
path relative to cwd (defaults to .)

**user**
User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

**ignore_retcode**
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding**
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Example:

```
salt myminion git.discard_local_changes /path/to/repo
salt myminion git.discard_local_changes /path/to/repo path=foo
```

salt.modules.git.fetch(cwd, remote=None, force=False, refspecs=None, opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to git-fetch(1)

**cwd**
The path to the git checkout

**remote**
Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in git-fetch(1)).

New in version 2015.8.0.

**force**
Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

**refspecs**
Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.
opts

Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts**

Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**

Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**ignore_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**saltenv**

The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

```
salt.modules.git.init(cwd, bare=False, template=None, separate_git_dir=None, shared=None, opts='',
  git_opts='', user=None, password=None, ignore_retcode=False,
  output_encoding=None)
```

Interface to `git-init(1)`

cwd

The path to the directory to be initialized

bare

[False] If True, init a bare repository

New in version 2015.8.0.

```
template
```

Set this argument to specify an alternate template directory

New in version 2015.8.0.

```
separate_git_dir
```

Set this argument to specify an alternate $GIT_DIR

New in version 2015.8.0.

```
shared
```

Set sharing permissions on git repo. See `git-init(1)` for more details.

New in version 2015.8.0.

```
opts
```

Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

```
git_opts
```

Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

```
user
```

User under which to run the git command. By default, the command is run by the user under which the minion is running.

```
password
```

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```shell
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

salt.modules.git.is_worktree(cwd, user=, password=, output_encoding=)
New in version 2015.8.0.

This function will attempt to determine if cwd is part of a worktree by checking its .git to see if it is a file containing a reference to another gitdir.

cwd
path to the worktree to be removed

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```shell
salt myminion git.is_worktree /path/to/repo
```

salt.modules.git.list_branches(cwd, remote=False, user=, password=, ignore_retcode=False, output_encoding=)

26.6. execution modules
New in version 2015.8.0.

Return a list of branches

`cwd`

The path to the git checkout

`remote`

[Boolean] If True, list remote branches. Otherwise, local branches will be listed.

**Warning:** This option will only return remote branches of which the local checkout is aware, use `git.fetch` to update remotes.

`user`

User under which to run the git command. By default, the command is run by the user under which the minion is running.

`password`

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

`ignore_retcode`

[Boolean] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

`output_encoding`

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

`salt.modules.git.list_tags`(cwd, user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Return a list of tags

`cwd`

The path to the git checkout

`user`

User under which to run the git command. By default, the command is run by the user under which the minion is running.

`password`
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**

[False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

```python
salt.modules.git.list_worktrees(cwd, stale=False, user=None, password=None, output_encoding=None, **kwargs)
```

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to `git-worktree(1)` which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

**Note:** By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

**cwd**

The path to the git checkout

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**all**

[False] If `True`, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.

**stale**

[False] If `True`, return only worktrees whose gitdir is no longer present.

26.6. execution modules
Note: Only one of all and stale can be set to True.

**output_encoding**
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

salt.modules.git.ls_remote(cwd=None, remote='origin', ref=None, opts='', git_opts='', user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, output_encoding=None, saltenv='base')

Interface to `git-ls-remote(1)`. Returns the upstream hash for a remote reference.

cwd
The path to the git checkout. Optional (and ignored if present) when remote is set to a URL instead of a remote name.

remote
[origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the cwd parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from repository to remote

ref
The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, ref can be set to refs/pull/1234/head)

Changed in version 2015.8.0: Argument renamed from branch to ref

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

opts
Any additional options to add to the command line, in a single string

New in version 2015.8.0.

git_opts
Any additional options to add to git command itself (not the ls-remote subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.
user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file
Changed in version 2016.3.0.

https_user
Set HTTP Basic Auth username. Only accepted for HTTPS URLs.
New in version 2015.5.0.

https_pass
Set HTTP Basic Auth password. Only accepted for HTTPS URLs.
New in version 2015.5.0.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from
New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git
--ref=mytag opts='--tags'
```
salt.modules.git.merge(cwd, rev=None, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, output_encoding=None, **kwargs)

Interface to `git-merge(1)`

cwd
The path to the git checkout

rev
Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.
New in version 2015.8.0.

opts
Any additional options to add to the command line, in a single string

**Note**: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts
Any additional options to add to git command itself (not the `merge` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.
New in version 2017.7.0.

**Note**: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

**Note**: For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5,2019.2.1,3000.

ignore_retcode
`[False]` If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# ... or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

```
salt.modules.git.merge_base(cwd, refs=None, octopus=False, is_ancestor=False, independent=False,
    fork_point=None, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)
```

New in version 2015.8.0.

Interface to `git-merge-base(1)`.

**cwd**
- The path to the git checkout

**refs**
- Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

**all**
- [False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

**octopus**
- [False] If True, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See here for a description of how these bases are determined.

  Set `all` to True with this option to return all computed merge bases, otherwise only the "best" will be returned.

**is_ancestor**
- [False] If True, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

Note: This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

**independent**
- [False] If True, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

**fork_point**
- If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, None is returned.
**Note:** At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then HEAD is assumed.

**opts**

Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing. This option should not be necessary unless new CLI arguments are added to `git-merge-base(1)` and are not yet supported in Salt.

**git_opts**

Any additional options to add to git command itself (not the `merge-base` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**

[False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

**CLI Examples:**

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886
    → octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886
    → independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_
    → ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
```

(continues on next page)
salt.myminion.git.merge_base /path/to/repo refs=mybranch fork=_point=upstream/master

salt.modules.git.merge_tree(cwd, ref1, ref2, base=None, user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to git-merge-tree(1), shows the merge results and conflicts from a 3-way merge without touching the index.

cwd
The path to the git checkout

ref1
First ref/commit to compare

ref2
Second ref/commit to compare

base
The base tree to use for the 3-way-merge. If not provided, then git.merge_base will be invoked on ref1 and ref2 to determine the merge base to use.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] if True, do not log an error to the minion log if the git command returns a nonzero exit status.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d

salt.modules.git.pull(cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None)

Interface to git-pull(1)

cwd
The path to the git checkout
opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with \texttt{opts=} (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git\_opts
Any additional options to add to git command itself (not the \texttt{pull} subcommand), in a single string. This is useful for passing \texttt{\textendash\ c} to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying \texttt{user}. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using \texttt{salt\textendash call}, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the \texttt{sshd(8)} manpage for information on securing the keypair from the remote side in the \texttt{authorized\_keys} file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using \texttt{salt\textendash call}, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. \texttt{salt://location/identity\_file}

Changed in version 2016.3.0.

ignore\_retcode
[\texttt{False}] If \texttt{True}, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output\_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

```
salt.modules.git.push(cwd, remote=None, ref=None, opts='', user=None, password=None, identity=None, ignore_retcode=False, saltenv='base', output_encoding=None, **kwargs)
```

Interface to `git-push(1)`

cwd
The path to the git checkout

remote
Name of the remote to which the ref should being pushed

New in version 2015.8.0.

ref
[master] Name of the ref to push

**Note:** Being a refspec, this argument can include a colon to define local and remote ref names.

opts
Any additional options to add to the command line, in a single string

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

git_opts
Any additional options to add to git command itself (not the push subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs
Warning: Unless Salt is invoked from the minion using salt-call, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
New in version 2015.8.0.

saltenv
The default salt environment to pull sls files from
New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
New in version 2018.3.1.

CLI Example:

```bash
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

salt.modules.git.rebase(cwd, rev='master', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)

Interface to git-rebase(1)

cwd
The path to the git checkout

rev
[master] The revision to rebase onto the current branch

opts
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts=(as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.
**git_opts**

Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

salt.modules.git.remote_get(cwd, remote='origin', user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None)

Get the fetch and push URL for a specific remote

**cwd**

The path to the git checkout

**remote**

[origin] Name of the remote to query

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**redact_auth**

[True] Set to False to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

**Warning:** Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

**ignore_retcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

**CLI Examples:**

```bash
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

**salt.modules.git.remote_reps**

```python
salt.modules.git.remote_reps(url, heads=False, tags=False, user=None, password=None, identity=None, https_user=None, https_pass=None, ignore_retcode=False, output_encoding=None, saltenv='base', **kwargs)
```

New in version 2015.8.0.

Return the remote refs for the specified URL by running git `ls-remote`.

**url**

URL of the remote repository

**filter**

Optionally provide a ref name to git `ls-remote`. This can be useful to make this function run faster on repositories with many branches/tags.

New in version 2019.2.0.

**heads**

[False] Restrict output to heads. Can be combined with `tags`.

**tags**

[False] Restrict output to tags. Can be combined with `heads`.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**identity**
Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphrase-less. For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`

Changed in version 2016.3.0.

**https_user**
Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

**https_pass**
Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

**ignore_retcode**
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**saltenv**
The default salt environment to pull sls files from

New in version 2016.3.1.

**output_encoding**
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
salt myminion git.remote_refs https://github.com/saltstack/salt.git
  -filter=develop
```

```
salt.modules.git.remote_set(cwd, url, remote='origin', user=None, password=None, https_user=None, https_pass=None, push_url=None, push_https_user=None, push_https_pass=None, ignore_retcode=False, output_encoding=None)
```

**cwd**
The path to the git checkout

**url**
Remote URL to set
remote
   [origin] Name of the remote to set

push_url
   If unset, the push URL will be identical to the fetch URL.
   New in version 2015.8.0.

user
   User under which to run the git command. By default, the command is run by the user under which the
   minion is running.

password
   Windows only. Required when specifying user. This parameter will be ignored on non-
   Windows platforms.
   New in version 2016.3.4.

https_user
   Set HTTP Basic Auth username. Only accepted for HTTPS URLs.
   New in version 2015.5.0.

https_pass
   Set HTTP Basic Auth password. Only accepted for HTTPS URLs.
   New in version 2015.5.0.

push_https_user
   Set HTTP Basic Auth user for push_url. Ignored if push_url is unset. Only accepted for HTTPS
   URLs.
   New in version 2015.8.0.

push_https_pass
   Set HTTP Basic Auth password for push_url. Ignored if push_url is unset. Only accepted for
   HTTPS URLs.
   New in version 2015.8.0.

ignore_retcode
   [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
   New in version 2015.8.0.

output_encoding
   Use this option to specify which encoding to use to decode the output from any git commands which are
   run. This should not be needed in most cases.

   Note: This should only be needed if the files in the repository were created with filenames using an
   encoding other than UTF-8 to handle Unicode characters.

   New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
   → remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.
   → git.remote=upstream push_url=git@github.com:user/repo.git
```
salt.modules.git.remotes(cwd, user=None, password=None, redact_auth=True, ignore_retcode=False, output_encoding=None)

Get fetch and push URLs for each remote in a git checkout

cwd
   The path to the git checkout

user
   User under which to run the git command. By default, the command is run by the user under which the
   minion is running.

password
   Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

   New in version 2016.3.4.

redact_auth
   [True] Set to False to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

   Warning: Setting this to False will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

   New in version 2015.5.6.

ignore_retcode
   [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

   New in version 2015.8.0.

output_encoding
   Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

   Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

   New in version 2018.3.1.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

salt.modules.git.reset(cwd, opts='', git_opts='', user=None, password=None, identity=None, ignore_retcode=False, output_encoding=None)

Interface to git-reset(1), returns the stdout from the git command

cwd
   The path to the git checkout

opts
   Any additional options to add to the command line, in a single string
Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts**
Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.
New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

**user**
User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.
New in version 2016.3.4.

**identity**
Path to a private key to use for ssh URLs. Salt will not attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input. Key can also be specified as a SaltStack file server URL, eg. `salt://location/identity_file`.

Note: For greater security with passphraseless private keys, see the `sshd(8)` manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

New in version 2018.3.5, 2019.2.1, 3000.

**ignore_retcode**
`[False]` If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.
New in version 2015.8.0.

**output_encoding**
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```
New in version 2015.8.0.

Interface to `git-rev-parse(1)`

**cwd**

The path to the git checkout

**rev**

Revision to parse. See the SPECIFYING REVISIONS section of the `git-rev-parse(1)` manpage for details on how to format this argument.

This argument is optional when using the options in the Options for Files section of the `git-rev-parse(1)` manpage.

**opts**

Any additional options to add to the command line, in a single string

**git_opts**

Any additional options to add to git command itself (not the rev-parse subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**

[Boolean] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

**CLI Examples:**

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
```

(continues on next page)
salt modules.git.revision(cwd, rev='HEAD', short=False, user=None, password=None, ignore_retcode=False, output_encoding=None)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

cwd
The path to the git checkout

rev
[HEAD] The revision

short
[False] If True, return an abbreviated SHA1 git hash

user
User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-
Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are
run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:
salt myminion git.revision /path/to/repo mybranch

salt modules.git.rm_(cwd, filename, opts='', git_opts='', user=None, password=None, ignore_retcode=False,
output_encoding=None)

Interface to git-rm(1)

cwd
The path to the git checkout

filename
The location of the file/directory to remove, relative to cwd
**Note:** To remove a directory, `-r` must be part of the `opts` parameter.

**opts**
Any additional options to add to the command line, in a single string.

**Note:** On the Salt CLI, if the `opts` are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts**
Any additional options to add to git command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

**Note:** This is only supported in git 1.7.2 and newer.

**user**
User under which to run the git command. By default, the command is run by the user under which the minion is running.

**password**
Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_retcode**
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

**CLI Examples:**

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

```
salt.modules.git.stash(cwd, action='save', opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

Interface to `git-stash(1)`, returns the stdout from the git command.

**cwd**
The path to the git checkout.
opts
Any additional options to add to the command line, in a single string. Use this to complete the git stash command by adding the remaining arguments (i.e. 'save <stash comment>', 'apply stash@{2}', 'show', etc.). Omitting this argument will simply run git stash.

git_opts
Any additional options to add to git command itself (not the stash subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

New in version 2018.3.1.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

CLI Examples:

salt myminion gitstash /path/to/repo save opts='work in progress'
salt myminion gitstash /path/to/repo apply opts='stash@{1}'
salt myminion gitstash /path/to/repo drop opts='stash@{1}'
salt myminion gitstash /path/to/repo list

salt.modules.git.status(cwd=None, user=None, password=None, ignore_retcode=False, output_encoding=None)
Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

cwd
The path to the git checkout

user
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

**ignore_reetcode**

[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

**output_encoding**

Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```
salt myminion git.status /path/to/repo
```

salt.modules.git.submodule(cwd, command, opts='', git_opts='', user=None, password=None, identity=None, ignore_reetcode=False, saltenv='base', output_encoding=None, **kwargs)

Changed in version 2015.8.0: Added the command argument to allow for operations other than update to be run on submodules, and deprecated the init argument. To do a submodule update with init=True moving forward, use command=update opts='--init'

Interface to git-submodule(1)

**cwd**

The path to the submodule

**command**

Submodule command to run, see git-submodule(1) <git submodule> for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the opts parameter.

New in version 2015.8.0.

**opts**

Any additional options to add to the command line, in a single string

---

**Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= (as in the CLI examples below) to avoid causing errors with Salt’s own argument parsing.

**git_opts**

Any additional options to add to git command itself (not the submodule subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

---

**Note:** This is only supported in git 1.7.2 and newer.
init
[False] If True, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass init as the command parameter, or include --init in the
opts param with command set to update.

user
User under which to run the git command. By default, the command is run by the user under which the
minion is running.

password
Windows only. Required when specifying user. This parameter will be ignored on non-
Windows platforms.

New in version 2016.3.4.

identity
Path to a private key to use for ssh URLs

**Warning:** Unless Salt is invoked from the minion using salt-call, the key(s) must be passphrase-
less. For greater security with passphraseless private keys, see the sshd(8) manpage for information
on securing the keypair from the remote side in the authorized_keys file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked
from the minion using salt-call, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

caltenv
The default salt environment to pull sls files from

New in version 2016.3.1.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are
run. This should not be needed in most cases.

**Note:** This should only be needed if the files in the repository were created with filenames using an
encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Example:

```bash
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True

# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
```

(continues on next page)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://
→ mydomain.tld/repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit

salt.modules.git.symbolic_ref(cwd, ref, value=None, opts='', git_opts='',
    user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to git-symbolic-ref(1)

cwd
    The path to the git checkout

ref
    Symbolic ref to read/modify

value
    If passed, then the symbolic ref will be set to this value and an empty string will be returned.
    If not passed, then the ref to which ref points will be returned, unless --delete is included in opts
    (in which case the symbolic ref will be deleted).

opts
    Any additional options to add to the command line, in a single string

git_opts
    Any additional options to add to git command itself (not the symbolic-refs subcommand), in a single
    string. This is useful for passing -c to run git with temporary changes to the git configuration.

    New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user
    User under which to run the git command. By default, the command is run by the user under which the
    minion is running.

password
    Windows only. Required when specifying user. This parameter will be ignored on non-
    Windows platforms.

    New in version 2016.3.4.

ignore_retcode
    [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

    New in version 2015.8.0.

output_encoding
    Use this option to specify which encoding to use to decode the output from any git commands which are
    run. This should not be needed in most cases.
Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD

# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo

# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

```python
salt.modules.git.tag(cwd, name, ref='HEAD', message=None, opts='', user=None, password=None, ignore_retcode=False, output_encoding=None)
```

New in version 2018.3.4.

Interface to `git-tag(1)`, adds and removes tags.

**cwd**

The path to the main git checkout or a linked worktree

**name**

Name of the tag

**ref**

[HEAD] Which ref to tag (defaults to local clone's HEAD)

Note: This argument is ignored when either `-d` or `--delete` is present in the `opts` passed to this function.

**message**

Optional message to include with the tag. If provided, an annotated tag will be created.

**opts**

Any additional options to add to the command line, in a single string

Note: Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

**git_opts**

Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

Note: This is only supported in git 1.7.2 and newer.

**user**

User under which to run the git command. By default, the command is run by the user under which the minion is running.
**password**
Windows only. Required when specifying **user**. This parameter will be ignored on non-Windows platforms.

**ignore_retcode**
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

**output_encoding**
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

---

**Note:** This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

---

**CLI Example:**

```bash
salt myminion git.tag /path/to/repo v1.2
salt myminion git.tag /path/to/repo v1.2 message='Version 1.2'
```

---

**salt.modules.git.version**(versioninfo=False)

New in version 2015.8.0.

Returns the version of Git installed on the minion

**versioninfo**
[False] If True, return the version in a versioninfo list (e.g. [2, 5, 0])

**CLI Example:**

```bash
salt myminion git.version
```

---

**salt.modules.git.worktree_add**(cwd, worktree_path, ref=None, reset_branch=None, force=None, detach=False, opts='', git_opts='', user=None, password=None, ignore_retcode=False, output_encoding=None, **kwargs)

New in version 2015.8.0.

Interface to **git-worktree(1)**, adds a worktree

**cwd**
The path to the git checkout

**worktree_path**
Path to the new worktree. Can be either absolute, or relative to **cwd**.

**branch**
Name of new branch to create. If omitted, will be set to the basename of the **worktree_path**. For example, if the **worktree_path** is `/foo/bar/baz`, then **branch** will be `baz`.

**ref**
Name of the ref on which to base the new worktree. If omitted, then HEAD is used, and a new branch will be created, named for the basename of the **worktree_path**. For example, if the **worktree_path** is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at HEAD.
reset_branch  
[False] If False, then `git-worktree(1)` will fail to create the worktree if the targeted branch already exists. Set this argument to True to reset the targeted branch to point at ref, and checkout the newly-reset branch into the new worktree.

force  
[False] By default, `git-worktree(1)` will not permit the same branch to be checked out in more than one worktree. Set this argument to True to override this.

opts  
Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with opts= to avoid causing errors with Salt's own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

git_opts  
Any additional options to add to git command itself (not the worktree subcommand), in a single string. This is useful for passing -c to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user  
User under which to run the git command. By default, the command is run by the user under which the minion is running.

password  
Windows only. Required when specifying user. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode  
[False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

output_encoding  
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:

```bash
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
```
salt.modules.git.worktree_prune(cwd, dry_run=False, verbose=True, expire=None, opts=';', git_opts=';', user=None, password=None, ignore_retcode=False, output_encoding=None)

New in version 2015.8.0.

Interface to `git-worktree(1)`, prunes stale worktree administrative data from the gitdir

- **cwd**
  The path to the main git checkout or a linked worktree

- **dry_run**
  [False] If True, then this function will report what would have been pruned, but no changes will be made.

- **verbose**
  [True] Report all changes made. Set to False to suppress this output.

- **expire**
  Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the `git-config(1)` manpage.

- **opts**
  Any additional options to add to the command line, in a single string

  **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

  All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to `git-worktree(1)` and are not yet supported in Salt.

- **git_opts**
  Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

  New in version 2017.7.0.

  **Note:** This is only supported in git 1.7.2 and newer.

- **user**
  User under which to run the git command. By default, the command is run by the user under which the minion is running.

- **password**
  Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.4.

- **ignore_retcode**
  [False] If True, do not log an error to the minion log if the git command returns a nonzero exit status.
output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.

New in version 2018.3.1.

CLI Examples:
```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

salt.modules.git.worktree_rm(cwd, user=None, output_encoding=None)
New in version 2015.8.0.

Recursively removes the worktree located at cwd, returning True if successful. This function will attempt to determine if cwd is actually a worktree by invoking git.is_worktree. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

Warning: There is no undoing this action. Be VERY careful before running this function.

cwd
Path to the worktree to be removed

user
Used for path expansion when cwd is not an absolute path. By default, when cwd is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

output_encoding
Use this option to specify which encoding to use to decode the output from any git commands which are run. This should not be needed in most cases.

Note: This should only be needed if the files in the repository were created with filenames using an encoding other than UTF-8 to handle Unicode characters.
26.6.152 salt.modules.github

Module for interacting with the GitHub v3 API.
New in version 2016.3.0.

  depends
   PyGithub python module

Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'github' key by default, if defined.

For example:

```
github:
  token: abc1234
  org_name: my_organization

# optional: some functions require a repo_name, which
# can be set in the config file, or passed in at the CLI.
repo_name: my_repo

# optional: it can be dangerous to change the privacy of a repository
# in an automated way. set this to True to allow privacy modifications
allow_repo_privacy_changes: False
```

salt.modules.github.add_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, auto_init=None, gitignore_template=None, license_template=None, profile='github')

Create a new github repository.

name
   The name of the team to be created.

description
   The description of the repository.

homepage
   The URL with more information about the repository.

private
   The visibility of the repository. Note that private repositories require a paid GitHub account.

has_issues
   Whether to enable issues for this repository.

has_wiki
   Whether to enable the wiki for this repository.

has_downloads
   Whether to enable downloads for this repository.

auto_init
   Whether to create an initial commit with an empty README.

gitignore_template
   The desired language or platform for a .gitignore, e.g "Haskell".
**license_template**

The desired LICENSE template to apply, e.g. "mit" or "mozilla".

**profile**

The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team(name, description=None, repo_names=None, privacy=None, permission=None, profile='github')**

Create a new Github team within an organization.

- **name**
  - The name of the team to be created.

- **description**
  - The description of the team.

- **repo_names**
  - The names of repositories to add the team to.

- **privacy**
  - The level of privacy for the team, can be 'secret' or 'closed'.

- **permission**
  - The default permission for new repositories added to the team, can be 'pull', 'push' or 'admin'.

- **profile**
  - The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team_member(name, team_name, profile='github')**

Adds a team member to a team with team_name.

- **name**
  - The name of the team member to add.

- **team_name**
  - The name of the team of which to add the user.

- **profile**
  - The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```bash
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

**salt.modules.github.add_team_repo(repo_name, team_name, profile='github', permission=None)**

Adds a repository to a team with team_name.
repo_name
The name of the repository to add.

team_name
The name of the team of which to add the repository.

profile
The name of the profile configuration to use. Defaults to github.

permission
The permission for team members within the repository, can be 'pull', 'push' or 'admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```
salt myminion github.add_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.add_user(name, profile='github')
Add a GitHub user.

name
The user for which to obtain information.

profile
The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.add_user github-handle
```

salt.modules.github.edit_repo(name, description=None, homepage=None, private=None, has_issues=None, has_wiki=None, has_downloads=None, profile='github')
Updates an existing Github repository.

name
The name of the team to be created.

description
The description of the repository.

homepage
The URL with more information about the repository.

private
The visiblity of the repository. Note that private repositories require a paid GitHub account.

has_issues
Whether to enable issues for this repository.

has_wiki
Whether to enable the wiki for this repository.

has_downloads
Whether to enable downloads for this repository.

profile
The name of the profile configuration to use. Defaults to github.
CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

```
salt.modules.github.edit_team('team_name', description='Team description')
```

Updates an existing Github team.

```
name
description
privacy
permission
profile
```

New in version 2016.11.0.

```
salt.modules.github.get_issue(514, repo_name='salt')
```

Return information about a single issue in a named repository.

```
salt.modules.github.get_issue_comments(514, repo_name='salt')
```

Return information about the comments for a given issue in a named repository.
issue_number
The number of the issue for which to retrieve comments.

repo_name
The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile
The name of the profile configuration to use. Defaults to github.

since
Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.

output
The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:
```bash
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.get_issues(repo_name=None, profile='github', milestone=None, state='open', assignee=None, creator=None, mentioned=None, labels=None, sort='created', direction='desc', since=None, output='min', per_page=None)

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name
The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile
The name of the profile configuration to use. Defaults to github.

milestone
The number of a GitHub milestone, or a string of either * or none.

If a number is passed, it should refer to a milestone by its number field. Use the github.get_milestone function to obtain a milestone’s number.

If the string * is passed, issues with any milestone are accepted. If the string none is passed, issues without milestones are returned.

state
Indicates the state of the issues to return. Can be either open, closed, or all. Default is open.

assignee
Can be the name of a user. Pass in none (as a string) for issues with no assigned user or * for issues assigned to any user.

creator
The user that created the issue.

mentioned
A user that's mentioned in the issue.
labels
A string of comma separated label names. For example, bug, ui, @high.

sort
What to sort results by. Can be either created, updated, or comments. Default is created.

direction
The direction of the sort. Can be either asc or desc. Default is desc.

since
Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: YYYY-MM-DDTHH:MM:SSZ.

output
The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

per_page
GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:
salt myminion github.get_issues my-github-repo

salt.modules.github.get_milestone(
    number=None, name=None, repo_name=None, profile='github',
    output='min')

Return information about a single milestone in a named repository.

New in version 2016.11.0.

number
The number of the milestone to retrieve. If provided, this option will be favored over name.

name
The name of the milestone to retrieve.

repo_name
The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A repo_name passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile
The name of the profile configuration to use. Defaults to github.

output
The amount of data returned by each issue. Defaults to min. Change to full to see all issue output.

CLI Example:
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone

salt.modules.github.get_milestones(
    repo_name=None, profile='github', state='open', sort='due_on',
    direction='asc', output='min', per_page=None)

Return information about milestones for a given repository.

New in version 2016.11.0.

repo_name
The name of the repository for which to list issues. This argument is required, either passed via the CLI, or
defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**
The name of the profile configuration to use. Defaults to `github`.

**state**
The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.

**sort**
What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.

**direction**
The direction of the sort. Either `asc` or `desc`. Default is `asc`.

**output**
The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

**per_page**
GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:
```
salt myminion github.get_milestones
```

salt.modules.github.get_prs(repo_name=None, profile='github', state='open', head=None, base=None, sort='created', direction='desc', output='min', per_page=None)

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

**repo_name**
The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

**profile**
The name of the profile configuration to use. Defaults to `github`.

**state**
Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.

**head**
Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `'github:new-script-format'`. Default is `None`.

**base**
Filter pulls by base branch name. Example: `gh-pages`. Default is `None`.

**sort**
What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.

**direction**
The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

**output**
The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.
per_page
GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

`salt.modules.github.get_repo_info(repo_name, profile='github', ignore_cache=False)`
Return information for a given repo.

New in version 2016.11.0.

**repo_name**
The name of the repository.

**profile**
The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

`salt.modules.github.get_repo_teams(repo_name, profile='github')`
Return teams belonging to a repository.

New in version 2017.7.0.

**repo_name**
The name of the repository from which to retrieve teams.

**profile**
The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

`salt.modules.github.get_team(name, profile='github')`
Returns the team details if a team with the given name exists, or None otherwise.

**name**
The team name for which to obtain information.

**profile**
The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.get_team 'team_name'
```

`salt.modules.github.get_user(name, profile='github', user_details=False)`
Get a GitHub user by name.

**name**
The user for which to obtain information.
profile
  The name of the profile configuration to use. Defaults to github.

user_details
  Prints user information details. Defaults to False. If the user is already in the organization and user_details is set to False, the get_user function returns True. If the user is not already present in the organization, user details will be printed by default.

CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

salt.modules.github.is_team_member(name, team_name, profile='github')
Returns True if the github user is in the team with team_name, or False otherwise.

name
  The name of the user whose membership to check.

team_name
  The name of the team to check membership in.

profile
  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.list_members_without_mfa(profile='github', ignore_cache=False)
List all members (in lower case) without MFA turned on.

profile
  The name of the profile configuration to use. Defaults to github.

ignore_cache
  Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

salt.modules.github.list_private_repos(profile='github')
List private repositories within the organization. Dependent upon the access rights of the profile token.

profile
  The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```
salt.modules.github.list_public_repos(profile='github')
List public repositories within the organization.
New in version 2016.11.0.

profile
The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

class modules.github.list_repos(profile='github')
List all repositories within the organization. Includes public and private repositories within the organization Dependent upon the access rights of the profile token.
New in version 2016.11.0.

profile
The name of the profile configuration to use. Defaults to github.

CLI Example:
```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

class modules.github.list_team_members(team_name, profile='github', ignore_cache=False)
Gets the names of team members in lower case.

team_name
The name of the team from which to list members.

profile
The name of the profile configuration to use. Defaults to github.

ignore_cache
Bypasses the use of cached team members.

CLI Example:
```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

class modules.github.list_team_repos(team_name, profile='github', ignore_cache=False)
Gets the repo details for a given team as a dict from repo_name to repo details. Note that repo names are always in lower case.

team_name
The name of the team from which to list repos.

profile
The name of the profile configuration to use. Defaults to github.

ignore_cache
Bypasses the use of cached team repos.

CLI Example:
New in version 2016.11.0.
salt.modules.github.list_team_repos(profile='github', ignore_cache=False)
Lists all teams with the organization.

**profile**
The name of the profile configuration to use. Defaults to `github`.

**ignore_cache**
Bypasses the use of cached teams.

CLI Example:
```sql
class myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.
salt.modules.github.list_teams(profile='github', ignore_cache=False)
Lists all users within the organization.

**profile**
The name of the profile configuration to use. Defaults to `github`.

**ignore_cache**
Bypasses the use of cached users.

CLI Example:
```sql
class myminion github.list_teams
```

New in version 2016.11.0.
salt.modules.github.list_users(profile='github', ignore_cache=False)
List all users within the organization.

**profile**
The name of the profile configuration to use. Defaults to `github`.

**ignore_cache**
Bypasses the use of cached users.

CLI Example:
```sql
class myminion github.list_users
```

salt.modules.github.remove_repo(name, profile='github')
Remove a Github repository.

**name**
The name of the repository to be removed.

**profile**
The name of the profile configuration to use. Defaults to `github`.

CLI Example:
```sql
class myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.
salt.modules.github.remove_team(name, profile='github')
Remove a github team.

**name**
The name of the team to be removed.

**profile**
The name of the profile configuration to use. Defaults to `github`.

CLI Example:
New in version 2016.11.0.
salt.modules.github.remove_team_member(name, team_name, profile='github')
Removes a team member from a team with team_name.

name
The name of the team member to remove.

team_name
The name of the team from which to remove the user.

profile
The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.
salt.modules.github.remove_team_repo(repo_name, team_name, profile='github')
Removes a repository from a team with team_name.

repo_name
The name of the repository to remove.

team_name
The name of the team of which to remove the repository.

profile
The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.
salt.modules.github.remove_user(name, profile='github')
Remove a Github user by name.

name
The user for which to obtain information.

profile
The name of the profile configuration to use. Defaults to github.

CLI Example:

```
salt myminion github.remove_user github-handle
```
26.6.153  salt.modules.glanceng

Glance module for interacting with OpenStack Glance
New in version 2018.3.0.
:depends: shade

Example configuration

```yaml
glance:
  cloud: default

  auth:
    username: admin
    password: password123
    user_domain_name: mydomain
    project_name: myproject
    project_domain_name: myproject
    auth_url: https://example.org:5000/v3
    identity_api_version: 3
```

salt.modules.glanceng.compare_changes(obj, **kwargs)

Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.glanceng.get_openstack_cloud(auth=None)

Return an openstack_cloud

salt.modules.glanceng.get_operator_cloud(auth=None)

Return an operator_cloud

salt.modules.glanceng.image_create(auth=None, **kwargs)

Create an image

CLI Example:

```
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw
salt '*' glanceng.image_create name=cirros file=cirros.raw disk_format=raw hw_scsi_model=virtio-scsi hw_disk_bus=scsi
```

salt.modules.glanceng.image_delete(auth=None, **kwargs)

Delete an image

CLI Example:

```
salt '*' glanceng.image_delete name=image1
salt '*' glanceng.image_delete name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.glanceng.image_get(auth=None, **kwargs)

Get a single image

CLI Example:

```
salt '*' glanceng.image_get name=image1
salt '*' glanceng.image_get name=0e4febc2a5ab4f2c8f374b054162506d
```
**salt.modules.glanceng.image_list** *(auth=None, **kwargs)*

List images

CLI Example:

```
salt '*' glanceng.image_list
salt '*' glanceng.image_list
```

**salt.modules.glanceng.image_search** *(auth=None, **kwargs)*

Search for images

CLI Example:

```
salt '*' glanceng.image_search name=image1
salt '*' glanceng.image_search
```

**salt.modules.glanceng.setup_clouds** *(auth=None)*

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

**salt.modules.glanceng.update_image_properties** *(auth=None, **kwargs)*

Update properties for an image

CLI Example:

```
salt '*' glanceng.update_image_properties name=image1 hw_scsi_→model=virtio-scsi hw_disk_bus=scsi
salt '*' glanceng.update_image_properties name=0e4febc2a5ab4f2c8f374b054162506d min_ram=1024
```

### 26.6.154 salt.modules.glassfish

Module for working with the Glassfish/Payara 4.x management API .. versionadded:: 2016.11.0 :depends: requests

**salt.modules.glassfish.create_admin_object_resource** *(name, server=None, **kwargs)*

Create a JMS destination

**salt.modules.glassfish.create_connector_c_pool** *(name, server=None, **kwargs)*

Create a connection pool

**salt.modules.glassfish.create_connector_resource** *(name, server=None, **kwargs)*

Create a connection resource

**salt.modules.glassfish.create_jdbc_connection_pool** *(name, server=None, **kwargs)*

Create a connection resource

**salt.modules.glassfish.create_jdbc_resource** *(name, server=None, **kwargs)*

Create a JDBC resource

**salt.modules.glassfish.delete_admin_object_resource** *(name, target='server', server=None)*

Delete a JMS destination

**salt.modules.glassfish.delete_connector_c_pool** *(name, target='server', cascade=True, server=None)*

Delete a connection pool
salt.modules.glassfish.delete_connector_resource(name, target='server', server=None)
    Delete a connection resource

salt.modules.glassfish.delete_jdbc_connection_pool(name, target='server', cascade=False, server=None)
    Delete a JDBC pool

salt.modules.glassfish.delete_jdbc_resource(name, target='server', server=None)
    Delete a JDBC resource

salt.modules.glassfish.delete_system_properties(name, server=None)
    Delete a system property

salt.modules.glassfish.enum_admin_object_resource(server=None)
    Enum JMS destinations

salt.modules.glassfish.enum_connector_c_pool(server=None)
    Enum connection pools

salt.modules.glassfish.enum_connector_resource(server=None)
    Enum connection resources

salt.modules.glassfish.enum_jdbc_connection_pool(server=None)
    Enum JDBC pools

salt.modules.glassfish.enum_jdbc_resource(server=None)
    Enum JDBC resources

salt.modules.glassfish.get_admin_object_resource(name, server=None)
    Get a specific JMS destination

salt.modules.glassfish.get_connector_c_pool(name, server=None)
    Get a specific connection pool

salt.modules.glassfish.get_connector_resource(name, server=None)
    Get a specific connection resource

salt.modules.glassfish.get_jdbc_connection_pool(name, server=None)
    Get a specific JDBC pool

salt.modules.glassfish.get_jdbc_resource(name, server=None)
    Get a specific JDBC resource

salt.modules.glassfish.get_system_properties(server=None)
    Get system properties

salt.modules.glassfish.update_admin_object_resource(name, server=None, **kwargs)
    Update a JMS destination

salt.modules.glassfish.update_connector_c_pool(name, server=None, **kwargs)
    Update a connection pool

salt.modules.glassfish.update_connector_resource(name, server=None, **kwargs)
    Update a connection resource

salt.modules.glassfish.update_jdbc_connection_pool(name, server=None, **kwargs)
    Update a JDBC pool
salt.modules.glassfish.update_jdbc_resource(name, server=None, **kwargs)
Update a JDBC resource

salt.modules.glassfish.update_system_properties(data, server=None)
Update system properties

26.6.155 salt.modules.glusterfs
Manage a glusterfs pool

salt.modules.glusterfs.add_volume_bricks(name, bricks)
Add brick(s) to an existing volume

    name
    Volume name

    bricks
    List of bricks to add to the volume

CLI Example:

    salt '*' glusterfs.add_volume_bricks <volume> <bricks>

salt.modules.glusterfs.create_volume(name, bricks, stripe=False, replica=False, device_vg=False, transport='tcp', start=False, force=False, arbiter=False)
Create a glusterfs volume

    name
    Name of the gluster volume

    bricks
    Bricks to create volume from, in <peer>:<brick path> format. For multiple bricks use list format: ['<peer1>:<brick1>', '<peer2>:<brick2>']

    stripe
    Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

    replica
    Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

    arbiter
    If true, specifies volume should use arbiter brick(s). Valid configuration limited to "replica 3 arbiter 1" per Gluster documentation. Every third brick in the brick list is used as an arbiter brick.
    New in version 2019.2.0.

    device_vg
    If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

    transport
    Transport protocol to use, can be 'tcp', 'rdma' or 'tcp,rdma'

    start
    Start the volume after creation

    force
    Force volume creation, this works even if creating in root FS
CLI Examples:

```
salt host1 glusterfs.create newvolume host1:/brick
salt gluster1 glusterfs.create vol2 ['"gluster1:/export/vol2/brick", "gluster2:/export/vol2/brick"'] replica=2 start=True
```

`salt.modules.glusterfs.delete_volume(target, stop=True)`

Deletes a gluster volume

- **target**: Volume to delete
- **stop**: [True] If True, stop volume before delete

CLI Example:

```
salt '*' glusterfs.delete_volume <volume>
```

`salt.modules.glusterfs.disable_quota_volume(name)`

Disable quota on a glusterfs volume.

- **name**: Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.disable_quota_volume <volume>
```

`salt.modules.glusterfs.enable_quota_volume(name)`

Enable quota on a glusterfs volume.

- **name**: Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.enable_quota_volume <volume>
```

`salt.modules.glusterfs.get_max_op_version()`

New in version 2019.2.0.

Returns the glusterfs volume's max op-version value Requires Glusterfs version > 3.9

CLI Example:

```
salt '*' glusterfs.get_max_op_version
```

`salt.modules.glusterfs.get_op_version(name)`

New in version 2019.2.0.

Returns the glusterfs volume op-version

- **name**: Name of the glusterfs volume

CLI Example:
salt '*' glusterfs.get_op_version <volume>

```python
salt.modules.glusterfs.get_version()
```

New in version 2019.2.0.

Returns the version of glusterfs.

CLI Example:

```
salt '*' glusterfs.get_version
```

salt.modules.glusterfs.info(name=None)

New in version 2015.8.4.

Return gluster volume info.

**name**

Optional name to retrieve only information of one volume

CLI Example:

```
salt '*' glusterfs.info
```

salt.modules.glusterfs.list_quota_volume(name)

List quotas of glusterfs volume

**name**

Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.list_quota_volume <volume>
```

salt.modules.glusterfs.list_volumes()

List configured volumes

CLI Example:

```
salt '*' glusterfs.list_volumes
```

salt.modules.glusterfs.peer(name)

Add another node into the peer list.

**name**

The remote host to probe.

CLI Example:

```
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer probe ftp2
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
# if the "peer" is the local host: peer probe: success: on localhost not needed
# if the peer was just added: peer probe: success
# if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list
```
salt.modules.glusterfs.peer_status()

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:

```
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):

```
$ gluster peer status
```

GLUSTER CLI 3.4.4 return example (so we know what we are parsing):

```
Number of Peers: 2
Hostname: ftp2 Port: 24007 Uuid: cbcb256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)
Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)
```

salt.modules.glusterfs.set_op_version(version)

New in version 2019.2.0.

Set the glusterfs volume op-version

version

Version to set the glusterfs volume op-version

CLI Example:

```
salt '*' glusterfs.set_op_version <volume>
```

salt.modules.glusterfs.set_quota_volume(name, path, size, enable_quota=False)

Set quota to glusterfs volume.

name

Name of the gluster volume

path

Folder path for restriction in volume ("/")

size

Hard-limit size of the volume (MB/GB)

enable_quota

Enable quota before set up restriction

CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```

salt.modules.glusterfs.start_volume(name, force=False)

Start a gluster volume

name

Volume name
**force**

Force the volume start even if the volume is started ..

versionadded:: 2015.8.4

CLI Example:

```
salt '*' glusterfs.start mycluster
```

salt.modules.glusterfs.**status**(name)

Check the status of a gluster volume.

**name**
Volume name

CLI Example:

```
salt '*' glusterfs.status myvolume
```

salt.modules.glusterfs.**stop_volume**(name, force=False)

Stop a gluster volume

**name**
Volume name

**force**
Force stop the volume

New in version 2015.8.4.

CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

salt.modules.glusterfs.**unset_quota_volume**(name, path)

Unset quota on glusterfs volume

**name**
Name of the gluster volume

**path**
Folder path for restriction in volume

CLI Example:

```
salt '*' glusterfs.unset_quota_volume <volume> <path>
```

### 26.6.156 salt.modules.gnomedesktop

**GNOME implementations**

salt.modules.gnomedesktop.**get**(schema=None, key=None, user=None, **kwargs)

Get key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled
```
salt.modules.gnomedesktop.getClockFormat(**kwargs)
Return the current clock format, either 12h or 24h format.
CLI Example:

```
salt '*' gnome.getClockFormat user=<username>
```

salt.modules.gnomedesktop.getClockShowDate(**kwargs)
Return the current setting, if the date is shown in the clock
CLI Example:

```
salt '*' gnome.getClockShowDate user=<username>
```

salt.modules.gnomedesktop.getIdleActivation(**kwargs)
Get whether the idle activation is enabled
CLI Example:

```
salt '*' gnome.getIdleActivation user=<username>
```

salt.modules.gnomedesktop.getIdleDelay(**kwargs)
Return the current idle delay setting in seconds
CLI Example:

```
salt '*' gnome.getIdleDelay user=<username>
```

salt.modules.gnomedesktop.ping(**kwargs)
A test to ensure the GNOME module is loaded
CLI Example:

```
salt '*' gnome.ping user=<username>
```

salt.modules.gnomedesktop.setClockFormat(clockFormat, **kwargs)
Set the clock format, either 12h or 24h format.
CLI Example:

```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

salt.modules.gnomedesktop.setClockShowDate(kvalue, **kwargs)
Set whether the date is visible in the clock
CLI Example:

```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```

salt.modules.gnomedesktop.setIdleActivation(kvalue, **kwargs)
Set whether the idle activation is enabled
CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```
salt.modules.gnomedesktop.setIdleDelay(delaySeconds, **kwargs)

Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

salt.modules.gnomedesktop.set_(schema=None, key=None, user=None, value=None, **kwargs)

Set key in a particular GNOME schema

CLI Example:

```python
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-activation-enabled value=False
```

26.6.157 salt.modules.google_chat

Module for sending messages to google chat.

New in version 2019.2.0.

To use this module you need to configure a webhook in the google chat room where you would like the message to be sent, see:

https://developers.google.com/hangouts/chat/how-tos/webhooks

salt.modules.google_chat.sendMessage(url, message)

Send a message to the google chat room specified in the webhook url.

```python
salt '*' google_chat.sendMessage "https://chat.googleapis.com/v1/spaces/example_space/messages?key=example_key" "This is a test message"
```

26.6.158 salt.modules.gpg

Manage GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt, sign plus encrypt and verify text and files.

New in version 2015.5.0.

Note: The python-gnupg library and gpg binary are required to be installed. Be aware that the alternate gnupg and pretty-bad-protocol libraries are not supported.

class salt.modules.gpg.FixedVerify(gpg)

This is a workaround for https://github.com/vsajip/python-gnupg/issues/214. It ensures invalid or otherwise unverified signatures are not merged into sig_info in any way.

https://github.com/vsajip/python-gnupg/commit/ee94a7ecc1a86484c9f02337e2bddd05fd32b383

handle_status(key, value)

Handle status messages from the gpg child process. These are lines of the format

```
[GNUPG:] <key> <value>
```

Parameters
- **key** *(str)* -- Identifies what the status message is.
- **value** *(str)* -- Identifies additional data, which differs depending on the key.

```
salt.modules.gpg.create_key(key_type='RSA', key_length=1024, name_real='Autogenerated Key', name_comment='Generated by SaltStack', name_email=None, subkey_type=None, subkey_length=None, expire_date=None, use_passphrase=False, user=None, gnupghome=None, keyring=None)
```

Create a key in the GPG keychain

**Note:** GPG key generation requires a lot of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the `rng-tools` package.

The `create_key` process takes awhile so increasing the timeout may be necessary, e.g. `-t 15`.

- **key_type**
  The type of the primary key to generate. It must be capable of signing. ‘RSA’ or ‘DSA’.

- **key_length**
  The length of the primary key in bits.

- **name_real**
  The real name of the user identity which is represented by the key.

- **name_comment**
  A comment to attach to the user id.

- **name_email**
  An email address for the user.

- **subkey_type**
  The type of the secondary key to generate.

- **subkey_length**
  The length of the secondary key in bits.

- **expire_date**
  The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.

- **use_passphrase**
  Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key `gpg_passphrase`.

- **user**
  Which user’s keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to `/etc/salt/gpgkeys`.

- **gnupghome**
  Specify the location where the GPG keyring and related files are stored.

- **keyring**
  Limit the operation to this specific keyring, specified as a local filesystem path.
  New in version 3007.0.

CLI Example:
salt -t 15 'salt.modules.gpg.decrypt(user=None, text=None, filename=None, output=None, use_passphrase=False, gnupghome=None, bare=False, keyring=None)

Decrypt a message or a file

user
   Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

text
   The encrypted text to decrypt.

filename
   The path of the encrypted file to decrypt.

output
   Instead of printing to standard out, write the output to this path.

use_passphrase
   Whether to use a passphrase with the signing key. The passphrase is retrieved from Pillar value gpg_passphrase.

gnupghome
   Specify the location where the GPG keyring and related files are stored.

bare
   If True, return the (armored) decrypted block as a string without the standard comment/res dict.

keyring
   Limit the operation to this specific keyring, specified as a local filesystem path.

   New in version 3007.0.

CLI Example:

salt '*' gpg.decrypt filename='/path/to/important.file.gpg'
salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True

salt.modules.gpg.delete_key(keyid=None, fingerprint=None, delete_secret=False, user=None, gnupghome=None, use_passphrase=True, keyring=None)

Delete a key from the GPG keychain.

keyid
   The keyid of the key to be deleted.

fingerprint
   The fingerprint of the key to be deleted.

delete_secret
   Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user
   Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnupghome
   Specify the location where the GPG keyring and related files are stored.
use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key
`gpg_passphrase`. Note that this defaults to True here, contrary to the rest of the module functions
that provide this parameter.

New in version 3003.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.delete_key keyid=3FAD9F1E
salt '*' gpg.delete_key fingerprint=53C96788253E58416D20BCD352952C84C3252192
salt '*' gpg.delete_key keyid=3FAD9F1E user=username
salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

salt.modules.gpg.encrypt(`user=None, recipients=None, text=None, filename=None, output=None, 
  sign=None, use_passphrase=False, always_trust=False, gnupghome=None, 
  bare=False, keyring=None)```

Encrypt a message or a file

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set
the GnuPG home directory to /etc/salt/gpgkeys.

recipients
The key ID, fingerprint, user ID or email address associated with the recipients key can be used.

text
The text to encrypt.

filename
The path of the file to encrypt.

output
Instead of printing to standard out, write the output to this path.

sign
Whether to sign, in addition to encrypt, the data. True to use default key or fingerprint to specify a
different key to sign with.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key
`gpg_passphrase`.

always_trust
Skip key validation and assume that used keys are fully trusted.

New in version 3006.0.

gnupghome
Specify the location where the GPG keyring and related files are stored.
bare

If True, return the (armored) encrypted block as a string without the standard comment/res dict.

keyring

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```
salt '*' gpg.encrypt text='Hello there. How are you?'
  → recipients=recipient@example.com

salt '*' gpg.encrypt filename='/path/to/important.file'
  → recipients=recipient@example.com

salt '*' gpg.encrypt filename='/path/to/important.file' sign=True use_
  → passphrase=True \  
  recipients=recipient@example.com
```

salt.modules.gpg.export_key(keyids=None, secret=False, user=None, gnupghome=None,
                          use_passphrase=False, output=None, bare=False, keyring=None)

Export a key from the GPG keychain

keyids

The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key for example, the key ID, fingerprint, user ID or email address could be used.

secret

Export the secret key identified by the keyids information passed.

user

Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnupghome

Specify the location where the GPG keyring and related files are stored.

use_passphrase

Whether to use a passphrase to export the secret key. The passphrase is retrieved from the Pillar key gpg_passphrase.

New in version 3003.

output

Instead of printing to standard out, write the output to this path.

New in version 3006.0.

bare

If True, return the (armored) exported key block as a string without the standard comment/res dict.

New in version 3006.0.

keyring

Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
salt '_salt' gpg.export_key keyids=3FAD9F1E
salt '_salt' gpg.export_key keyids=3FAD9F1E secret=True
salt '_salt' gpg.export_key keyids="[3FAD9F1E,3FBD8F1E]" user=username

salt.modules.gpg.get_key(keyid=None, fingerprint=None, user=None, gnupghome=None, keyring=None)
Get a key from the GPG keychain

keyid
The key ID (short or long) of the key to be retrieved.

fingerprint
The fingerprint of the key to be retrieved.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

salt '_salt' gpg.get_key keyid=3FAD9F1E
salt '_salt' gpg.get_key fingerprint=53C96788253E58416D20B0CD352952C84C3252192
salt '_salt' gpg.get_key keyid=3FAD9F1E user=username

salt.modules.gpg.get_secret_key(keyid=None, fingerprint=None, user=None, gnupghome=None, keyring=None)
Get a secret key from the GPG keychain

keyid
The key ID (short or long) of the key to be retrieved.

fingerprint
The fingerprint of the key to be retrieved.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
salt '*' gpg.get_secret_key keyid=3FAD9F1E
salt '*' gpg.get_secret_key keyid=3FAD9F1E fingerprint=53C9678253E58416D20BCD352952C84C3252192
salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username

salt.modules.gpg.import_key(text=None, filename=None, user=None, gnupghome=None, keyring=None)
Import a key from text or a file

text
The text containing the key to import.

filename
The path of the file containing the key to import.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----
 ... -
-----END PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'

salt.modules.gpg.list_keys(user=None, gnupghome=None, keyring=None)
List keys in GPG keychain

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
salt '*' gpg.list_keys

salt.modules.gpg.list_secret_keys(user=None, gnupghome=None, keyring=None)
List secret keys in GPG keychain

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.
**gnupghome**
Specify the location where the GPG keyring and related files are stored.

**keyring**
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
```
salt '*' gpg.list_secret_keys
```

```
salt.modules.gpg.receive_keys(keyserver=None, keys=None, user=None, gnupghome=None, keyring=None)
```

Receive key(s) from keyserver and add them to the keychain

**keyserver**
Keyserver to use for searching for GPG keys, defaults to keys.openpgp.org

**keys**
The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.

**user**
Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

**gnupghome**
Specify the location where the GPG keyring and related files are stored.

**keyring**
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
```
salt '*' gpg.receive_keys keys='3FAD9F1E'
salt '*' gpg.receive_keys keys='[3FAD9F1E,3FBD9F2E]'
salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

```
salt.modules.gpg.search_keys(text, keyserver=None, user=None, gnupghome=None)
```

Search for keys on a keyserver

**text**
Text to search the keyserver for, e.g. email address, keyID or fingerprint.

**keyserver**
Keyserver to use for searching for GPG keys, defaults to keys.openpgp.org.

**user**
Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

**gnupghome**
Specify the location where the GPG keyring and related files are stored.

New in version 3007.0.

