    - \* 4164047951 Fix apache.config with multiple statement At this moment when you post more than one statement in config only last is used. Also file is rewritten multiple times until last statement is written. Example: salt '\*' apache.config /etc/httpd/conf.d/ports.conf config="{Listen: '8080'}, {'Proxy': 'Something'}" Ends only with Proxy Something and ignore Listen 8080, This patch fix this issue.

## Changes to `file.blockreplace` State

The `append_newline` argument was added to this state. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

---

**Note:** This will require changes to your SLS if your `marker_end` does not include the very beginning of the content you want to keep.

---

See the `file.blockreplace` state documentation for further information.

#### Tornado 5.0 Support for Python 2 Only

Tornado 5.0 moves to using asyncio for all python3 versions. Because of this and changes in asyncio between python 3.4 and 3.5 to only be able to use one ioloop, which requires some rearchitecting, support for tornado 5.0 and python3 versions of salt has been delayed to a later release.

For now, to use tornado 5.0, the python 2 version of salt must be used.

## Option to Return to Previous Pillar Include Behavior

Prior to version 2017.7.3, keys from *pillar includes* would be merged on top of the pillar SLS. Since 2017.7.3, the includes are merged together and then the pillar SLS is merged on top of that.

The *pillar\_includes\_override\_sls* option has been added allow users to switch back to the pre-2017.7.3 behavior.

  - 152c43c843 Accounting for a case when multiple onfails are used along with requires. Previously if you have multiple states using 'onfail' and two of those states using a 'require' against the first one state, the last two will run even if the 'onfail' isn't met because the 'require' is met because the first state returns true even though it didn't execute. This change adds an additional hidden variable that is used when checking requisities to determine if the state actually ran.

### 33.2.80 Salt 2017.7.7 Release Notes

Version 2017.7.7 is a bugfix release for 2017.7.0.

The 2017.7.7 release contains only a small number of fixes, which are detailed below.

This release fixes two critical issues.

The first is Issue #48038, which is a critical bug that occurs in a multi-syndic setup where the same job is run multiple times on a minion.

The second issue is #48130. This bug appears in certain setups where the Master reports a Minion time-out, even though the job is still running on the Minion.

Both of these issues have been fixed with this release.

### 33.2.81 Salt 2017.7.8 Release Notes

Version 2017.7.8 is a security and bugfix release for 2017.7.0.

#### Statistics

- Total Merges: 237

#### Security Fix

CVE-2018-15751 Remote command execution and incorrect access control when using salt-api.

CVE-2018-15750 Directory traversal vulnerability when using salt-api. Allows an attacker to determine what files exist on a server when querying /run or /events.

Credit and thanks for discovery and responsible disclosure: nullbr4in, xcuter, koredge, loupos, blackcon, Naver Business Platform

#### New win\_snmp behavior

- `win_snmp.get_community_names` now returns the SNMP settings actually in effect on the box. If settings are managed via GroupPolicy, those settings will be returned. Otherwise, normal settings are returned.
- `win_snmp.set_community_names` now raises an error when SNMP settings are being managed by GroupPolicy.

#### Option Added to Disable Docker Mine Updates

When a docker container is added, removed, started, stopped, etc., the results of a `docker.ps verbose=True all=True host=True` are sent to the `mine`, to be used by `mine.get_docker`.

A new config option (`docker.update_mine`) has been added. When set to `False`, Salt will not send this information to the mine. This is useful in cases where sensitive information is stored in the container's environment.

- **PR #48426:** (garethgreenaway) [2017.7] fixes to states/pkg.py @ 2018-07-31 20:18:05 UTC
  - 8a1285239a Merge pull request #48426 from garethgreenaway/46689\_fixing\_pkg\_held\_when\_package\_is\_installed
  - 9b0f5dd212 Fixing indentation, removing some unnecessary conditionals.
  - 727964ab55 One last cleanup.
  - 11cb86e6eb General cleanup in pkg state, reducing duplicate code. Fixing the requires\_salt\_modules decorator, sys.doc was returning too much information for the event to handle. This change specifically calls sys.doc with the module name.
  - 16fb6ae635 Make sure pkg.hold and pkg.unhold are available before running the test.
  - 998651102d Fixing a situation when a package is already installed via salt or manually and a state attempts to set that package to be held. Previously the holding/unholding logic was only being run against packages that were being installed. This change moves the holding logic outside and runs it against all desired packages. Adding a new test to test holding logic.

### 33.2.82 In Progress: Salt 2017.7.9 Release Notes

Version 2017.7.9 is an **unreleased** bugfix release for *2017.7.0*. This release is still in progress and has not been released yet.

#### Salt Cloud Features

##### GCE Driver

The GCE salt cloud driver can now be used with GCE instance credentials by setting the configuration parameters `service_account_private_key` and `service_account_private_email` to an empty string.

## 33.2.83 Salt 2016.11.0 Release Notes - Codename Carbon

### New Features

#### Docker Introspection and Configuration

Major additions have been made to the Docker support in 2016.11.0. The new addition allows Salt to be executed within a Docker container without a minion running or installed in the container. This allows states to be run inside a container, but also all of Salt's remote execution commands to be run inside docker containers as well. This makes container introspection simple and powerful. See the tutorial on using this new feature here:

See *Salt in Docker Containers*.

#### Advanced Ceph Control

Our friends over at SUSE have delivered a powerful new tool to make the deployment of Ceph storage systems using Salt very easy. These new Ceph tools allow for a storage system to be easily defined using the new *ceph.quorum* state.

#### Thorium Additions and Improvements

The Thorium advanced reactor has undergone extensive testing and updates. These updates include many more Thorium states, a system for automating key management, the ability to use Thorium to easily replace old reactors and a great deal of stability and bug fixes.

#### State Rollback Using Snapper

Rollback has been one of the most prevalent requests for Salt. We have researched it extensively and concluded that the only way to accomplish truly reliable rollback would be to execute it at the filesystem layer. To accomplish this we have introduced Snapper integration into Salt States.

Snapper is a tool which allows for simple and reliable snapshots of the filesystem to be made. With the new *snapper\_states* option set to *True* in the minion config a snapshot will be made before and after every Salt State run.

These snapshots can be viewed, managed and rolled back to via the *snapper* execution module.

#### Preserve File Perms in File States

This feature has been requested for years, the ability to set a flag and use the same file permissions for files deployed to a minion as the permissions set to the file on the master. Just set the *keep\_mode* option on any file management state to *True*.

## Ponies!

We all agreed that cowsay was just not good enough, install the *ponysay* command and the new *pony* outputter will work. Fun for the whole family!

## Additional Features

- Minions can run in stand-alone mode to use beacons and engines without having to connect to a master. (Thanks @adelcast!)
- Added a `salt` runner to allow running salt modules via `salt-run`.

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

- Added SSL support to Cassandra CQL returner. SSL can be enabled by setting `ssl_options` for the returner. Also added support for specifying `protocol_version` when establishing cluster connection.
- The `mode` parameter in the *file.managed* state, and the `file_mode` parameter in the *file.recurse* state, can both now be set to `keep` and the minion will keep the mode of the file from the Salt fileserver. This works only with files coming from sources prefixed with `salt://`, or files local to the minion (i.e. those which are absolute paths, or are prefixed with `file://`). For example:

```
/etc/myapp/myapp.conf:
file.managed:
- source: salt://conf/myapp/myapp.conf
- mode: keep

/var/www/myapp:
file.recurse:
- source: salt://path/to/myapp
- dir_mode: 755
- file_mode: keep
```

- The `junos` state module is now available. It has all the functions that are present in the `junos` execution module.
- The `junos` state module is now available. It has all the functions that are present in the `junos` execution module.
- The minion data cache is a pluggable data store now. It's configurable with `cache` option. Default is `localfs`.
- User names in `client_acl` support glob matching now.

## New Top File Merging Strategy for States

A new strategy called `merge_all` has been added to provide a new way of merging top file matches when executing a `highstate`. See the [top\\_file\\_merging\\_strategy](#) documentation for further information.

In addition, the `same` merging strategy was not functioning as documented. This has now been corrected. While this is technically a bugfix, we decided to hold a change in top file merging until a feature release to minimize user impact.

## Improved Archive Extraction Support

The `archive.extracted` state has been overhauled. Notable changes include the following:

- When enforcing ownership (with the `user` and/or `group` arguments), the `if_missing` argument no longer has any connection to which path(s) have ownership enforced. Instead, the paths are determined using the either the newly-added `archive.list` function, or the newly-added `enforce_ownership_on` argument.
- `if_missing` also is no longer required to skip extraction, as Salt is now able to tell which paths would be present if the archive were extracted. It should, in most cases, only be necessary in cases where a semaphore file is used to conditionally skip extraction of the archive.
- Password-protected ZIP archives are now detected before extraction, and the state fails without attempting to extract the archive if no password was specified.
- By default, a single top-level directory is enforced, to guard against 'tar-bombs'. This enforcement can be disabled by setting `enforce_toplevel` to `False`.
- The `tar_options` and `zip_options` arguments have been deprecated in favor of a single `options` argument.
- The `archive_format` argument is now optional. The ending of the `source` argument is used to guess whether it is a tar, zip or rar file. If the `archive_format` cannot be guessed, then it will need to be specified, but in many cases it can now be omitted.
- Ownership enforcement is now performed irrespective of whether or not the archive needed to be extracted. This means that the state can be re-run after the archive has been fully extracted to repair changes to ownership.

A number of new arguments were also added. See the docs `py:func:docs for the archive.extracted state <salt.states.archive.extracted>` for more information.

Additionally, the following changes have been made to the `archive` execution module:

- A new function (`archive.list`) has been added. This function lists the files/directories in an archive file, and supports a `verbose` argument that gives a more detailed breakdown of which paths are files, which are directories, and which paths are at the top level of the archive.
- A new function (`archive.is_encrypted`) has been added. This function will return `True` if the archive is a password-protected ZIP file, `False` if not. If the archive is not a ZIP file, an error will be raised.
- `archive.cmd_unzip` now supports passing a password, bringing it to feature parity with `archive.unzip`. Note that this is still not considered to be secure, and `archive.unzip` is recommended for dealing with password-protected ZIP archives.
- The default value for the `extract_perms` argument to `archive.unzip` has been changed to `True`.

## Improved Checksum Handling in `file.managed`, `archive.extracted` States

When the `source_hash` argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (`source_hash_name`) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the `source_hash` file.

A more detailed explanation of this functionality can be found in the *file.managed* documentation, in the section for the new `source_hash_name` argument.

---

**Note:** This improved functionality is also available in the 2016.3 (Boron) release cycle, starting with the 2016.3.5 release.