CLI Example:
salt modules.gpg.sign(user=None, keyid=None, text=None, filename=None, output=None,
use_passphrase=False, gnupghome=None, keyring=None)

Sign a message or a file

user
Which user’s keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

keyid
The keyid of the key to use for signing, defaults to the first key in the secret keyring.

text
The text to sign.

filename
The path of the file to sign.

output
Instead of printing to standard out, write the output to this path.

use_passphrase
Whether to use a passphrase with the signing key. The passphrase is retrieved from the Pillar key gpg_passphrase.

gnupghome
Specify the location where the GPG keyring and related files are stored.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:
salt '*' gpg.sign text='Hello there. How are you?'
salt '*' gpg.sign filename='/path/to/important.file'
salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True

salt modules.gpg.trust_key(keyid=None, fingerprint=None, trust_level=None, user=None,
gnupghome=None, keyring=None)

Set the trust level for a key in the GPG keychain

keyid
The keyid of the key to set the trust level for.

fingerprint
The fingerprint of the key to set the trust level for.

trust_level
The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately
user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnuhome
Specify the location where the GPG keyring and related files are stored.
New in version 3007.0.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.
New in version 3007.0.

CLI Example:

```
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20BCD352952C84C3252192' trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user='username'
```

salt.modules.gpg.verify( text=None, user=None, filename=None, gnupghome=None, signature=None, trustmodel=None, signed_by_any=None, signed_by_all=None, keyring=None)
Verify a message or a file

text
The text to verify.

filename
The path of the file to verify.

user
Which user's keychain to access, defaults to user Salt is running as. Passing the user as salt will set the GnuPG home directory to /etc/salt/gpgkeys.

gnuhome
Specify the location where the GPG keyring and related files are stored.

signature
Specify the path of a detached signature.
New in version 2018.3.0.

trustmodel
Explicitly define the used trust model. One of:

- pgp
- classic
- tofu
- tofu+pgp
- direct
- always
- auto
New in version 2019.2.0.
signed_by_any
A list of key fingerprints from which any valid signature will mark verification as passed. If none of the provided keys signed the data, verification will fail. Optional. Note that this does not take into account trust.

New in version 3007.0.

signed_by_all
A list of key fingerprints whose signatures are required for verification to pass. If a single provided key did not sign the data, verification will fail. Optional. Note that this does not take into account trust.

New in version 3007.0.

keyring
Limit the operation to this specific keyring, specified as a local filesystem path.

New in version 3007.0.

CLI Example:

```bash
salt '*' gpg.verify text='Hello there. How are you?'
salt '*' gpg.verify filename='/path/to/important.file'
salt '*' gpg.verify filename='/path/to/important.file' trustmodel=direct
```

26.6.159 salt.modules.grafana4

Module for working with the Grafana v4 API

New in version 2017.7.0.

deeps
requests

configuration
This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the 'grafana' key by default, if defined.

For example:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

salt.modules.grafana4.create_datasource(orgname=None, profile='grafana', **kwargs)
Create a new datasource in an organisation.

ame
Name of the data source.

type
Type of the datasource ('graphite', 'influxdb' etc.).

access
Use proxy or direct.

url
The URL to the data source API.
user
  Optional - user to authenticate with the data source.

password
  Optional - password to authenticate with the data source.

database
  Optional - database to use with the data source.

basicAuth
  Optional - set to True to use HTTP basic auth to authenticate with the data source.

basicAuthUser
  Optional - HTTP basic auth username.

basicAuthPassword
  Optional - HTTP basic auth password.

jsonData
  Optional - additional json data to post (eg. "timeInterval").

isDefault
  Optional - set data source as default.

withCredentials
  Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

typeLogoUrl
  Optional - Logo to use for this datasource.

orgname
  Name of the organization in which the data source should be created.

profile
  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.create_datasource
```

```
salt.modules.grafana4.create_org(profile='grafana', **kwargs)
```

Create a new organization.

name
  Name of the organization.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

```
salt.modules.grafana4.create_org_user(orgname=None, profile='grafana', **kwargs)
```

Add user to the organization.

loginOrEmail
  Login or email of the user.

role
  Role of the user for this organization. Should be one of:
• Admin
• Editor
• Read Only Editor
• Viewer

**orgname**
Name of the organization in which users are added.

**profile**
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> → role=<role>
```

salt.modules.grafana4.create_update_dashboard *(orgname=None, profile='grafana', **kwargs)*
Create or update a dashboard.

**dashboard**
A dict that defines the dashboard to create/update.

**overwrite**
Whether the dashboard should be overwritten if already existing.

**orgname**
Name of the organization.

**profile**
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard> → overwrite=True orgname=<orgname>
```

salt.modules.grafana4.create_user *(profile='grafana', **kwargs)*
Create a new user.

**login**
Login of the new user.

**password**
Password of the new user.

**email**
Email of the new user.

**name**
Optional - Full name of the new user.

**profile**
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.create_user login=<login> password=<password> email=<email>
```
salt.modules.grafana4.delete_dashboard(slug, orgname=None, profile='grafana')
Delete a dashboard.

slug
Slug (name) of the dashboard.

orgname
Name of the organization.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.delete_dashboard <slug>
```

salt.modules.grafana4.delete_datasource(datasourceid, orgname=None, profile='grafana')
Delete a datasource.

datasourceid
Id of the datasource.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.delete_datasource <datasource_id>
```

salt.modules.grafana4.delete_org(orgid, profile='grafana')
Delete an organization.

orgid
Id of the organization.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.delete_org <org_id>
```

salt.modules.grafana4.delete_org_user(userid, orgname=None, profile='grafana')
Remove user from the organization.

userid
Id of the user.

orgname
Name of the organization in which users are updated.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

salt.modules.grafana4.delete_user(userid, profile='grafana')
Delete a user.
userid
   Id of the user.

profile
   Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

salt.modules.grafana4.delete_user_org(userid, orgid, profile='grafana')
Remove a user from an organization.

userid
   Id of the user.

orgid
   Id of the organization.

profile
   Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

salt.modules.grafana4.get_dashboard(slug, orgname=None, profile='grafana')
Get a dashboard.

slug
   Slug (name) of the dashboard.

orgname
   Name of the organization.

profile
   Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_dashboard <slug>
```

salt.modules.grafana4.get_datasource(name, orgname=None, profile='grafana')
Show a single datasource in an organisation.

name
   Name of the datasource.

orgname
   Name of the organization.

profile
   Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '*' grafana4.get_datasource <name> <orgname>
```

salt.modules.grafana4.get_datasources(orgname=None, profile='grafana')
List all datasources in an organisation.
orgname
    Name of the organization.

profile
    Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```bash
salt '*' grafana4.get_datasources <orgname>
```

```
salt.modules.grafana4.get_org(name, profile='grafana')
```

Show a single organization.

```
name
    Name of the organization.

profile
    Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```bash
salt '*' grafana4.get_org <name>
```

```
salt.modules.grafana4.get_org_address(orgname=None, profile='grafana')
```

Get the organization address.

```
orgname
    Name of the organization in which users are updated.

profile
    Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```bash
salt '*' grafana4.get_org_address <orgname>
```

```
salt.modules.grafana4.get_org_prefs(orgname=None, profile='grafana')
```

Get the organization preferences.

```
orgname
    Name of the organization in which users are updated.

profile
    Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```bash
salt '*' grafana4.get_org_prefs <orgname>
```

```
salt.modules.grafana4.get_org_users(orgname=None, profile='grafana')
```

Get the list of users that belong to the organization.

```
orgname
    Name of the organization.

profile
    Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '*' grafana4.get_org_users <orgname>

grafana4.get_orgs (profile='grafana')
List all organizations.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '*' grafana4.get_orgs

grafana4.get_user (login, profile='grafana')
Show a single user.

login
Login of the user.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '*' grafana4.get_user <login>

grafana4.get_user_data (userid, profile='grafana')
Get user data.

userid
Id of the user.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '*' grafana4.get_user_data <user_id>

grafana4.get_user_orgs (userid, profile='grafana')
Get the list of organisations a user belong to.

userid
Id of the user.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
salt '*' grafana4.get_user_orgs <user_id>

grafana4.get_users (profile='grafana')
List all users.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:
Salt Documentation, Release 3007.1

```bash
salt '*' grafana4.get_users
```

**salt.modules.grafana4.switch_org** *(orgname, profile='grafana')*

Switch the current organization.

- **name**
  - Name of the organization to switch to.

- **profile**
  - Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```bash
salt '*' grafana4.switch_org <name>
```

**salt.modules.grafana4.update_datasource** *(datasourceid, orgname=None, profile='grafana', **kwargs)*

Update a datasource.

- **datasourceid**
  - Id of the datasource.

- **name**
  - Name of the data source.

- **type**
  - Type of the datasource ('graphite', 'influxdb' etc.).

- **access**
  - Use proxy or direct.

- **url**
  - The URL to the data source API.

- **user**
  - Optional - user to authenticate with the data source.

- **password**
  - Optional - password to authenticate with the data source.

- **database**
  - Optional - database to use with the data source.

- **basicAuth**
  - Optional - set to True to use HTTP basic auth to authenticate with the data source.

- **basicAuthUser**
  - Optional - HTTP basic auth username.

- **basicAuthPassword**
  - Optional - HTTP basic auth password.

- **jsonData**
  - Optional - additional json data to post (eg. "timeInterval").

- **isDefault**
  - Optional - set data source as default.

- **withCredentials**
  - Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
typeLogoUrl
Optional - Logo to use for this datasource.

profile
Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '* grafana4.update_datasource <datasourceid>
```

```{python}
salt.modules.grafana4.update_org(orgid, profile='grafana', **kwargs)
```
Update an existing organization.

- **orgid**
  Id of the organization.

- **name**
  New name of the organization.

- **profile**
  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '* grafana4.update_org <org_id> name=<name>
```

```{python}
salt.modules.grafana4.update_org_address(orgname=None, profile='grafana', **kwargs)
```
Update the organization address.

- **orgname**
  Name of the organization in which users are updated.

- **address1**
  Optional - address1 of the org.

- **address2**
  Optional - address2 of the org.

- **city**
  Optional - city of the org.

- **zip_code**
  Optional - zip_code of the org.

- **state**
  Optional - state of the org.

- **country**
  Optional - country of the org.

- **profile**
  Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```
salt '* grafana4.update_org_address <orgname> country=<country>
```

```{python}
salt.modules.grafana4.update_org_prefs(orgname=None, profile='grafana', **kwargs)
```
Update the organization preferences.

- **orgname**
  Name of the organization in which users are updated.
theme
   Selected theme for the org.

homeDashboardId
   Home dashboard for the org.

timezone
   Timezone for the org (one of: "browser", "utc", or ").

profile
   Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

CLI Example:

```bash
salt '*' grafana4.update_orgPrefs <orgname> theme=<theme> timezone=<timezone>
```

```python
salt.modules.grafana4.update_org_user(userid, orgname=None, profile='grafana', **kwargs)
```

Update user role in the organization.

<table>
<thead>
<tr>
<th>userid</th>
<th>Id of the user.</th>
</tr>
</thead>
<tbody>
<tr>
<td>loginOrEmail</td>
<td>Login or email of the user.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>role</th>
<th>Role of the user for this organization. Should be one of:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Admin</td>
<td></td>
</tr>
<tr>
<td>Editor</td>
<td></td>
</tr>
<tr>
<td>Read Only Editor</td>
<td></td>
</tr>
<tr>
<td>Viewer</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>orgname</th>
<th>Name of the organization in which users are updated.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>profile</th>
<th>Configuration profile used to connect to the Grafana instance. Default is 'grafana'.</th>
</tr>
</thead>
</table>

CLI Example:

```bash
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail> role=<role>
```

```python
salt.modules.grafana4.update_user(userid, profile='grafana', **kwargs)
```

Update an existing user.

<table>
<thead>
<tr>
<th>userid</th>
<th>Id of the user.</th>
</tr>
</thead>
<tbody>
<tr>
<td>login</td>
<td>Optional - Login of the user.</td>
</tr>
<tr>
<td>email</td>
<td>Optional - Email of the user.</td>
</tr>
<tr>
<td>name</td>
<td>Optional - Full name of the user.</td>
</tr>
</tbody>
</table>
profile
   Configuration profile used to connect to the Grafana instance. Default is 'grafana'.

   CLI Example:
   ```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
   ```

salt.modules.grafana4.update_user_password
   Update a user password.
   ```
salt '*' grafana4.update_user_password <user_id> password=<password>
   ```

salt.modules.grafana4.update_user_permissions
   Update a user password.
   ```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
   ```

26.6.160 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the 'grains' file on the minions. By default, this file is located at:
/etc/salt/grains

Note: This does NOT override any grains set in the minion config file.

salt.modules.grains.append
   Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.
   ```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
   ```

   key 
      The grain key to be appended to
val
   The value to append to the grain key

convert
   If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list
   contents, an error is given. Defaults to False.

delimiter
   The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the
   default :. You can now append values to a list in nested dictionary grains. If the list doesn’t exist at this
   level, it will be created.
   New in version 2014.7.6.

   CLI Example:

   ```shell
   salt '*' grains.append key val
   ```

salt.modules.grains.delkey(key, force=False)
   New in version 2017.7.0.
   Remove a grain completely from the grain system, this will remove the grain key and value

   key
      The grain key from which to delete the value.

   force
      Force remove the grain even when it is a mapped value. Defaults to False

   CLI Example:

   ```shell
   salt '*' grains.delkey key
   ```

salt.modules.grains.delval(key, destructive=False, force=False)
   New in version 0.17.0.
   Delete a grain value from the grains config file. This will just set the grain value to None. To completely
   remove the grain, run grains.delkey or pass destructive=True to grains.delval.

   key
      The grain key from which to delete the value.

   destructive
      Delete the key, too. Defaults to False.

   force
      Force remove the grain even when it is a mapped value. Defaults to False

   CLI Example:

   ```shell
   salt '*' grains.delval key
   ```

salt.modules.grains.equals(key, value)
   Used to make sure the minion’s grain key/value matches.

   Returns True if matches otherwise False.

   New in version 2017.7.0.

   CLI Example:
salt '*/' grains.equals fqdn <expected_fqdn>
salt '*/' grains.equals systemd:version 219

salt.modules.grains.fetch(key, default='', delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

{ 'pkg': { 'apache': 'httpd' } }

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

pkg:apache

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.
  New in version 2014.7.0.
- **ordered** -- Outputs an ordered dict if applicable (default: True)
  New in version 2016.11.0.

CLI Example:

salt '*/' grains.get pkg:apache
salt '*/' grains.get abc::def|ghi delimiter='|'

salt.modules.grains.filter_by(lookup_dict, grain='os_family', merge=None, default='default', base=None)

New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```jinja
{% set apache = salt['grains.filter_by']({
  'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
  'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:
The call to `filter_by()` would be modified as follows to reference those Pillar values:

```python
{%
set apache = salt['grains.filter_by']({
  ...
}, merge=salt['pillar.get']('apache:lookup')) %}
```

### Parameters

- **lookup_dict** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could the name of a package on that particular OS.

  Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

  ```
  # this will render 'got some salt' if Minion ID begins from 
  # 'salt'
  salt '*' grains.filter_by '{salt*: got some salt, default:
  # salt is not here}' id
  ```

- **grain** -- The name of a grain to match with the current system's grains. For example, the value of the "os_family" grain for the current system could be used to pull values from the `lookup_dict` dictionary.

  Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).

- **default** -- default `lookup_dict`'s key used if the grain does not exists or if the grain value has no match on `lookup_dict`. If unspecified the value is "default".

  New in version 2014.1.0.

- **base** -- A `lookup_dict` key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

  New in version 2015.5.0.

### CLI Example:

```
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}}'
```
salt.modules.grains.get(key, default='', delimiter=':', ordered=True)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```python
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

salt.modules.grains.has_value(key)

Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```python
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

salt.modules.grains.item(*args, **kwargs)

Return one or more grains

CLI Example:
salt '*/' grains.item os
salt '*/' grains.item os osrelease oscodename

Sanitized CLI Example:

    salt '*/' grains.item host sanitize=True

salt.modules.grains.items(sanitize=False)
Return all of the minion's grains

CLI Example:

    salt '*/' grains.items

Sanitized CLI Example:

    salt '*/' grains.items sanitize=True

salt.modules.grains.ls()
Return a list of all available grains

CLI Example:

    salt '*/' grains.ls

salt.modules.grains.remove(key, val, delimiter=':"
New in version 0.17.0.
Remove a value from a list in the grains config file

key
The grain key to remove.

val
The value to remove.

delimiter
The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the
default '. You can now append values to a list in nested dictionary grains. If the list doesn’t exist at this
level, it will be created.

New in version 2015.8.2.

CLI Example:

    salt '*/' grains.remove key val

salt.modules.grains.set(key, val='", force=False, destructive=False, delimiter=':"
Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a
dict. The force parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

Parameters

- **force** -- Force writing over existing entry if given or existing values are list or dict. De-
defaults to False.
- **destructive** -- If an operation results in a key being removed, delete the key, too. Defaults to False.

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict, the default being:

 CLI Example:

```bash
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

**salt.modules.grains.setval** *(key, val, destructive=False, refresh_pillar=True)*

Set a grains value in the grains config file

- **key**
  - The grain key to be set.

- **val**
  - The value to set the grain key to.

- **destructive**
  - If an operation results in a key being removed, delete the key, too. Defaults to False.

- **refresh_pillar**
  - Whether pillar will be refreshed. Defaults to True.

 CLI Example:

```bash
salt '*' grains.setval key val
salt '*' grains.setval key "{'sub-key': 'val', 'sub-key2': 'val2'}"
```

**salt.modules.grains.setvals** *(grains, destructive=False, refresh_pillar=True)*

Set new grains values in the grains config file

- **destructive**
  - If an operation results in a key being removed, delete the key, too. Defaults to False.

- **refresh_pillar**
  - Whether pillar will be refreshed. Defaults to True.

 CLI Example:

```bash
salt '*' grains.setvals "{'key1': 'val1', 'key2': 'val2'}"
```

### 26.6.161 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

**Important:** If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *'group.info' is not available*), see [here](#).

**salt.modules.groupadd.add** *(name, gid=None, system=False, root=None, non_unique=False, local=False)*

Changed in version 3006.0.

Add the specified group

- **name**
  - Name of the new group
gid
  Use GID for the new group
system
  Create a system account
root
  Directory to chroot into
non_unique
  Allow creating groups with duplicate (non-unique) GIDs
  New in version 3006.0.
local
  Specifically add the group locally rather than through remote providers (e.g. LDAP)
  New in version 3007.0.

CLI Example:

salt '*' group.add foo 3456

_salt.modules.groupadd.adduser(name, username, root=None)_

Add a user in the group.

name
  Name of the group to modify
username
  Username to add to the group
root
  Directory to chroot into

CLI Example:

salt '*' group.adduser foo bar

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

_salt.modules.groupadd.chgid(name, gid, root=None, non_unique=False)_

Changed in version 3006.0.

Change the gid for a named group

name
  Name of the group to modify
gid
  Change the group ID to GID
root
  Directory to chroot into
non_unique
  Allow modifying groups with duplicate (non-unique) GIDs
  New in version 3006.0.

CLI Example:
salt.group.chgid foo 4376

salt.modules.groupadd.delete(name, root=None, local=False)
Remove the named group

name
Name group to delete

root
Directory to chroot into

local (Only on systems with lgroupdel available):
Ensure the group account is removed locally ignoring global account management (default is False).
New in version 3007.0.

CLI Example:
salt '*' group.delete foo

salt.modules.groupadd.deluser(name, username, root=None)
Remove a user from the group.

name
Name of the group to modify

username
Username to delete from the group

root
Directory to chroot into

CLI Example:
salt '*' group.deluser foo bar

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.groupadd.getent(refresh=False, root=None)
Return info on all groups

refresh
Force a refresh of group information

root
Directory to chroot into

CLI Example:
salt '*' group.getent

salt.modules.groupadd.info(name, root=None)
Return information about a group

name
Name of the group

root
Directory to chroot into

CLI Example:
salt '*' group.info foo

salt.modules.groupadd.members(name, members_list, root=None)
Replaces members of the group with a provided list.

name
   Name of the group to modify

members_list
   Username list to set into the group

root
   Directory to chroot into

CLI Example:
salt '*' group.members foo 'user1,user2,user3,...'

Replaces a membership list for a local group 'foo'.
   foo:x:1234:user1,user2,user3,...

26.6.162 salt.modules.grub_legacy

Support for GRUB Legacy
salt.modules.grub_legacy.conf()
   Parse GRUB conf file

CLI Example:
salt '*' grub.conf

salt.modules.grub_legacy.version()
   Return server version from grub --version

CLI Example:
salt '*' grub.version

26.6.163 salt.modules.guestfs

Interact with virtual machine images via libguestfs

depends
   * libguestfs

salt.modules.guestfs.mount(location, access='rw', root=None)
   Mount an image

CLI Example:
salt '*' guest.mount /srv/images/fedora.qcow
salt.modules.guestfs.umount(name, disk=None)

Unmount an image

CLI Example:

```shell
salt '*' guestfs.umount /mountpoint disk=/srv/images/fedora.qcow
```

## 26.6.164 salt.modules.hadoop

Support for hadoop

- maintainer
  - Yann Jouanin <yann.jouanin@intelunix.fr>
- maturity
  - new
- depends
  - platform
    - linux

### salt.modules.hadoop.dfs(command=None, *args)

Execute a command on DFS

CLI Example:

```shell
salt '*' hadoop.dfs ls /
```

### salt.modules.hadoop.dfs_absent(path)

Check if a file or directory is absent on the distributed FS.

CLI Example:

```shell
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

### salt.modules.hadoop.dfs_present(path)

Check if a file or directory is present on the distributed FS.

CLI Example:

```shell
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

### salt.modules.hadoop.dfsadmin_report(arg=None)

New in version 2019.2.0.

Reports basic filesystem information and statistics. Optional flags may be used to filter the list of displayed DataNodes.

- arg
  - [live] [dead] [decommissioning]

CLI Example:

```shell
salt '*' hadoop.dfsadmin -report
```
**salt.modules.hadoop.namenode_format**(force=None)

Format a name node

```
salt '*' hadoop.namenode_format force=True
```

**salt.modules.hadoop.version()**

Return version from hadoop version

CLI Example:
```
salt '*' hadoop.version
```

## 26.6.165 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

**salt.modules.haproxyconn.disable_server**(name, backend, socket="/var/run/haproxy.sock")

Disable server in haproxy.

name
Server to disable

backend
haproxy backend, or all backends if """" is supplied

socket
haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.disable_server db1.example.com mysql
```

**salt.modules.haproxyconn.enable_server**(name, backend, socket="/var/run/haproxy.sock")

Enable Server in haproxy

name
Server to enable

backend
haproxy backend, or all backends if """" is supplied

socket
haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '*' haproxy.enable_server web1.example.com www
```

**salt.modules.haproxyconn.get_backend**(backend, socket="/var/run/haproxy.sock")

Receive information about a specific backend.

backend
haproxy backend

socket
haproxy stats socket, default /var/run/haproxy.sock
CLI Example:

```bash
salt '*' haproxy.get_backend mysql
```

salt.modules.haproxyconn.get_sessions(name, backend, socket='/var/run/haproxy.sock')

New in version 2016.11.0.

Get number of current sessions on server in backend (scur)

- **name**
  - Server name

- **backend**
  - haproxy backend

- **socket**
  - haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.get_sessions web1.example.com www
```

salt.modules.haproxyconn.get_weight(name, backend, socket='/var/run/haproxy.sock')

Get server weight

- **name**
  - Server name

- **backend**
  - haproxy backend

- **socket**
  - haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.get_weight web1.example.com www
```

salt.modules.haproxyconn.list_backends(servers=True, socket='/var/run/haproxy.sock')

List HaProxy Backends

- **socket**
  - haproxy stats socket, default /var/run/haproxy.sock

- **servers**
  - list backends with servers

CLI Example:

```bash
salt '*' haproxy.list_backends
```

salt.modules.haproxyconn.list_frontends(socket='/var/run/haproxy.sock')

List HaProxy frontends

- **socket**
  - haproxy stats socket, default /var/run/haproxy.sock

CLI Example:

```bash
salt '*' haproxy.list_frontends
```
salt.modules.haproxyconn.list_servers(backend, socket='/var/run/haproxy.sock', objectify=False)

List servers in haproxy backend.

backend
  haproxy backend

socket
  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.list_servers mysql

salt.modules.haproxyconn.set_state(name, backend, state, socket='/var/run/haproxy.sock')

Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to "ready" puts the server in normal mode, and the command is the equivalent of the "enable server" command. Setting the state to "maint" disables any traffic to the server as well as any health checks. This is the equivalent of the "disable server" command. Setting the mode to "drain" only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.

name
  Server name

backend
  haproxy backend

state
  A string of the state to set. Must be 'ready', 'drain', or 'maint'

socket
  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.set_state my_proxy_server my_backend ready

salt.modules.haproxyconn.set_weight(name, backend, weight=0, socket='/var/run/haproxy.sock')

Set server weight

name
  Server name

backend
  haproxy backend

weight
  Server Weight

socket
  haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
salt '*' haproxy.set_weight web1.example.com www 13

salt.modules.haproxyconn.show_backends(socket='/var/run/haproxy.sock')

Show HaProxy Backends

socket
  haproxy stats socket, default /var/run/haproxy.sock
CLI Example:
```
salt '* ' haproxy.show_backends
```

salt.modules.haproxyconn.show_frontends(socket='/var/run/haproxy.sock')

Show HaProxy frontends

socket
haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '* ' haproxy.show_frontends
```

salt.modules.haproxyconn.wait_state(backend, server, value='up', timeout=300, socket='/var/run/haproxy.sock')

Wait for a specific server state

backend
haproxy backend

server
targeted server

value
state value

timeout
timeout before giving up state value, default 5 min

socket
haproxy stats socket, default /var/run/haproxy.sock

CLI Example:
```
salt '* ' haproxy.wait_state mysql server01 up 60
```

26.6.166 salt.modules.hashutil

A collection of hashing and encoding functions

salt.modules.hashutil.base64_b64decode(instr)

Decode a base64-encoded string using the "modern" Python interface

New in version 2016.3.0.

CLI Example:
```
salt '* ' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

salt.modules.hashutil.base64_b64encode(instr)

Encode a string as base64 using the "modern" Python interface.

Among other possible differences, the "modern" encoder does not include newline ('n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:
salt '*' hashutil.base64_b64encode 'get salted'
salt.modules.hashutil.base64_decodefile(instr, outfile)
    Decode a base64-encoded string and write the result to a file
    New in version 2016.3.0.
    CLI Example:
    ```bash
    salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/~path/to/binary_file'
    ```
salt.modules.hashutil.base64_decodestring(instr)
    Decode a base64-encoded byte-like object using the "modern" Python interface
    New in version 3000.
    CLI Example:
    ```bash
    salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
    ```
salt.modules.hashutil.base64_encodefile(fname)
    Read a file from the file system and return as a base64 encoded string
    New in version 2016.3.0.
    Pillar example:
    ```yaml
    path:
      to:
        data: |
          {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
    ```
    The file.decode state function can be used to decode this data and write it to disk.
    CLI Example:
    ```bash
    salt '*' hashutil.base64_encodefile /path/to/binary_file
    ```
salt.modules.hashutil.base64_encodestring(instr)
    Encode a byte-like object as base64 using the "modern" Python interface.
    Among other possible differences, the "modern" encoder includes a newline ('n') character after every 76 characters and always at the end of the encoded byte-like object.
    New in version 3000.
    CLI Example:
    ```bash
    salt '*' hashutil.base64_encodestring 'get salted'
    ```
salt.modules.hashutil.digest(instr, checksum='md5')
    Return a checksum digest for a string
    instr
      A string
checksum

CLI Example:
```
salt '*' hashutil.digest 'get salted'
```

`salt.modules.hashutil.digest_file(infile, checksum='md5')`

Return a checksum digest for a file

infile
A file path

checksum
[md5] The hashing algorithm to use to generate checksums. Wraps the `hashutil.digest` execution
function.

CLI Example:
```
salt '*' hashutil.digest_file /path/to/file
```

`salt.modules.hashutil.github_signature(string, shared_secret, challenge_hmac)`

Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:
```
salt '*' hashutil.github_signature '{"ref":....}' 'shared secret'
```
```
→'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

`salt.modules.hashutil.hmac_compute(string, shared_secret)`

New in version 3000.

Compute a HMAC SHA256 digest using a string and secret.

CLI Example:
```
salt '*' hashutil.hmac_compute 'get salted' 'shared secret'
```

`salt.modules.hashutil.hmac_signature(string, shared_secret, challenge_hmac)`

Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:
```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'
```
```
→'eBWf9bstXg+NiP5AOwppB5HMvZiYMPzEM9W5YMm/AmQ='
```

`salt.modules.hashutil.md5_digest(instr)`

Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:
**salt.modules.hashutil.sha256_digest** *(instr)*

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```bash
salt '*' hashutil.sha256_digest 'get salted'
```

**salt.modules.hashutil.sha512_digest** *(instr)*

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```bash
salt '*' hashutil.sha512_digest 'get salted'
```

### 26.6.167 salt.modules.heat

Module for handling OpenStack Heat calls

New in version 2017.7.0.

**depends**

- heatclient Python module

**configuration**

This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```yaml
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False  # (optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'  # Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```yaml
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
```
With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '* heat.flavor_list profile=openstack1
```

### salt.modules.heat.create_stack(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None)

Create a stack (heat stack-create)

- **name**
  - Name of the new stack
- **template_file**
  - File of template
- **environment**
  - File of environment
- **parameters**
  - Parameter dict used to create the stack
- **poll**
  - Poll and report events until stack complete
- **rollback**
  - Enable rollback on create failure
- **timeout**
  - Stack creation timeout in minutes
- **profile**
  - Profile to build on

CLI Example:

```
salt '* heat.create_stack name=mystack \\  template_file=salt://template.yaml \\  environment=salt://environment.yaml \\  parameters="{"image": "Debian 8", "flavor": "m1.small"}" \\  poll=5 rollback=|False \ timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *environment* was corrected to *environment*. The *enviroment* spelling mistake has been removed in Salt 3000.

### salt.modules.heat.delete_stack(name=None, poll=0, timeout=60, profile=None)

Delete a stack (heat stack-delete)

- **name**
  - Name of the stack
- **poll**
  - Poll and report events until stack complete
- **timeout**
  - Stack creation timeout in minutes
- **profile**
  - Profile to use

CLI Examples:
```
salt '*' heat.delete_stack name=mystack poll=5 \
    profile=openstack1
```

```python
salt.modules.heat.list_stack(profile=None)
```
Return a list of available stack (heat stack-list)

    profile
        Profile to use

    CLI Example:
```
salt '*' heat.list_stack profile=openstack1
```

```python
salt.modules.heat.show_stack(name=None, profile=None)
```
Return details about a specific stack (heat stack-show)

    name
        Name of the stack

    profile
        Profile to use

    CLI Example:
```
salt '*' heat.show_stack name=mystack profile=openstack1
```

```python
salt.modules.heat.template_stack(name=None, profile=None)
```
Return template a specific stack (heat stack-template)

    name
        Name of the stack

    profile
        Profile to use

    CLI Example:
```
salt '*' heat.template_stack name=mystack profile=openstack1
```

```python
salt.modules.heat.update_stack(name=None, template_file=None, environment=None, parameters=None, poll=0, rollback=False, timeout=60, profile=None)
```
Update a stack (heat stack-template)

    name
        Name of the stack

    template_file
        File of template

    environment
        File of environment

    parameters
        Parameter dict used to update the stack

    poll
        Poll and report events until stack complete

    rollback
        Enable rollback on update failure

26.6. execution modules
timeout
   Stack creation timeout in minutes

profile
   Profile to build on

CLI Example:

```bash
salt '*' heat.update_stack name=mystack \
   template_file=salt://template.yaml \
   environment=salt://environment.yaml \
   parameters="{"image": "Debian 8", "flavor": "m1.small"}"
   poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter enviroment was corrected to environment. The enviroment spelling mistake has been removed in Salt 3000.

26.6.168  salt.modules.helm

Interface with Helm

depends
   pyhelm Python package

Note: This module use the helm-cli. The helm-cli binary have to be present in your Salt-Minion path.

Helm-CLI vs Salt-Modules

This module is a wrapper of the helm binary. All helm v3.0 command are implemented.

To install a chart with the helm-cli:

```bash
helm install grafana stable/grafana --wait --values /path/to/values.yaml
```

To install a chart with the Salt-Module:

```bash
salt '*' helm.install grafana stable/grafana values='/path/to/values.yaml'\n   flags="['wait']"
```

Detailed Function Documentation

salt.modules.helm.completion (shell, flags=None, kvflags=None)
   Generate auto-completions script for Helm for the specified shell (bash or zsh). Return the shell auto-completion content.

   shell
      (string) One of ['bash', 'zsh'].

   flags
      (list) Flags in argument of the command without values. ex: ['help', '--help']

   kvflags
      (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}
CLI Example:
```
salt '*' helm.completion bash
```

click modules.helm.create(name, flags=None, kvflags=None)

Create a chart directory along with the common files and directories used in a chart. Return True if succeed, else the error message.

name
  (string) The chart name to create.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.create NAME
```

click modules.helm.dependency_build(chart, flags=None, kvflags=None)

Build out the charts/ directory from the Chart.lock file. Return True if succeed, else the error message.

chart
  (string) The chart name to build dependency.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.dependency_build CHART
```

click modules.helm.dependency_list(chart, flags=None, kvflags=None)

List all of the dependencies declared in a chart. Return chart dependencies if succeed, else the error message.

chart
  (string) The chart name to list dependency.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.dependency_list CHART
```

click modules.helm.dependency_update(chart, flags=None, kvflags=None)

Update the on-disk dependencies to mirror Chart.yaml. Return True if succeed, else the error message.

chart
  (string) The chart name to update dependency.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

26.6. execution modules
**salt.modules.helm.env** *(flags=None, kvflags=None)*

Prints out all the environment information in use by Helm. Return Helm environments variables if succeed, else the error message.

- **flags** *(list)* Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** *(dict)* Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

**CLI Example:**

```
salt '*' helm.env
```

**salt.modules.helm.get_all** *(release, flags=None, kvflags=None)*

Prints a human readable collection of information about the notes, hooks, supplied values, and generated manifest file of the given release. Return release information if succeed, else the error message.

- **release** *(string)* Release name to get information from.
- **flags** *(list)* Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** *(dict)* Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

**CLI Example:**

```
salt '*' helm.get_all RELEASE
```

**salt.modules.helm.get_hooks** *(release, flags=None, kvflags=None)*

Prints a human readable collection of information about the hooks of the given release. Return release hooks information if succeed, else the error message.

- **release** *(string)* Release name to get hooks information from.
- **flags** *(list)* Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** *(dict)* Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

**CLI Example:**

```
salt '*' helm.get_hooks RELEASE
```

**salt.modules.helm.get_manifest** *(release, flags=None, kvflags=None)*

Prints a human readable collection of information about the manifest of the given release. Return release manifest information if succeed, else the error message.

- **release** *(string)* Release name to get manifest information from.
flags
   (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
   (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_manifest RELEASE
```

`salt.modules.helm.get_notes(release, flags=None, kvflags=None)`

Prints a human readable collection of information about the notes of the given release. Return release notes information if succeed, else the error message.

**release**
   (string) Release name to get notes information from.

**flags**
   (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**
   (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_notes RELEASE
```

`salt.modules.helm.get_values(release, flags=None, kvflags=None)`

Prints a human readable collection of information about the values of the given release. Return release values information if succeed, else the error message.

**release**
   (string) Release name to get values information from.

**flags**
   (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**
   (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.get_values RELEASE
```

# In YAML format
```
salt '*' helm.get_values RELEASE kvflags="{'output': 'yaml'}"
```

`salt.modules.helm.help_(command, flags=None, kvflags=None)`

Provides help for any command in the application. Return the full help if succeed, else the error message.

**command**
   (string) Command to get help. ex: 'get'

**flags**
   (list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**
   (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
salt.modules.helm.history(release, flags=None, kvflags=None)

Prints historical revisions for a given release. Return release historic if succeed, else the error message.

**release**
(string) Release name to get history from.

**flags**
(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.history RELEASE
```

# In YAML format
```
salt '*' helm.history RELEASE kvflags="{'output': 'yaml'}"
```

salt.modules.helm.install(release, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None)

Installs a chart archive. Return True if succeed, else the error message.

**release**
(string) Release name to get values information from.

**chart**
(string) Chart name to install.

**values**
(string) Absolute path to the values.yaml file.

**version**
(string) The exact chart version to install. If this is not specified, the latest version is installed.

**namespace**
(string) The namespace scope for this request.

**set**
(string or list) Set a values on the command line.

**flags**
(list) Flags in argument of the command without values. ex: ['help', '--help']

**kvflags**
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.install RELEASE CHART
```

# With values file.
```
salt '*' helm.install RELEASE CHART values='/path/to/values.yaml'
```

salt.modules.helm.lint(path, values=None, namespace=None, set=None, flags=None, kvflags=None)

Takes a path to a chart and runs a series of tests to verify that the chart is well-formed. Return True if succeed, else the error message.
path
  (string) The path to the chart to lint.

values
  (string) Absolute path to the values.yaml file.

namespace
  (string) The namespace scope for this request.

set
  (string or list) Set a values on the command line.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
salt '*' helm.lint PATH

salt.modules.helm.list_(namespace=None, flags=None, kvflags=None)
  Lists all of the releases. By default, it lists only releases that are deployed or failed. Return the list of release if succeed, else the error message.

namespace
  (string) The namespace scope for this request.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
salt '*' helm.list

# In YAML format
salt '*' helm.list kvflags="{'output': 'yaml'}"

salt.modules.helm.package_(chart, flags=None, kvflags=None)
  Packages a chart into a versioned chart archive file. If a path is given, this will look at that path for a chart (which must contain a Chart.yaml file) and then package that directory. Return True if succeed, else the error message.

chart
  (string) Chart name to package. Can be an absolute path.

flags
  (list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
salt '*' helm.package CHART

(continues on next page)
salt.modules.helm.plugin_install(path, flags=None, kvflags=None)

Install a Helm plugin from a url to a VCS repo or a local path. Return True if succeed, else the error message.

- **path**
  - (string) Path to the local plugin. Can be an url.
- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_install PATH
```

salt.modules.helm.plugin_list(flags=None, kvflags=None)

List installed Helm plugins. Return the plugin list if succeed, else the error message.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_list
```

salt.modules.helm.plugin_uninstall(plugin, flags=None, kvflags=None)

Uninstall a Helm plugin. Return True if succeed, else the error message.

- **plugin**
  - (string) The plugin to uninstall.
- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.plugin_uninstall PLUGIN
```

salt.modules.helm.plugin_update(plugin, flags=None, kvflags=None)

Update a Helm plugin. Return True if succeed, else the error message.

- **plugin**
  - (string) The plugin to update.
- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}
CLI Example:

```
salt '*' helm.plugin_update PLUGIN
```

salt.modules.helm.pull(pkg, flags=None, kvflags=None)

Retrieve a package from a package repository, and download it locally. Return True if succeed, else the error message.

- **pkg**
  - (string) The package to pull. Can be url or repo/chartname.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']

- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.pull PKG
```

# With destination path to write the chart.

```
salt '*' helm.pull PKG kvflags="{'destination': '/path/to/the/chart'}"
```

salt.modules.helm.repo_add(name, url, namespace=None, flags=None, kvflags=None)

Add a chart repository. Return True if succeed, else the error message.

- **name**
  - (string) The local name of the repository to install. Have to be unique.

- **url**
  - (string) The url to the repository.

- **namespace**
  - (string) The namespace scope for this request.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']

- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_add NAME URL
```

salt.modules.helm.repo_index(directory, namespace=None, flags=None, kvflags=None)

Read the current directory and generate an index file based on the charts found. Return True if succeed, else the error message.

- **directory**
  - (string) The path to the index.

- **namespace**
  - (string) The namespace scope for this request.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']

- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}
CLI Example:

```
salt '*' helm.index DIRECTORY
```

**salt.modules.helm.repo_list**(namespace=None, flags=None, kvflags=None)

List a chart repository. Return the repository list if succeed, else the error message.

- **namespace** *(string)* The namespace scope for this request.
- **flags** *(list)* Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** *(dict)* Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_list
```

# In YAML format
```
salt '*' helm.repo_list kvflags="{'output': 'yaml'}"
```

**salt.modules.helm.repo_manager**(present=None, absent=None, prune=False, namespace=None, flags=None, kvflags=None)

Manage charts repository. Return the summery of all actions.

- **present** *(list)* List of repository to be present. It’s a list of dict: [{'name': 'local_name', 'url': 'repository_url'}]
- **absent** *(list)* List of local name repository to be absent.
- **prune** *(boolean - default: False)* If True, all repository already present but not in the present list would be removed.
- **namespace** *(string)* The namespace scope for this request.
- **flags** *(list)* Flags in argument of the command without values. ex: ['help', '--help']
- **kvflags** *(dict)* Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.repo_manager present="[{'name': 'LOCAL_NAME', 'url': 'REPO_URL'}]" absent="['LOCAL_NAME']"
```

**salt.modules.helm.repo_remove**(name, namespace=None, flags=None, kvflags=None)

Remove a chart repository. Return True if succeed, else the error message.

- **name** *(string)* The local name of the repository to remove.
- **namespace** *(string)* The namespace scope for this request.
flags
(list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.repo_remove NAME
```

salt.modules.helm.repo_update(namespace=None, flags=None, kvflags=None)
Update all charts repository. Return True if succeed, else the error message.

namespace
(string) The namespace scope for this request.

flags
(list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.repo_update
```

salt.modules.helm.rollback(release, revision, namespace=None, flags=None, kvflags=None)
Rolls back a release to a previous revision. To see release revision number, execute the history module. Return True if succeed, else the error message.

release
(string) The name of the release to managed.

revision
(string) The revision number to roll back to.

namespace
(string) The namespace scope for this request.

flags
(list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.rollback RELEASE REVISION
```

salt.modules.helm.search_hub(keyword, flags=None, kvflags=None)
Search the Helm Hub or an instance of Monocular for Helm charts. Return the research result if succeed, else the error message.

keyword
(string) The keyword to search in the hub.

flags
(list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags
    (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```python
salt '*' helm.search_hub KEYWORD
# In YAML format
salt '*' helm.search_hub KEYWORD kvflags="{'output': 'yaml'}"
```

salt.modules.helm.search_repo(keyword, flags=None, kvflags=None)

Search reads through all of the repositories configured on the system, and looks for matches. Search of these
repositories uses the metadata stored on the system. Return the research result if succeed, else the error
message.

keyword
    (string) The keyword to search in the repo.
flags
    (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags
    (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```python
salt '*' helm.search_hub KEYWORD
# In YAML format
salt '*' helm.search_hub KEYWORD kvflags="{'output': 'yaml'}"
```

salt.modules.helm.show_all(chart, flags=None, kvflags=None)

Inspects a chart (directory, file, or URL) and displays all its content (values.yaml, Charts.yaml, README).
Return chart information if succeed, else the error message.

chart
    (string) The chart to inspect.
flags
    (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags
    (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```python
salt '*' helm.show_all CHART
```

salt.modules.helm.show_chart(chart, flags=None, kvflags=None)

Inspects a chart (directory, file, or URL) and displays the contents of the Charts.yaml file. Return chart inform-
ation if succeed, else the error message.

chart
    (string) The chart to inspect.
flags
    (list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags
    (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}
CLI Example:

```
salt '*' helm.show_chart CHART
```

`salt.modules.helm.show_readme(chart, flags=None, kvflags=None)`

Inspects a chart (directory, file, or URL) and displays the contents of the README file. Return chart information if succeed, else the error message.

- **chart**
  - (string) The chart to inspect.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']

- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.show_readme CHART
```

`salt.modules.helm.show_values(chart, flags=None, kvflags=None)`

Inspects a chart (directory, file, or URL) and displays the contents of the values.yaml file. Return chart information if succeed, else the error message.

- **chart**
  - (string) The chart to inspect.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']

- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.show_values CHART
```

`salt.modules.helm.status(release, namespace=None, flags=None, kvflags=None)`

Show the status of the release. Return the release status if succeed, else the error message.

- **release**
  - (string) The release to status.

- **namespace**
  - (string) The namespace scope for this request.

- **flags**
  - (list) Flags in argument of the command without values. ex: ['help', '--help']

- **kvflags**
  - (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
```
salt '*' helm.status RELEASE
```

# In YAML format
```
salt '*' helm.status RELEASE kvflags="{'output': 'yaml'}"
```
salt.modules.helm.template(name, chart, values=None, output_dir=None, set=None, flags=None, kvflags=None)

Render chart templates locally and display the output. Return the chart renderer if succeed, else the error message.

name
(string) The template name.

chart
(string) The chart to template.

values
(string) Absolute path to the values.yaml file.

output_dir
(string) Absolute path to the output directory.

set
(string or list) Set a values on the command line.

flags
(list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```bash
salt '*' helm.template NAME CHART
# With values file.
salt '*' helm.template NAME CHART values='/path/to/values.yaml' output_dir='path/to/output/dir'
```

salt.modules.helm.test(release, flags=None, kvflags=None)

Runs the tests for a release. Return the test result if succeed, else the error message.

release
(string) The release name to test.

flags
(list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags
(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```bash
salt '*' helm.test RELEASE
```

salt.modules.helm.uninstall(release, namespace=None, flags=None, kvflags=None)

Uninstall the release name. Return True if succeed, else the error message.

release
(string) The name of the release to managed.

namespace
(string) The namespace scope for this request.

flags
(list) Flags in argument of the command without values. ex: ['help', '--help']
kvflags
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.uninstall RELEASE
# In dry-run mode.
salt '*' helm.uninstall RELEASE flags=['dry-run']
```

salt.modules.helm.upgrade (release, chart, values=None, version=None, namespace=None, set=None, flags=None, kvflags=None)

Upgrades a release to a new version of a chart. Return True if succeed, else the error message.

`release`
  (string) The name of the release to managed.

`chart`
  (string) The chart to managed.

`values`
  (string) Absolute path to the values.yaml file.

`version`
  (string) The exact chart version to install. If this is not specified, the latest version is installed.

`namespace`
  (string) The namespace scope for this request.

`set`
  (string or list) Set a values on the command line.

`flags`
  (list) Flags in argument of the command without values. ex: ['help', '--help']

`kvflags`
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.upgrade RELEASE CHART
# In dry-run mode.
salt '*' helm.upgrade RELEASE CHART flags=['dry-run']

# With values file.
salt '*' helm.upgrade RELEASE CHART values='/path/to/values.yaml'
```

salt.modules.helm.verify (path, flags=None, kvflags=None)

Verify that the given chart has a valid provenance file. Return True if succeed, else the error message.

`path`
  (string) The path to the chart file.

`flags`
  (list) Flags in argument of the command without values. ex: ['help', '--help']

`kvflags`
  (dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:

```
salt '*' helm.verify path=/path/to/chart.yaml
```
salt '⋆' helm.verify PATH

salt.modules.helm.version\(^{\text{flags=\textit{None}, kvflags=\textit{None}}\)}\)

Show the version for Helm. Return version information if succeed, else the error message.

flags

(list) Flags in argument of the command without values. ex: ['help', '--help']

kvflags

(dict) Flags in argument of the command with values. ex: {'v': 2, '--v': 4}

CLI Example:
salt '⋆' helm.version

26.6.169 salt.modules.hg

Support for the Mercurial SCM

salt.modules.hg.archive\(^{\text{cwd=\textit{None}, output=\textit{None}, rev='tip', fmt=\textit{None}, prefix=\textit{None}, user=\textit{None}}\)}\)

Export a tarball from the repository

cwd

The path to the Mercurial repository

output

The path to the archive tarball

rev: tip

The revision to create an archive from

fmt: None

Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.

prefix

[None] Prepend <prefix>/ to every filename in the archive

user

[None] Run hg as a user other than what the minion runs as

If prefix is not specified it defaults to the basename of the repo directory.

CLI Example:
salt '⋆' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz

salt.modules.hg.clone\(^{\text{cwd=\textit{None}, repository=\textit{None}, opts=\textit{None}, user=\textit{None}, identity=\textit{None}}\)}\)

Clone a new repository

cwd

The path to the Mercurial repository

repository

The hg URI of the repository

opts

[None] Any additional options to add to the command line

user

[None] Run hg as a user other than what the minion runs as

Chapter 26. Salt Module Reference
identity
[None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

salt.modules.hg.describe(cwd, rev='tip', user=None)

Mimic git describe and return an identifier for the given revision

cwd
The path to the Mercurial repository

rev: tip
The path to the archive tarball

user
[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.describe /path/to/repo
```

salt.modules.hg.pull(cwd, opts=None, user=None, identity=None, repository=None)

Perform a pull on the given repository

cwd
The path to the Mercurial repository

repository
[None] Perform pull from the repository different from .hg/hgrc:[paths]:default

opts
[None] Any additional options to add to the command line

user
[None] Run hg as a user other than what the minion runs as

identity
[None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.pull /path/to/repo opts=-u
```

salt.modules.hg.revision(cwd, rev='tip', short=False, user=None)

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

cwd
The path to the Mercurial repository

rev: tip
The revision

short: False
Return an abbreviated commit hash
user

[None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.revision /path/to/repo mybranch
```

```
salt.modules.hg.status(cwd, opts=None, user=None)
```

Show changed files of the given repository

- **cwd**
  - The path to the Mercurial repository

- **opts**
  - [None] Any additional options to add to the command line

- **user**
  - [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.status /path/to/repo
```

```
salt.modules.hg.update(cwd, rev, force=False, user=None)
```

Update to a given revision

- **cwd**
  - The path to the Mercurial repository

- **rev**
  - The revision to update to

- **force**
  - [False] Force an update

- **user**
  - [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt devserver1 hg.update /path/to/repo somebranch
```

26.6.170 `salt.modules.highstate_doc`

This module renders highstate configuration into a more human readable format.

How it works:

- **highstate or lowstate** data is parsed with a processor this defaults to `highstate_doc.processor_markdown`. The processed data is passed to a `jinja` template that builds up the document content.

configuration: Pillar

```
# the following defaults can be overridden
highstate_doc.config:
  # list of regex of state names to ignore in `highstate_doc.process_
  # lowstates`
  filter_id_regex:
```

(continues on next page)
State example

```

  note: highstate_doc.note:
    - name: example
    - order: 0
    - contents: |
      example 'highstate_doc.note'
      --------------------------
      This state does not do anything to the system! It is only used by a `processor` you can use `requisites` and `order` to move your docs around the rendered file.

{{sls}} a file we don't want in the doc !doc_skip:

  file.managed:
    - name: /root/passwords
    - contents: 'password: sadefgq34y45h56q'
      # also could use `highstate_doc.config: text_replace_regex` to replace # password string. `password:.\^': '[PASSWORD]'
```

To create the help document build a State that uses `highstate_doc.render`. For performance it’s advised to not included this state in your `top.sls` file.

```
# example `salt://makereadme.sls`
make helpfile:

  file.managed:
    - name: /root/README.md
    - contents: {{salt.highstate_doc.render()|json}}
    - show_diff: {{opts['test']}}</opts>
    - mode: '0640'
    - order: last
```

Run our `makereadme.sls` state to create `/root/README.md`. 

26.6. execution modules 2071
# first ensure `highstate` return without errors or changes
salt-call state.highstate
salt-call state.apply makereadme
# or if you don't want the extra `make helpfile` state
salt-call --out=newline_values_only salt.highstate_doc.render > /root/README.md ; chmod 0600 /root/README.md

Creating a document collection

From the master we can run the following script to creates a collection of all your minion documents.

```python
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
# NOTE: because of issues with 'cp.push' use 'highstate_doc.read_file'
o = s.cmd('*', 'highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available. '):
        # mkdir m
        #directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md', 'wb') as f:
            f.write(d)
        print('ADDED: ' + m + '/README.md')
```

Once the master has a collection of all the README files. You can use pandoc to create HTML versions of the markdown.

```bash
# process all the readme.md files to readme.html
if which pandoc; then echo "Found pandoc"; else echo "** Missing pandoc"; exit 1; fi
if which gs; then echo "Found gs"; else echo "** Missing gs(ghostscript)"; exit 1; fi
readme_files=$(find $dest -type f -path "*/README.md" -print)
for f in $readme_files ; do
    ff=${f#$dest/}
    minion=${ff%*/}
    echo "process: $dest/$minion/$(basename $f)"
    cat $dest/$minion/$(basename $f) | pandoc --standalone --from markdown_github --to html --include-in-header $dest/style.html
    $dest/$minion/$(basename $f).html
done
```

It is also nice to put the help files in source control.

```bash
# git init git add -A git commit -am 'updated docs' git push -f
```
Other hints

If you wish to customize the document format:

```python
# you could also create a new `processor` for perhaps reStructuredText
# highstate_doc.config:
#   processor: doc_custom.processor_rst

# example `salt://makereadme.jinja`

{{opts['id']}}</p>

==========================================
{# lowstates is set from highstate_doc.render() #}
{# if lowstates is missing use salt.highstate_doc.process_lowstates() #}
{% for s in lowstates %}
{{s.id}}
-----------------------------------------------------------------
{{s.function}}
{{s.markdown.requisite}}
{{s.markdown.details}}
{% endfor %}

# example `salt://makereadme.sls`
{% import_text "makereadme.jinja" as makereadme %}
{{sls}} or:
```
file.managed:
  - name: /root/README_other.md
  - contents: {{salt.highstate_doc.render(jinja_template_,
→ text=makereadme)|json}}
  - mode: '0640'
```

Some `replace_text_regex` values that might be helpful:

CERTS

HTACCESS
--------

```

salt.modules.highstate_doc.markdown_basic_jinja_template(**kwargs)

Return text for a simple markdown jinja template

This function can be used from the highstate_doc.render modules jinja_template_function option.

salt.modules.highstate_doc.markdown_default_jinja_template(**kwargs)

Return text for a markdown jinja template that included a header

This function can be used from the highstate_doc.render modules jinja_template_function option.

salt.modules.highstate_doc.markdown_full_jinja_template(**kwargs)

Return text for an advanced markdown jinja template

This function can be used from the highstate_doc.render modules jinja_template_function option.

salt.modules.highstate_doc.process_lowstates(**kwargs)

return processed lowstate data that was not blacklisted

render_module_function is used to provide your own. defaults to from_lowstate

salt.modules.highstate_doc.processor_markdown(lowstate_item, config, **kwargs)

Takes low state data and returns a dict of processed data that is by default used in a jinja template when rendering a markdown highstate_doc.

This lowstate_item_markdown given a lowstate item, returns a dict like:
salt.modules.highstate_doc.read_file(name)

output the contents of a file:

this is a workaround if the cp.push module does not work. https://github.com/saltstack/salt/issues/37133

help the master output the contents of a document that might be saved on the minions filesystem.

```
#!/bin/python
import os
import salt.client
s = salt.client.LocalClient()
o = s.cmd('!', 'highstate_doc.read_file', ['/root/README.md'])
for m in o:
    d = o.get(m)
    if d and not d.endswith('is not available.'):
        # mkdir m
        #directory = os.path.dirname(file_path)
        if not os.path.exists(m):
            os.makedirs(m)
        with open(m + '/README.md', 'wb') as fin:
            fin.write(d)
        print('ADDED: ' + m + '/README.md')
```
	salt.modules.highstate_doc.render(jinja_template_text=None,
jinja_template_function='highstate_doc.markdown_default_jinja_template',
**kwargs)

Render highstate to a text format (default Markdown)

if jinja_template_text is not set, jinja_template_function is used.

jinja_template_text: jinja text that the render uses to create the document. jinja_template_function: a salt module call that returns template text.

Options

- highstate_doc.markdown_basic_jinja_template
- highstate_doc.markdown_default_jinja_template
- highstate_doc.markdown_full_jinja_template

26.6. execution modules
26.6.171 salt.modules.hosts

Manage the information in the hosts file

salt.modules.hosts.add_host(ip, alias)
Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:
```
salt '*' hosts.add_host <ip> <alias>
```

salt.modules.hosts.get_alias(ip)
Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:
```
salt '*' hosts.get_alias <ip addr>
```

salt.modules.hosts.get_ip(host)
Return the ip associated with the named host

CLI Example:
```
salt '*' hosts.get_ip <hostname>
```

salt.modules.hosts.has_pair(ip, alias)
Return true if the alias is set

CLI Example:
```
salt '*' hosts.has_pair <ip> <alias>
```

salt.modules.hosts.list_hosts()
Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:
```
salt '*' hosts.list_hosts
```

salt.modules.hosts.rm_host(ip, alias)
Remove a host entry from the hosts file

CLI Example:
```
salt '*' hosts.rm_host <ip> <alias>
```

salt.modules.hosts.set_comment(ip, comment)
Set the comment for a host to an existing entry, if the entry is not in place then return False

CLI Example:
```
salt '*' hosts.set_comment <ip> <comment>
```
salt.modules.hosts.set_host(ip, alias, comment=None)

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip.

Changed in version 2016.3.0: If alias does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:
```
salt '*' hosts.set_host <ip> <alias>
```

26.6.172 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

salt.modules.http.query(url, **kwargs)

New in version 2015.5.0.

Query a resource, and decode the return data

Passes through all the parameters described in the `utils.http.query` function:

```
salt.utils.http.query(url, method='GET', params=None, data=None, data_file=None, 
header_dict=None, header_list=None, header_file=None, 
username=None, password=None, auth=None, decode=False, decode_type='auto', 
status=False, headers=False, text=False, cookies=None, cookie_jar=None, 
cookie_format='lwp', persist_session=False, session_cookie_jar=None, 
data_render=False, data_renderer=None, header_render=False, 
header_renderer=None, template_dict=None, test=False, test_url=None, 
node='minion', port=80, opts=None, backend=None, 
ca_bundle=None, verify_ssl=None, cert=None, text_out=None, headers_out=None, 
decode_out=None, stream=False, streaming_callback=None, 
header_callback=None, handle=False, agent='Salt/3007.1', 
raise_error=True, formdata=False, formdata_fieldname=None, 
formdata_filename=None, decode_body=True, **kwargs)
```

Query a resource, and decode the return data

raise_error

[True] If False, and if a connection cannot be made, the error will be suppressed and the body of the return will simply be None.

CLI Example:
```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST params='{
"key1": "val1", "key2": "val2"}'}
salt '*' http.query http://somelink.com/ method=POST data='
<xml>somecontent</xml>'
```

salt.modules.http.update_ca_bundle(target=None, source=None, merge_files=None)

Update the local CA bundle file from a URL.

New in version 2015.5.0.

CLI Example:
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle

If the target is not specified, it will be pulled from the ca_cert configuration variable available to the minion. If it cannot be found there, it will be placed at <<FILE_ROOTS>>/cacerts.pem.

If the source is not specified, it will be pulled from the ca_cert_url configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

merge_files may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem

salt.modules.http.wait_for_successful_query(url, wait_for=300, **kwargs)

Query a resource until a successful response, and decode the return data

CLI Example:

salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160 request_interval=1

26.6.173 salt.modules.icinga2

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

depends
• icinga2 server

salt.modules.icinga2.generate_cert(domain)

Generate an icinga2 client certificate and key.

Returns:
icinga2 pki new-cert --cn domain.tld --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt

CLI Example:

salt '*' icinga2.generate_cert domain.tld

salt.modules.icinga2.generate_ticket(domain)

Generate and save an icinga2 ticket.

Returns:
icinga2 pki ticket --cn domain.tld

CLI Example:

salt '*' icinga2.generate_ticket domain.tld
salt.modules.icinga2.**node_setup***(domain, master, ticket)  
Setup the icinga2 node.

**Returns:**
- icinga2 node setup --ticket TICKET_ID --endpoint master.domain.tld --zone domain.tld --master_host master.domain.tld --trustedcert /etc/icinga2/pki/trusted-master.crt

CLI Example:

```
salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
```

salt.modules.icinga2.**request_cert**(domain, master, ticket, port)  
Request CA cert from master icinga2 node.

**Returns:**
- icinga2 pki request --host master.domain.tld --port 5665 --ticket TICKET_ID --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --ca /etc/icinga2/pki/ca.crt

CLI Example:

```
salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
```

salt.modules.icinga2.**save_cert**(domain, master)  
Save the certificate for master icinga2 node.

**Returns:**
- icinga2 pki save-cert --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --host master.domain.tld

CLI Example:

```
salt '*' icinga2.save_cert domain.tld master.domain.tld
```

---

**26.6.174 salt.modules.idem**

**Idem Support**

This module provides access to idem execution modules

New in version 3002.

salt.modules.idem.**exec***(path, acct_file=None, acct_key=None, acct_profile=None, *args, **kwargs)  
Call an idem execution module

**path**
- The idem path of the idem execution module to run

**acct_file**
- Path to the acct file used in generating idem ctx parameters. Defaults to the value in the ACCT_FILE environment variable.

**acct_key**
- Key used to decrypt the acct file. Defaults to the value in the ACCT_KEY environment variable.

**acct_profile**
- Name of the profile to add to idem's ctxacct parameter. Defaults to the value in the ACCT_PROFILE environment variable.
args
Any positional arguments to pass to the idem exec function

kwargs
Any keyword arguments to pass to the idem exec function

CLI Example:
```
salt '*' idem.exec test.ping
```

Maturity
new

Depends
acct, pop, pop-config, idem

Platform
all

26.6.175 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an api_key in /etc/salt/minion:

```
ifttt:
  secret_key: '280d4699-a817-4719-ba6f-ca56e573e44f'
```

salt.modules.ifttt.trigger_event(event=None, **kwargs)
Trigger a configured event in IFTTT.

Parameters

- event -- The name of the event to trigger.

Returns
A dictionary with status, text, and error if result was failure.

26.6.176 salt.modules.ilo

Manage HP ILO

depends
hponecfg (SmartStart Scripting Toolkit Linux Edition)

salt.modules.ilo.change_password(username, password)
Reset a users password

CLI Example:
```
salt '*' ilo.change_password damianMyerscough
```

salt.modules.ilo.change_username(old_username, new_username)
Change a username

CLI Example:
salt '*! ilo.change_username damian diana

salt.modules.ilo.configure_network(ip, netmask, gateway)
Configure Network Interface
CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

salt.modules.ilo.configure_snmp(community, snmp_port=161, snmp_trapport=161)
Configure SNMP
CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

salt.modules.ilo.create_user(name, password, *privileges)
Create user
CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

If no permissions are specify the user will only have a read-only account.
Supported privelges:

- ADMIN_PRIV Enables the user to administer user accounts.
- REMOTE_CONS_PRIV Enables the user to access the Remote Console functionality.
- RESET_SERVER_PRIV Enables the user to remotely manipulate the server power setting.
- VIRTUAL_MEDIA_PRIV Enables the user permission to access the virtual media functionality.
- CONFIG_ILO_PRIV Enables the user to configure iLO settings.

salt.modules.ilo.delete_ssh_key(username)
Delete a users SSH key from the ILO
CLI Example:

```
salt '*' ilo.delete_user_sshkey damian
```

salt.modules.ilo.delete_user(username)
Delete a user
CLI Example:

```
salt '*' ilo.delete_user damian
```

salt.modules.ilo.disable_dhcp()
Disable DHCP
CLI Example:

```
salt '*' ilo.disable_dhcp
```
salt.modules.ilo.disable_ssh()
    Disable the SSH daemon
    CLI Example:
    ```
salt '*' ilo.disable_ssh
    ```

salt.modules.ilo.enable_dhcp()
    Enable DHCP
    CLI Example:
    ```
salt '*' ilo.enable_dhcp
    ```

salt.modules.ilo.enable_ssh()
    Enable the SSH daemon
    CLI Example:
    ```
salt '*' ilo.enable_ssh
    ```

salt.modules.ilo.get_user(username)
    Returns local user information, excluding the password
    CLI Example:
    ```
salt '*' ilo.get_user damian
    ```

salt.modules.ilo.global_settings()
    Show global settings
    CLI Example:
    ```
salt '*' ilo.global_settings
    ```

salt.modules.ilo.list_users()
    List all users
    CLI Example:
    ```
salt '*' ilo.list_users
    ```

salt.modules.ilo.list_users_info()
    List all users in detail
    CLI Example:
    ```
salt '*' ilo.list_users_info
    ```

salt.modules.ilo.network()
    Grab the current network settings
    CLI Example:
    ```
salt '*' ilo.network
    ```
salt.modules.ilo.set_http_port(port=80)
Configure the port HTTP should listen on
CLI Example:
```
salt '*' ilo.set_http_port 8080
```

salt.modules.ilo.set_https_port(port=443)
Configure the port HTTPS should listen on
CLI Example:
```
salt '*' ilo.set_https_port 4334
```

salt.modules.ilo.set_ssh_key(public_key)
Configure SSH public keys for specific users
CLI Example:
```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1ka... damian"
```
The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-sensitive) of the ILO username.

salt.modules.ilo.set_ssh_port(port=22)
Enable SSH on a user defined port
CLI Example:
```
salt '*' ilo.set_ssh_port 2222
```

26.6.177 salt.modules.incron

Work with incron

salt.modules.incron.list_tab(user)
Return the contents of the specified user's incrontab
CLI Example:
```
salt '*' incron.list_tab root
```

salt.modules.incron.ls(user)
This function is an alias of list_tab.
Return the contents of the specified user's incrontab
CLI Example:
```
salt '*' incron.list_tab root
```

salt.modules.incron.raw_incron(user)
Return the contents of the user's incrontab
CLI Example:
salt '*/' incron.raw_incron root

salt.modules.incron.raw_system_incron()
Return the contents of the system wide incrontab

   CLI Example:

   salt '*/' incron.raw_system_incron

salt.modules.incron.rm(user, path, mask, cmd)
This function is an alias of rm_job.

   Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

   CLI Example:

   salt '*/' incron.rm_job root /path

salt.modules.incron.rm_job(user, path, mask, cmd)
Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

   CLI Example:

   salt '*/' incron.rm_job root /path

salt.modules.incron.set_job(user, path, mask, cmd)
Sets an incron job up for a specified user.

   CLI Example:

   salt '*/' incron.set_job root '/root' 'IN_MODIFY' 'echo $$ $@ $# $% $&''

salt.modules.incron.write_incron_file(user, path)
Writes the contents of a file to a user's incrontab

   CLI Example:

   salt '*/' incron.write_incron_file root /tmp/new_incron

salt.modules.incron.write_incron_file_verbose(user, path)
Writes the contents of a file to a user's incrontab and return error message on error

   CLI Example:

   salt '*/' incron.write_incron_file_verbose root /tmp/new_incron
26.6.178 salt.modules.influxdb08mod

InfluxDB - A distributed time series database
Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)
New in version 2014.7.0.

depends

- influxdb Python module (>= 1.0.0)

configuration

This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```plaintext
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

### salt.modules.influxdb08mod.db_create(name, user=None, password=None, host=None, port=None)

Create a database

- **name** Database name to create
- **user** The user to connect as
- **password** The password of the user
- **host** The host to connect to
- **port** The port to connect to

CLI Example:

```shell
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

### salt.modules.influxdb08mod.db_exists(name, user=None, password=None, host=None, port=None)

Checks if a database exists in Influxdb

- **name** Database name to create
- **user** The user to connect as
- **password** The password of the user
- **host** The host to connect to
port
   The port to connect to

CLI Example:

```
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```

```
salt.modules.influxdb08mod.db_list(user=None, password=None, host=None, port=None)
   List all InfluxDB databases
   user
      The user to connect as
   password
      The password of the user
   host
      The host to connect to
   port
      The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

```
salt.modules.influxdb08mod.db_remove(name, user=None, password=None, host=None, port=None)
   Remove a database
   name
      Database name to remove
   user
      The user to connect as
   password
      The password of the user
   host
      The host to connect to
   port
      The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

```
salt.modules.influxdb08mod.login_test(name, password, database=None, host=None, port=None)
   Checks if a credential pair can log in at all.
   If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.
   name
      The user to connect as
password
   The password of the user

database
   The database to try to log in to

host
   The host to connect to

port
   The port to connect to

CLI Example:

```bash
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> ...
```

```
salt.modules.influxdb08mod.query(database, query, time_precision='s', chunked=False, user=None, password=None, host=None, port=None)
```

Querying data

database
   The database to query

query
   Query to be executed

time_precision
   Time precision to use ('s', 'm', or 'u')

chunked
   Whether is chunked or not

user
   The user to connect as

password
   The password of the user

host
   The host to connect to

port
   The port to connect to

CLI Example:

```bash
salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked> ...
```

```
salt.modules.influxdb08mod.retention_policy_add(database, name, duration, replication, default=False, user=None, password=None, host=None, port=None)
```

Add a retention policy.

database
   The database to operate on.
name
   Name of the policy to modify.

duration
   How long InfluxDB keeps the data.

replication
   How many copies of the data are stored in the cluster.

default
   Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb.retention_policy_add metrics default 1d 1
```

`salt.modules.influxdb08mod.retention_policy_alter`(database, name, duration, replication, default=False, user=None, password=None, host=None, port=None)

Modify an existing retention policy.

database
   The database to operate on.

name
   Name of the policy to modify.

duration
   How long InfluxDB keeps the data.

replication
   How many copies of the data are stored in the cluster.

default
   Whether this policy should be the default or not. Default is False.

CLI Example:

```
salt '*' influxdb08.mod.retention_policy_modify metrics default 1d 1
```

`salt.modules.influxdb08mod.retention_policy_exists`(database, name, user=None, password=None, host=None, port=None)

Check if a retention policy exists.

database
   The database to operate on.

name
   Name of the policy to modify.

CLI Example:

```
salt '*' influxdb08.mod.retention_policy_exists metrics default
```

`salt.modules.influxdb08mod.retention_policy_get`(database, name, user=None, password=None, host=None, port=None)

Get an existing retention policy.

database
   The database to operate on.
name
    Name of the policy to modify.

CLI Example:

```bash
salt '*' influxdb08.retention_policy_get metrics default
```

---

**salt.modules.influxdb08mod.user_chpass** *(name, passwd, database=None, user=None, password=None, host=None, port=None)*

Change password for a cluster admin or a database user.
If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.

- **name**
  - User name for whom to change the password

- **passwd**
  - New password

- **database**
  - The database on which to operate

- **user**
  - The user to connect as

- **password**
  - The password of the user

- **host**
  - The host to connect to

- **port**
  - The port to connect to

CLI Example:

```bash
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user>
  → <password> <host> <port>
```

---

**salt.modules.influxdb08mod.user_create** *(name, passwd, database=None, user=None, password=None, host=None, port=None)*

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.

- **name**
  - User name for the new user to create

- **passwd**
  - Password for the new user to create

- **database**
  - The database to create the user in

- **user**
  - The user to connect as
password
  The password of the user

host
  The host to connect to

port
  The port to connect to

CLI Example:

salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user>
  ← <password> <host> <port>

salt.modules.influxdb08mod.user_exists(name, database=None, user=None, password=None, host=None, port=None)

Checks if a cluster admin or database user exists.
If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

name
  User name

database
  The database to check for the user to exist

user
  The user to connect as

password
  The password of the user

host
  The host to connect to

port
  The port to connect to

CLI Example:

salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host>
  ← <port>

salt.modules.influxdb08mod.user_list(database=None, user=None, password=None, host=None, port=None)

List cluster admins or database users.
If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.

database
  The database to list the users from

user
  The user to connect as
password
   The password of the user

host
   The host to connect to

port
   The port to connect to

CLI Example:

```bash
salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>
```

salt.modules.influxdb08mod.user_remove(name, database=None, user=None, password=None, host=None, port=None)

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

name
   User name to remove

database
   The database to remove the user from

user
   User name for the new user to delete

user
   The user to connect as

password
   The password of the user

host
   The host to connect to

port
   The port to connect to

CLI Example:

```bash
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```
26.6.179 salt.modules.influxdbmod

InfluxDB - A distributed time series database
Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

depends
  • influxdb Python module (>= 3.0.0)

configuration
This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function influxdb_user='influxadmin' influxdb_password='s3cr1t'
```

would override user and password while still using the defaults for host and port.

**salt.modules.influxdbmod.alter_retention_policy**(database, name, duration, replication, default=False, **client_args)**

Modify an existing retention policy.

**name**
Name of the retention policy to modify.

**database**
Name of the database for which the retention policy was defined.

**duration**
New duration of given retention policy.

  Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use 'INF' for duration. The minimum retention period is 1 hour.

**replication**
New replication of given retention policy.

  This determines how many independent copies of each data point are stored in a cluster.

**default**
[False] Whether or not to set the modified policy as default.

CLI Example:

```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```
salt.modules.influxdbmod.continuous_query_exists(database, name, **client_args)

Check if continuous query with given name exists on the database.

- **database**: Name of the database for which the continuous query was defined.
- **name**: Name of the continuous query to check.

CLI Example:
```
salt '*' influxdb.continuous_query_exists metrics default
```

salt.modules.influxdbmod.create_continuous_query(database, name, query, resample_time=None, coverage_period=None, **client_args)

Create a continuous query.

- **database**: Name of the database for which the continuous query will be created on.
- **name**: Name of the continuous query to create.
- **query**: The continuous query string.
- **resample_time**: [None] Duration between continuous query resampling.
- **coverage_period**: [None] Duration specifying time period per sample.

CLI Example:
```
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*)\n→ INTO mydb.a_month.:MEASUREMENT FROM mydb.a_week./.*/ GROUP BY time(5m),\n→ '*
```

salt.modules.influxdbmod.create_db(name, **client_args)

Create a database.

- **name**: Name of the database to create.

CLI Example:
```
salt '*' influxdb.create_db <name>
```

salt.modules.influxdbmod.create_retention_policy(database, name, duration, replication, default=False, **client_args)

Create a retention policy.

- **database**: Name of the database for which the retention policy will be created.
- **name**: Name of the new retention policy.
duration
Duration of the new retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7
day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use ‘INF’
for duration. The minimum retention period is 1 hour.

replication
Replication factor of the retention policy.

This determines how many independent copies of each data point are stored in a cluster.

default
[False] Whether or not the policy as default will be set as default.

CLI Example:
salt '*' influxdb.create_retention_policy metrics default 1d 1

salt.modules.influxdbmod.\texttt{create\_user}(name, passwd, admin=False, **client_args)
Create a user.

name
Name of the user to create.

passwd
Password of the new user.

admin
[False] Whether the user should have cluster administration privileges or not.

CLI Example:
salt '*' influxdb.create_user \textless name\textgreater \textless password\textgreater
salt '*' influxdb.create_user \textless name\textgreater \textless password\textgreater admin=True

salt.modules.influxdbmod.\texttt{db\_exists}(name, **client_args)
Checks if a database exists in InfluxDB.

name
Name of the database to check.

CLI Example:
salt '*' influxdb.db_exists \textless name\textgreater

salt.modules.influxdbmod.\texttt{drop\_continuous\_query}(database, name, **client_args)
Drop a continuous query.

database
Name of the database for which the continuous query will be drop from.

name
Name of the continuous query to drop.

CLI Example:
salt '*' influxdb.drop_continuous_query mydb my_cq
salt.modules.influxdbmod.drop_db(name, **client_args)

Drop a database.

    name
    Name of the database to drop.

    CLI Example:
    
    salt '*' influxdb.drop_db <name>

salt.modules.influxdbmod.drop_retention_policy(database, name, **client_args)

Drop a retention policy.

    database
    Name of the database for which the retention policy will be dropped.

    name
    Name of the retention policy to drop.

    CLI Example:
    
    salt '*' influxdb.drop_retention_policy mydb mypr

salt.modules.influxdbmod.get_continuous_query(database, name, **client_args)

Get an existing continuous query.

    database
    Name of the database for which the continuous query was defined.

    name
    Name of the continuous query to get.

    CLI Example:
    
    salt '*' influxdb.get_continuous_query mydb cq_month

salt.modules.influxdbmod.get_retention_policy(database, name, **client_args)

Get an existing retention policy.

    database
    Name of the database for which the retention policy was defined.

    name
    Name of the retention policy.

    CLI Example:
    
    salt '*' influxdb.get_retention_policy metrics default

salt.modules.influxdbmod.grant_admin_privileges(name, **client_args)

Grant cluster administration privileges to a user.

    name
    Name of the user to whom admin privileges will be granted.

    CLI Example:
    
    salt '*' influxdb.grant_admin_privileges <name>
salt.modules.influxdbmod.grant_privilege(database, privilege, username, **client_args)
Grant a privilege on a database to a user.

  database
    Name of the database to grant the privilege on.

  privilege
    Privilege to grant. Can be one of 'read', 'write' or 'all'.

  username
    Name of the user to grant the privilege to.

salt.modules.influxdbmod.list_dbs(**client_args)
List all InfluxDB databases.

  CLI Example:

      salt '*' influxdb.list_dbs

salt.modules.influxdbmod.list_privileges(name, **client_args)
List privileges from a user.

  name
    Name of the user from whom privileges will be listed.

  CLI Example:

      salt '*' influxdb.list_privileges <name>

salt.modules.influxdbmod.list_users(**client_args)
List all users.

  CLI Example:

      salt '*' influxdb.list_users

salt.modules.influxdbmod.query(database, query, **client_args)
Execute a query.

  database
    Name of the database to query on.

  query
    InfluxQL query string.

salt.modules.influxdbmod.remove_user(name, **client_args)
Remove a user.

  name
    Name of the user to remove

  CLI Example:

      salt '*' influxdb.remove_user <name>

salt.modules.influxdbmod.retention_policy_exists(database, name, **client_args)
Check if retention policy with given name exists.

  database
    Name of the database for which the retention policy was defined.
name
   Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

```
salt.modules.influxdbmod.revoke_admin_privileges(name, **client_args)
```

Revoke cluster administration privileges from a user.

name
   Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

```
salt.modules.influxdbmod.revoke_privilege(database, privilege, username, **client_args)
```

Revoke a privilege on a database from a user.

database
   Name of the database to grant the privilege on.

privilege
   Privilege to grant. Can be one of 'read', 'write' or 'all'.

username
   Name of the user to grant the privilege to.

```
salt.modules.influxdbmod.set_user_password(name, passwd, **client_args)
```

Change password of a user.

name
   Name of the user for whom to set the password.

passwd
   New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

```
salt.modules.influxdbmod.user_exists(name, **client_args)
```

Check if a user exists.

name
   Name of the user to check.

CLI Example:

```
salt '*' influxdb.user_exists <name>
```

```
salt.modules.influxdbmod.user_info(name, **client_args)
```

Get information about given user.

name
   Name of the user for which to get information.

CLI Example:
salt Documentation, Release 3007.1

salt '*' influxdb.user_info <name>

26.6.180 salt.modules.infoblox

This module has been tested on infoblox API v1.2.1, other versions of the API are likely workable.

```
depends
libinfoblox, https://github.com/steverweber/libinfoblox
libinfoblox can be installed using pip install libinfoblox
```

API documents can be found on your infoblox server at:

```
https://INFOBLOX/wapidoc
```

configuration

The following configuration defaults can be defined (pillar or config files '/etc/salt/master.d/infoblox.conf'):

```
infoblox.config:
  api_sslverify: True
  api_url: 'https://INFOBLOX/wapi/v1.2.1'
  api_user: 'username'
  api_key: 'password'
```

Many of the functions accept `api_opts` to override the API config.

```
salt-call infoblox.get_host name=my.host.com api_url: ->'https://INFOBLOX/wapi/v1.2.1' api_user=admin api_key=pass
``` 

salt.modules.infoblox.create_a(data, **api_opts)

Create A record.

This is a helper function to `create_object`. See your infoblox API for full data format.

CLI Example:

```
salt-call infoblox.create_a
data =
  name: 'fastlinux.math.example.ca'
  ipv4addr: '127.0.0.1'
  view: External
```

salt.modules.infoblox.create_cname(data, **api_opts)

Create a cname record.

CLI Example:

```
salt-call infoblox.create_cname
data={
  "comment": "cname to example server",
  "name": "example.example.com",
  "zone": "example.com",
  "view": "Internal",
  "canonical": "example-ha-0.example.com"
}
```

salt.modules.infoblox.create_host(data, **api_opts)

Add host record

Avoid race conditions, use `func:nextavailableip` for ipv[4,6]addrs:
- `func:nextavailableip:network/ZG54dfgsrDFEFsfslza:10.0.0.0/8/default`
- `func:nextavailableip:10.0.0.0/8`
- `func:nextavailableip:10.0.0.0/8,external`
- `func:nextavailableip:10.0.0.3-10.0.0.10`

See your infoblox API for full data format.

CLI Example:

```bash
salt-call infoblox.create_host data=
   {'name': 'hostname.example.ca',
    'aliases': ['hostname.math.example.ca'],
    'extattrs': [{'Business Contact': {'value': 'example@example.ca'}},
                 {'Pol8 Classification': {'value': 'Restricted'}},
                 {'Technical Contact': {'value': 'example@example.ca'}},
                 {'ipv4addrs': [{'configure_for_dhcp': True,
                                 'ipv4addr': 'func:nextavailableip:129.97.139.0/24',
                                 'mac': '00:50:56:84:6e:ae'}]},
    'ipv6addrs': []}
```

```
salt.modules.infoblox.create_ipv4_range(data, **api_opts)
Create a ipv4 range
This is a helper function to create_object See your infoblox API for full data format.

CLI Example:

```bash
salt-call infoblox.create_ipv4_range data={
    start_addr: '129.97.150.160',
    end_addr: '129.97.150.170'
}
```

```
salt.modules.infoblox.create_object(object_type, data, **api_opts)
Create raw infoblox object. This is a low level api call.

CLI Example:

```bash
salt-call infoblox.update_object object_type=record:host  data={}
```

```
salt.modules.infoblox.delete_a(name=None, ipv4addr=None, allow_array=False, **api_opts)
Delete A record
If the A record is used as a round robin you can set allow_array=True to delete all records for the hostname.

CLI Examples:

```bash
salt-call infoblox.delete_a name=abc.example.com
salt-call infoblox.delete_a ipv4addr=192.168.3.5
salt-call infoblox.delete_a name=acname.example.com allow_array=True
```

```
salt.modules.infoblox.delete_cname(name=None, canonical=None, **api_opts)
Delete CNAME. This is a helper call to delete_object.
If record is not found, return True

CLI Examples:

```bash
```
salt-call infoblox.delete_cname name=example.example.com
salt-call infoblox.delete_cname canonical=example-ha-0.example.com

salt.modules.infoblox.delete_host(name=None, mac=None, ipv4addr=None, **api_opts)
Delete host

CLI Example:
salt-call infoblox.delete_host name=example.domain.com
salt-call infoblox.delete_host ipv4addr=123.123.122.12
salt-call infoblox.delete_host ipv4addr=123.123.122.12\mac=00:50:56:84:6e:ae

salt.modules.infoblox.delete_ipv4_range(start_addr=None, end_addr=None, **api_opts)
Delete ip range.

CLI Example:
salt-call infoblox.delete_ipv4_range start_addr=123.123.122.12

salt.modules.infoblox.delete_object(objref, **api_opts)
Delete infoblox object. This is a low level api call.

CLI Example:
salt-call infoblox.delete_object objref=[ref_of_object]

salt.modules.infoblox.diff_objects(obja, objb)
Diff two complex infoblox objects. This is used from salt states to detect changes in objects.
Using func:nextavailableip will not cause a diff if the ipaddress is in range

salt.modules.infoblox.get_a(name=None, ipv4addr=None, allow_array=True, **api_opts)
Get A record

CLI Examples:
salt-call infoblox.get_a name=abc.example.com
salt-call infoblox.get_a ipv4addr=192.168.3.5

salt.modules.infoblox.get_cname(name=None, canonical=None, return_fields=None, **api_opts)
Get CNAME information.

CLI Examples:
salt-call infoblox.get_cname name=example.example.com
salt-call infoblox.get_cname canonical=example-ha-0.example.com

salt.modules.infoblox.get_host(name=None, ipv4addr=None, mac=None, return_fields=None, **api_opts)
Get host information

CLI Examples:
salt-call infoblox.get_host hostname.domain.ca
salt-call infoblox.get_host ipv4addr=123.123.122.12
salt-call infoblox.get_host mac=00:50:56:84:6e:ae
salt.modules.infoblox.get_host_advanced

Get all host information

CLI Example:

```
salt-call infoblox.get_host_advanced hostname.domain.ca
```

salt.modules.infoblox.get_host_domainname

Get host domain name

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is returned.

If none are found the return is None

dots at end of names are ignored.

CLI Example:

```
salt-call uwl.get_host_domainname name=localhost.t.domain.com → domains=['domain.com', 't.domain.com.']
# returns: t.domain.com
```

salt.modules.infoblox.get_host_hostname

Get hostname

If no domains are passed, the hostname is checked for a zone in infoblox, if no zone split on first dot.

If domains are provided, the best match out of the list is truncated from the fqdn leaving the hostname.

If no matching domains are found the fqdn is returned.

dots at end of names are ignored.

CLI Examples:

```
salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com → domains="['domain.com', 't.domain.com']"
#returns: localhost.xxx
```

salt-call infoblox.get_host_hostname fqdn=localhost.xxx.t.domain.com
#returns: localhost

salt.modules.infoblox.get_host_ipv4

Get ipv4 address from host record.

Use allow_array to return possible multiple values.

CLI Examples:

```
salt-call infoblox.get_host_ipv4 host=localhost.domain.com
salt-call infoblox.get_host_ipv4 mac=00:50:56:84:6e:ae
```

salt.modules.infoblox.get_host_ipv4addr_info

Get host ipv4addr information

CLI Examples:
salt-call infoblox.get_ipv4addr ipv4addr=123.123.122.12
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae
salt-call infoblox.get_ipv4addr mac=00:50:56:84:6e:ae return_fields=host
  → return_fields='mac,host,configure_for_dhcp,ipv4addr'

salt.modules.infoblox.get_host_ipv6addr_info(ipv6addr=None, mac=None, discovered_data=None, return_fields=None, **api_opts)
Get host ipv6addr information
CLI Example:
salt-call infoblox.get_host_ipv6addr_info ipv6addr=2001:db8:85a3:8d3:1349:8a2e:370:7348

salt.modules.infoblox.get_host_mac(name=None, allow_array=False, **api_opts)
Get mac address from host record.
Use allow_array to return possible multiple values.
CLI Example:
salt-call infoblox.get_host_mac host=localhost.domain.com

salt.modules.infoblox.get_ipv4_range(start_addr=None, end_addr=None, return_fields=None, **api_opts)
Get ip range
CLI Example:
salt-call infoblox.get_ipv4_range start_addr=123.123.122.12

salt.modules.infoblox.get_network(ipv4addr=None, network=None, return_fields=None, **api_opts)
Get list of all networks. This is helpful when looking up subnets to use with func:nextavailableip
This call is often slow and not cached!
some return_fields comment, network, network_view, ddns_domainname, disable, enable_ddns
CLI Example:
salt-call infoblox.get_network

salt.modules.infoblox.get_object(objref, data=None, return_fields=None, max_results=None, ensure=None_or_one_result=False, **api_opts)
Get raw infoblox object. This is a low level api call.
CLI Example:
salt-call infoblox.get_object objref=[_ref of object]

salt.modules.infoblox.is_ipaddr_in_ipfunc_range(ipaddr, ipfunc)
Return true if the ipaddress is in the range of the nextavailableip function
CLI Example:
salt.modules.infoblox.update_cname(name, data, **api_opts)

Update CNAME. This is a helper call to update_object.

Find a CNAME _ref then call update_object with the record data.

CLI Example:

```
salt-call infoblox.update_cname name=example.example.com data=

  '{
    'canonical': 'example-ha-0.example.com',
    'use_ttl': true,
    'ttl': 200,
    'comment': 'Salt managed CNAME'
  }'
```

salt.modules.infoblox.update_host(name, data, **api_opts)

Update host record. This is a helper call to update_object.

Find a hosts _ref then call update_object with the record data.

CLI Example:

```
salt-call infoblox.update_host name=fqdn data=
```

salt.modules.infoblox.update_object(objref, data, **api_opts)

Update raw infoblox object. This is a low level api call.

CLI Example:

```
salt-call infoblox.update_object objref=[ref_of_object] data=
```

26.6.181 salt.modules.ini_manage

Edit ini files

```
maintainer
  <akilesh1597@gmail.com>
maturity
  new
depends
  re
platform
  all
```

(for example /etc/sysctl.conf)

salt.modules.ini_manage.get_ini(file_name, separator='=', encoding=None)

Retrieve the whole structure from an ini file and return it as a dictionary.

Parameters

- **file_name** (str) -- The full path to the ini file.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
  New in version 2016.11.0.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None
  New in version 3006.6.

Returns

A dictionary containing the sections along with the values and names contained in each section

Return type

dict

API Example:

```python
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_ini', [path_to Ini_file])
```

CLI Example:

```
salt '*' ini.get_ini /path/to/ini
```

**salt.modules.ini_manage.get_option** (*file_name*, *section*, *option*, *separator='='*, *encoding=None*)

Get value of a key from a section in an ini file. Returns None if no matching key was found.

Parameters

- **file_name** (*str*) -- The full path to the ini file.
- **section** (*str*) -- A string value representing the section of the ini that the option is in. If the option is not in a section, leave this empty.
- **option** (*str*) -- A string value representing the option to search for.
- **separator** (*str*) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
  New in version 2016.11.0.
- **encoding** (*str*) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None
  New in version 3006.6.

Returns

The value as defined in the ini file, or None if empty or not found

Return type

str

API Example:

```python
import salt.client
with salt.client.get_local_client() as sc:
```

(continues on next page)
sc.cmd('target', 'ini.get_option', [path_to_ini_file, section_name, option])

CLI Example:

cmd '*' ini.get_option /path/to/ini section_name option_name

salt.modules.ini_manage.get_section(file_name, section, separator='=', encoding=None)
Retrieve a section from an ini file. Returns the section as a dictionary. If the section is not found, an empty dictionary is returned.

Parameters

- file_name (str) -- The full path to the ini file.
- section (str) -- A string value representing name of the section to search for.
- separator (str) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
  New in version 2016.11.0.
- encoding (str) -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None
  New in version 3006.6.

Returns
A dictionary containing the names and values of all items in the section of the ini file. If the section is not found, an empty dictionary is returned

Return type
dict

API Example:

```python
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.get_section', [path_to_ini_file, section_name])
```

CLI Example:

cmd '*' ini.get_section /path/to/ini section_name

salt.modules.ini_manage.remove_option(file_name, section, option, separator='=', encoding=None)
Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

Parameters

- file_name (str) -- The full path to the ini file.
- section (str) -- A string value representing the section of the ini that the option is in. If the option is not in a section, leave this empty.
- option (str) -- A string value representing the option to search for.
- separator (str) -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
  New in version 2016.11.0.
• **encoding** *(str)* -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None

New in version 3006.6.

**Returns**

A string value representing the option that was removed or **None** if nothing was removed

**Return type**

str

API Example:

```python
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option', [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

**salt.modules.ini_manage.remove_section** *(file_name, section, separator='=', encoding=None)*

Remove a section in an ini file. Returns the removed section as a dictionary, or None if nothing is removed.

**Parameters**

• **file_name** *(str)* -- The full path to the ini file.

• **section** *(str)* -- A string value representing the name of the section search for.

• **separator** *(str)* -- The character used to separate keys and values. Standard ini files use the “=” character. The default is =.

New in version 2016.11.0.

• **encoding** *(str)* -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None

New in version 3006.6.

**Returns**

A dictionary containing the names and values of all items in the section that was removed or None if nothing was removed

**Return type**

dict

API Example:

```python
import salt.client
with salt.client.get_local_client() as sc:
    sc.cmd('target', 'ini.remove_section', [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```
salt.modules.ini_manage.set_option(file_name, sections=None, separator='=', encoding=None)

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

Parameters
- **file_name (str)** -- The full path to the ini file.
- **sections (dict)** -- A dictionary representing the sections to be edited in the ini file. The keys are the section names and the values are a dictionary containing the options. If the ini file does not contain sections the keys and values represent the options. The default is None.
- **separator (str)** -- The character used to separate keys and values. Standard ini files use the "=" character. The default is =.
  New in version 2016.11.0.
- **encoding (str)** -- A string value representing encoding of the target ini file. If None is passed, it uses the system default which is likely utf-8. Default is None.
  New in version 3006.6.

Returns
A dictionary representing the changes made to the ini file

Return type
dict

API Example:

```python
import salt.client

with salt.client.get_local_client() as sc:
    sc.cmd(
        'target', 'ini.set_option', [['path_to_ini_file', '{"section_to_change": {"key": "value"}}']]
    )
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section foo: {key: value}}'
```

---

26.6.182 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector

```python
class salt.modules.inspectlib.collector.Inspector(cachedir=None, piddir=None, pidfilename=None)
```

```
DEFAULT_MINION_CONFIG_PATH = '/etc/salt/minion'
IGNORE_FS_TYPES = ['autofs', 'cifs', 'nfs', 'nfs4']
IGNORE_MOUNTS = ['proc', 'sysfs', 'devtmpfs', 'tmpfs', 'fuse.gvfs-fuse-daemon']
```
IGNORE_PATHS = ['/tmp', '/var/tmp', '/lost+found', '/var/run', '/var/lib/rpm', '/.snapshots', '/.zfs', '/etc/ssh', '/root', '/home']

MODE = ['configuration', 'payload', 'all']

build(format='qcow2', path='/tmp')
Build an image using Kiwi.

Parameters
- format --
- path --

Returns

create_snapshot()
Open new snapshot.

Returns

export(description, local=False, path='/tmp', format='qcow2')
Export description for Kiwi.

Parameters
- local --
- path --

Returns

request_snapshot(mode, priority=19, **kwargs)
Take a snapshot of the system.

reuse_snapshot()
Open an existing, latest snapshot.

Returns

snapshot(mode)
Take a snapshot of the system.

salt.modules.inspectlib.collector.is_alive(pidfile)
Check if PID is still alive.

salt.modules.inspectlib.collector.main(dbfile, pidfile, mode)
Main analyzer routine.

salt.modules.inspectlib.dbhandle

class salt.modules.inspectlib.dbhandle.DBHandle(*args, **kwargs)

class salt.modules.inspectlib.dbhandle.DBHandleBase(path)
Handle for the volatile database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

close()
Close the database connection.
flush(table)
Flush the table.

open(new=False)
Init the database, if required.

purge()
Purge whole database.

salt.modules.inspectlib.exceptions

exception salt.modules.inspectlib.exceptions.InspectorKiwiProcessorException
Kiwi builder/exporter exception.

exception salt.modules.inspectlib.exceptions.InspectorQueryException
Exception that is only for the inspector query.

exception salt.modules.inspectlib.exceptions.InspectorSnapshotException
Snapshot exception.

exception salt.modules.inspectlib.exceptions.SIException
System information exception.

salt.modules.inspectlib.query

class salt.modules.inspectlib.query.Query(scope, cachedir=None)
Query the system. This class is actually puts all Salt features together, so there would be no need to pick it
from various places.

SCOPES = ['changes', 'configuration', 'identity', 'system', 'software',
'services', 'payload', 'all']

class salt.modules.inspectlib.query.SysInfo(systype)
System information.

Module contents

class salt.modules.inspectlib.EnvLoader(cachedir=None, piddir=None, pidfilename=None)
Load environment.

DB_FILE = '_minion_collector.db'
DEFAULT_CACHE_PATH = '/var/cache/salt'
DEFAULT_PID_PATH = '/var/run'
PID_FILE = '_minion_collector.pid'
26.6.183 salt.modules.inspectlib.entities

```python
class salt.modules.inspectlib.entities.AllowedDir
    Allowed directories

class salt.modules.inspectlib.entities.IgnoredDir
    Ignored directories

class salt.modules.inspectlib.entities.Package
    Package.

class salt.modules.inspectlib.entities.PackageCfgFile
    Config file, belongs to the package

class salt.modules.inspectlib.entities.PayloadFile
    Payload file.
```

26.6.184 salt.modules.inspectlib.fsdb

```python
codeauthor
Bo Maryniuk <bo@suse.de>

class salt.modules.inspectlib.fsdb.CsvDB(path)
    File-based CSV database. This database is in-memory operating relatively small plain text csv files.

    close()
        Close the database.
        Returns

    create_table_from_object(obj)
        Create a table from the object. NOTE: This method doesn't stores anything.
        Parameters
            obj --
        Returns

    delete(obj, matches=None, mt=None, lt=None, eq=None)
        Delete object from the database.
        Parameters
            • obj --
            • matches --
            • mt --
            • lt --
            • eq --
        Returns

    flush(table)
        Flush table.
        Parameters
            table --
```
Returns

\textbf{get}(\textit{obj, matches=}None, \textit{mt=}None, \textit{lt=}None, \textit{eq=}None)

Get objects from the table.

Parameters

- \texttt{table\_name} --
- \texttt{matches} -- Regexp.
- \texttt{mt} -- More than.
- \texttt{lt} -- Less than.
- \texttt{eq} -- Equals.

Returns

\textbf{is\_closed}()

Return if the database is closed.

Returns

\textbf{list}()

List all the databases on the given path.

Returns

\textbf{list\_tables}()

Load existing tables and their descriptions.

Returns

\textbf{new}()

Create a new database and opens it.

Returns

\textbf{open}(\textit{dbname=}None)

Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

Returns

\textbf{purge}(\textit{dbid})

Purge the database.

Parameters

- \texttt{dbid} --

Returns

\textbf{store}(\textit{obj, distinct=}False)

Store an object in the table.

Parameters

- \texttt{obj} -- An object to store
- \texttt{distinct} -- Store object only if there is none identical of such. If at least one field is different, store it.

Returns
update(obj, matches=None, mt=None, lt=None, eq=None)

Update object(s) in the database.

Parameters

- obj --
- matches --
- mt --
- lt --
- eq --

Returns

class salt.modules.inspectlib.fsdb.CsvDBEntity

Serializable object for the table.

26.6.185 salt.modules.inspectlib.kiwiproc

class salt.modules.inspectlib.kiwiproc.KiwiExporter(grains, format)

Exports system description as Kiwi configuration.

export(name)

Export to the Kiwi config.xml as text.

Returns

load(**descr)

Load data by keys.

Parameters
data --

Returns

26.6.186 salt.modules.inspector

Module for full system inspection.

salt.modules.inspector.build(format='qcow2', path='/tmp/)

Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:

- format: Specifies output format: "qcow2" or "iso. Default: qcow2.
- path: Specifies output path where to store built image. Default: /tmp.

CLI Example:

salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
salt.modules.inspector.delete(all=False, *databases)

Remove description snapshots from the system.

:parameter: all. Default: False. Remove all snapshots, if set to True.

CLI Example:

```
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

salt.modules.inspector.export(local=False, path='/tmp', format='qcow2')

Export an image description for Kiwi.

Parameters:

- **local**: Specifies True or False if the export has to be in the local file. Default: False.
- **path**: If local=True, then specifies the path where file with the Kiwi description is written. Default: /tmp.

CLI Example:

```
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

salt.modules.inspector.inspect(mode='all', priority=19, **kwargs)

Start node inspection and save the data to the database for further query.

Parameters:

- **mode**: Clarify inspection mode: configuration, payload, all (default)
  payload
  - **filter**: Comma-separated directories to track payload.
- **priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:

```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

salt.modules.inspector.query(*args, **kwargs)

Query the node for specific information.

Parameters:

- **scope**: Specify scope of the query.
  
  - **System**: Return system data.
  - **Software**: Return software information.
  - **Services**: Return known services.
  - **Identity**: Return user accounts information for this system.
  
  **accounts**
  
  Can be either 'local', 'remote' or 'all' (equal to "local,remote"). Remote accounts cannot be resolved on all systems, but only those, which supports 'passwd -S -a'.
disabled
True (or False, default) to return only disabled accounts.

- payload: Payload scope parameters:
  
  filter
  Include only results which path starts from the filter string.

  time
  Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)

  size
  Format size. Values: B, KB, MB, GB

  type
  Include payload type. Values (comma-separated): directory (or dir), link, file (default) Example (returns everything): type=directory,link,file

  owners
  Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id

  brief
  Return just a list of payload elements, if True. Default: False.

  all:
  Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb \n  brief=False
```

```
salt.modules.inspector.snapshots()

List current description snapshots.

CLI Example:
salt myminion inspector.snapshots
```

26.6.187 salt.modules.introspect

Functions to perform introspection on a minion, and return data in a format usable by Salt States

```
salt.modules.introspect.enabled_service_owners()

Return which packages own each of the services that are currently enabled.

CLI Example:
salt myminion introspect.enabled_service_owners
```

```
salt.modules.introspect.running_service_owners()

Determine which packages own the currently running services. By default, excludes files whose full path starts with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by passing in a new list to exclude.

CLI Example:
```
**salt.myminion.introspect.running_service_owners**

```python
salt.modules.introspect.service_highstate(requires=True)
```

Return running and enabled services in a highstate structure. By default also returns package dependencies for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set `requires` to False.

CLI Example:

```
salt myminion introspect.service_highstate
salt myminion introspect.service_highstate requires=False
```

### 26.6.188 salt.modules.iosconfig

Cisco IOS configuration manipulation helpers

New in version 2019.2.0.

This module provides a collection of helper functions for Cisco IOS style configuration manipulation. This module does not have external dependencies and can be used from any Proxy or regular Minion.

```python
salt.modules.iosconfig.clean(config=None, path=None, saltenv='base')
```

Return a clean version of the config, without any special signs (such as `!` as an individual line) or empty lines, but just lines with significant value in the configuration of the network device.

- **config**
  
  The configuration sent as text. This argument is ignored when `path` is configured.