---

## Config Changes

The following default config values were changed:

- `gitfs_ssl_verify`: Changed from `False` to `True`
- `git_pillar_ssl_verify`: Changed from `False` to `True`
- `winrepo_ssl_verify`: Changed from `False` to `True`

## Grains Changes

- All core grains containing `VMWare` have been changed to `VMware`, which is the [official capitalization](#). Additionally, all references to `VMWare` in the documentation have been changed to `VMware` [issue 30807](#). Environments using versions of Salt before and after Salt 2016.11.0 should employ case-insensitive grain matching on these grains.

```
{% set on_vmware = grains['virtual'].lower() == 'vmware' %}
```

- On Windows the `cpu_model` grain has been changed to provide the actual cpu model name and not the cpu family.

Old behavior:

```
root@master:~# salt 'testwin200' grains.item cpu_model
testwin200:
-----
cpu_model:
  Intel64 Family 6 Model 58 Stepping 9, GenuineIntel
```

New behavior:

```
root@master:~# salt 'testwin200' grains.item cpu_model
testwin200:
-----
cpu_model:
  Intel(R) Core(TM) i7-3520M CPU @ 2.90GHz
```

## Beacons Changes

- The `loadavg` beacon now outputs averages as integers instead of strings. (Via [issue 31124](#).)

## Runner Changes

- Runners can now call out to *utility modules* via `__utils__`.
- `ref:Utility modules <writing-utility-modules>` (placed in `salt://_utils/`) are now able to be synced to the master, making it easier to use them in custom runners. A `saltutil.sync_utils` function has been added to the `saltutil runner` to facilitate the syncing of utility modules to the master.

## Pillar Changes

- Thanks to the new `saltutil.sync_utils` runner, it is now easier to get `ref:utility modules <writing-utility-modules>` synced to the correct location on the Master so that they are available in execution modules called from Pillar SLS files.

## Junos Module Changes

- The following new functionalities were added to the junos module
  - `facts` - Displays the facts gathered during the connection.
  - `shutdown` - Shut down or reboot a device running Junos OS.
  - `install_config` - Modify the configuration of a Junos device.
  - `install_os` - Install Junos OS software package.
  - `zeroize` - Remove all configuration information on the Routing Engines and reset all key values on a device.
  - `file_copy` - Copy file from proxy to the Junos device.

## Network Automation: NAPALM

Beginning with 2016.11.0, network automation is included by default in the core of Salt. It is based on a the [NAPALM](#) library and provides facilities to manage the configuration and retrieve data from network devices running widely used operating systems such: JunOS, IOS-XR, eOS, IOS, NX-OS etc.

- see [the complete list of supported devices](#).

The connection is established via the `NAPALM proxy`.

In the current release, the following modules were included:

- `NAPALM grains` - Select network devices based on their characteristics
- `NET execution module` - Networking basic features
- `NTP execution module`
- `BGP execution module`
- `Routes execution module`
- `SNMP execution module`
- `Users execution module`

- *Probes execution module*
- *NTP peers management state*
- *SNMP configuration management state*
- *Users management state*

### Cisco NXOS Proxy Minion

Beginning with 2016.11.0, there is a proxy minion that can be used to configure nxos cisco devices over ssh.

- *Proxy Minion*
- *Execution Module*
- *State Module*

### Cisco Network Services Orchestrator Proxy Minion

Beginning with 2016.11.0, there is a proxy minion to use the Cisco Network Services Orchestrator as a proxy minion.

- *Proxy Minion*
- *Execution Module*
- *State Module*

### Junos Module Changes

- The following new functionalities were added to the junos module
  - facts - Displays the facts gathered during the connection.
  - shutdown - Shut down or reboot a device running Junos OS.
  - install\_config - Modify the configuration of a Junos device.
  - install\_os - Install Junos OS software package.
  - zeroize - Remove all configuration information on the Routing Engines and reset all key values on a device.
  - file\_copy - Copy file from proxy to the Junos device.

### Returner Changes

- Any returner which implements a *save\_load* function is now required to accept a *minions* keyword argument. All returners which ship with Salt have been modified to do so.

## Renderer Changes

Added the ability to restrict allowed renderers. Two new config parameters, `renderer_whitelist` and `renderer_blacklist` are introduced for this purpose.

## eAuth Changes

- External auth modules' `auth` method can return an ACL list for the given username instead of `True`. This list should be in the same format as described in the *eAuth documentation*. It will be used for the user instead of one set in master config.

Example of the `auth` method return that allows a user to execute functions in the `test` and `network` modules on the minions that match the `web*` target and allow access to `wheel` and `runner` modules:

```
[{"web*": ["test.*", "network.*"]}, "@wheel", "@runner"]
```

- External auth is supported by `salt-run` and `salt-key` now. Note that master must be started to use them with eAuth.

## External Module Packaging

Modules may now be packaged via entry-points in `setuptools`. See *external module packaging* tutorial for more information.

## Functionality Changes

- The `onfail` requisite now uses OR logic instead of AND logic. [issue 22370](#)
- The `consul` external pillar now strips leading and trailing whitespace. [issue 31165](#)
- The `win_system.py` state is now case sensitive for computer names. Previously computer names set with a state were converted to all caps. If you have a state setting computer names with lower case letters in the name that has been applied, the computer name will be changed again to apply the case sensitive name.
- The `mac_user.list_groups` function in the `mac_user` execution module now lists all groups for the specified user, including groups beginning with an underscore. In previous releases, groups beginning with an underscore were excluded from the list of groups.
- The `junos.call_rpc` function in the `junos` execution module can now be used to call any valid `rpc`. Earlier it used to call only "get\_software\_information".
- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default `hash_type` is now `sha256` instead of `md5`. You will need to make sure both your master and minion share the same `hash_type`.
- Nodegroups consisting of a simple list of minion IDs can now also be declared as a `yaml` list. The below two examples are equivalent:

```
# Traditional way
nodegroups:
- group1: L@host1,host2,host3
```

(continues on next page)

(continued from previous page)

```
# New way (optional)
nodegroups:
  - group1:
    - host1
    - host2
    - host3
```

## New Azure ARM Cloud Driver

A new cloud driver has been added for Azure ARM, aka, the Azure Resource Manager. The older Azure driver is still required to work with the older Azure API. This new driver works with the newer ARM API, which is managed via the newer Azure Portal website.

## New Modules

### Beacons

## Thorium

- `salt.thorium.calc`
- `salt.thorium.key`
- `salt.thorium.runner`
- `salt.thorium.status`
- `salt.thorium.wheel`

## Deprecations

### General Deprecations

- `env` to `saltenv`

All occurrences of `env` and some occurrences of `__env__` marked for deprecation in Salt 2016.11.0 have been removed. The new way to use the salt environment setting is with a variable called `saltenv`:

```
def fcn(msg="", env="base", refresh=True, saltenv="base", **kwargs): ...
```

has been changed to

```
def fcn(msg="", refresh=True, saltenv="base", **kwargs): ...
```

- If `env` (or `__env__`) is supplied as a keyword argument to a function that also accepts arbitrary keyword arguments, then a new warning informs the user that `env` is no longer used if it is found. This new warning will be removed in Salt 2017.7.0.

```
def fcn(msg="", refresh=True, saltenv="base", **kwargs): ...
```

```
# will result in a warning log message
fcn(msg="add more salt", env="prod", refresh=False)
```

- If `env` (or `__env__`) is supplied as a keyword argument to a function that does not accept arbitrary keyword arguments, then python will issue an error.

```
def fcn(msg="", refresh=True, saltenv="base"): ...
```

```
# will result in a python TypeError  
fcn(msg="add more salt", env="prod", refresh=False)
```

- If `env` (or `__env__`) is supplied as a positional argument to a function, then undefined behavior will occur, as the removal of `env` and `__env__` from the function's argument list changes the function's signature.

```
def fcn(msg="", refresh=True, saltenv="base"): ...
```

```
# will result in refresh evaluating to True and saltenv likely not  
↳ being a string at all  
fcn("add more salt", "prod", False)
```

- Deprecations in `minion.py`:
  - The `salt.minion.parse_args_and_kwargs` function has been removed. Please use the `salt.minion.load_args_and_kwargs` function instead.

## Cloud Deprecations

- The `vsphere` cloud driver has been removed. Please use the `vmware` cloud driver instead.
- The `private_ip` option in the `linode` cloud driver is deprecated and has been removed. Use the `assign_private_ip` option instead.
- The `create_dns_record` and `delete_dns_record` functions are deprecated and have been removed from the `digital_ocean` driver. Use the `post_dns_record` function instead.

## Execution Module Deprecations

- The `blockdev` execution module had four functions removed:
  - `dump`
  - `tune`
  - `resize2fs`
  - `wipe`

The `disk` module should be used instead with the same function names.

- The `boto_vpc` execution module had two functions removed, `boto_vpc.associate_new_dhcp_options_to_vpc` and `boto_vpc.associate_new_network_acl_to_subnet` in favor of more concise function names, `boto_vpc.create_dhcp_options` and `boto_vpc.create_network_acl`, respectively.
- The `data` execution module had `getval` and `getvals` functions removed in favor of one function, `get`, which combines the functionality of the removed functions.
- File module deprecations:
  - The `contains_regex_multiline` function was removed. Use `file.search` instead.

- Additional command line options for `file.grep` should be passed one at a time. Please do not pass more than one in a single argument.
- The `lxc` execution module has the following changes:
  - The `run_cmd` function was removed. Use `lxc.run` instead.
  - The `nic` argument was removed from the `lxc.init` function. Use `network_profile` instead.
  - The `clone` argument was removed from the `lxc.init` function. Use `clone_from` instead.
  - passwords passed to the `lxc.init` function will be assumed to be hashed, unless `password_encrypted=False`.
  - The `restart` argument for `lxc.start` was removed. Use `lxc.restart` instead.
  - The old style of defining `lxc` containers has been removed. Please use keys under which LXC profiles should be configured such as `lxc.container_profile.profile_name`.
- The `env` and `activate` keyword arguments have been removed from the `install` function in the `pip` execution module. The use of `bin_env` replaces both of these options.
- `reg` execution module

Functions in the `reg` execution module had misleading and confusing names for dealing with the Windows registry. They failed to clearly differentiate between hives, keys, and name/value pairs. Keys were treated like value names. There was no way to delete a key.

New functions were added in 2015.5 to properly work with the registry. They also made it possible to edit key default values as well as delete an entire key tree recursively. With the new functions in place, the following functions have been deprecated:

- `read_key`
- `set_key`
- `create_key`
- `delete_key`

Use the following functions instead:

- for `read_key` use `read_value`
- for `set_key` use `set_value`
- for `create_key` use `set_value` with no `vname` and no `vdata`
- for `delete_key` use `delete_key_recursive`. To delete a value, use `delete_value`.

- The `hash_hostname` option was removed from the `salt.modules.ssh` execution module. The `hash_known_hosts` option should be used instead.
- The `human_readable` option was removed from the `uptime` function in the `status` execution module. The function was also updated in 2015.8.9 to return a more complete offering of uptime information, formatted as an easy-to-read dictionary. This updated function replaces the need for the `human_readable` option.
- The `persist` kwarg was removed from the `win_useradd` execution module. This option is no longer supported for Windows. `persist` is only supported as part of user management in UNIX/Linux.
- The `zpool_list` function in the `zpool` execution module was removed. Use `list` instead.

## Outputter Module Deprecations

- The `compact` outputter has been removed. Set `state_verbose` to `False` instead.

## Runner Module Deprecations

- The `grains.cache` runner no longer accepts `outputter` or `minion` as keyword arguments. Users will need to specify an outputter using the `--out` option. `tgt` is replacing the `minion` kwarg.
- The `fileservers` runner no longer accepts the `outputter` keyword argument. Users will need to specify an outputter using the `--out` option.
- The `jobs` runner no longer accepts the `outputter` keyword argument. Users will need to specify an outputter using the `--out` option.
- `virt` runner module:
  - The `hyper` kwarg was removed from the `init`, `list`, and `query` functions. Use the `host` option instead.
  - The `next_hyper` function was removed. Use the `next_host` function instead.
  - The `hyper_info` function was removed. Use the `host_info` function instead.

## State Module Deprecations

- The `env` and `activate` keyword arguments were removed from the `installed` function in the `pip` state module. The use of `bin_env` replaces both of these options.
- `reg` state module

The `reg` state module was modified to work with the new functions in the execution module. Some logic was left in the `reg.present` and the `reg.absent` functions to handle existing state files that used the final key in the name as the value name. That logic has been removed so you now must specify value name (`vname`) and, if needed, value data (`vdata`).

For example, a state file that adds the version value/data pair to the `Software\Salt` key in the `HKEY_LOCAL_MACHINE` hive used to look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt\\version:
reg.present:
  - value: 2016.3.1
```

Now it should look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt
reg.present:
  - vname: version
  - vdata: 2016.3.1
```

A state file for removing the same value added above would have looked like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt\\version:
reg.absent:
```

Now it should look like this:

```
HKEY_LOCAL_MACHINE\\Software\\Salt
reg.absent:
  - vname: version
```

This new structure is important as it allows salt to deal with key default values which was not possible before. If `vname` is not passed, salt will work with the default value for that hivekey.

Additionally, since you could only delete a value from a the state module, a new function (`key_absent`) has been added to allow you to delete a registry key and all subkeys and name/value pairs recursively. It uses the new `delete_key_recursive` function.

For additional information see the documentation for the `reg` execution and state modules.

- `lxc` state module: The following functions were removed from the `lxc` state module:
  - `created`: replaced by the `present` state.
  - `started`: replaced by the `running` state.
  - `cloned`: replaced by the `present` state. Use the `clone_from` argument to set the name of the clone source.
- The `hash_hostname` option was removed from the `salt.states.ssh_known_hosts` state. The `hash_known_hosts` option should be used instead.
- The `always` kwarg used in the `built` function of the `pkgbuild` state module was removed. Use `force` instead.

### Utils Module Deprecations

- The use of `jid_dir` and `jid_load` were removed from the `salt.utils.jid.jid_dir` functionality for `job_cache` management was moved to the `local_cache` returner. `jid_load` data is now retrieved from the `master_job_cache`.
- `ip_in_subnet` function in `salt.utils.network.py` has been removed. Use the `in_subnet` function instead.
- The `iam` utils module had two functions removed: `salt.utils.iam.get_iam_region` and `salt.utils.iam.get_iam_metadata` in favor of the `aws` utils functions `salt.utils.aws.get_region_from_metadata` and `salt.utils.aws.creds`, respectively.

### 33.2.84 Salt 2016.11.1 Release Notes

### 33.2.85 Salt 2016.11.10 Release Notes

Version 2016.11.10 is a security release for *2016.11.0*.

#### Changes for v2016.11.9..v2016.11.10

##### Security Fix

CVE-2018-15751 Remote command execution and incorrect access control when using salt-api.

CVE-2018-15750 Directory traversal vulnerability when using salt-api. Allows an attacker to determine what files exist on a server when querying /run or /events.

Credit and thanks for discovery and responsible disclosure: nullbr4in, xcuter, koredge, loupos, blackcon, Naver Business Platform

### 33.2.86 Salt 2016.11.2 Release Notes

Version 2016.11.2 is a bugfix release for *2016.11.0*.

#### Statistics

- Total Merges: 157
- Total Issue References: 34
- Total PR References: 116
- Contributors: 45 (Ch3LL, Cybolic, DmitryKuzmenko, UtahDave, Vaelatern, alex-zel, alxwr, amendlik, anlutro, aosagie, basdusee, bbinet, benediktwerner, cachedout, clinta, cro, dereckson, disaster123, ewapptus, ezh, folti, gmacon, gqgunhed, gtmanfred, kkoppel, lorengordon, martintamare, mcalmer, meaksh, mirceaulinic, mostafahussein, mvdwalle, rallytime, rbjorklin, scthi, sjorge, techhat, terminalmage, tsaridas, twangboy, vutny, wolfpackmars2, yhekma, yopito, yue9944882)

#### Security Fixes

**CVE-2017-5192** local\_batch client external authentication not respected

The `LocalClient.cmd_batch()` method client does not accept `external_auth` credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the `root` user.

**CVE-2017-5200** Salt-api allows arbitrary command execution on a salt-master via Salt's `ssh_client`

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone upgrade to 2016.11.2 as soon as possible.

- **PR #39153:** (nicholasmhughes) Fix selinux.mode state config file handling @ 2017-02-06 18:37:34 UTC
  - 30455079fe Merge pull request #39153 from nicholasmhughes/fix-selinux.mode-config-predictability
  - 8d8ba9c7d2 added the new getconfig function to the test
  - a6a24e1a1b Addressed edge case when attempting to set the config file to 'Disabled'. The state should only check the file, since the in-memory setting won't disappear until after reboot.
  - 6858658cc2 The selinux.mode state only checked the current status of SELinux in memory (getenforce) when determining if changes needed to be made. The /etc/selinux/config file could have a different value, and it would not be changed. This commit enhances idempotency of the state in regards to both the in-memory and configuration file enforcement of SELinux.

### 33.2.88 Salt 2016.11.4 Release Notes

Version 2016.11.4 is a bugfix release for *2016.11.0*.

#### Statistics

- Total Merges: 276
- Total Issue References: 63
- Total PR References: 223
- Contributors: 62 (Ch3LL, DennisHarper, DmitryKuzmenko, L4rS6, MasterNayru, Seb-Solon, The-Loeki, Utah-Dave, aabognah, alankrita, amontalban, ardakuyumcu, attiasr, bdrung, bewing, cachedout, cro, defanator, discountbin, dmurphy18, drawsmcgraw, eldadru, garethgreenaway, githubcdr, gtmanfred, hkrist, isbm, jbadson, jeanpralo, jettero, jinn, joe-niland, kaszuba, lomeroy, lorengordon, mateiw, mcalmer, mchugh19, meaksh, mirceaulinic, mlalpho, narendraingale2, nmadhok, rallytime, redbaron4, roaldnefs, s0undt3ch, skazi0, skizunov, smarsching, sofixa, sp1r, sthrasher, techhat, terminalmage, thatch45, thor, ticosax, twangboy, vutny, whiteinge, zer0def)

#### AIX Support Expanded

AIX support has been added for the following execution modules:

- *user*
- *group*
- *network*
- *status*
- *timezone*

Additionally, AIX is now supported in the *disk.iostat* remote-execution function, and the *status* beacon is now supported.

#### Minion Data Cache Enhancement

Memcache is now supported as a data store for the minion data cache.

Memcache is an additional cache layer that keeps a limited amount of data fetched from the minion data cache for a limited period of time in memory that makes cache operations faster. It doesn't make much sense for the `localfs` cache driver but helps for more complex drivers like `consul`.

For more details see `memcache_expire_seconds` and other `memcache_*` options in the master config reference.

## Docker Fixes

- Docker authentication has been re-organized. Instead of attempting a login for each push/pull (which was unnecessary), a new function called `dockerng.login` has been added, which authenticates to the registry and adds the credential token to the `~/.docker/config.json`. After upgrading, if you have not already performed a `docker login` on the minion using the docker CLI, you will need to run `dockerng.login` to login. This only needs to be done once.
- A bug in resolving the tag name for images in a custom registry (where a colon can appear in the image name, e.g. `myregistry.com:5000/image:tagname`) has been fixed. In previous releases, Salt would use the colon to separate the tag name from the image name, and if there was no colon, the default tag name of `latest` would be assumed. However, this caused custom registry images to be misidentified when no explicit tag name was passed (e.g. `myregistry.com:5000/image`). To work around this in earlier releases, simply specify the tag name.

## Salt-Cloud Fixes

2016.11.0 added support for templating userdata files for the `ec2` driver, using the `renderer` option from the master config file. However, as the default renderer first evaluates jinja templating, followed by loading the data as a YAML dictionary, this results in unpredictable results when userdata files are comprised of non-YAML data (which they generally are).

2016.11.4 fixes this by only templating the `userdata_file` when it is explicitly configured to do so. This is done by adding a new optional parameter to the cloud profile called `userdata_template`. This option is used in the same way as the `template` argument in `file.managed` states, it is simply set to the desired templating renderer:

```
my-ec2-config:
# Pass userdata to the instance to be created
userdata_file: /etc/salt/my-userdata-file
userdata_template: jinja
```

If no `userdata_template` option is set in the cloud profile, then salt-cloud will check for the presence of the master configuration parameter `userdata_renderer`. If this is also not set, then no templating will be performed on the `userdata_file`.

In addition, the other cloud drivers which support setting a `userdata_file` (`azurearm`, `nova`, and `openstack`) have had templating support added to bring them to feature parity with the `ec2` driver's implementation of the `userdata_file` option.

## Patched Packages

Due to the critical nature of issue [issue 41230](#) we have decided to patch the 2016.11.5 packages with [PR 41244](#). This issue affects all calls to a salt-minion if there is an ipv6 nameserver set on the minion's host. The patched packages on [repo.saltstack.com](#) will divert from the v2016.11.5 tag and pypi packages due to the patches applied to the packages.

  - d9546c6283 Merge pull request #41599 from garethgreenaway/41540\_fixes\_to\_archive\_module
  - 66a136e6d8 Fixing issues raised in #41540 when a zip file is created on a Windows system. The issue has two parts, first directories that end up in the archive end up in the results of aarchive.list twice as they show up as both files and directories because of the logic to handle the fact that Windows doesn't mark them as directories. This issue shows up when an extraction is run a second time since the module verified the file types and the subdirectory is not a file. The second issue is related to permissions, if Salt is told to extract permissions (which is the default) then the directory and files end up being unreadable since the permissions are not available. This change sets the permissions to what the default umask for the user running Salt is.

### 33.2.91 Salt 2016.11.7 Release Notes

Version 2016.11.7 is a bugfix release for *2016.11.0*.

#### Security Fix

CVE-2017-12791 Maliciously crafted minion IDs can cause unwanted directory traversals on the Salt-master

This release corrects a flaw in minion ID validation which could allow certain minions to authenticate to a master despite not having the correct credentials. To exploit the vulnerability, an attacker must create a salt-minion with an ID containing characters that will cause a directory traversal. Credit for discovering the security flaw goes to [Vernhk@qq.com](mailto:Vernhk@qq.com)

### 33.2.92 Salt 2016.11.8 Release Notes

Version 2016.11.8 is a bugfix release for *2016.11.0*.

#### Security Fix

**CVE-2017-14695** Directory traversal vulnerability in minion id validation in SaltStack. Allows remote minions with incorrect credentials to authenticate to a master via a crafted minion ID. Credit for discovering the security flaw goes to: Julian Brost ([julian@0x4a42.net](mailto:julian@0x4a42.net))

**CVE-2017-14696** Remote Denial of Service with a specially crafted authentication request. Credit for discovering the security flaw goes to: Julian Brost ([julian@0x4a42.net](mailto:julian@0x4a42.net))

#### Anonymous Binds and LDAP/Active Directory

When `auth.ldap.anonymous` is set to `False`, the bind password can no longer be empty.

#### Windows Changes

##### pkg Execution Module`

Significant changes (PR #43708 & #45390, damon-atkins) have been made to the pkg execution module. Users should test this release against their existing package sls definition files.

- *pkg.list\_available* no longer defaults to refreshing the winrepo meta database.
- *pkg.install* without a `version` parameter no longer upgrades software if the software is already installed. Use `pkg.install version=latest` (or simply use a *pkg.latest* state to get the old behavior).
- *pkg.list\_pkgs* now returns multiple versions if software installed more than once.

- `pkg.list_pkgs` now returns `Not Found` when the version is not found instead of `(value not set)` which matches the contents of the sls definitions.
- `pkg.remove` will wait up to 3 seconds (normally about a second) to detect changes in the registry after removing software, improving reporting of version changes.
- `pkg.remove` can remove `latest` software, if `latest` is defined in sls definition.
- Documentation was update for the execution module to match the style in new versions, some corrections as well.
- All install/remove commands are prefix with `cmd.exe shell` and `cmdmod` is called with a command line string instead of a list. Some sls files in `saltstack/salt-winrepo-ng` expected the commands to be prefixed with `cmd.exe` (i.e. the use of `&`).
- Some execution module functions results, now behave more like their Unix/Linux versions.

### cmd Execution Module

Due to a difference in how Python's `subprocess.Popen()` spawns processes on Windows, passing the command as a list of arguments can result in problems. This is because Windows' `CreateProcess` requires the command to be passed as a single string. Therefore, `subprocess` will attempt to re-assemble the list of arguments into as string. Some escaped characters and quotes can cause the resulting string to be incorrectly-assembled, resulting in a failure to execute the command.

Salt now deals with these cases by joining the list of arguments correctly and ensuring that the command is passed to `subprocess.Popen()` as a string.

### 33.2.94 Salt 2016.3.0 Release Notes - Codename Boron

#### Known Issues

**Warning: Some Salt Masters may need to apply a patch for Default Job Cache to prevent a possible crash**

An issue exists that prevents the Salt master from cleaning the default job cache. This issue can cause an over-consumption of resources resulting in a crash. 2016.3.0 Salt masters should apply the patch in [PR 33555](#). This issue will be addressed in 2016.3.1.

- [issue 33516](#): When upgrading from 2015.8.10 to 2016.3.0 on centos7/redhat7 salt-minion must be restarted twice.
- [issue 33517](#): SPM does not work on amazon linux 2015 in 2016.3.0.

#### Backwards-incompatible Changes

- The default path for the `extension_modules` master config option has been changed. Prior to this release, the location was a directory named `extmods` in the Salt cachedir. On most platforms, this would put the `extension_modules` directory in `/var/cache/salt/extmods`. It has been moved one directory down, into the master cachedir. On most platforms, this is `/var/cache/salt/master/extmods`. Most users won't have to worry about this, but those who have been manually placing custom runners into `/var/cache/salt/extmods/runners`, or outputters into `/var/cache/salt/extmods/output`, etc. will be affected by this. To transition, it is recommended not to simply move the `extmods` directory into `/var/cache/salt/master`, but to copy the custom modules into the salt fileservers under `salt:/_runners`, `salt://_output`, etc. and sync them using the functions in the new `saltutil runner`.
- The `pkg.check_db` function has been removed for yum/dnf.

## Core Changes

- The `onchanges` requisite now fires if any watched state changes. [issue 19592](#).
- The `ext_pillar` functions **must** now accept a minion ID as the first argument. This stops the deprecation path started in Salt 0.17.x. Before this minion ID first argument was introduced, the minion ID could be retrieved accessing `__opts__['id']` losing the reference to the master ID initially set in `opts`. This is no longer the case, `__opts__['id']` will be kept as the master ID.
- Custom types can now be synced to the master using the new `saltutil runner`. Before, these needed to manually be placed under the `extension_modules` directory. This allows custom modules to easily be synced to the master to make them available when compiling Pillar data. Just place custom runners into `salt://_runners`, custom outputters into `salt://_output`, etc. and use the functions from the `saltutil runner` to sync them.
- The `client_acl` configuration options were renamed to `publisher_acl`.
- Added a new `--config-dump` option ([issue 26639](#)).
- TCP Transport presence events were updated to work with a NAT ([PR 30629](#)).
- A `minion_pillar_cache` setting was added to save rendered pillar data to `cachedir` for later use when `file_client` is set to `local` ([PR 30428](#)).
- Added the ability for binary data (such as a license key) to be distributed via pillar using the `file.managed` ([issue 9569](#)).
- Scheduled jobs now include `success` and `retcode` ([issue 24237](#)).
- The `saltversioninfo` grain was changed from a string to a list to enable reading values by index. ([PR 30082](#)).
- A `pillar_merge_lists` option was added to enable recursively merging pillar lists by aggregating them instead of replacing them ([PR 30062](#)).
- Grain values reported by Debian 8 (jessie) when `lsb-release` is installed were updated for consistency ([PR 28649](#)).
- A new option for minions called `master_tries` has been added. This specifies the number of times a minion should attempt to contact a master to attempt a connection. This allows better handling of occasional master downtime in a multi-master topology.
- The default directory for deploying the salt-thin tarball has changed for salt-ssh. It is now `/var/tmp` instead of `/tmp`. Users may also wish to delete any directories in `/tmp` ending with `_salt/`. ([issue 32771](#))

## External Module Packaging

Modules may now be packaged via entry-points in `setuptools`. See [external module packaging](#) tutorial for more information.

## Cloud Changes

- Refactored the OpenNebula driver and added numerous `--function` and `--action` commands to enhance Salt support for image, template, security group, virtual network and virtual machine management in OpenNebula.
- Added execution/state modules to support the deployment of AWS cognito identity pools (PR 31094).
- Added ability to set tags and listener policies on a AWS ELB (PR 27552).

## Platform Changes

- Renamed modules related to macOS. The following module filenames were changed. The virtual name remained unchanged.
- PR #30558: renamed `osxdesktop.py` to `mac_desktop.py`
- PR #30557: renamed `macports.py` to `mac_ports.py`
- PR #30556: renamed `darwin_sysctl.py` to `mac_sysctl.py`
- PR #30555: renamed `brew.py` to `mac_brew.py`
- PR #30552: renamed `darwin_pkgutil.py` to `mac_pkgutil.py`

## Package Support

- Ubuntu Xenial: Packages for Ubuntu Xenial (16.04) are available for 2016.3.0 and onwards. See [repo.saltstack.com](http://repo.saltstack.com) for more information. Note that Xenial comes with Debian's packaged version of Salt 2015.8.8 and official [repo.saltstack.com](http://repo.saltstack.com) packages are available for 2015.8 releases beginning with Salt 2015.8.11.

## Proxy Minion Changes

The deprecated config option `enumerate_proxy_minions` has been removed.

As mentioned in earlier documentation, the `add_proxymodule_to_opts` configuration variable defaults to `False` in this release. This means if you have proxymodules or other code looking in `__opts__['proxymodule']` you will need to set this variable in your `/etc/salt/proxy` file, or modify your code to use the `__proxy__` injected variable.

The `__proxyenabled__` directive now only applies to grains and proxy modules themselves. Standard execution modules and state modules are not prevented from loading for proxy minions.

Support has been added to Salt's loader allowing custom proxymodules to be placed in `salt://_proxy`. Proxy minions that need these modules will need to be restarted to pick up any changes. A corresponding utility function, `saltutil.sync_proxymodules`, has been added to sync these modules to minions.

Enhancements in grains processing have made the `__proxyenabled__` directive somewhat redundant in dynamic grains code. It is still required, but best practices for the `__virtual__` function in grains files have changed. It is now recommended that the `__virtual__` functions check to make sure they are being loaded for the correct proxytype, example below:

```
def __virtual__():
    """
    Only work on proxy
    """
    try:
```

(continues on next page)

(continued from previous page)

```

    if salt.utils.is_proxy() and __opts__["proxy"]["proxytype"] == "ssh_
↪sample":
        return __virtualname__
    except KeyError:
        pass

    return False

```

**Note:** `salt.utils.is_proxy()` has been renamed to `salt.utils.platform.is_proxy` as of the Oxygen release.

The try/except block above exists because grains are processed very early in the proxy minion startup process, sometimes earlier than the proxy key in the `__opts__` dictionary is populated.

Grains are loaded so early in startup that no dunder dictionaries are present, so `__proxy__`, `__salt__`, etc. are not available. Custom grains located in `/srv/salt/_grains` and in the salt install grains directory can now take a single argument, `proxy`, that is identical to `__proxy__`. This enables patterns like