- **path**

  Absolute or remote path from where to load the configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

- **saltenv**: `base`

  Salt files server environment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.clean path=salt://path/to/my/config.txt
salt '*' iosconfig.clean path=https://bit.ly/2mAdq7z
```

```python
salt.modules.iosconfig.diff_text(candidate_config=None, candidate_path=None, running_config=None, running_path=None, saltenv='base')
```

Return the diff, as text, between the candidate and the running config.

- **candidate_config**

  The candidate configuration sent as text. This argument is ignored when `candidate_path` is set.

- **candidate_path**

  Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.

- **running_config**

  The running configuration sent as text. This argument is ignored when `running_path` is set.

- **running_path**

  Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.

CLI Example:

```bash
salt '*' iosconfig.diff_text candidate_path=salt://path/to/candidate.cfg
→ running_path=salt://path/to/running.cfg
```

```
salt.modules.iosconfig.diff_tree(**candidate_config=None, candidate_path=None,**
  **running_config=None, running_path=None, saltenv='base')**
```

Return the diff, as Python dictionary, between the candidate and the running configuration.

**candidate_config**
The candidate configuration sent as text. This argument is ignored when candidate_path is set.

**candidate_path**
Absolute or remote path from where to load the candidate configuration text. This argument allows any URI supported by `cp.get_url()`, e.g., salt://, https://, s3://, ftp://, etc.

**running_config**
The running configuration sent as text. This argument is ignored when running_path is set.

**running_path**
Absolute or remote path from where to load the running configuration text. This argument allows any URI supported by `cp.get_url()`, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if candidate_path or running_path is not a salt:// URL.

CLI Example:

```bash
salt '*' iosconfig.diff_tree candidate_path=salt://path/to/candidate.cfg
→ running_path=salt://path/to/running.cfg
```

```
salt.modules.iosconfig.merge_diff(**initial_config=None, initial_path=None,**
  **merge_config=None, merge_path=None, saltenv='base')**
```

Return the merge diff, as text, after merging the merge config into the initial config.

**initial_config**
The initial configuration sent as text. This argument is ignored when initial_path is set.

**initial_path**
Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url()`, e.g., salt://, https://, s3://, ftp://, etc.

**merge_config**
The config to be merged into the initial config, sent as text. This argument is ignored when merge_path is set.

**merge_path**
Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url()`, e.g., salt://, https://, s3://, ftp://, etc.

saltenv: **base**
Salt fileserver environment from which to retrieve the file. Ignored if initial_path or merge_path is not a salt:// URL.

CLI Example:
salt.modules.iosconfig.merge_text(**kwargs)**

Return the merge result of the `initial_config` with the `merge_config`, as plain text.

- **initial_config**: The initial configuration sent as text. This argument is ignored when `initial_path` is set.
- **initial_path**: Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **merge_config**: The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.
- **merge_path**: Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **saltenv**: `base` Salt filesystem environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_text initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```

salt.modules.iosconfig.merge_tree(**kwargs)**

Return the merge tree of the `initial_config` with the `merge_config`, as a Python dictionary.

- **initial_config**: The initial configuration sent as text. This argument is ignored when `initial_path` is set.
- **initial_path**: Absolute or remote path from where to load the initial configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **merge_config**: The config to be merged into the initial config, sent as text. This argument is ignored when `merge_path` is set.
- **merge_path**: Absolute or remote path from where to load the merge configuration text. This argument allows any URI supported by `cp.get_url`, e.g., `salt://`, `https://`, `s3://`, `ftp://`, etc.
- **saltenv**: `base` Salt filesystem environment from which to retrieve the file. Ignored if `initial_path` or `merge_path` is not a `salt://` URL.

CLI Example:

```
salt '*' iosconfig.merge_tree initial_path=salt://path/to/running.cfg merge_path=salt://path/to/merge.cfg
```
salt.modules.iosconfig.tree(config=None, path=None, with_tags=False, saltenv='base')

Transform Cisco IOS style configuration to structured Python dictionary. Depending on the value of the with_tags argument, this function may provide different views, valuable in different situations.

config
The configuration sent as text. This argument is ignored when path is configured.

path
Absolute or remote path from where to load the configuration text. This argument allows any URI supported by cp.get_url, e.g., salt://, https://, s3://, ftp://, etc.

with_tags: False
Whether this function should return a detailed view, with tags.

saltenv: base
Salt files server environment from which to retrieve the file. Ignored if path is not a salt:// URL.

CLI Example:
```
salt '*' iosconfig.tree path=salt://path/to/my/config.txt
salt '*' iosconfig.tree path=https://bit.ly/2mAdq7z
```

26.6.189 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module pyghmi.

depends
Python module pyghmi. You can install pyghmi using pip:
```
pip install pyghmi
```

configuration
The following configuration defaults can be define (pillar or config files):
```
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
    api_pass: apassword
    api_port: 623
    api_kg: None
```

Usage can override the config defaults:
```
salt-call ipmi.get_user api_host=myipmienabled.system
    api_user=admin api_pass=pass
    uid=1
```

salt.modules.ipmi.create_user(uid, name, password, channel=14, callback=False, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)
create/ensure a user is created with provided settings.

Parameters

- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) * callback * user * operator * administrator * proprietary * no_access
**kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:
```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 →api_pass=nevertell
```

```
salt.modules.ipmi.fast_connect_test(**kwargs)
```
Returns True if connection success. This uses an aggressive timeout value!

Parameters
**kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:
```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

```
salt.modules.ipmi.get_bootdev(**kwargs)
```
Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters
**kwargs --
- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:
```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

```
salt.modules.ipmi.get_channel_access(channel=14, read_mode='non_volatile', **kwargs)
```
:param kwargs:api_host='127.0.0.1' api_user='admin' api_pass='example' api_port=623

Parameters
- **channel** -- number [1:7]
- **read_mode** --
  - non_volatile = get non-volatile Channel Access
  - volatile = get present volatile (active) setting of Channel Access
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

A Python dict with the following keys/values:

```python
{
    'alerting':
    'per_msg_auth':
    'user_level_auth':
    'access_mode': { (ONE OF)
        0: 'disabled',
        1: 'pre_boot',
        2: 'always',
        3: 'shared'
    }
    'privilege_level': { (ONE OF)
        1: 'callback',
        2: 'user',
        3: 'operator',
        4: 'administrator',
        5: 'proprietary'
    }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

```python
salt.modules.ipmi.get_channel_info(channel=14, **kwargs)
```

Get channel info

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
Return Data

channel session supports

- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
- auto: channel is session-based (channel could alternate between single- and multi-session operation, as can occur with a serial/modem channel that supports connection mode auto-detect)

CLI Examples:

```
salt-call ipmi.get_channel_info
```

salt.modules.ipmi.get_channel_max_user_count(channel=14, **kwargs)

Get max users in channel

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns

int -- often 16

CLI Examples:

```
salt-call ipmi.get_channel_max_user_count
```

salt.modules.ipmi.get_health(**kwargs)

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {'badreadings': [], 'health': 0}

Parameters

- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

26.6. execution modules
Salt Documentation, Release 3007.1

CLI Example:
```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

```
salt.modules.ipmi.get_power(**kwargs)

Get current power state

The response, if successful, should contain 'powerstate' key and either 'on' or 'off' to indicate current state.

Parameters

**kwargs --
  * api_host=127.0.0.1
  * api_user=admin
  * api_pass=example
  * api_port=623
  * api_kg=None

CLI Example:
```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

```
salt.modules.ipmi.get_sensor_data(**kwargs)

Get sensor readings

Iterates sensor reading objects

Parameters

**kwargs --
  * api_host=127.0.0.1
  * api_user=admin
  * api_pass=example
  * api_port=623
  * api_kg=None

CLI Example:
```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass
```

```
salt.modules.ipmi.get_user(uid, channel=14, **kwargs)

Get user from uid and access on channel

Parameters

  * **kwargs --
    * api_host=127.0.0.1
    * api_user=admin
    * api_pass=example
api_port=623
api_kg=None

Return Data

```python
name: (str)
uid: (int)
channel: (int)
access:
    - callback (bool)
    - link_auth (bool)
    - ipmi_msg (bool)
    - privilege_level: (str)[callback, user, operator administrator, proprietary, no_access]
``` 

CLI Examples:

```bash
call ipmi.get_user uid=2
``` 

### salt.modules.ipmi.get_user_access

Get user access

**Parameters**

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

**Return Data**

```python
channel_info:
    - max_user_count = maximum number of user IDs on this channel
    - enabled_users = count of User ID slots presently in use
    - users_with_fixed_names = count of user IDs with fixed names
access:
    - callback
    - link_auth
    - ipmi_msg
    - privilege_level: [reserved, callback, user, operator administrator, proprietary, no_access]
``` 

CLI Examples:

```bash
call ipmi.get_user_access uid=2
``` 

### salt.modules.ipmi.get_user_name

Get user name

**Parameters**

- **uid** -- user number [1:16]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

**Return Data**

```python
```
Parameters

- **uid** -- user number [1:16]
- **return_none_on_error** -- return None on error
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.get_user_name uid=2
```

```python
salt.modules.ipmi.get_users(channel=14, **kwargs)
```

get list of users and access information

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns

- name: (str)
- uid: (int)
- channel: (int)
- access:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operator, administrator, proprietary, no_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

```python
salt.modules.ipmi.raw_command(netfn, command, bridge_request=None, data=(), retry=True, delay_xmit=None, **kwargs)
```

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.
Parameters

- **netfn** -- Net function number
- **command** -- Command value
- **bridge_request** -- The target slave address and channel number for the bridge request.
- **data** -- Command data as a tuple or list
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns

dict -- The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

```python
salt.modules.ipmi.set_bootdev(bootdev='default', persist=False, uefiboott=False, **kwargs)
```

Set boot device to use on next reboot

Parameters

- **bootdev** --
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting 'safe mode'
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request
- **persist** -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this
- **uefiboott** -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no "don't care" option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None
Returns

dict or True -- If callback is not provided, the response

CLI Examples:
salt-call ipmi.set_bootdev bootdev=network persist=True

salt.modules.ipmi.set_channel_access(channel=14, access_update_mode='non_volatile',
alerting=False, per_msg_auth=False, user_level_auth=False,
access_mode='always', privilege_update_mode='non_volatile',
privilege_level='administrator', **kwargs)

Set channel access

Parameters

- **channel** -- number [1:7]
- **access_update_mode** --
  - 'dont_change' = don't set or change Channel Access
  - 'non_volatile' = set non-volatile Channel Access
  - 'volatile' = set volatile (active) setting of Channel Access
- **alerting** -- PEF Alerting Enable/Disable
  - True = enable PEF Alerting
  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used
to generate alerts)
- **per_msg_auth** -- Per-message Authentication
  - True = enable
  - False = disable Per-message Authentication. [Authentication required to activate any
  session on this channel, but authentication not used on subsequent packets for the ses-
sion.]
- **user_level_auth** -- User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenti-
cated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed
  without being authenticated. If the option to disable User Level Command authentica-
tion is accepted, the BMC will accept packets with Authentication Type set to None if
  they contain user level commands. For outgoing packets, the BMC returns responses
  with the same Authentication Type that was used for the request.
- **access_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled sep-
arately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre_boot = pre-boot only channel only available when system is in a powered down
  state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates
  the serial connection to the BMC.
  - shared = same as always available, but BIOS typically leaves the serial port available for
  software use.
• **privilege_update_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - `dont_change` = don’t set or change channel Privilege Level Limit
  - `non_volatile` = non-volatile Privilege Level Limit according
  - `volatile` = volatile setting of Privilege Level Limit

• **privilege_level** -- Channel Privilege Level Limit
  - `reserved` = unused
  - `callback`
  - `user`
  - `operator`
  - `administrator`
  - `proprietary` = used by OEM

• **kwargs**
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`
  - `api_kg=None`

CLI Examples:
```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

salt.modules.ipmi.set_identify(on=True, duration=600, **kwargs)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

• **on** -- Set to True to force on or False to force off

• **duration** -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.

• **kwargs**
  - `api_host=127.0.0.1`
  - `api_user=admin`
  - `api_pass=example`
  - `api_port=623`
  - `api_kg=None`

CLI Examples:
```
salt-call ipmi.set_identify
```
salt.modules.ipmi.set_power(state='power_on', wait=True, **kwargs)

Request power state change

Parameters

- **name**
  - power_on -- system turn on
  - power_off -- system turn off (without waiting for OS)
  - shutdown -- request OS proper shutdown
  - reset -- reset (without waiting for OS)
  - boot -- If system is off, then 'on', else 'reset'

- **ensure** -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds

- **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns

dict -- A dict describing the response retrieved

CLI Examples:

```bash
salt-call ipmi.set_power state=shutdown wait=True
```

salt.modules.ipmi.set_user_access(uid, channel=14, callback=True, link_auth=True, ipmi_msg=True, privilege_level='administrator', **kwargs)

Set user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** -- User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they 'call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

- **link_auth** -- User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
• **ipmi_msg** -- User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, 'IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)

• **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no_access

• **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

salt.modules.ipmi.**set_user_name**(uid, name, **kwargs)

Set user name

Parameters

• **uid** -- user number [1:16]
• **name** -- username (limit of 16 bytes)
• **kwargs**
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```

---

26.6. execution modules
salt.modules.ipmi.set_user_password(uid, mode='set_password', password=None, **kwargs)

Set user password and (modes)

- **uid** -- id number of user. see: get_names_uid()]['name']
- **mode** --
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns

True on success when mode = test_password, return False on bad password

CLI Example:

```bash
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass uid=1 password=newPass
```

salt.modules.ipmi.user_delete(uid, channel=14, **kwargs)

Delete user (helper)

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```bash
salt-call ipmi.user_delete uid=2
```
26.6.190 salt.modules.ipset

Support for ipset

salt.modules.ipset.add(name=None, entry=None, family='ipv4', **kwargs)

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add name 192.168.1.26
salt '*' ipset.add name 192.168.0.3,AA:BB:CC:DD:EE:FF
```

salt.modules.ipset.check(name=None, entry=None, family='ipv4')

Check that an entry exists in the specified set.

name
The ipset name

time
An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

family
IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check name '192.168.0.1 comment "Hello"'
```

salt.modules.ipset.check_set(name=None, family='ipv4')

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set name
```

salt.modules.ipset.delete(name=None, entry=None, family='ipv4', **kwargs)

Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete name 192.168.0.3,AA:BB:CC:DD:EE:FF
```

salt.modules.ipset.delete_set(name=None, family='ipv4')

New in version 2014.7.0.

Delete ipset set.

CLI Example:
salt '*

| delete_set custom_set
| IPv6:
| '*

| delete_set custom_set family=ipv6

**salt.modules.ipset.flush** *(name=\None, family=ipv4)*
Flush entries in the specified set. Flush all sets if set is not specified.

CLI Example:

```
salt '*

| flush
| IPv6:
| '*

| flush set
```

**salt.modules.ipset.list_sets** *(family=ipv4)*
New in version 2014.7.0.
List all ipset sets.

CLI Example:

```
salt '*

| list_sets
```

**salt.modules.ipset.new_set** *(name=\None, set_type=\None, family=ipv4, comment=False, **kwargs)*
New in version 2014.7.0.
Create new custom set

CLI Example:

```
salt '*

| new_set custom_set list:set

| new_set custom_set list:set comment=True

| IPv6:

| new_set custom_set list:set family=ipv6
```

**salt.modules.ipset.rename_set** *(name=\None, new_set=\None, family=ipv4)*
New in version 2014.7.0.
Delete ipset set.

CLI Example:

```
salt '*

| rename_set custom_set new_set=new_set_name

| IPv6:

| rename_set custom_set new_set=new_set_name family=ipv6
```

**salt.modules.ipset.test** *(name=\None, entry=\None, family=ipv4, **kwargs)*
Test if an entry is in the specified set.
CLI Example:

```bash
salt '*' ipset.test name 192.168.0.2
IPv6:
salt '*' ipset.test name fd81:fc56:9ac7::/48
```

```python
salt.modules.ipset.version()
    Return version from ipset --version
    CLI Example:
    salt '*' ipset.version
```

### 26.6.191 salt.modules.iptables

Support for iptables

#### Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using `config.get`.

- **iptables.save_filters**: List of REGEX strings to FILTER OUT matching lines
  
  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.
  
  The default is to not filter out anything.

```text
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

```python
salt.modules.iptables.append(table='filter', chain=None, rule=None, family='ipv4')
    Append a rule to the specified table/chain.
    This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.
    CLI Example:
    salt '*' iptables.append filter INPUT \
        rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'
    IPv6:
    salt '*' iptables.append filter INPUT \
        rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
        family=ipv6
```
salt.modules.iptables.build_rule(table='filter', chain=None, command=None, position='', full=None, family='ipv4', **kwargs)

Build a well-formatted iptables rule based on kwargs. A table and chain are not required, unless full is True.

If full is True, then table, chain and command are required. command may be specified as either a short option (T) or a long option (--insert). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with -I or -D), it may be specified as position. This will only be useful if full is True.

If state is passed, it will be ignored, use connstate. If connstate is passed in, it will automatically be changed to state.

To pass in jump options that doesn't take arguments, pass in an empty string.

Note: Whereas iptables will accept -p, --proto[c[o[l]]] as synonyms of --protocol, if --proto appears in an iptables command after the appearance of -m policy, it is interpreted as the --proto option of the policy extension (see the iptables-extensions(8) man page).

CLI Examples:

```
salt '*' iptables.build_rule match=state \  
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \  
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \  
    full=True match=state connstate=RELATED,ESTABLISHED \  
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \  
    full=True match=state connstate=RELATED,ESTABLISHED \  
    source='!127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \  
    full=True match=state connstate=RELATED,ESTABLISHED \  
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \  
    connstate=RELATED,ESTABLISHED jump=ACCEPT \  
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \  
    full=True match=state connstate=RELATED,ESTABLISHED jump=ACCEPT \  
    family=ipv6
```

salt.modules.iptables.check(table='filter', chain=None, rule=None, family='ipv4')

Check for the existence of a rule in the table and chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:
salt.modules.iptables.check_chain(table='filter', chain=None, family='ipv4')

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' iptables.check_chain filter INPUT
IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6
```

salt.modules.iptables.delete(table, chain=None, position=None, rule=None, family='ipv4')

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule’s position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT'
IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
   rule='^-m state --state RELATED,ESTABLISHED -j ACCEPT' \
   family=ipv6
```

salt.modules.iptables.delete_chain(table='filter', chain=None, family='ipv4')

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN
IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

salt.modules.iptables.flush(table='filter', chain='', family='ipv4')

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:
salt '*' iptables.flush filter INPUT
IPv6:
salt '*' iptables.flush filter INPUT family=ipv6

salt.modules.iptables.get_policy(table='filter', chain=None, family='ipv4')
Return the current policy for the specified table/chain
   CLI Example:
   
salt '*' iptables.get_policy filter INPUT
IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6

salt.modules.iptables.get_rules(family='ipv4')
   Return a data structure of the current, in-memory rules
   CLI Example:
   
salt '*' iptables.get_rules
IPv6:
salt '*' iptables.get_rules family=ipv6

salt.modules.iptables.get_saved_policy(table='filter', chain=None, conf_file=None, family='ipv4')
   Return the current policy for the specified table/chain
   CLI Examples:
   
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \conf_file=/etc/iptables.saved
IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \conf_file=/etc/iptables.saved family=ipv6

salt.modules.iptables.get_saved_rules(conf_file=None, family='ipv4')
   Return a data structure of the rules in the conf file
   CLI Example:
   
salt '*' iptables.get_saved_rules
IPv6:
salt '*' iptables.get_saved_rules family=ipv6

salt.modules.iptables.insert(table='filter', chain=None, position=None, rule=None, family='ipv4')
   Insert a rule into the specified table/chain, at the specified position.
   This function accepts a rule in a standard iptables command format,
      starting with the chain. Trying to force users to adapt to a new method of creating rules would be
      irritating at best, and we already have a parser that can handle it.
If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```shell
salt '*' iptables.insert filter INPUT position=3 \
   rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.insert filter INPUT position=3 \
   rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
   family=ipv6
```

`salt.modules.iptables.new_chain(table='filter', chain=None, family='ipv4')`

New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```shell
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

`salt.modules.iptables.save(filename=None, family='ipv4')`

Save the current in-memory rules to disk

CLI Example:

```shell
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

`salt.modules.iptables.set_policy(table='filter', chain=None, policy=None, family='ipv4')`

Set the current policy for the specified table/chain

CLI Example:

```shell
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

`salt.modules.iptables.version(family='ipv4')`

Return version from iptables --version

CLI Example:

```shell
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```
26.6.192  salt.modules.iwtools

Support for Wireless Tools for Linux

salt.modules.iwtools.list_interfaces(style=\'None\')
   List all of the wireless interfaces
   CLI Example:
   ```
salt minion iwtools.list_interfaces
   ```

salt.modules.iwtools.scan(iface, style=\'None\')
   List networks on a wireless interface
   CLI Examples:
   ```
salt minion iwtools.scan wlp3s0
salt minion iwtools.scan wlp3s0 list
   ```

salt.modules.iwtools.set_mode(iface, mode)
   List networks on a wireless interface
   CLI Example:
   ```
salt minion iwtools.set_mode wlp3s0 Managed
   ```

26.6.193  salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, jboss_config dictionary with the following properties must be passed:
   • cli_path: the path to jboss-cli script, for example: '\opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   • controller: the IP address and port of controller, for example: 10.11.12.13:9999
   • cli_user: username to connect to jboss administration console if necessary
   • cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
    cli_path: '\opt/jboss/jboss-7.0/bin/jboss-cli.sh'
    controller: 10.11.12.13:9999
    cli_user: 'jbossadm'
    cli_password: 'jbossadm'
```

salt.modules.jboss7.create_datasource(jboss_config, name, datasource_properties, profile=\'None\')
   Create datasource in running jboss instance
   ```
   jboss_config
      Configuration dictionary with properties specified above.
   name
      Datasource name
   ```
**datasource_properties**

A dictionary of datasource properties to be created:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```
```

salt.modules.jboss7.create_simple_binding(jboss_config, binding_name, value, profile=None)

Create a simple jndi binding in the running jboss instance

**jboss_config**

Configuration dictionary with properties specified above.

**binding_name**

Binding name to be created

**value**

Binding value

**profile**

The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_simple_binding "{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}" 'my_binding_name' 'my_binding_value'
```

salt.modules.jboss7.deploy(jboss_config, source_file)

Deploy the application on the jboss instance from the local file system where minion is running.

**jboss_config**

Configuration dictionary with properties specified above.
source_file
Source file to deploy from

CLI Example:

```
```

```
salt.modules.jboss7.list_deployments(jboss_config)
List all deployments on the jboss instance

jboss_config
Configuration dictionary with properties specified above.

CLI Example:

```
```

```
salt.modules.jboss7.read_datasource(jboss_config, name, profile=None)
Read datasource properties in the running jboss instance.

jboss_config
Configuration dictionary with properties specified above.

name
Datasource name

profile
Profile name (JBoss domain mode only)

CLI Example:

```
```

```
salt.modules.jboss7.read_simple_binding(jboss_config, binding_name, profile=None)
Read jndi binding in the running jboss instance

jboss_config
Configuration dictionary with properties specified above.

binding_name
Binding name to be created

profile
The profile name (JBoss domain mode only)

CLI Example:

```
```

my_binding_name
salt.modules.jboss7.reload_(jboss_config, host=None)
Reload running jboss instance

jboss_config
Configuration dictionary with properties specified above.

host
The name of the host. JBoss domain mode only and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:
```
```

salt.modules.jboss7.remove_datasource(jboss_config, name, profile=None)
Remove an existing datasource from the running jboss instance.

jboss_config
Configuration dictionary with properties specified above.

name
Datasource name

profile
The profile (JBoss domain mode only)

CLI Example:
```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

salt.modules.jboss7.status(jboss_config, host=None, server_config=None)
Get status of running jboss instance.

jboss_config
Configuration dictionary with properties specified above.

host
The name of the host. JBoss domain mode only and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

server_config
The name of the Server Configuration. JBoss Domain mode only and required if running in domain mode.

CLI Example:
```
```

salt.modules.jboss7.stop_server(jboss_config, host=None)
Stop running jboss instance

jboss_config
Configuration dictionary with properties specified above.
host

The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the "name" attribute of the "host" element in host.xml

CLI Example:

```
```

salt.modules.jboss7.undeploy (jboss_config, deployment)

Undeploy the application from jboss instance

jboss_config

Configuration dictionary with properties specified above.

deployment

Deployment name to undeploy

CLI Example:

```
```

salt.modules.jboss7.update_datasource (jboss_config, name, new_properties, profile=None)

Update an existing datasource in running jboss instance. If the property doesn't exist if will be created, if it does, it will be updated with the new value

jboss_config

Configuration dictionary with properties specified above.

name

Datasource name

new_properties

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
- jndi-name: 'java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile

The profile name (JBoss domain mode only)

CLI Example:

```
```

(continues on next page)
salt.modules.jboss7.update_simple_binding(jboss_config, binding_name, value, profile=None)

Update the simple jndi binding in the running jboss instance

**jboss_config**
Configuration dictionary with properties specified above.

**binding_name**
Binding name to be updated

**value**
New binding value

**profile**
The profile name (JBoss domain mode only)

**CLI Example:**
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_binding_name\nmy_binding_value

---

26.6.194 salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

**Note:** Following JBoss documentation (https://developer.jboss.org/wiki/CommandLineInterface): "Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

**In order to run each function, jboss_config dictionary with the following properties must be passed:**

- **cli_path**: the path to jboss-cli script, for example: `/opt/jboss/jboss-7.0/bin/jboss-cli.sh`
- **controller**: the IP address and port of controller, for example: `10.11.12.13:9999`
- **cli_user**: username to connect to jboss administration console if necessary
- **cli_password**: password to connect to jboss administration console if necessary

**Example:**
**salt.modules.jboss7_cli.run_command**(*jboss_config, command, fail_on_error=True*)

Execute a command against jboss instance through the CLI interface.

- **jboss_config**
  Configuration dictionary with properties specified above.

- **command**
  Command to execute against jboss instance

- **fail_on_error (default=True)**
  Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

CLI Example:
```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_command
```

**salt.modules.jboss7_cli.run_operation**(*jboss_config, operation, fail_on_error=True, retries=1*)

Execute an operation against jboss instance through the CLI interface.

- **jboss_config**
  Configuration dictionary with properties specified above.

- **operation**
  An operation to execute against jboss instance

- **fail_on_error (default=True)**
  Is true, raise CommandExecutionError exception if execution fails. If false, 'success' property of the returned dictionary is set to False

- **retries:**
  Number of retries in case of "JBAS012144: Could not connect to remote" error.

CLI Example:
```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password": "jbossadm"}' my_operation
```

### 26.6.195 salt.modules.jenkinsmod

Module for controlling Jenkins

- **depends**
  python-jenkins

New in version 2016.3.0.

- **depends**
  python-jenkins Python module (not to be confused with jenkins)
configuration

This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.jenkinsmod.build_job(name=None, parameters=None)`

Initiate a build for the provided job.

Parameters

- name -- The name of the job is check if it exists.
- parameters -- Parameters to send to the job.

Returns

True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

`salt.modules.jenkinsmod.create_job(name=None, config_xml=None, saltenv='base')`

Return the configuration file.

Parameters

- name -- The name of the job is check if it exists.
- config_xml -- The configuration file to use to create the job.
- saltenv -- The environment to look for the file in.

Returns

The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname
salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

`salt.modules.jenkinsmod.delete_job(name=None)`

Return true is job is deleted successfully.

Parameters

- name -- The name of the job to delete.

Returns

Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

`salt.modules.jenkinsmod.disable_job(name=None)`

Return true is job is disabled successfully.
Parameters
   name -- The name of the job to disable.

Returns
   Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

```
salt.modules.jenkinsmod.enable_job(name=None)
   Return true if job is enabled successfully.

Parameters
   name -- The name of the job to enable.

Returns
   Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

```
salt.modules.jenkinsmod.get_job_config(name=None)
   Return the current job configuration for the provided job.

Parameters
   name -- The name of the job to return the configuration for.

Returns
   The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

```
salt.modules.jenkinsmod.get_job_info(name=None)
   Return information about the Jenkins job.

Parameters
   name -- The name of the job is check if it exists.

Returns
   Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

```
salt.modules.jenkinsmod.get_jobs()
   Return the currently configured jobs.

Returns
   The currently configured jobs.

CLI Example:

```
salt '*' jenkins.get_jobs
```
salt.modules.jenkinsmod.get_version()
    Return version of Jenkins
    
    Returns
    The version of Jenkins
    
    CLI Example:
    ```
salt '*' jenkins.get_version
    ```

salt.modules.jenkinsmod.job_exists(name=None)
    Check whether the job exists in configured Jenkins jobs.
    
    Parameters
    name -- The name of the job is check if it exists.
    
    Returns
    True if job exists, False if job does not exist.
    
    CLI Example:
    ```
salt '*' jenkins.job_exists jobname
    ```

salt.modules.jenkinsmod.job_status(name=None)
    Return the current status, enabled or disabled, of the job.
    
    Parameters
    name -- The name of the job to return status for
    
    Returns
    Return true if enabled or false if disabled.
    
    CLI Example:
    ```
salt '*' jenkins.job_status jobname
    ```

salt.modules.jenkinsmod.plugin_installed(name)
    New in version 2016.11.0.
    Return if the plugin is installed for the provided plugin name.
    
    Parameters
    name -- The name of the parameter to confirm installation.
    
    Returns
    True if plugin exists, False if plugin does not exist.
    
    CLI Example:
    ```
salt '*' jenkins.plugin_installed pluginName
    ```

salt.modules.jenkinsmod.run(script)
    New in version 2017.7.0.
    Execute a script on the jenkins master
    
    Parameters
    script -- The script
    
    CLI Example:
salt '*' jenkins.run 'Jenkins.instance.doSafeRestart()'

salt.modules.jenkinsmod.update_job(name=None, config_xml=None, saltenv='base')

Return the updated configuration file.

Parameters

- **name** -- The name of the job is check if it exists.
- **config_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

Returns

The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.update_job jobname
salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

26.6.196 salt.modules.jinja

Module for checking jinja maps and verifying the result of loading JSON/YAML files

New in version 3000.

salt.modules.jinja.import_json(path)

Loads JSON data from the specified path

CLI Example:

```
salt myminion jinja.import_json myformula/foo.json
```

salt.modules.jinja.import_yaml(path)

Loads YAML data from the specified path

CLI Example:

```
salt myminion jinja.import_yaml myformula/foo.yaml
```

salt.modules.jinja.load_map(path, value)

 Loads the map at the specified path, and returns the specified value from that map.

CLI Example:

```
# Assuming the map is loaded in your formula SLS as follows:
# {% from "myformula/map.jinja" import myformula with context %}
# the following syntax can be used to load the map and check the
# results:
salt myminion jinja.load_map myformula/map.jinja myformula
```
26.6.197 salt.modules.jira_mod

JIRA Execution module

New in version 2019.2.0.

Execution module to manipulate JIRA tickets via Salt.

This module requires the jira Python library to be installed.

Configuration example:

```
jira:
  server: https://jira.atlassian.org
  username: salt
  password: pass
```

salt.modules.jira_mod.add_comment(issue_key, comment, visibility=None, is_internal=False, server=None, username=None, password=None)

Add a comment to an existing ticket. Return True when it successfully added the comment.

issue_key
The issue ID to add the comment to.

comment
The body of the comment to be added.

visibility: None
A dictionary having two keys:

- type: is role (or group if the JIRA server has configured comment visibility for groups).
- value: the name of the role (or group) to which viewing of this comment will be restricted.

is_internal: False
Whether a comment has to be marked as Internal in Jira Service Desk.

CLI Example:
```
salt '*' jira.add_comment NE-123 'This is a comment'
```

salt.modules.jira_mod.assign_issue(issue_key, assignee, server=None, username=None, password=None)

Assign the issue to an existing user. Return True when the issue has been properly assigned.

issue_key
The JIRA ID of the ticket to manipulate.

assignee
The name of the user to assign the ticket to.

CLI Example:
```
salt '*' jira.assign_issue NET-123 example_user
```

salt.modules.jira_mod.create_issue(project, summary, description, template_engine='jinja', context=None, defaults=None, saltenv='base', issuetype='Bug', priority='Normal', labels=None, assignee=None, server=None, username=None, password=None, **kwargs)

Create a JIRA issue using the named settings. Return the JIRA ticket ID.
**project**
The name of the project to attach the JIRA ticket to.

**summary**
The summary (title) of the JIRA ticket. When the `template_engine` argument is set to a proper value of an existing Salt template engine (e.g., jinja, mako, etc.) it will render the summary before creating the ticket.

**description**
The full body description of the JIRA ticket. When the `template_engine` argument is set to a proper value of an existing Salt template engine (e.g., jinja, mako, etc.) it will render the description before creating the ticket.

**template_engine:** jinja
The name of the template engine to be used to render the values of the summary and description arguments. Default: jinja.

**context:** None
The context to pass when rendering the summary and description. This argument is ignored when `template_engine` is set as None.

**defaults:** None
Default values to pass to the Salt rendering pipeline for the summary and description arguments. This argument is ignored when `template_engine` is set as None.

**saltenv:** base
The Salt environment name (for the rendering system).

**issuetype:** Bug
The type of the JIRA ticket. Default: Bug.

**priority:** Normal
The priority of the JIRA ticket. Default: Normal.

**labels:** None
A list of labels to add to the ticket.

**assignee:** None
The name of the person to assign the ticket to.

CLI Examples:

```
salt '*' jira.create_issue NET 'Ticket title' 'Ticket description'
salt '*' jira.create_issue NET 'Issue on {{opts.id}}' 'Error detected, on {{opts.id}}' template_engine=jinja
```

salt.modules.jira_mod.issue_closed(issue_key, server=None, username=None, password=None)
Check if the issue is closed.

**issue_key**
The JIRA ID of the ticket to close.

Returns:
- **True:** the ticket exists and it is closed.
- **False:** the ticket exists and it has not been closed.
- **None:** the ticket does not exist.

CLI Example:
26.6.198 salt.modules.junos

Module to interact with Junos devices.

maturity
new

dependencies
junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to junos for information on connecting to junos proxy.

class salt.modules.junos.HandleFileCopy(path, **kwargs)

To figure out proper path either from proxy local file system or proxy cache or on master. If required, then only copy from master to proxy

salt.modules.junos.cli(command=None, **kwargs)

Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

command (required)
The command to execute on the Junos CLI

format
[text] Format in which to get the CLI output (either text or xml)

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

dest
Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use cp.push.

CLI Examples:
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/→user/cli_output.txt

salt.modules.junos.commit(**kwargs)

To commit the changes loaded in the candidate configuration.

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

comment
Provide a comment for the commit

confirm
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
sync
[False] When True, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.

force_sync
[False] When True, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.

full
When True, requires all the daemons to check and evaluate the new configuration.

detail
When True, return commit detail

CLI Examples:

```
salt 'device_name' junos.commit comment='Commiting via saltstack' \n      --detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

salt.modules.junos.commit_check()
Perform a commit check on the configuration

CLI Example:

```
salt 'device_name' junos.commit_check
```

salt.modules.junos.diff(**kwargs)
Returns the difference between the candidate and the current configuration

id
[0] The rollback ID value (0-49)

d_id
[0] The rollback ID value (0-49)

CLI Example:

```
salt 'device_name' junos.diff d_id=3
```

NOTE: Because of historical reasons and the internals of the Salt state compiler, there are three possible sources of the rollback ID--the positional argument, and the id and d_id kwargs. The precedence of the arguments are id (positional), id (kwarg), d_id (kwarg). In other words, if all three are passed, only the positional argument will be used. A warning is logged if more than one is passed.

salt.modules.junos.dir_copy(source, dest, force=False, **kwargs)
Copy a directory and recursively its contents from source to dest.

Note: This function only works on the Juniper native minion

Parameters:

source : Directory to use as the source

dest : Directory in which to place the source and its contents.

force : This function will not copy identical files unless force is True
New in version 3003.

CLI Example:

```
salt 'device_name' junos.dir_copy /etc/salt/pki rel1: />
```

This will take the `pki` directory, its absolute path and copy it and its contents to routing engine 1 root directory. The result will be `re1:/etc/salt/pki/<files and dirs in /etc/salt/pki`.

**salt.modules.junos.facts()**

Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```
salt 'device_name' junos.facts
```

**salt.modules.junos.facts_refresh()**

Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:

```
salt 'device_name' junos.facts_refresh
```

**salt.modules.junos.file_compare(file1, file2, **kwargs)**

Compare two files and return a dictionary indicating if they are different.

Dictionary includes `success` key. If False, one or more files do not exist or some other error occurred.

Under the hood, this uses the junos CLI command `file compare files ...`

**Note:** This function only works on Juniper native minions

New in version 3003.

CLI Example:

```
salt junos-router junos.file_compare /var/tmp/backup1/cmt.script /var/tmp/ → backup2/cmt.script
```

```
junos-router:
  identical:
    False
  success:
    True
```

**salt.modules.junos.file_copy(src, dest)**

Copies the file from the local device to the junos device

**Note:** This function does not work on Juniper native minions

**src**
The source path where the file is kept.

**dest**
The destination path on the where the file will be copied
New in version 3001.

CLI Example:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

```
salt.modules.junos.fsentry_exists(dir, **kwargs)
```

Returns a dictionary indicating if `dir` refers to a file or a non-file (generally a directory) in the file system, or if there is no file by that name.

**Note:** This function only works on Juniper native minions

New in version 3003.

CLI Example:

```
salt junos-router junos.fsentry_exists /var/log
```

```
junos-router:
  is_dir: True
  exists: True
```

```
salt.modules.junos.get_table (table, table_file, path=None, target=None, key=None, key_items=None, filters=None, table_args=None)
```

New in version 3001.

Retrieve data from a Junos device using Tables/Views

**table** *(required)*

Name of PyEZ Table

**table_file** *(required)*

YAML file that has the table specified in table parameter

**path:**

Path of location of the YAML file. defaults to op directory in jnpr.junos.op

**target:**

if command need to run on FPC, can specify fpc target

**key:**

To overwrite key provided in YAML

**key_items:**

To select only given key items

**filters:**

To select only filter for the dictionary from columns

**table_args:**

key/value pair which should render Jinja template command or are passed as args to rpc call in op table

CLI Example:

```
salt 'device_name' junos.get_table RouteTable routes.yml
```

```
salt 'device_name' junos.get_table EthPortTable ethport.yml table_args='{'
```

(continues on next page)
salt.modules.junos.install_config(path=None, **kwargs)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

**path (required)**

Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.

**mode**

[exclusive] The mode in which the configuration is locked. Can be one of private, dynamic, batch, exclusive, ephemeral

**dev_timeout**

[30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

**overwrite**

[False] Set to True if you want this file is to completely replace the configuration file. Sets action to override

**Note:** This option cannot be used if format is "set".

**replace**

[False] Specify whether the configuration file uses replace: statements. If True, only those statements under the replace tag will be changed.

**merge**

[False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**format**

Determines the format of the contents

**update**

[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

**comment**

Provide a comment for the commit

**confirm**

Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

**diffs_file**

Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use:

```
py:func:cp.push <salt.modules.cp.push>.
```
**template_vars**

Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.install_config 'salt://production/network/routers/config.set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.conf' replace=True comment='Committed via SaltStack'
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' dev_timeout=300 diffs_file='/salt/conf/old_config.conf'
salt 'device_name' junos.install_config 'salt://syslog_template.conf' overwrite=True
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' template_vars='{"syslog_host": "10.180.222.7"}"
```

**salt.modules.junos.install_os**(path=None, **kwargs)**

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

- **path** *(required)*
  - Path where the image file is present on the proxy minion

- **remote_path**
  - [/var/tmp] If the value of path is a file path on the local (Salt host's) filesystem, then the image is copied from the local filesystem to the :remote_path: directory on the target Junos device. The default is /var/tmp. If the value of :path: or is a URL, then the value of :remote_path: is unused.

- **dev_timeout**
  - [1800] The NETCONF RPC timeout (in seconds). This argument was added since most of the time the "package add" RPC takes a significant amount of time. So this :timeout: value will be used in the context of the SW installation process. Defaults to 30 minutes (30*60=1800 seconds)

- **timeout**
  - [1800] Alias to dev_timeout for backward compatibility

- **reboot**
  - [False] Whether to reboot after installation

- **no_copy**
  - [False] If True the software package will not be SCP’d to the device

- **bool validate**
  - When True this method will perform a config validation against the new image

- **bool issu**
  - When True allows unified in-service software upgrade (ISSU) feature enables you to upgrade between two different Junos OS releases with no disruption on the control plane and with minimal disruption of traffic.

- **bool nssu**
  - When True allows nonstop software upgrade (NSSU) enables you to upgrade the software running on a Juniper Networks EX Series Virtual Chassis or a Juniper Networks EX Series Ethernet Switch with redundant Routing Engines with a single command and minimal disruption to network traffic.

- **bool all_re**
  - When True (default), executes the software install on all Routing Engines of the Junos device.
False, execute the software install only on the current Routing Engine.

New in version 3001.

Note: Any additional keyword arguments specified are passed down to PyEZ sw.install() as is. Please refer to below URL for PyEZ swinstall() documentation: https://pyez.readthedocs.io/en/latest/jnpr.junos.utils.html#jnpr.junos.utils.sw.SW.install

CLI Examples:

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz'\n  --reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_\n  --timeout=300
```

```
salt.modules.junos.load(path=None, **kwargs)
```

Loads the configuration from the file provided onto the device.

**path (required)**

Path where the configuration/template file is present. If the file has a .conf extension, the content is treated as text format. If the file has a .xml extension, the content is treated as XML format. If the file has a .set extension, the content is treated as Junos OS set commands.

**overwrite**

[False] Set to True if you want this file is to completely replace the configuration file. Sets action to override

Note: This option cannot be used if format is "set".

**replace**

[False] Specify whether the configuration file uses replace: statements. If True, only those statements under the replace tag will be changed.

**merge**

[False] If set to True will set the load-config action to merge. the default load-config action is 'replace' for xml/json/text config

**update**

[False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

**format**

Determines the format of the contents

**template_vars**

Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:
salt 'device_name' junos.load 'salt://production/network/routers/config
→set'
salt 'device_name' junos.load 'salt://templates/replace_config.conf'
→replace=True
salt 'device_name' junos.load 'salt://my_new_configuration.conf'
→overwrite=True
salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars=
→'{"syslog_host": "10.180.222.7"}"

salt.modules.junos.lock()
Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: When locking, it is important to remember to call junos.unlock once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

salt 'device_name' junos.lock

salt.modules.junos.ping(dest_ip=None, **kwargs)
Send a ping RPC to a device

dest_ip
The IP of the device to ping

dev_timeout
[30] The NETCONF RPC timeout (in seconds)

rapid
[False] When True, executes ping at 100pps instead of 1pps

ttl
Maximum number of IP routers (IP hops) allowed between source and destination

routing_instance
Name of the routing instance to use to send the ping

interface
Interface used to send traffic

count
[5] Number of packets to send

CLI Examples:

salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True

salt.modules.junos.rollback(**kwargs)
Roll back the last committed configuration changes and commit

id
[0] The rollback ID value (0-49)
d_id
    [0] The rollback ID value (0-49)

develop_timeout
    [30] The NETCONF RPC timeout (in seconds)

comment
    Provide a comment for the commit

confirm
    Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled
    back in the specified amount of time unless the commit is confirmed.

diffs_file
    Path to the file where the diff (difference in old configuration and the committed configuration) will be
    stored. Note that the file will be stored on the proxy minion. To push the files to the master use cp.push.

CLI Example:

```
salt 'device_name' junos.rollback 10
```

NOTE: Because of historical reasons and the internals of the Salt state compiler, there are three possible sources
of the rollback ID--the positional argument, and the id and d_id kwargs. The precedence of the arguments are
id (positional), id (kwarg), d_id (kwarg). In other words, if all three are passed, only the positional argument
will be used. A warning is logged if more than one is passed.

salt.modules.junos.routing_engine(**kwargs)
    Returns a dictionary containing the routing engines on the device and their status (Master, Disabled, Backup).
    Under the hood parses the result of show chassis routing-engine
    New in version 3003.

CLI Example:

```
salt junos-router junos.routing_engine
```

junos-router:
    backup:
        - rel:
    master:
        - rel:
    success:
        True

Returns success: False if the device does not appear to have multiple routing engines.

salt.modules.junos.rpc(cmd=None, dest=None, **kwargs)
    This function executes the RPC provided as arguments on the junos device. The returned data can be stored
    in a file.

    cmd
        The RPC to be executed

    dest
        Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To
        push the files to the master use cp.push.

    format
        [xml] The format in which the RPC reply is received from the device
dev_timeout

[30] The NETCONF RPC timeout (in seconds)

filter

Used with the get-config RPC to get specific configuration

terse

[False] Amount of information you want

interface_name

Name of the interface to query

CLI Example:

```python
salt 'device' junos.rpc get_config dest=/var/log/config.txt format=text

salt 'device' junos.rpc get-interface-information dest=/home/user/ interface.xml interface_name='lo0' terse=True

salt 'device' junos.rpc get-chassis-inventory
```

salt.modules.junos.rpc_file_list(path, **kwargs)

Use the Junos RPC interface to get a list of files and return them as a structure dictionary.

New in version 3003.

CLI Example:

```python
salt junos-router junos.rpc_file_list /var/local/salt/etc

junos-router:
  files:
    directory:
      directory-name: /var/local/salt/etc
      file-information:
        file-directory: pki
        file-name: pki
        file-directory: proxy
        file-name: proxy.d
      total-file-blocks: 10
      total-files: 1
  success: True
```

salt.modules.junos.set_hostname(hostname=None, **kwargs)

Set the device's hostname

hostname

The name to be set
**comment**
Provide a comment to the commit

**dev_timeout**
[30] The NETCONF RPC timeout (in seconds)

**confirm**
Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:

```
salt 'device_name' junos.set_hostname salt-device
```

**salt.modules.junos.shutdown(**kwargs**)
Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

---

**Note:** One of shutdown or reboot must be set to True or no action will be taken.

**shutdown**
[False] Set this to True if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.

**reboot**
[False] If True, reboot instead of shutting down

**at**
Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.

**in_min**
Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

**salt.modules.junos.unlock()**
Unlocks the candidate configuration.

CLI Example:

```
salt 'device_name' junos.unlock
```

**salt.modules.junos.zeroize()**
Resets the device to default factory settings

---

**Note:** In case of non-root user, proxy_reconnect will not be able to re-connect to the device as zeroize will delete the local user’s configuration. For more details on zeroize functionality, please refer https://www.juniper.net/documentation/en_US/junos/topics/reference/command-summary/request-system-zeroize.html

CLI Example:
26.6.199 salt.modules.k8s

Warning: This module will be removed from Salt in version 3009 in favor of the kubernetes Salt Extension.

Salt module to manage Kubernetes cluster
New in version 2016.3.0.

Roadmap:
- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scalling

salt.modules.k8s.create_namespace(name, apiserver_url= None)
New in version 2016.3.0.
Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: ..
code-block:: bash

    kubectl create namespaces namespace-name

CLI Example:

    salt '*' k8s.create_namespace namespace_name
    salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local

salt.modules.k8s.create_secret(namespace, name, sources, apiserver_url= None, force=False, update=False, saltenv='base')
New in version 2016.3.0.
Create k8s secrets in the defined namespace from the list of files
CLI Example:

    salt '*' k8s.create_secret namespace_name secret_name sources
    salt '*' k8s.create_secret namespace_name secret_name sources http://kube-master.cluster.local

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.
Example of paths array:
Salt Documentation, Release 3007.1

['/full/path/filename', 'file:///full/path/filename', 'salt://secret/storage/file.txt', 'http://user:password@securesite.com/secret-file.json']  

Example of dictionaries:

{"name1": '/full/path/filename', name2: "salt://secret/storage/file.txt"}

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to "true" and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=["base"] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

salt.modules.k8s.delete_secret(namespace, name, apiserver_url=None, force=True)

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name
salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.
```

salt.modules.k8s.get_labels(node=None, apiserver_url=None)

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.
```

salt.modules.k8s.get_namespaces(namespace='', apiserver_url=None)

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```
kubectl get namespaces namespace_name -o json
```

CLI Example:
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local

salt.modules.k8s.get_secrets(namespace, name='', apiserver_url=None, decode=False, brief=False)
Get k8s namespaces

CLI Example:
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.local

salt.modules.k8s.label_absent(name, node=None, apiserver_url=None)
Delete label to the current node

CLI Example:
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local.local http://kube-master.cluster.local

salt.modules.k8s.label_folder_absent(name, node=None, apiserver_url=None)
Delete label folder to the current node

CLI Example:
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local.local http://kube-master.cluster.local

salt.modules.k8s.label_present(name, value, node=None, apiserver_url=None)
Set label to the current node

CLI Example:
salt '*' k8s.label_present hw/disktype ssd
salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local.local http://kube-master.cluster.local

salt.modules.k8s.update_secret(namespace, name, sources, apiserver_url=None, force=True, saltenv='base')
New in version 2016.3.0.
alias to k8s.create_secret with update=true

CLI Example:
salt '*' k8s.update_secret namespace_name_name_secret_name_sources [apiserver_url] [force=true] [update=false] [saltenv='base']
sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```markdown
['/full/path/filename',  
"file://full/path/filename",  
"salt://secret/storage/file.txt",  
"http://user:password@securesite.com/secret-file.json"]
```

Example of dictionaries:

```markdown
{"nameit": '/full/path/filename', name2: "salt://secret/storage/file.txt"}
```

optional parameters accepted:

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid
kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped
but secret will be created any way.

saltenv=['base'] default value is base in case 'salt://' path is used, this parameter can change the visibility of files

### 26.6.200 salt.modules.kapacitor

Kapacitor execution module.

**configuration**

This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```yaml
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

New in version 2016.11.0.

Also protocol and SSL settings could be configured:

```yaml
kapacitor.unsafe_ssl: 'false'
kapacitor.protocol: 'http'
```

New in version 2019.2.0.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into
pillar.

salt.modules.kapacitor.define_task(name, tick_script, task_type='stream', database=None, retention_policy='default', dbrps=None)

Define a task. Serves as both create/update.

**name**

Name of the task.

**tick_script**

Path to the TICK script for the task. Can be a salt:// source.

**task_type**

Task type. Defaults to 'stream'
dbbps
A list of databases and retention policies in "dbname"."rpname" format to fetch data from. For backward compatibility, the value of 'database' and 'retention_policy' will be merged as part of dbbps.

New in version 2019.2.0.

database
Which database to fetch data from.

retention_policy
Which retention policy to fetch data from. Defaults to 'default'.

CLI Example:
```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick
    --> database=telegraf
```

salt.modules.kapacitor.delete_task(name)
Delete a kapacitor task.

name
Name of the task to delete.

CLI Example:
```
salt '*' kapacitor.delete_task cpu
```

salt.modules.kapacitor.disable_task(name)
Disable a kapacitor task.

name
Name of the task to disable.

CLI Example:
```
salt '*' kapacitor.disable_task cpu
```

salt.modules.kapacitor.enable_task(name)
Enable a kapacitor task.

name
Name of the task to enable.

CLI Example:
```
salt '*' kapacitor.enable_task cpu
```

salt.modules.kapacitor.get_task(name)
Get a dict of data on a task.

name
Name of the task to get information about.

CLI Example:
```
salt '*' kapacitor.get_task cpu
```

salt.modules.kapacitor.version()
Get the kapacitor version.
26.6.201 salt.modules.kerberos

Manage Kerberos KDC configuration

In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

salt.modules.kerberos.create_keytab(name, keytab, enctypes=None)

Create keytab

CLI Example:

```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com kadmin/admin host1.example.com.keytab
```

salt.modules.kerberos.create_principal(name, enctypes=None)

Create Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

salt.modules.kerberos.delete_principal(name)

Delete Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
```

salt.modules.kerberos.get_policy(name)

Get policy details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

salt.modules.kerberos.get_principal(name)

Get principal details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

salt.modules.kerberos.get_privs()

Current privileges

CLI Example:
### salt.modules.kerberos.list_policies()

List policies

**CLI Example:**

```
salt 'kdc.example.com' kerberos.list_policies
```

### salt.modules.kerberos.list_principals()

Get all principals

**CLI Example:**

```
salt 'kde.example.com' kerberos.list_principals
```

---

#### 26.6.202 salt.modules.kernelpkg_linux_apt

Manage Linux kernel packages on APT-based systems

### salt.modules.kernelpkg_linux_apt.active()

Return the version of the running kernel.

**CLI Example:**

```
salt '*' kernelpkg.active
```

### salt.modules.kernelpkg_linux_apt.cleanup(keep_latest=True)

Remove all unused kernel packages from the system.

**keep_latest**  
[True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

**CLI Example:**

```
salt '*' kernelpkg.cleanup
```

### salt.modules.kernelpkg_linux_apt.latest_available()

Return the version of the latest kernel from the package repositories.

**CLI Example:**

```
salt '*' kernelpkg.latest_available
```

### salt.modules.kernelpkg_linux_apt.latest_installed()

Return the version of the latest installed kernel.

**CLI Example:**

```
salt '*' kernelpkg.latest_installed
```
Note: This function may not return the same value as `active()` if a new kernel has been installed and the system has not yet been rebooted. The `needs_reboot()` function exists to detect this condition.

```python
salt.modules.kernelpkg_linux_apt.list_installed()
```

Return a list of all installed kernels.

CLI Example:

```bash
salt '*' kernelpkg.list_installed
```

```python
salt.modules.kernelpkg_linux_apt.needs_reboot()
```

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```bash
salt '*' kernelpkg.needs_reboot
```

```python
salt.modules.kernelpkg_linux_apt.remove(release)
```

Remove a specific version of the kernel.

**release**
The release number of an installed kernel. This must be the entire release number as returned by `list_installed()`, not the package name.

CLI Example:

```bash
salt '*' kernelpkg.remove 4.4.0-70-generic
```

```python
salt.modules.kernelpkg_linux_apt.upgrade(reboot=False, at_time=None)
```

Upgrade the kernel and optionally reboot the system.

**reboot**
[False] Request a reboot if a new kernel is available.

**at_time**
[immediate] Schedule the reboot at some point in the future. This argument is ignored if reboot=False. See `reboot()` for more details on this argument.

CLI Example:

```bash
salt '*' kernelpkg.upgrade
salt '*' kernelpkg.upgrade reboot=True at_time=1
```

Note: An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

```python
salt.modules.kernelpkg_linux_apt.upgrade_available()
```

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

```bash
salt '*' kernelpkg.upgrade_available
```
26.6.203  salt.modules.kernelpkg_linux_yum

Manage Linux kernel packages on YUM-based systems
salt.modules.kernelpkg_linux_yum.active()

Return the version of the running kernel.

CLI Example:

```shell
salt '*' kernelpkg.active
```

salt.modules.kernelpkg_linux_yum.cleanup(keep_latest=True)

Remove all unused kernel packages from the system.

keep_latest

[True] In the event that the active kernel is not the latest one installed, setting this to True will retain the latest kernel package, in addition to the active one. If False, all kernel packages other than the active one will be removed.

CLI Example:

```shell
salt '*' kernelpkg.cleanup
```

salt.modules.kernelpkg_linux_yum.latest_available()

Return the version of the latest kernel from the package repositories.

CLI Example:

```shell
salt '*' kernelpkg.latest_available
```

salt.modules.kernelpkg_linux_yum.latest_installed()

Return the version of the latest installed kernel.

CLI Example:

```shell
salt '*' kernelpkg.latest_installed
```

Note: This function may not return the same value as active() if a new kernel has been installed and the system has not yet been rebooted. The needs_reboot() function exists to detect this condition.

salt.modules.kernelpkg_linux_yum.list_installed()

Return a list of all installed kernels.

CLI Example:

```shell
salt '*' kernelpkg.list_installed
```

salt.modules.kernelpkg_linux_yum.needs_reboot()

Detect if a new kernel version has been installed but is not running. Returns True if a new kernel is installed, False otherwise.

CLI Example:

```shell
salt '*' kernelpkg.needs_reboot
```
salt.modules.kernelpkg_linux_yum.remove\(release\)

Remove a specific version of the kernel.

\begin{itemize}
\item \textbf{release} \\
\hspace{1em} The release number of an installed kernel. This must be the entire release number as returned by \texttt{list_installed()}, not the package name.
\end{itemize}

CLI Example:

\begin{verbatim}
salt * kernelpkg.remove 3.10.0-327.el7
\end{verbatim}

salt.modules.kernelpkg_linux_yum.upgrade\(reboot=False, at_time=None\)

Upgrade the kernel and optionally reboot the system.

\begin{itemize}
\item \textbf{reboot} \\
\hspace{1em} [False] Request a reboot if a new kernel is available.
\item \textbf{at_time} \\
\hspace{1em} [immediate] Schedule the reboot at some point in the future. This argument is ignored if \texttt{reboot=False}. See \texttt{reboot()} for more details on this argument.
\end{itemize}

CLI Example:

\begin{verbatim}
salt * kernelpkg.upgrade
salt * kernelpkg.upgrade reboot=True at_time=1
\end{verbatim}

\textbf{Note:} An immediate reboot often shuts down the system before the minion has a chance to return, resulting in errors. A minimal delay (1 minute) is useful to ensure the result is delivered to the master.

salt.modules.kernelpkg_linux_yum.upgrade_available()

Detect if a new kernel version is available in the repositories. Returns True if a new kernel is available, False otherwise.

CLI Example:

\begin{verbatim}
salt * kernelpkg.upgrade_available
\end{verbatim}

\textbf{26.6.204 salt.modules.key}

Functions to view the minion’s public key information

salt.modules.key.finger\(hash_type=None\)

Return the minion’s public key fingerprint

\begin{itemize}
\item \textbf{hash_type} \\
\hspace{1em} The hash algorithm used to calculate the fingerprint
\end{itemize}

CLI Example:

\begin{verbatim}
salt * key.finger
\end{verbatim}

salt.modules.key.finger_master\(hash_type=None\)

Return the fingerprint of the master’s public key on the minion.

\begin{itemize}
\item \textbf{hash_type} \\
\hspace{1em} The hash algorithm used to calculate the fingerprint
\end{itemize}
26.6.205 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

```python
salt.modules.keyboard.get_sys()
Get current system keyboard setting
```

CLI Example:

```
salt '*' keyboard.get_sys
```

```python
salt.modules.keyboard.get_x()
Get current X keyboard setting
```

CLI Example:

```
salt '*' keyboard.get_x
```

```python
salt.modules.keyboard.set_sys(layout)
Set current system keyboard setting
```

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

```python
salt.modules.keyboard.set_x(layout)
Set current X keyboard setting
```

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

26.6.206 salt.modules.keystone

Module for handling openstack keystone calls.

**optdepends**

- keystoneclient Python adapter

**configuration**

This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
keystone.verify_ssl: True
```
OR (for token based authentication)

```yaml
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```yaml
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/
  keystone.verify_ssl: True

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/
  keystone.verify_ssl: True
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```bash
salt '*' keystone.tenant_list profile=openstack1
```

```py
salt.modules.keystone.api_version(profile=None, **connection_args)
```
Returns the API version derived from endpoint's response.

CLI Example:

```bash
salt '*' keystone.api_version
```

```py
salt.modules.keystone.auth(profile=None, **connection_args)
```
Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```bash
salt '*' keystone.auth
```

```py
salt.modules.keystone.ec2_credentials_create(user_id=None, name=None, tenant_id=None, tenant=None, profile=None, **connection_args)
```
Create EC2-compatible credentials for user per tenant

CLI Examples:

```bash
salt '*' keystone.ec2_credentials_create name=admin tenant=admin
salt '*' keystone.ec2_credentials_create user_id=c965f79c4f864eaa9c3b41904e67082 tenant_id=722787eb540849158668378dc627ec5f
```
salt.modules.keystone.ec2_credentials_delete(user_id=None, name=None, access_key=None, profile=None, **connection_args)

Delete EC2-compatible credentials

CLI Examples:
salt '*' keystone.ec2_credentials_delete
  → 860f8c2c38ca4fab989f9bc56a061a64  
  → key=5f66d2f24f604b8bb9cd28886106f442

salt '*' keystone.ec2_credentials_delete name=admin
  → key=5f66d2f24f604b8bb9cd28886106f442

salt.modules.keystone.ec2_credentials_get(user_id=None, name=None, access=None, profile=None, **connection_args)

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082
  → access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_
  → id=c965f79c4f864eaaa9c3b41904e67082 access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova
  → access=722787eb540849158668370dc627ec5f

salt.modules.keystone.ec2_credentials_list(user_id=None, name=None, profile=None, **connection_args)

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_
  → id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack

salt.modules.keystone.endpoint_create(service, publicurl=None, internalurl=None, adminurl=None, region=None, profile=None, url=None, interface=None, **connection_args)

Create an endpoint for an Openstack service

CLI Examples:
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://
  → internal/url' 'http://admin/url' region
salt 'v3' keystone.endpoint_create nova url='http://public/url' interface=
  → 'public' region='RegionOne'

salt.modules.keystone.endpoint_delete(service, region=None, profile=None, interface=None, **connection_args)

Delete endpoints of an Openstack service

CLI Examples:
salt 'v2' keystone.endpoint_delete nova [region=RegionOne]
salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]

salt.modules.keystone.endpoint_get(service, region=None, profile=None, interface=None, **connection_args)

Return a specific endpoint (keystone endpoint-get)

CLI Example:
salt 'v2' keystone.endpoint_get nova [region=RegionOne]
salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]

salt.modules.keystone.endpoint_list(profile=None, **connection_args)

Return a list of available endpoints (keystone endpoints-list)

CLI Example:
salt '*' keystone.endpoint_list

salt.modules.keystone.project_create(name, domain, description=None, enabled=True, profile=None, **connection_args)

Create a keystone project. Overrides keystone tenant_create form api V2. For keystone api V3.

New in version 2016.11.0.

name
The project name, which must be unique within the owning domain.

domain
The domain name.

description
The project description.

enabled
Enables or disables the project.

profile
Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:
salt '*' keystone.project_create nova default description='Nova Compute

←Project'
salt '*' keystone.project_create test default enabled=False

salt.modules.keystone.project_delete(project_id=None, name=None, profile=None, **connection_args)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id
The project id.
name

The project name.

profile

Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```text
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_
    → id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

```
salt.modules.keystone.project_get(project_id=None, name=None, profile=None, **connection_args)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id

The project id.

name

The project name.

profile

Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

```
salt.modules.keystone.project_list(profile=None, **connection_args)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

profile

Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:

```
salt '*' keystone.project_list
```

```
salt.modules.keystone.project_update(project_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)

Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id

The project id.

name

The project name, which must be unique within the owning domain.
description
  The project description.

enabled
  Enables or disables the project.

profile
  Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```bash
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082
   → name=admin email=admin@domain.com
```

```
salt.modules.keystone.role_create(name, profile=None, **connection_args)
  Create a named role.
  CLI Example:
  ```bash
  salt '*' keystone.role_create admin
  ```

salt.modules.keystone.role_delete(role_id=None, name=None, profile=None, **connection_args)
  Delete a role (keystone role-delete)
  CLI Examples:
  ```bash
  salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
  salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
  salt '*' keystone.role_delete name=admin
  ```

salt.modules.keystone.role_get(role_id=None, name=None, profile=None, **connection_args)
  Return a specific roles (keystone role-get)
  CLI Examples:
  ```bash
  salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
  salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
  salt '*' keystone.role_get name=admin
  ```

salt.modules.keystone.role_list(profile=None, **connection_args)
  Return a list of available roles (keystone role-list)
  CLI Example:
  ```bash
  salt '*' keystone.role_list
  ```

salt.modules.keystone.service_create(name, service_type, description=None, profile=None, **connection_args)
  Add service to Keystone service catalog
  CLI Examples:
  ```bash
  salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
  ```

salt.modules.keystone.service_delete(service_id=None, name=None, profile=None, **connection_args)
Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

salt.modules.keystone.service_get(service_id=None, name=None, profile=None, **connection_args)
Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

salt.modules.keystone.service_list(profile=None, **connection_args)
Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

salt.modules.keystone.tenant_create(name, description=None, enabled=True, profile=None, **connection_args)
Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

salt.modules.keystone.tenant_delete(tenant_id=None, name=None, profile=None, **connection_args)
Delete a tenant (keystone tenant-delete)

CLI Examples:

```
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
```

salt.modules.keystone.tenant_get(tenant_id=None, name=None, profile=None, **connection_args)
Return a specific tenants (keystone tenant-get)

CLI Examples:

```
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova
```

salt.modules.keystone.tenant_list(profile=None, **connection_args)
Return a list of available tenants (keystone tenants-list)

CLI Example:
salt '*' keystone.tenant_list

salt.modules.keystone.tenant_update(tenant_id=None, name=None, description=None, enabled=None, profile=None, **connection_args)

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082

-> name=admin email=admin@domain.com

salt.modules.keystone.token_get(profile=None, **connection_args)

Return the configured tokens (keystone token-get)

CLI Example:
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082

salt.modules.keystone.user_create(name, password, email, tenant_id=None, enabled=True, profile=None, project_id=None, description=None, **connection_args)

Create a user (keystone user-create)

CLI Examples:
salt '*' keystone.user_create name=jack password=zero

-> email=jack@halloweentown.org tenant_

-> id=a28a7b5a999a455f84b1f5210264375e enabled=True

salt.modules.keystone.user_delete(user_id=None, name=None, profile=None, **connection_args)

Delete a user (keystone user-delete)

CLI Examples:
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova

salt.modules.keystone.user_get(user_id=None, name=None, profile=None, **connection_args)

Return a specific users (keystone user-get)

CLI Examples:
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova

salt.modules.keystone.user_list(profile=None, **connection_args)

Return a list of available users (keystone user-list)

CLI Example:
salt '*' keystone.user_list
salt.modules.keystone.user_password_update(user_id=None, name=None, password=None, profile=None, **connection_args)

Update a user's password (keystone user-password-update)

CLI Examples:

```bash
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082 password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082 password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

salt.modules.keystone.user_role_add(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```bash
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654 tenant_id=7167a092e84bae8ced4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e8ced4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

salt.modules.keystone.user_role_list(user_id=None, tenant_id=None, user_name=None, tenant_name=None, profile=None, project_id=None, project_name=None, **connection_args)

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:

```bash
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654 tenant_id=7167a092e84bae8ced4bf9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

salt.modules.keystone.user_role_remove(user_id=None, user=None, tenant_id=None, tenant=None, role_id=None, role=None, profile=None, project_id=None, project_name=None, **connection_args)

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```bash
salt '*' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654 tenant_id=7167a092e84bae8ced4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e8ced4
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

salt.modules.keystone.user_update(user_id=None, name=None, email=None, enabled=None, tenant=None, profile=None, project=None, description=None, **connection_args)

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:
salt '*' keystone.user_update user_id=c965f79c4f864eaa9c3b41904e67082
    → name=newname
salt '*' keystone.user_update c965f79c4f864eaa9c3b41904e67082
    → name=newname email=newemail@domain.com

salt.modules.keystone.user_verify_password

Verify a user's password

CLI Examples:
salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_
    → id=c965f79c4f864eaa9c3b41904e67082 password=foobar

26.6.207 salt.modules.keystoneng

Keystone module for interacting with OpenStack Keystone

New in version 2018.3.0.
:depends: shade

Example configuration

```yaml
keystone:
    cloud: default

keystone:
    auth:
        username: admin
        password: password123
        user_domain_name: mydomain
        project_name: myproject
        project_domain_name: myproject
        auth_url: https://example.org:5000/v3
        identity_api_version: 3
```

salt.modules.keystoneng.compare_changes

Compare two dicts returning only keys that exist in the first dict and are different in the second one

salt.modules.keystoneng.domain_create

Create a domain

CLI Example:
salt '*' keystoneng.domain_create name=domain1

salt.modules.keystoneng.domain_delete

Delete a domain

CLI Example:
salt '*' keystoneng.domain_delete name=domain1
salt '*' keystoneng.domain_delete name=b62e76fbee4e8fb787073f591cf21e
salt.modules.keystoneng.domain_get(\texttt{auth=None, **kwargs})

Get a single domain

CLI Example:

\begin{verbatim}
salt '*' keystoneng.domain_get name=domain1
salt '*' keystoneng.domain_get name=b62e76fbeff4e8fb77073f591cf211e
\end{verbatim}

salt.modules.keystoneng.domain_list(\texttt{auth=None, **kwargs})

List domains

CLI Example:

\begin{verbatim}
salt '*' keystoneng.domain_list
\end{verbatim}

salt.modules.keystoneng.domain_search(\texttt{auth=None, **kwargs})

Search domains

CLI Example:

\begin{verbatim}
salt '*' keystoneng.domain_search
salt '*' keystoneng.domain_search name=domain1
\end{verbatim}

salt.modules.keystoneng.domain_update(\texttt{auth=None, **kwargs})

Update a domain

CLI Example:

\begin{verbatim}
salt '*' keystoneng.domain_update name=domain1 new_name=newdomain
salt '*' keystoneng.domain_update name=domain1 enabled=True description='new description'
\end{verbatim}

salt.modules.keystoneng.endpoint_create(\texttt{auth=None, **kwargs})

Create an endpoint

CLI Example:

\begin{verbatim}
salt '*' keystoneng.endpoint_create interface=admin service=glance\texttt{\_url=https://example.org:9292}
salt '*' keystoneng.endpoint_create interface=public service=glance\texttt{\_region=RegionOne \_url=https://example.org:9292}
salt '*' keystoneng.endpoint_create interface=admin service=glance\texttt{\_url=https://example.org:9292 enabled=True}
\end{verbatim}

salt.modules.keystoneng.endpoint_delete(\texttt{auth=None, **kwargs})

Delete an endpoint

CLI Example:

\begin{verbatim}
salt '*' keystoneng.endpoint_delete id=3bee4bd8c2b040ee966adfda1f0bfca9
\end{verbatim}

salt.modules.keystoneng.endpoint_get(\texttt{auth=None, **kwargs})

Get a single endpoint

CLI Example:
salt '!' keystoneng.endpoint_get id=02cffaa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_list(auth=None, **kwargs)
List endpoints
CLI Example:
salt '!' keystoneng.endpoint_list

salt.modules.keystoneng.endpoint_search(auth=None, **kwargs)
Search endpoints
CLI Example:
salt '!' keystoneng.endpoint_search
salt '!' keystoneng.endpoint_search id=02cffaa173b2460f98e40eda3748dae5

salt.modules.keystoneng.endpoint_update(auth=None, **kwargs)
Update an endpoint
CLI Example:
salt '!' keystoneng.endpoint_update endpoint_
   →id=4f961ad09d2d48948896bbe7c6a79717 interface=public enabled=False
salt '!' keystoneng.endpoint_update endpoint_
   →id=4f961ad09d2d48948896bbe7c6a79717 region=newregion
salt '!' keystoneng.endpoint_update endpoint_
   →id=4f961ad09d2d48948896bbe7c6a79717 service_name_or_id=glance
   →url=https://example.org:9292

salt.modules.keystoneng.get_entity(ent_type, **kwargs)
Attempt to query Keystone for more information about an entity

salt.modules.keystoneng.get_openstack_cloud(auth=None)
Return an openstack_cloud

salt.modules.keystoneng.get_operator_cloud(auth=None)
Return an operator_cloud

salt.modules.keystoneng.group_create(auth=None, **kwargs)
Create a group
CLI Example:
salt '!' keystoneng.group_create name=group1
salt '!' keystoneng.group_create name=group2 domain=domain1 description=
   →'my group2'

salt.modules.keystoneng.group_delete(auth=None, **kwargs)
Delete a group
CLI Example:
salt '!' keystoneng.group_delete name=group1
salt '!' keystoneng.group_delete name=group2 domain_
   →id=b62e76fbee4f87787f591cf211e
salt '!' keystoneng.group_delete name=0e4febc2a5ab4f2c8f374b054162506d
Salt Documentation, Release 3007.1

salt.modules.keystoneng.group_get(auth=None, **kwargs)
Get a single group

CLI Example:

```python
salt '*' keystoneng.group_get name=group1
salt '*' keystoneng.group_get name=group2 domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.group_get name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.keystoneng.group_list(auth=None, **kwargs)
List groups

CLI Example:

```python
salt '*' keystoneng.group_list
domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.group_search(auth=None, **kwargs)
Search for groups

CLI Example:

```python
salt '*' keystoneng.group_search name=group1
domain_id=b62e76fbeeff4e8fb77073f591cf211e
```

salt.modules.keystoneng.group_update(auth=None, **kwargs)
Update a group

CLI Example:

```python
salt '*' keystoneng.group_update name=group1 description='new description'
salt '*' keystoneng.group_create name=group2 domain_id=b62e76fbeeff4e8fb77073f591cf211e new_name=newgroupname
domain_id=b62e76fbeeff4e8fb77073f591cf211e new_name=newgroupname
salt '*' keystoneng.group_create name=0e4febc2a5ab4f2c8f374b054162506d
```

salt.modules.keystoneng.project_create(auth=None, **kwargs)
Create a project

CLI Example:

```python
salt '*' keystoneng.project_create name=project1
domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.project_create name=project2 domain_id=b62e76fbeeff4e8fb77073f591cf211e
salt '*' keystoneng.project_create name=project3 enabled=False description='my project3'
```

salt.modules.keystoneng.project_delete(auth=None, **kwargs)
Delete a project

CLI Example:
salt modules.keystoneng.project_get

Get a single project

CLI Example:

```bash
salt '*' keystoneng.project_get name=project1
salt '*' keystoneng.project_get name=project2
domain_id=b62e76fbee1f4e8f73f591cf211e
salt '*' keystoneng.project_get name=f315afcf12f24ad88c92b936c38f2d5a
```

salt modules.keystoneng.project_list

List projects

CLI Example:

```bash
salt '*' keystoneng.project_list
salt '*' keystoneng.project_list domain_id=b62e76fbee1f4e8f73f591cf211e
```

salt modules.keystoneng.project_search

Search projects

CLI Example:

```bash
salt '*' keystoneng.project_search
salt '*' keystoneng.project_search name=project1
domain_id=b62e76fbee1f4e8f73f591cf211e
```

salt modules.keystoneng.project_update

Update a project

CLI Example:

```bash
salt '*' keystoneng.project_update name=project1 new_name=newproject
description='new description'
salt '*' keystoneng.project_update name=project2 enabled=False
```

salt modules.keystoneng.role_assignment_list

List role assignments

CLI Example:

```bash
salt '*' keystoneng.role_assignment_list
```

salt modules.keystoneng.role_create

Create a role

CLI Example:
salt '*' keystoneng.role_create name=role1
salt '*' keystoneng.role_create name=role1 domain_

  id=b62e76fbee7f77073f591cf211e

salt.modules.keystoneng.role_delete(auth=None, **kwargs)
Delete a role
CLI Example:
salt '*' keystoneng.role_delete name=role1 domain_

  id=b62e76fbee7f77073f591cf211e
salt '*' keystoneng.role_delete name=1eb6edd5525e4ac39af571adee673559

salt.modules.keystoneng.role_get(auth=None, **kwargs)
Get a single role
CLI Example:

salt '*' keystoneng.role_get name=role1
domain_

  id=b62e76fbee7f77073f591cf211e
salt '*' keystoneng.role_get name=1eb6edd5525e4ac39af571adee673559

salt.modules.keystoneng.role_grant(auth=None, **kwargs)
Grant a role in a project/domain to a user/group
CLI Example:

salt '*' keystoneng.role_grant name=role1 user=user1 project=project1
group=group1
salt '*' keystoneng.role_grant name=ddbe3e0ed74e4c7f8027bad4af03339d
  group=user1 project=project1 domain=domain1
salt '*' keystoneng.role_grant name=ddbe3e0ed74e4c7f8027bad4af03339d
  group=19573af5e4241d8b65c42215b5e9704
  project=1dcac318a83b4610b7a7f7ba01465548

salt.modules.keystoneng.role_list(auth=None, **kwargs)
List roles
CLI Example:

salt '*' keystoneng.role_list
salt '*' keystoneng.role_list domain_id=b62e76fbee7f77073f591cf211e

salt.modules.keystoneng.role_revoke(auth=None, **kwargs)
Grant a role in a project/domain to a user/group
CLI Example:

salt '*' keystoneng.role_revoke name=role1 user=user1 project=project1
group=group1
salt '*' keystoneng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d
  group=user1 project=project1 domain=domain1
salt '*' keystoneng.role_revoke name=ddbe3e0ed74e4c7f8027bad4af03339d
  group=19573af5e4241d8b65c42215b5e9704
  project=1dcac318a83b4610b7a7f7ba01465548
salt.modules.keystoneng.role_search(auth=None, **kwargs)

Search roles

CLI Example:

```
salt '*' keystoneng.role_search
salt '*' keystoneng.role_search name=role1
salt '*' keystoneng.role_search domain_id=b62e76fbee4e8f77073f591cf211e
```

salt.modules.keystoneng.role_update(auth=None, **kwargs)

Update a role

CLI Example:

```
salt '*' keystoneng.role_update name=role1 new_name=newrole
salt '*' keystoneng.role_update name=1eb6edd5525e4ac39af571adee673559 new_name=newrole
```

salt.modules.keystoneng.service_create(auth=None, **kwargs)

Create a service

CLI Example:

```
salt '*' keystoneng.service_create name=glance type=image
go
salt '*' keystoneng.service_create name=glance type=image description="Image"
```

salt.modules.keystoneng.service_delete(auth=None, **kwargs)

Delete a service

CLI Example:

```
salt '*' keystoneng.service_delete name=glance
salt '*' keystoneng.service_delete name=39cc1327cdf744ab815331554430e8ec
```

salt.modules.keystoneng.service_get(auth=None, **kwargs)

Get a single service

CLI Example:

```
salt '*' keystoneng.service_get name=glance
salt '*' keystoneng.service_get name=75a5804638944ab3ab54f7fbc3205a
```

salt.modules.keystoneng.service_list(auth=None, **kwargs)

List services

CLI Example:

```
salt '*' keystoneng.service_list
```

salt.modules.keystoneng.service_search(auth=None, **kwargs)

Search services

CLI Example:
salt.modules.keystoneng.service_search

Update a service

CLI Example:

salt '*' keystoneng.service_search name=glance
salt '*' keystoneng.service_search name=135f0403f8e544dc9008c6739ecda860

salt.modules.keystoneng.service_update(auth=None, **kwargs)

Update a service

CLI Example:

salt '*' keystoneng.service_update name=cinder type=volumev2
description='new
salt '*' keystoneng.service_update name=ab4d35e269f147b3ae2d849f77f5c88f
enabled=False

salt.modules.keystoneng.setup_clouds(auth=None)

Call functions to create Shade cloud objects in __context__ to take advantage of Shade's in-memory caching across several states

salt.modules.keystoneng.user_create(auth=None, **kwargs)

Create a user

CLI Example:

salt '*' keystoneng.user_create name=user1
salt '*' keystoneng.user_create name=user2 password=1234 enabled=False
salt '*' keystoneng.user_create name=user3 domain_
id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.user_delete(auth=None, **kwargs)

Delete a user

CLI Example:

salt '*' keystoneng.user_delete name=user1
salt '*' keystoneng.user_delete name=user2 domain_
id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.user_delete name=a42cbbfa1e894e839fd0f584d22e321f

salt.modules.keystoneng.user_get(auth=None, **kwargs)

Get a single user

CLI Example:

salt '*' keystoneng.user_get name=user1
salt '*' keystoneng.user_get name=user1 domain_
id=b62e76fbee4e8fb77073f591cf211e
salt '*' keystoneng.user_get name=02c7faa173b2460f98e40eda3748da5

salt.modules.keystoneng.user_list(auth=None, **kwargs)

List users

CLI Example:

salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbee4e8fb77073f591cf211e
salt.modules.keystoneng.user_search(*args, **kwargs)
List users

CLI Example:

salt '*' keystoneng.user_list
salt '*' keystoneng.user_list domain_id=b62e76fbee4e8fb77073f591cf211e

salt.modules.keystoneng.user_update(*args, **kwargs)
Update a user

CLI Example:

salt '*' keystoneng.user_update name=user1 enabled=False description='new\n\n→description'
salt '*' keystoneng.user_update name=user1 new_name=newuser

26.6.208 salt.modules.keystore

Module to interact with keystores

salt.modules.keystore.add(name, keystore, passphrase, certificate, private_key=None)

Adds certificates to an existing keystore or creates a new one if necessary.

Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **certificate** -- The PEM public certificate to add to keystore. Can be a string for file.
- **private_key** -- (Optional for TrustedCert) The PEM private key to add to the keystore

CLI Example:

salt '*' keystore.add aliasname /tmp/test.store changeit /tmp/testcert.crt
salt '*' keystore.add aliasname /tmp/test.store changeit certificate="-----\n\n→BEGIN CERTIFICATE-----SIb...BM=-----END CERTIFICATE-----"
salt '*' keystore.add keyname /tmp/test.store changeit /tmp/512.cert\n\n→private_key=/tmp/512.key

salt.modules.keystore.get_sha1(certificate)

Returns the SHA1 sum of a ASN1/PEM certificate

Parameters

- **name** -- ASN1/PEM certificate

CLI Example:

salt '*' keystore.get_sha1 "(certificate_content_string)"

salt.modules.keystore.list(keystore, passphrase, alias=None, return_cert=False)

Lists certificates in a keytool managed keystore.

Parameters
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore
- **alias** -- (Optional) If found, displays details on only this key
- **return_certs** -- (Optional) Also return certificate PEM.

**Warning:** There are security implications for using return_cert to return decrypted certificates.

CLI Example:

```
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts → changeit
salt '*' keystore.list /usr/lib/jvm/java-8/jre/lib/security/cacerts → changeit debian:verisign-_g5.pem
```

`salt.modules.keystore.remove(name, keystore, passphrase)`

Removes a certificate from an existing keystore. Returns True if remove was successful, otherwise False

Parameters

- **name** -- alias for the certificate
- **keystore** -- The path to the keystore file to query
- **passphrase** -- The passphrase to use to decode the keystore

CLI Example:

```
salt '*' keystore.remove aliasname /tmp/test.store changeit
```

26.6.209 `salt.modules.kmod`

Module to manage Linux kernel modules

`salt.modules.kmod.available()`

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

`salt.modules.kmod.check_available(mod)`

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

`salt.modules.kmod.is_loaded(mod)`

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```
salt.modules.kmod.load(mod, persist=False)
Load the specified kernel module

    mod
    Name of module to add

    persist
    Write module to /etc/modules to make it load on system reboot

    CLI Example:
salt '*' kmod.load kvm

salt.modules.kmod.lsmod()
Return a dict containing information about currently loaded modules

    CLI Example:
salt '*' kmod.lsmod

salt.modules.kmod.mod_list(only_persist=False)
Return a list of the loaded module names

    only_persist
    Only return the list of loaded persistent modules

    CLI Example:
salt '*' kmod.mod_list

salt.modules.kmod.remove(mod, persist=False, comment=True)
Remove the specified kernel module

    mod
    Name of module to remove

    persist
    Also remove module from /etc/modules

    comment
    If persist is set don't remove line from /etc/modules but only comment it

    CLI Example:
salt '*' kmod.remove kvm

26.6.210 salt.modules.kubeadm

Warning: This module will be removed from Salt in version 3009 in favor of the kubernetes Salt Extension.

Module for kubeadm :maintainer: Alberto Planas <aplanas@suse.com> :maturity: new :depends: None :platform: Linux

salt.modules.kubeadm.alpha_certs_renew(rootfs=None)
New in version 3001.
Renews certificates for a Kubernetes cluster
rootfs
The path to the real host root filesystem

CLI Example:
```
salt '*' kubeadm.alpha_certs_renew
```

```
salt.modules.kubeadm.alpha_kubeconfig_user(client_name, apiserver_advertise_address=None, apiserver_bind_port=None, cert_dir=None, org=None, token=None, rootfs=None)
```

New in version 3001.

Outputs a kubeconfig file for an additional user

client_name
The name of the user. It will be used as the CN if client certificates are created

apiserver_advertise_address
The IP address the API server is accessible on

apiserver_bind_port
The port the API server is accessible on (default 6443)

cert_dir
The path where certificates are stored (default "/etc/kubernetes/pki")

org
The organization of the client certificate

token
The token that should be used as the authentication mechanism for this kubeconfig, instead of client certificates

rootfs
The path to the real host root filesystem

CLI Example:
```
salt '*' kubeadm.alpha_kubeconfig_user client_name=user
```

```
salt.modules.kubeadm.alpha_kubelet_config_download(kubeconfig=None, kubelet_version=None, rootfs=None)
```

New in version 3001.

Downloads the kubelet configuration from the cluster ConfigMap kubelet-config-1.X

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

kubeflet_version
The desired version for the kubelet

rootfs
The path to the real host root filesystem

CLI Example:
```
salt '*' kubeadm.alpha_kubelet_config_download
salt '*' kubeadm.alpha_kubelet_config_download kubelet_version='1.14.0'
```
salt.modules.kubeadm.alpha_kubelet_config_enable_dynamic(node_name, kubeconfig=None, kubernetes_version=None, rootfs=None)

New in version 3001.
Enables or updates dynamic kubelet configuration for a node

node_name
Name of the node that should enable the dynamic kubelet configuration

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

kubernetes_version
The desired version for the kubelet
	no
The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_kubelet_config_enable_dynamic node-1
```

salt.modules.kubeadm.alpha_selfhosting_pivot(cert_dir=None, config=None, kubeconfig=None, store_certs_in_secrets=False, rootfs=None)

New in version 3001.
Converts a static Pod-hosted control plane into a self-hosted one

cert_dir
The path where certificates are stored (default "/etc/kubernetes/pki")

config
Path to kubeadm configuration file

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

store_certs_in_secrets
Enable storing certs in secrets

rootfs
The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.alpha_selfhosting_pivot
```

salt.modules.kubeadm.config_images_list(config=None, feature_gates=None, kubernetes_version=None, kubeconfig=None, rootfs=None)

New in version 3001.
Print a list of images kubeadm will use

cfg
Path to kubeadm configuration file

feature_gates
A set of key=value pairs that describe feature gates for various features
**kubernetes_version**
Choose a specific Kubernetes version for the control plane (default "stable-1")

**kubeconfig**
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**
The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_images_list
```

**salt.modules.kubeadm.config_images_pull**

```
salt.modules.kubeadm.config_images_pull(config=None, cri_socket=None, feature_gates=None, kubernetes_version=None, kubeconfig=None, rootfs=None)
```

New in version 3001.
Pull images used by kubeadm

- **config**
  Path to kubeadm configuration file

- **cri_socket**
  Path to the CRI socket to connect

- **feature_gates**
  A set of key=value pairs that describe feature gates for various features

**kubernetes_version**
Choose a specific Kubernetes version for the control plane (default "stable-1")

**kubeconfig**
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**
The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_images_pull
```

**salt.modules.kubeadm.config_migrate**

```
salt.modules.kubeadm.config_migrate(old_config, new_config=None, kubeconfig=None, rootfs=None)
```

New in version 3001.
Read an older version of the kubeadm configuration API types from a file, and output the similar config object for the newer version

- **old_config**
  Path to the kubeadm config file that is using the old API version and should be converted

- **new_config**
  Path to the resulting equivalent kubeadm config file using the new API version. If not specified the output will be returned

- **kubeconfig**
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

- **rootfs**
The path to the real host root filesystem

CLI Example:
salt '*' kubeadm.config_migrate /oldconfig.cfg

salt.modules.kubeadm.config_print_init_defaults(component_configs=None, kubeconfig=None, rootfs=None)

New in version 3001.
Return default init configuration, that can be used for 'kubeadm init'

component_config
A comma-separated list for component config API object to print the default values for (valid values: KubeProxyConfiguration, KubeletConfiguration)

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs
The path to the real host root filesystem

CLI Example:
salt '*' kubeadm.config_print_init_defaults

salt.modules.kubeadm.config_print_join_defaults(component_configs=None, kubeconfig=None, rootfs=None)

New in version 3001.
Return default join configuration, that can be used for 'kubeadm join'

component_config
A comma-separated list for component config API object to print the default values for (valid values: KubeProxyConfiguration, KubeletConfiguration)

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs
The path to the real host root filesystem

CLI Example:
salt '*' kubeadm.config_print_join_defaults

salt.modules.kubeadm.config_upload_from_file(config, kubeconfig=None, rootfs=None)

New in version 3001.
Upload a configuration file to the in-cluster ConfigMap for kubeadm configuration

config
Path to a kubeadm configuration file

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

rootfs
The path to the real host root filesystem

CLI Example:
salt '*' kubeadm.config_upload_from_file /config.cfg
salt.modules.kubeadm.config_upload_from_flags(apiserver_advertise_address=None, apiserver_bind_port=None, apiserver_cert_extra_sans=None, cert_dir=None, cri_socket=None, feature_gates=None, kubernetes_version=None, node_name=None, pod_network_cidr=None, service_cidr=None, service_dns_domain=None, kubeconfig=None, rootfs=None)

New in version 3001.

Create the in-cluster configuration file for the first time using flags

apiserver_advertise_address
The IP address the API server will advertise it’s listening on

apiserver_bind_port
The port the API server is accessible on (default 6443)

apiserver_cert_extra_sans
Optional extra Subject Alternative Names (SANs) to use for the API Server serving certificate

cert_dir
The path where to save and store the certificates (default "/etc/kubernetes/pki")

cri_socket
Path to the CRI socket to connect

feature_gates
A set of key=value pairs that describe feature gates for various features

kubernetes_version
Choose a specifig Kubernetes version for the control plane (default "stable-1")

node_name
Specify the node name

pod_network_cidr
Specify range of IP addresses for the pod network

service_cidr
Use alternative range of IP address for service VIPs (default "10.96.0.0/12")

service_dns_domain
Use alternative domain for services (default "cluster.local")

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

roots
The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.config_upload_from_flags
```

salt.modules.kubeadm.config_view(kubeconfig=None, rootfs=None)

New in version 3001.

View the kubeadm configuration stored inside the cluster

kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf
rootfs
The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.config_view
```

`salt.modules.kubeadm.init`(*apiserver_advertise_address=None, apiserver_bind_port=None, apiserver_cert_extra_sans=None, cert_dir=None, certificate_key=None, control_plane_endpoint=None, config=None, cri_socket=None, experimental_upload_certs=False, upload_certs=False, feature_gates=None, ignorepreflight_errors=None, image_repository=None, kubernetes_version=None, node_name=None, pod_network_cidr=None, service_cidr=None, service_dns_domain=None, skip_certificate_key_print=False, skip_phases=None, skip_token_print=False, token=None, token_ttl=None, rootfs=None)*

New in version 3001.

Command to set up the Kubernetes control plane

**apiserver_advertise_address**
The IP address the API server will advertise it's listening on

**apiserver_bind_port**
The port the API server is accessible on (default 6443)

**apiserver_cert_extra_sans**
Optional extra Subject Alternative Names (SANs) to use for the API Server serving certificate

**cert_dir**
The path where to save and store the certificates (default "/etc/kubernetes/pki")

**certificate_key**
Key used to encrypt the control-plane certificates in the kubeadm-certs Secret

**config**
Path to a kubeadm configuration file

**control_plane_endpoint**
Specify a stable IP address or DNS name for the control plane

**cri_socket**
Path to the CRI socket to connect

**experimental_upload_certs**
Upload control-plane certificate to the kubeadm-certs Secret. ( kubeadm version <= 1.16 )

**upload_certs**
Upload control-plane certificate to the kubeadm-certs Secret. ( kubeadm version > 1.16 )

**feature_gates**
A set of key=value pairs that describe feature gates for various features

**ignore_preflight_errors**
A list of checks whose errors will be shown as warnings

**image_repository**
Choose a container registry to pull control plane images from

**kubernetes_version**
Choose a specifig Kubernetes version for the control plane (default "stable-1")
node_name
   Specify the node name

pod_network_cidr
   Specify range of IP addresses for the pod network

service_cidr
   Use alternative range of IP address for service VIPs (default "10.96.0.0/12")

service_dns_domain
   Use alternative domain for services (default "cluster.local")

skip_certificate_key_print
   Don’t print the key used to encrypt the control-plane certificates

skip_phases
   List of phases to be skipped

skip_token_print
   Skip printing of the default bootstrap token generated by ‘kubeadm init’

token
   The token to use for establishing bidirectional trust between nodes and control-plane nodes. The token
   must match a regular expression, that by default is \[a-z0-9\]{6}.\[a-z0-9\]{16}

token_ttl
   The duration before the token is automatically deleted (1s, 2m, 3h). If set to ‘0’ the token will never expire.
   Default value is 24h0m0s

rootfs
   The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.init pod_network_cidr='10.244.0.0/16'
```

salt.modules.kubeadm.join(api_server_endpoint=None, apiserver_advertise_address=None,
api_server_bind_port=None, certificate_key=None, config=None,
cri_socket=None, discovery_file=None, discovery_token=None,
discovery_token_ca_cert_hash=None,
discovery_token_unsafe_skip_ca_verification=False,
experimental_control_plane=False, control_plane=False,
ignore PREFlight_errors=None, node_name=None, skip_phases=None,
     tls_bootstrap_token=None, token=None, rootfs=None)

New in version 3001.

Command to join to an existing cluster

api_server_endpoint
   IP address or domain name and port of the API Server

apiserver_advertise_address
   If the node should host a new control plane instance, the IP address the API Server will advertise its
   listening on

apiserver_bind_port
   If the node should host a new control plane instance, the port the API Server to bind to (default 6443)

certificate_key
   Use this key to decrypt the certificate secrets uploaded by init
config
Path to a kubeadm configuration file

cri_socket
Path to the CRI socket to connect

discovery_file
For file-based discovery, a file or URL from which to load cluster information

discovery_token
For token-based discovery, the token used to validate cluster information fetched from the API Server

discovery_token_ca_cert_hash
For token-based discovery, validate that the root CA public key matches this hash (format: 
"<type>:<value>"
)
discovery_token_unsafe_skip_ca_verification
For token-based discovery, allow joining without 'discovery-token-ca-cert-hash' pinning

experimental_control_plane
Create a new control plane instance on this node (kubeadm version <= 1.16)

control_plane
Create a new control plane instance on this node (kubeadm version > 1.16)

ignore_preflight_errors
A list of checks whose errors will be shown as warnings

node_name
Specify the node name

skip_phases
List of phases to be skipped

tls_bootstrap_token
Specify the token used to temporarily authenticate with the Kubernetes Control Plane while joining the node

token
Use this token for both discovery-token and tls-bootstrap-token when those values are not provided

rootfs
The path to the real host root filesystem

CLI Example:
salt '*' kubeadm.join 10.160.65.165:6443 token='token'

salt.modules.kubeadm.join_params(create_if_needed=False)
New in version 3001.
Return the parameters required for joining into the cluster

create_if_needed
If the token bucket is empty and this parameter is True, a new token will be created.

CLI Example:
salt '*' kubeadm.join_params
salt '*' kubeadm.join_params create_if_needed=True
salt.modules.kubeadm.reset(**kwargs=*

New in version 3001.

Revert any changes made to this host by `kubeadm init` or `kubeadm join`

**cert_dir**

The path to the directory where the certificates are stored (default "/etc/kubernetes/pki")

**cri_socket**

Path to the CRI socket to connect

**ignore_preflight_errors**

A list of checks whose errors will be shown as warnings

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:

```
salt '*' kubeadm.join 10.160.65.165:6443 token='token'
```

salt.modules.kubeadm.token_create(**kwargs=*

New in version 3001.

Create bootstrap tokens on the server

**token**

Token to write. If None one will be generated. The token must match a regular expression, that by default is [a-z0-9][6].[a-z0-9][16]

**config**

Path to kubeadm configuration file

**description**

A human friendly description of how this token is used

**groups**

List of extra groups that this token will authenticate, default to ['system:bootstrappers:kubeadm:default-node-token']

**ttl**

The duration before the token is automatically deleted (1s, 2m, 3h). If set to '0' the token will never expire. Default value is 24h0m0s

**usages**

Describes the ways in which this token can be used. The default value is ['signing', 'authentication']

**kubeconfig**

The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

**rootfs**

The path to the real host root filesystem

CLI Example:
new in version 3001.

delete bootstrap tokens on the server

```python
salt '*' kubeadm.token_delete token kubeconfig=None, rootfs=None
```

token

Token to write, if None one will be generated. The token must match a regular expression, that by default is `[a-z0-9][6][a-z0-9][16]`

kubeconfig

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

rootfs

The path to the real host root filesystem

cli example:

```bash
salt '*' kubeadm.token_delete a1b2c
salt '*' kubeadm.token_create a1b2c.0123456789abcdef	salt '*' kubeadm.token_create ttl='6h'
salt '*' kubeadm.token_create usages=['signing']
```

salt.modules.kubeadm.token_generate(kubeconfig=None, rootfs=None)

new in version 3001.

generate and return a bootstrap token, but do not create it on the server

kubeconfig

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

rootfs

The path to the real host root filesystem

cli example:

```bash
salt '*' kubeadm.token_generate
```

salt.modules.kubeadm.token_list(kubeconfig=None, rootfs=None)

new in version 3001.

list bootstrap tokens on the server

kubeconfig

The kubeconfig file to use when talking to the cluster. The default values in `/etc/kubernetes/admin.conf`

rootfs

The path to the real host root filesystem

cli example:

```bash
salt '*' kubeadm.token_list
```

salt.modules.kubeadm.version(kubeconfig=None, rootfs=None)

new in version 3001.

return the version of kubeadm
kubeconfig
The kubeconfig file to use when talking to the cluster. The default values in /etc/kubernetes/admin.conf

roofs
The path to the real host root filesystem

CLI Example:

```bash
salt '*' kubeadm.version
```

26.6.211 salt.modules.kubernetesmod

**Warning:** This module will be removed from Salt in version 3009 in favor of the kubernetes Salt Extension.

Module for handling kubernetes calls.

**optdepends**
- kubernetes Python client < 4.0
- PyYAML < 6.0

**configuration**
The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.kubeconfig: '/path/to/kubeconfig'
kubernetes.kubeconfig-data: '<base64 encoded kubeconfig content>'
kubernetes.context: 'context'
```

These settings can be overridden by adding `context` and `kubeconfig` or `kubeconfig_data` parameters when calling a function.

The data format for `kubernetes.kubeconfig-data` value is the content of `kubeconfig` base64 encoded in one line. Only `kubeconfig` or `kubeconfig-data` should be provided. In case both are provided `kubeconfig` entry is preferred.

CLI Example:

```bash
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig context=minikube
```

New in version 2017.7.0.

Changed in version 2019.2.0.

**Warning:** Configuration options changed in 2019.2.0. The following configuration options have been removed:
- kubernetes.user
- kubernetes.password
- kubernetes.api_url
- kubernetes.certificate-authority-data/file
- kubernetes.client-certificate-data/file
- kubernetes.client-key-data/file
Please use now:

- kubernetes.kubeconfig or kubernetes.kubeconfig-data
- kubernetes.context

salt.modules.kubernetesmod.configmaps

Return a list of kubernetes configmaps defined in the namespace

CLI Example:

```bash
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

salt.modules.kubernetesmod.create_configmap

Creates the kubernetes configmap as defined by the user.

CLI Example:

```bash
salt 'minion1' kubernetes.create_configmap
settings default '{
  "example.conf": "# example file"}'

salt 'minion2' kubernetes.create_configmap
name=settings
namespace=default data='{"example.conf": "# example file"}'
```

salt.modules.kubernetesmod.create_deployment

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetesmod.create_namespace

Creates a namespace with the specified name.

CLI Example:

```bash
salt '*' kubernetes.create_namespace salt
salt '*' kubernetes.create_namespace name=salt
```

salt.modules.kubernetesmod.create_pod

Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetesmod.create_secret

Creates the kubernetes secret as defined by the user.

CLI Example:

```bash
salt 'minion1' kubernetes.create_secret
passwords default '{
  "db": "letmein"}'

salt 'minion2' kubernetes.create_secret
name=passwords
namespace=default data='{"db": "letmein"}'
```
salt.modules.kubernetesmod.create_service(name, namespace, metadata, spec, source, template, saltenv, **kwargs)

Creates the kubernetes service as defined by the user.

salt.modules.kubernetesmod.delete_configmap(name, namespace='default', **kwargs)

Deletes the kubernetes configmap defined by name and namespace

CLI Example:
```
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

salt.modules.kubernetesmod.delete_deployment(name, namespace='default', **kwargs)

Deletes the kubernetes deployment defined by name and namespace

CLI Example:
```
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```

salt.modules.kubernetesmod.delete_namespace(name, **kwargs)

Deletes the kubernetes namespace defined by name

CLI Example:
```
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

salt.modules.kubernetesmod.delete_pod(name, namespace='default', **kwargs)

Deletes the kubernetes pod defined by name and namespace

CLI Example:
```
salt '*' kubernetes.delete_pod guestbook-70836848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-70836848-5nl8c namespace=default
```

salt.modules.kubernetesmod.delete_secret(name, namespace='default', **kwargs)

Deletes the kubernetes secret defined by name and namespace

CLI Example:
```
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

salt.modules.kubernetesmod.delete_service(name, namespace='default', **kwargs)

Deletes the kubernetes service defined by name and namespace

CLI Example:
```
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

salt.modules.kubernetesmod.deployments(namespace='default', **kwargs)

Return a list of kubernetes deployments defined in the namespace

CLI Example:
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default

salt.modules.kubernetesmod.namespaces(**kwargs)
Return the names of the available namespaces

CLI Example:

```bash
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces kubeconfig=/etc/salt/k8s/kubeconfig
  context=minikube
```

salt.modules.kubernetesmod.node(name, **kwargs)
Return the details of the node identified by the specified name

CLI Example:

```bash
salt '*' kubernetes.node name='minikube'
```

salt.modules.kubernetesmod.node_add_label(node_name, label_name, label_value, **kwargs)
Set the value of the label identified by `label_name` to `label_value` on the node identified by the name `node_name`. Creates the label if not present.

CLI Example:

```bash
salt '*' kubernetes.node_add_label node_name="minikube" label_name="foo" label_value="bar"
```

salt.modules.kubernetesmod.node_labels(name, **kwargs)
Return the labels of the node identified by the specified name

CLI Example:

```bash
salt '*' kubernetes.node_labels name="minikube"
```

salt.modules.kubernetesmod.node_remove_label(node_name, label_name, **kwargs)
Removes the label identified by `label_name` from the node identified by the name `node_name`.

CLI Example:

```bash
salt '*' kubernetes.node_remove_label node_name="minikube" label_name="foo"
```

salt.modules.kubernetesmod.nodes(**kwargs)
Return the names of the nodes composing the kubernetes cluster

CLI Example:

```bash
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes kubeconfig=/etc/salt/k8s/kubeconfig
  context=minikube
```

salt.modules.kubernetesmod.ping(**kwargs)
Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example:
salt '*' kubernetes.ping

salt.modules.kubernetesmod.pods(namespace='default', **kwargs)

Return a list of kubernetes pods defined in the namespace

CLI Example:

salt '*' kubernetes.pods

salt '*' kubernetes.pods namespace=default

salt.modules.kubernetesmod.replace_configmap(name, data, source=None, template=None, saltenv='base', namespace='default', **kwargs)

Replaces an existing configmap with a new one defined by name and namespace with the specified data.

CLI Example:

salt 'minion1' kubernetes.replace_configmap settings default '←{"example.conf": "# example file"}''

salt 'minion2' kubernetes.replace_configmap name=settings name=namespace=default data='{"example.conf": "# example file"}''

salt.modules.kubernetesmod.replace_deployment(name, metadata, spec, source, template, saltenv, namespace='default', **kwargs)

Replaces an existing deployment with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetesmod.replace_secret(name, data, source=None, template=None, saltenv='base', namespace='default', **kwargs)

Replaces an existing secret with a new one defined by name and namespace, having the specified data.

CLI Example:

salt 'minion1' kubernetes.replace_secret name=passwords data='←{"db": "letmein"}''

salt 'minion2' kubernetes.replace_secret name=passwords name=namespace=saltstack data='{"db": "passw0rd"}''

salt.modules.kubernetesmod.replace_service(name, metadata, spec, source, template, old_service, saltenv, namespace='default', **kwargs)

Replaces an existing service with a new one defined by name and namespace, having the specified metadata and spec.

salt.modules.kubernetesmod.secrets(namespace='default', **kwargs)

Return a list of kubernetes secrets defined in the namespace

CLI Example:

salt '*' kubernetes.secrets

salt '*' kubernetes.secrets namespace=default

salt.modules.kubernetesmod.services(namespace='default', **kwargs)

Return a list of kubernetes services defined in the namespace

CLI Example:
Salt modules for Kubernetes are provided in the Saltstack ecosystem, allowing for the management and automation of Kubernetes resources. Here are some examples of how to use them:

### show_configmap

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

**Function:**
salt.modules.kubernetesmod.show_configmap(name, namespace='default', **kwargs)

**Description:**
Return the Kubernetes configmap defined by name and namespace.

**CLI Example:**
```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

### show_deployment

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

**Function:**
salt.modules.kubernetesmod.show_deployment(name, namespace='default', **kwargs)

**Description:**
Return the Kubernetes deployment defined by name and namespace.

**CLI Example:**
```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

### show_namespace

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

**Function:**
salt.modules.kubernetesmod.show_namespace(name, **kwargs)

**Description:**
Return information for a given namespace defined by the specified name.

**CLI Example:**
```
salt '*' kubernetes.show_namespace kube-system
```

### show_pod

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

**Function:**
salt.modules.kubernetesmod.show_pod(name, namespace='default', **kwargs)

**Description:**
Return POD information for a given pod name defined in the namespace.

**CLI Example:**
```
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x namespace=default
```

### show_secret

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

**Function:**
salt.modules.kubernetesmod.show_secret(name, namespace='default', decode=False, **kwargs)

**Description:**
Return the Kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

**CLI Example:**
```
salt '*' kubernetes.show_secret confidential default
salt '*' kubernetes.show_secret name=confidential namespace=default
salt '*' kubernetes.show_secret name=confidential decode=True
```

### show_service

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

**Function:**
salt.modules.kubernetesmod.show_service(name, namespace='default', **kwargs)

**Description:**
Return the Kubernetes service defined by name and namespace.

**CLI Example:**
```
salt '*' kubernetes.show_service my-nginx default
salt '*' kubernetes.show_service name=my-nginx namespace=default
```
26.6.212 salt.modules.launchctl_service

Module for the management of MacOS systems that use launchd/launchctl

**Important:** If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to 'service.start' is not available), see here.