```

def get_ip(proxy):
    """
    Ask the remote device what IP it has
    """
    return {"ip": proxy["proxymodulename.get_ip"]()}

```

Then the grain `ip` will contain the result of calling the `get_ip()` function in the proxymodule called `proxymodulename`.

Proxy modules now benefit from including a function called `initialized()`. This function should return `True` if the proxy's `init()` function has been successfully called. This is needed to make grains processing easier.

Finally, if there is a function called `grains` in the proxymodule, it will be executed on proxy-minion startup and its contents will be merged with the rest of the proxy's grains. Since older proxy-minions might have used other methods to call such a function and add its results to grains, this is config-gated by a new proxy configuration option called `proxy_merge_grains_in_module`. This defaults to `False` in this release. It will default to `True` in the release after next. The next release is codenamed **Carbon**, the following is **Nitrogen**.

The example proxy minions `rest_sample` and `ssh_sample` have been updated to reflect these changes.

## Syndic Updates

A major performance and management issue was found and fixed in the syndic. This makes the Salt Syndic substantially more reliable and performant. Please make sure that the syndic and the master of masters which syndics attach to are updated, otherwise the syndic fixes alone can cause minor performance issues with older master of masters. Please update masters first, then syndics. Minions do not need to be updated for this fix to work.

## Module Changes

- *file execution module*: `show_diff` is deprecated in favor of `show_changes`. (PR 30988)
- *reg execution module*:
  - Removed the following deprecated functions from the `reg` module (PR 30956):
    - \* `read_key`
    - \* `set_key`
    - \* `create_key`
    - \* `delete_key`
  - Removed `force` parameter from `reg state` module
  - Fixed virtual function in `state`
  - Improved error information for `reg.delete_value` function
- *jboss7 execution module*: `deployed` function was decoupled from Artifactory by removing Artifactory-specific functionality. Note that the changes in some of the function arguments break existing state files, see [issue 30515](#) and [PR 3080](#) for details.
- *pkg state module*: The `wait` function was removed, the functionality was replaced with the `onchanges` requisite (PR 30297).
- *firewalld state module*: A `permanent` argument was added `add_port`. Note that `permanent` defaults to `True`, which changes previous behavior (PR 30275). A `bind` function was also added that allows binding zones to interfaces and sources (PR 29497).
- *journalld beacon module*: The event string was updated to include a tag. Note this might impact existing reactors based on this beacon. (PR 30116).
- *postgres\_privileges state module*: The default value of the `prepend` argument was changed from `None` to `public`.
- *zenoss execution module*: The `add_device` function was updated with a default value of `1000` for `prod_state` to match the documentation (PR 28924).
- The `etcd` execution module, `state` module, `returner` module, and `util` module were refactor (PR 28599). This refactor changes error returns for several functions (primarily edge cases):
  - `get`: Used to return `"` on key-not-found. Now returns `None`.
  - `set`: Used to return `"` on issues setting keys. Now returns `None`.
  - `ls`: Used to return `{path: {}}` on key-not-found. Now returns `None`.
  - `Tree`: Used to return `{}` on key-not-found. Now returns `None`.
- *smartos\_virt execution module*: Updated to use most of the new `smartos_vmadm` (PR 28284).

- *apache\_conf state module*, *apache\_module state module*, and *apache\_site state module*: the `enable` and `disable` functions were renamed to `enabled` and `disabled`, respectively. In PR 33562, these functions were readded and properly deprecated and will be removed in Salt 2017.7.0. This fix will be available in 2016.3.1. As a workaround, try