```python
depends
  * plistlib Python module
```

salt.modules.launchctl_service.available(job_label)
Check that the given service is available.
CLI Example:
```bash
salt '*' service.available com.openssh.sshd
```

salt.modules.launchctl_service.disabled(job_label, runas=None)
Return True if the named service is disabled, false otherwise
CLI Example:
```bash
salt '*' service.disabled <service label>
```

salt.modules.launchctl_service.enabled(job_label, runas=None)
Return True if the named service is enabled, false otherwise
CLI Example:
```bash
salt '*' service.enabled <service label>
```

salt.modules.launchctl_service.get_all()
Return all installed services
CLI Example:
```bash
salt '*' service.get_all
```

salt.modules.launchctl_service.missing(job_label)
The inverse of service.available Check that the given service is not available.
CLI Example:
```bash
salt '*' service.missing com.openssh.sshd
```

salt.modules.launchctl_service.restart(job_label, runas=None)
Restart the named service
CLI Example:
```bash
salt '*' service.restart <service label>
```

salt.modules.launchctl_service.start(job_label, runas=None)
Start the specified service
CLI Example:
```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

salt.modules.launchctl_service.status(name, runas=None)

Return the status for a service via systemd. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

**Parameters**

- **name** (str) -- The name of the service to check
- **runas** (str) -- User to run launchctl commands

**Returns**

True if running, False otherwise dict: Maps service name to True if running, False otherwise

**Return type**

bool

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.launchctl_service.stop(job_label, runas=None)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

### 26.6.213 salt.modules.layman

Support for Layman

salt.modules.layman.add(overlay)

Add the given overlay from the cached remote list to your locally installed overlays. Specify ‘ALL’ to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```
salt '*' layman.add <overlay name>
```

salt.modules.layman.delete(overlay)

Remove the given overlay from the your locally installed overlays. Specify ‘ALL’ to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```
salt '*' layman.delete <overlay name>
```
**salt.modules.layman**

**list_all()**

List all overlays, including remote ones.
Return a list of available overlays:

CLI Example:

```
salt '*' layman.list_all
```

**list_local()**

List the locally installed overlays.
Return a list of installed overlays:

CLI Example:

```
salt '*' layman.list_local
```

**sync(overlay='ALL')**

Update the specified overlay. Use 'ALL' to synchronize all overlays. This is the default if no overlay is specified.

- **overlay**
  Name of the overlay to sync. (Defaults to 'ALL')

CLI Example:

```
salt '*' layman.sync
```

### 26.6.214 salt.modules.ldap3

**Query and modify an LDAP database (alternative interface)**

New in version 2016.3.0.
This is an alternative to the ldap interface provided by the ldapmod execution module.

- **depends**
  - ldap Python module

- **exception** salt.modules.ldap3.LDAPError(message, cause= None)
  Base class of all LDAP exceptions raised by backends.
  This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

- **Variables**
  - **cause** -- backend exception object, if applicable

- **salt.modules.ldap3.add(connect_spec, dn, attributes)**
  Add an entry to an LDAP database.

- **Parameters**
  - **connect_spec** -- See the documentation for the connect_spec parameter for `connect()`.
  - **dn** -- Distinguished name of the entry.
• **attributes** -- Non-empty dict mapping each of the new entry’s attributes to a non-empty iterable of values.

**Returns**
True if successful, raises an exception otherwise.

CLI Example:

```bash
salt '*' ldap3.add "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret',
    },
}"
    "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

salt.modules.ldap3.change(connect_spec, dn, before, after)

Modify an entry in an LDAP database.

This does the same thing as `modify()`, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

**Parameters**

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **before** -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **after** -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

**Returns**
True if successful, raises an exception otherwise.

CLI Example:

```bash
salt '*' ldap3.change "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'
    },
}"
    "dn='cn=admin,dc=example,dc=com'"
    "before={}'example_value': 'before_val'}"
    "after={}'example_value': 'after_val'}"
```

salt.modules.ldap3.connect(connect_spec=None)

Connect and optionally bind to an LDAP server.

**Parameters**

- **connect_spec** -- This can be an LDAP connection object returned by a previous call to
connect() (in which case the argument is simply returned), None (in which case an empty dict is used), or a dict with the following keys:

- **'backend'**
  Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only 'ldap' is supported at the moment.

- **'url'**
  Optional; defaults to 'ldapi://'. URL to the LDAP server.

- **'bind'**
  Optional; defaults to None. Describes how to bind an identity to the LDAP connection. If None, an anonymous connection is made. Valid keys:
  - **'method'**
    Optional; defaults to None. The authentication method to use. Valid values include but are not necessarily limited to 'simple', 'sasl', and None. If None, an anonymous connection is made. Available methods depend on the chosen backend.
  - **'mechanism'**
    Optional; defaults to 'EXTERNAL'. The SASL mechanism to use. Ignored unless the method is 'sasl'. Available methods depend on the chosen backend and the server’s capabilities.
  - **'credentials'**
    Optional; defaults to None. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is 'sasl'.
    For the 'ldap' backend, this is a dictionary. If None, an empty dict is used. Keys:
    - **'args'**
      Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
    - **'kwargs'**
      Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
  - **'dn'**
    Optional; defaults to an empty string. The distinguished name to bind.

  - **'password'**
    Optional; defaults to an empty string. Password for binding. Ignored if the method is 'sasl'.

- **'tls'**
  Optional; defaults to None. A backend-specific object containing settings to override default TLS behavior.

  For the 'ldap' backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of `python-ldap` or the underlying TLS library. If None, an empty dict is used. Possible keys:
    - **'starttls'**
      If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)
- `cacertdir`
  Set the path of the directory containing CA certificates.

- `cacertfile`
  Set the pathname of the CA certificate file.

- `certfile`
  Set the pathname of the certificate file.

- `cipher_suite`
  Set the allowed cipher suite.

- `crlcheck`
  Set the CRL evaluation strategy. Valid values are `'none'`, `'peer'`, and `'all'`.

- `crlfile`
  Set the pathname of the CRL file.

- `dhfile`
  Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.

- `keyfile`
  Set the pathname of the certificate key file.

- `newctx`
  If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)

- `protocol_min`
  Set the minimum protocol version.

- `random_file`
  Set the pathname of the random file when `/dev/random` and `/dev/urandom` are not available.

- `require_cert`
  Set the certificate validation policy. Valid values are `'never'`, `'hard'`, `'demand'`, `'allow'`, and `'try'`.

- `opts`
  Optional; defaults to `None`. A backend-specific object containing options for the backend.

For the `'ldap'` backend, this is a dictionary of OpenLDAP options to set. If `None`, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the `'LDAP_OPT_'` prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the `connect_spec` argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest with statements.

CLI Example:

```
salt '*' ldap3.connect "{'
  'url': 'ldaps://ldap.example.com/',
  'bind': {...
```

(continues on next page)
salt.modules.ldap3.delete(connect_spec, dn)

Delete an entry from an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.

Returns

`True` if successful, raises an exception otherwise.

CLI Example:

```
salt '*' ldap3.delete "{
'url': 'ldaps://ldap.example.com/',
'bind': {
'method': 'simple',
'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```

salt.modules.ldap3.modify(connect_spec, dn, directives)

Modify an entry in an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form `(op, attr, vals)`, where:
  - **op** identifies the modification operation to perform. One of:
    - `'add'` to add one or more values to the attribute
    - `'delete'` to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
    - `'replace'` to replace all of the attribute's values with zero or more new values
  - **attr** names the attribute to modify
  - **vals** is an iterable of values to add or delete

Returns

`True` if successful, raises an exception otherwise.

CLI Example:

```
salt '*' ldap3.modify "{
'url': 'ldaps://ldap.example.com/',
'bind': {
'method': 'simple',
'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```
salt.modules.ldap3.search(connect_spec, base, scope='subtree', filterstr='(objectClass=*)', attrlist=None, attrsonly=0)

Search an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for `connect()`.
- **base** -- Distinguished name of the entry at which to start the search.
- **scope** -- One of the following:
  - `'subtree'`  
    Search the base and all of its descendants.
  - `'base'`  
    Search only the base itself.
  - `'onelevel'`  
    Search only the base’s immediate children.
- **filterstr** -- String representation of the filter to apply in the search.
- **attrlist** -- Limit the returned attributes to those in the specified list. If `None`, all attributes of each entry are returned.
- **attrsonly** -- If non-zero, don’t return any attribute values.

Returns

A dict of results. The dict is empty if there are no results. The dict maps each returned entry’s distinguished name to a dict that maps each of the matching attribute names to a list of its values.

CLI Example:

```bash
salt '*' ldap3.search "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret',
    },
}" "base='dc=example,dc=com"
```
26.6.215 salt.modules.ldapmod

Salt interface to LDAP commands

depends

• ldap Python module

configuration

In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```plaintext
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```plaintext
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```plaintext
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

Warning: At the moment this module only recommends connection to LDAP services listening on localhost. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It’s easy enough to override this behavior, but badness may ensue - you have been warned.

salt.modules.ldapmod.search(filter, dn=None, scope=None, attrs=None, **kwargs)

Run an arbitrary LDAP query and return the results.

CLI Example:

```plaintext
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```plaintext
{"myhost": {'count': 1,
    'results': [['cn=myhost,ou=hosts,o=acme,c=gb',
      {'saltKeyValue': ['ntpserver=ntp.acme.local',
        'foo=myfoo'],
      'saltState': ['foo', 'bar']]]],
    'time': {'human': '1.2ms', 'raw': '0.00123'}}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:
26.6.216  **salt.modules.libcloud_compute**

**Apache Libcloud Compute Management**

Connection module for Apache Libcloud Compute management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/compute/supported_providers.html

Clouds include Amazon EC2, Azure, Google GCE, VMware, OpenStack Nova

New in version 2018.3.0.

**configuration**

This module uses a configuration profile for one or multiple cloud providers

```yaml
libcloud_compute:
  profile_test1:
    driver: google
    key: service-account@googlecloud.net
    secret: /path/to.key.json
  profile_test2:
    driver: arm
    key: 12345
    secret: mysecret
```

**depends**

apache-libcloud

**salt.modules.libcloud_compute.attach_volume**(*node_id*, *volume_id*, *profile*, *device=None*, **libcloud_kwargs*)

Attaches volume to node.

**Parameters**

- **node_id** *(str)* -- Node ID to target
- **volume_id** *(str)* -- Volume ID from which to attach
- **profile** *(str)* -- The profile key
- **device** *(str)* -- Where the device is exposed, e.g. '/dev/sdb'
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's attach_volume method

**CLI Example:**

```
salt myminion libcloud_compute.detach_volume vol1 profile1
```

**salt.modules.libcloud_compute.copy_image**(*source_region*, *image_id*, *name*, *profile*, *description=None*, **libcloud_kwargs*)

Copies an image from a source region to the current region.

**Parameters**

- **source_region** *(str)* -- Region to copy the node from.
- **image_id** *(str)* -- Image to copy.
**name** (str) -- name for new image.

**profile** (str) -- The profile key

**description** -- description for new image.

**libcloud_kwargs** (dict) -- Extra arguments for the driver's copy_image method

CLI Example:

```
salt myminion libcloud_compute.copy_image us-east1 image1 'new image'
```

salt.modules.libcloud_compute.create_image(node_id, name, profile, description=None, **libcloud_kwargs)

Create an image from a node

Parameters

- **node_id** (str) -- Node to run the task on.
- **name** (str) -- name for new image.
- **profile** (str) -- The profile key
- **description** (description) -- description for new image.
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_image method

CLI Example:

```
salt myminion libcloud_compute.create_image server1 my_image profile1
tsalt myminion libcloud_compute.create_image server1 my_image profile1
```

salt.modules.libcloud_compute.create_key_pair(name, profile, **libcloud_kwargs)

Create a single key pair by name

Parameters

- **name** (str) -- Name of the key pair to create.
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_key_pair method

CLI Example:

```
salt myminion libcloud_compute.create_key_pair pair1 profile1
tsalt myminion libcloud_compute.create_key_pair pair1 profile1
```

salt.modules.libcloud_compute.create_volume(size, name, profile, location_id=None, **libcloud_kwargs)

Create a storage volume

Parameters

- **size** (int) -- Size of volume in gigabytes (required)
- **name** (str) -- Name of the volume to be created
- **location_id** (str) -- Which data center to create a volume in. If empty, undefined behavior will be selected. (optional)
- **profile** (str) -- The profile key
• **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's list_volumes method

**CLI Example:**
salt myminion libcloud_compute.create_volume 1000 voll profile1

```bash
click modules.libcloud_compute.create_volume_snapshot(volume_id, profile, name=Name, **libcloud_kwargs)
```

Create a storage volume snapshot

**Parameters**

- **volume_id** *(str)* -- Volume ID from which to create the new snapshot.
- **profile** *(str)* -- The profile key
- **name** *(str)* -- Name of the snapshot to be created (optional)
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's create_volume_snapshot method

**CLI Example:**
salt myminion libcloud_compute.create_volume_snapshot voll profile1

```bash
click modules.libcloud_compute.delete_image(image_id, profile, **libcloud_kwargs)
```

Delete an image of a node

**Parameters**

- **image_id** *(str)* -- Image to delete
- **profile** *(str)* -- The profile key
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's delete_image method

**CLI Example:**
salt myminion libcloud_compute.delete_image image1 profile1

```bash
click modules.libcloud_compute.delete_key_pair(name, profile, **libcloud_kwargs)
```

Delete a key pair

**Parameters**

- **name** *(str)* -- Key pair name.
- **profile** *(str)* -- The profile key
- **libcloud_kwargs** *(dict)* -- Extra arguments for the driver's import_key_pair_from_xxx method

**CLI Example:**
salt myminion libcloud_compute.delete_key_pair pair1 profile1

```bash
click modules.libcloud_compute.destroy_node(node_id, profile, **libcloud_kwargs)
```

Destroy a node in the cloud

**Parameters**

- **node_id** *(str)* -- Unique ID of the node to destroy
- **profile** *(str)* -- The profile key
libcloud_kwargs (dict) -- Extra arguments for the driver's destroy_node method

CLI Example:
salt myminion libcloud_compute.destroy_node as-2346 profile1

salt.modules.libcloud_compute.destroy_volume(volume_id, profile, **libcloud_kwargs)

Destroy a volume.
Parameters
  • volume_id (str) -- Volume ID from which to destroy
  • profile (str) -- The profile key
  • libcloud_kwargs (dict) -- Extra arguments for the driver's destroy_volume method

CLI Example:
salt myminion libcloud_compute.destroy_volume voll profile1

salt.modules.libcloud_compute.destroy_volume_snapshot(volume_id, snapshot_id, profile, **libcloud_kwargs)

Destroy a volume snapshot.
Parameters
  • volume_id (str) -- Volume ID from which the snapshot belongs
  • snapshot_id (str) -- Volume Snapshot ID from which to destroy
  • profile (str) -- The profile key
  • libcloud_kwargs (dict) -- Extra arguments for the driver's destroy_volume_snapshot method

CLI Example:
salt myminion libcloud_compute.destroy_volume_snapshot snap1 profile1

salt.modules.libcloud_compute.detach_volume(volume_id, profile, **libcloud_kwargs)

Detaches a volume from a node.
Parameters
  • volume_id (str) -- Volume ID from which to detach
  • profile (str) -- The profile key
  • libcloud_kwargs (dict) -- Extra arguments for the driver's detach_volume method

CLI Example:
salt myminion libcloud_compute.detach_volume vol1 profile1

salt.modules.libcloud_compute.extra(method, profile, **libcloud_kwargs)

Call an extended method on the driver.
Parameters
  • method (str) -- Driver's method name
  • profile (str) -- The profile key
  • libcloud_kwargs (dict) -- Extra arguments for the driver's method
CLI Example:
```
salt myminion libcloud_compute.extra ex_get_permissions google container_   ↓name=my_container object_name=me.jpg --out=yaml
```

```
salt myminion libcloud_compute.get_image image1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```

```
salt myminion libcloud_compute.get_key_pair pair1 profile1
```

```
salt myminion libcloud_compute.get_image img1 profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 key_value_data123→ profile1
```

```
salt myminion libcloud_compute.import_key_pair pair1 /path/to/key profile1
```

```
salt myminion libcloud_compute.list_images profile=profile1 location_id=None, **libcloud_kwargs
```
- **profile** (str) -- The profile key
- **location_id** (str) -- The location key, from list_locations
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_images method

 CLI Example:
```
salt myminion libcloud_compute.list_images profile1
```

salt.modules.libcloud_compute.list_key_pairs(profile, **libcloud_kwargs)
List all the available key pair objects.

 Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_key_pairs method

 CLI Example:
```
salt myminion libcloud_compute.list_key_pairs profile1
```

salt.modules.libcloud_compute.list_locations(profile, **libcloud_kwargs)
Return a list of locations for this cloud

 Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_locations method

 CLI Example:
```
salt myminion libcloud_compute.list_locations profile1
```

salt.modules.libcloud_compute.list_nodes(profile, **libcloud_kwargs)
Return a list of nodes

 Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_nodes method

 CLI Example:
```
salt myminion libcloud_compute.list_nodes profile1
```

salt.modules.libcloud_compute.list_sizes(profile, location_id=None, **libcloud_kwargs)
Return a list of node sizes

 Parameters

- **profile** (str) -- The profile key
- **location_id** (str) -- The location key, from list_locations
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_sizes method

 CLI Example:
```
salt myminion libcloud_compute.list_sizes profile1
salt myminion libcloud_compute.list_sizes profile1 us-east1
```
salt.modules.libcloud_compute.list_volume_snapshots(volume_id, profile, **libcloud_kwargs)

Return a list of storage volumes snapshots for this cloud

Parameters

- **volume_id** (str) -- The volume identifier
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's
  list_volume_snapshots method

CLI Example:

```
salt myminion libcloud_compute.list_volume_snapshots voll profile1
```

salt.modules.libcloud_compute.list_volumes(profile, **libcloud_kwargs)

Return a list of storage volumes for this cloud

Parameters

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_volumes
  method

CLI Example:

```
salt myminion libcloud_compute.list_volumes profile1
```

salt.modules.libcloud_compute.reboot_node(node_id, profile, **libcloud_kwargs)

Reboot a node in the cloud

Parameters

- **node_id** (str) -- Unique ID of the node to reboot
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's reboot_node
  method

CLI Example:

```
salt myminion libcloud_compute.reboot_node as-2346 profile1
```

26.6.2.17 salt.modules.libcloud_dns

Apache Libcloud DNS Management

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

configuration

This module uses a configuration profile for one or multiple DNS providers

```
lbcloud_dns:
    profile_test1:
        driver: cloudflare
        key: 12345
        secret: mysecret
    profile_test2:
```

(continues on next page)
depends

apache-libcloud

salt.modules.libcloud_dns.create_record(name, zone_id, type, data, profile)

Create a new record.

Parameters

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string ("") for this argument.
- **zone_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:

```shell
salt myminion libcloud_dns.create_record www google.com A 12.32.12.20 profile1
```

salt.modules.libcloud_dns.create_zone(domain, profile, type='master', ttl=None)

Create a new zone.

Parameters

- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```shell
salt myminion libcloud_dns.create_zone google.com profile1
```

salt.modules.libcloud_dns.delete_record(zone_id, record_id, profile)

Delete a record.

Parameters

- **zone_id** (str) -- Zone to delete.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

Return type

bool

CLI Example:

```shell
salt myminion libcloud_dns.delete_record google.com www profile1
```
salt.modules.libcloud_dns.delete_zone(zone_id, profile)
Delete a zone.
Parameters
  • zone_id (str) -- Zone to delete.
  • profile (str) -- The profile key
Return type
  bool
CLI Example:
salt myminion libcloud_dns.delete_zone google.com profile1

salt.modules.libcloud_dns.extra(method, profile, **libcloud_kwargs)
Call an extended method on the driver
Parameters
  • method (str) -- Driver's method name
  • profile (str) -- The profile key
  • libcloud_kwargs (dict) -- Extra arguments for the driver's delete_container method
CLI Example:
salt myminion libcloud_dns.extra ex_get_permissions google container_→name=my_container object_name=me.jpg --out=yaml

salt.modules.libcloud_dns.get_bind_data(zone_id, profile)
Export Zone to the BIND compatible format.
Parameters
  • zone_id (str) -- Zone to export.
  • profile (str) -- The profile key
Returns
  Zone data in BIND compatible format.
Return type
  str
CLI Example:
salt myminion libcloud_dns.get_bind_data google.com profile1

salt.modules.libcloud_dns.get_record(zone_id, record_id, profile)
Get record information for the given zone_id on the given profile
Parameters
  • zone_id (str) -- Zone to export.
  • record_id (str) -- Record to delete.
  • profile (str) -- The profile key
CLI Example:
salt myminion libcloud_dns.get_record google.com www profile1

salt.modules.libcloud_dns.get_zone(zone_id, profile)
Get zone information for the given zone_id on the given profile
Parameters
- **zone_id** (str) -- Zone to export.

- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_zone google.com profile1
```

```python
salt.modules.libcloud_dns.list_record_types(profile)
```

List available record types for the given profile, e.g. A, AAAA

**Parameters**

- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_record_types profile1
```

```python
salt.modules.libcloud_dns.list_records(zone_id, profile, type=None)
```

List records for the given zone_id on the given profile

**Parameters**

- **zone_id** (str) -- Zone to export.

- **profile** (str) -- The profile key

- **type** (str) -- The record type, e.g. A, NS

CLI Example:

```
salt myminion libcloud_dns.list_records google.com profile1
```

```python
salt.modules.libcloud_dns.list_zones(profile)
```

List zones for the given profile

**Parameters**

- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_zones profile1
```

```python
salt.modules.libcloud_dns.update_zone(zone_id, domain, profile, type='master', ttl=None)
```

Update an existing zone.

**Parameters**

- **zone_id** (str) -- Zone ID to update.

- **domain** (str) -- Zone domain name (e.g. example.com)

- **profile** (str) -- The profile key

- **type** (str) -- Zone type (master / slave).

- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.update_zone google.com google.com profile1
```

→ **type=slave**
26.6.218  salt.modules.libcloud_loadbalancer

Apache Libcloud Load Balancer Management

Connection module for Apache Libcloud Storage load balancer management for a full list of supported clouds, see http://libcloud.readthedocs.io/en/latest/loadbalancer/supported_providers.html

Clouds include Amazon ELB, ALB, Google, Aliyun, CloudStack, Softlayer

New in version 2018.3.0.

configuration

This module uses a configuration profile for one or multiple Storage providers

```
libcloud_loadbalancer:
  profile_test1:
    driver: gce
    key: G00G0123456789ABCXYZ
    secret: mysecret
  profile_test2:
    driver: alb
    key: 12345
    secret: mysecret
```

depends

apache-libcloud

salt.modules.libcloud_loadbalancer.balancer_attach_member(balancer_id, ip, port, profile, extra=None, **libcloud_kwargs)

Add a new member to the load balancer

Parameters

- `balancer_id` (str) -- id of a load balancer you want to fetch
- `ip` (str) -- IP address for the new member
- `port` (int) -- Port for the new member
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's balancer_attach_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_attach_member balancer123 1.2.3.4 80 profile1
```

salt.modules.libcloud_loadbalancer.balancer_detach_member(balancer_id, member_id, profile, **libcloud_kwargs)

Add a new member to the load balancer

Parameters

- `balancer_id` (str) -- id of a load balancer you want to fetch
- `ip` (str) -- IP address for the new member
- `port` (int) -- Port for the new member
- `profile` (str) -- The profile key
**libcloud_kwargs** (dict) -- Extra arguments for the driver's balancer_detach_member method

CLI Example:

```
salt myminion libcloud_storage.balancer_detach_member balancer123\n    member123 profile1
```

`salt.modules.libcloud_loadbalancer.create_balancer` *(name, port, protocol, profile, algorithm=None, members=None, **libcloud_kwargs)*

Create a new load balancer instance

**Parameters**

- **name** (str) -- Name of the new load balancer (required)
- **port** (str) -- Port the load balancer should listen on, defaults to 80
- **protocol** (str) -- Loadbalancer protocol, defaults to http.
- **algorithm** (str) -- Load balancing algorithm, defaults to ROUND_ROBIN. See Algorithm type in Libcloud documentation for a full listing.
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's create_balancer method

**Returns**

The details of the new balancer

CLI Example:

```
salt myminion libcloud_storage.create_balancer my_balancer 80 http\n    profile1
```

`salt.modules.libcloud_loadbalancer.destroy_balancer` *(balancer_id, profile, **libcloud_kwargs)*

Destroy a load balancer

**Parameters**

- **balancer_id** (str) -- LoadBalancer ID which should be used
- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's destroy_balancer method

**Returns**

True if the destroy was successful, otherwise False.

**Return type**

bool

CLI Example:

```
salt myminion libcloud_storage.destroy_balancer balancer_1 profile1
```

`salt.modules.libcloud_loadbalancer.extra` *(method, profile, **libcloud_kwargs)*

Call an extended method on the driver

**Parameters**

- **method** (str) -- Driver's method name
- **profile** (str) -- The profile key
Salt Documentation, Release 3007.1

• **libcloud_kwargs** (dict) -- Extra arguments for the driver's method

CLI Example:

```
salt myminion libcloud_loadbalancer.extra ex_get_permissions google
  → container_name=my_container object_name=me.jpg --out=yaml
```

```python
salt.modules.libcloud_loadbalancer.get_balancer(balancer_id, profile, **libcloud_kwargs)
```

Get the details for a load balancer by ID

Parameters

• **balancer_id** (str) -- id of a load balancer you want to fetch
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's get_balancer method

Returns

the load balancer details

CLI Example:

```
salt myminion libcloud_loadbalancer.get_balancer balancer123 profile1
```

```python
salt.modules.libcloud_loadbalancer.get_balancer_by_name(name, profile, **libcloud_kwargs)
```

Get the details for a load balancer by name

Parameters

• **name** (str) -- Name of a load balancer you want to fetch
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancers method

Returns

the load balancer details

CLI Example:

```
salt myminion libcloud_loadbalancer.get_balancer_by_name my_balancer profile1
```

```python
salt.modules.libcloud_loadbalancer.list_balancer_members(balancer_id, profile, **libcloud_kwargs)
```

List the members of a load balancer

Parameters

• **balancer_id** (str) -- id of a load balancer you want to fetch
• **profile** (str) -- The profile key
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancer_members method

CLI Example:

```
salt myminion libcloud_loadbalancer.list_balancer_members balancer123 profile1
```

```python
salt.modules.libcloud_loadbalancer.list_balancers(profile, **libcloud_kwargs)
```

Return a list of load balancers.

Parameters

• **profile** (str) -- The profile key

26.6. execution modules 2229
**libcloud_kwargs** (dict) -- Extra arguments for the driver's list_balancers method

CLI Example:
```bash
salt myminion libcloud_storage.list_balancers profile1
```

`salt.modules.libcloud_loadbalancer.list_protocols(profile, **libcloud_kwargs)`

Return a list of supported protocols.

**Parameters**

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_protocols method

**Returns**

- a list of supported protocols

**Return type**

- list of str

CLI Example:
```bash
salt myminion libcloud_storage.list_protocols profile1
```

`salt.modules.libcloud_loadbalancer.list_supported_algorithms(profile, **libcloud_kwargs)`

Get the supported algorithms for a profile

**Parameters**

- **profile** (str) -- The profile key
- **libcloud_kwargs** (dict) -- Extra arguments for the driver's list_supported_algorithms method

**Returns**

- The supported algorithms

CLI Example:
```bash
salt myminion libcloud_storage.list_supported_algorithms profile1
```

### 26.6.219 salt.modules.libcloud_storage

**Apache Libcloud Storage Management**

Connection module for Apache Libcloud Storage (object/blob) management for a full list of supported clouds, see [http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html](http://libcloud.readthedocs.io/en/latest/storage/supported_providers.html)

Clouds include Amazon S3, Google Storage, Aliyun, Azure Blobs, Ceph, OpenStack swift

New in version 2018.3.0.

**configuration**

This module uses a configuration profile for one or multiple Storage providers

```yaml
libcloud_storage:
  profile_test1:
    driver: google_storage
    key: G00G0123456789ABCXYZ
```

(continues on next page)
depends
   apache-libcloud

salt.modules.libcloud_storage.create_container(container_name, profile, **libcloud_kwargs)
Create a container in the cloud
Parameters
   • container_name (str) -- Container name
   • profile (str) -- The profile key
   • libcloud_kwargs (dict) -- Extra arguments for the driver's create_container method

CLI Example:
salt myminion libcloud_storage.create_container MyFolder profile1

salt.modules.libcloud_storage.delete_container(container_name, profile, **libcloud_kwargs)
delete an object container in the cloud
Parameters
   • container_name (str) -- Container name
   • profile (str) -- The profile key
   • libcloud_kwargs (dict) -- Extra arguments for the driver's delete_container method

Returns
   True if an object container has been successfully deleted, False otherwise.
Return type
   bool

CLI Example:
salt myminion libcloud_storage.delete_container MyFolder profile1

salt.modules.libcloud_storage.delete_object(container_name, object_name, profile, **libcloud_kwargs)
delete an object in the cloud
Parameters
   • container_name (str) -- Container name
   • object_name (str) -- Object name
   • profile (str) -- The profile key
   • libcloud_kwargs (dict) -- Extra arguments for the driver's delete_object method

Returns
   True if an object has been successfully deleted, False otherwise.
Return type
   bool
CLI Example:
```
salt myminion libcloud_storage.delete_object MyFolder me.jpg profile1
```

```
salt.modules.libcloud_storage.delete_object(container_name, object_name, destination_path, profile, overwrite_existing=False, delete_on_failure=True, **libcloud_kwargs)
```

Download an object to the specified destination path.

Parameters
- `container_name` (str) -- Container name
- `object_name` (str) -- Object name
- `destination_path` (str) -- Full path to a file or a directory where the incoming file will be saved.
- `profile` (str) -- The profile key
- `overwrite_existing` (bool) -- True to overwrite an existing file, defaults to False.
- `delete_on_failure` (bool) -- True to delete a partially downloaded file if the download was not successful (hash mismatch / file size).
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's download_object method

Returns
- True if an object has been successfully downloaded, False otherwise.

Return type
- bool

CLI Example:
```
salt myminion libcloud_storage.download_object MyFolder me.jpg /tmp/me.jpg profile1
```

```
salt.modules.libcloud_storage.extra(method, profile, **libcloud_kwargs)
```

Call an extended method on the driver

Parameters
- `method` (str) -- Driver's method name
- `profile` (str) -- The profile key
- `libcloud_kwargs` (dict) -- Extra arguments for the driver's delete_container method

CLI Example:
```
salt myminion libcloud_storage.extra ex_get_permissions google container_name=my_container object_name=me.jpg --out=yaml
```

```
salt.modules.libcloud_storage.get_container(container_name, profile, **libcloud_kwargs)
```

List container details for the given container_name on the given profile

Parameters
- `container_name` (str) -- Container name
- `profile` (str) -- The profile key
libcloud_kwargs (dict) -- Extra arguments for the driver's get_container method

CLI Example:

```
salt myminion libcloud_storage.get_container MyFolder profile1
```

salt.modules.libcloud_storage.get_container_object (container_name, object_name, profile, **libcloud_kwargs)

Get the details for a container object (file or object in the cloud)

Parameters

- container_name (str) -- Container name
- object_name (str) -- Object name
- profile (str) -- The profile key
- libcloud_kwargs (dict) -- Extra arguments for the driver's get_container_object method

CLI Example:

```
salt myminion libcloud_storage.get_container_object MyFolder MyFile.xyz profile1
```

salt.modules.libcloud_storage.list_container_objects (container_name, profile, **libcloud_kwargs)

List container objects (e.g. files) for the given container_id on the given profile

Parameters

- container_name (str) -- Container name
- profile (str) -- The profile key
- libcloud_kwargs (dict) -- Extra arguments for the driver's list_container_objects method

CLI Example:

```
salt myminion libcloud_storage.list_container_objects MyFolder profile1
```

salt.modules.libcloud_storage.list_containers (profile, **libcloud_kwargs)

Return a list of containers.

Parameters

- profile (str) -- The profile key
- libcloud_kwargs (dict) -- Extra arguments for the driver's list_containers method

CLI Example:

```
salt myminion libcloud_storage.list_containers profile1
```

salt.modules.libcloud_storage.upload_object (file_path, container_name, object_name, profile, extra=None, verify_hash=True, headers=None, **libcloud_kwargs)

Upload an object currently located on a disk.

Parameters

- file_path (str) -- Path to the object on disk.
• **container_name** (str) -- Destination container.
• **object_name** (str) -- Object name.
• **profile** (str) -- The profile key
• **verify_hash** (bool) -- Verify hash
• **extra** (dict) -- Extra attributes (driver specific). (optional)
• **headers** (dict) -- (optional) Additional request headers, such as CORS headers.
  For example: headers = {'Access-Control-Allow-Origin': 'http://mozilla.com'}
• **libcloud_kwargs** (dict) -- Extra arguments for the driver's upload_object method

Returns
The object name in the cloud
Return type
str

CLI Example:
```shell
salt myminion libcloud_storage.upload_object /file/to/me.jpg MyFolder me. → jpg profile1
```

### 26.6.220 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the `getfacl` and `setfacl` binaries.

salt.modules.linux_acl.delfacl(*acl_type, acl_name='', *args, **kwargs*)

Remove specific FACL from the specified file(s)

CLI Examples:
```shell
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

salt.modules.linux_acl.getfacl(*args, **kwargs*)

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:
```shell
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

salt.modules.linux_acl.modfacl(*acl_type, acl_name='', *args, **kwargs*)

Add or modify a FACL for the specified file(s)

CLI Examples:
salt.modules.linux_acl.version()

Return facl version from getfacl --version

CLI Example:

salt '*' acl.version

salt.modules.linux_acl.wipefacls(*args, **kwargs)

Remove all FACLs from the specified file(s)

CLI Examples:

salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
    → recursive=True

26.6.221 salt.modules.linux_ip

The networking module for Non-RH/Deb Linux distros

salt.modules.linux_ip.down(iface, iface_type=None)

Shutdown a network interface

CLI Example:

salt '*' ip.down eth0

salt.modules.linux_ip.get_interface(iface)

Return the contents of an interface script

CLI Example:

salt '*' ip.get_interface eth0

salt.modules.linux_ip.get_routes(iface=None)

Return the current routing table

CLI Examples:

salt '*' ip.get_routes
salt '*' ip.get_routes eth0

salt.modules.linux_ip.up(iface, iface_type=None)

Start up a network interface

CLI Example:
salt '*' ip.up eth0

26.6.222 salt.modules.linux_lvm

Support for Linux LVM2

salt.modules.linux_lvm.fullversion()

    Return all version info from lvm version

    CLI Example:

        salt '*' lvm.fullversion

salt.modules.linux_lvm.lvcreate(lvname, vgname, size=None, extents=None, snapshot=None, pv=None, thinvolume=False, thinpool=False, force=False, **kwargs)

    Create a new logical volume, with option for which physical volume to be used

    CLI Examples:

        salt '*' lvm.lvcreate new_volume_name vg_name size=10G
        salt '*' lvm.lvcreate new_volume_name vg_name extents=100 pv=/dev/sdb
        salt '*' lvm.lvcreate new_snapshot vg_name snapshot=volume_name size=3G

    New in version 0.12.0.

    Support for thin pools and thin volumes

    CLI Examples:

        salt '*' lvm.lvcreate new_thinpool_name vg_name size=20G
        salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G

salt.modules.linux_lvm.lvdisplay(lvname='', quiet=False)

    Return information about the logical volume(s)

    lvname
        logical device name

    quiet
        if the logical volume is not present, do not show any error

    CLI Examples:

        salt '*' lvm.lvdisplay
        salt '*' lvm.lvdisplay /dev/vg_myserver/root

salt.modules.linux_lvm.lvextend(size=None, lvpath=None, extents=None, force=False, resizefs=False)

    Increase a logical volume to specific size.

    CLI Examples:

        salt '*' lvm.lvextend +12M /dev/mapper/vg1-test
        salt '*' lvm.lvextend lvpath=/dev/mapper/vg1-test extents=+100%FREE
salt.modules.linux_lvm.lvremove(lvname, vname, force=True)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```shell
salt '*' lvm.lvremove lvname vname force=True
```

salt.modules.linux_lvm.lvresize(size=None, lvpath=None, extents=None, force=False, resizefs=False)

Resize a logical volume to specific size.

CLI Examples:

```shell
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
salt '*' lvm.lvresize lvpath=/dev/mapper/vg1-test extents=+100%FREE
```

salt.modules.linux_lvm.pvcreate(devices, override=True, force=True, **kwargs)

Set a physical device to be used as an LVM physical volume

override

Skip devices, if they are already LVM physical volumes

CLI Examples:

```shell
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

salt.modules.linux_lvm.pvdisplay(pvname='', real=False, quiet=False)

Return information about the physical volume(s)

pvname

physical device name

real

dereference any symlinks and report the real device

quiet

if the physical volume is not present, do not show any error

New in version 2015.8.7.

CLI Examples:

```shell
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

salt.modules.linux_lvm.pvremove(devices, override=True, force=True)

Remove a physical device being used as an LVM physical volume

override

Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```shell
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

salt.modules.linux_lvm.pvresize(devices, override=True, force=True)

Resize a LVM physical volume to the physical device size

override

Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```shell
salt mymachine lvm.pvresize /dev/sdb1,/dev/sdb2
```
salt.modules.linux_lvm.version()
Return LVM version from lvm version
CLI Example:
```
salt '*' lvm.version
```

salt.modules.linux_lvm.vgcreate(vgname, devices, force=False, **kwargs)
Create an LVM volume group
CLI Examples:
```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

salt.modules.linux_lvm.vgdisplay(vgname='', quiet=False)
Return information about the volume group(s)
```
vname
  volume group name
quiet
  if the volume group is not present, do not show any error
```
CLI Examples:
```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

salt.modules.linux_lvm.vgextend(vgname, devices, force=False)
Add physical volumes to an LVM volume group
CLI Examples:
```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

salt.modules.linux_lvm.vgremove(vgname, force=True)
Remove an LVM volume group
CLI Examples:
```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

26.6.223 salt.modules.linux_service

If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.

salt.modules.linux_service.available(name)
Returns True if the specified service is available, otherwise returns False.
CLI Example:
```
salt '*' service.available ssdh
```
salt.modules.linux_service.get_all()
    Return a list of all available services
    CLI Example:
    ```
salt '*' service.get_all
    ```

salt.modules.linux_service.missing(name)
    The inverse of service.available. Returns True if the specified service is not available, otherwise returns False.
    CLI Example:
    ```
salt '*' service.missing sshd
    ```

salt.modules.linux_service.reload_(name)
    Refreshes config files by calling service reload. Does not perform a full restart.
    CLI Example:
    ```
salt '*' service.reload <service name>
    ```

salt.modules.linux_service.restart(name)
    Restart the specified service
    CLI Example:
    ```
salt '*' service.restart <service name>
    ```

salt.modules.linux_service.run(name, action)
    Run the specified service with an action.
    name  Service name.
    action  Action name (like start, stop, reload, restart).
    CLI Example:
    ```
salt '*' service.run apache2 reload
salt '*' service.run postgresql initdb
    ```

salt.modules.linux_service.start(name)
    Start the specified service
    CLI Example:
    ```
salt '*' service.start <service name>
    ```

salt.modules.linux_service.status(name, sig=None)
    Return the status for a service. If the name contains globbing, a dict mapping service name to PID or empty string is returned.
    Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)
    Parameters
    - name (str) -- The name of the service to check
• **sig**(*str*) -- Signature to use to find the service via ps

**Returns**
- PID if running, empty otherwise
- dict: Maps service name to PID if running, empty string otherwise

**Return type**
- string

**CLI Example:**
```
salt '* service.status <service name> [service signature]
```

**salt.modules.linux_service**.**stop**(*name*)

Stop the specified service

**CLI Example:**
```
salt '*' service.stop <service name>
```

---

### 26.6.224 **salt.modules.linux_shadow**

Manage the shadow file on Linux systems

**Important:** If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *'shadow.info' is not available*), see [here](#).

**salt.modules.linux_shadow**.**default_hash**()

Returns the default hash used for unset passwords

**CLI Example:**
```
salt '*' shadow.default_hash
```

**salt.modules.linux_shadow**.**del_password**(*name, root=None*)

New in version 2014.7.0.

Delete the password from name user

**name**
- User to delete

**root**
- Directory to chroot into

**CLI Example:**
```
salt '*' shadow.del_password username
```

**salt.modules.linux_shadow**.**gen_password**(*password, crypt_salt=None, algorithm='sha512')

New in version 2014.7.0.

Generate hashed password

**Note:** When called this function is called directly via remote-execution, the password argument may be displayed in the system’s process list. This may be a security risk on certain systems.

**password**
- Plaintext password to be hashed.
crypt_salt
Cryptographic salt. If not given, a random 8-character salt will be generated.

algorithm
The following hash algorithms are supported:
• md5
• blowfish (not in mainline glibc, only available in distros that add it)
• sha256
• sha512 (default)

CLI Example:
```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
```

salt.modules.linux_shadow.info(name, root=None)
Return information for the specified user

name
User to get the information for

root
Directory to chroot into

CLI Example:
```
salt '*' shadow.info root
```

salt.modules.linux_shadow.list_users(root=None)
New in version 2018.3.0.
Return a list of all shadow users

root
Directory to chroot into

CLI Example:
```
salt '*' shadow.list_users
```

salt.modules.linux_shadow.lock_password(name, root=None)
New in version 2016.11.0.
Lock the password from specified user

name
User to lock

root
Directory to chroot into

CLI Example:
```
salt '*' shadow.lock_password username
```

salt.modules.linux_shadow.set_date(name, date, root=None)
Sets the value for the date the password was last changed to days since the epoch (January 1, 1970). See man chage.

name
User to modify

date
Date the password was last changed

root
Directory to chroot into
CLI Example:

```shell
salt '*' shadow.set_date username 0
```

```python
salt.modules.linux_shadow.set_expire(name, expire, root=None)
```

Sets the value for the date the account expires as days since the epoch (January 1, 1970). Using a value of -1 will clear expiration. See man chage.

- **name**: User to modify
- **date**: Date the account expires
- **root**: Directory to chroot into

CLI Example:

```shell
salt '*' shadow.set_expire username -1
```

```python
salt.modules.linux_shadow.set_inactdays(name, inactdays, root=None)
```

Set the number of days of inactivity after a password has expired before the account is locked. See man chage.

- **name**: User to modify
- **inactdays**: Set password inactive after this number of days
- **root**: Directory to chroot into

CLI Example:

```shell
salt '*' shadow.set_inactdays username 7
```

```python
salt.modules.linux_shadow.set_maxdays(name, maxdays, root=None)
```

Set the maximum number of days during which a password is valid. See man chage.

- **name**: User to modify
- **maxdays**: Maximum number of days during which a password is valid
- **root**: Directory to chroot into

CLI Example:

```shell
salt '*' shadow.set_maxdays username 90
```

```python
salt.modules.linux_shadow.set_mindays(name, mindays, root=None)
```

Set the minimum number of days between password changes. See man chage.

- **name**: User to modify
- **mindays**: Minimum number of days between password changes
- **root**: Directory to chroot into

CLI Example:
salt.modules.linux_shadow.set_password(name, password, use_usermod=False, root=None)
    Set the password for a named user. The password must be a properly defined hash. A password hash can be generated with gen_password()
    name
        User to set the password
    password
        Password already hashed
    use_usermod
        Use usermod command to better compatibility
    root
        Directory to chroot into
    CLI Example:

    salt '*' shadow.set_password root '$1$UYCIxa628.9qXjpQCjM4a..'

salt.modules.linux_shadow.set_warndays(name, warndays, root=None)
    Set the number of days of warning before a password change is required. See man chage.
    name
        User to modify
    warndays
        Number of days of warning before a password change is required
    root
        Directory to chroot into
    CLI Example:

    salt '*' shadow.set_warndays username 7

salt.modules.linux_shadow.unlock_password(name, root=None)
    New in version 2016.11.0.
    Unlock the password from name user
    name
        User to unlock
    root
        Directory to chroot into
    CLI Example:

    salt '*' shadow.unlock_password username

26.6.225  salt.modules.linux_sysctl

Module for viewing and modifying sysctl parameters
salt.modules.linux_sysctl.assign(name, value)
    Assign a single sysctl parameter for this minion
    CLI Example:

    salt '*' sysctl.assign net.ipv4.ip_forward 1
salt.modules.linux_sysctl.default_config()

Linux hosts using systemd 207 or later ignore /etc/sysctl.conf and only load from /etc/sysctl.d/*.conf. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use /etc/sysctl.d/99-salt.conf.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

salt.modules.linux_sysctl.get(name)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

salt.modules.linux_sysctl.persist(name, value, config=None)

Assign and persist a simple sysctl parameter for this minion. If config is not specified, a sensible default will be chosen using sysctl.default_config.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

salt.modules.linux_sysctl.show(config_file=False)

Return a list of sysctl parameters for this minion

config: Pull the data from the system configuration file instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

26.6.226 salt.modules.localemod

Module for managing locales on POSIX-like systems.

salt.modules.localemod.avail(locale)

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

salt.modules.localemod.gen_locale(locale, **kwargs)

Generate a locale. Options:

New in version 2014.7.0.

Parameters

```
locale -- Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.
```

```
verbose
Show extra warnings about errors that are normally ignored.
```
Salt Documentation, Release 3007.1

CLI Example:

```bash
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8'  # Debian/Gentoo only
```

**salt.modules.localemod.get_locale()**
Get the current system locale

CLI Example:

```bash
salt '*' locale.get_locale
```

**salt.modules.localemod.list_avail()**
Lists available (compiled) locales

CLI Example:

```bash
salt '*' locale.list_avail
```

**salt.modules.localemod.set_locale(locale)**
Sets the current system locale

CLI Example:

```bash
salt '*' locale.set_locale 'en_US.UTF-8'
```

### 26.6.227 salt.modules.locate

Module for using the locate utilities

**salt.modules.locate.locate(pattern, database='', limit=0, **kwargs)**
Performs a file lookup. Valid options (and their defaults) are:

- **basename**=False
- **count**=False
- **existing**=False
- **follow**=True
- **ignore**=False
- **nofollow**=False
- **wholename**=True
- **regex**=False
- **database**=<locate's default database>
- **limit**=<integer, not set by default>

See the manpage for locate(1) for further explanation of these options.

CLI Example:

```bash
salt '*' locate.locate
```

**salt.modules.locate.stats()**
Returns statistics about the locate database

CLI Example:
26.6.228  salt.modules.logadm

Module for managing Solaris logadm based log rotations.

salt.modules.logadm.list_conf(conf_file='/etc/logadm.conf', log_file=None, include_unset=False)

Show parsed configuration

New in version 2018.3.0.

conf_file
  [string] path to logadm.conf, defaults to /etc/logadm.conf

log_file
  [string] optional show only one log file

include_unset
  [boolean] include unset flags in output

CLI Example:

salt '*' logadm.list_conf
salt '*' logadm.list_conf log=/var/log/syslog
salt '*' logadm.list_conf include_unset=False

salt.modules.logadm.remove(name, conf_file='/etc/logadm.conf')

Remove log pattern from logadm

CLI Example:

salt '*' logadm.remove myapplog

salt.modules.logadm.rotate(name, pattern=None, conf_file='/etc/logadm.conf', **kwargs)

Set up pattern for logging.

name
  [string] alias for entryname

pattern
  [string] alias for log_file

conf_file
  [string] optional path to alternative configuration file

kwargs
  [boolean|string|int] optional additional flags and parameters
Note: name and pattern were kept for backwards compatibility reasons.

name is an alias for the entryname argument, pattern is an alias for log_file. These aliases will only be used if the entryname and log_file arguments are not passed.

For a full list of arguments see `logadm.show_args`.

CLI Example:

```bash
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
salt '*' logadm.rotate myapplog log_file='/var/log/myapp/*.log' count=4
``` 

```bash
owner=myappd mode='0700'
```

salt.modules.logadm.show_args()

Show which arguments map to which flags and options.

New in version 2018.3.0.

CLI Example:

```bash
salt '*' logadm.show_args
```

salt.modules.logadm.show_conf(conf_file='/etc/logadm.conf', name=None)

Show configuration

- `conf_file` [string] path to logadm.conf, defaults to /etc/logadm.conf
- `name` [string] optional show only a single entry

CLI Example:

```bash
salt '*' logadm.show_conf
salt '*' logadm.show_conf name=/var/log/syslog
``` 

### 26.6.229 salt.modules.logmod

**On-demand logging**

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```yaml
{% for var in range(10) %}
  {% do salt["log.info"](var) -%}
{% endfor %}
```

CLI Example:

```bash
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

salt.modules.logmod.critical(message)

Log message at level CRITICAL.
salt.modules.logmod.debug(message)
    Log message at level DEBUG.
salt.modules.logmod.error(message)
    Log message at level ERROR.
salt.modules.logmod.exception(message)
    Log message at level EXCEPTION.
salt.modules.logmod.info(message)
    Log message at level INFO.
salt.modules.logmod.warning(message)
    Log message at level WARNING.

26.6.230 salt.modules.logrotate

Module for managing logrotate.
salt.modules.logrotate.get(key, value=None, conf_file='/etc/logrotate.conf')
    Get the value for a specific configuration line.
    Parameters
    • key (str) -- The command or stanza block to configure.
    • value (str) -- The command value or command of the block specified by the key parameter.
    • conf_file (str) -- The logrotate configuration file.
    Returns
    The value for a specific configuration line.
    Return type
    bool|int|str
    CLI Example:
    salt '*' logrotate.get rotate
    salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf

salt.modules.logrotate.set_(key, value, setting=None, conf_file='/etc/logrotate.conf')
    Set a new value for a specific configuration line.
    Parameters
    • key (str) -- The command or block to configure.
    • value (str) -- The command value or command of the block specified by the key parameter.
    • setting (str) -- The command value for the command specified by the value parameter.
    • conf_file (str) -- The logrotate configuration file.
    Returns
    A boolean representing whether all changes succeeded.
    Return type
    bool
    CLI Example:
Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

```
salt.modules.logrotate.show_conf(conf_file='/etc/logrotate.conf')
```

Show parsed configuration

Parameters
- `conf_file (str)` -- The logrotate configuration file.

Returns
- The parsed configuration.

Return type
- dict

CLI Example:

```
salt '*' logrotate.show_conf
```

## 26.6.231 salt.modules.lvs

Support for LVS (Linux Virtual Server)

```
salt.modules.lvs.add_server(protocol=None, service_address=None, server_address=None, packet_forward_method='dr', weight=1, **kwargs)
```

Add a real server to a virtual service.

- `protocol` -- The service protocol(only support tcp, udp and fwmark service).
- `service_address` -- The LVS service address.
- `server_address` -- The real server address.
- `packet_forward_method` -- The LVS packet forwarding method(dr for direct routing, tunnel for tunneling, nat for network access translation).
- `weight` -- The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```
salt.modules.lvs.add_service(protocol=None, service_address=None, scheduler='wlc')

Add a virtual service.

- **protocol**
  The service protocol (only support tcp, udp and fwmark service).

- **service_address**
  The LVS service address.

- **scheduler**
  Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.80 rr
```

salt.modules.lvs.check_server(protocol=None, service_address=None, server_address=None, **kwargs)

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.80 192.168.0.11:8080
```

salt.modules.lvs.check_service(protocol=None, service_address=None, **kwargs)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.80
```

salt.modules.lvs.clear()

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

salt.modules.lvs.delete_server(protocol=None, service_address=None, server_address=None)

Delete the real server from the virtual service.

- **protocol**
  The service protocol (only support tcp, udp and fwmark service).

- **service_address**
  The LVS service address.

- **server_address**
  The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.80 192.168.0.11:8080
```

salt.modules.lvs.delete_service(protocol=None, service_address=None)

Delete the virtual service.

- **protocol**
  The service protocol (only support tcp, udp and fwmark service).

- **service_address**
  The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.80
```
salt.modules.lvs.edit_server(\n    protocol=None, \n    service_address=None, \n    server_address=None, \n    packet_forward_method=None, \n    weight=None, \n    **kwargs\n)\n
Edit a real server to a virtual service.\n
- **protocol**: The service protocol (only support tcp, udp and fwmark service).\n- **service_address**: The LVS service address.\n- **server_address**: The real server address.\n- **packet_forward_method**: The LVS packet forwarding method (dr for direct routing, tunnel for tunneling, nat for network access translation).\n- **weight**: The capacity of a server relative to the others in the pool.\n
CLI Example:
```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.edit_service(\n    protocol=None, \n    service_address=None, \n    scheduler=None\n)\n
Edit the virtual service.\n
- **protocol**: The service protocol (only support tcp, udp and fwmark service).\n- **service_address**: The LVS service address.\n- **scheduler**: Algorithm for allocating TCP connections and UDP datagrams to real servers.\n
CLI Example:
```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.get_rules()\n
Get the virtual server rules\n
CLI Example:
```
salt '*' lvs.get_rules
```

salt.modules.lvs.list_(\n    protocol=None, \n    service_address=None\n)\n
List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.\n
CLI Example:
```
salt '*' lvs.list
```

salt.modules.lvs.zero(\n    protocol=None, \n    service_address=None\n)\n
Zero the packet, byte and rate counters in a service or all services.\n
CLI Example:
```
salt '*' lvs.zero
```
26.6.232  salt.modules.lxc

Control Linux Containers via Salt

```python
depends
  lxc package for distribution
lxc >= 1.0 (even beta alpha) is required
```

```python
salt.modules.lxc.add_veth(name, interface_name, bridge=None, path=None)
```

Add a veth to a container. Note: this function doesn't update the container config, just add the interface at runtime

```python
name
  Name of the container
interface_name
  Name of the interface in the container
bridge
  Name of the bridge to attach the interface to (facultative)
```

CLI Examples:

```bash
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

```python
salt.modules.lxc.apply_network_profile(name, network_profile, nic_opts=None, path=None)
```

New in version 2015.5.0.

Apply a network profile to a container

```python
network_profile
  profile name or default values (dict)
nic_opts
  values to override in defaults (dict) indexed by nic card names
path
  path to the container parent
```

New in version 2015.8.0.

CLI Examples:

```bash
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
  nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
salt 'minion' lxc.apply_network_profile web1 \n  "{'eth0': {'mac': 'xx:xx:xx:xx:xx:yy'}}"

salt 'minion' lxc.apply_network_profile web1 \n  "{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
```

The special case to disable use of ethernet nics:

```bash
salt 'minion' lxc.apply_network_profile web1 centos \n  "{eth0: {disable: true}}"
```

```python
salt.modules.lxc.attachable(name, path=None)
```

Return True if the named container can be attached to via the lxc-attach command

```python
path
  path to the container parent default: /var/lib/lxc (system default)
```

New in version 2015.8.0.

CLI Example:
salt 'minion' lxc.attachable ubuntu

salt.modules.lxc.bootstrap(name, config=None, approve_key=True, install=True, pub_key=None, priv_key=None, bootstrap_url=None, force_install=False, unconditional_install=False, path=None, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None)

Install and configure salt in a container.

config
Minion configuration options. By default, the master option is set to the target host's master.

approve_key
Request a pre-approval of the generated minion key. Requires that the salt-master be configured to
either auto-accept all keys or expect a signing request from the target host. Default: True

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

pub_key
Explicit public key to pressed the minion with (optional). This can be either a filepath or a string represen-
ting the key

priv_key
Explicit private key to pressed the minion with (optional). This can be either a filepath or a string represen-
ting the key

bootstrap_delay
Delay in seconds between end of container creation and bootstrapping. Useful when waiting for con-
tainer to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url
url, content or filepath to the salt bootstrap script

bootstrap_args
salt bootstrap script arguments

bootstrap_shell
shell to execute the script into

install
Whether to attempt a full installation of salt-minion if needed.

force_install
Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if
a salt minion is already present in the container

unconditional_install
Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \[
    [approve_key=(True|False)] [install=(True|False)]
```

salt.modules.lxc.clone(name, orig, profile=None, network_profile=None, nic_opts=None, **kwargs)

Create a new container as a clone of another container

name
Name of the container

orig
Name of the original container to be cloned

profile
Profile to use in container cloning (see lxc.get_container_profile). Values in a profile will be
overridden by the Container Cloning Arguments listed below.
path
    path to the container parent directory default: /var/lib/lxc (system)

    New in version 2015.8.0.

Container Cloning Arguments
snapshot
    Use Copy On Write snapshots (LVM)

size
    [1G] Size of the volume to create. Only applicable if backing=lvm.

backing
    The type of storage to use. Set to lvm to use an LVM group. Defaults to filesystem within /var/lib/lxc.

network_profile
    Network profile to use for container

    New in version 2015.8.0.

nic_opts
    give extra opts overriding network profile values

    New in version 2015.8.0.

CLI Examples:

salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True

salt.modules.lxc.cloud_init(name, vm_=None, **kwargs)

    Thin wrapper to lxc.init to be used from the saltcloud lxc driver

name
    Name of the container may be None and then guessed from saltcloud mapping

vm_
    saltcloud mapping defaults for the vm

CLI Example:

salt '*' lxc.cloud_init foo

salt.modules.lxc.cloud_init_interface(name, vm_=None, **kwargs)

    Interface between salt.cloud.lxc driver and lxc.init vm_ is a mapping of vm opts in the salt.cloud format as documented for the lxc driver.

    This can be used either:
    • from the salt cloud driver
    • because you find the argument to give easier here than using directly lxc.init

    Warning: BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

name
    name of the lxc container to create

pub_key
    public key to preseed the minion with. Can be the keycontent or a filepath

priv_key
    private key to preseed the minion with. Can be the keycontent or a filepath

path
    path to the container parent directory (default: /var/lib/lxc)

    New in version 2015.8.0.
profile

profile selection

network_profile

network profile selection

nic_opts

per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:

```python
- {'eth0': {'mac': '00:16:3e:01:29:40', 'gateway': None, (default) 'link': 'br0', (default) 'gateway': None, (default) 'netmask': '', (default) 'ip': '22.1.4.25'}}
```

unconditional_install

given to lxc.bootstrap (see relative doc)

force_install

given to lxc.bootstrap (see relative doc)

config

any extra argument for the salt minion config

dnsservers

list of DNS servers to set inside the container

dns_via_dhcp

do not set the dns servers, let them be set by the dhcp.

autostart

autostart the container at boot time

password

administrative password for the container

bootstrap_delay

delay before launching bootstrap script at Container init

---

Warning: Legacy but still supported options:

from_container

which container we use as a template when running lxc.clone

image

which template do we use when we are using lxc.create. This is the default mode unless you specify something in from_container

backing

which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, btrfs

fstype

When using a blockdevice level backing store, which filesystem to use on

size

When using a blockdevice level backing store, which size for the filesystem to use on

snapshot

Use snapshot when cloning the container source

vgname

if using LVM: vgname
lvname
  if using LVM: lvname
thinpool:
  if using LVM: thinpool
ip
  ip for the primary nic
mac
  mac address for the primary nic
netmask
  netmask for the primary nic (24) = vm_.get('netmask', '24')
bridge
  bridge for the primary nic (lxcbr0)
gateway
  network gateway for the container
additional_ips
  additional ips which will be wired on the main bridge (br0) which is connected to internet. Be aware that you may use manual virtual mac addresses providen by you provider (online, ovh, etc). This is a list of mappings {ip: '', mac: '', netmask:''} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:

- { 'mac': '00:16:3e:01:29:40',
  'gateway': None, (default)
  'link': 'br0', (default)
  'netmask': '', (default)
  'ip': '22.1.4.25'}

users
  administrative users for the container default: [root] and [root, ubuntu] on ubuntu
default_nic
  name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

salt.modules.lxc.copy_to(name, source, dest, overwrite=False, makedirs=False, path=None)

Changed in version 2015.8.0: Function renamed from lxc.cp to lxc.copy_to for consistency with other container types. lxc.cp will continue to work, however. For versions 2015.2.x and earlier, use lxc.cp.

Copy a file or directory from the host into a container

name
  Container name
source
  File to be copied to the container
path
  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

dest
  Destination on the container. Must be an absolute path.
Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

**overwrite**

[False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

New in version 2015.8.0.

**makedirs** : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

**salt.modules.lxc.cp**(name, source, dest, overwrite=False, makedirs=False, path=None)

This function is an alias of copy_to.

Changed in version 2015.8.0: Function renamed from lxc.cp to lxc.copy_to for consistency with other container types. lxc.cp will continue to work, however. For versions 2015.2.x and earlier, use lxc.cp.

Copy a file or directory from the host into a container

**name**

Container name

**source**

File to be copied to the container

**path**

path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**dest**

Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

**overwrite**

[False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.

New in version 2015.8.0.

**makedirs** : False

Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

**salt.modules.lxc.create**(name, config=None, profile=None, network_profile=None, nic_opts=None, **kwargs)

Create a new container.

**name**

Name of the container

**config**

The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).
profile
Profile to use in container creation (see `lxc.get_container_profile`). Values in a profile will be overridden by the Container Creation Arguments listed below.

network_profile
Network profile to use for container

New in version 2015.5.0.

**Container Creation Arguments**

**template**
The template to use. For example, *ubuntu* or *fedora*. For a full list of available templates, check out the `lxc.templates` function.

Conflicts with the `image` argument.

---

**Note:** The `download` template requires the following three parameters to be defined in `options`:

- `dist` - The name of the distribution
- `release` - Release name/version
- `arch` - Architecture of the container

The available images can be listed using the `lxc.images` function.

---

**options**
Template-specific options to pass to the `lxc-create` command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options='{"dist": "centos", "release": "6", "arch": "amd64"}'
```

For available template options, refer to the lxc template scripts which are usually located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

**image**
A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

**backing**
The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within `/var/lib/lxc`.

**fstype**
Filesystem type to use on LVM logical volume

**size**
`[1G]` Size of the volume to create. Only applicable if `backing=lvm`.

**vgname**
`[lxc]` Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

**lvname**
Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

**thinpool**
Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

**nic_opts**
give extra opts overriding network profile values

**path**
parent path for the container creation (default: `/var/lib/lxc`)

**zfsroot**
Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: `tank/lxc`)

New in version 2015.8.0.

**salt.modules.lxc.destroy**(name, stop=False, path=None)
Destroy the named container.

**Warning:** Destroys all data associated with the container.

### path
path to the container parent directory (default: /var/lib/lxc)
New in version 2015.8.0.

### stop
[False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to False. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

### CLI Examples:
```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

**salt.modules.lxc.edit_conf**(*conf_file*, *out_format='simple', read_only=False, *lxc_config=None, **kwargs*)
Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

#### out_format:
Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

#### read_only:
return only the edited configuration without applying it to the underlying lxc configuration file

#### lxc_config:
List of dict containing lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatches, be aware of that!

After the file is edited, its contents will be returned. By default, it will be returned in simple format, meaning an unordered dict (which may not represent the actual file order). Passing in an out_format of commented will return a data structure which accurately represents the order and content of the file.

### CLI Example:
```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \   out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \   out_format=commented \   lxc_config="[{'lxc.network.name': 'eth0', \     'lxc.network.ipv4': '1.2.3.4'}, \   {'lxc.network.name': 'eth2', \     'lxc.network.ipv4': '1.2.3.5',\   'lxc.network.gateway': '1.2.3.1']"
```

**salt.modules.lxc.exists**(name, path=``None``)
Returns whether the named container exists.

### path
path to the container parent directory (default: /var/lib/lxc)
New in version 2015.8.0.
CLI Example:

```
salt '*' lxc.exists name
```

salt.modules.lxc.freeze(name, **kwargs)

Freeze the named container

- **path**: path to the container parent directory default: /var/lib/lxc (system)
  
  New in version 2015.8.0.

- **start**: [False] If True and the container is stopped, the container will be started before attempting to freeze.
  
  New in version 2015.5.0.

- **use_vt**: run the command through VT
  
  New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

salt.modules.lxc.get_container_profile(name=None, **kwargs)

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.container_profile`. profile_name. An example container profile would be as follows:

```
**lxc.container_profile:**

- **ubuntu**:
  
  - **template**: ubuntu
  
  - **backing**: lvm
  
  - **vgname**: lxc
  
  - **size**: 1G

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to `lxc.create`) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the LXC Tutorial for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu&
  backing=overlayfs
```

salt.modules.lxc.get_network_profile(name=None, **kwargs)

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:
Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using `config.get`. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
  eth0:
    link: br0
    type: veth
    flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the [LXC Tutorial](#) for more information on how to use network profiles.

**Warning:** The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.).

CLI Example:

```
salt-call lxc.get_network_profile default
```

```python
salt.modules.lxc.get_parameter(name, parameter, path=None)
```

Returns the value of a cgroup parameter for a container

```
path to the container parent directory default: /var/lib/lxc (system)
```

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

```python
salt.modules.lxc.get_pid(name, path=None)
```

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

```python
salt.modules.lxc.get_root_path(path)
```

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:
salt '*/' lxc.get_root_path

salt.modules.lxc.images(dist=None)

New in version 2015.5.0.

List the available images for LXC's download template.

dist

[None] Filter results to a single Linux distribution

CLI Examples:

salt myminion lxc.images
salt myminion lxc.images dist=centos

salt.modules.lxc.info(name, path=None)

Returns information about a container

path

path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

salt '*/' lxc.info name

salt.modules.lxc.init(name, config=None, cpuset=None, cpus=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, cpu=None, autostart=True, password=None, password_encrypted=None, users=None, dnservers=None, searchdomains=None, bridge=None, gateway=None, pub_key=None, priv_key=None, force_install=False, unconditional_install=False, bootstrap_delay=None, bootstrap_args=None, bootstrap_shell=None, bootstrap_url=None, **kwargs)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

name

Name of the container

image

A tar archive to use as the rootfs for the container. Conflicts with the template argument.

cpus

Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset

Explicitly define the cpus this container will be bound to

cpushare

cgroups cpu shares

autostart

autostart container on reboot

memory

cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass memory=0 to set no limit.

gateway

the ipv4 gateway to use the default does nothing more than lxcutils does
bridge
the bridge to use the default does nothing more than lxcutils does

network_profile
Network profile to use for the container
New in version 2015.5.0.

nic_opts
Extra options for network interfaces, will override
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
or
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}

users
Users for which the password defined in the password param should be set. Can be passed as a comma separated list or a python list. Defaults to just the root user.

password
Set the initial password for the users defined in the users parameter

password_encrypted
[False] Set to True to denote a password hash instead of a plaintext password
New in version 2015.5.0.

profile
A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

start
Start the newly-created container

dnsservers
list of dns servers to set in the container, default [] (no setting)

seed
Seed the container with the minion config. Default: True

install
If salt-minion is not already installed, install it. Default: True

cfg
Optional config parameters. By default, the id is set to the name of the container.

master
salt master (default to minion's master)

master_port
salt master port (default to minion's master port)

pub_key
Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key

priv_key
Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key

approve_key
If explicit preseeding is not used; Attempt to request key approval from the master. Default: True

path
path to the container parent directory default: /var/lib/lxc (system)
New in version 2015.8.0.

clone_from
Original from which to use a clone operation to create the container. Default: None

bootstrap_delay
Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

**bootstrap_url**
See lxc.bootstrap

**bootstrap_shell**
See lxc.bootstrap

**bootstrap_args**
See lxc.bootstrap

**force_install**
Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

**unconditional_install**
Run the script even if the container seems seeded

CLI Example:
```
salt '*' lxc.init name [cpuset=cgroups_cpuset] \ 
 [cpushare=cgroups_cpushare] [memory=cgroups_memory] \ 
 [nic=cnic_profile] [profile=lxc_profile] \ 
 [nic_opts=nic_opts] [start=(True|False)] \ 
 [seed=(True|False)] [install=(True|False)] \ 
 [config=minion_config] [approve_key=(True|False)] \ 
 [clone_from=original] [autostart=True] \ 
 [priv_key=/path_or_content] [pub_key=/path_or_content] \ 
 [bridge=lxcbr0] [gateway=10.0.3.1] \ 
 [dnsservers=dns1,dns2] \ 
 [users=[foo]] [password='secret'] \ 
 [password_encrypted=(True|False)]
```

salt.modules.lxc.list_(extra=False, limit=None, path=None)
List containers classified by state

extra
Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from lxc.info.

path
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

limit
Return output matching a specific state (frozen, running, or stopped).

New in version 2015.5.0.

CLI Examples:
```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

salt.modules.lxc.ls_(active=None, cache=True, path=None)
Return a list of the containers available on the minion

path
path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.
active
If True, return only active (i.e. running) containers
New in version 2015.5.0.
CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

`salt.modules.lxc.read_conf` *(conf_file, out_format='simple')*
Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

Out_format:
set to 'simple' if you need the old and unsupported behavior. This won’t support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

`salt.modules.lxc.reboot` *(name, path=None)*
Reboot a container.

Path
path to the container parent default: /var/lib/lxc (system default)
New in version 2015.8.0.
CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

`salt.modules.lxc.reconfigure` *(name, cpu=None, cpuset=None, cpushare=None, memory=None, profile=None, network_profile=None, nic_opts=None, bridge=None, gateway=None, autostart=None, utsname=None, rootfs=None, path=None, **kwargs)*
Reconfigure a container.
This only applies to a few property

Name of the container.

Utsname
utsname of the container.
New in version 2016.3.0.

Rootfs
rootfs of the container.
New in version 2016.3.0.

Cpu
Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

Cpuset
Explicitly define the cpus this container will be bound to

Cpushare
cgroups cpu shares.

Autostart
autostart container on reboot
memory

Cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

gateway

The IPv4 gateway to use the default does nothing more than lxcutils does

bridge

The bridge to use the default does nothing more than lxcutils does

nic

Network interfaces profile (defined in config or pillar).

nic_opts

Extra options for network interfaces, will override

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6": "2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1/24", "ipv6": "2001:db8::ff00:42:8329"}}
```

path

Path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{'eth1': {'mac': '00:16:3e:dd:ee:44'}}" memory=4
```

salt.modules.lxc.remove(name, stop=False, path=None)

This function is an alias of destroy.

Destroy the named container.

**Warning:** Destroys all data associated with the container.

path

Path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

stop

[False] If True, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to False. This more closely matches the behavior of lxc-destroy(1), and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

salt.modules.lxc.restart(name, path=None, lxc_config=None, force=False)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

name

The name of the container

path

Path to the container parent directory default: /var/lib/lxc (system)
New in version 2015.8.0.

**lxc_config**
path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

**force**
[False] If True, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

**salt.modules.lxc.retcod**e**(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True,**
```
output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False,**
```
chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.5.0.

Run `cmd.retcode` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using `lxc.run_stderr` or `lxc.run_all`.

**name**
Name of the container in which to run the command

**cmd**
Command to run

**no_start**
[False] If the container is not running, don't start it

**preserve_state**
[True] After running the command, return the container to its previous state

**path**
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

**stdin**
[None] Standard input to be used for the command

**output_loglevel**
[debug] Level at which to log the output from the command. Set to quiet to suppress logging.

**use_vt**
[False] Use SaltStack's utils.vt to stream output to console output=all.

**keep_env**
[http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

**chroot_fallback**
if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.retcodemycontainer 'ip addr show'
```

**salt.modules.lxc.run****(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True,**
```
output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False,**
```
chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

26.6. execution modules
New in version 2015.8.0.

Run `cmd.run` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using `lxc.run_stderr` or `lxc.run_all`.

---

**name**
Name of the container in which to run the command

**cmd**
Command to run

**path**
path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

**no_start**
[False] If the container is not running, don't start it

**preserve_state**
[True] After running the command, return the container to its previous state

**stdin**
[None] Standard input to be used for the command

**output_loglevel**
[debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

**use_vt**
[False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

**chroot_fallback**
if the container is not running, try to run the command using chroot default: false

**keep_env**
[http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

---

**CLI Example:**
```
salt myminion lxc.run mycontainer 'ip addr show'
```

```
salt.modules.lxc.run_all(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')
```

New in version 2015.5.0.

Run `cmd.run_all` within a container

**Note:** While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```
The same error will be displayed in stderr if the command being run does not exist.

name
Name of the container in which to run the command

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

cmd
Command to run

no_start
[False] If the container is not running, don't start it

preserve_state
[True] After running the command, return the container to its previous state

stdin
[None] Standard input to be used for the command

output_loglevel
[debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
[False] Use SaltStack's utils.vt to stream output to console output=all.

keep_env
[http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback
if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

salt.modules.lxc.run_stderr(name, cmd, no_start=False, preserve_state=True, stdin=None, python_shell=True, output_loglevel='debug', use_vt=False, path=None, ignore_retcode=False, chroot_fallback=False, keep_env='http_proxy,https_proxy,no_proxy')

New in version 2015.5.0.

Run `cmd.run_stderr` within a container

**Warning:** Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

name
Name of the container in which to run the command

cmd
Command to run

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start
[False] If the container is not running, don't start it
preserve_state
  [True] After running the command, return the container to its previous state

stdin
  [None] Standard input to be used for the command

output_loglevel
  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
  [False] Use SaltStack's utils.vt to stream output to console output=all.

keep_env
  [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.

chroot_fallback
  if the container is not running, try to run the command using chroot default: false

CLI Example:
salt myminion lxc.run_stderr mycontainer 'ip addr show'

New in version 2015.5.0.

Run cmd.run_stdout within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using lxc.run_stderr or lxc.run_all.

name
  Name of the container in which to run the command

cmd
  Command to run

path
  path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start
  [False] If the container is not running, don't start it

preserve_state
  [True] After running the command, return the container to its previous state

stdin
  [None] Standard input to be used for the command

output_loglevel
  [debug] Level at which to log the output from the command. Set to quiet to suppress logging.

use_vt
  [False] Use SaltStack's utils.vt to stream output to console output=all.

keep_env
  [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as comma-delimited list.
chroot_fallback
if the container is not running, try to run the command using chroot default: false

CLI Example:
```
salt myminion lxc.run_stdout mycontainer 'ip addr show'
```

c. lxc.running_systemd(name, cache=True, path=None)
Determine if systemD is running

```
path
path to the container parent
```

New in version 2015.8.0.

CLI Example:
```
salt '* lxc.running_systemd ubuntu
```

c. lxc.search_lxc_bridge()
Search the first bridge which is potentially available as LXC bridge

CLI Example:
```
salt '* lxc.search_lxc_bridge
```

c. lxc.search_lxc_bridges()
Search which bridges are potentially available as LXC bridges

CLI Example:
```
salt '* lxc.search_lxc_bridges
```

c. lxc.set_dns(name, dnsservers=None, searchdomains=None, path=None)
Changed in version 2015.5.0: The dnsservers and searchdomains parameters can now be passed as a comma-separated list.

Update /etc/resolv.conf

```
path
path to the container parent default: /var/lib/lxc (system default)
```

New in version 2015.8.0.

CLI Example:
```
salt myminion lxc.set_dns ubuntu "["8.8.8.8", "4.4.4.4"]"
```

c. lxc.set_parameter(name, parameter, value, path=None)
Set the value of a cgroup parameter for a container.

```
path
path to the container parent directory default: /var/lib/lxc (system)
```

New in version 2015.8.0.

CLI Example:
```
salt '* lxc.set_parameter name parameter value
```

c. lxc.set_pass(name, users, password, encrypted=True, path=None)
This function is an alias of set_password.
Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

```
users
Comma-separated list (or python list) of users to change password
```

```
password
Password to set for the specified user(s)
```

```
encrypted
[True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).
```

New in version 2015.5.0.

```
path
path to the container parent directory default: /var/lib/lxc (system)
```

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '"6$uJ2uAyLUSKoI67t8As/
    X0FxtJOPcHKGXmUpcoYucVR2K6x93wanShTCQvjRwq25yiKiCBQgfdKQSFnAo28/
    ek6716vEV1' 'salt '*' lxc.set_pass container-name root foo encrypted=False
```

```
salt.modules.lxc.set_password(name, users, password, encrypted=True, path=None)
```

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

```
users
Comma-separated list (or python list) of users to change password
```

```
password
Password to set for the specified user(s)
```

```
encrypted
[True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).
```

New in version 2015.5.0.

```
path
path to the container parent directory default: /var/lib/lxc (system)
```

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '"6$uJ2uAyLUSKoI67t8As/
    X0FxtJOPcHKGXmUpcoYucVR2K6x93wanShTCQvjRwq25yiKiCBQgfdKQSFnAo28/
    ek6716vEV1' 
```

```
salt '*' lxc.set_pass container-name root foo encrypted=False
```

```
salt.modules.lxc.start(name, **kwargs)
```

Start the named container

```
path
path to the container parent directory default: /var/lib/lxc (system)
```

New in version 2015.8.0.
lxc_config
   path to a lxc config file config file will be guessed from container name otherwise
   New in version 2015.8.0.

use_vt
   run the command through VT
   New in version 2015.8.0.

CLI Example:
```
salt myminion lxc.start name
```

salt.modules.lxc.state(name, path=None)
Returns the state of a container.

path
   path to the container parent directory (default: /var/lib/lxc)
   New in version 2015.8.0.

CLI Example:
```
salt 'lxc.state' name
```

salt.modules.lxc.stop(name, kill=False, path=None, use_vt=None)
Stop the named container

path
   path to the container parent directory default: /var/lib/lxc (system)
   New in version 2015.8.0.

kill: False
   Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop con-
tainers like this irrespective of this argument.

   Changed in version 2015.5.0: Default value changed to False

use_vt
   run the command through VT
   New in version 2015.8.0.

CLI Example:
```
salt myminion lxc.stop name
```

salt.modules.lxc.systemd_running_state(name, path=None)
Get the operational state of a systemd based container

path
   path to the container parent default: /var/lib/lxc (system default)
   New in version 2015.8.0.

CLI Example:
```
salt myminion lxc.systemd_running_state ubuntu
```

salt.modules.lxc.templates()
New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:
salt myminion lxc.templates

salt.modules.lxc.test_bare_started_state(name, path=None)
    Test if a non systemd container is fully started
    For now, it consists only to test if the container is attachable
    path
        path to the container parent default: /var/lib/lxc (system default)
    New in version 2015.8.0.
    CLI Example:
    ```
salt myminion lxc.test_bare_started_state ubuntu
    ```

salt.modules.lxc.test_sd_started_state(name, path=None)
    Test if a systemd container is fully started
    path
        path to the container parent default: /var/lib/lxc (system default)
    New in version 2015.8.0.
    CLI Example:
    ```
salt myminion lxc.test_sd_started_state ubuntu
    ```

salt.modules.lxc.unfreeze(name, path=None, use_vt=None)
    Unfreeze the named container.
    path
        path to the container parent directory default: /var/lib/lxc (system)
    New in version 2015.8.0.
    use_vt
        run the command through VT
    New in version 2015.8.0.
    CLI Example:
    ```
salt '*!' lxc.unfreeze name
    ```

salt.modules.lxc.update_lxc_conf(name, lxc_conf, lxc_conf_unset, path=None)
    Edit LXC configuration options
    path
        path to the container parent default: /var/lib/lxc (system default)
    New in version 2015.8.0.
    CLI Example:
    ```
salt myminion lxc.update_lxc_conf ubuntu \
    lxc_conf="[{'network.ipv4.ip':'10.0.3.5'}]" \
    lxc_conf_unset="['lxc.utsname']"
    ```

salt.modules.lxc.version()
    Return the actual lxc client version
    New in version 2015.8.0.
    CLI Example:
    ```
salt '*!' lxc.version
    ```
salt.modules.lxc.wait_started(name, path=None, timeout=300)

Check that the system has fully inited
This is actually very important for systemd based containers

see https://github.com/saltstack/salt/issues/23847

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:
salt myminion lxc.wait_started ubuntu

salt.modules.lxc.write_conf(conf_file, conf)

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from lxc.read_conf(), with out_format set to commented.

An example might look like:

```
[
    {'lxc.utsname': '$CONTAINER_NAME'},
    '# This is a commented line
    
    {'lxc.mount': '$CONTAINER_FSTAB'},
    {'lxc.rootfs': {'comment': 'This is another test', 'value': 'This is another test'}},
    
    {'lxc.network.type': 'veth'},
    {'lxc.network.flags': 'up'},
    {'lxc.network.link': 'br0'},
    {'lxc.network.mac': '$CONTAINER_MACADDR'},
    {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
    {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
out_format=commented

26.6.233 salt.modules.lxd

Module for managing the LXD daemon and its containers.

New in version 2019.2.0.

LXD(1) is a container "hypervisor". This execution module provides several functions to help manage it and its containers.

Note:

- pylxd(2) version >=2.2.5 is required to let this work, currently only available via pip.
To install on Ubuntu:

```
$ apt-get install libssl-dev python-pip $ pip install -U pylxd
```

- you need lxd installed on the minion for the init() and version() methods.
- for the config_get() and config_get() methods you need to have lxd-client installed.

```
maintainer
René Jochum <rene@jochums.at>
maturity
new
depends
python-pylxd
platform
Linux
```

**salt.modules.lxd.authenticate** *(remote_addr, password, cert, key, verify_cert=True)*

Authenticate with a remote LXDaemon.

- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: `https://myserver.lan:8443`
- **password**: The password of the remote.
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: `~/.config/lxc/client.crt`
- **key**: PEM Formatted SSL Key.
  - **Examples**: `~/.config/lxc/client.key`
- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false
```

See the requests-docs for the SSL stuff.

**salt.modules.lxd.config_get**(key)

Get an LXD daemon config option

- **key**: The key of the config value to retrieve

CLI Examples:

```
salt '*' lxd.config_get core.https_address
```

**salt.modules.lxd.config_set**(key, value)

Set an LXD daemon config option
CLI Examples:

To listen on IPv4 and IPv6 port 8443, you can omit the :8443 its the default:
```
salt '*' lxd.config_set core.https_address [::]:8443
```

To set the server trust password:
```
salt '*' lxd.config_set core.trust_password blah
```

```python
salt.modules.lxd.container_config_delete(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Delete a container config value
- **name**: Name of the container
- **config_key**: The config key to delete
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**:
    ```
    https://myserver.lan:8443 /var/lib/mysocket.sock
    ```
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**:
    ```
    ~/.config/lxc/client.crt
    ```
- **key**: PEM Formatted SSL Key.
  - **Examples**:
    ```
    ~/.config/lxc/client.key
    ```
- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

```python
salt.modules.lxd.container_config_get(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
```

Get a container config value
- **name**: Name of the container
- **config_key**: The config key to retrieve
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**:
    ```
    https://myserver.lan:8443 /var/lib/mysocket.sock
    ```
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**:
    ```
    ~/.config/lxc/client.crt
    ```
- **key**: PEM Formatted SSL Key.
  - **Examples**:
    ```
    ~/.config/lxc/client.key
    ```
verify_cert

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
LXD normally uses self-signed certificates.

**salt.modules.lxd.container_config_set**

```
salt.modules.lxd.container_config_set(name, config_key, config_value, remote_addr=None,
cert=None, key=None, verify_cert=True)
```

Set a container config value

**name** :
Name of the container

**config_key** :
The config key to set

**config_value** :
The config value to set

**remote_addr** :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

**key** :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
LXD normally uses self-signed certificates.

**salt.modules.lxd.container_create**

```
salt.modules.lxd.container_create(name, source, profiles=None, config=None, devices=None,
architecture='x86_64', ephemeral=False, wait=True,
remote_addr=None, cert=None, key=None, verify_cert=True,
__raw=False)
```

Create a container

**name** :
The name of the container

**source** :
Can be either a string containing an image alias:
"xenial/amd64"
or an dict with type "image" with alias:

{"type": "image",
 "alias": "xenial/amd64"}
or image with "fingerprint":

{"type": "image",
 "fingerprint": "SHA-256"}
or image with "properties":

{"type": "image",
 "properties": {
 "os": "ubuntu", "release": "14.04", "architecture": "x86_64"]}
or none:

{"type": "none"}
profiles
[[['default']]] List of profiles to apply on this container

cfg
A config dict or None (None = unset).
Can also be a list:

[[{'key': 'boot.autostart', 'value': 1},
   {'key': 'security.privileged', 'value': '1'}]]

devices
A device dict or None (None = unset).

architecture
['x86_64']
Can be one of the following:

- unknown
- i686
- x86_64
- armv7l
- aarch64
- ppc
- ppc64
- ppc64le
- s390x

ephemeral
[False] Destroy this container after stop?

remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert:
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key:
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_raw
[False] Return the raw pyxld object or a dict?
CLI Examples:
salt '*' lxd.container_create test xenial/amd64

See also the rest-api-docs.
salt.modules.lxd.container_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a container

name:
  Name of the container to delete
remote_addr:
  An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples:
  https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
  PEM Formatted SSL Certificate.
  Examples:
  ~/.config/lxc/client.crt
key:
  PEM Formatted SSL Key.
  Examples:
  ~/.config/lxc/client.key
verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_add(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)

Add a container device

name:
  Name of the container
device_name:
  The device name to add
device_type:
  Type of the device
**kwargs:
  Additional device args
remote_addr:
  An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples:
  https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
  PEM Formatted SSL Certificate.
  Examples:
  ~/.config/lxc/client.crt
key:
  PEM Formatted SSL Key.
  Examples:
  ~/.config/lxc/client.key
verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a container device

name:
Name of the container

device_name:
The device name to delete

remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
  https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
PEM Formatted SSL Certificate.
Examples:
  ~/.config/lxc/client.crt
key:
PEM Formatted SSL Key.
Examples:
  ~/.config/lxc/client.key
verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_device_get(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a container device

name:
Name of the container
device_name:
The device name to retrieve
remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
  https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
PEM Formatted SSL Certificate.
Examples:
  ~/.config/lxc/client.crt
key:
PEM Formatted SSL Key.
Examples:
  ~/.config/lxc/client.key
verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_execute(name, cmd, remote_addr=None, cert=None, key=None, verify_cert=True)

Execute a command list on a container.

name:
Name of the container
cmd:
Command to be executed (as a list)
Example:
  ['ls', '-l']
remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:

https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
salt '*' lxd.container_execute <container name> '[["ls", "-l"]'

salt.modules.lxd.container_file_get(name, src, dst, overwrite=False, mode=None, uid=None, gid=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a file from a container

name :
Name of the container

src :
The source file or directory

dst :
The destination file or directory

mode :
Set file mode to octal number

uid :
Set file uid (owner)

gid :
Set file gid (group)

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_file_put(name, src, dst, recursive=False, overwrite=False, mode=None, uid=None, gid=None, saltenv='base', remote_addr=None, cert=None, key=None, verify_cert=True)
Put a file into a container

name : Name of the container
src : The source file or directory
dst : The destination file or directory
recursive : Decend into src directory
overwrite : Replace destination if it exists
mode : Set file mode to octal number
uid : Set file uid (owner)
gid : Set file gid (group)
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
   Examples:
   https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
   Examples:
   ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
   Examples:
   ~/.config/lxc/client.key
verify_cert : [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

salt '*' lxd.container_file_put <container name> /var/tmp/foo /var/tmp/

salt.modules.lxd.container_freeze(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Freeze a container

name : Name of the container to freeze
remote_addr :
   An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
   Examples:
   https://myserver.lan:8443 /var/lib/mysocket.sock
cert :
   PEM Formatted SSL Certificate.
   Examples:
   ~/.config/lxc/client.crt
key :
   PEM Formatted SSL Key.
Examples:

- ~/.config/lxc/client.key

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_get(name=None, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Gets a container from the LXD

**name**:
The name of the container to get.

**remote_addr**:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples**:

- https://myserver.lan:8443 /var/lib/mysocket.sock

**cert**:
PEM Formatted SSL Certificate.

**Examples**:

- ~/.config/lxc/client.crt

**key**:
PEM Formatted SSL Key.

**Examples**:

- ~/.config/lxc/client.key

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**_raw**:
Return the pylxd object, this is internal and by states in use.

salt.modules.lxd.container_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Lists containers

**list_names**

[False] Only return a list of names when True

**remote_addr**:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples**:

- https://myserver.lan:8443 /var/lib/mysocket.sock

**cert**:
PEM Formatted SSL Certificate.

**Examples**:

- ~/.config/lxc/client.crt

**key**:
PEM Formatted SSL Key.

**Examples**:

- ~/.config/lxc/client.key

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

Full dict with all available information:
**salt '*' lxd.container_list**

For a list of names:

**salt '*' lxd.container_list true**

See also: container-attributes.

**salt.modules.lxd.container_migrate**(name, stop_and_start=False, remote_addr=None, cert=None, key=None, verify_cert=True, src_remote_addr=None, src_cert=None, src_key=None, src_verify_cert=None)

Migrate a container.

If the container is running, it either must be shut down first (use stop_and_start=True) or criu must be installed on the source and destination machines.

For this operation both certs need to be authenticated, use `lxd.authenticate <salt.modules.lxd.authenticate` to authenticate your cert(s).

- **name**: Name of the container to migrate
- **stop_and_start**: Stop the container on the source and start it on dest
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  - **Examples**: `https://myserver.lan:8443` `/var/lib/mysocket.sock`
- **cert**: PEM Formatted SSL Certificate.
  - **Examples**: `~/config/lxc/client.crt`
- **key**: PEM Formatted SSL Key.
  - **Examples**: `~/config/lxc/client.key`
- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```
# Authorize
salt '*' lxd.authenticate https://srv01:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false
salt '*' lxd.authenticate https://srv02:8443 <yourpass> ~/.config/lxc/client.crt ~/.config/lxc/client.key false

# Migrate phpmyadmin from srv01 to srv02
salt '*' lxd.container_migrate phpmyadmin stop_and_start=true remote_addr=https://srv02:8443 cert=~/.config/lxc/client.crt key=~/.config/lxc/client.key verify_cert=False src_remote_addr=https://srv01:8443
```

**salt.modules.lxd.container_rename**(name, newname, remote_addr=None, cert=None, key=None, verify_cert=True)

Rename a container

26.6. execution modules 2285
name : Name of the container to Rename
newname : The new name of the container
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
salt.modules.lxd.container_restart(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Restart a container
name : Name of the container to restart
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
salt.modules.lxd.container_start(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Start a container
name : Name of the container to start
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples:

```
~/.config/lxc/client.crt
```

**key**:

PEM Formatted SSL Key.

Examples:

```
~/.config/lxc/client.key
```

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_state

Get container state

name=None, remote_addr=None, cert=None, key=None,
verify_cert=True)

salt.modules.lxd.container_stop

Stop a container

name=

Name of the container to stop

remote_addr:

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

cert:

PEM Formatted SSL Certificate.

Examples:

```
~/.config/lxc/client.crt
```

key:

PEM Formatted SSL Key.

Examples:

```
~/.config/lxc/client.key
```

verify_cert

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

salt.modules.lxd.container_unfreeze

Unfreeze a container

name, remote_addr=None, cert=None, key=None,
verify_cert=True)
name:
    Name of the container to unfreeze
remote_addr:
    An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
    Address!
    Examples:
    https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
    PEM Formatted SSL Certificate.
    Examples:
    ~/.config/lxc/client.crt
key:
    PEM Formatted SSL Key.
    Examples:
    ~/.config/lxc/client.key
verify_cert
    [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
    LXD normally uses self-signed certificates.
salt.modules.lxd.image_alias_add(image, alias, description='', remote_addr=None, cert=None,
key=None, verify_cert=True)

Create an alias on the given image
image:
    An image alias, a fingerprint or a image object
alias:
    The alias to add
description:
    Description of the alias
remote_addr:
    An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
    Address!
    Examples:
    https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
    PEM Formatted SSL Certificate.
    Examples:
    ~/.config/lxc/client.crt
key:
    PEM Formatted SSL Key.
    Examples:
    ~/.config/lxc/client.key
verify_cert
    [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
    LXD normally uses self-signed certificates.

CLI Examples:
salt '*' lxd.image_alias_add xenial/amd64 ""Short version of xenial/amd64"

salt.modules.lxd.image_alias_delete(image, alias, remote_addr=None, cert=None, key=None,
verify_cert=True)

Delete an alias (this is currently not restricted to the image)
image:
    An image alias, a fingerprint or a image object
alias:
The alias to delete

remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock

cert:
PEM Formatted SSL Certificate.
Examples:
~/.config/lxc/client.crt

key:
PEM Formatted SSL Key.
Examples:
~/.config/lxc/client.key

verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```shell
salt '*' lxd.image_alias_add xenial/amd64 x "Short version of xenial/amd64"
```

### salt.modules.lxd.image_copy_lxd

Copy an image from another LXD instance

**source:**
An alias or a fingerprint of the source.

**src_remote_addr:**
An URL to the source remote daemon
Examples:
https://mysourceserver.lan:8443

**src_cert:**
PEM Formatted SSL Certificate for the source
Examples:
~/.config/lxc/client.crt

**src_key:**
PEM Formatted SSL Key for the source
Examples:
~/.config/lxc/client.key

**src_verify_cert**
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**remote_addr:**
Address of the destination daemon
Examples:
https://mydestserver.lan:8443

**cert:**
PEM Formatted SSL Certificate for the destination
Examples:
~/.config/lxc/client.crt

**key:**
PEM Formatted SSL Key for the destination

---

26.6. execution modules
Examples:

`~/.config/lxc/client.key`

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**aliases**

[[]] List of aliases to append to the copied image

**public**

[None] Make this image public available, None = copy source

**auto_update**

[None] Wherever to auto-update from the original source, None = copy source

**_raw**

[False] Return the raw pylxd object or a dict of the destination image?

**CLI Examples:**

```
```

**salt.modules.lxd.image_delete**(*image*, **remote_addr**=None, **cert**=None, **key**=None, **verify_cert**=True)

Delete an image by an alias or fingerprint

**name**:

The alias or fingerprint of the image to delete, can be a obj for the states.

**remote_addr**:

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples:**

https://myserver.lan:8443 /var/lib/mysocket.sock

**cert**:

PEM Formatted SSL Certificate.

**Examples:**

`~/.config/lxc/client.crt`

**key**:

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**CLI Examples:**

```
salt '*!' lxd.image_delete xenial/amd64
```

**salt.modules.lxd.image_from_file**(*filename*, **remote_addr**=None, **cert**=None, **key**=None, **verify_cert**=True, **aliases**=None, **public**=False, **saltenv**='base', **_raw**=False)

Create an image from a file

**filename**:

The filename of the rootfs

**remote_addr**:

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples:**

https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
   PEM Formatted SSL Certificate.
   Examples:
      ~/.config/lxc/client.crt
key:
   PEM Formatted SSL Key.
   Examples:
      ~/.config/lxc/client.key
verify_cert
   [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
   LXD normally uses self-signed certificates.
aliases
   [[]] List of aliases to append to the copied image
public
   [False] Make this image public available
saltenv
   [base] The saltenv to use for salt:// copies
_raw
   [False] Return the raw pylxd object or a dict of the image?

CLI Examples:

salt '*' lxd.image_from_file salt://lxd/files/busybox.tar.xz aliases=['busybox-amd64']

salt.modules.lxd.image_from_simplestreams(server, alias, remote_addr=None, cert=None,
   key=None, verify_cert=True, aliases=None,
   public=False, auto_update=False, _raw=False)

Create an image from simplestreams

server:
   Simplestreams server URI
alias:
   The alias of the image to retrieve
remote_addr:
   An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
   Address!
   Examples:
      https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
   PEM Formatted SSL Certificate.
   Examples:
      ~/.config/lxc/client.crt
key:
   PEM Formatted SSL Key.
   Examples:
      ~/.config/lxc/client.key
verify_cert
   [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
   LXD normally uses self-signed certificates.
aliases
   [[]] List of aliases to append to the copied image
public
   [False] Make this image public available
auto_update
   [False] Should LXD auto update that image?
salt modules.lxd.image_from_url(url, remote_addr=None, cert=None, key=None, verify_cert=True, 
    aliases=None, public=False, auto_update=False, _raw=False)

Create an image from an url
url : The URL from where to download the image
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples: ~/.config/lxc/client.crt
key : PEM Formatted SSL Key.
Examples: ~/.config/lxc/client.key
verify_cert [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.
aliases [ ] List of aliases to append to the copied image
public [False] Make this image public available
auto_update [False] Should LXD auto update that image?
_raw [False] Return the raw pylxd object or a dict of the image?

salt modules.lxd.image_get(fingerprint, remote_addr=None, cert=None, key=None, verify_cert=True, 
    _raw=False)

Get an image by its fingerprint
fingerprint : The fingerprint of the image to retrieve
remote_addr : An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
Examples: https://myserver.lan:8443 /var/lib/mysocket.sock
cert : PEM Formatted SSL Certificate.
Examples:

```
~/.config/lxc/client.crt
```

**key**: PEM Formatted SSL Key.

**verify_cert**

*True* Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**_raw**

*False* Return the raw pylxd object or a dict of it?

CLI Examples:

```
salt '!' lxd.image_get <fingerprint>
```

```python
salt.modules.lxd.image_get_by_alias(
    alias, remote_addr=None, cert=None, key=None,
    verify_cert=True, _raw=False)
```

Get an image by an alias

**alias**:

The alias of the image to retrieve

**remote_addr**:

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**cert**:

PEM Formatted SSL Certificate.

**key**:

PEM Formatted SSL Key.

**verify_cert**

*True* Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**_raw**

*False* Return the raw pylxd object or a dict of it?

CLI Examples:

```
salt '!' lxd.image_get_by_alias xenial/amd64
```

```python
salt.modules.lxd.image_list(
    list_aliases=False, remote_addr=None, cert=None, key=None,
    verify_cert=True)
```

Lists all images from the LXD.

**list_aliases**:

Return a dict with the fingerprint as key and a list of aliases as value instead.

**remote_addr**:

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples:**

```
https://myserver.lan:8443 /var/lib/mysocket.sock
```

26.6. execution modules  2293
cert:
- PEM Formatted SSL Certificate.
  Examples:
  ~/.config/lxc/client.crt

key:
- PEM Formatted SSL Key.
  Examples:
  ~/.config/lxc/client.key

verify_cert
- [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.image_list true --out=json
salt '*' lxd.image_list --out=json
```

**salt.modules.lxd.init** (storage_backend='dir', trust_password=None, network_address=None, network_port=None, storage_create_device=None, storage_create_loop=None, storage_pool=None)

Calls lxd init --auto -- opts

- **storage_backend**
  - Storage backend to use (zfs or dir, default: dir)
- **trust_password**
  - Password required to add new clients
- **network_address**
  - [None] Address to bind LXD to (default: none)
- **network_port**
  - [None] Port to bind LXD to (Default: 8443)
- **storage_create_device**
  - [None] Setup device based storage using this DEVICE
- **storage_create_loop**
  - [None] Setup loop based storage with this SIZE in GB
- **storage_pool**
  - [None] Storage pool to use or create

CLI Examples:

To listen on all IPv4/IPv6 Addresses:

```
salt '*' lxd.init dir PaSsW0rD [:]:
```

To not listen on Network:

```
salt '*' lxd.init
```

**salt.modules.lxd.normalize_input_values** (config, devices)

normalize config input so returns can be put into mongodb, which doesn't like .

This is not meant to be used on the commandline.

CLI Examples:

```
salt '*' lxd.normalize_input_values config={} devices={}
```

**salt.modules.lxd.profile_config_delete** (name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)
Delete a profile config item.

name:
The name of the profile to delete the config item.

config_key:
The config key for the value to retrieve.

remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
PEM Formatted SSL Certificate.

Examples:
~/config/lxc/client.crt
key:
PEM Formatted SSL Key.

Examples:
~/config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
salt '*' lxd.profile_config_delete autostart boot.autostart.delay

salt.modules.lxd.profile_config_get(name, config_key, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a profile config item.

name:
The name of the profile to get the config item from.

config_key:
The key for the item to retrieve.

remote_addr:
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

Examples:
https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
PEM Formatted SSL Certificate.

Examples:
~/config/lxc/client.crt
key:
PEM Formatted SSL Key.

Examples:
~/config/lxc/client.key
verify_cert
[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:
salt '*' lxd.profile_config_get autostart boot.autostart

salt.modules.lxd.profile_config_set(name, config_key, config_value, remote_addr=None, cert=None, key=None, verify_cert=True)

26.6. execution modules
Set a profile config item.

- **name**: The name of the profile to set the config item to.
- **config_key**: The item's key.
- **config_value**: Its item's value.
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and it's a TCP Address!
  
  **Examples:**
  
  ```
  https://myserver.lan:8443 /var/lib/mysocket.sock
  ```

- **cert**: PEM Formatted SSL Certificate.
  
  **Examples:**
  
  ```
  ~/.config/lxc/client.crt
  ```

- **key**: PEM Formatted SSL Key.
  
  **Examples:**
  
  ```
  ~/.config/lxc/client.key
  ```

- **verify_cert**: [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**CLI Example:**

```
salt '*' lxd.profile_config_set autostart boot.autostart 0
```

---

**salt.modules.lxd.profile_create**

This function creates a profile.

- **name**: The name of the profile to get.
- **config**: A config dict or None (None = unset).
  
  Can also be a list:
  
  ```
  [{'key': 'boot.autostart', 'value': 1},
   {'key': 'security.privileged', 'value': '1'}]
  ```

- **devices**: A device dict or None (None = unset).
- **description**: A description string or None (None = unset).
- **remote_addr**: An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  
  **Examples:**
  
  ```
  https://myserver.lan:8443 /var/lib/mysocket.sock
  ```

- **cert**: PEM Formatted SSL Certificate.
  
  **Examples:**
  
  ```
  ~/.config/lxc/client.crt
  ```

- **key**: PEM Formatted SSL Key.
Examples:

~/.config/lxc/client.key

verify_cert

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
LXD normally uses self-signed certificates.

CLI Examples:

```bash
salt '*' lxd.profile_create autostart config="{boot.autostart: 1, boot.autostart.delay: 2, boot.autostart.priority: 1}"  
salt '*' lxd.profile_create shared_mounts devices="{shared_mount: {type: 'disk', source: '/home/shared', path: '/home/shared'}}"  
```

See the lxd-docs for the details about the config and devices dicts.

salt.modules.lxd.profile_delete(name, remote_addr=None, cert=None, key=None, verify_cert=True)

Deletes a profile.

name :
The name of the profile to delete.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
Address!