```
apache_module.enable{{ 'd' if grains.saltversioninfo == [2016, 3, 0] else
→ '' }}
```

## New Features

### Thorium - Provisional New Reactor

The 2016.3 release introduces the new Thorium Reactor. This reactor is an experimental new feature that implements a flow programming interface using the salt state system as the engine. This means that the Thorium reactor uses a classic state tree approach to create a reactor that can aggregate event data from multiple sources and make aggregate decisions about executing reactions.

This feature is both experimental and provisional, it may be removed and APIs may be changed. This system should be considered as ambitious as the Salt State System in that the scope of adding a programmable logic engine of this scale into the event systems is non trivial.

See *Thorium Complex Reactor*.

### Improved Mac OS Support

### Improved Solaris Support

A lot of work was done to improve support for SmartOS. This work also resulted in improvements for Solaris and illumos as SmartOS.

- rewrite of *vmadm module* (SmartOS)
- rewrite of *imgadm module* (SmartOS)
- deprecation of *virt module* in favor of *vmadm* (SmartOS)
- implemented *smartos state* (SmartOS)
- improved *zpool module* add SmartOS, illumos and Solaris support
- improved *zfs module* add SmartOS, illumos and Solaris support
- implemented *zpool state*
- implemented *zfs state* implemented *solaris\_system* system module to provide better Solaris support (PR 30519)
- other minor fixes to grains, localmod, ...

## Tornado Transport

---

**Important:** The Tornado Transport wire protocol was changed in 2016.3, making it incompatible with 2015.8 (PR 29339).

---

## Windows DSC Integration (Experimental)

### Dimension Data Cloud Support

A SaltStack Cloud driver for [Dimension Data Public Cloud](#), provides the driver functionality to service automation for any of the Dimension Data Public Cloud locations:

- Deploy new virtual machines
- List and query virtual machine images
- Destroy and query virtual machines

Documentation of the Dimension Data SaltStack integration is found on [developer.dimensiondata.com](http://developer.dimensiondata.com)

### Minion Blackout

During a blackout, minions will not execute any remote execution commands, except for `saltutil.refresh_pillar`. Blackouts are enabled using a special pillar key, `minion_blackout` set to True.

See *Minion Blackout*.

### Splunk Returner

A Splunk Returner that uses HTTP Event Collector is now available (PR 30718).

### SQLCipher Pillar Module

Support was added for retrieving pillar data via queries to SQLCipher databases (PR 29782).

### New Modules

The following list contains a link to the new modules added in this release.

### 33.2.95 Salt 2016.3.1 Release Notes

Version 2016.3.1 is a bugfix release for *2016.3.0*.

#### Statistics

- Total Merges: 87
- Total Issue References: 23
- Total PR References: 58
- Contributors: 25 (abednarik, amontalban, anlutro, babilen, cachedout, cburlison, danslimmon, eliasp, glomium, jacobhammons, jfindlay, kev009, lomeroy, michalsuba, neil-williamson, onorua, opdude, rallytime, sorge, terminalmage, thatch45, ticosax, tomlaredo, twangboy, zigarn)

#### Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th, 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

#### Known Issues

issue 36055: Salt Cloud events (`salt/cloud`) are not generated on the master event bus when provisioning cloud systems.

Bootstrap Issue #973: `python-futures` is not installed when installing from a git tag on RedHat-based distributions. `Python futures` is needed when

running Salt with the TCP transport. This is fixed on the `develop` branch of the [salt-bootstrap repo](#) and the fix will be included in the upcoming release of `salt-bootstrap`, but is a bug in the bootstrap release that ships with this version of Salt. Please see the [salt-bootstrap repo](#) for more information on how to update your bootstrap version.

#### Known Issues

The Salt Minion does not clean up files in `/tmp` when rendering templates. This potentially results in either running out of disk space or running out of inodes. Please see [issue 37541](#) for more information. This bug was fixed with PR [37540](#), which will be available in the 2016.3.5 release of Salt.

The release of the `bootstrap-salt.sh` script that is included with 2016.3.4 release has a bug in it that fails to install salt correctly for git installs using tags in the 2015.5 branch. This bug has not been fixed in the `salt-bootstrap` repository yet, but the previous bootstrap release (v2016.08.16) does not contain this bug.

#### Changes

- The `disk.wipe` execution module function has been modified so that it correctly wipes a disk.
- Add ability to clone from a snapshot to the VMWare salt-cloud driver.
- Add ability to specify disk backing mode in the VMWare salt cloud profile.

## Security Fixes

### CVE-2017-5192 local\_batch client external authentication not respected

The `LocalClient.cmd_batch()` method client does not accept `external_auth` credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the `root` user.

### CVE-2017-5200 Salt-api allows arbitrary command execution on a salt-master via Salt's ssh\_client

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2016.3 branch upgrade to a patched release as soon as possible.

## Improved Checksum Handling in `file.managed`, `archive.extracted` States

When the `source_hash` argument for these states refers to a file containing checksums, Salt now looks for checksums matching the name of the source URI, as well as the file being managed. Prior releases only looked for checksums matching the filename being managed. Additionally, a new argument (`source_hash_name`) has been added, which allows the user to disambiguate ambiguous matches when more than one matching checksum is found in the `source_hash` file.

A more detailed explanation of this functionality can be found in the *file.managed* documentation, in the section for the new `source_hash_name` argument.

### 33.2.101 Salt 2016.3.7 Release Notes

Version 2016.3.7 is a bugfix release for *2016.3.0*.

#### Security Fix

CVE-2017-12791 Maliciously crafted minion IDs can cause unwanted directory traversals on the Salt-master

This release corrects a flaw in minion ID validation which could allow certain minions to authenticate to a master despite not having the correct credentials. To exploit the vulnerability, an attacker must create a salt-minion with an ID containing characters that will cause a directory traversal. Credit for discovering the security flaw goes to [Vernhk@qq.com](mailto:Vernhk@qq.com)

#### Changelog for v2016.3.6..v2016.3.7

Generated at: 2018-05-27 14:09:17 UTC

- 11d176ff1b Add release notes for 2016.3.7 release
- dc649ded51 Add clean\_id function to salt.utils.verify.py

### 33.2.102 Salt 2016.3.8 Release Notes

Version 2016.3.8 is a bugfix release for *2016.3.0*.

#### Security Fix

**CVE-2017-14695** Directory traversal vulnerability in minion id validation in SaltStack. Allows remote minions with incorrect credentials to authenticate to a master via a crafted minion ID. Credit for discovering the security flaw goes to: Julian Brost ([julian@0x4a42.net](mailto:julian@0x4a42.net))

**CVE-2017-14696** Remote Denial of Service with a specially crafted authentication request. Credit for discovering the security flaw goes to: Julian Brost ([julian@0x4a42.net](mailto:julian@0x4a42.net))

#### Changelog for v2016.3.7..v2016.3.8

Generated at: 2018-05-27 14:11:36 UTC

- 8cf08bd7be Update 2016.3.7 Release Notes
- 0425defe84 Do not allow IDs with null bytes in decoded payloads
- 31b38f50eb Don't allow path separators in minion ID

### 33.2.103 Salt 2016.3.9 Release Notes

Version 2016.3.9 is a bugfix release for *2016.3.0*.

#### Master Changes

The following options have been added to the master config file:

- `allow_minion_key_revoke` - This option controls whether a minion can request that the master revoke its key. When `True`, a minion can request a key revocation and the master will comply. If it is `False`, the key will not be revoked by the msater.
- `require_minion_sign_messages` - This requires that minions cryptographically sign the messages they publish to the master. If minions are not signing, then log this information at loglevel INFO and drop the message without acting on it.
- `drop_messages_signature_fail` - Drop messages from minions when their signatures do not validate. Note that when this option is `False` but `require_minion_sign_messages` is `True`, minions *MUST* sign their messages, but the validity of their signatures is ignored.
- `minion_sign_messages` - Causes the minion to cryptographically sign the payload of messages it places on the event bus for the master. The payloads are signed with the minion's private key so the master can verify the signature with its public key.

## 33.2.104 Salt 2015.8.0 Release Notes - Codename Beryllium

- #25130: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

The 2015.8.0 feature release of Salt contains several major new features. As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

### New SaltStack Installation Repositories

SaltStack now provides installation repositories for several platforms, with more to come. For instructions, see: [repo.saltstack.com](http://repo.saltstack.com).

### Send Event on State Completion

A `fire_event` global state keyword argument was added that allows any state to send an event upon completion. Useful for custom progress bars and checking in on long state runs. See [fire\\_event](#).

### ZeroMQ socket monitoring

If `zmq_monitor` is enabled, log all ZMQ events for socket monitoring purposes. Verbose, but useful.

### SPM (Salt Package Manager)

Allows Salt formulas to be packaged for ease of deployment. See [spm](#).

---

**Note:** The `spm` executable was not included in the Debian or Ubuntu packages for the 2015.8.0 or the 2015.8.1 releases. This executable will be included in an upcoming release. As a workaround, copy the SPM script from the salt library installation into `/usr/local/bin` or your local equivalent.

---

### Specify a Single Environment for Top Files

A new `default_top` option was added to load the state top file from a single, specific environment, rather than merging top data across all environments. Additionally, new `top_file_merge_strategy` and `env_order` options were added for more control over top file merging. See [The Top File](#).

### Tornado TCP Transport

Implemented a pure-TCP transport, in addition to ZeroMQ and RAET. The new transport uses Tornado, which allows Salt to use a standardized set of libraries for asynchronous behavior, which should greatly improve reliability and performance.

---

**Note:** Tornado is considered experimental in this release. The following known issues were being investigated at the time of release:

- TCP tests show performance degradation over time ([issue 26051](#))
  - TCP transport stacktrace on windows minion: Future exception was never retrieved ([issue 25718](#))
  - [freebsd] TCP transport not working in 2015.8.0rc3 ([issue 26364](#))
- 

### Proxy Minion Enhancements

Proxy Minions have undergone a significant overhaul in 2015.8, see [Proxy Minion Enhancements](#).

### Engines

Salt engines are long-running, external processes that leverage Salt. See [Salt Engines](#).

### Core Changes

- Add system version info to `versions_report`, which appears in both `salt --versions-report` and `salt '*' test.versions_report`. Also added is an alias `test.versions` to `test.versions_report`. ([issue 21906](#))
- Add colored console logging support. This is activated by using `%(colorlevel)s`, `%(colorname)s`, `%(colorprocess)s`, `%(colormsg)s` in `log_fmt_console` in the config file for any of `salt-master`, `salt-minion`, and `salt-cloud`.

### Git Pillar

The git external pillar has been rewritten to bring it up to feature parity with [gitfs](#). Support for [pygit2](#) has been added, bringing with it the ability to access authenticated repositories.

Using the new features will require updates to the git ext\_pillar configuration, further details can be found in the [pillar.git\\_pillar](#) docs.

### Salt Cloud Improvements

- Pricing data from several cloud providers (GCE, DigitalOcean, SoftLayer\_HW, EC2)
- All cloud providers now use standardized bootstrapping code.
- Modified the Linode Salt Cloud driver to use Linode's native API instead of depending on `apache-libcloud` or `linode-python`.

### Salt Cloud Changes

- Changed the default behavior of `rename_on_destroy` to be set to `True` in the EC2 and AWS drivers.
- Changed the default behavior of the EC2 and AWS drivers to always check for duplicate names of VMs before trying to create a new VM. Will now throw an error similarly to other salt-cloud drivers when trying to create a VM of the same name, even if the VM is in the `terminated` state.
- When querying for VMs in `digital_ocean.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.Ocean.

### State and Execution Module Improvements

- New and improved Docker state and execution modules (`state` and `execution module`).

## Git State and Execution Modules Rewritten

The git state and execution modules have gone through an extensive overhaul.

### Changes in the `git.latest` State

- The `branch` argument has been added, allowing for a custom branch name to be used in the local checkout maintained by the `git.latest` state. This can be helpful in avoiding ambiguous refs in the local checkout when a tag is used as the `rev` argument. If no `branch` is specified, then the state uses the value of `rev` as the branch name.
- The `always_fetch` argument no longer has any effect, and will be removed in a future release. The state now detects whether or not a fetch is needed based on comparisons made between the local and remote repositories.
- The `force_fetch` argument has been added to force a fetch if the fetch is not a fast-forward (for instance, if someone has done a reset and force-pushed to the remote repository).
- The `remote_name` argument has been deprecated and renamed to `remote`.
- The `force` argument has been deprecated and renamed to `force_clone` to reduce ambiguity with the other "force" arguments.
- Using SHA1 hashes (full or shortened) in the `rev` argument is now properly supported.
- Non-fast-forward merges are now detected before the repository is updated, and the state will not update the repository if the change is not a fast-forward. Non-fast-forward updates must be overridden with the `force_reset` argument. If `force_reset` is set to `True`, the state will only reset the repository if it cannot be fast-forwarded. This is in contrast to the earlier behavior, in which a hard-reset would be performed every time the state was run if `force_reset` was set to `True`.
- A `git pull` is no longer performed by this state, dropped in favor of a fetch-and-merge (or fetch-and-reset) workflow.

### `git.config_unset` state added

This state allows for configuration values (or entire keys) to be unset. See [here](#) for more information and example SLS.

### `git.config` State Renamed to `git.config_set`

To reduce confusion after the addition of `git.config_unset`, the `git.config` state has been renamed to `git.config_set`. The old `config.get` name will still work for a couple releases, allowing time for SLS files to be updated.

In addition, this state now supports managing multivar git configuration values. See [here](#) for more information and example SLS.

## Initial Support for Git Worktrees in Execution Module

Several functions have been added to the execution module to manage `worktrees` (a feature new to Git 2.5.0). State support does not exist yet, but will follow soon.

## New Functions in Git Execution Module

- `git.config_get_regexp`
- `git.config_unset`
- `git.is_worktree`
- `git.list_branches`
- `git.list_tags`
- `git.list_worktrees`
- `git.merge_base`
- `git.merge_tree`
- `git.rev_parse`
- `git.version`
- `git.worktree_rm`
- `git.worktree_add`
- `git.worktree_prune`

## Changes to Functions in Git Execution Module

### **git.add**

- `--verbose` is now implied when running the `git add` command, to provide a list of the files added in the return data.

### **git.archive**

- Now returns `True` when the `git archive` command was successful, and otherwise raises an error.
- The `overwrite` argument has been added to prevent an existing archive from being overwritten by this function.
- The `fmt` argument has been deprecated and renamed to `format`.
- Trailing slash no longer implied in `prefix` argument, must be included if this argument is passed.

### **git.checkout**

- The `rev` argument is now optional when using `-b` or `-B` in `opts`, allowing for a branch to be created (or reset) using `HEAD` as the starting point.

### **git.clone**

- The `name` argument has been added to specify the name of the directory in which to clone the repository. If this option is specified, then the clone will be made within the directory specified by the `cwd`, instead of at that location.
- The `repository` argument has been deprecated and renamed to `url`.

### **git.config\_get**

- The `setting_name` argument has been deprecated and renamed to `key`.
- The `global` argument has been added, to query the global git configuration
- The `all` argument has been added to return a list of all values for the specified key, allowing for all values in a multivar to be returned.
- The `cwd` argument is now optional if `global` is set to `True`

### **git.config\_set**

- The value(s) of the key being set are now returned
- The `setting_name` argument has been deprecated and renamed to `key`.
- The `setting_value` argument has been deprecated and renamed to `value`.
- The `is_global` argument has been deprecated and renamed to `global`.
- The `multivar` argument has been added to specify a list of values to set for the specified key. The `value` argument is not compatible with `multivar`.
- The `add` argument has been added to add a value to a key (this essentially just adds an `--add` to the `git config` command that is run to set the value).

### **git.fetch**

- The `force` argument has been added to force the fetch when it is not a fast-forward. This could have been achieved in previous Salt versions by including `--force` in the `opts` argument, this argument is just for convenience and to match the usage of other functions with `force` arguments.
- The `refspecs` argument has been added to allow for one or more refspecs to be provided which override the one(s) specified by the `remote.remote_name.fetch` git configuration option.

### **git.ls\_remote**

- The `repository` argument has been deprecated and renamed to `remote`.
- The `branch` argument has been deprecated and renamed to `ref`.
- The `opts` argument has been added to allow for additional CLI options to be passed to the `git ls-remote` command.

### **git.merge**

- The `branch` argument has been deprecated and renamed to `rev`.

### **git.status**

- Return data has been changed from a list of lists to a dictionary containing lists of files in the modified, added, deleted, and untracked states.

### **git.submodule**

- Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`.
- OpenStack Glance API V2 execution module
- Amazon VPC state module
- RallyDev execution module
- BambooHR execution module
- Stormpath execution, state modules
- Remove unused argument `timeout` in `jboss7.status`.
- Deprecate `enabled` argument in `pkgrepo.managed` in favor of `disabled`.
- Archive module changes: In the `archive.tar` and `archive.cmd_unzip` module functions, remove the arbitrary prefixing of the options string with `-`. An options string beginning with a `--long-option`, would have uncharacteristically needed its first `-` removed under the former scheme. Also, `tar` will parse its options differently if short options are used with or without a preceding `-`, so it is better to not confuse the user into thinking they're using the non-`-` format, when really they are using the with-`-` format.
- Added `__states__` to state modules, for cross-calling states. This enables using existing states when writing custom states. See *cross calling states*.

## Windows Improvements

- Enhanced the windows minion silent installation with command line parameters to configure the salt master and minion name.
- Improved user management with additional capabilities in the user module for Windows.
- Improved patch management with a new module for managing windows updates (`win_wua`).
- Turned on multi-processing by default for windows in minion configuration.

## Windows Software Repo Changes

A next-generation (ng) windows software repo is available for 2015.8.0 and later minions. When using this new repository, the repo cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time.

See the Windows Software Repository documentation for more information.

## Changes to legacy Windows repository

If you have pre 2015.8 Windows minions connecting to your 2015.8 Salt master, you can continue to use the legacy Windows repository for these Salt minions.

If you were previously using this repository and have customized settings, be aware that several config options have been renamed to make their naming more consistent.

See the Windows Software Repository documentation for more information.

## Win System Module

The unit of the `timeout` parameter in the `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` functions has been changed from seconds to minutes in order to be consistent with the linux timeout setting. ([issue 24411](#)) Optionally, the unit can be reverted to seconds by specifying `in_seconds=True`.

## Other Improvements

- Sanitize sensitive fields in `http.query`
- Allow authorization to be read from Django and eauth
- Add templating to SMTP returner
- New REST module for SDB
- Added `rest_timeout` config option and `timeout` argument to jobs api call
- Provide config options for Raet lane and road buffer count. (Useful for BSD kernels)
- Implemented ZeroMQ socket monitor for master and minion
- Add end time to master job cache for jobs (optional, off by default)
- Tornado is now the default backend for `http.request`
- Support `pillarenv` selection as it's done for `saltenv`
- salt was updated to use `python-crypto` version 2.6.1, which removes the dependency on `python-m2crypto`.

## Deprecations

- The `digital_ocean.py` Salt Cloud driver was removed in favor of the `digital_ocean_v2.py` driver as DigitalOcean has removed support for APIv1. The `digital_ocean_v2.py` was renamed to `digital_ocean.py` and supports DigitalOcean's APIv2.
- The `vsphere.py` Salt Cloud driver has been deprecated in favor of the `vmware.py` driver.
- The `openstack.py` Salt Cloud driver has been deprecated in favor of the `nova.py` driver.
- The use of `provider` in Salt Cloud provider files to define cloud drivers has been deprecated in favor of using `driver`. Both terms will work until the 2017.7.0 release of Salt. Example provider file:

```
my-ec2-cloud-config:
  id: 'HJGRYCILJLKJYG'
  key: 'kdjgfgsm;woormgl/aseregksjdhasdfgn'
  private_key: /etc/salt/my_test_key.pem
  keyname: my_test_key
  securitygroup: default
  driver: ec2
```

- The use of `lock` has been deprecated and from `salt.utils.fopen`. `salt.utils.flopen` should be used instead.
- The following args have been deprecated from the `rabbitmq_vhost.present` state: `user`, `owner`, `conf`, `write`, `read`, and `runas`.
- The use of `runas` has been deprecated from the `rabbitmq_vhost.absent` state.
- Support for output in `mine.get` was removed. `--out` should be used instead.
- The use of `delim` was removed from the following functions in the `match` execution module: `pillar_pcre`, `pillar`, `grain_pcre`,

## Security Fixes

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <[asteiger@suse.com](mailto:asteiger@suse.com)> for bringing this to our attention.

## Security Fixes

CVE-2015-6941 The Windows `user` module and `salt-cloud` display passwords in log when log level is set to `debug` or more verbose.

For the Windows `user` module, the password is now replaced with the string `XXX-REDACTED-XXX`.

For `salt-cloud`, debug logging no longer displays `win_password` and `sudo_password` authentication credentials.

CVE-2015-6918 Git `state/execution` modules log HTTPS auth credentials when log level is set to `debug` or more verbose.

These credentials are now replaced with `REDACTED` in the debug output. Thanks to Andreas Stieger <[asteiger@suse.com](mailto:asteiger@suse.com)> for bringing this to our attention.

## Major Bug Fixes

- Add support for `spm.d/*.conf` configuration of SPM (issue 27010)
- Fix `proxy` grains breakage for non-proxy minions (issue 27039)
- Fix global key management for git state
- Fix passing `http` auth to `util.http` from `state.file` (issue 21917)
- Fix `multiprocessing: True` in windows (on by default)
- Add `pkg.info` to `pkg` modules
- Fix name of `serial` grain (this was accidentally renamed in 2015.8.0)
- Merge config values from `master.d/minion.d` conf files (rather than flat update)
- Clean grains cache on grains sync (issue 19853)
- Remove streamed response for fileclient to avoid HTTP redirection problems (issue 27093)
- Fixed incorrect warning about `osrelease` grain (issue 27065)
- Fix authentication via Salt-API with tokens (issue 27270)
- Fix winrepo downloads from https locations (issue 27081)
- Fix potential error with salt-call as non-root user (issue 26889)
- Fix global minion provider overrides (issue 27209)
- Fix backward compatibility issues for `pecl` modules
- Fix Windows uninstaller to only remove `./bin, salt*, nssm.exe, uninst.exe` (issue 27383)
- Fix misc issues with mongo returner.
- Add `sudo` option to cloud config files (issue 27398)
- Fix regression in `RunnerClient` argument handling (issue 25107)
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig (issue 27265)
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig (issue 27265)
- Increased performance on boto `asg/elb` states due to `__states__` integration
- Windows minion no longer requires powershell to restart (issue 26629)
- Fix `x509` module to support recent versions of OpenSSL (issue 27326)

- Some issues with proxy minions were corrected.

### Known Issues

- Proxy minions currently cannot execute a highstate because of the way the proxymodule is being loaded internally. This will be fixed in a future release.

### 33.2.106 Salt 2015.8.10 Release Notes

Version 2015.8.10 is a bugfix release for *2015.8.0*.

This release includes fixes for two issues discovered in *2015.8.9*:

- Pip state broken in 2015.8.9 with pip <6.0 (issue 33376)
- Fix traceback in logging for config validation (PR 33386)

#### Final Release of Debian 7 Packages

Regular security support for Debian 7 ended on April 25th 2016. As a result, 2016.3.1 and 2015.8.10 will be the last Salt releases for which Debian 7 packages are created.

#### Important Post-Upgrade Instructions for Linux Mint

As a result of some upstream changes, the `os` grain on Mint Linux is now being detected as `LinuxMint` (issue 33295). Run the following command **after you upgrade to 2015.8.10** to reset the `os` grain to `Mint` and the `os_family` grain to `Debian`:

```
salt -G 'os:LinuxMint' grains.setvals '{"os': 'Mint', 'os_family': 'Debian}'"
```

## Ubuntu 16.04 Packages

SaltStack is now providing official Salt 2015.8 [packages](#) for Ubuntu 16.04.

## Returner Changes

- Any returner which implements a `save_load` function is now required to accept a `minions` keyword argument. All returners which ship with Salt have been modified to do so.

## New Master Configuration Parameter

- `rotate_aes_key` - if `True`, causes Salt to generate a new AES key whenever a minion key is deleted. This eliminates the chance that a deleted minion could continue to eavesdrop on communications with the master if it continues to run after its key is deleted.

### 33.2.109 Salt 2015.8.13 Release Notes

Version 2015.8.13 is a bugfix release for *2015.8.0*.

#### Security Fixes

**CVE-2017-5192** local\_batch client external authentication not respected

The `LocalClient.cmd_batch()` method client does not accept `external_auth` credentials and so access to it from salt-api has been removed for now. This vulnerability allows code execution for already-authenticated users and is only in effect when running salt-api as the `root` user.

**CVE-2017-5200** Salt-api allows arbitrary command execution on a salt-master via Salt's `ssh_client`

Users of Salt-API and salt-ssh could execute a command on the salt master via a hole when both systems were enabled.

We recommend everyone on the 2015.8 branch upgrade to a patched release as soon as possible.

### 33.2.110 Salt 2015.8.2 Release Notes

Version 2015.8.2 is a bugfix release for *2015.8.0*.

#### Security Fix

CVE-2015-8034 Saving *state.sls* cache data to disk with insecure permissions

This affects users of the *state.sls* function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to [zmalone](#) for bringing this issue to our attention.

#### Known Issues

- `*_in` requisites (issue 30820)

This issue affects all users targeting an explicit `- name: <name>` with a `_in` requisite (such as `watch_in` or `require_in`). If you are not using explicit `- name: <name>` arguments, are targeting with the state ID instead of the name, or are not using `_in` requisites, then you should be safe to upgrade to 2015.8.4.

This issue is resolved in the *2015.8.5* release.

#### Security Fix

**CVE-2016-1866** Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Kraemer <kraemer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

## Core Changes

- Support for IAM roles added to S3 module
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` (issue 30118 and issue 30189).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

### 33.2.113 Salt 2015.8.5 Release Notes

Version 2015.8.5 is a bugfix release for *2015.8.0*.

---

**Important:** About this Release Salt 2015.8.5 is identical to the 2015.8.4 release with the addition of a fix for [issue 30820](#), fixed by PR 30833. See [here](#) for the 2015.8.4 release notes.

---

#### Known Issue in `boto_*` execution modules

This release contains an issue that causes the `boto_*` execution modules to display a `__salt__ not defined` error ([issue 30300](#)). This issue will be fixed in an upcoming release, but can be manually resolved by completing the following:

1. Download the `boto_*` execution modules that you would like to update from the 2015.8 branch of Salt. A complete list of affected modules with the specific changes is available in `:pull`30867``.

A simple way to get the updated modules is to [download](#) a zip file of the 2015.8 branch from GitHub. The updated modules are in the `salt\modules` directory.

2. Place the `boto_*` modules into `salt://_modules`.
3. Run the following command to sync these modules to all Salt minions:

```
salt '*' saltutil.sync_modules
```

## 33.2.114 Salt 2015.8.7 Release Notes

Version 2015.8.7 is a bugfix release for *2015.8.0*.

---

**Note:** Salt 2015.8.4, 2015.8.5, and 2015.8.7 were all released within a short period due to regressions found soon after the releases of 2015.8.4 and 2015.8.5. See [here](#) for the 2015.8.4 release notes, and [here](#) for the 2015.8.5 release notes.

### Change to Epoch Support for YUM/DNF

For *pkg.installed* states, on Linux distributions which use yum/dnf, packages which have a non-zero epoch in the version number now require this epoch to be included when specifying an exact version for a package. For example:

```
vim-enhanced:
pkg.installed:
- version: 2:7.4.160-1.el7
```

The *pkg.latest\_version* and *pkg.list\_repo\_pkgs* functions can be used to get the correct version string to use, as they will now contain the epoch when it is non-zero.

### 33.2.115 Salt 2015.8.8 Release Notes

Version 2015.8.8 is a bugfix release for *2015.8.0*.

---

**Important:** Version *2015.8.8.2* was released shortly after 2015.8.8 to fix several known issues. If you installed 2015.8.8 before 03/30/2016, you likely have installed 2015.8.8 and can optionally upgrade (find out which version you have installed using `salt --version`).

## Security Fix

### CVE-2016-3176 Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM *external authentication* is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to *LocalClient*, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM `eAuth service` that users authenticate against in the Salt Master configuration.

### Read Before Upgrading Debian 7 (Wheezy) from 2015.8.7 to 2015.8.8

Before you upgrade from 2015.8.7 on Debian 7, you must run the following commands to remove previous packages:

```
sudo apt-get remove python-pycrypto
sudo apt-get remove python-apache-libcloud
```

Note that `python-pycrypto` will likely remove `python-apache-libcloud`, so the second command might not be necessary. These have been replaced by `python-crypto` and `python-libcloud` with `~bpo70+1` moniker.

### Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.8.4

Salt `systemd` service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

  - de215bd0cd Merge pull request #30978 from garethgreenaway/30472\_state\_functions\_no\_default\_retcode
  - e33b5140f6 removing extra spaces.
  - f668ccf1f7 removing duplicate code, just set the default in the \_set\_retcode function
  - 5f2f0f60c0 The functions in the state module that return a retcode when something goes wrong, eg. a 1 or a 2, do not return a 0 when things go the way they're supposed to go. With the recent changes to the scheduler to ensure that the retcode is returned this is problematic and results in exceptions when a state function is run from the schedule. This simple fix ensures a default retcode of 0 exists, it is then override in the \_set\_retcode function if there is an issue with the run

### 33.2.116 Salt 2015.8.8.2 Release Notes

Version 2015.8.8.2 is a bugfix release for *2015.8.0*.

#### Fixes to 2015.8.8

Salt 2015.8.8.2 includes fixes for the following known issues in 2015.8.8:

- Key master with value [...] has an invalid type of list Error (issue 32044)
- Failed to import module win\_dacl Error (issue 32004)
- Wrong validation type for file\_ignore\_glob key (issue 32114)
- Fix file.managed for windows (issue 31969)

---

**Important:** issue 32183 prevents Salt Cloud from installing the Salt minion on new systems. To workaroud this issue, call `salt-cloud -u` to update the bootstrap script to the latest version.

---

## Important Post-Upgrade Instructions for Linux Mint

As a result of some upstream changes, the `os` grain on Mint Linux is now being detected as `LinuxMint` (issue 33295). Run the following command **after you upgrade to 2015.8.9** to reset the `os` grain to `Mint` and the `os_family` grain to `Debian`:

```
salt -G 'os:LinuxMint' grains.setvals '{"os': 'Mint', 'os_family': 'Debian}'"
```

### 33.2.118 Salt 2015.5.0 Release Notes - Codename Lithium

The 2015.5.0 feature release of Salt is focused on hardening Salt and mostly on improving existing systems. A few major additions are present, primarily the new Beacon system. Most enhancements have been focused around improving existing features and interfaces.

As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

**Warning:** In order to fix potential shell injection vulnerabilities in salt modules, a change has been made to the various `cmd` module functions. These functions now default to `python_shell=False`, which means that the commands will not be sent to an actual shell.

The largest side effect of this change is that "shellisms", such as pipes, will not work by default. The modules shipped with salt have been audited to fix any issues that might have arisen from this change. Additionally, the `cmd` state module has been unaffected, and use of `cmd.run` in jinja is also unaffected. `cmd.run` calls on the CLI will also allow shellisms.

However, custom execution modules which use shellisms in `cmd` calls will break, unless you pass `python_shell=True` to these calls.

As a temporary workaround, you can set `cmd_safe: False` in your minion and master configs. This will revert the default, but is also less secure, as it will allow shell injection vulnerabilities to be written in custom code. We recommend you only set this setting for as long as it takes to resolve these issues in your custom code, then remove the override.

---

**Note:** Starting in this version of salt, `pillar_opts` defaults to `False` instead of `True`. This means that master opts will not be present in minion pillar, and as a result, `config.get` calls will not include master opts.

We recommend pillar is used for configuration options which need to make it to the minion.

---

## Beacons

The beacon system allows the minion to hook into system processes and continually translate external events into the salt event bus. The primary example of this is the *inotify* beacon. This beacon uses inotify to watch configured files or directories on the minion for changes, creation, deletion etc.

This allows for the changes to be sent up to the master where the reactor can respond to changes.

## Sudo Minion Settings

It is now possible to run the minion as a non-root user and for the minion to execute commands via sudo. Simply add `sudo_user: root` to the minion config, run the minion as a non-root user and grant that user sudo rights to execute salt-call.

## Lazy Loader

The Lazy Loader is a significant overhaul of Salt's module loader system. The Lazy Loader will lazily load modules on access instead of all on start. In addition to a major performance improvement, this "sandboxes" modules so a bad/broken import of a single module will only affect jobs that require accessing the broken module. (:issue: 20274)

## Enhanced Active Directory Support

The eauth system for LDAP has been extended to support Microsoft Active Directory out of the box. This includes Active Directory and LDAP group support for eauth.

## Salt LXC Enhancements

The LXC systems have been overhauled to be more consistent and to fix many bugs.

This overhaul makes using LXC with Salt much easier and substantially improves the underlying capabilities of Salt's LXC integration.

## Salt SSH

- Additional configuration options and command line flags have been added to configure the scan roster on the fly
- Added support for `state.single` in `salt-ssh`
- Added support for `publish.publish`, `publish.full_data`, and `publish.runner` in `salt-ssh`
- Added support for `mine.get` in `salt-ssh`

## New Windows Installer

The new Windows installer changes how Salt is installed on Windows. The old installer used bbfreeze to create an isolated python environment to execute in. This made adding modules and python libraries difficult. The new installer sets up a more flexible python environment making it easy to manage the python install and add python modules.

Instead of frozen packages, a full python implementation resides in the bin directory (`C:\salt\bin`). By executing `pip` or `easy_install` from within the Scripts directory (`C:\salt\bin\Scripts`) you can install any additional python modules you may need for your custom environment.

The `.exe`'s that once resided at the root of the salt directory (`C:\salt`) have been replaced by `.bat` files and should function the same way as the `.exe`'s in previous versions.

The new Windows Installer will not replace the minion config file and key if they already exist on the target system. Only the salt program files will be replaced. `C:\salt\conf` and `C:\salt\var` will remain unchanged.

## Removed Requests Dependency

The hard dependency on the requests library has been removed. Requests is still required by a number of cloud modules but is no longer required for normal Salt operations.

This removal fixes issues that were introduced with requests and salt-ssh, as well as issues users experienced from the many different packaging methods used by requests package maintainers.

## Python 3 Updates

While Salt does not YET run on Python 3 it has been updated to INSTALL on Python 3, taking us one step closer. What remains is getting the test suite to the point where it can run on Python 3 so that we can verify compatibility.

## RAET Additions

The RAET support continues to improve. RAET now supports multi-master and many bugs and performance issues have been fixed. RAET is much closer to being a first class citizen.

## Modified File Detection

A number of functions have been added to the RPM-based package managers to detect and diff files that are modified from the original package installs. This can be found in the new `pkg.modified` functions.

## Reactor Update

Fix an infinite recursion problem for runner/wheel reactor jobs by passing a "user" (Reactor) to all jobs that the reactor starts. The reactor skips all events created by that username -- thereby only reacting to events not caused by itself. Because of this, runner and wheel executions from the runner will have user "Reactor" in the job cache.

## Misc Fixes/Additions

- SDB driver for etcd. (:issue: 22043)
- Add `only_upgrade` argument to `apt-based pkg.install` to only install a package version if the package is already installed. (Great for security updates!)
- Joyent now requires a `keyname` to be specified in the provider configuration. This change was necessitated upstream by the 7.0+ API.
- Add `args` argument to `cmd.script_retcode` to match `cmd.script` in the `cmd` module. (:issue: 21122)
- Fixed bug where TCP keepalive was not being sent on the defined interval on the return port (4506) from minion to master. (:issue: 21465)
- `LocalClient` may now optionally raise `SaltClientError` exceptions. If using this class directly, checking for and handling this exception is recommended. (:issue: 21501)
- The `SAuth` object is now a singleton, meaning authentication state is global (per master) on each minion. This reduces sign-ins of minions from 3->1 per startup.
- Nested outputter has been optimized, it is now much faster.
- Extensive fileserver backend updates.

## Deprecations

- Removed parameter keyword argument from `eselect.exec_action` execution module.
- Removed `runas` parameter from the following `pip`` execution module functions: `install`, `uninstall`, `freeze`, `list_`, `list_upgrades`, `upgrade_available`, `upgrade`. Please migrate to `user`.
- Removed `runas` parameter from the following `pip` state module functions: `installed`, `removed`, `uptodate`. Please migrate to `user`.
- Removed `quiet` option from all functions in `cmdmod` execution module. Please use `output_loglevel=quiet` instead.
- Removed `parameter` argument from `eselect.set_state`. Please migrate to `module_parameter` or `action_parameter`.
- The `salt_events` table schema has changed to include an additional field called `master_id` to distinguish between events flowing into a database from multiple masters. If `event_return` is enabled in the master config, the database schema must first be updated to add the `master_id` field. This alteration can be accomplished as follows:

```
ALTER TABLE salt_events ADD master_id VARCHAR(255) NOT NULL;
```

## Known Issues

- In multi-master mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting `'auth_timeout'` and `'auth_tries'` down to shorter periods.

### 33.2.120 Salt 2015.5.10 Release Notes

release

2015-03-22

Version 2015.5.10 is a bugfix release for *2015.5.0*.

## Security Fix

### CVE-2016-3176 Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM *external authentication* is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to *LocalClient*, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM `eAuth service` that users authenticate against in the Salt Master configuration.

No additional fixes are included in this release.

### Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.5.9

Salt `systemd` service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

### Changelog for v2015.5.9..v2015.5.10

Generated at: 2018-05-27 22:39:26 UTC

- 69ba1de71d Remove ability of authenticating user to specify pam service

## 33.2.121 Salt 2015.5.11 Release Notes

release  
2015-07-22

Version 2015.5.11 is a bugfix release for *2015.5.0*.

## Bug Fixes

- The `cron.present` state now correctly defaults to state ID as identifier.

## Salt-Cloud Changes

- When querying for VMs in the `digital_ocean_v2` cloud driver, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The `vmware` salt-cloud driver was back-ported from the develop branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.