Examples:

https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:

~/.config/lxc/client.crt

key :
PEM Formatted SSL Key.

Examples:

~/.config/lxc/client.key

verify_cert

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
LXD normally uses self-signed certificates.

CLI Example:

```bash
salt '*' lxd.profile_delete shared_mounts
```

salt.modules.lxd.profile_device_delete(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a profile device.

name :
The name of the profile to delete the device.

device_name :
The name of the device to delete.

remote_addr :
An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
Address!

Examples:

https://myserver.lan:8443 /var/lib/mysocket.sock

cert :
PEM Formatted SSL Certificate.

Examples:

~/.config/lxc/client.crt
**key**

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**CLI Example:**

```
salt '*' lxd.profile_device_delete autostart eth1
```

salt.modules.lxd.

**profile_device_get**

(name, device_name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get a profile device.

**name**

The name of the profile to get the device from.

**device_name**

The name of the device to retrieve.

**remote_addr**

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert**

PEM Formatted SSL Certificate.

**Examples:**

`~/.config/lxc/client.crt`

**key**

PEM Formatted SSL Key.

**Examples:**

`~/.config/lxc/client.key`

**verify_cert**

[True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

**CLI Example:**

```
salt '*' lxd.profile_device_get default eth0
```

salt.modules.lxd.

**profile_device_set**

(name, device_name, device_type='disk', remote_addr=None, cert=None, key=None, verify_cert=True, **kwargs)

Set a profile device.

**name**

The name of the profile to set the device to.

**device_name**

The name of the device to set.

**remote_addr**

An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!

**Examples:**

`https://myserver.lan:8443 /var/lib/mysocket.sock`

**cert**

PEM Formatted SSL Certificate.

**Examples:**

`~/.config/lxc/client.crt`
key:
  PEM Formatted SSL Key.
  Examples:
  ~/.config/lxc/client.key

verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

CLI Example:

```bash
salt '*' lxd.profile_device_set autostart eth1 nic nictype=bridged
  parent=lxdbr0
```

salt.modules.lxd.profile_get(name, remote_addr=None, cert=None, key=None, verify_cert=True, _raw=False)

Gets a profile from the LXD

name:
  The name of the profile to get.

remote_addr:
  An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples:
  https://myserver.lan:8443 /var/lib/mysocket.sock

cert:
  PEM Formatted SSL Certificate.
  Examples:
  ~/.config/lxc/client.crt

key:
  PEM Formatted SSL Key.
  Examples:
  ~/.config/lxc/client.key

verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as LXD normally uses self-signed certificates.

_cli:
  Return the pylxd object, this is internal and by states in use.

CLI Examples:

```bash
salt '*' lxd.profile_get autostart
```

salt.modules.lxd.profile_list(list_names=False, remote_addr=None, cert=None, key=None, verify_cert=True)

Lists all profiles from the LXD.

list_names:
  Return a list of names instead of full blown dicts.

remote_addr:
  An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP Address!
  Examples:
  https://myserver.lan:8443 /var/lib/mysocket.sock

cert:
  PEM Formatted SSL Certificate.
  Examples:
  ~/.config/lxc/client.crt
key:
  PEM Formatted SSL Key.
  Examples:
    ~/.config/lxc/client.key

verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
  LXD normally uses self-signed certificates.

CLI Examples:

```
salt '*' lxd.profile_list true --out=json
salt '*' lxd.profile_list --out=json
```

salt.modules.lxd.pylxd_client_get(remote_addr=None, cert=None, key=None, verify_cert=True)
Get an pylxd client, this is not meant to be run over the CLI.

remote_addr:
  An URL to a remote Server, you also have to give cert and key if you provide remote_addr and its a TCP
  Address!
  Examples:
    https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
  PEM Formatted SSL Certificate.
  Examples:
    ~/.config/lxc/client.crt

key:
  PEM Formatted SSL Key.
  Examples:
    ~/.config/lxc/client.key

verify_cert
  [True] Wherever to verify the cert, this is by default True but in the most cases you want to set it off as
  LXD normally uses self-signed certificates.
  See the requests-docs for the SSL stuff.

salt.modules.lxd.pylxd_save_object(obj)
Saves an object (profile/image/container) and
  translate its execpetion on failure
  obj:
    The object to save
    This is an internal method, no CLI Example.

salt.modules.lxd.pylxd_version()
Returns the actual pylxd version.

CLI Example:

```
salt '*' lxd.pylxd_version
```

salt.modules.lxd.snapshots_all(container, remote_addr=None, cert=None, key=None, verify_cert=True)
Get all snapshots for a container
container:
  The name of the container to get.
remote_addr:
  An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
  Examples:
    https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
    PEM Formatted SSL Certificate.
    Examples:
    ~/.config/lxc/client.crt
key:
    PEM Formatted SSL Key.
    Examples:
    ~/.config/lxc/client.key
verify_cert
    [True] Verify the ssl certificate. Default: True

CLI Examples:
salt '*' lxd.snapshots_all test-container

salt.modules.lxd.snapshots_create(container, name=None, remote_addr=None, cert=None, key=None, verify_cert=True)

Create a snapshot for a container

container:
    The name of the container to get.
name:
    The name of the snapshot.
remote_addr:
    An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
    Examples:
    https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
    PEM Formatted SSL Certificate.
    Examples:
    ~/.config/lxc/client.crt
key:
    PEM Formatted SSL Key.
    Examples:
    ~/.config/lxc/client.key
verify_cert
    [True] Verify the ssl certificate. Default: True

CLI Examples:
salt '*' lxd.snapshots_create test-container test-snapshot

salt.modules.lxd.snapshots_delete(container, name, remote_addr=None, cert=None, key=None, verify_cert=True)

Delete a snapshot for a container

container:
    The name of the container to get.
name:
    The name of the snapshot.
remote_addr:
    An URL to a remote server. The 'cert' and 'key' fields must also be provided if 'remote_addr' is defined.
    Examples:
    https://myserver.lan:8443 /var/lib/mysocket.sock
cert:
    PEM Formatted SSL Certificate.
    Examples:
    ~/.config/lxc/client.crt
key :  
- PEM Formatted SSL Key.
Examples:
  ~/.config/lxc/client.key

verify_cert  
- [True] Verify the ssl certificate. Default: True

CLI Examples:
```
salt '*!' lxd.snapshots_delete test-container test-snapshot
```

`salt.modules.lxd.snapshots_get` (container, name, remote_addr=None, cert=None, key=None, verify_cert=True)

Get information about snapshot for a container

- `container` :  
The name of the container to get.

- `name` :  
The name of the snapshot.

- `remote_addr` :  
An URL to a remote server. The `cert` and `key` fields must also be provided if `remote_addr` is defined.
Examples:
  https://myserver.lan:8443
  /var/lib/mysocket.sock

- `cert` :  
- PEM Formatted SSL Certificate.
Examples:
  ~/.config/lxc/client.crt

- `key` :  
- PEM Formatted SSL Key.
Examples:
  ~/.config/lxc/client.key

- `verify_cert`  
- [True] Verify the ssl certificate. Default: True

CLI Examples:
```
salt '*!' lxd.snapshots_get test-container test-snapshot
```

`salt.modules.lxd.sync_config_devices` (obj, newconfig, newdevices, test=False)

Syncs the given config and devices with the object (a profile or a container) returns a changes dict with all changes made.

- `obj` :  
The object to sync with / or just test with.

- `newconfig` :  
The new config to check with the obj.

- `newdevices` :  
The new devices to check with the obj.

- `test` :  
Wherever to not change anything and give "Would change" message.

`salt.modules.lxd.version`

Returns the actual lxd version.

CLI Example:
```
salt '*!' lxd.version
```
26.6.234 salt.modules.mac_assistive

This module allows you to manage assistive access on macOS minions with 10.9+
New in version 2016.3.0.

```bash
salt '*' assistive.install /usr/bin/osascript
```

**class** salt.modules.mac_assistive.TccDB(path=None)

- **disable** *(app_id)*
- **enable** *(app_id)*
- **enabled** *(app_id)*
- **install** *(app_id, enable=True)*
- **installed** *(app_id)*
- **remove** *(app_id)*

**salt.modules.mac_assistive.enable_(app_id, enabled=True)**

Enable or disable an existing assistive access application.

- **app_id**
  - The bundle ID or command to set assistive access status.
- **enabled**
  - Sets enabled or disabled status. Default is True.

CLI Example:

```bash
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

**salt.modules.mac_assistive.enabled(app_id)**

Check if a bundle ID or command is listed in assistive access and enabled.

- **app_id**
  - The bundle ID or command to retrieve assistive access status.

CLI Example:

```bash
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

**salt.modules.mac_assistive.install(app_id, enable=True, tries=3, wait=10)**

Install a bundle ID or command as being allowed to use assistive access.

- **app_id**
  - The bundle ID or command to install for assistive access.
- **enabled**
  - Sets enabled or disabled status. Default is True.
- **tries**
  - How many times to try and write to a read-only tcc. Default is 3.
- **wait**
  - Number of seconds to wait between tries. Default is 10.

CLI Example:

```bash
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```
salt.modules.mac_assistive.installed(app_id)
Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

**app_id**
The bundle ID or command to check installed status.

CLI Example:
```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

salt.modules.mac_assistive.remove(app_id)
Remove a bundle ID or command as being allowed to use assistive access.

**app_id**
The bundle ID or command to remove from assistive access list.

CLI Example:
```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

### 26.6.235 salt.modules.mac_brew_pkg

Homebrew for macOS

It is recommended for the salt-minion to have the HOMEBREW_PREFIX environment variable set. This will ensure that Salt uses the correct path for the brew binary.

Typically, this is set to /usr/local for Intel Macs and /opt/homebrew for Apple Silicon Macs.

**Important:** If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to 'pkg.install' is not available), see [here](#).

salt.modules.mac_brew_pkg.available_version(*names, **kwargs)
This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation
Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:
```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_brew_pkg.hold(name=None, pkgs=None, sources=None, **kwargs)
Set package in 'hold' state, meaning it will not be upgraded.

New in version 3001.

**name**
The name of the package, e.g., 'tmux'

CLI Example:
```
salt '*' pkg.hold <package name>
```

**pkgs**
A list of packages to hold. Must be passed as a python list.
CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.mac_brew_pkg.homebrew_prefix()`

Returns the full path to the homebrew prefix.

CLI Example:

```
salt '*' pkg.homebrew_prefix
```

`salt.modules.mac_brew_pkg.info_installed(*names, **kwargs)`

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

**names**
The names of the packages for which to return information.

CLI Example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.mac_brew_pkg.install(name=None, pkgs=None, taps=None, options=None, **kwargs)`

Install the passed package(s) with `brew install`

**name**
The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

**taps**
Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes ...']
```

**options**
Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if "pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes ..."]' options='["--with-fpm"]'
```

Multiple Package Installation Options:

**pkgs**
A list of formulas to install. Must be passed as a python list.

CLI Example:
salt '*' pkg.install pkgs='["foo","bar"]'

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

salt.modules.mac_brew_pkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation
Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_brew_pkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.mac_brew_pkg.list_upgrades(refresh=True, include_casks=False, **kwargs)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.mac_brew_pkg.pin(name=None, pkgs=None, sources=None, **kwargs)

Set package in 'hold' state, meaning it will not be upgraded.
New in version 3001.

**name**

The name of the package, e.g., 'tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

**pkgs**

A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.mac_brew_pkg.refresh_db(**kwargs)

Update the homebrew package repository.

CLI Example:
salt '*' pkg.refresh_db

salt.modules.mac_brew_pkg.remove(name=None, pkgs=None, **kwargs)

Removes packages with brew uninstall.

name
The name of the package to be deleted.

Multiple Package Options:

pkgs
A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```bash
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['"foo", "bar"]'
```

salt.modules.mac_brew_pkg.unhold(name=None, pkgs=None, sources=None, **kwargs)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name
The name of the package, e.g., 'tmux'

CLI Example:

```bash
salt '*' pkg.unhold <package name>
```

pkgs
A list of packages to unhold. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.unhold pkgs=['"foo", "bar"]'
```

salt.modules.mac_brew_pkg.unpin(name=None, pkgs=None, sources=None, **kwargs)

Set package current in 'hold' state to install state, meaning it will be upgraded.

New in version 3001.

name
The name of the package, e.g., 'tmux'

CLI Example:

```bash
salt '*' pkg.unhold <package name>
```

pkgs
A list of packages to unhold. Must be passed as a python list.

CLI Example:

```bash
salt '*' pkg.unhold pkgs=['"foo", "bar"]'
```

salt.modules.mac_brew_pkg.upgrade(refresh=True, **kwargs)

Upgrade outdated, unpinned brews.

refresh
Fetch the newest version of Homebrew and all formulae from GitHub before installing.
Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.mac_brew_pkg.upgrade_available(pkg, **kwargs)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_brew_pkg.version(*names, **kwargs)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

### 26.6.236 salt.modules.mac_desktop

macOS implementations of various commands in the "desktop" interface

salt.modules.mac_desktop.get_output_volume()
Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

salt.modules.mac_desktop.lock()
Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

salt.modules.mac_desktop.say(*words)
Say some words.

```
words
```

The words to execute the say command with.

CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

salt.modules.mac_desktop.screensaver()
Launch the screensaver.

CLI Example:
salt '*' desktop.screensaver

salt.modules.mac_desktop.set_output_volume(volume)
    Set the volume of sound.
    volume
        The level of volume. Can range from 0 to 100.
    CLI Example:
        salt '*' desktop.set_output_volume <volume>

26.6.237 salt.modules.mac_group

Manage groups on Mac OS 10.7+

salt.modules.mac_group.add(name, gid=None, **kwargs)
    Changed in version 3006.0.
    Add the specified group
    name
        Name of the new group
    gid
        Use GID for the new group
    CLI Example:
        salt '*' group.add foo 3456

salt.modules.mac_group.adduser(group, name)
    Add a user in the group.
    CLI Example:
        salt '*' group.adduser foo bar

    Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

salt.modules.mac_group.chomp(name, gid)
    Change the gid for a named group
    CLI Example:
        salt '*' group.chomp foo 4376

salt.modules.mac_group.delete(name)
    Remove the named group
    CLI Example:
        salt '*' group.delete foo

salt.modules.mac_group.deluser(group, name)
    Remove a user from the group
    New in version 2016.3.0.
    CLI Example:
salt '*' group.deluser foo bar

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

salt.modules.mac_group.getent(refresh=False)

Return info on all groups

CLI Example:

salt '*' group.getent

salt.modules.mac_group.info(name)

Return information about a group

CLI Example:

salt '*' group.info foo

salt.modules.mac_group.members(name, members_list)

Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

salt '*' group.members foo 'user1,user2,user3,...'

Replaces a membership list for a local group 'foo'.

26.6.238 salt.modules.mac_keychain

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.get_default_keychain(user=None, domain='user')

Get the default keychain

user
The user to check the default keychain of
domain
The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

salt '*' keychain.get_default_keychain

salt.modules.mac_keychain.get_friendly_name(cert, password, legacy=False)

Get the friendly name of the given certificate

cert
The certificate to install
password
The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section
Note: The password given here will show up as plaintext in the returned job info.
legacy
Assume legacy format for certificate.
CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
salt '*' keychain.get_friendly_name /tmp/test.p12 test123 legacy=True
```

```
salt.modules.mac_keychain.get_hash(name, password=None)
```

Returns the hash of a certificate in the keychain.

- **name**
  The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.

- **password**
  The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

```
salt.modules.mac_keychain.install(cert, password, keychain='/Library/Keychains/System.keychain', allow_any=False, keychain_password=None)
```

Install a certificate

- **cert**
  The certificate to install

- **password**
  The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

  Note: The password given here will show up as plaintext in the job returned info.

- **keychain**
  The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

- **allow_any**
  Allow any application to access the imported certificate without warning

- **keychain_password**
  If your keychain is likely to be locked pass the password and it will be unlocked before running the import

  Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

```
salt.modules.mac_keychain.list_certs(keychain="/Library/Keychains/System.keychain")
```

List all of the installed certificates

- **keychain**
  The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

CLI Example:

```
salt '*' keychain.list_certs
```

```
salt.modules.mac_keychain.set_default_keychain(keychain, domain='user', user=None)
```

Set the default keychain

- **keychain**
  The location of the keychain to set as default

- **domain**
  The domain to use valid values are user|system|common|dynamic, the default is user
user
The user to set the default keychain as

CLI Example:
```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.
```

salt.modules.mac_keychain.uninstall(cert_name, keychain='/Library/Keychains/System.keychain', keychain_password=None)

Uninstall a certificate from a keychain

cert_name
The name of the certificate to remove

keychain
The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

keychain_password
If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.unlock_keychain(keychain, password)

Unlock the given keychain with the password

keychain
The keychain to unlock

password
The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.
CLI Example:
```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

26.6.239 salt.modules.mac_pkgutil

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

salt.modules.mac_pkgutil.forget(package_id)

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

**Warning**: DO NOT use this command to fix broken package design

Parameters

**package_id** *(str)* -- The name of the package to forget

Returns

True if successful, otherwise False

Return type

bool
CLI Example:
```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

```
salt.modules.mac_pkgutil.install(source, package_id)
```
Install a .pkg from an URI or an absolute path.

Parameters
- `source` *(str)* -- The path to a package.
- `package_id` *(str)* -- The package ID

Returns
- True if successful, otherwise False

Return type
- bool

CLI Example:
```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.apple.pkg.gcc4.2Leo
```

```
salt.modules.mac_pkgutil.is_installed(package_id)
```
Returns whether a given package id is installed.

Returns
- True if installed, otherwise False

Return type
- bool

CLI Example:
```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

```
salt.modules.mac_pkgutil.list()
```
List the installed packages.

Returns
- A list of installed packages

Return type
- list

CLI Example:
```
salt '*' pkgutil.list
```

26.6.240 salt.modules.mac_portspkg

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, `refresh=True` is the default for all operations that need an up-to-date copy of available ports. Consider `refresh=False` when you are sure no db update is needed.

2. In some cases MacPorts doesn’t always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where `salt mac-machine pkg./something/` won't want to return. Use
salt-run jobs.active

on the master to check for potentially long-running calls to port.

Finally, ports database updates are always handled with port selfupdate as opposed to port sync. This makes sense in the MacPorts user community but may confuse experienced Linux admins as Linux package managers don’t upgrade the packaging software when doing a package database update. In other words salt mac-machine pkg.refresh_db is more like apt-get update; apt-get upgrade dpkg apt-get than simply apt-get update.

salt.modules.mac_portspkg.available_version(*names, **kwargs)

This function is an alias of latest_version.

Return the latest version of the named package available for upgrade or installation

Options:
refresh
Update ports with port selfupdate

CLI Example:
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>

salt.modules.mac_portspkg.install(name=None, refresh=False, pkgs=None, **kwargs)

Install the passed package(s) with port install

name
The name of the formula to be installed. Note that this parameter is ignored if "pkgs" is passed.

CLI Example:
salt '*' pkg.install <package name>

version
Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'

variant
Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_osxkeychain+doc+pcre'

Multiple Package Installation Options:
pkgs
A list of formulas to install. Must be passed as a python list.

CLI Example:
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'

Returns a dict containing the new package names and versions:

{"<package>' : { 'old': '<old-version>',
                'new': '<new-version>' }}
salt.modules.mac_portspkg.latest_version(names, **kwargs)

Return the latest version of the named package available for upgrade or installation

Options:
refresh
   Update ports with port selfupdate

CLI Example:
salt '*' pkg.latest_version <package_name>
salt '*' pkg.latest_version <package1> <package2> <package3>

salt.modules.mac_portspkg.list_pkgs(versions_as_list=False, **kwargs)

List the packages currently installed in a dict:

{
'package_name': '<version>'
}

CLI Example:
salt '*' pkg.list_pkgs

salt.modules.mac_portspkg.list_upgrades(refresh=True, **kwargs)

Check whether or not an upgrade is available for all packages

Options:
refresh
   Update ports with port selfupdate

CLI Example:
salt '*' pkg.list_upgrades

salt.modules.mac_portspkg.refresh_db(**kwargs)

Update ports with port selfupdate

CLI Example:
salt mac pkg.refresh_db

salt.modules.mac_portspkg.remove(name=None, pkgs=None, **kwargs)

Removes packages with port uninstall.

name
   The name of the package to be deleted.
Multiple Package Options:
pkgs
   A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:
**salt.modules.mac_portspkg**

### upgrade(refresh=True, **kwargs)

Run a full upgrade using MacPorts 'port upgrade outdated'

**Options:**
- **refresh**
  
  Update ports with `port selfupdate`

**Returns**

A dictionary containing the changes:

```python
{'<package>': {'old': '<old-version>',
              'new': '<new-version>'}}
```

**CLI Example:**

```bash
salt '*' pkg.upgrade
```

### upgrade_available(pkg, refresh=True, **kwargs)

Check whether or not an upgrade is available for a given package

**CLI Example:**

```bash
salt '*' pkg.upgrade_available <package name>
```

### version(*names, **kwargs)

Returns a string representing the version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

**CLI Example:**

```bash
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

---

**26.6.241 salt.modules.mac_power**

Module for editing power settings on macOS

New in version 2016.3.0.

### get_computer_sleep()

Display the amount of idle time until the computer sleeps.

**Returns**

A string representing the sleep settings for the computer

**Return type**

str

**CLI Example:**

```bash
salt '*' power.get_computer_sleep
```

### get_display_sleep()

Display the amount of idle time until the display sleeps.

**Returns**

A string representing the sleep settings for the display
Return type
str
CLI Example:

```
salt '*' power.get_display_sleep
```

```
salt.modules.mac_power.get_harddisk_sleep()
```

Display the amount of idle time until the hard disk sleeps.

Returns
A string representing the sleep settings for the hard disk

Return type
str
CLI Example:

```
salt '*' power.get_harddisk_sleep
```

```
salt.modules.mac_power.get_restart_freeze()
```

Displays whether 'restart on freeze' is on or off if supported

Returns
A string value representing the "restart on freeze" settings

Return type
string
CLI Example:

```
salt '*' power.get_restart_freeze
```

```
salt.modules.mac_power.get_restart_power_failure()
```

Displays whether 'restart on power failure' is on or off if supported

Returns
A string value representing the "restart on power failure" settings

Return type
string
CLI Example:

```
salt '*' power.get_restart_power_failure
```

```
salt.modules.mac_power.get_sleep()
```

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

Returns
A dictionary containing the sleep status for Computer, Display, and Hard Disk

Return type
dict
CLI Example:

```
salt '*' power.get_sleep
```

```
salt.modules.mac_power.get_sleep_on_power_button()
```

Displays whether 'allow power button to sleep computer' is on or off if supported

Returns
A string value representing the "allow power button to sleep computer" settings

Return type
string
CLI Example:
salt '*' power.get_sleep_on_power_button

salt.modules.mac_power.get_wake_on_modem()
Displays whether 'wake on modem' is on or off if supported

Returns
A string value representing the "wake on modem" settings

Return type
str

CLI Example:
salt '*' power.get_wake_on_modem

salt.modules.mac_power.get_wake_on_network()
Displays whether 'wake on network' is on or off if supported

Returns
A string value representing the "wake on network" settings

Return type
string

CLI Example:
salt '*' power.get_wake_on_network

salt.modules.mac_power.set_computer_sleep(minutes)
Set the amount of idle time until the computer sleeps. Pass "Never" or "Off" to never sleep.

Parameters

minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str

Returns
True if successful, False if not

Return type
bool

CLI Example:
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off

salt.modules.mac_power.set_display_sleep(minutes)
Set the amount of idle time until the display sleeps. Pass "Never" or "Off" to never sleep.

Parameters

minutes -- Can be an integer between 1 and 180 or "Never" or "Off"

Ptype
int, str

Returns
True if successful, False if not

Return type
bool

CLI Example:
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off

salt.modules.mac_power.set_harddisk_sleep(minutes)
Set the amount of idle time until the harddisk sleeps. Pass "Never" of "Off" to never sleep.

**Parameters**
- **minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"
- **Ptype**
  - int, str
- **Returns**
  - True if successful, False if not
- **Return type**
  - bool

**CLI Example:**
```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

salt.modules.mac_power.set_restart_freeze(enabled)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

**Parameters**
- **enabled** (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**
- True if successful, False if not

**Return type**
- bool

**CLI Example:**
```
salt '*' power.set_restart_freeze True
```

salt.modules.mac_power.set_restart_power_failure(enabled)

Set whether or not the computer will automatically restart after a power failure.

**Parameters**
- **enabled** (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**
- True if successful, False if not

**Return type**
- bool

**CLI Example:**
```
salt '*' power.set_restart_power_failure True
```

salt.modules.mac_power.set_sleep(minutes)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass "Never" or "Off" for computers that should never sleep.

**Parameters**
- **minutes** -- Can be an integer between 1 and 180 or "Never" or "Off"
- **Ptype**
  - int, str
- **Returns**
  - True if successful, False if not
- **Return type**
  - bool
CLI Example:

```bash
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

salt.modules.mac_power.set_sleep_on_power_button(enabled)

Set whether or not the power button can sleep the computer.

**Parameters**

- `enabled (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' power.set_sleep_on_power_button True
```

salt.modules.mac_power.set_wake_on_modem(enabled)

Set whether or not the computer will wake from sleep when modem activity is detected.

**Parameters**

- `enabled (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' power.set_wake_on_modem True
```

salt.modules.mac_power.set_wake_on_network(enabled)

Set whether or not the computer will wake from sleep when network activity is detected.

**Parameters**

- `enabled (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

- True if successful, False if not

**Return type**

- bool

CLI Example:

```bash
salt '*' power.set_wake_on_network True
```
26.6.242 salt.modules.mac_service

The service module for macOS

New in version 2016.3.0.

This module has support for services in the following locations.

/System/Library/LaunchDaemons/
/System/Library/LaunchAgents/
/Library/LaunchDaemons/
/Library/LaunchAgents/

# As of version "2019.2.0" support for user-specific services were added.
/Users/foo/Library/LaunchAgents/

Note: As of the 2019.2.0 release, if a service is located in a LaunchAgent path and a runas user is NOT specified, the current console user will be used to properly interact with the service.

Note: As of the 3002 release, if a service name of salt-minion is passed this module will convert it over to its macOS equivalent name, in this case to com.saltstack.salt.minion. This is true for salt-master, salt-api, and salt-syndic as well.

salt.modules.mac_service.available(name)

Check that the given service is available.

Parameters

name (str) -- The name of the service

Returns

True if the service is available, otherwise False

Return type

bool

CLI Example:

```
salt '*/' service.available com.openssh.sshd
```

salt.modules.mac_service.disable(name, runas=None)

Disable a launchd service. Raises an error if the service fails to be disabled.

Parameters

- name (str) -- Service label, file name, or full path
- runas (str) -- User to run launchctl commands

Returns

True if successful or if the service is already disabled

Return type

bool

CLI Example:

```
salt '*/' service.disable org.cups.cupsd
```

salt.modules.mac_service.disabled(name, runas=None, domain='system')

Check if the specified service is not enabled. This is the opposite of service.enabled

Parameters
**name** *(str)* -- The name to look up

**runas** *(str)* -- User to run launchctl commands

**domain** *(str)* -- domain to check for disabled services. Default is system.

**Returns**
True if the specified service is NOT enabled, otherwise False

**Return type**
bool

**CLI Example:**
salt '*' service.disabled org.cups.cupsd

**salt.modules.mac_service.enable**(name, runas=None)
Enable a launchd service. Raises an error if the service fails to be enabled

**Parameters**
- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

**Returns**
True if successful or if the service is already enabled

**Return type**
bool

**CLI Example:**
salt '*' service.enable org.cups.cupsd

**salt.modules.mac_service.enabled**(name, runas=None)
Check if the specified service is enabled (not disabled, capable of being loaded/bootstrapped).

**Note:** Previously this function would see if the service is loaded via `launchctl list` to determine if the service is enabled. This was not an accurate way to do so. The new behavior checks to make sure its not disabled to determine the status. Please use `service.loaded` for the previous behavior.

**Parameters**
- **name** *(str)* -- The name of the service to look up.
- **runas** *(str)* -- User to run launchctl commands.

**Returns**
True if the specified service enabled, otherwise False

**Return type**
bool

**CLI Example:**
salt '*' service.enabled org.cups.cupsd

**salt.modules.mac_service.get_all**(runas=None)
Return a list of services that are enabled or available. Can be used to find the name of a service.

**Parameters**
- **runas** *(str)* -- User to run launchctl commands

**Returns**
A list of all the services available or enabled

**Return type**
list
CLI Example:

```
salt '*' service.get_all
```

```
salt.modules.mac_service.get_enabled(runas=None)
```

Return a list of all services that are enabled. Can be used to find the name of a service.

**Parameters**

- `runas` *(str)* -- User to run launchctl commands

**Returns**

A list of all the services enabled on the system

**Return type**

list

CLI Example:

```
salt '*' service.get_enabled
```

```
salt.modules.mac_service.launchctl(sub_cmd, *args, **kwargs)
```

Run a launchctl command and raise an error if it fails

**Parameters**

- `sub_cmd` *(str)* -- Sub command supplied to launchctl
- `args` *(tuple)* -- Tuple containing additional arguments to pass to launchctl
- `kwargs` *(dict)* -- Dictionary containing arguments to pass to cmd.run_all
- `return_stdout` *(bool)* -- A keyword argument. If true return the stdout of the launchctl command

**Returns**

True if successful, raise CommandExecutionError if not, or the stdout of the launchctl command if requested

**Return type**

bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

```
salt.modules.mac_service.list_(name=None, runas=None)
```

Run launchctl list and return the output

**Parameters**

- `name` *(str)* -- The name of the service to list
- `runas` *(str)* -- User to run launchctl commands

**Returns**

If a name is passed returns information about the named service, otherwise returns a list of all services and pids

**Return type**

str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

```
salt.modules.mac_service.loaded(name, runas=None)
```

Check if the specified service is loaded.

**Parameters**
• **name** *(str)* -- The name of the service to look up

• **runas** *(str)* -- User to run launchctl commands

**Returns**
- True if the specified service is loaded, otherwise False

**Return type**
- bool

**CLI Example:**

```bash
salt '*' service.loaded org.cups.cupsd
```

salt.modules.mac_service.missing(name)

The inverse of service.available Check that the given service is not available.

**Parameters**
- **name** *(str)* -- The name of the service

**Returns**
- True if the service is not available, otherwise False

**Return type**
- bool

**CLI Example:**

```bash
salt '*' service.missing com.openssh.sshd
```

salt.modules.mac_service.restart(name, runas=None)

Unloads and reloads a launchd service. Raises an error if the service fails to reload

**Parameters**
- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

**Returns**
- True if successful

**Return type**
- bool

**CLI Example:**

```bash
salt '*' service.restart org.cups.cupsd
```

salt.modules.mac_service.show(name)

Show properties of a launchctl service

**Parameters**
- **name** *(str)* -- Service label, file name, or full path

**Returns**
- The service information if the service is found

**Return type**
- dict

**CLI Example:**

```bash
salt '*' service.show org.cups.cupsd  # service label
salt '*' service.show org.cups.cupsd.plist  # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist  # full path
```

salt.modules.mac_service.start(name, runas=None)

Start a launchd service. Raises an error if the service fails to start
Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

### Parameters

- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

### Returns

True if successful or if the service is already running

### Return type

bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

### Function: `salt.modules.mac_service.status(name, sig=None, runas=None)`

Return the status for a service.

Note: Previously this function would return a PID for a running service with a PID or 'loaded' for a loaded service without a PID. This was changed to have better parity with other service modules that return True/False.

### Parameters

- **name** *(str)* -- Used to find the service from launchctl. Can be the service Label, file name, or path to the service file. (normally a plist)
- **sig** *(str)* -- Find the service with status.pid instead. Note that name must still be provided.
- **runas** *(str)* -- User to run launchctl commands.

### Returns

True if running, otherwise False.

### Return type

str

CLI Example:

```
salt '*' service.status cups
```

### Function: `salt.modules.mac_service.stop(name, runas=None)`

Stop a launchd service. Raises an error if the service fails to stop

Note: Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

### Parameters

- **name** *(str)* -- Service label, file name, or full path
- **runas** *(str)* -- User to run launchctl commands

### Returns

True if successful or if the service is already stopped
Return type

**bool**

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

### 26.6.243 salt.modules.mac_shadow

Manage macOS local directory passwords and policies

New in version 2016.3.0.

Note that it is usually better to apply password policies through the creation of a configuration profile.

**salt.modules.mac_shadow.del_password(name)**

Deletes the account password

**Parameters**

- **name (str)** -- The user name of the account

**Returns**

- True if successful, otherwise False

**Return type**

**bool**

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

**salt.modules.mac_shadow.get_account_created(name)**

Get the date/time the account was created

**Parameters**

- **name (str)** -- The username of the account

**Returns**

- The date/time the account was created (yyyy-mm-dd hh:mm:ss) or 0 if the value is not defined

**Return type**

**str**

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

**salt.modules.mac_shadow.get_change(name)**

Gets the date on which the password expires

**Parameters**

- **name (str)** -- The name of the user account

**Returns**

- The date the password will expire

**Return type**

**str**

**Raises**

CommandExecutionError on user not found or any other unknown error

CLI Example:
salt '*' shadow.get_change username

salt.modules.mac_shadow.get_expire(name)
Gets the date on which the account expires
Parameters
   name (str) -- The name of the user account
Returns
   The date the account expires
Return type
   str
Raises
   CommandExecutionError on user not found or any other unknown error
CLI Example:
salt '*' shadow.get_expire username

salt.modules.mac_shadow.get_last_change(name)
Get the date/time the account was changed
Parameters
   name (str) -- The username of the account
Returns
   The date/time the account was modified (yyyy-mm-dd hh:mm:ss) or 0 if the value is not
defined
Return type
   str
Raises
   CommandExecutionError on user not found or any other unknown error
CLI Example:
salt '*' shadow.get_last_change admin

salt.modules.mac_shadow.get_login_failed_count(name)
Get the number of failed login attempts
Parameters
   name (str) -- The username of the account
Returns
   The number of failed login attempts. 0 may mean there are no failed login attempts or the
value is not defined
Return type
   str
Raises
   CommandExecutionError on user not found or any other unknown error
CLI Example:
salt '*' shadow.get_login_failed_count admin

salt.modules.mac_shadow.get_login_failed_last(name)
Get the date/time of the last failed login attempt
Parameters
   name (str) -- The username of the account
Returns
   The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss) or 0
if the value is not defined
Return type
str
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.get_login_failed_last admin
```

salt.modules.mac_shadow.get_maxdays(name)
Get the maximum age of the password

Parameters
name (str) -- The username of the account

Returns
The maximum age of the password in days

Return type
int
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.get_maxdays admin 90
```

salt.modules.mac_shadow.info(name)
Return information for the specified user

Parameters
name (str) -- The username

Returns
A dictionary containing the user's shadow information

Return type
dict

CLI Example:
```
salt '*' shadow.info admin
```

salt.modules.mac_shadow.set_change(name, date)
Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters
- name (str) -- The name of the user account
- date (date) -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns
True if successful, otherwise False

Return type
bool
Raises
CommandExecutionError on user not found or any other unknown error

CLI Example:
```
salt '*' shadow.set_change username 09/21/2016
```

salt.modules.mac_shadow.set_expire(name, date)
Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy
Parameters

- **name** (str) -- The name of the user account
- **date** (datetime) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns

True if successful, False if not

Return type

bool

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

salt.modules.mac_shadow.set_inactdays(name, days)

Set the number of inactive days before the account is locked. Not available in macOS

Parameters

- **name** (str) -- The user name
- **days** (int) -- The number of days

Returns

Will always return False until macOS supports this feature.

Return type

bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

salt.modules.mac_shadow.set_maxdays(name, days)

Set the maximum age of the password in days

Parameters

- **name** (str) -- The username of the account
- **days** (int) -- The maximum age of the account in days

Returns

True if successful, False if not

Return type

bool

Raises

CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

salt.modules.mac_shadow.set_mindays(name, days)

Set the minimum password age in days. Not available in macOS.

Parameters

- **name** (str) -- The user name
- **days** (int) -- The number of days

Returns

Will always return False until macOS supports this feature.

Return type

bool
CLI Example:
```
salt '*' shadow.set_mindays admin 90
```

```
salt.modules.mac_shadow.set_password(name, password)
```
Set the password for a named user (insecure, the password will be in the process list while the command is running)

**Parameters**
- `name (str)` -- The name of the local user, which is assumed to be in the local directory service
- `password (str)` -- The plaintext password to set

**Returns**
- True if successful, otherwise False

**Return type**
- `bool`

**Raises**
- `CommandExecutionError` on user not found or any other unknown error

CLI Example:
```
salt '*' mac_shadow.set_password macuser macpassword
```

```
salt.modules.mac_shadow.set_warndays(name, days)
```
Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

**Parameters**
- `name (str)` -- The user name
- `days (int)` -- The number of days

**Returns**
- Will always return False until macOS supports this feature.

**Return type**
- `bool`

CLI Example:
```
salt '*' shadow.set_warndays admin 90
```

### 26.6.244 salt.modules.mac_softwareupdate

Support for the softwareupdate command on MacOS.

```
salt.modules.mac_softwareupdate.download(name)
```
Download a named update so that it can be installed later with the `update` or `update_all` functions

**Parameters**
- `name (str)` -- The update to download.

**Returns**
- True if successful, otherwise False

**Return type**
- `bool`

CLI Example:
```
salt '*' softwareupdate.download <update name>
```
salt.modules.mac_softwareupdate.download_all(recommended=False, restart=True)

Download all available updates so that they can be installed later with the update or update_all functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended (bool)** -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart (bool)** -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns

A list containing all downloaded updates on the system.

Return type

list

CLI Example:

```
salt '*' softwareupdate.download_all
```

salt.modules.mac_softwareupdate.get_catalog()

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word 'Default' will be returned

Returns

The catalog being used for update lookups

Return type

str

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

salt.modules.mac_softwareupdate.ignore(name)

Ignore a specific program update. When an update is ignored the '-' and version number at the end will be omitted, so "SecUpd2014-001-1.0" becomes "SecUpd2014-001". It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters

- **name** -- The name of the update to add to the ignore list.

Return type

bool

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

salt.modules.mac_softwareupdate.list_available(recommended=False, restart=False, shut_down=False)

List all available updates.

Parameters

- **recommended (bool)** -- Show only recommended updates.
- **restart (bool)** -- Show only updates that require a restart.
Returns
Returns a dictionary containing the updates
Return type
dict
CLI Example:

```
salt '*' softwareupdate.list_available
```

```salt.modules.mac_softwareupdate.list_downloads()

Return a list of all updates that have been downloaded locally.

Returns
A list of updates that have been downloaded
Return type
list
CLI Example:

```
salt '*' softwareupdate.list_downloads
```

```salt.modules.mac_softwareupdate.list_ignored()

List all updates that have been ignored. Ignored updates are shown without the '-' and version number at the end, this is how the softwareupdate command works.

Returns
The list of ignored updates
Return type
list
CLI Example:

```
salt '*' softwareupdate.list_ignored
```

```salt.modules.mac_softwareupdate.reset_catalog()

New in version 2016.3.0.
Reset the Software Update Catalog to the default.

Returns
True if successful, False if not
Return type
bool
CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

```salt.modules.mac_softwareupdate.reset_ignored()

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns
True if the list was reset, Otherwise False
Return type
bool
CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

```salt.modules.mac_softwareupdate.schedule_enable(enable)

Enable/disable automatic update scheduling.

Enable/disable automatic update scheduling.
Parameters

**enable** -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.

Type

bool str

Returns

True if scheduling is enabled, False if disabled

Return type

bool

CLI Example:

```bash
salt '*' softwareupdate.schedule_enable on|off
```

salt.modules.mac_softwareupdate.schedule_enabled()

Check the status of automatic update scheduling.

Returns

True if scheduling is enabled, False if disabled

Return type

bool

CLI Example:

```bash
salt '*' softwareupdate.schedule_enabled
```

salt.modules.mac_softwareupdate.set_catalog(url)

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters

**url** (str) -- The url to the update catalog

Returns

True if successful, False if not

Return type

bool

CLI Example:

```bash
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.→sucatalog
```

salt.modules.mac_softwareupdate.update(name)

Install a named update.

Parameters

**name** (str) -- The name of the of the update to install.

Returns

True if successfully updated, otherwise False

Return type

bool

CLI Example:

```bash
salt '*' softwareupdate.update <update-name>
```

salt.modules.mac_softwareupdate.update_all(recommended=False, restart=True)

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters
• **recommended**(bool) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.

• **restart**(bool) -- Set this to False if you do not want to install updates that require a restart. Default is True

**Returns**
A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.

**Return type**
dict

**CLI Example:**
salt '*' softwareupdate.update_all

**salt.modules.mac_softwareupdate.update_available**(name)
Check whether or not an update is available with a given name.

**Parameters**
name (str) -- The name of the update to look for

**Returns**
True if available, False if not

**Return type**
bool

**CLI Example:**
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"

### 26.6.245 salt.modules.mac_sysctl

Module for viewing and modifying sysctl parameters

**salt.modules.mac_sysctl.assign**(name, value)
Assign a single sysctl parameter for this minion

name
The name of the sysctl value to edit.

value
The sysctl value to apply.

**CLI Example:**
salt '*' sysctl.assign net.inet.icmp.icmplim 50

**salt.modules.mac_sysctl.get**(name)
Return a single sysctl parameter for this minion

name
The name of the sysctl value to display.

**CLI Example:**
salt '*' sysctl.get hw.physmem

**salt.modules.mac_sysctl.persist**(name, value, config='/etc/sysctl.conf', apply_change=False)
Assign and persist a simple sysctl parameter for this minion

name
The name of the sysctl value to edit.
value
   The sysctl value to apply.
config
   The location of the sysctl configuration file.
apply_change
   Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the
   changes are applied to the system.

CLI Example:

```bash
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

salt.modules.mac_sysctl.show(config_file=False)
   Return a list of sysctl parameters for this minion
   config: Pull the data from the system configuration file
           instead of the live data.
   CLI Example:

```bash
salt '*' sysctl.show
```

26.6.246 salt.modules.mac_system

System module for sleeping, restarting, and shutting down the system on Mac OS X

New in version 2016.3.0.

**Warning:** Using this module will enable `atrun` on the system if it is disabled.

salt.modules.mac_system.get_boot_arch()
   Get the kernel architecture setting from `com.apple.Boot.plist`
   Returns
   A string value representing the boot architecture setting
   Return type
   str
   CLI Example:

```bash
salt '*' system.get_boot_arch
```

salt.modules.mac_system.get_computer_name()
   Gets the computer name
   Returns
   The computer name
   Return type
   str
   CLI Example:

```bash
salt '*' system.get_computer_name
```

salt.modules.mac_system.get_disable_keyboard_on_lock()
   Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.
   Returns
   True if disable keyboard on lock is on, False if off

26.6. execution modules
Return type
    bool
CLI Example:

```bash
salt '*' system.get_disable_keyboard_on_lock
```

**salt.modules.mac_system.get_remote_events()**

Displays whether remote apple events are on or off.

- **Returns**
  - True if remote apple events are on, False if off

- **Return type**
  - bool

CLI Example:

```bash
salt '*' system.get_remote_events
```

**salt.modules.mac_system.get_remote_login()**

Displays whether remote login (SSH) is on or off.

- **Returns**
  - True if remote login is on, False if off

- **Return type**
  - bool

CLI Example:

```bash
salt '*' system.get_remote_login
```

**salt.modules.mac_system.get_restart_delay()**

Get the number of seconds after which the computer will start up after a power failure.

- **Returns**
  - A string value representing the number of seconds the system will delay restart after power loss

- **Return type**
  - str

CLI Example:

```bash
salt '*' system.get_restart_delay
```

**salt.modules.mac_system.get_startup_disk()**

Displays the current startup disk

- **Returns**
  - The current startup disk

- **Return type**
  - str

CLI Example:

```bash
salt '*' system.get_startup_disk
```

**salt.modules.mac_system.get_subnet_name()**

Gets the local subnet name

- **Returns**
  - The local subnet name

- **Return type**
  - str

CLI Example:
**salt**

`salt '*' system.get_subnet_name`

**salt.modules.mac_system.halt** *(at_time=None)*

Halt a running system

**Parameters**

- **at_time (str)** -- Any valid at expression. For example, some valid at expressions could be:
  - noon
  - midnight
  - fri
  - 9:00 AM
  - 2:30 PM tomorrow
  - now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

**CLI Example:**

```bash
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

**salt.modules.mac_system.list_startup_disks()**

List all valid startup disks on the system.

**Returns**

A list of valid startup disks

**Return type**

list

**CLI Example:**

```bash
salt '*' system.list_startup_disks
```

**salt.modules.mac_system.restart** *(at_time=None)*

Restart the system

**Parameters**

- **at_time (str)** -- Any valid at expression. For example, some valid at expressions could be:
  - noon
  - midnight
  - fri
  - 9:00 AM
  - 2:30 PM tomorrow
  - now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"
CLI Example:

```bash
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

```
salt.modules.mac_system.set_boot_arch(arch='default')
salt.modules.mac_system.set_boot_arch(arch='default')
```

Set the kernel to boot in 32 or 64 bit mode on next boot.

**Note:** When this function fails with the error *changes to kernel architecture failed to save!*, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

**Parameters**

`arch (str)` -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

- `i386`
- `x86_64`
- `default`

**Returns**

True if successful, False if not

**Return type**

`bool`

CLI Example:

```bash
salt '*' system.set_boot_arch i386
```

```
salt.modules.mac_system.set_computer_name(name)
salt.modules.mac_system.set_computer_name(name)
```

Set the computer name

**Parameters**

`name (str)` -- The new computer name

**Returns**

True if successful, False if not

**Return type**

`bool`

CLI Example:

```bash
salt '*' system.set_computer_name "Mike's Mac"
```

```
salt.modules.mac_system.set_disable_keyboard_on_lock(enable)
salt.modules.mac_system.set_disable_keyboard_on_lock(enable)
```

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

**Parameters**

`enable (bool)` -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

**Returns**

True if successful, False if not

**Return type**

`bool`

CLI Example:

```bash
salt '*' system.set_disable_keyboard_on_lock False
```
salt.modules.mac_system.set_remote_events(enable)
Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters
enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:
salt '*' system.set_remote_events On

salt.modules.mac_system.set_remote_login(enable)
Set the remote login (SSH) to either on or off.

Parameters
enable (bool) -- True to enable, False to disable. "On" and "Off" are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns
True if successful, False if not

Return type
bool

CLI Example:
salt '*' system.set_remote_login True

salt.modules.mac_system.set_restart_delay(seconds)
Set the number of seconds after which the computer will start up after a power failure.

Warning: This command fails with the following error:
Error, IOServiceOpen returned 0x10000003

The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.

Parameters
seconds (int) -- The number of seconds. Must be a multiple of 30

Returns
True if successful, False if not

Return type
bool

CLI Example:
salt '*' system.set_restart_delay 180

salt.modules.mac_system.set_startup_disk(path)
Set the current startup disk to the indicated path. Use system.list_startup_disks to find valid startup disks on the system.

Parameters
path (str) -- The valid startup disk path
Returns
True if successful, False if not
Return type
bool
CLI Example:
```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

```python
salt.modules.mac_system.set_subnet_name(name)
```
Set the local subnet name
Parameters

```
name (str) -- The new local subnet name
```

Note: Spaces are changed to dashes. Other special characters are removed.

Returns
True if successful, False if not
Return type
bool
CLI Example:
```
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

```python
salt.modules.mac_system.shutdown(at_time=None)
```
Shutdown the system
Parameters

```
at_time (str) -- Any valid at expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes
```

Note: If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:
```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

```python
salt.modules.mac_system.sleep(at_time=None)
```
Sleep the system. If a user is active on the system it will likely fail to sleep.
Parameters

```
at_time (str) -- Any valid at expression. For example, some valid at expressions could be:
```

• noon
• midnight
• fri
• 9:00 AM
• 2:30 PM tomorrow
• now + 10 minutes

**Note:** If you pass a time only, with no 'AM/PM' designation, you have to double quote the parameter on the command line. For example: "14:00"

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

### 26.6.247 salt.modules.mac_timezone

Module for editing date/time settings on macOS

New in version 2016.3.0.

**salt.modules.mac_timezone.get_date()**

Displays the current date

Returns

the system date

Return type

str

CLI Example:

```
salt '*' timezone.get_date
```

**salt.modules.mac_timezone.get_hwclock()**

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

**salt.modules.mac_timezone.get_offset()**

Displays the current time zone offset

Returns

The current time zone offset

Return type

str

CLI Example:

```
salt '*' timezone.get_offset
```

**salt.modules.mac_timezone.get_time()**

Get the current system time.
Returns
The current time in 24 hour format
Return type
str
CLI Example:
salt '*' timezone.get_time

salt.modules.mac_timezone.get_time_server()
Display the currently set network time server.
Returns
the network time server
Return type
str
CLI Example:
salt '*' timezone.get_time_server

salt.modules.mac_timezone.get_using_network_time()
Display whether network time is on or off
Returns
True if network time is on, False if off
Return type
bool
CLI Example:
salt '*' timezone.get_using_network_time

salt.modules.mac_timezone.get_zone()
Displays the current time zone
Returns
The current time zone
Return type
str
CLI Example:
salt '*' timezone.get_zone

salt.modules.mac_timezone.get_zonecode()
Displays the current time zone abbreviated code
Returns
The current time zone code
Return type
str
CLI Example:
salt '*' timezone.get_zonecode

salt.modules.mac_timezone.list_zones()
Displays a list of available time zones. Use this list when setting a time zone using timezone.set_zone
Returns
a list of time zones
Return type
list
CLI Example:

```
salt '*' timezone.list_zones
```

salt.modules.mac_timezone.set_date\(date\)

Set the current month, day, and year

**Parameters**

\(date\)\(\text{(str)}\) -- The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

SaltInvocationError on Invalid Date format

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

salt.modules.mac_timezone.set_hwclock\(clock\)

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.mac_timezone.set_time\(time\)

Sets the current time. Must be in 24 hour format.

**Parameters**

\(time\)\(\text{(str)}\) -- The time to set in 24 hour format. The value must be double quoted. ie: "17:46"

**Returns**

True if successful, False if not

**Return type**

bool

**Raises**

SaltInvocationError on Invalid Time format

**Raises**

CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time "17:34"
```

salt.modules.mac_timezone.set_time_server\(time_server='time.apple.com'\)

Designates a network time server. Enter the IP address or DNS name for the network time server.

**Parameters**

\(time_server\) -- IP or DNS name of the network time server. If nothing is passed the time server will be set to the macOS default of 'time.apple.com'
Type
str

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on failure

CLI Example:
```
salt '*' timezone.set_time_server time.acme.com
```

salt.modules.mac_timezone.set_using_network_time(enable)
Set whether network time is on or off.

Parameters

- **enable** -- True to enable, False to disable. Can also use 'on' or 'off'

Type
str bool

Returns
True if successful, False if not

Return type
bool

Raises
CommandExecutionError on failure

CLI Example:
```
salt '*' timezone.set_using_network_time True
```

salt.modules.mac_timezone.set_zone(time_zone)
Set the local time zone. Use timezone.list_zones to list valid time_zone arguments

Parameters

- **time_zone** (str) -- The time zone to apply

Returns
True if successful, False if not

Return type
bool

Raises
SaltInvocationError on Invalid Timezone

CLI Example:
```
salt '*' timezone.set_zone America/Denver
```

salt.modules.mac_timezone.zone_compare(time_zone)
Compares the given timezone name with the system timezone name.

Returns
True if they are the same, False if not

Return type
bool

CLI Example:
```
salt '*' timezone.zone_compare America/Boise
```
26.6.248 salt.modules.mac_user

Manage users on Mac OS 10.7+

**Important:** If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to 'user.info' is not available), see [here](#).
